We're not in a land of milk-and-honey. We're in a land where the major political battles of the coming decades will be over the allocation of resources under conditions of scarcity—the task that once earned economics the title of 'the dismal science'. That science is being returned to its roots by our inability to kick the can down the road too much further and this situation will likely bring our political system down with it. In terms of sheer size, the biggest problems in this battle will be Social Security and Medicare though Buchanan is justified in emphasizing our military expenses at this time. Those military expenses have grown at an extraordinary rate and at the cost of our personal liberties and perhaps at the cost of the moral integrity of our country as a whole and the moral sanity of those soldiers we put into situations where we function as enemies of civilian populations—we never learned the real lessons of Viet Nam. Furthermore, many of our military expenses could be cut soon, though there are many troops and much doomed-to-rust equipment to bring back as well as a lot of veteran's

benefits to fund.

Whether or not we get our would be imperial rulers under control, the deficits of Social Security and Medicare are so huge that we couldn't maintain these systems past 2020—at best—even if we started to steal the economic productivity of the entire globe, leaving all others on earth to live as impoverished slaves. In fact, it's likely the system has lasted this long only because the role of the American dollar as reserve currency, including its role in the international oil trade, has allowed us to fund our deficits through the Federal Reserve bankers and their fellow-crooks on Wall Street in such a way that other countries have absorbed part of our deficits through inflation. Our advanced hospital systems and our generous pension plans are subsidized by Chinese and Russians who have far lower standards of living and far less access to medical care. I doubt if they will continue subsidizing us in this way.

The Social Security and Medicare systems are unsustainable and immoral – along with our general governmental spending, they've been a regressive tax upon the American middle-class and upon the peoples of nearly all countries no matter how poor. The deficit funding schemes which are dragging down the world's financial systems are needed to prop up our Social Security and Medicare systems even more than to prop up our rulers' imperial ambitions. We must have the courage to face up to the problems of those systems in a deliberate and direct way or they will drag us down even if we find a better way to manage our banks and even if we manage to bring our military and foreign aid costs under control.

# 247 No Wonder We Have to Choose Between McCain and Obama

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=286>. It was finished and uploaded on 2008/10/15.]

In this article, *Narcissistic People Most Likely To Emerge As Leaders* at <http://www.sciencedaily.com/releases/2008/10/081007155100.htm>, we learn that tests of small groups presented with a problem to solve have indicated that:

When a group is without a leader, you can often count on a narcissist to take charge, a new study suggests. Researchers found that people who score high in narcissism tend to take control of leaderless groups. Narcissism is a trait in which people are self-centered, exaggerate their talents and abilities, and lack empathy for others.

The researchers emphasize that those narcissists are not necessarily lacking in talents and abilities, only that they exaggerate whatever talents and abilities they do possess. This may explain a lot. In the 1830s, the famous French commentator Tocqueville noted that the moral caliber and general level of talent of American leaders he found during his visit was far lower than he'd expected based upon the stories of a family friend, the Marquis de Lafayette. My memory tells me Tocqueville used a term translated as "self-serving scoundrel" or something similar to describe this country's chosen leaders at the time of his visit.

The question, not attempting to be at all subtle, is:

Why did we have Washington and Franklin and Jefferson in the first generation of American leaders and recently we had Bush and Clinton with Obama and McCain on deck?

I think the answer is fairly obvious. The quest for leadership positions in the United States is a free-for-all of sorts. We have the political machines to screen out men and women who have too much moral integrity to be willing to deliver the goods to the clients of those machines, but there is certainly no selection process for actual competence. The Founding Fathers were a group of intellectually prepared men, knowing history and at least some legal and political theory, and were self-selected by their acts of moral and political courage. The supporters of political independence for the eastern-coast colonies risked lives and fortunes while “self-serving scoundrels” hid under rocks waiting for the dangers to go away.

Once the generation of Founding Fathers had died, the American people, free to choose their leaders tended with frightening consistency to choose those scoundrels, who are generally very good at flattering us and denying the need for sacrifices during difficult times; after all, they don't intend to sacrifice their lives or fortunes for much of anything. We tend to choose leaders who claim to be able to cut taxes and balance the budget while increasing funding of colleges and aiming at 1,000 American military bases throughout the world. Observers of the Soviet Union noted that the system was most effective when the bureaucrats and policemen believed the lies they lived, even when they knew them to be lies on some level. I think the same phenomenon, along with narcissistic effect, explains the apparent sincerity of our current leaders and the two aspirants to the Presidency of the United States when they put forward truly absurd claims to be able to garrison the world and keep the money flowing for our health-care systems and send every human being within our borders through college and balance the budget and cut taxes for at least some major part of the citizenry. Only a man or woman part scoundrel and part narcissist and part self-deluded liar could speak or promise in the way of our current politicians.

## 248 Dealing with Natural Law: A Summary To-date

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=253>. It was finished and uploaded on 2008/10/17.]

This is a summary of my thoughts on dealing with natural law from my viewpoint of updated Thomistic existentialism. There may be some new thoughts in this entry but mostly I'm aiming at two goals:

1. Improving my presentation of my views of a truer natural law, that is, one that corresponds to modern improvements in our understanding of human nature.
2. Providing a foundation for viewing human nature in terms of our evolutionary past but also in terms of the new opportunities which arise from the nature of the human mind which can shape itself by active responses to its environments or multiple environments or the entire universe or even the world—the universe seen in light of God's purposes which define a moral ordering upon His self-aware creatures.

The second goal is the more important though we must understand the ways in which human nature is part of this universe before we can understand how we can transcend our natural-born condition by the seemingly odd strategy of shaping our minds in response to this universe, our physical environments but also our knowledge of deep-space objects and quantum events and very abstract mathematics. To put it in a lightly different way: a human mind can be shaped to correspond to the nature of created being in a very wide sense. To be sure, this is a matter of principle. No particular human mind could actually shape itself to fully correspond to the universe,

including all that we can't see—in which category, I'd place such bodies of truths as transfinite set theory though they might not be manifested directly in this universe.

Non-Christians and perhaps even non-theists can develop a version of this worldview in which the human mind can, in principle, come into a somewhat direct communion with created being. Or so I would assume on their part, though I have a specific viewpoint as a Catholic Christian and convert from liberal Protestantism who is updating Thomistic existentialism to account for modern empirical knowledge. This sort of creative thinking must be done from a specific stance. Motivation is crucial and so is faith in the rationality of Creation, or the cosmos if you prefer. Faith is always of a particular shape or it's not likely to hold up when the going gets rough, which is true for many stretches of creative efforts. Only a few of those few who can do this sort of thinking will persevere. In my case, faith in rationality comes with my belief in a rational Creator. And so I turn to a recapitulation of my understanding of human nature, of man's nature as a particular species of great ape, on my way to an understanding of man as a potential creaturely person, an entity resembling a world in having an objective substance and also a narrative structure which is well-ordered.

We modern human beings, Christian and non-Christian alike, have failed to integrate our empirical knowledge into our culture. Our cultures, even the entirety of Western Civilization, have become ghettos, isolated from God's Creation. Some Christian thinkers of this age reject the need to even study modern empirical knowledge because, to consider just one pile of empirical knowledge, evolutionary theory doesn't seem to fit with their view of human morality. Many other Christians accept evolution while seeming to somehow put it to the side—their metaphysical view of man and his moral nature seems to be related, but not always closely, to the empirical reality indicated very strongly by modern science. Their view of human morality is largely structured according to the best of ancient philosophical thought founded upon ancient science and mathematics. (See Chapter 69, *Hellenistic Metaphysics is too Small* which is an effort to rebut the idea that we can rebuild a civilization on traditional foundations.)

Thomistic thought, which is the only ground-up Christian philosophy I know of, looks at empirical entities, creatures, from an empirical stance, rather than the idealistic Greek philosophy which started from abstract concepts of virtue and understands human moral nature by weaving such pieces together into a whole. See Chapter 83, *Christian Morality a Natural*

*Morality?* for one of many discussions I've provided on this topic. Walter J. Freeman, the neuroscientist whose views I discuss in that entry and some others with the same major title, *What is Mind?*, has proposed that, of all major philosophers, Aquinas provides the best foundations for an understanding of human nature that is built from modern scientific knowledge. (See the various chapters in Part III for discussions of various aspects of this topic.) I'd only add that we should generalize from 'scientific' knowledge (as narrowly understood) to empirical knowledge that includes history and literature and the practical arts by which we make our livings, and other specialized fields of empirical knowledge as well.

Once the world is seen as the physical universe ordered to God's purposes and once we've gained the confidence to speak of even the flow of natural events as part of a story being told by God, we can even speak of morality as arising in this story. In fact, if we look directly at the evidence gathered and organized by evolutionary biologists, we can see that moral natures seem to have arisen and evolved to more complex states in the flow of the same story in which eyes and nervous systems evolved. There are a lot of details to be settled and, without the proper critique on both biological and philosophical bases, ideologists find it easy to distort this evidence, but a fresh look should allow a thinker to realize that the story of the evolution of life is not so much nastier than the story of the formation of Israel. That alone hints of a reconciliation between a Biblical God who shaped Israel and a God who created a nature which can be downright and disgustingly nasty at times.

Morality has evolved during the course of that biological evolution with all of its nasty events. The so-called altruism which leads social rodents to sacrifice themselves for others, preferentially their close relatives, isn't an indication that the higher altruism – even *caritas*—of a St. Francis is 'only' a biological impulse. It's an indication that morality is a very basic part of the story by which life evolved. Evolution leads to moral order, at least in social mammals, by developing ties between closely related animals and then similar animals. It's not only human beings who respond tenderly to a creature with oversized eyes and chubby cheeks – females of one species are often used by farmers or zookeepers to nurse the young of another species.

Even the order found in non-living things, such as stars or galaxies, is a sign of the moral purposefulness of the Creator. Yet, we have to remember that the higher altruism of a St. Francis is different and I've proposed a way of understanding that difference—we can shape our minds in active efforts

to understand Creation and those efforts are as good as child-like imitations of God's work in bringing Creation into being and then shaping it into this world and the world of the resurrected and maybe others.

Does God impose order as if He were a human engineer forcing silicon and other minerals into the state we call 'semiconductor'? Is mind imposed upon a brain and maternal nature upon a pregnant woman? Or does mind emerge from the purely physical actions of brain-cells as if an engineer could cause nature herself to produce semiconductors by her 'own' processes and for his own pleasure? Is maternal nature no more than genetically controlled rules or is it a set of behaviors and attitudes which develop as a pregnant woman responds to hormonal flows during pregnancy, then to childbirth, and then to the child put at her breast? Those who see God as outside of us and outside of His own Creation have to think in terms of imposed order, perhaps calling it 'intelligent design'. Those who see God as His own Act-of-being, Creator of all other acts-of-being, can see matters a bit differently. We and rattlesnakes and interstellar gas-clouds exist as objects of God's love, yet He doesn't love only from the outside. He loves us even as He first creates the stuff of Creation and then shapes it into the concrete stuff of our universe and then brings us into being from that stuff by telling our story. He loves us from deeper inside of us than we ourselves can reach.

# 249 Still More Evidence that We're Organisms in Einstein's Universe

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=262>. It was finished and uploaded on 2008/10/24.]

This article, *Genomic Changes Found In Brains Of People Who Commit Suicide* found at <http://www.sciencedaily.com/releases/2008/10/081023100543.htm>, asks questions which I've been handling in my first book and my blogs for the past two years:

Are genes destiny? Alternatively, are we simply the products of our environment? There is a growing sense that neither of these two possibilities fully captures the essence of the risk for psychiatric disorders. New light is being shed on the complex interaction of genetic and environmental factors as the result of growth in the field of epigenetics.

We need to recognize importance of the soma which is shaped not only by genes and the later environment but also the environment in the womb and all that goes into the development of that human being, including sheer chance. I think we even need to start thinking of ourselves as being boundary phenomena of a sort. Crudely speaking: our innards, soma and genes, exist to create the movements which are our interaction with our environments.

This is one reason for my efforts to explore those powerful ways of looking at being which are found in modern physics and not yet in metaphysics

or theology. I'm thinking in this context of the geometric techniques developed first by Einstein to describe the very nature of that complex entity space-time as well as the various forms of energy embedded in that entity. Techniques that work well in describing physical being at a fundamental level, even work well in predicting behavior of that being, won't necessarily work so well with complex entities composed of that fundamental being. It's likely that even stars and galaxies have individual histories that can be fully expressed only by narrative techniques—if we could know enough about those histories. For all our differences, we human beings share our fundamental being with stars, our collective natures probably share some of the nature of galaxies. This isn't so different from our current assumptions except that modern biologists and social-scientists, even when not reductionists, think in terms of an earlier mechanical phase of man's efforts to understand physical and metaphysical physical being and space-time.

The more sophisticated models, such as various differential geometries, used by Einstein and his successors can—it seems to me – be used to describe our basic being. After all, we were born into and developed within that same universe which Einstein described so well. It seems unlikely to me that God created Aristotelian creatures within an Einsteinian universe. It also seems likely to me that a qualitative understanding of our basic being which uses the more sophisticated models of modern physics might well allow us to come up with good ways of speaking of our limited but real freedom to move about and to respond to our environments.

[More recently, I've come to believe that the advanced tools of mathematical physics, including differential geometry and tensor calculus, will be very useful in our efforts to understand complex narratives. Our understanding of the sorts of narratives we perceive directly uses language and concepts for movements, say, through our lives which isn't really Euclidean so much as a common-sense interpretation of our concrete experiences with movement and with our physical relationships with other entities and even those relationships between our various parts. We need to go beyond this and, as of April, 2011, no one—including me—has done much in this regard.]

## 250 Preliminary Thoughts on the Evolution of the Human Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=399>. It was finished and uploaded on 2009/01/15.]

There's little or no reason to believe there is any 'mind-stuff', material or supernatural, unless you simply wish to dogmatically assert that matter isn't adequate as the foundation of our thoughts and feelings. Brain-scientists, geneticists, and evolutionary theorists are researching the workings of the human mind (and human nature more generally) and are producing remarkable descriptions of brain events underlying human thoughts. So far, all efforts to determine the nature of the most spiritual of experiences, such as after-death or out-of-body experiences, have tied those to specific brain events—those two cases seem to be caused by a disruption of the brain system which constructs our self-awareness. Self-awareness and the effects of a disruption of such are real, as are other soul-like or mind-like events. That they are real tells us that at least the potential for those aspects exists in a human being at conception but it doesn't say the aspects are actually present at conception. To use a simple analogy from the animal kingdom, a black Labrador retriever is born with certain playful traits that make him potentially a good water retriever but it takes a sustained and patient effort to actualize that potentiality.

The evidence is growing that mind is tied to the physical brain and not to any immaterial stuff, but the mind isn't strictly the brain, not even strictly the brain and any electromagnetic fields it might generate. The mind is formed when the physical human being responds to his environments or any greater world he acknowledges, even if he only dimly suspects the existence of some parts of that greater world. The mind involves re-

relationships and relationships are perhaps what we understand least about the physical universe which is our birthplace and our place of growth.

This is the point of Thomistic theories of the mind, which do a good job of providing the language and basic concepts for a narrative explanation of the mind and its development in the individual. Despite the confusion in some popularizations of so-called ‘theories of everything’ and perhaps even in some serious scientific discussions of such theories, human knowledge can’t penetrate to the very ground of what-is because that ground is a contingency brought into existence in a way that lies well beyond any sort of thinking we’re aware of. We can speak of the very basic idea of something coming into existence from nothing but there is no known way of imagining or even speaking ‘scientifically’ about such an event. We can speak of what-is, such as the mind-like aspects of a human being, but there is some elementary level, or perhaps an ever descending series of seemingly elementary levels, which we have to accept and use in our speech about and our understanding of what-is. The task before us is to gain the ability to speak intelligently about the mind, using the a language which preserves the phenomena while also allowing more fundamental explanations. In practical terms, this might involve multiple but reconcilable languages, but that’s a complication of no immediate importance.

And so, I return to the Thomistic proposal that the mind forms in response to the environments of the human being. For the record, St. Thomas Aquinas actually split up what we would now call the mind into mostly embodied components with abstract reasoning located in an immaterial soul which wasn’t quite human. By abstract reasoning, I mean such mental acts as the construction of classes, species, etc. from particular examples. Aquinas considered our more concrete mental acts, such as those of moral reasoning, to be embodied and to mature and be shaped in an organic way. I take his understanding of the mental operations of moral reasoning as the understanding he would have had of the entire human mind if he’d known about the nature of matter. Aquinas thought of matter as being inert as did all ancient and Medieval thinkers that I know of. That understandable mistake threw St. Thomas off and led him to the false conclusion that the brain couldn’t be flexible enough to engage in truly abstract reasoning, such as drawing the concept of the species ‘dog’ from particular examples such as dachshunds and great Danes. In passing, I’ll state an idea I’ve often used, implicitly and explicitly—our current opportunities for better understandings of even human nature are due to our better understandings

of the nature of matter-energy, of space-time, and of mathematics. Biological evolution is a very important secondary line of thought but we have to remember that life is a phenomenon within a particular universe with a specific nature and more than slight hints of a relationship to a greater realm of truth. That greater realm is not supernatural as such. Roughly speaking, it's the stuff from which this universe was shaped.

In my way of thought, there is no clear separation between a valid thought and reality. This is not to say that we have minds which magically correspond to reality. We don't carry a magical chain of keys which can open all locked doors. We make a key for a new locked door in a way that's often as ad-hoc as a burglar with a plastic card and some crude lock-picks and sometimes as elegant as the finest work done by a locksmith with a traveling van filled with the latest of modern tools.

Our brains aren't analogous to computer hardware nor are our minds analogous to software. If we use that sort of an analogy, our mind-brain complex is analogous to a computer network manned by various sorts of experts. The physical equipment for a given network is largely determined within the short-term, but the software can be adjusted even in the short-term and human expertise can be added or moved out, at least in the form of books or other materials for the staff to use. On the other hand, the system evolves over time, not only in its hardware and software but in a variety of ways in which it interacts with the outside world.

Organisms are born with the genetic capacity to become different particular entities. Some amphibians have double sets of genes, one of which is activated in the embryonic stage of development when temperatures are relatively low and another when temperatures are relatively high. The genetic code isn't dominant as some still believe, but rather a partner to the soma which is represented in embryos by the egg-cell contributed by the mother.

I'm claiming that there is no pre-existing and pre-formed mind, just as there is no pre-existing and pre-formed human person. In old-fashioned language, we're born as particular instantiations of human nature but that's far from a well-formed human being and not a person in any but a nominalistic sense. A particular human being is formed, well or otherwise, as he responds to what lies around him and a particular mind is an aspect of that particular human being formed as that being begins to form abstractions from the reality around him or from books or other compendiums of knowledge. Now, I'll remind myself and the reader that an organism is the

result of the evolution of the lines of his ancestral organisms since life began and his own development during his lifetime.

The evidence seems to be fairly solid that the human mind has evolved, as least the evidence is solid enough for a serious hypothesis. The ordinary assumption, implicit or explicit, in the writings of many scientists as well as nearly all historians and philosophers and theologians is that Euclid had a mind not so much different from that of Gauss while I'd been implicitly claiming that Gauss had shaped his mind to a world described by human knowledge which is far, far, far richer than the knowledge of Euclid's time. Gauss' mind was not just stuffed with better and more information than that of Euclid. Gauss' mind was shaped to a radically different body of knowledge from that available to Euclid and also radically different ways of gaining new knowledge. If Euclid's mind was analogous to the figures of plane geometry, Gauss' mind was analogous to the wider and more general 'figures' or algebraic formulations of differential geometry. Gauss' mind was shaped to deal with more abstract levels or deeper layers of Creation.

Long after biological evolution of species had been accepted, long after Waddington and Wolpert and other embryologists had taught us about the constraints and freedom of embryological development, many have spoken and written as if the human mind at the species level had been some sort of magical special creation, as if the human mind of Luke will be the same whether he sinks into alcoholism and life on the street or goes through Harvard Medical School. The mind of a human creature of 100,000 years ago is assumed to be just 16 years of modern education away from possibly taking on the shape of Einstein's mind as he graduated from ETH. The minds of Luke I and Luke II are typically assumed to differ only in the memories each contains including the second Luke's brain-surgery skills which are merely humanly remembered versions of textbook instructions.

No.

Our inherent mental capabilities are more in the nature of mind-building traits and not in the nature of a pre-formed mind. Our minds reflect the state of the underlying organism, not even just the brain, but also the relationships with Creation defined narrowly or widely.

If the human mind has evolved at the species level in a manner somewhat independently of the evolution of the brain, then we should see some signs of such patterns of development in history, but we should recognize the physical constraint: the mind would have to evolve after the formation of brain-structures which make possible abstract thought including the

ability to think of objects not present and the ability to make explicit plans for using those objects in gathering food or making shelters. Such brain-structures and the related abilities, in a rudimentary form, do occur in at least chimpanzees. Unless there was independent development of very complex structures, then the underlying brain-structures for abstract reasoning might well have first evolved more than five million years ago, though there is no evidence that chimpanzees have ever much used abstract reasoning unless cued to do so in specific ways. I believe there is now some evidence that creatures who were either ancestral to *homo sapiens* or offshoots of that ancestral line did use tools and maybe manufactured primitive tools perhaps more than a million years ago. Evidently, progress towards anti-personnel bombs and iPods was even slower than scientists once thought.

There are a variety of interesting problems to solve. If Western Civilization survives, there won't be any lack of employment opportunities for anthropologists and other scientists. I'll mention just one. We were taught by popular science writers that body structures which are expensive to maintain will tend to disappear if not used. If true, what in the world were those prefrontal regions of humanoid brains used for during those hundreds of thousands of years in which the mind was gestating, if I may speak with purpose-filled terseness?

I'm more interested in what seems to have been rapid development of abstract reasoning ability over the past 3,000 years or so. Perhaps this should be expanded back another few thousand years to the development of large-scale agricultural enterprises which logically would have required profound changes in the minds of those first settled farmers. It's not clear how the transition would have been made from the lives of their ancestors, lives spent in small family groups living nomadic lives over various natural landscapes. The development of the human mind as we know it seems more plausible once men began gathering in larger communities which would reward specialized skills and knowledge and would even demand planning for sanitation systems and for larger-scale food storage. Moreover, complex but somewhat regular patterns of activity would make for an easier pattern to start developing skills of abstraction.

Some scholars of philosophy and literature, such as Bruno Snell (*The Discovery of the Mind in Greek Philosophy and Literature* [128]) and R.B. Onians (*The Origins of European Thought About the Body, the Mind, the Soul, the World, Time, and Fate* [106]), have done some preliminary but serious work in understanding still later stages of the development of the

human mind at the group or species level. I'll be trying to understand these more recent developments (from the time of the pre-Socratics or so) in terms of my updated version of St. Thomas Aquinas' understanding of the development of the human mind. For now, I'd just like to propose a general set of stages in this development. The following isn't intended to be a piece of scholarship but rather a sketch at the preliminary stages of a study I might not have a chance to ever complete:

1. The practical mind developed early, well before cities or even permanent agricultural villages had formed. Weapons and tools were manufactured, pigments were invented for cave-paintings, and all that. At some point during the age of the gestation of the human mind, a sense of narrative and some unknown sort of spirituality also developed.
2. The speculative mind developed in a theological form among the Israelites and the founders of Hinduism circa 600BC.
3. The speculative mind developed in a philosophical form amongst the pre-Socratic Greeks, perhaps a little after 600BC. The early philosophers seemed to be engaging in natural philosophy of the sort which is also the early stages of a theoretical physicist's work if he's taking on fundamental problems. I can then propose the scientific empirical mind made its early appearance in the work of philosophers who seemed to be empirically oriented without having the tools or habits of empirical investigation. Perhaps for that reason, that scientific empirical mind made a fairly quick vanishing act—though several centuries later, Archimedes would make his appearance out of time. Then the scientific mind continued to arise only in isolated cases for a thousand years or so.
4. A more disciplined form of practical empirical knowledge appears with Roman political and military organization.
5. The speculative mind develops further in the Christian West and shows a willingness to let empirical knowledge constrain and shape speculations. We see the emergence even in the letters of St. Paul of an end to a Platonic split between really real reality and concrete reality. This is a very complex process of development which shows funny results in such intellectual events as St. Augustine's claim that animal

species can transmute into other species except for man who was a special creation. Unfortunately, human thinkers including those who profess Christianity have shown they're ever tempted to move back to a thoroughly inappropriate idealism and dualism.

St. Thomas Aquinas was very much an empirically oriented philosopher, though his Medieval writing style and his formal acceptance of the angel-infested chain-of-being teachings of Pseudo-Dionysius would lead naive readers to think otherwise. I was one of those. Under the guidance of Etienne Gilson and others, I came to realize (perhaps going further than they did) that angels and demons were formal entities in the writings of Aquinas, filling slots in some chain-of-being without having much to do with the world of men or with salvation history. On the other hand, Aquinas seems to have been quite serious when he said that metaphysics uses the specific sciences. Having claimed that things are true, he seems to have also realized that the truths in things are more particular versions of abstract truths. It's not generally so easy to go from particular truths to more general or abstract truths.

Aquinas lived near the end of the High Middle Ages which was a period in which mathematics was being rediscovered by Europeans, optics was being developed, and many other sciences, theoretical and practical, were being explored. It was a good sign that it didn't take a Newton or an Archimedes to develop the foundations of optics, but it should be considered odd that a founder of optics made an elementary mistake in measuring the angle of refraction for rainbows and no one caught the error. The first to publish became an authority and the need to check results from even the greatest of thinkers or experimenters wasn't yet acknowledged. Along similar lines, Albert the Great was one of the first of those who practiced empirical investigation as a science and yet even he was seemingly unaware of the need for disciplined experiments or even second-opinions on speculations when he theorized wildly on possible causes for the creation of new species. I don't remember all his exuberant proposals, but I do remember he thought a new species was created when a rose stalk was grafted onto the root-stock of another variety. The training-wheels were off and the apprentices were pedaling as fast as possible to compensate for lack of balance. I may well be in a similar situation. In any case, St. Albert seems not to have made the proper effort to understand such words as 'species' in empirical terms. Maybe that was the problem—he tried to

subject his thought to empirical constraints but the ‘chunks’ of his thought were themselves *a priori*.

With Galileo, we see the emergence of a more disciplined sort of scientific mind though one that doesn’t seem to appreciate the power of speculation in empirical investigations. Yet, he taught at least some European investigators a variety of lessons about designing experiments and building equipment and analyzing the results.

With Newton, we see the emergence of a mind which is truly multifaceted though a bit fragmented. Newton did theology at apparently a high level, and bible studies which at least tried to make allowance for quality of manuscripts and history of the texts and histories of the peoples involved. I might disagree with his Unitarianism but not with his understanding that human beings know even God through His effects on Creation. Newton showed his brilliance in practical empirical matters with his alchemical experiments (which overlapped true science) and his ability to manufacture and use instruments for his optical and other experiments. He showed his mental powers as a philosopher in the speculations that preceded his more formal work in gravity and dynamics. And he showed his powers in scientific empirical work by his mathematical explorations beginning in his teen years as well as that later physics work in gravity and dynamics. Newton’s importance in the history of human thought probably is underestimated, as strange as that statement may seem, just because of the strangeness of his theology from mainstream Christian viewpoints and also because few seem to appreciate that much of his scientific work (but not his development in his youth of the calculus and the theory of infinite series) began with philosophical speculation into the nature of space and time. In the end, his thought ran in several largely disconnected streams and, thus, he didn’t accomplish as much as Augustine and Aquinas in unifying seemingly disparate fields of thought.

In the Renaissance, we also see the beginning of a more disciplined approach to history and to texts, both historical and literary. This is a little amusing since the textual analyses of the Renaissance humanists began in hero-worship of the ancients and ended in confessions of their all-too human natures.

In the 1800s, we see some unique men, Keble and Newman and a handful of others, who were able to engage in still more honest history and textual analyses than the Renaissance humanists and yet kept their orthodox Christian faith.

With the great mathematicians and physicists of the 19th century and early 20th century, we see the emergence of more versatile minds in bulk, in a manner of speaking, though not even Einstein had a mind quite as versatile as that of Newton. We've perhaps seen the emergence of that general sort of mind in modern neuroscience.

The modern empirically based understanding of the universe points towards a Thomistic existentialism rather than a Platonic essentialism. I've explored this claim in a variety of entries on this blog and also, in a more preliminary form, in my first published book, *To See a World in a Grain of Sand* [41]. The sheer power of mathematics in understanding concrete being and the way that highly abstract mathematics emerges from modern scientific investigations point to the likelihood that being is unified rather than some sort of form, or abstraction, impressed upon inert substance. Abstraction is to be found and investigated by moving more deeply into concrete being, in a manner of speaking. Now we also know that space-time is itself contingent and part of the concrete being of this universe, opening up all sorts of investigations the meanings of which are probably beyond our current understanding.

Modern brain-science is moving towards the confirmation of the teaching of St. Thomas Aquinas that the mind is shaped by the responses of the organism to its environments. Strictly speaking, Aquinas treated the abstract reasoning abilities of a human being as located in a soul-like object which wasn't really human but was more of an immaterial prosthetic device. I take his teaching that concrete reasoning (such as moral reasoning) is embodied in the organism and, like the organism as a whole, develops in response to its environments as what he would have taught about all forms of human reasoning if he'd been able to believe the brain is as highly plastic as we now know it to be. Perhaps the most important aspect of Aquinas' thought about human beings is his default assumption that we're organisms and develop in the way of organisms. An organism is a unity, however defectively so.

The general thrust of modern science indicates that there is a deep relationship between Creation and a well-formed human mind, though theoretical physicists have seen this more clearly than other thinkers, even brain-scientists. This relationship, almost a synchronization, occurs not because we are conceived with minds that operate according to some body of higher truths but rather because a well-formed mind—as I define it—is shaped to the surrounding reality, a reality which is the manifestation of the

truths God chose for our world, manifestations which point back towards the more 'raw' or abstract foundations of those truths.

While I'm emphasizing human progress as seen in the minds of philosophers and theologians and scientists, we should remember that there is a somewhat amazing general movement towards something that could be called a higher state in most general realms of human activity in most civilizations. Progress is for real though it's certainly not a given nor has it been consistent in all domains of human activity nor in all regions of the world.

# 251 Darwin, Einstein, and the Totemic Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=421>. It was finished and uploaded on 2009/01/29.]

In the January, 2009 issue of the newsletter *Brain in the news* published by the *Dana Foundation*, (see <http://www.dana.org>), there's an interesting article, *In Search of the God Neuron*, by Steven Rose which reviews some recent books on the alleged problem of mind and brain.

It's true that the brain has evolved as part of an organism which is descended from organisms which survived, but what's most important about the mind-like aspects of a human being is that creature's totemic tendencies, its ability to put itself in the place of its prey or any external object it was seeking to understand. Undoubtedly, survival is necessary for this process to have gone on and to continue, but that hardly provides any sort of causal explanation or narrative description of what really happened when our ancestors implausibly, by the needs of survival, developed a mind capable of not only writing symphonies and painting masterpieces in oil, but also capable of inventing plumbing and exploring the properties of time and space and matter and energy. As neuroscientists try to deal with those aspects of the human being we call 'mind', they've failed to encounter the importance of the totemic nature of the human brain when it interacts in a creative and aggressive way with its environments, including the jungles of the hunting peoples of Central Africa and also the rather abstract environments to which Newton and Einstein responded.

In the totemic mind of ancient hunters of elk, we see the possibility of modern hunters of the secrets of God's Creation, hunters who carry out their quest in the acts of shaping their minds to embody the very actions

and traits of what they study. There is nothing mystical going on here, simply normal events in a universe which rewards with reproductive success those who are able and willing to reshape their minds to encapsulate their environments, to put themselves in the place of their prey for greater success in hunting, more recently to put themselves in the place of Nature in pagan terms or of the Creator in Christian terms. It's interesting that Einstein was an atheist more than not but one of his speculative strategies was to put himself in the place of the Old One. At other times, he'd ride a wave of light, putting himself in the place of a photon.

The ultimate in totemic thinking is to try to put yourself in the place of God as Creator, often seen as the father of the pagan gods or the Old One, a perhaps fictitious entity who has that good, old God's-eye view of matters. To try to transcend God's own actions as Creator is clearly beyond the capacity of a creature. Anything we might know about God in His absolute being, His transcendence, has to come by way of revelation and that's a tricky matter itself—even revelations have to be perceived by the physical organs of the human being.

God as Creator creates and what He creates seems quite subject to study, even the most abstract of His manifested truths. A Christian should even regard it to be his duty, or the duty of some in the body of Christians, to investigate God's Creation and to make sense of that Creation as the setting for the story of salvation.

The human brain with its totemic 'circuitry' has survival benefits and that totemism gives us a mind first understood by St. Thomas Aquinas as an entity which shapes itself by responses to its environment. I'm going further here than Aquinas or his interpreters over the centuries and apparently further than modern neuroscientists, but I'm confident that our best path forward is to speak of truths and knowledge as coming to us from the things, things which are true as Aquinas told us to the giggles of most metaphysicians. This is my response to my rather eclectic environment consisting of a variety of books as well as my practical experience and my contemplations about the formation of knowledge in my brain. I'm certainly not saying that our brains see truths or obtain valid knowledge perfectly. The messiness of biological evolution and the imperfection of organisms and their particular organs provides a pretty good explanation of the history of mankind, in its intellectual and other aspects.

It's important to realize that abstractions are part of being human, just as much a part of the trade of a plumber as that of a mathematical

physicist though the idea of pipes to move fresh water and sewage have become part of our cultural apparatus in a way that hasn't yet occurred with the idea that space and time are actually one spacetime which is well described by something called 'differential geometry'. We think that such an conceptual apparatus as that of general relativity is inherently difficult but the principles of hydraulic engineering which are now part of the thinking of any competent plumber took far longer to be developed and accepted. Galileo had one heck of a time convincing some engineers that water couldn't rise to an arbitrary height.

Higher levels of human intelligence involve the ability to creatively respond to one's environment. The Pascals and Einsteins, the Homers and Goethes, the Bossuets and Barzuns, move ahead of the rest of us, and so do those who tinker with better internal combustion engines in their garages. Whether it comes to understanding the physical world or the characteristics of human beings of a particular age or understanding the flow of events we call human history or understanding the movements of pistons, the answers—of any sort – come as a human being actively responds to the world and don't come from some sort of abstract realm **separate** from the world. Abstractions lie deep within concrete being and not alongside concrete being.

The human mind isn't to be adequately described or understood in terms of any worldview that separates the concrete and the abstract, whether idealistic or reductionistic. So far as I can see, the only worldviews capable of giving us a rich and plausible narrative of developing being and the developing human mind have to be based upon the Christian (Creator-centered) philosophy of methodical or moderate realism, which sees truths as coming to us as we respond to the parts of Creation we can perceive or plausibly imagine.

Things are true.

Truth is to be found in the things and relationships and processes of that world in which men strive to survive, that is, they strive to survive by responding properly to that world filled with truths, however obscured they are by textbook standards. Some can even respond to certain clues invisible to most of us, responses that are the lifework of a Newton or a Mozart, a Goethe or a Blake.

As I've said before, abstract truths represent a deeper level to being, the directly perceptible level being concrete being. Think of being as a plant with a rich network of unseen roots which not only reach deep into the earth but also are intertwined with the roots of other nearby plants which are intertwined with the roots of still other plants. Moreover, there is much earthly substance down below the reach of the most extensive root-system. The human mind has the unexpected ability to penetrate to the roots by first shaping itself to the entities and relationships and processes of the above-ground, or perceptible, world. Then we can even go to depths only implied by those plants and their roots.

To continue with the above metaphor, the usual explanations of aspects of reality not fully or even partially explained by what can be seen fall into two groups:

1. Reductionistic: Wave your hands and say the difficult-to-explain aspects are epiphenomenon or otherwise 'non-existent'. All that really exists is the plant-parts we can perceive or perhaps the top layers of soil which can be chemically analyzed.
2. Dualistic or idealistic: The difficult-to-explain aspects of the plants are explained by imperceptible components of the plants or invisible plants growing between the ones which can be perceived.

As I've written often before: the human mind isn't separate from created being in all its concrete and abstract levels. Understanding the human mind and proper nurturing of the mind isn't separate from the understanding of being, and the skills of working with that being, in all its concrete and abstract levels. The mind can't be understood as a container or processor which holds facts or truths which come from it. The mind has to be understood as being formed by active processes of response. To the extent we can speak of the mind as a container, its shape is determined by its contents. To the extent we can speak of the mind as a processor, its activities are an internalization of the interactions between the human organism and its environments.

# 252 Mathematical Physics and Moral Philosophy

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=436>. It was finished and uploaded on 2009/02/07.]

I'm still trying to sketch out better ways to view causation and the human moral situation, ways that recognize both Christian truths and modern empirical knowledge. The first step is to start a refounding of our understanding of our own human nature and of concrete being in general, a refounding based upon the richer understandings of being which have been developed in modern empirical science, especially theoretical physics and mathematics. Most language and concepts currently used to discuss causation and morality and human nature in general draw upon Aristotelian biology, Euclidean geometry, and a naive physics. Historical analysis, literary exegesis, moral philosophy, politics, and other important narrative-based sciences draw upon some understanding of being and currently that means that old and somewhat soured wine of ancient and Medieval science and metaphysics and mathematics.

There's at least one example of a pre-modern thinker, the poet Dante, having some intuition that something different might be needed to describe, for example, the path to salvation. At the very beginning of Dante's *Inferno*, the pilgrim keeps going straight while the path wanders away. The true path to salvation can move away from us while we move ahead paying attention to less important matters. I'll invite the reader to think of the path to moral integrity if he doesn't think in terms of salvation and then I'll point to a historical analogy oft-discussed by Hannah Arendt. The nice middle-class Germans of the 1930s and 1940s continued to act morally by the rules of earlier decades. That is, they worked hard, advanced in their careers,

paid their taxes and other bills, took care of their children, and so forth. To do this, they were processing papers for Jews and others being moved to Warsaw, making chemicals designed to kill human beings efficiently and quickly, manufacturing tanks and fighter-planes, and so forth. What's still worse is that many Christian leaders encouraged their followers to act in this way.

With our simplified view of being and our simplistic tools for analyzing narratives, we tend to draw straight lines and to assume straight paths. When those don't work for even qualitative descriptions, we wave our hands helplessly or perhaps we speak of the complications of reality and maybe of moral freedom. Those complications are real. Moral freedom is real. The problem is that we have no ways of speaking of the full complexity of modern human life in intelligent and literate ways. Philosophers and poets worthy of those titles should be able to give the citizens of the modern world ways to speak of reality and moral freedom.

In other words, we have a frightening lack of richness in most of our current political and social discourse relative to our situations. The philosopher Alasdair MacIntyre has been raising the claim for more than two decades that the lack of meaningful encounter in our public discussions about controversial issues (such as abortion or embryonic stem-cell research or male-female relationships) is due to our lack of a shared moral vocabulary. As I see matters, no major group in the modern world has a rich enough vocabulary to express our situation, not those who share my beliefs (I'm a morally conservative Catholic) nor any others. We default to behaviors and to narratives which assume environments far simpler than the ones we inhabit and relationships far simpler than those of our modern societies. For now, I'll claim without discussion that this has occurred just because new possibilities have arisen due to the enrichment of the human mind which has developed in response to God's Creation but this enrichment has occurred primarily in physics, mathematics, and related sciences. We have enriched our moral, social, and political environments but we don't understand those environments and have done no better than to try to deform traditional ideas developed when the human mind was developed to a lesser understanding of created being. Various thinkers have noted we've passed through an age when human technological accomplishments and scientific knowledge advanced even as our moral and political situation decayed. Those two human treasures, technological accomplishments and scientific knowledge, are linked and don't occur together as a matter of ac-

cident. Our technology advanced because our physics advanced and that was tied to richer understandings of being. The technological advancements allowed huge growths in population as well as huge increases in the specialization of human work and of the complexity of our societies and political entities.

Much of this analysis can be made simpler and more abstract. To understand man's place in the world and his relationships to his fellow-men requires a preliminary stage in which questions have to be formulated regarding the very nature of time, space, matter, empirical truth, abstractions, and other creatures involved in man's understanding of being. This is the sort of preliminary metaphysical analyses that Newton and Einstein performed before moving on to their detailed mathematical analyses. Those analyses produced understandings of time, space, etc. that haven't yet been dealt with adequately by philosophers and hardly dealt with at all by theologians, historians, poets, and men of practical affairs though so much of the preliminary work has been done by modern physicists and mathematicians, and it's those preliminary stages which are most difficult in such creative expansions of human understanding of being.

Let me take one example from the human condition where a more enriched view of being might help us understand our own age and perhaps the immediate future. Such understanding is necessary for intelligent and lasting solutions to our various problems. I'll be careful not to tie things together too tightly because cause, effect, accident, etc. are tricky issues in biological evolution.

The human species is unusual in its dimorphism by sex. Solid sociobiological analyses indicate rather strongly that this is due to the long gestation period and long period of helplessness on the part of the infant—still embryonic at birth. Chimpanzees are far more mature at birth and for months afterward. If rapid maturity were good in itself, we should give up civilized standards of education and apprenticeship and return to a life where boys and girls become working, reproducing members of society as soon as they pass puberty.

This slow maturing of the human child places a great cost upon the human female relative to the low cost of a single offspring to a female chimpanzee who pushes her young into adult lives after a few years. What does this mean in terms of social organization and in terms of moral relationships between male and female? I don't know. Look at the changes brought about just by changes in levels of poverty and prosperity. What sorts of invariant

aspects are there to human social possibilities or the possible relationships between individual men and women? What sorts of transformations occur when a poor society becomes wealthy and how can those transformations go wrong? The beginning point to applying a richer and truer understanding of created being in our efforts to understand ourselves has to be an understanding of the invariant aspects of fundamental human nature.

I think we were quite mindless and quite heedless of various dangers when we adopted our current ways of making a living. I suspect we don't have problems within basically good social systems but rather twisted social structures and deformed relationships between men and women. Some had tried early in the industrial industrial to experiment with different ways of organizing our lives and of making a living. When the industrial revolution was building up steam, a battle of sorts ensued between the advocates of the banking/investment system—which is currently collapsing—and others who were supporting a system of craftsman cooperatives financed by men less greedy than the Morgans or Rockefellers or Paulsons. See *From Cottage to Work Station: The Family's Search for Social Harmony in the Industrial Age* [17] by Allan C. Carlson for a short discussion of this struggle. Some Quaker investors were prominent in the effort to support that system of craftsmen coops.

The advocates of centralized finance, stock-markets, etc. won and one result was the devaluation of skills as depicted in the novel *Sybil or The Two Nations* by the British politician Benjamin Disraeli. Unskilled workers prospered and were drawn out of their rural homes and skilled workers sank into poverty. At first, the budding capitalists drew young men and young women into their factories but a backlash in Western countries led to increased wages for heads of households that allowed women to remain out of factories and offices with their children or the children of others if they had infertile marriages or chose to be 'spinster' teachers or nurses. Throughout most of history, Women had economic roles as important as those of men, though generally speaking female foraging was less prestigious than male hunting and farm-wifery less prestigious than farm-husbandry. Suddenly, middle-class women of the 1800s and forward had a strange role separated from the mainstream of the economy and the number of such women was increasing. The obvious—if not necessarily best—solution was for women to be freed from the home to join the men in the workplaces of modern industrial/financial capitalism. This was a solution to the liking of those industrialists who wanted a larger and cheaper workforce. Eventually,

the requirements of this strange form of liberation, that is—joining men in a certain sort of morally unstructured industrial army-life, led to the realization that the home could be invaded by corporations or government agencies offering services to replace those of mothers and grandmothers. The situation grew more desperate, or at least more boring, for most women remaining home.

Even in this summarized view, the situation is extremely complex and quite beyond description in terms of our acceptable language for moral, social, and political discourse. There are plenty of smart men and women of various viewpoints who have struggled to make sense of all of this, to try to determine the invariant or absolute aspects of human moral duties, to try to understand the processes by which modern industrial societies were deformed to their current shape. Some thinkers tried to understand the general nature of social transformations which could have led to better and more stable results.

The point I'm driving at is:

Human beings and their environments are shaped from concrete and abstract being well-described in important ways by modern physics and mathematics, yet, we try to describe ourselves and our societies in terms of words and concepts drawn from pre-modern and less satisfactory descriptions of being.

One rationale for defending the humanities and the social sciences against the intrusion of knowledge from the realms of modern physics and mathematics is that the aspects of being which lie in the realms of the humanities and the social sciences are complex in ways that make qualitative descriptions necessary and quantitative descriptions useful in specific cases (such as analyses that can help determine if a recently discovered manuscript is really Aristotle's lost work on comedy or whatever) but useless or even misleading in general. This is a complex idea summarized in a sentence hard to digest and it's a complex idea with which I largely agree, except for the underlying belief that mathematics and theoretical physics only deal with the quantitative.

Modern physics and mathematics have produced remarkably powerful tools for both the quantitative and qualitative analysis of being, of time and space and matter and of abstract truths. Refusing to even consider the use of these tools and these understandings of being puts many human thinkers

in the position of choosing the ancient and simpler understandings of being in its fundamental aspects and not adopting richer and more complex understandings with the absurd explanation that they're working in areas of complex levels of being. And the situation is still worse because those simpler understandings of created being are now known to be wrong. Aristotelian biology, Scholastic physics, and Euclidean geometry can't be used to provide correct descriptions of Created being as we now know it. Why would we think they provide good foundations for understanding of human nature or for literary explorations of that nature? Are we to understand ourselves in terms of a world different from the one we're born into and the one we inhabit? I would suggest that the great complexity and richness of human nature is built upon the complex being so powerfully described by modern physics and mathematics and those descriptions should be the starting point for constructing our various analogies and metaphors which we use for poetic or scientific or historical understandings of human nature.

## 253 Belly Over Brain

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=532>. It was finished and uploaded on 2009/06/23.]

Mind over matter. Willpower. Free-will. Those sound good when you wish to think of yourself as being in charge. The problem is that ‘yourself’ then becomes some entity which is an agent separate from the human organism and somehow in control over that organism. As I’ve argued repeatedly in my various writings, we shape ourselves by responding to created being as we encounter it. Once our encounters with created being were mostly at levels in which our apish ancestors had evolved. A man of the 21st century has a richer environment. He is in contact with far more human beings and is exposed to knowledge about outer space and also alien human cultures. A small businessman who keeps his own accounts is exercising skills which were at the level of a specialist scholar in the early Renaissance. A teenager who plays around with the statistics of his favorite athletes is showing skills unimaginable to the men who built the pyramids of Egypt. We have built somewhat powerful minds by proper responses to created being and by finding ways to build our knowledge and skill base up so that we can teach to children what would have been too difficult for any but the greatest thinkers of the Medieval world.

The higher regions of our brains inhabit, so to speak, more abstract regions, including the past and the future. The mind-like aspects of a human being contribute by understanding created being at abstract levels, allowing us to build powerful computers and to engineer the attributes of material almost down to the individual atom – nano-technology. We can form social relationships with those we never see and with whom we share only a dedication to Gaelic music or a set of professional credentials. Western Civilization is breaking down in some ways that are frightening

to me but it's also still growing more complex and is entering ever more complex relationships with other cultures and with the non-human parts of God's Creation.

In recent postings, I've been arguing that we need proper sorts of abstract thinking to meet our practical problems, but we need to understand what abstract thinking can do and what it can't do. The mind can be seen as a pilot of sorts, but the human body isn't just a plane. It flies by ingrained habit and responds to what's happening around it, before that mind is even made aware that there's a storm or a mountaintop ahead. Part of the task of a mind is to create a narrative explaining what has happened and those who think their minds or wills to be in control are often fooled into taking those narratives as memories of their planning or decision-making. Decisions are made too fast for the regions of our brain which control abstract reasoning and rational planning.

See the article *The Scientist and the Stairmaster* found at <http://nymag.com/news/sports/38001/> for a discussion of the mind's lack of direct control over our body's level of fatness. Will as you will, the belly is likely to win. The lesson isn't that it's useless to go on diets or to exercise, but rather that each human being has to work with his own bodily traits and his own environment. We don't have the sort of will which would allow us to pick up an instructional manual for a recorder and just tell our fingers to do what our mind wishes them to do as it reads the notes and the fingering, nor do we have any inborn knowledge or instincts to help us act properly in this civilization a bit different from the small-scale, foraging societies in which human beings first evolved. Obviously, many do learn how to play the recorder, by making plans, practicing in a disciplined manner, and persevering. How many learn how to act properly in this civilization? Not many. Perhaps even fewer than those who acquire good skills on the recorder.

It takes a bit of thought to analyze a complex situation and then lots of practice to execute any plans you've developed. As responsible citizens, we may decide to learn about Western Civilization so that we can figure out if we really are in a state of decay and then try to think of ways to improve the situation. Few of us have the will to just say, "I'm going to start reading Jacques Barzun's masterpiece *From Dawn to Decadence*"—published in 2000 when its author was 93. That history book, still more complex than *War and Peace* and perhaps longer as well, was the story of the decay of the West told largely in terms of the decay in literacy and—

by implication—abstract reasoning. Only those who have a high level of literary skills can read the narrative of the decay of literary skills in the West. Not many have such skills in the early part of the 21st century—that’s the point of the book. My own literary skills had decayed badly during the latter years of high school, college, and the ten or so years following. I worked hard to regain what skills I had and to raise them to a more appropriate level.

When we read a book such as *From Dawn to Decadence*—and use the references to find other worthwhile books, we discover there was a time when a well-educated man was supposed to be skilled in proof techniques of Euclidean geometry, but some of those men kept up with advancements in mathematics and physics and other difficult subjects on their own time. A man such as Jonathon Edwards, the Puritan theologian of the mid-18th century, was said by one historian of ideas to have had a profound understanding of Newtonian physics. On his own time, driven by interest or a sense of duty to keep up with important advancements in human thought, that Puritan divine studied Newton’s writings and other serious, difficult writings. This is comparable to a man of our times learning—on his own—the mathematical and physical aspects of Einstein’s general theory of relativity or quantum theory.

Developing your mind is no different from dieting or running a marathon. It takes sustained effort. Why would we wish to study demanding works of science or history or literature after escaping from the grind of school? Perhaps because a well-developed mind is itself a good, perhaps more of a good than the memories of 20 Sunday afternoons of watching football? I’m not saying that all should be spending their weekends and evenings reading intellectual works, but I am saying we need intellectual and moral and spiritual leaders who are willing to work hard reshaping their minds in active and openhearted response to Creation. Those not inclined to intellectual effort should actively respond to Creation in their proper ways, by playing music rather than always listening to recorded music, by joining the community theater rather than watching movies on television, by joining a religious community rather than watching services on television.

Once upon a time, even some public leaders read serious books or engaged in scientific work. Calvin Coolidge was very well educated and multilingual and was said to read classics in Latin or ancient Greek, as well as works in various modern languages, while he was in the White House. Benjamin Franklin was not only a wealthy, hardheaded businessman, but also

a highly regarded amateur scientist, not only conducting experiments in electromagnetism but also working on the conceptual or theoretical level in that field.

Why did modern man lose interest in developing his mind unless he was being paid to do so? Isn't Western Civilization still getting more complex in many ways? Doesn't empirical knowledge continue to pile up?

Without those active, self-driven responses which may take the form of studies or experimentation or perhaps the organization of a musical group, the mind is no more than a poorly organized brain. The belly, so to speak, will rule. This is to say that a man without a mind well-developed to his context will be something like an apeman with a noticeably well-developed prefrontal lobe allowing much more sophisticated planning than his cousin the chimpanzee, but he isn't going to be able to understand, for example, the relationship between the United States and China, let alone be able to evaluate possible ways of improving that relationship. He won't be able to understand the assaults on his liberty and the liberty of his children in the form of seemingly beneficial programs. One who did understand was the Austrian Franz Jaggerstatter, recently beatified by the Catholic Church and perhaps on his way to canonization as a saint. Jaggerstatter was beheaded for refusing to serve in the army of Nazi Germany, even in the medical corps. Earlier, he had withdrawn from the fraternal and charitable groups and activities in which he'd participated because he saw that the Nazis were using those groups and activities to forge the Austrians into a dependent and subservient herd of sorts.

Let's return to the belly. Did that belly somehow change during this age of diabetes and obesity? Did it suddenly develop a taste for more sugar? Or was that belly like the pilgrim of Dante's *Inferno*, a traveler who kept on going straight while the path changed? The path curved away. The belly continued to crave the rare opportunity to indulge in a hive of honey, only that opportunity isn't rare nowadays. A large jar of honey, as many cookies as you can carry, gallons and gallons of ice-cream, await you at your nearby supermarket.

Did that brain somehow change during this period when some human thinkers suddenly could speculate that time and space are particular manifestations of abstractions and that matter is frozen energy? Did it change during this period when understanding human moral nature became not a matter of understanding a static listing of virtues and vices but rather a matter of trying to grasp a mountain of facts about DNA and brain-cells and

billions of years of evolution, not to mention new reasoning skills dealing with frightening subjects such as chaos? Did our brains become suddenly dysfunctional so that they could not make good decisions as did the brains of the prior century or two of remarkable prosperity?

No. We human beings of, say, the 20th and 21st centuries are like that pilgrim in Dante's poem, continuing to interpret reality in terms of immediate impressions and models of created being which see concrete being as absolute and objective and abstractions as mere formalisms, though we and our modern cultures have been shaped so much by the abstractions of modern physics and mathematics, history of human thought and languages, literary exegesis, and engineering projects which are beyond the understanding of any one man. General relativity wasn't just a set of formal models which were resident in Einstein's mind; general relativity was manifest in Einstein's mind.

Let's return to the belly again. If you wish to gain some control over your weight in the modern world, you should come to an understanding of the strength of your will and the tendency of your body to make fat. You should also understand modern food technology, your body's handling of additives or different forms of sugar or fat, and the seductive layouts in certain aisles at the grocery store. You should step back and understand your own habits and schedule and the habits of those you live with or socialize with. This is possible only by way of abstract thought and a bit of work. The effort will be similar to that of writing a novel or an historical narrative.

But maybe there are still better reasons to come to an understanding of modern empirical knowledge, of your environments, and of your own mind. Maybe there are still better reasons to further develop your mind.

## 254 Are Some Men Born to be Free and Others. . .

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=704>. It was finished and uploaded on 2010/09/25.]

I wouldn't wish to complete the sentence in the title because I think the obvious completions are too pessimistic, yet, there is little room left to claim that human beings place a generally high value on freedom. Or that they can even recognize it.

It might be the case that a desire for freedom, the courage to accept freedom, and so forth are no different from other human traits—they lie on a spectrum. Just as some human beings seem nearly fearless in physical matters while others are very timid and most of us lie in between, so there are some nearly fearless when they face the great risks of freedom and some who shake in fear at the possible consequences of freedom or perhaps just at the uncertainty. Some may even be oblivious to the very possibility of freedom.

I'm starting to address moral and social and political issues within the context of my worldview. For now, I wish to make one specific point about difficult issues such as the possibility that many human beings aren't made for freedom:

The world is what God made it to be and not what it is in someone's speculative understanding of the world based, far too often on empirical knowledge now known to be wrong or—more likely—not rich enough to describe our universe.

When we overlook harsh realities of God's world, or turn away from them, we're not being 'idealistic', we're being dishonest and even disre-

spectful towards our Maker. We're making a claim that we know better than God. We're in a state of rebellion against God in His role as Creator of this world.

Historical evidence, and probably the weight of empirical evidence about human personality characteristics, tells us that few there are who can tolerate any substantial amount of freedom and many who seem to be in that camp lived in an era where they never had to make great sacrifices for freedom. This may be no more than support for the apparent claim of the New Testament that most men are sheep and few who pretend to be shepherds love freedom any more than those they pretend to guard and guide. Yet, if this is how we are to interpret Biblical claims, it merely emphasizes the great errors in our understanding of man and of the political, social, and moral aspects of his nature.

The more I try to make sense of human political and social and moral teachings, the more defects I can see. At the most fundamental level. That would indicate it's wrong to even speak of defects and closer to the truth to say that our beliefs in these areas aren't even wrong – they have nothing to do with reality.

And so I return to the need to reconsider our understanding of human desire for freedom and maybe even to reconsider our understanding of freedom itself. Given my belief that our minds are shaped by our responses to our environments, I'd have to conjecture that freedom is something you can't much enjoy, or at least fully enjoy, unless you have a coherent intellectual understanding of freedom set in the context of a coherent intellectual understanding of human nature. The pursuit of a poorly understood freedom will lead you to a state of deluded slavery. This doesn't mean that understanding of freedom has to be sophisticated or even defensible against the attack of philosophers. The simple farmers and tradesmen of Switzerland had a clear idea, if a bit simplistic, of the freedom they were defending against the Austrian occupiers of their country.

There's a need here for careful thought. Before we can produce better theories of man and the political and social and moral activities proper to him, we need to properly abstract from what has already been observed in history and what we can see around us. Just as Adam Smith taught us how primitive and apish man rose to the state of Scotsman, so the better thinkers of modern libertarianism have taught us that primitive and apish man was already a central European intellectual in embryo if only he can live in economic freedom and avoid fiat currencies. And, yet, there is much that's

true and useful in the teachings of Adam Smith as well as in the teachings of Ludwig von Mises, if also much in the way of human possibilities which is missing.

My claim remains: neither history nor my personal observations support any claim that more than a few human beings desire true freedom, though perhaps many wish to set their own schedule or to watch dirty movies. When the efforts of a small group of freedom lovers, such as those culminating in the American Revolution, have granted freedom to many around them, that freedom is sold within a frighteningly short time for promises of security. The Founding Fathers were barely turning to dust when Hawthorne wrote of his experiences as a customs agent and how it made him feel unmanned and he noted that most Americans seemed willing to be unmanned in return for mere promises of financial security. (See the introduction to the first edition of *The Scarlett Letter*.) The situation only got worse from that time, especially when power-hungry men could get the American herd stampeding in unison with tales of an enemy who had to be destroyed, of evil that threatened the purity which was the American way of life.

God is merciful and, in any case, He seems to have told us through His prophets and His Son that most men are sheep in need of good shepherds at least during their mortal existence. Yet, in all honesty, I have to wonder how someone who has little desire for freedom, perhaps little aptitude for it, can enjoy a life shared with God, a life in which, I would conjecture, we'll share the true freedom of the Almighty. Perhaps sheep can grow to be like their Shepherd? Perhaps they can even learn to understand and desire freedom in this mortal realm? To be sure, we are yet in the early stages of the growth of the mortal entity, the Body of Christ, which will reach its true and mature form only in the world of the resurrected.

I'm thinking it might be best when describing our current situation to adopt the pessimism that John Adams brought to bear in his political thought. When we look to the future, we should perhaps consider the optimism that Thomas Jefferson exercised towards human potential.

Interesting questions are like good books, so many and so little time.

## 255 When Do We Become Persons?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=707>. It was finished and uploaded on 2010/09/28.]

In a newsletter, (Letter #50, 2010/09/24, see the website for *Inside the Vatican* magazine at <http://insidethevatican.com>), Dr. Robert Moynihan, a journalist covering the ‘Vatican beat’, discusses a recent meeting in Vienna of high-level church officials from the Catholic and Orthodox churches. At least some of those officials are also theologians. It would seem good that there are serious movements towards unity of the the oldest churches in Christianity, but I’m most interested for now in Dr. Moynihan’s summary of the thoughts of a Greek Orthodox theologian regarding the nature of the human ‘person’. In the thought of Metropolitan John Zizioulas, human beings are not born as “creatures capable of sharing the life of God”—the only meaningful definition of ‘person’ for Christians. Like me, he thinks a human being (human biological hypostasis in his more traditional metaphysical language) becomes truly a ‘person’ when he has entered a certain relationship with God that will lead to a sharing of the life of the Holy Trinity. Actually, I would reserve the term ‘person’ for those who have matured in their relationship with God and that can only happen in the world of the resurrected. This is the relevant section from the newsletter:

The Ultimate Victory

The Christian message offers an entirely new type of existence to men and women.

Preserving and defending the Church is to preserve and defend the vehicle, the means, of this message.

The theology of one of the participants at the Vienna meeting, Metropolitan John Zizioulas, has expressed this in a striking and powerful way.

Zizioulas, who studied under the Russian Orthodox theologian Georges Florovsky, received his doctorate in 1965 from the University of Athens and has taught theology at the University of Edinburgh and then the University of Glasgow, Scotland.

Zizioulas has argued that full humanity is achieved only as “person” so that one may participate (*koinonia*) in the personal Trinitarian life of God — participate in the life of the divinity.

He argues that man initially exists as a biological hypostasis (person), constrained as to the types of relationships such a being can have (biological) and doomed to the eventual end of this type of being — death.

He argues that Baptism constitutes an ontological change in the human, creating an ecclesial hypostasis, or person.

This rebirth “from above” gives new ontological freedom as it is not constrained by the limits of biological existence.

Such an ecclesial being is eschatological, meaning it lives in a paradoxical “now,” but “not yet.”

The completion of this rebirth from above is the day of resurrection when the body will no longer be subject to death.

Metropolitan Zizioulas speaks in more traditional theological terms than I do—a mistake since this way of speaking tends to freeze current views into a schema while Thomistic ideas applied to modern views of a dynamic and developing world will leave, for example, our views of how a human being becomes suited to share God’s life, as itself a developing set of ideas. This dynamism isn’t something and human thought which follows it is something else. As I’ve noted elsewhere, the mind of a human being is shaped in response to his environments, ultimately to the thoughts God has manifested in His Creation. It’s not a process of a human mind trying to shape itself to a static world but rather a process of a human mind shaping itself to a world which is itself dynamic, a story and not a defective reflection of some sort of static realm of truths. The human mind is dynamic because Creation is dynamic. I’ll pursue this line of criticism in my next article, but, for now, I just wish to express agreement with the general thrust of the ideas stated by Dr. Moynihan and attributed to Metropolitan Zizioulas.

I have to believe that such a theory of human nature, even when stated in terms of a traditional Hellenistic metaphysics, had to have been motivated at least partly by both observations and modern scientific knowledge. We can watch a parent, or even a child, deteriorate in many of their human characteristics as some sort of brain disease or injury takes its toll. We can watch video shows about our apish ancestors. We can watch other shows, or read serious or pop books, about all the supposedly unique human characteristics which show up, if only in a primitive form, in chimps or gibbons or wolves or even humble and monstrous octopuses.

Reality rules. After all, reality is what God made it to be and He's powerful enough to force us to see things His way, the way He chose when He first brought this particular Creation into existence. He moves slowly but I suspect He's not happy with all the human beings who prefer to impose their own desired ideas upon the world around them—He may be downright angry with Christians who do this. But there's been some progress. Often reluctantly, Christians have bowed – slightly—to God's reality and have admitted that man is a natural creature descended from apish creatures who were also the ancestors of chimpanzees, but our intellectual and spiritual leaders have pulled off the trick of endorsing evolutionary theory while continuing to preach and teach as if the first man was a special creation from the mud of Eden. Monday through Saturday afternoon, man rose from an apish state to a creature with a higher but quite defective moral nature. And some of those *National Geographic* documentaries are quite interesting, especially the ones which present the well-supported theory that the last common male ancestor of all human beings lived about 75,000 years ago while the last common female ancestor lived about 150,000 years ago. Not to worry. . . Saturday evening (in the Catholic Church) through Sunday, man fell from a god-like state when the first human couple rebelled against God. If we could identify such first human beings, if they had lived within even a thousand years of each other, we would find ourselves putting a lot of moral responsibility upon creatures whose parents were apes.

We need to work honestly and courageously with empirical knowledge of the human species and to explore the implications of the insight that man is born an animal and remains such until the grave. I would support Metropolitan Zizioulas in his movement towards a sane view of man and his relationship to Creation and Creator, but he has only moved partway. We need to realize man is an empirical creature and not one whose nature is to be built up from metaphysical principles. We need the courage to

accept the near certainty that mortal man is truly mortal, not possessing a soul of immaterial substance and only God-like in potential. We need to ask: “What sorts of events, or single event, can realize that potential?” I think Zizioulas is right to emphasize baptism’s central role in forming man’s proper relationship to his maker but wrong to speak of ontological changes, as if man the ape becomes man the angelic creature at some identifiable point in space-time, but I have to admit I’ve only begun to think about the proper ways of discussing the Sacraments in my worldview. And I’ve not yet published a word on the topic.

## 256 Evolutionary Thomists Don't Do Ontology

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=713>. It was finished and uploaded on 2010/10/09.]

In the previous chapter, Chapter 255, *When Do We Become Persons?*, I quoted a summary of a view of man developed by the theologian Metropolitan John Zizioulas of the Greek Orthodox Church. I see much good in that view as stated in the summary and didn't go into a detailed critique, only mentioning that the chosen framework of "mainstream Platonism will always try to freeze current views into a 'system' while Thomistic ideas applied to modern views of a dynamic and developing world will leave, for example, our views of how a human being becomes suited to share God's life, as itself a developing set of ideas." I'll make a somewhat more specific comment on the issue of ontology.

First an often quoted but mostly ignored principle of Catholic thought:

Grace doesn't replace or destroy nature; it completes and perfects nature.

This principle argues against an ontological transformation which can be pinpointed in space-time. I'll also note this rule is a result of contemplation on the nature of this world shaped by God from the raw stuff of all Creation. It's not a necessary truth and could—in principle—be overridden by God.

As I understand that principle, it argues there's only two true ontological categories: necessary being (God) and contingent being (Creation and its creatures). Contingent being of the most mundane and ordinary sort can be completed by grace into images of the Creator. God can make for Himself children of Abraham from the stones in a field just because a

child of Abraham isn't a substantial creature in the sense of mainstream philosophy but rather an object of God's attention, a product of a certain relationship God has decided to form. Put this way, my claim becomes quite consistent with a fairly radical understanding of matter as described by quantum mechanics—see Chapter 74, *Rules or Context?*. The principle describing the relationship between grace and nature is ancient, but modern empirical knowledge would tighten that principle to agree with our best understanding of this world, this story being told by God. God has chosen to work in this Creation by way of evolution and development and not by way of changes which occur at a point of spacetime. Grace completes and perfects nature by processes which proceed in this world by paths described by modern physicists and evolutionary biologists.

Let me give the first definition of 'ontology' from the 1913 edition of *Webster's Unabridged Dictionary*:

**ontology** 1. That department of the science of metaphysics which investigates and explains the nature and essential properties and relations of all beings, as such, or the principles and causes of being. [140]

Thomists don't do epistemology because they know the mind is formed by response to the world and epistemology as a philosophical enterprise pretends to judge the world's presentation of itself to our senses. If our senses are less than perfect, that leaves work for neurobiologists and physiologists and psychologists and novelists and painters and others. It's irrational, and impious to this Christian, to judge the source of our knowledge, that which shapes our mind, from a standpoint outside of that comedy of presentation and response. It's an impossible and absurd enterprise.

Why would I also claim we shouldn't engage in ontological analyses? Actually, my better claim would be that we engage in a form of evolutionary ontology instead of hierarchical or categorical ontology. The only being we can directly observe and study, the starting point for our understanding of even the most abstract being, evolves and develops. It's shaped and worked into the form of landscapes and characters for narratives. It doesn't come to us as Man or Tree or even Matter. Nor as earth and sky and fire and water.

Being exists but not in the form of predefined substances—though obviously God knew what substances He would shape when He first created from nothing, that is, when He first manifested the basic truths which are

the foundations of this world and the rest of Creation. The being of this Creation exists in that primordial form and also as objects and landscapes along evolutionary and developmental paths leading out from that primordial being.

So let me return to the thoughts of Metropolitan John Zizioulas which do recognize the obvious constraints upon the nature of mortal man – neither mortal man nor any part of him can be immortal in himself but God may have a trick or two up His sleeve. Let's see how we can maybe reconcile Christian faith in the resurrection with modern understandings of empirical being as evolutionary and developmental.

In Chapter 255, *When Do We Become Persons?*, I quoted a summary of the views of Metropolitan John Zizioulas, including the following statement:

He argues that Baptism constitutes an ontological change in the human, creating an ecclesial hypostasis, or person.

I have to admit to a major gap in my work to date as a Christian thinker—I've not yet written of the Sacraments, but, intuitively, there is a clear path to follow towards a theology of the Eucharist, the Real Presence, because the concrete world is shaped from the primary abstractions, the manifestations of the thoughts God chose for this Creation. We might think of those manifested thoughts as being God's acts through His Word in the sense of the opening verses of the *Gospel of St. John*. Those manifested thoughts, God acting through the Christ, remain yet in the most concrete of things because they are the basic stuff of those things. Wheat provides the building blocks of human flesh, wine of human blood, because they are particular forms of concrete being shaped from some thoughts of God which correspond to the flesh of the Christ and the blood of Christ. Christ is present in that bread and that wine even before the consecration which occurs during the Eucharistic Rite. So the problem is to find a way of speaking as Christ being still more fully present after the consecration.

The solution, which may be complex, will involve a deeper understanding of God's acts of shaping thing-like being from more abstract stuff and of God's acts of shaping living creatures from more basic thing-like being. That shaping of living creatures has produced a human creature with a brain which can encapsulate other forms of being. And the story becomes more complex. I'll not give that story here, though I've written of different pieces and aspects of the story in which the Son of God enters the world

created through Him and calls men to join Him in His divine life. See Chapter 251, *Darwin, Einstein, and the Totemic Mind* for a discussion from an empirical view of an important aspect of this sacramental process of man becoming God.

It's not quite so clear to me how I should deal with baptism but an ontological change as such doesn't make sense in my worldview because there are no well-defined ontological categories to come from or go into. But "ontological change" would work if it were defined in terms of a change of direction in the path of development. Yet, more is involved because the entire Body of Christ is involved when a new member enters. I'll speak of another related problem after summarizing my evolutionary and developmental view of ontology:

Forms of being are the results of God shaping the truths He manifested as the basic stuff of this particular Creation. There is much value in thinking of those shaping processes as being two – evolutionary processes, such the evolution of the human race over an immense period, and developmental processes, such as the development of a specific man over his lifetime.

There is another sentence which bothers me in the summary of Metropolitan John Zizioulas' thoughts which I quoted in Chapter 255, *When Do We Become Persons?*.

The completion of this rebirth from above is the day of resurrection when the body will no longer be subject to death.

If God works by way of acts-of-being, bringing into existence, shaping, and sustaining, we should not be talking about "rebirth from above" as if God were a Zeus sitting on a throne on Mount Olympus and watching His world from a distance. The Thomistic view of God as the source of acts-of-being, including His own Act-of-being, the supreme Act-of-being, makes better sense of this world as a part of the work of a personal Creator than does the older, Hellenistic views of God. In saying this, I speak of the world as being a moral understanding of what might be called Einstein's universe, our physical world in light of the best of modern scientific knowledge and theories. But what I call Einstein's universe is a specific set of thoughts and acts of the Creator. He is here working now and doesn't work from above, saving us by waves of a magician's wand.

Man can become the image of God not because of a change at an instant which converts his being to a different being but rather because of a turn onto a path created by God and seen—for now in this mortal realm—in the evolutionary paths leading from single-cell creatures to fish to reptiles to rat-like mammals and so forth and also the various developmental paths which an individual human being can follow – if the environments of that human are proper.

These various processes of evolution and development are acts-of-being best viewed as God’s acts of shaping all or part of His Creation, working in His self-limited role as Creator of this particular Creation, we might even say, “peculiar Creation.”

Many say: “There is no conflict between scientific knowledge and Christian beliefs,” but we can’t just wave our hands and say, “Trust me on this,” to our children, to our friends with wavering faith, to those we’re supposed to be bringing to Christ, or—least of all – to those who think modern empirical knowledge gives them definitive proof that God doesn’t exist or maybe that He’s a distant and uninvolved God. Metropolitan Zizioulas has taken a major step in a better direction by describing man’s path toward salvation as one appropriate to the mortal creature that man seems to be in light of a lot of solid evidence. I think this can be better done in terms of a Thomistic existentialism updated to consider modern empirical knowledge, especially the realization from quantum mechanics that relationships seem to be primary and ‘stuff’ secondary. In Christian terms, I am an object of a particular love of God rather than being some sort of essential entity describable in traditional ontological terms. Such thoughts can be the foundation of a Christian theology of the Sacraments which properly considers modern empirical knowledge as the Scholastic or Cappadocian theologies properly considered the best understanding of God’s Creation in earlier ages.

# 257 Developing Virtues the Thomistic Way

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=736>. It was finished and uploaded on 2010/11/17.]

You're a moral creature when you live by moral principles, many of them turned into habitual behaviors or at least behaviors you sometimes exhibit and always admire. To be a moral creature, you have to look outside of yourself to God's Creation in light of your best take on objective moral truths which are embedded in that Creation. In terms of modern knowledge about human beings:

1. We have certain racial attributes which can be nurtured into virtues or vices and these attributes, such as recklessness or sexual hunger or an inclination to save energy, are distributed differently amongst members of the human race. These attributes can develop into courage or mindless seeking of thrills, love of spouse or lust, prudence in use of personal resources or a slothful withdrawal from active responses to your environments.

These attributes were those which allowed our ancestors to survive and to reproduce successfully over the eons and we can imagine that sometimes the development of these attributes into vices provided at least a short-term advantage over more virtuous human beings. It still happens, but human beings selected for life in complex societies will have at least some greater propensity to develop human virtues as commonly understood.

2. As individuals, we are born with particular sets of those racial attributes, some of us being more reckless and some having greater sex-

ual hungers and some being inclined to lower levels of activity when possible. We can develop these attributes in the direction of virtue or vice.

Let me discuss the fundamental virtue of courage with a particular concern for moral courage which will have elements of a courage in the face of physical suffering but also elements of a courage in the face of social ostracism. Those two forms of courage aren't always found in the same human being.

It's simple, though not often easy, to develop moral courage. You set out to follow the moral principles you believe in and don't give yourself any room to weasel out of your commitments. But Thomistic principles tell us that human beings are organisms and that human moral nature develops in an organic manner. We can't simply will to be morally courageous and—presto—a magical transformation has taken place.

Step by step. Daydream tough situations if you will. They say some athletes improve their response times in certain situations by having already imagined them in preparation for a competitive event.

In addition to imagining yourself in tough situations, you can also imagine yourself as being what you aim to be, a God-centered man or woman who behaves first according to Christian moral principles and then accepts the consequences good or bad.

Most of all, simply decide that you'll do what you deem right and worry about the consequences afterward. Brainwash yourself into being a morally courageous human being, one who just does what is right because you don't consider doing what is wrong and you don't consider being passive in the face of evil. Some of the biographers of George Washington claim he did exactly this when it came to the "public honor" components of his moral character—he trained himself from his late teens to act according to the model of an idealized portrayal of Cato, the man who fought against Caesar to defend the republican form of Roman government. Like Cincinnatus, another ancient Roman, Washington proved capable of holding the reins of great, almost absolute, power and then ceding that power when it was appropriate. Having developed his moral character without the direct guidance of a more mature man from his teen years, George Washington—though far from morally perfect—gives us a good example of an individual developing a particular subset of virtues the Thomistic way, moving step-by-step with the ultimate goal kept in mind but attention devoted mostly

to the next step, the next round of public duties in the case of George Washington.

## 258 The Invasion of Brain-eating Words and Concepts

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=782>. It was finished and uploaded on 2011/03/10.]

John Hawks, prominent anthropologist and leader of the Neandertal Anti-defamation League, made some interesting comments in reviewing the article *Language processing in the occipital cortex of congenitally blind adults*, published in the *Proceedings of the National Academy of Sciences (Early online)* by Marina Bedny, et al. See *John Hawks Weblog* at <http://johnhawks.net/weblog/> for his review, *Language bootstrapping the brain*.

Professor Hawks notes that “language itself is surprisingly voracious in its ability to consume brain resources and redirect development.” If language can grab even those regions, we know for sure that the human brain is quite plastic, at least at certain stages of development. After all, as I first learned from a book concentrating on color vision: *A Vision of the Brain* [155] by the prominent brain-scientist Semir Zeki, the visual cortex is one of the most highly specialized of the ‘higher’ brain regions.

In his article, *Language bootstrapping the brain*, Professor Hawks summarizes the results of an experiment at MIT in the late 1990s in which the scientists operated on the brains of ferrets and connected the nerves from the retinas to the auditory regions. The ferrets, surprisingly enough, could see and their auditory regions became organized in the way of the typical ferret’s visual cortex.

At the time, Michael Merzenich, a leading plasticity researcher at UCSF, called this experiment “The most compelling

demonstration you could have that experience shapes the brain.”  
Our mental hardware wasn’t hard at all.

Hawks engages in "informed speculation," including:

Language has sharp elbows. It muscles its way into the brain, crowding out other neural functions. Language has the most powerful weapons at hand—a baby’s first word prompts an entire language community to pull the dopamine and serotonin levers of emotion and attention.

A function that was strongly specified by genetics, patterned early in brain development, would not plant itself in spare neurons like a weed in a vacant lot. Only a system that bootstraps itself upon experiencing language inputs could have such plasticity. The structure of the language environment fosters the development of the classic language areas, biased to appear in those particular places by prenatal developmental trajectories, but not built according to a genetic blueprint.

The blind subjects tell us that the ground for language processing is almost as fertile elsewhere in the cortex. Many brain areas have the genetic equipment to recruit and organize neurons into useful circuits for language processing. Language development is developmentally robust because it can rely on a rich language environment, not because of genetic standardization. The basic problems of language evolution must be explained by showing how robust language communities emerged. I don’t preclude genetics, far from it—weaker language environments may have become stronger because of evolutionary change. But that evolution must have been substantially domain-general, because language processing is not specifically canalized by genetics.

Quite a reasonable speculation. A baby is born into a community of shared knowledge, knowledge not only of ‘intellectual’ matters but also of physical skills and emotions appropriate to the community’s life and so much more. There is clearly genetic predisposition to learning language but language must be learned and must be learned in a community of language-using human beings. I suspect that the same would be true of the related and additional skills of literacy proper, the use of written languages and

the ways in which our abstract reasoning abilities can be both unleashed and focused. We might conjecture that literacy is also a bootstrapping operation and it takes generations to develop higher levels of literacy. Once lost, it will take a number of generations to regain the levels of literacy which are necessary to modern science as well as other parts of Western Civilization.

Yet, there might be built-in predispositions which can over-power even the use of language. By at least the 1960s, Richard Gregory, British brain-scientist, was warning (with television and the movies in mind) that the visual systems in humans are so important over the long-term in gathering food and finding reproductive opportunities that they will awaken at strong stimuli and grab resources so that other regions of the brain, especially those of higher thought, will be shut down while the new stimuli is evaluated. Television and movies are a potential danger to proper development and use of our minds, but the modern tendency to place colorful, glossy pictures even in mathematics textbooks would seem to be a gratuitous way to damage minds or at least to make minds flabby.

Our minds grow in the context of particular communities. Not that mind or what it does is inherently 'subjective' or 'relative'. Those peoples who are developing civilizations, that is—higher minds, are moving across the same objectively existing plain, though not all are bound to start the journey nor to move in reasonable directions at all times. We can say each human tradition will have its own treasures of books or music or art or factories or farms or stores of blood-drenched weapons or many of these which it can pass on along with knowledge of how it used those treasures, in ways morally well-ordered or ill-ordered. As John Henry Newman told us, our words mediate and store and—far too often—deform our beliefs, even those which refer to the greatest truths. When we try to stubbornly hold on to words and concepts from an earlier time, when those words and concepts are no longer appropriate, we deform even the greatest truths by forcing them into old wineskins. For the greatest truths always show up as new wine, not matter how ancient their first appearance in human thought.

A living tradition will adjust to new knowledge of the world when appropriate, forming new words or redefining old words and injecting new concepts into the thinking processes of its adherents, including those who adhere in less conscious or less aware ways. If a tradition isn't truly alive, its language and concepts will still invade the minds in formation within its domain, rigidifying rather than imparting life. If a tradition is in forma-

tion, its language and concepts will be ill-formed and fluid, allowing great freedom to creative thinkers and artists and doers of all sorts but leaving many minds in a barbaric state, that is, a state of confusion and disorder. A society in such a barbaric state may well destroy those creative thinkers and doers. It may well destroy itself, even if it's embedded in a great tradition of civilization.

For some comments by Professor Hawks on the relationship between language and concepts, see his essay, *Number as cognitive technology*, at <http://johnhawks.net/weblog/>. Professor Hawks proposes that numbers are technology, an invention of an important sort, a use of a pre-existing but simple concept of number, rather than being a new concept which develops in the human mind as human knowledge grew. I have a problem with this only because my view of the mind leaves me with great difficulty in distinguishing between technology and concepts or—more generally—between our understanding/use of the world and our minds. After all, I've taken the Thomistic claim, "Things are true," and expanded it to, "Truths are thing-like."

What does this all mean? In Chapter 250, *Preliminary Thoughts on the Evolution of the Human Mind*, I talk about multiple levels of development of the mind. The human brain evolved on the species level and then mind develops over various levels of scale on the cultural and individual level. We shouldn't really think these levels are fully separable. They don't overlap so much as they interact and interpenetrate each other but that's a very complicated and complex issue and beyond the scope of this short essay.

We can make greater sense of human nature and how it came and comes into being by letting ourselves be guided by the views of St. Thomas Aquinas in the 13th century. So many years ago, he observed that human beings are organisms, developing in ways appropriate to organisms—by way of active response to their environments. The brain-scientist and philosopher Walter J. Freeman has even claimed that Aquinas, out of all major thinkers, provides the best general guidance for modern brain science. I would suggest that even Darwin's thoughts would have been not different but more coherent and richer if he'd been a Thomistic thinker. See Chapter 83, *Is Christian Morality a Natural Morality?* and some of the following chapters for my review of and responses to Professor Freeman's book, *How Brains Make Up Their Minds* [35].

## 259 The Resurrected Will Need to Be Flooded With Oxytocin and Vasopresin

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=795>. It was finished and uploaded on 2011/04/04.]

The brain-scientist and philosopher Patricia Churchland is giving some lectures on a specific and partial answer to the question: What can neuroscience tell us about morality? A short news article about these lectures can be found at <http://danapress.typepad.com/weblog/2011/03/what-neuroscience-can-tell-us-about-morality.html>.

Her main point according to the article is hardly a surprise to those who've been keeping up at all with developments in the brain sciences. Oxytocin, which I've seen referred to as the 'maternal hormone', and vasopresin increase sociability and apparently do this by decreasing fear levels and increasing trust levels. This reminds me of something I read in a book about human personality, perhaps in one of Jerome Kagan's books. Research psychologists tune up tests which look for links between brain-states and hormone levels by using dogs from certain breeds. There is a certain scale where dogs, not surprisingly, used as guards—such as German Shepherds—are the most fearful especially about things or living creatures which enter their 'personal space' to speak roughly. Fear leads to aggressiveness, at least in animals with the physical capabilities of effective attack. At the other end of the scale, they use hunting dogs, especially retrievers which have been bred to be fearless and highly sociable. Retrievers have been bred to be fearless so that they'll go charging into brush or jump into waters they don't know. They've been bred to be sociable for a variety of

reasons including the fact that hunting expeditions often involve sharing a blind or quarters with dogs and human beings they've not met or not seen for a year. It might well be that the same physical state, genetic or otherwise, creates the fearlessness and the sociability.

The point about this use of breeds of dogs to tune up those studies is that a Golden Retriever is full of so much of some happy-juice or fearlessness-juice that he often acts as if stupid—though a member of one of the very smartest of breeds. A Golden I once owned would repeatedly go right up to dogs which had attacked him and try to make friends and he could repulse the other dog only because he was so big and strong for a Golden. It seemed to take about ten attacks or so before he'd counter-attack. On the other hand, dogs from one of the 'guard' breeds could turn out to be nasty towards most creatures even when raised as pets in loving families. I don't believe genes are the only key to this because it apparently takes only about seven generations of deliberate selection to produce a pet-like family line from wild canines of various sorts. How many more to produce a Golden Retriever or other peaceful and fearless line? I don't know but they only started breeding retrievers as helpers in 'gun' hunting about the middle of the 19th century and it didn't take long in evolutionary terms. There's more going on here, maybe the mother's body activating particular possibilities in the puppies and maybe other factors not yet discovered. Yet, those other factors could be labeled as 'somatic', transmissible at least for some number of generations. That's still flesh-and-blood.

It's no different with human beings. Our race has many behavioral tendencies, some of which will contribute to peacefulness and others to aggression and still others to mostly unrelated character traits. Not all of these tendencies are found in all family lines to the same extent—a very complex issue. I know families where the members are generally much more pleasant and gentle than most human beings. I also know families whose members tend to be aggressive, sometimes to good and moral purposes and sometimes just to satisfy their own desires.

Sons do tend to be like their fathers, though I've read of dog-breeders claiming they tend even more strongly to be like their maternal grand-sires.

A fascinating line of research and, for now, we can only wonder if we have even identified many of the important questions or if we're set to be as surprised as Darwin himself was by the rapid emergence of those complex behaviors in hunting dogs which we could call gun instincts, that is, the tendency of even my pet Golden to move forward and start a weaving,

searching movement when he heard guns fired nearby. He was afraid of some loud sounds, but he would show no fear when honor guards fired during parades or various ceremonies. That wasn't because of any experiences with me—I don't hunt and I've fired guns a few times in my life and only at firing ranges.

A sociable and largely fearless creature can, of course, fear potential predators greatly, and other events or things. Even fearless dogs are said to have some strong instinctive fear of bears. I've read that in the days when dogs were used to distract, perhaps more accurately—torment, bears while the hunter is getting there and setting up for a shot, they had to undergo very demanding testing to select those most willing to follow a bear's track and there would be much training beyond that. They, naturally enough, will be inclined to go the other way when they know a bear's around.

It's quite interesting that fearlessness, and trust, seem to be the foundations of sociability though a well-ordered human community will also contain a number of fearful men and women. There's a certain quality of fear which leads to violent reaction, on the part of a Rottweiler—bred for guard duty—or on the part of a soldier who's forced to live under constant fear for his own life or fear for the lives of the others in his unit.

“Be not afraid,” as Pope John Paul II said often. Trust in God and be not afraid. Trust in your fellow-men, at least those in your family or other flesh-and-blood communities, and be not afraid. You will be disappointed in your fellow-men often, even parents or children or dearest friends, but get over it as my Golden often got over an attack the previous day by another dog. You will also be disappointed in God but you can only trust that He is taking care of your long-term interests however poorly He seems to reward those who take up His cause in this life. Sometimes, God even seems to punish with special severity those who serve Him in a dedicated way.

Be not afraid.

Easy enough to say, but hard to do—unless your body produces large amounts of certain hormones. An interesting and disturbing problem for a Christian who wants to believe each man and woman and child can be saved if only each of those individuals turns to God. I think that's true in the end, but there's a better way to express the difficulty of this matter:

How could a man of violent and distrustful tendencies, a man of inadequate oxytocin flows in this life and inadequate perfected oxytocin flows in the next life, be happy in Heaven?

Wouldn't Heaven be hell for such a man? Is God then to change each man so he can be happy in Heaven? Would he then be the same man? Or would God have destroyed Hercules and have created a gentle Francis to take his place in Heaven?

I've maintained that we're embodied creatures. We modern men are coming to understand the complexity of relationships between many aspects of human nature, including between hormonal flows or brain events and personality traits. We're made peaceful by the presence of proper flows of oxytocin, to simplify more than a bit.

The question returns: What does this mean?

We don't yet know, but we should courageously and faithfully respond to God's Creation, seeking to understand what the Almighty has done in His acts as Creator—even when it leads to difficult questions. I might say we need good flows of oxytocin to have so good a level of trust and courage.

As Pope Benedict XVI said during a speech on 2008/06/07, "Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man." I don't think he meant more exact in terms of hair-splitting arguments according to the science and philosophy of the Middle Ages or ancient Greece.

If the virtues of man are tied to man's physical nature, then we should understand man in the best available way, build our moral philosophies and moral theologies according. We shouldn't give up on those who seem to be missing 'virtue-genes', whatever that might mean, but we should learn to respond to the part of God's Creation which is the individual human being. We should learn to teach young men of violent tendencies to control themselves—and that's unlikely to be done by forcing them to sit in classrooms as if they were a different sort of young man. In fact, it might well be that some young men become violent because they're forced to sit in those classrooms at a time when they have urges to be moving about, hunting and fishing and exploring the wilderness or maybe working with horses and cattle. It's frightening that the schools seem to be controlled by some who don't even understand any human diversity beyond a liking for different television shows.

Our modern tolerance is a strange sort of attitude which really sees others as being "as good as us" only because we know they are potentially just like us in all ways. We'll do our darnedest to help them to achieve that noble goal of being just like us.

I was a student who was more interested in learning than in doing well in classroom situations. In my early 30s, I was classified as someone unsuited for life in modern corporations by a psychologist working for a management placement firm—a seemingly good man who wished he could have at least offered me some good advice and had none to give. Like those young men who can't stay quiet in classrooms, I have also spent much of my life at the business end of that modern tolerance. It isn't pleasant. Though it might concern other physical attributes than oxytocin production, I figure that what I am is built deep into my being because even during those years of my late teens and twenties when I wished to be like those corporate widgets who seemed so happy, I couldn't do it.

I'll say no more along those lines. Scientists, philosophers, theologians, novelists, and Parris Island drill sergeants all have worthwhile viewpoints outside of the scope of the work of each other. There are things I'll be able to better say as a novelist than I can say as a philosopher or theologian, things I'll say better than brain-scientists or anthropologists or even drill sergeants.

[I didn't throw in Parris Island drill sergeants as a matter of whim. In *Where Resident Aliens Live* [149], a book written by Stanley Hauerwas and William H. Willimon about the difficulties of retaining Christian faith as an undergraduate in an American college, they reprinted an article from the *Wall Street Journal* in which some of those sergeants spoke of a radical loss of moral structure in the young men coming to be trained as marines. They had seen this change happen all at once, circa 1990, and didn't differentiate between young men from different ethnic groups or those from unstable versus solid families. Interesting and strange and frightening.]

# 260 Much of Our Knowledge, Much of Our Thinking, Much of Our Moral Structure Lies Outside of Us

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=801>. It was finished and uploaded on 2011/04/07.]

Our moral disorder lies outside of us because we inhabit morally disordered human communities. But let me start from a ways back. . .

In Chapter 259, *The Resurrected Will Need to Be Flooded With Oxytocin and Vasopresin*, I wrote about some hormonal matters which work from our insides to shape our personality characteristics. By the end of that article, I was qualifying the insight to consider external matters, especially those involving communal matters, such as the way we educate our youth, even the general way we treat youth.

In fact, as Gerd Gigerenzer showed in his important book *Adaptive Thinking: Rationality in the Real World*[61], much of our knowledge is in the environments around us. In a sense, those environments do some of our thinking. I wrote a series of review articles to discuss some aspects of Gigerenzer's findings and his insights into those findings. They are published in this book as the following chapters:

- Chapter 78, *A Review of "Adaptive Thinking", Part I*,
- Chapter 79, *A Review of "Adaptive Thinking", Part II*,
- Chapter 80, *A Review of "Adaptive Thinking", Part III*,

- Chapter 81, *A Review of "Adaptive Thinking", Part IV*,
- Chapter 82, *A Review of "Adaptive Thinking", Part V*,

What is true of knowledge in our general environments, human as well as the landscape, is true of moral knowledge in particular. This doesn't mean our insides are of little importance. We need a highly developed human intelligence to respond properly to the knowledge contained in our environments. When we respond to the moral knowledge contained in our environments, we need that highly developed intelligence and also some specific personality traits such as the social traits correlated with flows of oxytocin and vasopresin. Still, we can only respond to what's there to respond to, as Yogi Berra might have said.

We shape our own selves to respond to our actual human communities. There are those, natural-born explorers and culture-spanning merchants, who can somehow develop multiple groups of behaviors so that they can behave properly in London today and in Mumbai tomorrow. Those more flexible men and women are few and probably they would be few even if more of us had the opportunity to try and develop that flexibility.

Our moral habits are necessarily practiced responses to particular events in our environments, even if some are able to carry multiple sets of such habits. Few of us do much thinking about such responses so long as our environments meet our needs and some of our desires, so long as those environments are relatively stable, and so long as our moral habits are appropriate for those environments.

Once upon a time, we knew how to do business with the grocer down the street. We knew how to speak to our doctor and to our religious leaders. We knew how to treat a lawyer who seemed to have grown inordinately rich while handling the estates of wealthy widows. When we gave to local charities, we knew those who were distributing the funds and who were receiving those funds. We were able to assume our government was acting largely in the interests of the spectrum of citizens of various levels of wealth and political awareness, though it was partially under the control of shady political machines.

Were all of the items in the previous paragraph always true? No. Did we understand the imperfections of all men and those particular vices to which the ambitious are prone? I think we did to some extent and we may have actually increased our problems with such ambitious men, and now—

women, by being overly cynical and overly abusive in our language towards those anti-social leaders without doing something about their abuses of power. During the 1960s and later decades, it wasn't so unusual for those anxious to conform to the role of well-behaved citizens obedient to their government (the new and true definition of patriotism) to speak in downright nasty terms about these men they let run amok in Southeast Asia and other parts of the world. But they did nothing about those crimes.

I don't accept the idea that the 1960s were the decade when the breakdown in American moral structures began. I think it was more of a period when a lot of men and women and even children were forced to become a bit more honest that something in their communal environments had decayed. My observations, at least as reorganized in recent years, indicate that Americans in my parents' generation (born after WWI) had already begun to walk away from their responsibilities to the human communities, including extended families, which had provided some stable moral structure to American life. They said families were good but only accepted those obligations which pleased them and their idea of their family included only those family members who met some expectations.

This isn't to say that this country was ever in truly good moral condition—see my discussions in Chapter 348, *My Ends are Mad and Now I'm Also Stupid*, Chapter 408, *The Need for Abstractions in Moral Self-understanding*, and Chapter 410, *As the Ruins Crumble...* for a rather brutal assessment of the moral status of the American character.

In *Moby Dick*, Melville wrote of Americans as being in rebellion against God—we really don't like all the constraints He has placed upon us. We feel we should be able to pick and choose which communal ties we'll keep though we assume our children and others in their generation will live up to what we feel their duties are towards us.

I agree with Melville. Our laziness and self-centeredness is true to our natural tendencies but that's the problem. Freed from the traditional moral structures which held in Europe in prior centuries, Americans proved to desire the materialistic rewards of good moral order but haven't shown the moral responsibility necessary to maintain that moral order, or build new versions of it, in a New World. We proved ourselves to be somewhat primitive human animals without the proper attitudes to build a new civilization or even to retain what little of European civilization might have been brought to North America.

The men and women of our age aren't evil. They haven't been corrupted

by Satan. Nearly all of them do have to live in morally disordered communities which give them, at best, mixed messages. Yet, we should realize our parents and their parents built the primitive and morally disordered communities we lived in when young and we continue their work. . .

We build without love or devotion and long for our vacations so we can go to Florida or some Caribbean island. And, yet, as individuals, we are partially excused by our sheep-like natures and the sad state of the communities we inhabit. There is no strict cause-and-effect relationship which convicts us of first-degree murder of our communities but we are certainly guilty of community-slaughter. And we are also our victims and the victims of our parents' and grandparents' moral irresponsibility.

I'm trying to develop concepts and words to better speak of these problems which aren't the moral problems of pre-modern man, despite what some half-blind conservatives think. Nor is there anything which has happened in the growth of our material wealth and power which has brought with it any technical solutions to our problems of forming good communities and living good lives as some half-blind liberals or progressives believe.

The sheer growth in human population and the intermingling of those from radically different cultures have brought enough confusion and disorder to account for much of our situation. We have entered a New Age and we're passing through a period where the answers will likely come from human experimentation in new ways of living and from the analyses of those who are a strange mixture of the radical and the reactionary. We need new answers but we need to restore some of the good characteristics of human communities which existed before television brought the entire globe into our living-room and so many human beings went out into that globe to do little more than dissipate whatever moral character they might have had as village-bound craftsmen and farm-bound mule-breeders.

I'm not really pessimistic—in the long term. In *The Revolt of the Masses*, Jose Ortega Y Gasset told us the growth in prosperity and changes in attitude freed men from parochial lives but only tainted good had come of that release from restrictively local lives. The leaders of the West failed to even try hard at fulfilling their duties to teach the wisdom of the West to these masses or to help them to mature into morally well-ordered adults in this radically new historical situation. Few, if any, leaders rose from the masses themselves to try to develop the sorts of moral characters and minds which could bring about moral order in the new communities which were growing up willy-nilly.

God's story moves forward. The Body of Christ is forming slowly by painful processes. Some legitimate organs, such as the American government, have decayed into cancers or parasitic organisms preying upon the greater body. The human race which is the mortal stuff of that Body is only reluctantly, and under great pressure, accepting the need to mature and to grow into something not yet seen. We will move forward along with God's story. What choice have we?

I am pessimistic in the short time. We've shown no willingness to respond properly on our own to our new environments in this world of huge human populations and advanced technology. We'll be forced to respond. We'll be shaped by saws and chisels and files. It will be ugly and painful.

## 261 Is Schizophrenia Now Really a Disease?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=820>. It was finished and uploaded on 2011/04/19.]

As I've noted in a couple of essays in this book, schizophrenia is a terrible disease, even by the standards of psychiatric diseases. Yet, there's something odd about even calling it a disease. See Chapter 91, *A Thomistic Take on Madness and Modernism*, for a discussion of schizophrenia in light of modern thought and aesthetic styles, which consciously respond to reality in ways which resemble some of the symptoms of that disease. That suggestion comes from the book, *Madness and Modernism* [126] by Louis Sass, a psychologist with deep knowledge in clinical practice and its history, brain research, art, literature, and other domains of culture. He casts some doubt on the 'reality' of schizophrenia, presenting historical and other arguments that it's a set of symptoms which are responses to modern, industrialized conditions on the part of deeply disturbed human beings. And he argued that the same symptoms are displayed, at least for aesthetic reasons, by modern artists and probably many others. I'm probably one of those—see my freely downloadable novels: *A Man for Every Purpose* at <http://loydfueston.com/downloads/aman.pdf> and *The Open Independence of the Sea* at <http://loydfueston.com/downloads/open.pdf>.

I once had a golden retriever who was very sensitive to human emotions or—shall we say—mental and emotional conditions in general. He didn't like to go near anyone who was drunk, even if he knew that fellow and would run up to him in a sober state. He once strongly shied away from one of his human friends and it turned out the fellow was on strong pain medication after the extraction of an impacted tooth. He also stayed

away from a friendly woman we'd encounter sometimes on our walks. She was schizophrenic and, when I first met her, she was either not taking her medicine or it wasn't working. Big friendly Rebel didn't want to go near her when she was telling fantastic stories nor was he willing to go near her when she seemed relatively calm. Then her treatments started working in a major way, for whatever reason. Her enthusiasm was strongly suppressed and it seemed her metabolism was generally slowed down. My retriever was not quite so reluctant to go near her but he still didn't exactly rush toward her.

The point is that her system was upset in an objective way detectable by a golden retriever's nose, whether she was in her schizophrenic state or one of her medicated phases. But that doesn't necessarily mean she had something called 'schizophrenia'. Nor does it necessarily mean her medications had brought her closer to some sort of normal state. She was disturbed, but did she have a specific set of wrongful brain activities? Maybe she was acting out her disturbance in a way she'd learned by her experiences? We shape our minds by our responses to our environments, but suppose there is some sort of a mismatch so that our minds won't be shaped properly or so we refuse to let our minds be shaped in a certain way?

In the fore-mentioned book, Professor Sass speaks of anecdotal tales of treatments for mentally disturbed human beings in pre-colonial Africa—these treatments disappeared before they could be studied. Native doctors provided havens for those who felt great stress inside of their selves. Inside those havens, the patients would 'act crazy' for a week or two and then rise, collect their belongings, pay their fees, and return home, supposedly at peace with reality.

In another problem domain, climate studies, which also deals with quasi-stable systems, Roy Spencer, professor at the University of Alabama in Huntsville and former climatological researcher for NASA, has questioned if we have a good cause-and-effect understanding of the relationships between carbon dioxide build-up and cloud cover changes or between cloud cover changes and temperature changes. See Professor Spencer's website at <http://www.drroyspencer.com/> for his discussions of the issues and for some of the to-and-fro involving Dr. Spencer and those colleagues willing to deal with challenges to the mainstream view. You can also see his postings about increases in atmospheric temperatures related to his ongoing work with NASA. His bio on his website tells us: "Dr. Spencer's work with NASA continues as the U.S. Science Team leader for the Advanced Microwave

Scanning Radiometer flying on NASA's Aqua satellite." That is, he's in charge of one set of measurements of those atmospheric temperatures.

I'm taking no position on the actual cause of increased atmospheric temperatures in recent years—carbon dioxide or cloud cover changes or mere chance or something we haven't even noticed. I am siding with Dr. Spencer completely on his main point—we need to be sure about the entire chain of causal factors and correlations on this globe with so many complex and intertwined systems. My position on mental illnesses is similar.

If brain-researchers, or climate-researchers, think to have already a good understanding of cause-and-effect relationships, they will have no problems finding evidence in support of some theory consistent with that understanding. If the assumed cause-and-effect relationships aren't at least in the right direction, involving the right entities or systems, it's hard to see how the research will converge on a more correct view anytime soon. Natural philosophy, and its more specialized children—physics and biology and so on, have a family history filled with theories that were plausible when proposed but proved to be quite wrong when further empirical information was gathered, and, yet, it took generations before thinkers were educated to accept new theories which could deal with the facts of the matter. I've seen no evidence that scientists of the modern sort are more creative, more flexible of mind, or more responsive to the best available view of reality than were the traditional natural philosophers of pre-modern times. Nor is there much reason to believe modern scientists are superior in those ways to theologians and philosophers, poets and businessmen. Just give all those thinkers in all fields time to dig ruts and they will try to travel them for time without end. It's a human weakness.

If we assume the climate has cause-and-effect relationships such that it can be disturbed by human intervention beyond the power of its own stabilizing mechanisms, then, in a time of a warming atmosphere, we'll find evidence that human changes to atmospheric gases can disrupt the atmosphere's self-stabilizing mechanisms. We'll be sure that quasi-stable system, the climate, will continue to warm up with the continued human output of what's really a modest amount of carbon dioxide for that quasi-stable system. If we assume the brain-mind complex is the same sort of entity, we'll find evidence that chemicals injected into the arm or psychotherapeutic treatments, will bring the brain-mind into a different and stable state.

That can be true but the atmosphere and brain have evolved over eons to be the sorts of entities capable of maintaining their own stability pretty

well. And both can stabilize, and have stabilized, in a disturbed state which is recognizably quasi-stable on short time-scales. A brain, or the atmosphere of a planet, which is disturbed in some significant sense might be able to do a good job of maintaining that disturbed state, which would have become the ‘preferred’ state in some sense. Researchers might better spend their time asking: Why has this system suddenly begun to change, perhaps to destabilize? Roy Spencer did this and realized he couldn’t answer some questions about fundamental cause-and-effect relationships involving different gases in the atmosphere, cloud-cover, and temperature.

In any case, it remains true that schizophrenia is a horrible disease and we should welcome any important results even if we seem to be missing a general understanding of the relationships between brain disruptions, poorly or wrongly formed minds, and behavior. It’s only in the past couple of decades that major brain-scientists such as Gerald Edelman, Antonio Damasio, and Walter J. Freeman have begun to produce a solid, however tentative, understanding of what the mind is and how the brain, indeed the entire human organism, generates it. The interested reader can read Professor Freeman’s *How Brains Make Up Their Minds* [35] for a short but idea-packed explanation from the viewpoint of one highly-regarded brain-scientist.

If I’m right, how can we tell if a disease exists if we only consider behavior or other external evidence, phenomenon at the interface with the environment which may be masking the true conditions in that brain? Perhaps we could find disruptions in the metabolism of brain-cells?

We see some possibly important results in this article: *One Step Closer to a Diagnostic Test for Schizophrenia* found at <http://www.sciencedaily.com/releases/2011/04/110405084302.htm>, where the claim is made they have found reliably testable metabolic changes in the brain-cells of schizophrenia. The advances of those Finnish scientists is good. They’ve identified some changes to the brain’s metabolism which—if verified by other scientists and perhaps other research techniques—can lead to better diagnoses of schizophrenic conditions and perhaps to better understanding of the changes in the brain which are part of the disorder. The question remains: what is cause and what is effect? How could an organ so well-adapted, in most cases, to dealing with our environments in a human way, sometimes be so out of sorts and in such a strange way, as if a character in a James Joyce novel found himself unable to escape from his surrealistic dreamworld? Professor Sass tells an anecdote in which

James Joyce took his badly psychotic daughter to Carl Jung. Jung could do nothing for the poor young woman and Joyce couldn't understand why she couldn't be helped. After all, she talked like one of the characters in his novels and those were works of genius—if a bit difficult to read. Surely, his daughter must be. . . Jung told Joyce that he, as a creative writer, dived into the river of madness but his poor daughter was chained to the bottom. Can I put it this way: James Joyce and his daughter, were diving into the same river known too well to modern men. Did earlier generations of man know much of this particular river of madness? Did they know it at all? Did they have their own rivers of madness or perhaps caves or deserts of madness?

If we think of the brain as being a well-determined and independent system, as a first approximation, then we see it will be interacting at an (somewhat abstract) interface with a similarly regarded—that is, well-determined and independent—environment or set of environments. That interface, at least the part which we could consider 'personal', is the mind. As the philosopher Stephen Toulmin pointed out in the early 1960s, the so-called 'randomness' of biological evolution is really the unpredictability of events at the interface of two well-determined and independent systems, an organism (or family line with proper complicated language) and its environment. This sort of view would lead to an immensely complex understanding of the human mind, its workings and its disturbances. I strongly believe such an understanding would be more realistic than the ones which come from the current understandings of the mind, dualistic or monistic, found in the most modern thinkers.

I'm also going to point to an article about diagnosis of Alzheimer's, *Alzheimer's Diagnostic Guidelines Updated for First Time in Decades* found at <http://www.sciencedaily.com/releases/2011/04/110419003653.htm>, which seems deceptively similar to a possible diagnosis of schizophrenia, but it speaks of progress which can—in principle – be more certain. Alzheimer's is a destruction of the brain which underlies the mind and is a progressive and clearly identifiable physical disease; at least it is identifiable by way of an autopsy and scientists seem to be developing more reliable means, biomarkers in blood and brain-fluid or brain-scans, to diagnosis it in a living patient. Alzheimer's is clearly a disease of the brain which is, in principle, subject to accurate diagnose and can be eased or somewhat cured by technical medical treatments after we come to a technical understanding of the biochemical changes in brain-cells as the disease

progresses.

The psychiatric diseases, such as schizophrenia and bipolar disorder, involve complexes of underlying brain-events and mind-events which are interactions at that interface with the ‘outside’ world that I discussed above. Without having a good understanding—however tentative—of the brain-mind-environment system, I don’t see how we can even know if schizophrenia is a disease, many diseases pretending to be one, or one form of a more general disease which is just the brain-mind complex out of synch with its environment in a general way which can’t be usefully split into smaller categories.

## 262 Shaped and Not Determined

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=824>. It was finished and uploaded on 2011/04/20.]

Are we determined by our genes or by our environments?

Yes.

But, it's not so simple as that. Those genes are us and we are part of those environments which are hardly independent of human technology – culture in general—these days. But the complications are still more than that. We are what's shaped but also the ones who help shape ourselves by way of response. We are what's shaped but our environments, for this purpose, are determined by our perception of what lies outside of us and—to an extent—down in our toes. Our perceptions of those environments are more or less honest, more or less complete, rich or impoverished.

Even genes aren't what they used to be. Nowadays they don't seem to always operate in that good old-fashioned mechanical way. The more up-to-date genes have more complex operations so that they operate in different ways depending upon our early environments and also the environments of the previous few generations. (See the article *Epigenetics* at <http://en.wikipedia.org/wiki/Epigenetics> for some background.) In general, the soma (body or flesh) of the fertilized egg-cell which is a recently conceived human being is not some sort of slave to its own DNA nor is the DNA a simple and mechanical system.

This is not to say we can transcend our DNA, at least not in a direct way, nor is it to say that DNA and soma engage in a war of domination. It is to say our DNA is complex and allows a wide variety of possibilities in interaction with our current environment and it's also to say that we should remember that DNA is some sort of collection of the biochemical responses to Earth's environments over the past three billion years or so—to oversim-

plify greatly. And it's to say along with modern embryologists: A complete set of genes isn't sufficient to make a dinosaur; you need a mommy dinosaur. The qualification is that it is quite possible that a modern elephant could be the mother of a mammoth if one of her egg-cells is fertilized with DNA taken from one of those frozen mammoths in Siberia and then implanted in her womb. But the resulting creature would be part modern elephant in ways which might be unpredictable. In addition, our environments are ever-changing and always presenting new opportunities and problems to us and to voles and to grasshoppers.

Besides the complications of epigenetics and the dynamic nature of the earth, there are some interesting problems posed by the insertion of alien DNA and possibly manipulations of our soma during our lifetimes by viruses, bacteria, or multi-celled parasites. I'll not discuss this in detail, but—for the benefit of those who have not heard of this sort of phenomena—I'll mention that HIV inserts negative images of itself in the DNA of human beings it infects. A human being infected by HIV becomes from that time a potential factory of HIV. Other, more complicated phenomenon can occur, not often leading to a stable species of three-headed dogs nor to supermen who can fly. Cancers or miscarriages are more likely.

But, my current interest is in the responses we make to our environments. The world offers possibilities to us, but creative human beings also offer possibilities not fully determined by their genes or inherited soma. The world itself responds, perhaps to destroy us for inadequate responses or simply because of bad luck. But the world does offer and we decide how to respond to opportunities and problems. And we make a counteroffer in response—if we are properly energetic and courageous. The nonlinear interplay of two systems results in new possibilities even if those two systems were themselves not only independent and well-determined but also linear. This raises issues of emergence vs. creativity but I'll pass over those for now. You can pursue just one small line of thought in this matter by reading Chapter 366, *Creation and Freedom*, for a short discussion of some of the ideas of Henri Bergson.

The main point is that we need to develop a different language to discuss our moral selves and our moral lives. We are not determined by supernatural forces nor by our genes. Nor are we creatures of some sort of free-will unanchored in flesh and blood, rocks and water. We are born as bundles of possible human beings, where those bundles were shaped over eons by the forces of evolutionary biology. We are shaped into particular human beings

by our responses to the particular environments, social and 'natural', into which we are born. There are metaphysical and theological issues and I'll say only that God knew all that would happen when He created contingent being and then shaped this world, but He left us with a limited but significant amount of freedom suitable for creatures such as us. While we are far from fully free, we aren't constrained by God's knowledge of what will happen. We share in the freedom which comes from the factual contingency of this world, this story being told by God.

We can participate along with God in the ongoing shaping of ourselves and our world, however subordinate our status and however weak our powers. To participate in this way, we must take the initiative and we must have faith that God has brought us into existence into a rational and morally well-ordered world. The faith and the corresponding courage to act can be faked until it becomes part of you.

## 263 Now Can We Use Video Screens for Target Practice?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=881>. It was finished and uploaded on 2011/06/03.]

This article, *Poorer Reading Skills Following Changed Computer Habits of Children* found at <http://www.sciencedaily.com/releases/2011/05/110523171103.htm>, discusses a study in which the reading abilities of children have deteriorated since 1970 in two countries in which children use computers more often in school and outside of school. That is, reading ability “has fallen rapidly since 1991 in both the US and Sweden.” On the other hand, “[r]eading ability has improved steadily in Italy and Hungary,” where students don’t use computers heavily in school or outside of school.

As I’ve noted repeatedly, we shape our minds by actively responding to the world. We can misshape our minds by actively responding in the wrong way or to a misconception of the world. We can even misshape our minds by passively accepting what a television or computer pushes into our heads. We become literate human beings capable of maintaining and reviving a complex civilization, like that of the West, by reading books and learning how to think in the ways of the good authors. This doesn’t mean I’m much impressed by the books used in the American school systems for sure. There is much improvement that could be made, starting with tossing out textbooks in many subjects, such as history, at least for talented students who would be better off spending a school-year reading two or three serious works of narrative history and writing a number of short papers on specific topics in those books. Even in mathematics, “written-for-school” textbooks are used too heavily for the development of good mathematical reasoning skills. A good number of college textbooks and some written for

the likes of scientists outside a specialty can be very good in presentation of material and of reasons for the specialists focusing on specific questions and so forth. With so many good books to choose from, why do textbook publishers so persistently ‘develop’ and publish mind-numbing junk? That is one of several problems in modern education which deserve a book’s worth of discussion and I’m not the one to write any of those books.

For the most part, the study discussed in the article under discussion, *Poorer Reading Skills Following Changed Computer Habits of Children* found at <http://www.sciencedaily.com/releases/2011/05/110523171103.htm>, speaks for itself but I will try to balance any counter-reaction by saying computers can play a very good role in education when used properly. If students of some talent in mathematical reasoning are learning how to program or how the ‘insides’ of the computer actually work, then some real learning is going on. This would include future car mechanics who would be better off working in the way of members of the mechanics crews for racing-car teams—learning how to program chips to change the behavior of the engines and thus learning more about how a modern engine works.

Another example: if future writers or editors or book-designers were learning how to do computer typesetting why not use a readily-available and high-quality typesetting system— $\text{\LaTeX}$ . See <http://en.wikipedia.com/wiki/LaTeX> for information. This system was designed by a distinguished mathematician and computer scientist who had grown dissatisfied with the low-quality of most computerized typesetting systems after the retirement of the last of the old-fashioned typesetters specializing in mathematics. See [http://en.wikipedia.com/wiki/Donald\\_knuth](http://en.wikipedia.com/wiki/Donald_knuth) for some background information on Donald Knuth. If those who wish to be involved with books were to learn such a system, with real typesetting commands to help separate ‘content’ and ‘structure’, then they would be learning something serious even if they later moved to radically different ways of typesetting books or e-books. Even if they came to believe that Knuth did a lot of things wrong, they’d have learned a lot just to reason to that conclusion.

And there have reportedly been good results from using computers in the education of students with autism or other conditions which involve problems interacting with other human beings.

I wouldn’t make an absolute rule that computers should be banished from schools, but any use of computers should be specifically justified by the development of meaningful skills, not those which merely make them

targets for marketing campaigns by companies selling systems for dummies. Most students, in fact, would be far better off learning the basics of reading and writing and arithmetic. Chemical engineers need those skills as much as lawyers and as much as conscientious citizens trying to learn a little about the wars their country is fighting in their name.

## 264 Maybe They Should be Feeling Sorry for Us

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=905>. It was finished and uploaded on 2011/06/26.]

Families with tendencies towards autistic traits tend to cluster in regions with opportunities for the exercise of ‘systemizing’ skills: see the article, *Diagnosed Autism Is More Common in an IT-Rich Region, Study Finds* at <http://www.sciencedaily.com/releases/2011/06/110620103937.htm>, for a discussion of this interesting yet less than surprising discovery.

Specifically:

The researchers predicted that autism spectrum conditions (ASC) would be more common in populations enriched for ‘systemizing’, which is the drive to analyse how systems work, and to predict, control and build systems. These skills are required in disciplines such as engineering, physics, computing and mathematics.

The team had previously discovered evidence for a familial association between a talent for systemizing and autism in that fathers and grandfathers of children with ASC are over-represented in the field of engineering. The team had also previously found that mathematicians more often have a sibling with ASC, and students in the natural and technological sciences, including mathematics, show a higher number of autistic traits.

...

The growth of the High Tech Campus Eindhoven has led to Eindhoven becoming a major technology and industrial hub: 30% of jobs in Eindhoven are now in technology or ICT, in Haarlem and Utrecht this is respectively 16 and 17%.

...

The researchers found school-reported prevalence estimates of ASC in Eindhoven was 229 per 10,000, significantly higher than in Haarlem (84 per 10,000) and Utrecht (57 per 10,000), whilst the prevalence for the control conditions were similar in all regions.

Later in the article, one of the researchers points out that “the genes for autism may be expressed in first degree relatives as a talent in systemizing.” In other words, those who have autism to a dysfunctional extent and those who are socially disabled by a somewhat lesser degree of autistic traits will likely have relatives who are skillful engineers and—I would speculate—metal-workers. The economist Thomas Sowell wrote a book, *Late-talking Children* because he had to fight for years to keep public school bureaucrats from classifying his late-talking son as mentally disabled—the son ended up as a high functioning computer scientist who graduated with high ranking from Stanford University. From research, including some done on relatives of late-talking children, of a high-achieving sort, whose parents had joined a support group he founded, Professor Sowell discovered that high-achieving children who were late in speaking had a disproportionate number of relatives who were engineers, skilled craftsmen (such as electronics repairmen), medical doctors, or worked in other fields where at least some of the specialists were ‘systemizers’. This article would indicate they probably also had a disproportionate number of relatives who had more disabling forms of autism spectrum conditions (ASC). (I think it reasonable to assume that most high-achieving, late-talking children have ASC.)

ASC is said to be tied in to ‘systemizer’ personality characteristics. Systemizer talents can only be developed during periods of intense concentration on a very well-specified task. A truly talented tinkerer or car-repairman will concentrate on his task in a way not appropriate for a farmer who has to remain aware of a greater variety of environmental factors as he goes about his work, such as the condition of soil as it’s turned over and the impending weather. A poet crafting lines in his head or a mathematical physicist pondering the applicability of a particular equation to analyzing

explosions near a black-hole will concentrate in a way that would not be good for a barber who's expected to keep up his side of a conversation or a retailer who's watching for customers who head towards the door without buying any goods.

The researchers who appear in this article seem quite aware of the two sides of this coin. Perhaps there be more than two sides. There are Einsteins who are sociable when they wish to be but can concentrate wonderfully well on a difficult line of thought and there are autistic boys who can't stand to be touched and get lost in the task of counting leaves falling from the tree in the front-yard—if they can even function that well. There may well be others who lie in between those particular extremes. There might well be some locked into institutions who are socially dysfunctional but would make wonderful repairmen, who shy from human contact but could assemble complex mechanisms better than any existing robots.

I have found little evidence that we modern human beings are truly tolerant or that we make consistent efforts to help our fellowmen to function well given their abilities and disabilities. Our way of being tolerant is to take those with strange bundles of talents and disabilities and turn them into low-performing 'normal folk'. In an essay collected in one of his books, the psychiatrist Oliver Sacks tells of finding mentally-disabled brothers who also showed some of the traits of autism in losing themselves in a rather strange but wonderful task—they could identify random numbers at least as large as the ones tabulated by the most powerful of computers of that time. They would sit and engage in a conversation of sorts, one speaking a large random number and the other—after perhaps a slight delay – responding with a larger random number. Dr. Sacks used one of those tabulations of random numbers to get the brothers to produce numbers, later confirmed to be random, which were larger than any of the ones in those tables. Years later, he ran into the higher-functioning brother getting off a bus. He'd been de-institutionalized, was living in a halfway house of sorts, and was a socially useful dishwasher. With the pair broken up, the lower-functioning brother had to be put away in an institution which could be called a 'warehouse'. Both had seemingly lost their strange but wonderful talent.

I don't wish to insult those who try to provide care for those who can't even bath themselves, but we show a very bad side when we can't appreciate such a unique talent, one which might have also been usefully studied by mathematicians—the brothers were incompetent at basic arithmetic and

were clearly identifying random numbers by some unknown process. We don't appreciate such unique talents but we glorify the man who can spin in mid-air before slamming the basketball through the hoop and the one who can prance across the stage while playing on his guitar one of the three chords he's conquered.

More importantly, we modern men are uncomfortable with those who have any mental talents, unbalanced like those of those two brothers or balanced like those of Einstein. I've written before of my damaged abilities to concentrate. They were damaged by the structures of modern schools. When young, I'd just be getting interested in a math problem or another sort of line of thought and the bell would ring. Sometimes, I'd not even hear it and would first hear the yells of a teacher telling me it was time to move on so I could, as they say, continue my learning for the day. We don't wish any students to be solving difficult math problems when it's time to move to the lunchroom, do we? We don't want any students to be lost in thoughts of living through the events of the American Revolution, do we? There's too much math and history to be learned to put up with such behavior.

Learning is no better than a bureaucratically regulated chore for most. The best parts of the school-day are the periods of socializing so that the students can talk about the latest pop songs or the television shows they watched the night before.

It's been years since I've read any science fiction, other than a recent re-read of *Fahrenheit 451*, but I remember that was far from the only story or novel which spoke prophetically of the lack of respect of modern men for profound learning or deep thinking or any hints of concentration. I remember one about a future in which those with inclinations to think or learn were outfitted with earphones which blasted junk music into their ears on a steady basis to keep them from so much as following a line of thought. We have become that people who do what we can to drag our children and our fellow-citizens into the constant noise and turmoil of a disordered public life. How generous of us.

I've written about this issue before:

- Chapter 226, *If Only They were Athletes, Part 1*,
- Chapter 227, *If Only They were Athletes, Part 2*, and
- Chapter 97, *Math is Hard and Math is Lonely*.

It might be a sign of social insanity of sorts that we have so little respect for those who can lose themselves in analysis of some aspect of objective reality, whether at the level of abstract or concrete being. We modern men, at least we Americans of the early 2000s, prefer to live inside our own imaginary world which has degraded standards of what is true and good and beautiful. We can perhaps learn something useful, and true and good and beautiful, by paying attention to the accomplishments of someone with autistic traits, whether those traits are part of a well-balanced personality and mind or whether they are part of a socially-isolated boy devoted to some strange, but perhaps wonderful, task. I would even suggest that some of those who suffer from a relatively severe form of ASC, such a boy who spends his time counting falling leaves, might be more sane in some serious sense than those lost in trash-music and the empty socializing of a cell-phone world. Those leaves are part of reality, unlike much of what fills the minds of modern human beings.

## 265 We are Legion and so are Our Forms of Relationship

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=930>. It was finished and uploaded on 2011/07/15.]

I've spoken of this issue before but there is an article about a fresh study, *Children's Personalities Linked to Their Chemical Response to Stress* at <http://www.sciencedaily.com/releases/2011/07/110708084005.htm>, that indicates:

Is your kid a “dove”—cautious and submissive when confronting new environments, or perhaps you have a “hawk”—bold and assertive in unfamiliar settings?

These basic temperamental patterns are linked to opposite hormonal responses to stress—differences that may provide children with advantages for navigating threatening environments, researchers report in a study published online July 8, 2011, in *Development and Psychopathology*.

This is to say that cautious human beings may survive better, even prosper better, in some circumstances while bolder and more assertive human beings may do better in other circumstances. It really is little different than saying that some human beings are better at developing and using their brains and some at developing and using their biceps and some can develop and use their ears and fingers so well as to become accomplished pianists. There are some who have more than one major talent and I've known some who can operate in more than one hormonal or emotional realm—cautious until they make a decision and then fearlessly focused on action from that point.

I'm not saying this research and analysis is trivial or useless, only noting they're researching us and, in this case, confirming St. Paul's observation that we have our own particular natures, some to preach and some to lead communities and some to heal and so forth. Human beings aren't uniform products and there is every reason to believe our race wouldn't have survived if our ancestors had been such.

I'll return to the article:

The researchers also documented the dove or hawk tendencies of the toddlers in a variety of unfamiliar situations. Children who showed dovish tendencies were vigilant and submissive in the face of novelty. The toddlers clung to their mothers, cried, or froze when encountering new surroundings. Hawks used bold, aggressive, and dominating strategies for coping with challenge. They fearlessly explored unknown objects and new environments.

What is that sound in that cave: a treasure of water in a desert region or an irritable predator about to emerge?

This article actually deals with the production of cortisol in the two populations of children when both are exposed to the stress of violent parental arguments at home. The conclusion was stated by co-author of the study, Melissa Sturge-Apple, as "When it comes to healthy psychological behavior, one size does not fit all."

We're different from each other. We are differently sized but we also have different mixtures of various human traits. We move in different ways and move towards different goals or desiderata of various sorts. We form a seemingly chaotic body of humanity, a flock composed of goats and even bison and elks and not just sheep.

What a mess. We all have our strengths and weaknesses, our own tendencies to various vices and virtues—which are often different developments in different contexts of the same human attributes.

It's not that we're individuals milling about. Nor does the traditional, Pauline, idea cover this entire complex mess. We can be said to be members of the Body of Christ, body of humanity if you prefer, but that's only a hint of a greater richness which I hope to be starting to comment upon in the near future. But I'll go a little further in my hints than St. Paul did.

As St. Paul told us: We're members of bodies, human communities, including the ultimate community which is the Body of Christ. We aren't just individuals milling around and forming accidental attachments. In the context of this article, we can imagine these toddlers, perhaps ten years down the road, having self-organized groupings in which the doves and hawks play different roles. They have different relationships with each other, with parents, with friends outside the original group, with community leaders, with ministers or other religious leaders. Those relationships involve a complex set of forms, some being repulsions and others being attractions. Some of those relationships might have the form of quark attractions, weak and non-disruptive near by but growing so strong as the entities draw apart that only destruction of the system or one or more entities can break the relationships. (Technically, in this last case, it would have to be an environment heated to an extreme state, perhaps by a brutal war or social revolution. In that case, a lot of relationships would be disrupted and a lot of entities destroyed.)

I have a vague vision of a human race as complex entities, each a whole unto its self, but each connected to other human beings by these relationships of a more complex sort than can be verbalized in traditional vocabularies. This opens up possibilities of an historically-aware development of a rich and insightful language as fully qualitative as the languages of traditional literature and philosophy and psychology. In the past, our ancestors—not so aware historically as are we—couldn't work so deliberately in fields of science or business or literature or music or technological innovation. Concepts entered our efforts of self-understanding in a slow way, over generations.

There are problems with this goal I'm setting.

First, we modern human beings are in a period of decay only a short few centuries after developing an intense historical awareness on the part of a good percentage of the population of the West. Serious multi-volume biographies, and one-volume abridgments of those same serious books, were read by well-educated insurance brokers and high school teachers and clergymen and—at least in my mother's family – machinists. It's likely not true that many modern men and women have enough historical awareness to participate in the process I'm trying to initiate.

Second, I'm proposing a way of enriching our understanding of the world and of our own selves which requires a sophisticated understanding of modern knowledge of our physical universe including knowledge of life on earth. That understanding is rare and not likely to increase any time

soon as we probably will shortly enter a period of economic and political instability—and maybe serious hardships.

Third, the actual movement towards a newer understanding of our world, of created being in all realms, will be powered by imagination, or it won't happen at all, at least not in a viable or attractive form. The modern imagination seems to be in worse shape than the modern mind.

And so it is that I'll end with an emphasis of one speculation I'm raising and also with a strong warning.

As for the speculation: I'll point out that the major claim I'm making here is that we who write or speak or think about social and moral and political issues should start looking at the relationships between human beings with a goal of enriching our words and thoughts by opening our eyes to the possibility of various sorts of relationships, or equivalently—forces. Some of those forces are repulsive between certain types of human beings, at least under some circumstances. For example, children who are doves might avoid relationships with hawks under peaceful circumstances but might seek those relationships in a violent world where our own warlords can help protect us against Viking and Mongolian invaders. Other forces might be undetectable nearby but might be strongly attractive if distance is increased, as is true of quarks inside of neutrons and protons. One case where they might be true is families where relationships between siblings might be casual under most circumstances but might be very strong if a totalitarian government tries to pull their family apart. More of that sort of analysis later, though maybe not for months.

As for the warning: I'm heading down a path of enriching our ways of thinking and talking about a complex world which is home to complex human creatures with constrained but significant moral freedom. I'm not trying to reduce human beings to creatures who can be studied and potentially controlled by the methods of the modern positive sciences. I'm trying to abstract from the modern knowledge about physical forces and to use those more abstract bodies of knowledge to develop richer understandings of human beings and other concrete entities which share this realm of created being with neutrons and stars and interstellar magnetic fields.

Any true and meaningful discussion of human beings has to take the overall form of moral narratives, biographies and “true fictions” and histories at various scales of human life and over various realms of human life. Yet, we must remember those narratives are far truer and more meaningful if we can speak more accurately of the creatures which are the moral actors

in those narratives, if we can speak more accurately of the ways in which they relate, if we can speak more accurately of the ways in which they can move along both the physical and the abstract paths they choose to travel or are forced to travel.

## 266 A Bit More Complicated Than Many Would Suggest

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=949>. It was finished and uploaded on 2011/07/23.]

I'm no expert on stem-cell therapy research and I won't try to say too much, but anyone who thinks miracles are guaranteed by any form of stem-cell therapy, morally acceptable or otherwise, should read this mostly optimistic but realistic article, *Carving the Neural Stem Cell 'Niche'* at <http://www.dana.org/news/features/detail.aspx?id=33672>.

Researchers have known for a while that many diseases which once seemed to be a problem in a very particular sort of cell are in fact caused by problems in their context, perhaps neighboring cells or cells they depend upon for some biochemicals. The small support cells, glia, which surround neurons seem to be involved in some neurological disorders, indicating they aren't 'just' support cells. Replace the neurons with cells grown from stem-cells and the surrounding glia will soon enough 'poison' the neurons—the disease will return.

This article is more concerned with what might be called the biochemical bath in which new cells might be inserted. Can that bath be supplemented to add the necessary biochemicals for successful treatment by stem-cells. Probably, at least in many cases, but researchers are going to be asking a variety of tough questions as they advance towards viable treatments. For example, did the diseased cells become such because the biochemical bath is itself somehow wrong? Then you have to worry that the blood-cell problem involves the liver or a problem with the hippocampus in the brain involves other brain regions, perhaps those which produce common brain chemicals such as dopamine.

We're organisms and even the different parts of our bodies have environments or contexts, relationships to biochemical baths and flows of other biochemicals, perhaps being constrained to specific areas or being thrown out of balance by another organ's production of a biochemical with multiple uses and effects throughout the organism.

We have to think of ourselves and other living creatures as being complex and particular organisms. We aren't just a sack of bones and organs and miscellaneous cells to be manipulated, tuned-up, fixed by a mechanic of the heart or a chemical technician specializing in blood.

DNA isn't some sort of independent master of organisms—it is part of those organisms which are very complex environments indeed. Neither are the particular organs or types of cells or individual cells of that organism independent of their environmental context as part of that organism. Neither is the organism itself, especially a social mammal such as a human being, independent of its context, including its social, economic, political, cultural environments.

Oh, the world is so complicated for those who like to draw flow-charts thinking them to be definitive rather than just indicative.

# 267 Our Grandchildren Are What We Eat

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=977>. It was finished and uploaded on 2011/08/08.]

This article is interesting though hardly surprising: *Can PTSD Become Hereditary?* found at <http://www.miller-mccune.com/health/can-ptsd-become-hereditary-33703/>. It tells us that we can pass on to future generations the psychiatric problems we develop during our lifetimes.

To simplify a lot:

Our genes carry out some very important tasks for the organism of which they are part, such as providing active templates—tiny assembly plants—for proteins. Those genes are not some sort of unalterable instructions given by a god of evolution; they are not somehow shaped over long periods of time and unalterable over short periods of time. At the very least, the activity level, say from none to low to very high, can be set by the organism as it responds to its environments.

To simplify just as much:

Each generation of men then has to respond to its environments with given resources, including the starting-point of their genome inherited from their family lines and set to some levels of activity in the womb. Neurochemical balance and proper neuro-anatomical development can be re-established but it may take a few generations of stable, well-behaved environments.

Let's consider a society of peaceful and prosperous farmers and fishermen and traders in Scandinavia. Let them suffer through a few generations of truly harsh weather, a Little Ice Age or something similar. A society of ruthless Vikings emerges. Reading a little bit into the research into the effects of climate change conducted by the late Reid Bryson (an opponent of Global Anthropogenic Climate Change theories for what that's worth), we can conjecture that a promising young civilization, that of the so-called mounds-building Amerinds of the Mississippi river valleys, was destroyed by adverse climate events. The descendants of that demolished civilization were nomads with minds and bodies well-adapted to a pre-civilized life. I'd argue, only on general principle, that the changes to the bodies of Vikings and Mississippi Valley Amerinds were deep and lasting, lasting for some number of generations. I'd argue that way partly because that makes more sense of history and even the biographies of friends and acquaintances, than does the idea that each of us comes into our life clean of any contamination or blessings from what happened to parents and grandparents. Sins are visited upon the children despite the claims of shallow-minded theologians and philosophers and social-reformers, men and women who know little of history and science and haven't thought clearly about what they do know.

This isn't an endorsement of a strict determinism or pagan fatalism but I am claiming we should look at our own recent ancestors and see what their environments were like and how they responded to them. Then look at your own environments, your schooling and—perhaps—your upbringing in some faith, your social climate and economic incentives and opportunities, your political possibilities or at least those presented to you, your general culture. To a certain extent, probably a large extent, this can allow you to see yourself a little more objectively and a little more clearly. If you know a little history of the human race and a little more of your own family line's history (such as Irish Gaelic or Chinese Han), if you know a little bit about the brain sciences and biological evolution, a little bit about modern technology and about its possibilities and dangers, a little bit about the nature of spacetime and matter and energy, a little bit about the possibilities of human thought raised by modern mathematics, then you know a lot that can help you see yourself more objectively and more clearly. I'm not saying this is the 'real you', but I am saying it allows you to see yourself in many of your aspects. It's a modern liberal education in a manner of speaking, one that ideally does draw upon a rich knowledge of the old liberal arts but also upon modern empirical knowledge.

We are shaped by a variety of factors and we have at best partial control over many of those factors but we have no control without self-awareness. In particular, to exercise moral freedom we need good understanding of the ways in which we've been shaped and constrained by factors inherited from our grandparents or even from those apish ancestors who lived tens of thousands of years ago. Our freedom to a large extent is that of being able to reshape ourselves and to redirect our movements into the future, gradually and slowly. Our freedom isn't that of a free-will without any sort of inertial constraints. Our freedom doesn't even lie in the present so important to the fans of free-will. Our freedom lies in the future, or—more precisely—it lies in our movements into that future, our responses to our environments, which responses will shape our future selves. We're organisms and we grow into freedom by growing toward a chosen state.

## 268 Even Our Genomes Seem to be Organisms of a Sort and Not Chemical Computers

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=986>. It was finished and uploaded on 2011/08/15.]

As we explore God's world, it turns out to be just as complicated and complex as some had suspected many centuries ago. And more so. Over the past century or so, DNA was discovered and shown to be that shadowy agent of heritability which was so important a part of the theories of Darwin and the variants of that theory developed by his followers. For a number of decades after Crick and Watson had discovered the magical shape of DNA, after others had developed sophisticated understandings of the stages of producing proteins by way of RNA, DNA was often presented as a straightforward and absolutely dominant set of recipes for constructing proteins, instructions for growth and managing metabolism, and so forth. Turn to page 124 and you'll see how the brain proteins are made which activate neurons so that they form a frontal lobe on a human being. Or something like that.

It had always seemed unlikely to me, and I believe many others who know far more than me about this topic, that a 'linear' set of instructions could produce such varied and rich results as we see in living creatures on Earth. Amongst other problems is the development of complex behaviors and maybe changes to bodily structures within too small a number of generations to be the result of Darwinian selection processes. Darwin himself noted the rapid appearance of dogs with instincts leading them to search upon hearing a gun. Wildlife biologists have gathered circumstantial but

solid evidence that grizzly bears in the Rockies, mostly males, became noticeably smaller after white men took up residence in the area or at least moved through regularly. There are many other interesting problems of this sort in evolutionary biology, with those working on brain and mind issues perhaps leading the pack in finding interesting problems of the sort which help to guide our exploration of our environments and help us gain a richer understanding of those environments and maybe those greater entities: the universe, the world, all of Creation.

So many interesting aspects to Creation and so little time.

This short meditation, on nothing new to my thought, is motivated by a study, *Your Genome Structure, Not Genetic Mutations, Makes You Different* found at <http://www.wired.com/wiredscience/2011/07/genome-structure/>.

Interesting, but I suspect that scientists are only starting to explore a realm of nature which is complex beyond the reach of our current intellectual tools. I suspect that human genomes will prove to be analogous to our greater organisms in richness and complexity.

I've noted before that the philosopher and historian Stephen Toulmin warned biologists back in the early 1960s that biological evolution produces 'randomness' because it occurs as an interface of two well-determined but independent systems: the organism and its environment. It might well prove to be the case that a similar situation holds at the interface of our genomes and our soma (our flesh and blood, roughly speaking).

Time will tell, but I'll hazard a guess that studying a complex genome will prove to be much like studying the number line in having a extraordinary richness of patterns beyond anything our imaginations could currently reach.

Not to worry. So long as we continue to explore Creation with the proper attitudes, our imaginations will grow and strengthen as will our various tools of measurement and analysis.

## 269 Self-aware Development Rather than Planning

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=991>. It was finished and uploaded on 2011/08/20.]

In the late 1980s, a Ph.d. psychologist working for an executive placement firm told me that, out of all the people he'd ever tested or interviewed, I was the one least suited for life in a corporation. Some might say that to be good news in terms of the **potential** for good moral character, but it's certainly bad news in terms of job prospects, especially for someone not really having entrepreneurial talents. By the way, the major reason he had for saying I'm ill-suited to corporate life was my living mind which he said was not desirable in American corporations and not common there. This doesn't mean there aren't smart or clever corporate creatures, only that their intelligence isn't the sort to be described as "living mind". I'm not so sure there are many living minds to be found nowadays in any of the realms within the West, not in academia, not in religious institutions, not in the offices of publishers, not in the news media. Of course, most of these human and mostly bureaucratic organizations are organized in ways similar to General Motors.

In any case, I found it a little bit surprising to read this article: *Conformity Does Not Necessarily Mean Good Team Work, Study Finds* found at <http://www.sciencedaily.com/releases/2011/08/110801094317.htm>. Then I realized I could write a book about this subject, but this is only a rough sketch of an introduction to that book.

I like putting in some of my volunteer time on projects where I'm one of ten or twenty or even fifty volunteers. I dislike attending meetings and—partly because of my time constraints—I also dislike being one of the or-

ganizers. Otherwise, I have too good a reputation of being a good team-worker, helping to cook at some projects or wash pots and dishes at others or organize supplies or whatever. I get asked to work at too many affairs at my parish, though I'm not currently active as a volunteer at other communities. Others like to organize or shop or visit merchants to solicit donations. Fine. I prefer to wash dishes and then quietly return to my books and computer when it's done.

It all works out. To a remarkable extent, these sorts of volunteer projects are self-organizing **not** because everyone shows up as generic human creatures ready to be told what to do. Nor do they enter those projects as free-willed human creatures ready to do whatever seems to be most profitable.

In general, we enter public spaces as particular creatures with particular intentions (growth paths as organism), constrained by our own human natures, soma and genome and mind formed by our responses to our environments. Of course, the formation of our minds take place in peculiar environments and much in the way of our responses is made possible by our specific cultures. What is not made possible is excluded, for the most part. New possibilities can be raised by non-conformists, by those who experience unusual mental or spiritual states, by those who learn or experience something unusual from another culture or from some recently explored region of God's Creation.

Freedom itself, of the sort which concerns us modern human beings, is something which arose in the empirical world as an apish creature became a different sort of apish creature, one living in communities in which new possibilities have arisen because of the relationships which develop as large-scale and complex human communities develop.

Let me summarize, at the risk of over-simplification, and I'll warn any new or casual readers that I'll be pulling in ideas from my worldview, the entire narrative which combines my metaphysical system and my Christian beliefs with a variety of realms of empirical knowledge to give my approximation of the story which God is telling – His Creation.

Human beings have behaviors, attitudes, and minds which exist at the interfaces of various human communities, nuclear families and extended families and local polities and churches and so forth, and those complex human beings are **not** under any sort of direct control of a free-will or any other agency, immaterial soul or whatever, which exists at a point or less so that it's not subject to the laws of our physical universe. Human beings

are physical organisms, as St. Thomas Aquinas and modern biologists teach us. We human beings are also the behaviors we exhibit as we live at those interfaces with so many parts of Creation.

An individual human being, a human physical organism, is only the foundation for a more complex creature which is organism plus a lot more where the “lot more” is mostly relationships. At the same time, we have to realize that—consistent with the so-called ‘radical’ interpretations of quantum mechanics—relationships create stuff, even living stuff. There is a very complex, recursive and iterative, process going on. Relationships create stuff, beginning with God’s love from which He created all that is not Him. And stuff formed by increasingly complex relationships will allow the formation of more complex relationships. We are physical organisms which are our behaviors (including thoughts) at the interfaces with those various realms of Creation and we are also the rapidly evolving technologies and skills we make part of our lives, assuming we make them part of our lives in a way that enriches us rather than just making us slaves to central powers or to the herd which lazy and compliant and fearful human beings form.

Relationships, at least serious relationships, are created by those who have some real stuff, in a manner of speaking. Those who are merely moving along with the herd aren’t in the process of forming the sorts of relationships which lead to rich and meaning-laden communities of any sort—economic or spiritual or intellectual. There is give-and-take to forming a successful social club just as there is to forming a successful multi-partner consulting operation. There is also a give-and-take when a social club successfully forms relationships with the local hospital and little league and give-and-take when a consulting firm of engineers form successful relationships with local manufacturers and departments of public works.

There’s a lot to explore in the general area of human social and moral order. I’m currently busy scoping out what I might contribute to an enrichment and complexification of our ability to discuss and analyze these aspects of human life in a world grown much more complicated and complex and rich than the most creative thinkers could have imagined even during the early decades of the 20th century when the ideas of Planck and Einstein and Bohr, Cantor and Russell, Nietzsche and Bergson, Joyce and Picasso, were starting to form a new human environment to which only those creative few could respond. A rapidly changing human realm of Creation leaves many of us ever more disoriented and incapable of dealing with

the changes by anything better than surrender to the central powers of our age or to the herd.

Those conformists who would fit fully into roles assigned them by others won't have any chance to develop the stuff to participate in the projects needed during a time of change, a time of opportunities and problems. More of us need to learn how to form teams of those sorts of feisty individuals who don't willingly follow orders from above unless they understand the reason for those orders and agree with them at least somewhat. In other words, we need to learn how to form teams in a radically different way from those which generally are formed, by directive, in our increasingly hierarchical societies with their secrecy at the top and with information and orders which come down on a need-to-know basis.

# 270 Discovering What Our Grandparents Knew 80 Years Ago

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=994>. It was finished and uploaded on 2011/08/22.]

Is it surprising to learn there is a *Marked Rise in Intensely Sexualized Images of Women, Not Men*? See <http://www.sciencedaily.com/releases/2011/08/110810133015.htm> to read the article.

It's funny we live in an age where we've learned so much that enriches the traditional understanding that men and women are shaped to their different roles in reproduction and we fail to transfer any of that newly enriched understanding to our public social and moral and political beliefs. For example, there is strong evidence from IQ tests that there are more smart women than smart men but nearly all geniuses are men. Since males and females have pretty much the same average IQs, this tells us that most dumb human beings are men. Why is this a surprise to so many? Why have so many reacted with violent emotions against this claim when I've made it in an otherwise calm discussion? Do we remain enchained prisoners of those sexual revolutionaries of the 20th century who conquered much and destroyed much more?

So far as I can tell, all traits developed in response to our environments have bad aspects, or at least aspects which are bad from some viewpoint. Human females have bodies and attitudes adjusted to their need to raise newborns which are describable as 'embryonic' and will need a decade and a half of care and education—or more. Unlike, say, female lions, female humans aren't as capable in violent activities as the males of their species.

Women are relatively weaker and slower compared to men than female lions are compared to male lions. They are more dependent upon men for protection and support, a fact easy to deny when we've become dependents of centralized powers and their various welfare programs and police forces. On the other hand, human romantic love is founded upon the particular weaknesses and strengths of human males and females. Maybe women and men gain more than they lose from women being physically weak and men having to protect them? Maybe much that is good about sexual relationships has been destroyed by our political system in which false promises of protection come from the central governments and boys are trained to call in the Seals to protect Mom.

And so I return to the article's specific topic: the 'pornifying' of women. Natural inclinations of men and women are developing in bad directions in our morally loose societies, which are less societies than mobs of individuals dependent upon central powers and impersonal systems of production and trade. Because of the traits which are so valuable in successful reproduction, women are more exploitable and probably more 'willing' in some ways to be exploited. I'll quote from the article I already referenced, *Marked Rise in Intensely Sexualized Images of Women, Not Men* found at <http://www.sciencedaily.com/releases/2011/08/110810133015.htm>:

A study by University at Buffalo sociologists has found that the portrayal of women in the popular media over the last several decades has become increasingly sexualized, even "pornified." The same is not true of the portrayal of men.

These findings may be cause for concern, the researchers say, because previous research has found sexualized images of women to have far-reaching negative consequences for both men and women.

...

"What we conclude from this is that popular media outlets such as Rolling Stone are not depicting women as sexy musicians or actors; they are depicting women musicians and actors as ready and available for sex. This is problematic," Hatton says, "because it indicates a decisive narrowing of media representations of women.

"We don't necessarily think it's problematic for women to be portrayed as 'sexy.' But we do think it is problematic when

nearly all images of women depict them not simply as ‘sexy women’ but as passive objects for someone else’s sexual pleasure.”

Our ancestors thought to raise their sons not to exploit women and to raise their daughters to avoid exploitation. Men were even raised to protect women. This was a matter of moral order and self-respect for both males and females. In their efforts to conform to the herd as directed by centralizers of power and self-righteous reformers of society, modern men in recent decades thought to raise their sons and daughters to be genial creatures of muted sexual characteristics. Those partially desexed creatures would respect each other because... Well, just because. A good enough explanation for two year-olds and also for the likes of modern political theorists and social reformers.

A number of years ago, I read *The Sexual Brain* [86] by Simon LeVay, a book that discussed the crucial role the brain plays in human sexuality. Professor LeVay, himself homosexual and an activist, put the female brain and the menstrual cycle at the center of that book. A thinker paying attention to reality, even one making claims of the moral goodness of homosexuality, has to realize we are sexual because we, as a race, reproduce. That’s why we’re still here and why human beings are likely to be living on the surface of the earth for many centuries.

Because of the different roles men and women play in reproduction, their brains are radically different and Professor LeVay emphasizes that even the brain of an effeminate homosexual is still a male brain. There are some men whose brains were not masculinized either because of genetic problems or because their mothers didn’t produce testosterone during crucial development periods when the male embryo can’t yet produce it or at least can’t produce enough. There are relatively few such men and we can currently do no more than sympathize with a hellish situation.

There are many things to be said on this general subject and we can explore matters in terms of history or biological evolution or moral freedom or political stability, but all these differences in human males and females have implications for pornography, visual depictions of human beings and human sex acts in advertisement as well what is sold in that seedy video store.

Men have brains which react strongly to visual evidence of sexual opportunities. *A quick Internet search indicates the situation is more complicated*

*than I remembered it to be. There is not a single brain-region but rather a vaguely defined network of brain-regions involved when men are sexually aroused by images. As a result—and speaking only of heterosexuals, men can be more easily aroused by the visual display of women’s bodies than women can be by the display of men’s bodies.*

This has implications for moral and social order, as do most human attributes whether common to most human beings or differing between the sexes or differing between ethnic groups. As is stated in the article: “These findings may be cause for concern, the researchers say, because previous research has found sexualized images of women to have far-reaching negative consequences for both men and women.” In more direct terms, women can be more easily exploited in certain ways. Just because of the different roles they play in reproduction, girls can be raised to be women who accept their exploitation and boys can be raised to readily exploit women in certain ways. An honest appraisal of clothing store catalogs and television shows and magazine covers tells us we have twisted the youth of our oh-so modern societies in exactly this way.

## 271 There's More Than One Way to Bias Results

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1042>. It was finished and uploaded on 2011/09/23.]

The main point of this article, *Put Down That Game Controller: Researcher Suggests Video Games May Not Boost Cognition* found at <http://www.sciencedaily.com/releases/2011/09/110915131637.htm>, is that we should pay attention to the ways in which social scientists recruit participants in their study. The argument is that earlier researchers claiming to find improvements in such attributes as hand-eye coordination from frequent playing of video games had biased their results by recruiting ads which disproportionately drew test subjects already highly skilled in video games. This would be akin to recruiting NFL players for a study of the effects of frequent and intense exercise and practice at athletic skills and then concluding that such exercise and practice will raise you, the ordinary Joe, to a high level as an athlete. Chances are that guy from the Redskins was born a better athlete than you. His exercise and practice will help him compete with other talented athletes while yours would be a waste of time above what is needed for your desired level of fitness.

Sometimes a researcher has to accept certain biases in his study population or unusual conditions in the setting of the research. This should be considered by way of strong and properly worded qualifications in any summaries of results. And sometimes biased results provide good and important scientific information. Interviews with men coming out of intense combat can help in the development of programs to reduce chances of various psychological problems, but it should be taken only as an indication of the state of a human being in extreme circumstances. Moreover, the

psychological conditions of such men might vary according not only to personal attributes but also to upbringing and to the general attitudes of their culture and age. The river rats of the valleys of New England and the Highlanders of Scotland both considered it a simple matter of course that they had to strip naked from the waist down to pass through rivers in cold weather – wet clothes during a New England winter or much of the year in the Highlands could kill. Fathers in some cultures, such as the Roman Republic, raise their sons to a harsh and demanding code, teaching them not to compromise no matter the suffering or even the chances of death. Fathers of the modern West have tended to step back and let their sons be shaped by public schools and the entertainment industry.

My current lines of thought lead me to think there are two problem areas in studying human beings:

1. Even when a study is properly qualified, we should read about it under the understanding that human beings are of a very diverse sort within the general constraints of human nature. This is very, very likely the result of an evolutionary history during which exuberant and optimistic human animals were often able to take hold of opportunities but depressed and pessimistic human animals were right often enough that the genes for those traits also remained in family lines.
2. A human being has a certain rough shape from his genes and other preconditions, but he will be shaped by responses to our environments—the shaping process goes much better with active and even exploratory responses. In many of the specifics of our general human characteristics, we who grew up in the 20th century are more than a little different from the human beings of ancient Greece and from those of New Guinea in the 1400s. That's not all bad though it's likely we've adopted some of the gentler virtues while giving up on some of those necessary for the hard times which are coming.

We need to continue gathering factual information on human nature with the goal of creating true knowledge, that is, a wider and deeper vision, of that factual information. That wider and deeper vision can come only from when the knowledge from scientific studies is merged with the knowledge of history, including the knowledge of literature and of philosophical thought through time. Right now, I'm working on the goal of providing

richer and more complex tools for understanding human nature, individual and communal. Those tools may come from various sources, but I'm starting with the goal of enriching our geometric talk about paths through life and about our various sorts of abstract relationships. I don't think Euclidean relationships come close to describing the relationships of our modern complex, rich lives and communities.

My arguments for the unity of knowledge aren't just some sort of blue-sky vision. I'm not looking at the clouds and ignoring the hazards on the ground in front of me. Rather am I claiming that we can't even truly understand the knowledge gained in particular realms unless we have that wider and deeper knowledge which can mature into a greater understanding of our world or even all of Creation.

# 272 Human Moral Nature: An Overview

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1079>. It was finished and uploaded on 2011/11/14.]

## 272.1 Preface

This entry is the core of a larger work. It's sketchy and incomplete but possibly worth the read.

## 272.2 Introduction

In the Gospel of St. John, we read:

As [Jesus] passed by, he saw a man blind from his birth. And his disciples asked him, "Rabbi, who sinned, this man or his parents, that he was born blind?" Jesus answered, "It was not that this man sinned or his parents, but that the works of God might be made manifest in him. We must work the works of him who sent me while it is day; night comes, when no one can work. As long as I am in the world, I am the light of the world." [John 9:1–5]

And the story continues to tell us that Jesus gave sight to this man who'd been blind from birth.

Sin is strange. The Bible, in various places, misdefines sin and this is the reason for the occasional but strong corrections made by Jesus Christ.

Medical problems are sometimes described as the result of ‘sin’. These medical problems include the likes of what is called ‘leprosy’, probably a skin-problem such as eczema, and blindness and epilepsy. The disorder, deep and ephemeral, of a world in which evolutionary and developmental processes take place is often described as sin in some sense, the result of a world imagined as having been created as a paradise and then some sort of great fall has taken place.

It’s even possible to speak loosely but truly in saying the writers of the Bible, well back to the time of David and perhaps before, were dealing with the question of “nature vs. nurture.” They were also dealing with the limits placed upon our moral freedom by the events of God’s story.

I’ll propose that sin or moral disorder in general is a result of a mismatch between a human being and the world—a deliberately vague way of speaking. In some of my prior writings, I’ve spoken in more specifically Christian terms but I wish to step back and maybe develop a way of speaking that allows non-Christians to engage in this conversation. I also wish to speak in terms general enough that I can more easily adopt new ways of speaking about human moral nature and about our moral journeys through this world. These new ways of speaking will draw upon richer and more complex understandings of being largely made possible by modern science including mathematics.

But what is morality?

From 1913 Webster’s dictionary as provided by The Collaborative International Dictionary of English v.0.48, we get the definition:

- morality** 1. The relation of conformity or nonconformity to the moral standard or rule; quality of an intention, a character, an action, a principle, or a sentiment, when tried by the standard of right. [1913 Webster [140]]
2. The quality of an action which renders it good; the conformity of an act to the accepted standard of right. [1913 Webster [140]]

Where do these rules come from? In discussing truths, even those of mathematics, I’ve claimed it makes best sense of what we now know to speak of being in terms of a spectrum running from very abstract forms to very concrete forms. So far as Creation goes, all that can be explored or accessed in any way by a creature, the most abstract form of being is what I’ve called the Primordial Universe, the truths manifested by God as

the basic stuff of Creation, the stuff from which successively more concrete forms of being is shaped.

Moral nature is a set of traits in a living creature, one formed in a very concrete level of being. We can almost speak, in an analogical way, of our moral nature as being itself a separate entity but the truth is that it's a combination of memories, behaviors in the present and in the near-term future, and planning and other cognitive and emotional activities in the more distant future. As I've noted before, our moral freedom in particular lies in the future. Next year, I'll realize my moral freedom in better formed habits that give me a healthier diet. Or so I hope. Few are born with the strong inclination to sacrifice themselves for their children, to die for the cause of liberty, to die for Church and God. For most of us, we anticipate sacrifices, visualizing tough situations and developing the little habits which will allow us to handle those situations—as some top-level athletes are said to do.

Morality can also be seen as the more abstract region of the spectrum which includes what we call 'ethics':

**ethics** The science of human duty; the body of rules of duty drawn from this science; a particular system of principles and rules concerting duty, whether true or false; rules of practice in respect to a single class of human actions; as, political or social ethics; medical ethics. [1913 Webster [140]]

Careful planning, moral anticipation, allows us to form our ethical habits.

In Chapter 438, I provided a diagram to help me present my claims that our understanding of our own moral natures can be enriched by borrowing, in a special way, from general relativity. Specifically, I had noticed that we speak of our moral paths through life in Euclidean terms but those terms seem inadequate for human beings who live in societies grown tremendously complex and rich. I stated that "I hope this makes my claim clearer and more plausible":

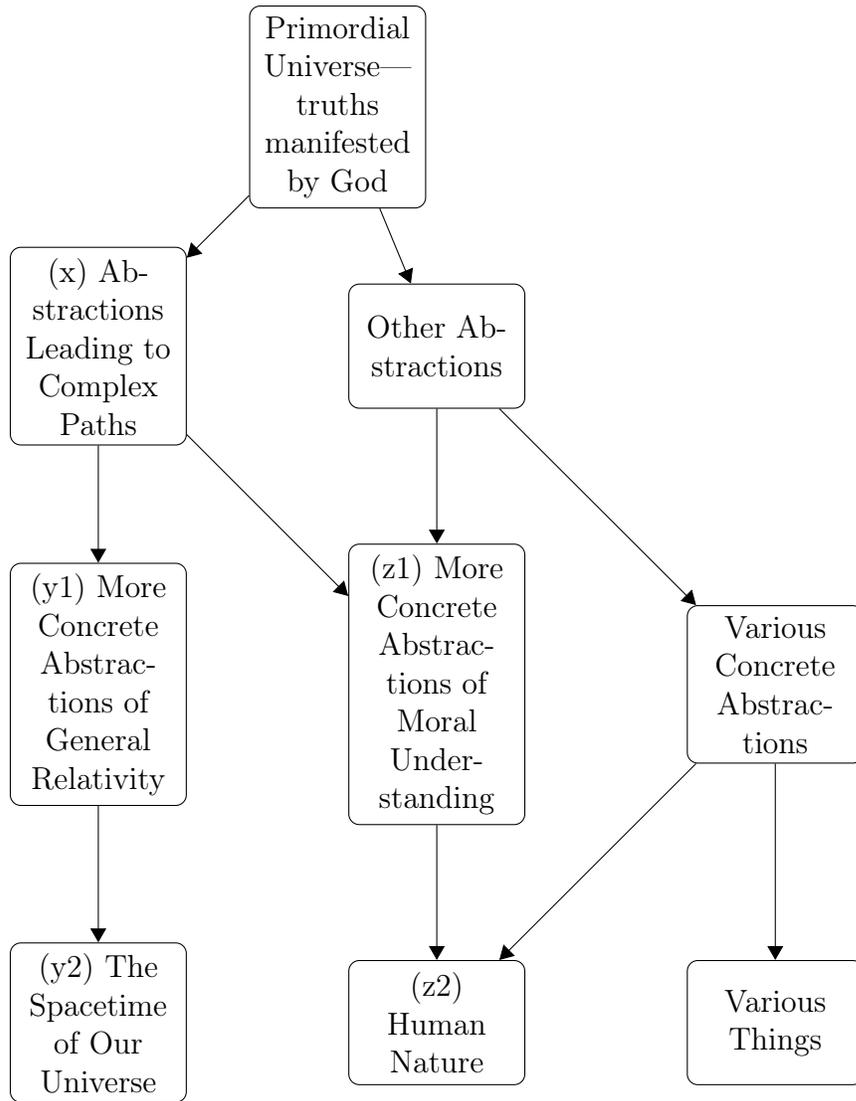

Figure 272.1: Simple Relationships of Abstract and Concrete Levels of Being

I'll continue to emphasize this issue of the spectrum of being, abstract to concrete, in my writings. Empirical being is one end of a spectrum, the other end being—roughly—what we might call metaphysical truths, the truths manifested by the Creator as the raw stuff of Creation.

The diagram above is misleading in one way. I explained this in Chapter 169 by comparing my way of thought to that of Plato where complex entities had what might be called Ideal Prototypes in a realm of the Real (Ideal in terms of most modern thinkers, philosophical or other types). The diagram for Platonic concepts of being from that entry is:

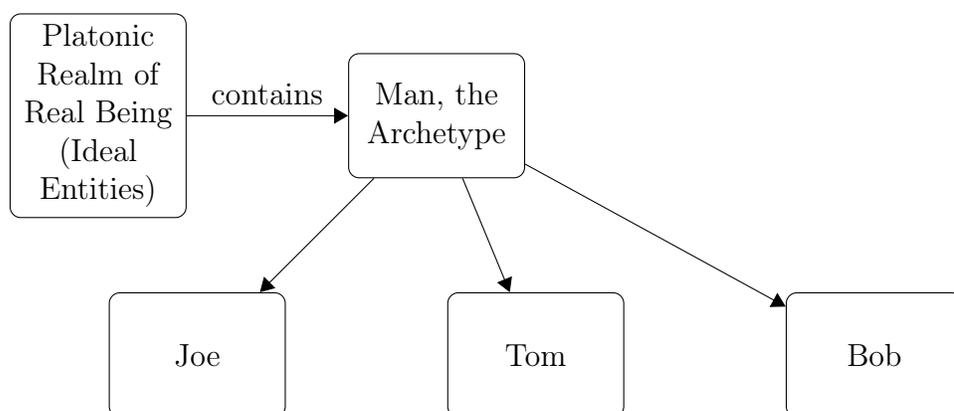

Figure 272.2: Platonist Particular Entities **Do** Come From a Single Archetype

Human beings are more complex than this would indicate and also share aspects of being with other living creatures and even with non-living entities. We can go back to the earlier diagram which shows my way of thinking about being and talking about being. This points to the richer and more complex truth but misleads only because it doesn't show—I don't know how to show for now—the tangles of aspects of being which move from one layer of abstract being to help form the next layer of somewhat more concrete being.

Our moral natures are part of our human natures on the whole, but in a very complex way that can be made clear only when we learn to speak in those richer and more complex terms. For now, try to imagine the clean, simple lines from one layer of being, relatively more abstract, down to the next layer of being, relatively more concrete, as being more like twisted

cables which don't really match up from one layer of being to the next in any simple manner. A qualitative mathematical description would be a very good thing, but such a description remains to be developed. Mathematical discussions usually don't involve badly behaved many-to-many functions. I most certainly don't regard man in terms of a 'mapping' similar to those of Platonists—see Chapter 169, *From Abstract Being to Concrete Being and Narratives*, for a short discussion of my way of looking at being compared to the ways in which being is implicitly described in modern physics as well as the way that Plato and his followers described it.

Let me shift a little to discuss this issue from a slightly different angle, one which will allow a richer discussion of the nature-nurture controversy in a more complete version of this entry.

### 272.3    Man as a Creature and Not a Metaphysical Entity

I've argued this point before: we can only speak about and generalize from layers of being we can perceive and explore directly. (Take 'perceive' in a very general way to include the use of much instrumentation and also indirect observations, even statistical analyses.) We should respect God's Creation by taking seriously those layers of being we can perceive and explore directly, by taking seriously analyses and conjectures based upon those layers, and by not committing ourselves to speculations inconsistent with those layers of empirical being. We should also be generally skeptical about making metaphysical speculations not plausible in terms of our best current understanding of realms of being which are directly observable and explorable—where we also recognize that many immaterial relationships and some immaterial entities (such as social groups) do show up in the realms of empirical being.

This doesn't argue that we shouldn't hold religious faith or theological claims, only that we should explain that faith and those claims in terms consistent with our best current understanding of the observable and explorable realms of Creation. Or else: we should remain respectfully silent if we can develop no coherent and rational explanation in such terms.

## 272.4 Man the Moral Organism

I've claimed that the human mind is formed on two levels: the species and the individual. In some of my writings, I've made a claim consistent with a fairly radical understanding of quantum mechanics:

Relationships are primary over substance. This is to say that relationships come from more abstract realms of being and are the shapers and raw stuff of concrete substance.

We are shaped by relationships and can shape other living creatures by proper relationships. In particular, we can perform miracles of a sort by loving even those who seem so unlovable. By way of love, in its greater or lesser forms—my favorite lesser form of love is wonder, we can shape ourselves and others into members of the Body of Christ. The relationships are real, more abstract than those studied by physics but the various sorts of relationship merge into each other at some higher level of abstraction.

In other writings, I've also begun to separate out social formation, believing the Body of Christ to be a real entity which unites individual human beings. As God is three Persons in one God, Father and Son and Holy Spirit retaining their individuality, so those who become part of the Body of Christ will retain their individuality while being true members of an entity which is such—not just a nominal designation for a collection of individuals. This shows in the claim:

The truth unfolds in time through a communal process,

or, equivalently,

The human mind forms in time through a communal process,

I could even add:

Human moral nature forms in time through a communal process,

Through a communal process do we even become truer individuals for we shape a true human nature by becoming part of the process of forming the pilgrim Body of Christ, the Body of Christ as it exists in this mortal

realm. We learn how to share the only true freedom, that of God, by learning how to live leaning forward into the future. I'll speak lightly of these communal processes for a while as I learn ways of speaking more truly. As I've noted a number of times, I'm convinced that the proper ways are in terms of the same abstractions from which mathematicians and physicists draw their qualitative and quantitative tools for speaking of the structures of space-time.

The formation of the species mind is what we call evolution and has actually been ongoing since the first self-reproducing organisms appeared on the earth. We could even say that the evolution began with the formation of concrete being as the universe expanded, beginning with the short and spectacular expansion we call the 'Big Bang'.

In any case, there is what might be called a set of family-lines, lines of creatures of direct genetic relation. This set is the human race.

Geneticists and various sorts of other biologists are working to unwind the complexities of how genes and soma transmit possibilities, constraints, and—how often?—well-defined traits and behaviors. Those aren't proving to be simple problems and there will be plenty of job opportunities for a number of generations to come.

## **272.5    Man the Responder to Moral           Environments**

Individual human beings start life with capabilities which are set in a complex way still being unraveled by biologists of various sorts, including anthropologists, and also those who study how we develop in specific social settings. We are born with a set of genes which are a mixture of those from the ovum produced by our mother and the sperm-cell produced by our father, but the way in which our particular possibilities and limitations are determined is more complex than that. See the article on epigenetics at <http://en.wikipedia.com/wiki/Epigenetics> for some basics on "epigenetics [which] is the study of heritable changes in gene expression or cellular phenotype caused by mechanisms other than changes in the underlying DNA sequence." For example, in recent years, it's been shown that bad eating habits can have an effect not just on babies in the womb but even on grandchildren and perhaps beyond, even though the underlying

genes are not changed in ways other than their level of activity. This is true even if the intermediary generations had better habits.

The individual is constrained. Few of us are Albert Einstein and few Vladimir Horowitz. Not many can dance as did Fred Astaire and not many can impress followers and enemies in the way of George Washington. At the same time, we have to remember that each of these men developed their unique characteristics and talents to a high level by aggressively appropriate responses to their environments, to their opportunities and problems.

Given some rough idea of a human nature with its relatively weak specific characteristics, we can move on to that idea of an individual shaping himself, perhaps even to become a true morally well-ordered person rather than just a human animal.

## 272.6 Man the Character in a Story Told by God

Created being gives the stuff of the story but the story is a dynamic movement through time, inherently unpredictable (that is—factual) and—in my opinion as a Christian—under the direction and control of God.

We can think of the universe, the object studied by physicists and chemists, as one realm of created being. When we see the events in and of this universe as a narrative morally ordered to the purposes of God, it becomes what I call a ‘world’.

Morality is a complex and multi-layered concept in my way of thought. It involves a certain ordering of the created being, the very flesh of the human moral actor and the relationships he has formed with other human beings and non-human creatures and with the physical world and with God.

But the actor has to act. He has to respond to the world, learning his role by an interaction of what he is in his created being and what seems to be expected of him by the activity around him. He forms himself as a person, or fails to do so, and can intend—that is, grow as an organism—toward the state of moral person, a human being shaped as a true brother or sister of the Son of God in His human nature.

I’ve not fully developed any of this. It’s still very sketchy in part but it’s necessary, at least to my way of thought, to lay it out this way before filling in the gaps or fleshing out the skeletal parts. To my way of thinking,

this is the point where stories are needed to describe this story, the smaller narratives which are our lives with their moral difficulties and moral accomplishments and moral vagaries and the larger narratives—right up to the entirety of Creation – which our lives are part of.

## **272.7    The Body of Christ Becomes Perceptible**

Biology teaches about entities within family lines, the entities developing as individuals and the family lines evolving in what might be called a neo-neo-Darwinist way. So much has been discovered or hinted at since the emergence of the synthesis of genetic knowledge into evolutionary theory. In particular, we're learning that there are effects such as those labeled 'epigenetic' which tie us into our communities, especially to our parents and grandparents, in very direct and observable ways.

In any case, the human race is such a family line, that is, a line of organisms with a shared history as manifested in both DNA and also flesh-and-blood. But something else has come to exist, something which is the home of human beings in most ways. As a Christian, I believe that mysterious something to be the Body of Christ which came into existence in a frail and mortal form with the Resurrection of Christ or perhaps the coming of the Holy Spirit upon the followers of Christ on Pentecost. Non-Christians can think of this something else as the human race becoming a self-conscious entity of a very vague and complex sort.

History since the Body of Christ formed can be described as the biography of that Body. The Body of Christ as it currently exists has been shaped partially by its often disedifying history though it works also, vaguely and indirectly, towards the purposes God has intended for it from its creation. In this way, the Body of Christ is not different from other mortal organisms forming in this world, even saints bound for Heaven.

So it is that the Body of Christ is disease-ridden, drained by parasites, and loaded with cancerous organs. Not a pretty sight, but, it remains alive as do so many human beings, for their allotted time, however much they are also moral and physical messes. We must remember that the opposite of love isn't hate but indifference. I'd add that the opposite of purity isn't lust but rather passiveness in the face of what can be loved properly or

improperly. In the end, it's life and not moral purity which drives us or leads us to the Body of Christ and to God.

## 272.8 A More Concrete Take on the Nature of Morality

Morality is a word which covers some aspects of human nature when it's well-shaped in response to Creation understood in terms of God's purposes. As such, morality itself has some aspects which draw more or less directly upon abstract forms of being and others which draw upon concrete forms of being. Perhaps most importantly, morality has aspects which draw upon the story God is telling in and with this universe, the story which is the world, that is again, the universe seen in light of God's purposes.

We should realize that good men can shape themselves to those purposes even if they don't believe in a personal God who is all-loving and all-powerful. It's also true that those who believe in such a God can be badly malformed in moral character—as a result of their own responses to this world misperceived and misunderstood. Melville came to the conclusion that Americans were willfully so malformed, trying to live in a world they preferred to the one the Creator has given us.

Americans are a nice people, morally well-ordered for a world different from the one in which we happen to live. We are shaped for the world which has been shown in *Father Knows Best*, *Leave it to Beaver*, and countless movies from Hollywood. As such, we are a dangerous and destructive people when we come into certain types of conflicts. We destroy countries and kill large numbers of people and—just like Hitler's logistical genius, Adolf Eichmann—can't understand why anyone could hate us when we feel so good about ourselves. We go in heavily armed and assuming that good people there will be just like those in television shows about American families living in Plastics town. When those people don't appreciate our efforts on their behalf, we know there are no good ones amongst them and we fire.

I use this example often, not because I hate my own people, though I'm not exactly a fan of the vast majority of American leaders since the generation of the Founding Fathers. I use this example of my own American people being morally malformed, morally insane as Melville put matters,

because we're a good example of a people who seem so morally good when in certain circumstances and are, in fact, quite willing to make a number of sacrifices for others, but are monsters of a unique type when unleashed upon the world with more power than we can even understand.

I think other peoples in the West, including the Germans of the 1930s and 1940s and the British over the past few centuries, are much like us Americans. We stubbornly stick to several wrong ideas, such as the (often implicit) belief that moral goodness is realized or at least confirmed when we feel good about ourselves. In *The Quiet American*, Graham Greene said that we Americans feel the world exists to give us opportunities to feel good about ourselves. Even as those middle-class Germans, so horrified by Hitler's goals as they were revealed, could feel good that they were doing their duty by their families and their communities, holding down respectable jobs and paying their bills and going to church each Sunday.

One major theme in my various writings is the need to make peace with empirical reality. In this context of moral nature, we need to realize that a moral nature formed in response to willfully held illusions of reality will be a psychotic nature of a special sort.

## 273 Embodied We Are

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1090>. It was finished and uploaded on 2011/12/01.]

Mind and body are not separate nor is body for real and mind a mere epiphenomenon. The body is concrete, objective stuff but mind is a set of relationships with both concrete and abstract being.

During recent weeks, I picked up links to various articles which reaffirm our embodied natures. From our bodies of physical stuff, we think to look out into a world but we don't even truly see it unless we engage in active exploration, unless we actively respond to what we find out there. It's a boom field, this business of exploring our embodied natures. The article titled *How Touch and Movement Contribute to the Development of the Brain* can be viewed at <http://www.sciencedaily.com/releases/2011/10/111014080017.htm>. But the well-formed brain itself makes it possible to develop the skills that allow us to continue our exploration of our environments. It must be so, there is a scientific study titled *Big, Little, Tall and Tiny: Learning Spatial Terms Improves Children's Spatial Skills* at <http://www.sciencedaily.com/releases/2011/11/111109125737.htm>. And it likely is true, though the researchers might have gotten some things wrong, because it is consistent with the body of modern knowledge about human nature, knowledge so consistent with the teachings of that Medieval man, St. Thomas Aquinas. Man is an organism. Man intends in a true sense when he is developing as an organism in a properly willed, properly thought-out, way.

Little of this new knowledge should be truly surprising to those who are self-aware, who have deeply experienced and come to know the way that a simple cold can distort perceptions and thoughts and fundamental attitudes. Many in this therapeutic age might be more surprised to learn that *Training*

in ‘Concrete Thinking’ Can Be Self-Help Treatment for Depression, *Study Suggests*—see the article of that title at <http://www.sciencedaily.com/releases/2011/11/111117202935.htm>. Learning how to deal with this thing-ish world can cure depression. Anchor yourself. The world can be nasty but those who deal with this world as it is can think straight and not have their thinking distorted in a way we’d label as ‘depressed’. There was recently a discovery I’d mentioned in an earlier entry that the physical problems, including posture problems, of bipolar disease—a truly nasty psychiatric disorder—develop years before those psychiatric problems. No one knows quite what that means yet, but it’s hardly surprising to learn that changing our posture can affect how we feel and how our brains work: go to <http://www.scientificamerican.com/podcast/episode.cfm?id=mind-body-mind-blower-posture-affec-11-11-28> for a short introduction and a podcast titled *Mind-Body Mindblower: Posture Affects Estimates*. Sit up straight, just as your Grannie told you to do.

I suspect that a very interesting study might be done on the relationship between psychiatric disorders and various disorders of the proprioceptive systems of human beings.

Are snakes nasty partly because they crawl through the dust? Were they selected over the ages for such an embodiment because they were a line of particularly nasty reptiles? As I recall from reading *Lord of the Rings* decades ago, noble creatures had noble postures and noble ways of moving through the world. Gollum was a crouching and slouching creature and the orcs moved as if stomping life out with every heavy-booted tread. I’m not a big fan of fantasy but Tolkien seems to have had good insight into some moral issues.

Were Lord Byron’s mental and emotional problems increased by his club-foot? (He was descended from a line of the Gordons which had a terrible problem with male-only bipolar disorder. I’m descended from a different line of the Gordons but there seems to be a certain amount of alcoholism and depression, male and female, in my family line.)

Should we be teaching children how to stand properly and how to move properly? Should all young humans be taught to stand tall, proud in the proper way?

I myself am coming out of a short period of writer’s block which followed an intense 3-week volunteer project in my parish—the last week was the period of no electricity and no heat in my part of New England. I think my histamine levels sky-rocketed, perhaps partly because of damage to my

tendons and general exhaustion and so forth. My arms often throbbed with what I suspect was a healing process. My mood was often dark, a sort of paranoia I often suffer when I have tendinitis or a cold or sinus infection or any other disorder which plays with histamine levels. During that dusky, though not truly dark, period, was I slouching? Was I looking at damaged trees and the blue skies of an abnormally mild November from a bad angle?

I am embodied but that doesn't mean that my body enslaves me. It doesn't mean this thing-like world enslaves me. Somehow, I've a small bit of moral freedom, mostly in the future, but that future nature of my freedom allows me to leverage that freedom. I can learn the ways in which I'm constrained, sometimes to the edge of slavery. I can move a fraction of an inch to the side to slip out of those constraints over the next few years. I can maneuver around the traps and snake-pits.

Why is the world as it is? Why did God create a world with so many problems, so much pain and suffering, so much death?

Perhaps we gain our freedom, a proper creaturely freedom, by learning how to look to our future self, to choose to be a better self, healthier in body and mind, healthier in our relationships to our own selves and to our human communities and to our world. Perhaps this active self which seeks its own true good and the good of all those around it is the dynamic self which can be happy living in community with the saints and with God? Perhaps we can learn how to be God-like by learning how to properly stand and move and how to properly look at the world and think about it?

# 274 The Analysis of Free-will and Other Metaphysical Misdirections of Empirical Thought

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1119>. It was finished and uploaded on 2011/12/12.]

In a faraway region of spacetime, I asked the question which resulted in Chapter 385, *Is this evidence against free-will?*, where I start by noting:

Over the past decade or more, neuroscientists have found strong evidence that we start to act before we're consciously aware of our own actions. This is a problem to those who believe in free-will in the sense of a power of an autonomous agent. It isn't much of a problem to one who accepts the views about moral nature which were taught by St. Thomas Aquinas.

If we think of free-will as being some sort of agent with true freedom from the constraints of our biological selves, our human organisms, then we can reach any absurdity in the same way that we can say: If pigs can fly then true peace can come to men in this mortal realm. This is to say that free-will of that sort is an absurdity, an ill-conception in a manner of speaking. If such a free-will existed, it would be our master and we would not have any freedom at all. We human creatures, biological organisms, would be illusions of a sort.

St. Thomas Aquinas knew better, though he often stated his insights in highly compromised ways—especially in his two *Summas*, perhaps his

great works only in number of pages. I'd advise reading his commentary on *St. Paul's First Letter to the Corinthians*. (A translation is freely available at the website, *Nova et Vetera* – <http://nvjournal.net/files/Aquinas-Corinthians.pdf>.) In a word, Aquinas knew our human natures to be embodied and his mistaken idea of a subsistent (not 'immortal') soul or mind (organ of thinking under either term) was a result of his fear that an organ of flesh could never be dynamic enough to allow for conceptual thought. A dry-as-dust Mr. Spock of sorts, a 'soul' or 'mind' had to be pasted on to our human selves to allow us to engage in such acts of forming the concept of 'species'. Modern brain-scientists and other physical scientists have proven that neurons made of the stuff of neutrons and protons and electrons are easily dynamic enough for such a task.

Modern scientists have also discovered reasons to disbelieve in any disembodied human will, let alone one fully 'free' of the states and events of our bodily stuff. This article, *Is Free Will an Illusion?* found at <http://www.scientificamerican.com/article.cfm?id=is-free-will-an-illusion>, discusses some of the arguments for and against free-will, mostly philosophical arguments of a sort I consider to be somewhat empty and meaningless. Even some of the better insights from modern psychology are presented as minor corrections to an inherited view of moral freedom which was a stretch to start with and seems now to be thoroughly implausible. This might seem strange since *Scientific American* would be expected to show a bias towards, yes, science. And scientists, as I noted at the beginning of this essay, have made a variety of discoveries involving human brain-activity and motor-activity which throw cold water—deservedly – upon most theories of this 'free-will' thingie.

If we were to address the philosophical issues, we should start out with discussions about the nature of a human being, a biological organism. Is it possible for such an entity to have a component corresponding to what philosophers seem to be describing when they talk or write about free-will? I'd say, "no," with no reservations. If you, the creature of flesh and blood, control that free-will do-hickey, it isn't free. And, again, if it is free from you as a highly-constrained biological organism, it's some sort of agent which is free from your control and would be your master for good or ill.

In Chapter 219, *What is Freedom?*, I said:

In the modern world, we tend to think of freedom in terms of satisfying desires. To be sure, even many who live for that

false sort of freedom seem to realize that we then become no more than our desires or, more horribly, the thwarting of those desires—a terrible and humiliating state in either case. Hannibal the Cannibal is the most free of all modern men because he has become his desires and he has gained the power to satisfy them. Hannibal the Cannibal is the role-model for our politicians and our lawyers, our investment bankers and our corporate executives, our athletes and our entertainers. He may even be a role-model for many clergymen.

And then I pointed in a different direction with a quote from Henri Bergson:

[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work. [11] [page 172]

In truth, you the human organism engage in acts of volition, acts of will, which are constrained in a number of ways, most importantly – as I often claim: you often have some substantial but limited freedom to change yourself but yourself in the short-term will almost always act according to the way it has been shaped in the past. In that same essay from an earlier time, I also provided this quote a book by the neurobiologist and philosopher Walter J. Freeman:

An intent is the directing of an action toward some future goal that is defined and chosen by the actor. [35] [page 8]

I then comment on that quote from Professor Freeman:

In Thomistic moral philosophy, ‘intent’ defines human morality and freedom. We don’t freely will to be a good man or a good woman, we choose to struggle towards that state of goodness. We don’t freely will to cut down on our drinking or stop smoking, we choose to move towards a state where we don’t continue our bad habits or bad thoughts because our brains and our bodies and our relationships to others and to our environments have all changed. We should realize that the very process

of forming intents can be a bit vague if only because we don't see the goal clearly until we're well along the path. I've certainly deluded myself often about the goal of becoming a Christ-like man and I've also deluded myself about the nature of the path I have to travel. The forming of our moral intentions is an ongoing process and not an action taken once and for all time.

The modern concept of free-will is useful to entrepreneurs, political or commercial, as they go about their task of destroying local community life to draw us all into the gigantic marketplaces of a land where natural cultural and physical boundaries have been dismantled. That concept of free-will leaves most human beings stripped of their defenses against those entrepreneurs and other predators and parasites of a cosmopolitanism and imperialism rendered all the more damaging to human beings by the pretense, in the U.S. and other countries, that we remain dedicated to traditional human values.

Our moral natures are now but our freedom lies in that future we can only dimly see as we intend, that is—plan and act, to develop the proper attitudes and habits, to become the human being we'd like to be. Return to Bergson's words above, “[W]e are free when our acts spring from our whole personality,” and remember that our whole personality is that of a biological organism, one of flesh and blood, of liver and heart and brain and relationships to other creatures and to the world as physical environments.

Read or re-read the article, *Is Free Will an Illusion?* at <http://www.scientificamerican.com/article.cfm?id=is-free-will-an-illusion>, if you wish. It makes some good points but in such a clumsy way. The author adopts the mainstream understanding of free-will, moral will, and all that, before starting to add and truncate and he points towards the sort of Baroque understanding of man which underlies our therapeutic society and makes it so hard to make sense of our own selves, hard to figure out how to move forward to that better future which can be seen so clearly—as a possibility—once we act according to the insights found in the writings of St. Thomas Aquinas and Walter J. Freeman and also found in my writings. That cleaner way of understanding human nature, cleaner in a way that strongly indicates “more truthful,” allows for cleaner discussions and for an “Aha!” moment when you see what's going on.

## 275 We Prefer to Cooperate With Those Like Ourselves

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1254>. It was finished and uploaded on 2012/04/30.]

I've written about evidence that we like to live and work with those similar to ourselves, though there is still some substantial uncertainty about the mixture of culture and genes in the understanding of "similar to ourselves." I've also written of my strong belief that this world, our universe seen in light of God's purposes, is the story of the formation of the Body of Christ. As I see it, that Body is Christ's brothers and sisters, similar to ourselves and dissimilar, united in an image of the truest community; as God is Father and Son and Holy Spirit in one God, so the Body of Christ will be a multitude of human beings, including the human nature of the Son of God, united in that one Body. In this sort of community, each person or Person retains their individuality while sharing fully in communal acts and thoughts and feelings.

Okay, so that taken care of, there is some more evidence coming in that we can detect those who are genetically similar to us and prefer to cooperate with those most similar to us. In this article, *Genetic Similarity Promotes Cooperation: Study of Simple Organisms Reveals Preference for Those Who Resemble Themselves* found at <http://www.sciencedaily.com/releases/2012/04/120418204358.htm>, we read:

In a dog-eat-dog world of ruthless competition and 'survival of the fittest,' new research from the University of Leicester reveals that individuals are genetically programmed to work together and cooperate with those who most resemble themselves.

A tendency for similar individuals to cooperate selectively with one another, even if they are not close relatives, can evolve spontaneously in simple organisms. This may help to explain why cooperation is so widespread in nature, the study suggests.

The modern world has had much in the way of education programs and other efforts to suppress that inborn tendency of organisms which evolve under conditions of cooperation so that they cooperate best with those similar to their own selves. I suspect there are a variety of very complex genetic and epigenetic mechanisms to further strengthen this tendency in social animals, such as wolves and men, and those mechanisms would be scattered across a variety of loosely linked genes, hormonal and other biochemical responses of egg-laying or live-bearing mothers, and perhaps other aspects of our reproducing selves. I might claim there has been an ongoing effort by those who have exaggerated our individualistic characteristics, the Liberals – both the intellectually coherent Classical Liberals and the somewhat scatterbrained and improvisational Collectivist Liberals, to suppress such tendencies, nativist or exclusionary or whatever term you wish to use.

Back in 2007, I wrote about this issue with regard to the work of a scholar, Robert Putnam, who deals more with the cultural aspects of human social life, though the genetic and cultural aspects aren't really fully separable, to say the least. In that essay which is included in this book as Chapter 218, *Networks of Public Spaces Rather Than One Square*, I wrote:

There's been a buzz of sorts on parts of the Internet because of a major study written by a pro-diversity liberal, Professor Robert Putnam of Harvard. That study indicates there are some serious problems with diversity. He thinks, or maybe hopes, those problems to be of a short-term nature. There might be other ways than a simple choice between a cosmopolitanism that melts down local communities or at least renders them ineffective and a return to tribalism.

There's an overview article on Putnam's study, *The Downside of Diversity* found at <http://www.iht.com/articles/2007/08/05/news/diversity.php>". The article begins:

"It has become increasingly popular to speak of racial and ethnic diversity as a civic strength. From multicultural festivals

to pronouncements from political leaders, the message is the same: our differences make us stronger.

“But a massive new study, based on detailed interviews of nearly 30,000 people across America, has concluded just the opposite. Harvard political scientist Robert Putnam—famous for *Bowling Alone*, his 2000 book on declining civic engagement—has found that the greater the diversity in a community, the fewer people vote and the less they volunteer, the less they give to charity and work on community projects. In the most diverse communities, neighbors trust one another about half as much as they do in the most homogeneous settings. The study, the largest ever on civic engagement in America, found that virtually all measures of civic health are lower in more diverse settings.

“‘The extent of the effect is shocking,’ says Scott Page, a University of Michigan political scientist.

“[Michael Jonas, *Boston Globe*, as published in *International Herald Tribune* on August 5, 2007]”

It’s not healthy, not in moral nor emotional nor mental terms, to try to fix reality by overriding it. We should be trying to form that Body of Christ, the greater and most inclusive possible human community, by being honest about our instincts and moving on to broaden the scope of our ways of thinking and our ways of acting, not by overriding instincts which are good in a limited way. The overriding of instincts which are good but too limited is more likely to end in moral confusion or even outright moral disorder.

We have to learn how to work towards changes which will take place over generations rather than rushing into rapid reforms within the scope of some 5-year plan of either a Socialist or Collectivist Liberal bureaucrat. Modern do-gooders tend to be a lot like those Californians of the common jokes, somewhat bubble-headed and “wanting it all and wanting it now.” The problem we now face is that objective developments in history and misdirected human efforts have done a lot of damage to the human communities in which our better behaviors and thoughts can develop so that we cooperate well with those like us, leaving open that possibility of expanding the scope of those better behaviors and thoughts. We’ve done damage even to our instincts to do good in limited communal contexts in our self-righteous efforts to mold everyone to be good to everyone.

# 276 Biologically-based Altruism is More Complicated Than We Might Think

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1260>. It was finished and uploaded on 2012/05/10.]

Many thinkers in history, philosophers and others, have imagined they could deal with moral issues by conjecturing a small set of sharply formed assumptions, perhaps a set of virtues which were said to be the building blocks of human moral character. Christians should have known better because the fundamental doctrine of moderate realism, similar to an empirical version of Aristotelian common-sense, tells us that any valid abstractions are drawn from what exists, thing-like being and its various immaterial aspects such as relationships between multiple things.

In line with some earlier thinkers, including Augustine of Hippo, I've claimed that virtues and vices can be useful but problems arise such as the unfortunate fact that virtues and vices are differently shaped versions of the same human traits. For example, lust—even of the type leading to rape, is a deformed version of the sexual attraction which is natural and good, which is a foundation of marital relationships and the forming of families.

We need to seriously examine our towering piles of modern empirical knowledge about human beings and other creatures, especially other social creatures, and to figure out a better way to describe and analyze our moral characters. I would expect a good deal of overlap with the descriptions and analyses of virtues and vices to be found in traditional works of moral philosophy and moral theology and political science and so forth. I would also expect some surprises as profound as those which came with the real-

ization that Maxwell's equations describing electromagnetism didn't obey the principles of Galilean/Newtonian relativity. That led to Einstein's proposals which were fully developed into Special Relativity by his subsequent efforts as well as those of a few other mathematicians and physicists. Mass and velocity and acceleration remained as valid descriptive elements but there were some important changes in our understanding of these elements, especially under extreme conditions which Galileo and Newton couldn't have explored. In a similar way, modern life with its technology as well as the sheer mass and variety of human life, has produced extreme social and political and economic conditions. I would expect these profound surprises about human moral nature to produce understandings which simplify to substantially the earlier understandings under many conditions but lead to surprises under the extreme conditions which are quite common in our time.

A recent article, *Not All Altruism Is Alike, Says New Study*, found at <http://www.sciencedaily.com/releases/2012/04/120430140023.htm>, we learn:

Not all acts of altruism are alike, says a new study. From bees and wasps that die defending their nests, to elephants that cooperate to care for young, a new mathematical model pinpoints the environmental conditions that favor one form of altruism over another.

The model predicts that creatures will help each other in different ways depending on whether key resources such as food and habitat are scarce or abundant, say researchers from Indiana University and the National Evolutionary Synthesis Center in Durham, North Carolina.

The article tells us about one complication which seems obvious in retrospect:

For example, some creatures cooperate for the sake of defense, others to find food, and others to care for young, [Michael Wade, a professor at Indiana University and a visiting scholar at the National Evolutionary Synthesis Center] explained.

There are some interesting ideas to be explored in this field, some of which may have practical implications for politics, charity work, family life, and who knows what else.

Often do I quote the historian Carroll Quigley:

The truth emerges in time through a communal process.

This is true of truths manifested in purely empirical ways and also of the allegedly grander truths of metaphysics. In fact, a truer and more humble metaphysics would recognize the truths which emerge as men explore empirical reality. A grand and absolute truth may not be so grand nor so absolute if it conflicts with a humble fact drawn from study of creaturely nature.

# 277 We Are Hunks of Clay, Not Creatures of Metaphysical Attributes

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1272>. It was finished and uploaded on 2012/05/24.]

Lust is a deformed version of the virtue of love, the binding force in a number of human relationships including those involving God. Moreover, the passions and more quiet feelings we know as love are those which evolved amongst social mammals. It's quite a plausible speculation that our ancient four-legged ancestors first began to melt inside when looking into the faces of infants with their soft features and outsized eyes and ears. Did love between Mom and Dad come from a transference of their separate loves for Junior? Maybe. It makes for a good tale and is supported well enough, if still speculatively, to be more than a just-so story.

Our characteristics aren't drawn from the opposing and non-overlapping lists which have come from the imaginations of philosophers and poets and theologians and pranksters. Many of those lists, to be sure, were essential parts of efforts which were highly plausible and which formed part of the historical development of human thought. Some remain the foundations of our best ways of educating our youth and our own selves in proper ways of behaving and forming relationships in stable environments, but they aren't dynamic. They have little to do with individual creatures who develop inside of evolving and developing communities, all part of a grand scheme of evolution taking place over billions of years inside of a universe evolving and developing over a greater amount of time. Systems of virtues and vices are pseudo-metaphysical schemes in which the definitions are no less and

no more than a snapshot of a world which can sometimes be stable but can sometimes change at a rapid pace.

On a more positive line of thought: I've noted before in my writings, we should be careful to think of our human selves as creatures of a strange clay-like stuff. The clay changes over time as our species evolves and the environments, including human relationships, which shape that clay also change over time. We are born with specific potentials and also some clearly defined characteristics. We become specific human animals as a result—at least ideally—of active responses to our environments and even some understanding of the entire world or even the entirety of Creation. For most human beings, these greater understandings aren't the result of personal exploration in strange lands or libraries, results further refined by analysis and contemplation. For most human beings, these greater understandings of world and Creation or Cosmos or whatever are the cultural air we breathe in and the economic food we eat. They are those environments which shape us.

What about those with damaged minds or bodies? Are, for example, terrible mental and emotional disorders the result of some potentially good trait going bad? I don't find it at all surprising that there is some evidence that even bipolar disorder might have some benefits in this messy world—see [http://en.wikipedia.com/wiki/bipolar\\_disorder](http://en.wikipedia.com/wiki/bipolar_disorder). In the article, *Research Explores the Positives of Bipolar Disorder* found at <http://www.sciencedaily.com/releases/2012/05/120503115927.htm>, we can read:

The problems of living with bipolar have been well documented, but a new study by Lancaster University has captured the views of those who also report highly-valued, positive experiences of living with the condition.

Researchers at Lancaster's Spectrum Centre, which is dedicated to the study of bipolar disorder, interviewed and recorded their views of ten people with a bipolar diagnosis, aged between 24 and 57. Participants in the study reported a number of perceived benefits to the condition ranging from sharper senses to increased productivity.

The research was designed to explore growing evidence that some people with bipolar value their experiences and in some cases would prefer not to be without the condition.

Participants described a wide range of experiences and internal states that they believed they felt to a far greater intensity than those without the condition. These included increased perceptual sensitivity, creativity, focus and clarity of thought.

We can also read:

Dr Fiona Lobban, who led the study, said: “Bipolar Disorder is generally seen as a severe and enduring mental illness with serious negative consequences for the people with this diagnosis and their friends and family. For some people this is very much the case. Research shows that long term unemployment rates are high, relationships are marred by high levels of burden on family and friends and quality of life is often poor. High rates of drug and alcohol misuse are reported for people with this diagnosis and suicide rates are twenty times that of the general population.

“However, despite all these factors researchers and clinicians are aware that that some aspects of bipolar experiences are also highly valued by some people. We wanted to find out what these positive experiences were.”

I'll suggest that the manic phases of bipolar disorder might well be hints of the 'high-energy' state we might enjoy in the world of the Resurrected where the saved share the life of the Son of God. The depressed phases might be a hint of the calm. Those who are resurrected to be companions of Jesus Christ might well enjoy both states at once, rather than the lukewarm state to which human beings accustom themselves in this life.

On a more mundane level, this issue is of some personal interest. After all, I do work, creative thought and writing, which has forced many into cycles of high-energy and quiet study or contemplation or simply energy-gathering. Perhaps some are attracted to creative fields because they naturally take to such patterns of work. I might be one of them. I naturally take to periods of quiet reading and the pursuance of lighter lines of thought and love the mood surges when lines of thought come together and I can put some words together to communicate what's been happening inside of me. I don't suffer from, or benefit from, the extreme mood and thought swings of a Lord Byron, but I certainly wouldn't want to give up my more

moderate swings even though I sometimes feel low-key at times when my external circumstances wouldn't justify any sort of depression.

## 278 Genetics Without Historical Context

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1301>. It was finished and uploaded on 2012/06/11.]

Here's an article about hunting for your ancestry by way of genetic analysis: *Ancestry testing goes for pinpoint accuracy* found at <http://www.nature.com/news/ancestry-testing-goes-for-pinpoint-accuracy-1.10785>.

The article warns that interpreting the results of genetic tests can be difficult. Apparently, some of the testing companies have not only advanced equipment and well-trained technicians but also reputable academic researchers as advisers. That may not matter in all cases since no one knows how to explain some of the complexities of genetic analysis in ordinary language nor can the experts themselves understand all those complexities. The results of tests from even the most sophisticated companies might well be wrong. Among other problems, the techniques can't yet correlate large numbers of genes well enough to clearly distinguish, in an example found in the article, a stretch of genes found in males from Scandinavia and North Africa.

What would detailed information give us if these technical problems are one day solved? So far as I know, I'm nearly all British in my ancestry—perhaps a mixture of Celt and archaic British and Germanic or Nordic of various sorts. (For this essay, I define 'British' in terms of residence as of a thousand years ago or so. By 'archaic British', I mean the residents of the British Isles before the Celtic and then Germanic immigrations, conquests, and other uninvited intrusions.) My father's side is mostly of English ancestry, coming probably from the Birmingham region with perhaps a drop

of Native American blood. My mother's side is a mixture of Highlander (true Scots who were members of a Gaelic tribe of the northern regions of Ireland: 'Scotia' was the Roman name for a region occupied by Irish Gaels), Anglo-Norman, Lowlander (labeled 'Lithonian English' by some historians and said by some to be largely Anglo-Saxon and perhaps some of that 'archaic Brit'.) Would I gain much to discover the exact percentages or to discover that, say, 4% of my genes are from the Lakota Sioux or maybe to discover that some guy from Greece slipped into my ancestry? It'd be interesting to discover I carry genes from someone as exotic as an Apache or a Babylonian Jew, but would it mean much to me? Serious genetic studies across all or some of the human race, some of which are ongoing, might tell us much that would be interesting and important about the large-scale movements of peoples. Such studies might also help us to answer such questions as: did various invaders exterminate or absorb the native populations? Recent research indicates that at least some Neandertal populations were absorbed by breeding into growing populations of modern human beings rather than being exterminated: see John Hawks' website at <http://johnhawks.net/weblog> for information and intelligent, professional analyses of the issues of human origin and some related issues. He also defends Neandertal man with great enthusiasm.

Math is difficult, Barbie. Genetics is difficult, Ken. And so is history. . .

One danger in all of this is that we might forget that genes are important but you don't come into or leave this world as a freestanding individual built according to some specs found in your genes. The advocates of cultural shaping or even cultural determinism were off-base but they were on the right continent. We are hunks of clay with particular characteristics and lots of undeveloped possibilities. We are shaped as others interact with us and as we interact with others and with our environments, including the entirety of our cultural settings. We are born into narratives, histories, and we will ourselves live in personal narratives, biographies, which interact with a large number of other narratives, including those of the non-living world. Within broad possibilities given by our genetic makeup, the entirety of the human species and then successively more specific family lines, we become moral creatures, of various qualities, by responding actively to our environments.

Let's say I get a genetic analysis and it confirms I carry Gaelic (Celtic) genes and Anglo-Norman (Germanic-Nordic) genes and English genes from the Birmingham area (I'm guessing those ancestors of mine were mostly

non-Gaelic Celts but they might have been at least partly Germanic or partly Gaelic). What does that mean? I have enough understanding of the history of those peoples and of some of my ancestors in recent generations so that I can draw tentative conclusions about the possible traits found in their genes or perhaps activity levels of genes coming from environmental factors—let's label this last effect as 'epigenetics'. (See <http://en.wikipedia.com/wiki/Epigenetics> for an introductory overview.) My Gaelic ancestors greatly preferred the pastoral life, in Ireland and the Highlands of Scotland and the backwoods of Kentucky. My Anglo-Norman ancestors were good at organizing or participating in large-scale projects, including military invasions and the imposition of hierarchical structures on conquered countries. My other (presumed) British ancestors have proven their worth as farmers, shopkeepers, factory workers, and managers—very modern of them. This seems to open up a lot of possibilities for my family line, though it's doubtful many will have more than a small share of all those implied talents and moral qualities.

The situation remains far from clear even given all my assumptions including that of improved technical understanding of genes and of our various human family lines. Were my ancestors typical Gaels or Anglo-Normans or Celts? Are epigenetic and cultural effects strong enough to mitigate any undesirable traits or to weaken any desirable traits displayed by my ancestors? Can my culture or my personal efforts help me to be a little different than any of my ancestral groups if I or my family or my other communities so choose?

Our world is a narrative composed of an unimaginably large number of smaller narratives. That narrative is set in a concrete world of concrete entities. Those entities and that world have been shaped from more abstract stuff which remains yet in the perceptible and tangible stuff of this world. To understand this world, we need to understand both the narrative (history in the context of this essay) and also the stuff (genes and other bodily substances in that same context). Without the larger scale perspective, without a knowledge of context and perhaps a very broad context, knowledge of our genetic makeup remains useful for medical purposes but it's worthless for understanding ourselves and our other possibilities. Even medical knowledge is improved by knowledge of the foods our ancestors ate or the level of their physical activity.

We're concrete creatures and not just a catalog of possible or actual medical problems, some good medical traits, and a variety of possible traits

of other sorts. We are flesh-and-blood us, for good and bad.

## 279 Intelligent Design: Technology and Biology

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1315>. It was finished and uploaded on 2012/06/22.]

One of the problems with a good understanding of some domain is that we adopt such understandings as rigid habits of thought even when they deal with empirical matters and should be rethought as we learn more or as new possibilities emerge as a result of human activities. We forget we're mortal creatures in a story during which more knowledge and deeper understandings of established knowledge emerge over time, at least if we live courageously and faithfully. The story is what it is but we move forward gaining richer and more complex understandings the story, its living characters, and its nonliving stuff.

The take-down of Intelligent Design in the realm of biology, to my own experience, will usually ignore the fact that complex systems can never be intelligently designed in the way that a child will design and build a simple car from Lego or from other similar or more powerful toys. Intelligent Design not only fails in trying to understand the world of carbon-based life-forms, it also fails in trying to understand the world of asphalt road-systems, though it can explain cars to a greater extent, and steel-and-concrete bridges, though it can explain concrete piers and steel arches to a very great extent indeed. Sometimes systems which work in some sense end up doing more harm than good, such as a well-designed, well-built bridge which destroys a community by interfering with the general flow of life in that community. As time goes on, a variety of adjustments are made to road-systems, to working methods in machine shops, to computer networks. It's likely a project will fail, sometimes in a spectacular and embarrassing way, if

it doesn't properly consider that greater context. Anyone wishing to explore these issues can look into the writings of the engineer and historian, Henry Petroski—see [http://en.wikipedia.com/wiki/Henry\\_Petroski](http://en.wikipedia.com/wiki/Henry_Petroski), an expert in failure analysis, who has written intelligently and in a truly humanistic manner about the greater context of engineering.

Let me concentrate on computer networks for discussing this lack of validity of Intelligent Design as a general concept; it's not just a good idea wrongfully applied to understanding the forms and functions and relationships of living creatures. The Internet itself as first proposed by the Pentagon's 'blue-sky' technology division, DARPA – see <http://en.wikipedia.com/wiki/DARPA>, was to be a flexible network which would adapt its communication routes to disasters, such as a nuclear attack, though the system lived on a rigidly designed physical network. The system was designed to use selection processes more directly oriented to specific goals than the processes of evolutionary theories in biology, but the designers tried to leave the Internet as flexible as possible. There was an attempt to move away from strictly mechanistic, rationalistic design techniques of the sort which are assumed to be true intelligence by advocates of Intelligent Design and by many others. We don't yet know the results, but it could certainly be argued, and has been argued in various ways, that the Internet is very successful as an open system which can be changed in various ways to meet the various needs of its users, ranging from insurance companies to journalists to social clubs to teenaged would-be engineers or software designers to teenaged gossipers to various sorts of consumers or producers or archivers of music and literature.

Not only is Intelligent Design a misapplication of rationalistic thought to evolutionary biology, it's a very limited understanding of intelligence, of mind if you will, and it pretty much excludes intellect as defined by Jacques Barzun:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought

to bear quickly, without the effort of redemonstration, on the matter in hand.

This capitalized and communal form of live intelligence truly is live intelligence just as a human community truly is a form of human life. The intellect includes all that knowledge found in the memories of pipe-layers and the files of a local government: where are the rock ledges which might create problems for future sewer projects. It includes knowledge of how to shop in the local retail stores, going to farm-stands for fresh fruits and vegetables at the right time and knowing where to find veal loaf for the Polish cousins when they come to town. It includes the knowledge in the hand-movements of the local fiddlers and the local painters of murals. It includes the knowledge held by only a few nowadays of what worthwhile books remain on the shelves of the public library. It also includes the engineering and other knowledge which allows proper installation of optical cables and the proper way to start up a link to the Internet and the knowledge of useful or interesting sites on the Web, including the websites of various local institutions.

On the whole, intellect isn't always rationalistic or even necessarily self-aware. Nor is our personal intelligence. Self-awareness of the wrong sort can tangle up the fingers of a musician or even the thought processes of a talented student tackling an interesting problem in high school calculus. Conservative thinkers of the sort who appreciated tradition and the way it changes behavior, makes it intelligent by some plausible standard, have known this for centuries and perhaps there were some who knew this in ancient times.

Flexibility can be united with this sort of intelligence in a form which can be embodied in ways below the self-awareness of most human beings, though one or the other can overwhelm. A flexible system with a good tradition can decay, melting into a hunk of putty or rigidifying into a concrete wall.

Flexibility isn't found just in thriving human communities and well-functioning human technology. It's also found, to a very high degree, in nature. For example, bacteria live in a sea of various sorts of antibiotic resistance genes which can be taken up by specific lines of bacteria though only some can be active in any given bacteria and there are sometimes trade-offs with other characteristics conducive to bacterial prosperity. This is intelligence, though not the rationalistic intelligence of Intelligent Design

nor its ancestral and more plausible form found in the writings of some brilliant thinkers, and many lesser thinkers, of the Age of Enlightenment.

There is a general feeling, one anticipated by many a science-fiction author from days when computers were large and clumsy calculators, that our networks of technology will soon take on a limited sort of life, perhaps even becoming self-aware and self-sustaining and self-reproducing. There is talk on the part of credentialed experts that drones might soon be a physical equivalent to computer viruses, self-reproducing and capable of taking on or shedding particular parts or characteristics. I can't evaluate the timing of this sort of technology but I'd be pretty sure it's coming before too many decades go by though I'd prefer it be developed for peaceful purposes.

Our simpler tools, such as a carpenter's saw or a surgeon's scalpel or writing systems, become part of us as we learn to use them skillfully as the chemist and surgeon and philosopher, Michael Polanyi told us – see [http://en.wikipedia.com/wiki/Michael\\_Polanyi](http://en.wikipedia.com/wiki/Michael_Polanyi) told us for an overview of his life and work. I dealt with this issue in Chapter 613, *Does the Body of Christ have Non-human Components?*, which I wrote in response to a *Scientific American* article on the effect of Internet usage on our memories. I have no problems with God's story working out as it will work out, though I know that some changes which are all-right with God will scare and disorient us, especially if they come too fast. In the short-term, the primary issue is that the development of our minds is increasingly occurring in response to highly technological environments though we seem intent on proving that we can also use technology to dull our senses and our minds and to reduce our physical health or to otherwise harm ourselves or our important technological systems..

The current celebrity computer viruses, Stuxnet described at <http://en.wikipedia.com/wiki/Stuxnet> and Flame described at [http://en.wikipedia.com/wiki/Flame\\_\(malware\)](http://en.wikipedia.com/wiki/Flame_(malware)), have their own individual ways of invading a host of the right type. They start out dangerous and have the potential to become viruses invading and harming a variety of computer networks, including factory control systems and power plants and airplanes and so on. They allegedly are capable of acting a bit like biological organisms living at a rapid pace. They change in ways that correspond at least somewhat to biological evolution. Most changes, as is true of biological evolution, will end in failure, by bad luck or because the software entity (or living organism) resulting from the change is dysfunctional or at least not as functional as other entities filling the 'living' space. [Disclaimer: I'm not

claiming to be exploring new ground here nor to be developing these ideas in a good way from most perspectives but only to be exploring old ground for colonization by my ideas.]

To return to my starting point, this entire mess and far greater potential mess caused by computer viruses, not just the recent celebrity viruses, supports my claim that so-called Intelligent Design doesn't work even when we try to understand technology. I'd just say it's not a viable way of thinking about this world nor all of Creation. Nor is it a viable way of analyzing either natural or man-made systems. More generally, it doesn't accord well with the way reality works. To a Christian, that means that it's a misunderstanding of the thoughts and thought-processes which the Almighty manifested in this world. We need to understand viruses as well as primates, computer viruses as well as computer systems, to understand the story God is telling. We need to understand systems beyond rationalistic understanding, systems which can be understood only by building a narrative understanding of this world which understanding respects our knowledge of stuff and the relationships it forms and a lot more knowledge which can't often be put into a schematic form.

In Chapter 174, *Moon-dust Really is More Ethereal Than Earth-dust*, I explore, in a particular context, the nature of Creation and the nature of a proper mind as an encapsulation of that Creation. My summary also provided pointers to more detailed discussions of this issue:

This moon-dust is thing-like being which exhibits some of the nature of more abstract forms of created being such as that we know as quantum wavefunction. I've claimed in my writings that the abstract being from which thing-like being is shaped remains in that thing-like being. We and the things around us are yet the truths manifested by God as the raw stuff of Creation, the stuff from which all created being is shaped. Moon-dust provides an interesting and unexpected support for the Thomistic claim that "Things are true" and also of my additional claim that "Truths are thing-like." For one of my earliest, but still relevant discussions of this issue of abstract and concrete realms of created being, see Chapter 159, *Negative Theology in Physics and Metaphysics*. A somewhat more advanced viewpoint, with simple graphs, is developed in Chapter 169, *From Abstract Being to Concrete Being and Narratives*.

The abstract stuff from which we're shaped is still here and particularly here in moon-dust.

Mind isn't just a set of rational operations nor is technology just a set of fully controllable mechanical entities. A fuller understanding of mind, of Creation, including such human contributions as technology, can come only on the foundation provided by a better understandings of being in its full spectrum from abstract to concrete and in an understanding of the nature of narratives in this concrete world.

# 280 Liberating the Self From Creation, Liberating the Brain From Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1355>. It was finished and uploaded on 2012/07/23.]

I've nearly finished reading *The Americans: The Democratic Experience* [13] by Daniel J. Boorstin. I didn't have any particular plans to comment on the insights and delicately ironic prose of Professor Boorstin until I read these words:

For while Eliot, reformer though he was, still thought and talked about "subjects" of study, Hall, Dewey, and their followers thought and talked about the pupil. While Eliot aimed to emancipate the student from narrow, antiquated subject matters, giving him a freedom to "elect" the subjects of greatest interest, the others aimed to liberate the student *from* subject matter, to emancipate him to be himself.

I took some high school history courses (I think two) from a mildly eccentric but competent and learned man. Once, one of my fellow students started to pontificate on some matter and Mr. Bosquet stopped him short and said, "You have no right to an opinion until you know some facts about the matter."

The problems caused by the American attitude toward the student are still deeper than we might think from Mr. Bosquet's statement to a pupil-centric pupil, but it gives us an insightful and hardheaded start in understanding why my worldview, though far more humane than the views of the

educrats, condemns this ‘pupil-centric’ education and strongly indicates a return to subject-centric education would be wise and might help us to become far better individuals and far better peoples. It might even help us to understand how to go about building a new, and far more glorious, phase of Western Civilization.

There’s no denying that Hall and Dewey and their followers won the war to control the American educational system and probably destroyed the American mind in the process. Certainly damaged that communal mind a lot along with a lot of individual minds. Certainly forced those desiring a healthy and active mind, a mind in contact with the intellect of the West, to avoid ‘learning’ too much in mainstream educational systems. (To be sure, some were lucky in being mentored by honorable and capable teachers, but that was purely a matter of luck. I wasn’t one of those lucky few.)

First, some wikipedia links to overview articles about the lives and works of the characters mentioned in this essay:

- an article on *Daniel J. Boorstin* can be found at [http://en.wikipedia.com/wiki/Daniel\\_Boorstin](http://en.wikipedia.com/wiki/Daniel_Boorstin),
- an article on *G. Stanley Hall* can be found at [http://en.wikipedia.com/wiki/G\\_Stanley\\_Hall](http://en.wikipedia.com/wiki/G_Stanley_Hall),
- an article on *John Dewey* can be found at [http://en.wikipedia.com/wiki/John\\_Dewey](http://en.wikipedia.com/wiki/John_Dewey),

Both Boorstin’s book, which deals with Hall and Dewey in multiple places, and also the articles at Wikipedia tell us that their followers have been more guilty than the masters at some of the excesses of this ‘child-centered’ business.

Now, I move on to my critique.

There is no creature with a mind, blank-slate or determined from conception, which presents itself at five to the kindergarten teacher. There is also no more than a hint of intellect, capitalized and communal mind, in the vast majority of 14 year-olds. Any competent teacher has to be responsive to the student’s needs and interests, strengths and weaknesses, to their progress or lack thereof, but teachers and students don’t come together to become buddies. They come together to each do the work appropriate to their role in their communities. And that job is mostly the development

of the individual and intellectual (communal) aspects of the mind of that student. For various reasons, that job seems to be best done by courses which deal with sometimes artificially defined ‘subjects’.

Of course, the ‘subject’ isn’t the real point but rather the reality to which the subject points and the goal is to nurture a mind which gives its proper attention to that reality. A school subject might be a natural science or human history or a human art or philosophy or theology or any of many other realms or aspects of reality. We develop human minds by a proper response to reality and that response can usually be at a high level only with the assistance of a sophisticated educational system. Even those with the talent to do creative work at some point can reach that point only by proper nurturing and guidance. A good school can help a mind acquire centuries worth of intellect in a few years—at least enough of that intellect so that the learning process can be self-sustaining, so that the student is ready to move on to being himself a true teacher or leader or thinker of a civilization.

Our brains are our own and the minds which arise upon a properly active brain are mostly our personal responses to reality, though those responses are—usually—best guided by expert teachers if those brains are to amount to much in the few years allotted to us in this mortal realm. The intellectual aspects of our minds are the communal responses to reality we accept into our own minds even though we might struggle against some things we see as errors or just unlovable in our traditions. We might even help to overthrow errors or to fill in some incomplete regions.

In any case, the student finds his real mind by giving his embryonic mind over to the subject, by losing his mind in that subject and allowing that immature mind to be reshaped so that it does not think about that line of mathematical reasoning but rather thinks that line of mathematical reasoning. The student should be preparing for those “Ah-ha!” moments which come after years of often frustrating study and leave the student in possession of Riemann’s insights into geometry and not just conversant about the textbook statements of Riemann’s accomplishments. The student should be helped not to stand over the founding of the United States, as if he were some sort of disembodied demon, but rather to find his mind actively carrying out lines of reasoning which flow along with the recorded reasoning of Jefferson and Adams and Sherman and Dickinson. He should acquire that informed and alert state where he is involved in those long-ago events but also detached and capable of a sympathetic and, perhaps, ironic

understanding. He should feel some upset, one part of his mind for another, as the representatives of heavily-populated states debated the structure of the Federal government with representatives of lightly-populated states because he should be able to think the thoughts of each group even if he comes to align his views with only one side.

A pupil-centric education system won't be oriented toward these higher states of the human mind. It will leave the student convinced he is inherently a person, a human animal with a difference. He comes in a five year-old human animal and leaves an 18 or 22 year-old human animal with misty memories of the stuff he learned for a bunch of tests. He will be in the dark about the nature of a civilization and the relationship between the human mind and civilization. He will be fundamentally ignorant of the ways in which a mind can be developed or a civilization built or nurtured and maintained. He will think he knows something when he knows no more than textbook and uninterested, not 'disinterested', summaries of something.

[In this essay, I've glossed over the power we have, especially in the modern world, to access external 'memories' of much in the Western intellect and even the intellects of other civilizations. We can also, for good and bad, quickly access the thoughts which can be considered those of individual minds over the globe. This is an interesting complication and possibly a game-changer. See Chapter 613, *Does the Body of Christ have non-human components?* for a very preliminary discussion of these sorts of issues.]

# 281 Social and Biological: Being Honest About the Basics of Human Nature

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1359>. It was finished and uploaded on 2012/08/03.]

While making plans for my more serious reading over the next month or two, I happened to read the opening pages of a book I'll be perusing before long—*Sociobiology, The Abridged Edition* [151] by Edward O. Wilson, the Harvard professor who learned a lot about social insects and found that he could apply some of his general knowledge and perhaps more of his techniques of analysis to social mammals as well, even to human beings. The opening words for the first paragraph are:

Camus said that the only serious philosophical question is suicide. That is wrong even in the strict sense intended. The biologist, who is concerned with questions of physiology and evolutionary history, realizes that self-knowledge is constrained and shaped by the emotional control centers in the hypothalamus and limbic system of the brain. These centers flood our consciousness with all the emotions – hate, love, guilt, fear, and others – that are consulted by ethical philosophers who wish to intuit the standards of good and evil. What, we are then compelled to ask, made the hypothalamus and limbic system? They evolved by natural selection. That simple biological statement must be pursued to explain ethics and ethical philosophers, if not epistemology and epistemologists, at all depths. [page 3]

So far, so good, but we have to realize the tendency of empirical thinkers, of several respectable schools of thought, to see how we understand from the ground up but to fail to understand, or at least to fully accept (William James is an example), that there is a point where the richness and complexity of what we know begins to cohere in such a way as to imply the existence of two different and equally important realms of being:

1. The greater entity of which we are part, the universe which is one aspect of a story and a collection of stories in which events are morally ordered, and
2. Abstract realms of being from which the concrete realms are shaped.

Wilson certainly seems to realize there is something to be “pursued to explain ethics and ethical philosophers” but I suspect I’ll disagree with Wilson, certainly with some evolutionary biologists, about our proper ways of going about this business of pursuing a deeper and greater understanding by starting from that immediate understanding of evolutionary processes. I’ll speak to that issue shortly, but I’ll first note that Camus deserves some credit for seeing the need for an essential decision in human moral life, at least in the modern context where there has been a fundamental denial of the proposition that our duty, our only real option, is to accept reality and to understand it well enough to respond properly to it. It’s sheer moral insanity to think we can plausibly deny reality, to kill ourselves and leave that reality behind or to somehow make of reality something else. A full acceptance of reality doesn’t lead to passivity. It leads us to strong responses to and in the context of reality. In terms of Thomistic teachings, we should ‘naively’ accept what is and accept that our perceptions and properly developed thoughts deal with a reality given to us and not something we can judge or push aside in favor of a set of abstractions or dreams we prefer.

For example, we should start our understanding of our moral duty not to murder by first accepting the human reluctance, strong but far from absolute, not to kill any creature which presents to us a human appearance; I believe it’s mostly the face that does it. In any case, it’s probably mediated through that hypothalamus and limbic system. In Biblical terms, we can hear God’s Fifth Commandment, can understand it, and can have a good chance of obeying it even in tough circumstances just because of that human hypothalamus and limbic system. In philosophical terms, and those of a

novelist or poet, we have to make peace with a jerry-built moral nature and try to see if we can make of it something more complete and less defective, even if perfection is little more than a dream. A natural-law theorist should be less concerned with constructing ideal systems and more concerned with the strange fact that, regarding a reluctance to kill other members of the same species, wolves seem to be our moral superiors.

A human being is a moral creature defined in many ways by his biological and social nature but capable of looking for meanings which transcend the flux of this mortal world as it immediately presents itself. Those realms of being which are part of Creation but transcendent to the most concrete realm of being demand from us responses just as do the more immediate environmental demands related to survival and reproduction. We respond to those demands from abstract realms of being when we posit moral views making sense of both Aristotle and Darwin. If we can begin to make better sense of it all by considering the theories of Boltzmann and Einstein and the esthetic responses of T.S. Eliot and the history-based wisdom of Lord Acton, then we are really getting somewhere.

Mostly, we are driven, as were Virgil and Homer and many before them, to draw a story out of what we are and what we have learned about our immediate environments and all that we believe to lie beyond this concrete realm. This isn't men imposing order upon an alien universe but rather men responding to a universe which shows narrative characteristics, certainly in the events studied by evolutionary biologists. From concrete realms, men have ascended to ever greater understandings of more abstract realms of being, often by way of mathematicians and theoretical physicists studying surprisingly abstract relationships between concrete bits of matter. Matter isn't what we naively think it to be and neither is space or time or number for that matter. We look for moral order as we try to draw those stories from the histories of life, from the histories of galaxies, from the more particular and even nastier histories of men. This is not an anthropomorphic response but rather a response to a universe which made us men by demanding proper responses from our ancestors.

Men are inclined to look for a more general meaning, if only a mythical cosmogony. If meaning isn't found, that takes a bit of wind out of our sails. Entire civilizations can be demoralized and their moral structures begin to decay along with the moral order in the souls of individual human beings. More positively, a civilization can form if an Augustine finds order even if he himself is in a state of despair because of the problems of the moment,

problems brought about as an older civilization is collapsing.

Even when meaning is fading, as it was by at least the late 1800s in the West, some men, such as Thomas Huxley, will struggle to find a new meaning and, failing, move on and to live a meaningful life to all appearances. A couple generations later, Jean-Paul Sartre, fell into a frenetic, amoral despair. Sartre, who as a philosopher could be seen a greater Camus, did see the importance of existence and – in Wilsonian terms – rebelled very consciously against the sanity enforced by his “hypothalamus and limbic system.” Sartre could have helped the men of his age find a newer and richer meaning in a world suddenly richer than it had been, but also seemingly chaotic if only because of its newness. He chose to rebel against what he was, what he felt himself to have been without any choice on his own part. That rebellion was as good as a rebellion against our universe, indeed against all of Creation.

Yes, the man who is Camus is the human animal described by Wilson, and so it is that the biologist can continue his critique of that starting point of philosophy when the wonder of what-is is turned to a rejection of what-is. Professor Wilson tells us [151]:

Self-existence, or the suicide that terminates it, is not the central question of philosophy. The hypothalamus-limbic complex automatically denies such logical reduction by countering it with feelings of guilt and altruism. In this one way the philosopher’s own emotional centers are wiser than his solipsist consciousness, “knowing” that in evolutionary time the individual organism counts for almost nothing. In a Darwinist sense, the organism does not live for itself. Its primary function is not even to reproduce other organisms; it reproduces genes, and it serves as their temporary carrier. [page 3]

The basic point which Wilson makes is a good one even though he weakens his overall position with a claim that life is genocentric. Genes are part of an entire organism, and it is the entire organism in the full range of its developed body, organs and behaviors as well as genetic systems, which is selected. The organism, genes and soma, are a reflection, an encapsulation of sorts, of at least adequate responses to environmental problems and opportunities. Wilson is right that the organism is part of a family line but it’s simplistic to reduce evolution to a process centered upon genes. To

the extent genes define us, and there is a great deal of truth in that claim, they do so as reflections of the responses of many creatures over the eons to their environments. However imperfect and incomplete, we and our fellow-creatures are encapsulations of what lies around us by way of responses to opportunities and problems over those eons. If we wish to make a better, if still reductionistic, summary of our situation: we aren't our genes so much as we are the heirs to our ancestors' responses to their environments. Genes play an important part in this narrative, but only a part.

There are two immediate claims I'm making. One is that Wilson is right in his most central claim and perhaps I'd go beyond him. To try to judge the goodness of our own existence is an act of biological insanity and all that which is human and which we judge to be greater than 'mere' biology, morality and cognition and other human traits and skills, comes from the responses of a human animal to what his environments offer him and from the responses his ancestors made to their environments, including those offers which seem very threatening. We even have some evidence from spectacular cases of child abuse and neglect that a human child raised in a non-demanding and non-stimulating environment won't even develop some of the most human of traits—kept from proper socializing to the age of 10 or even a little less, a rescued child can't even learn to use language in a human way no matter how much effort is made by the most knowledgeable and most compassionate of experts in the human brain and its development.

The second claim is that meaning lies outside of us though we make it our own by our responses to those environments. We know that our moral instinct against murder is strongly related to the rat's embodied reluctance to kill other community members who smell right and exhibit the correct behaviors. A weaker reluctance covers human beings we don't recognize as community members and a still weaker reluctance covers the likes of creatures with eyes similar to those of human beings. It's our duty not to recover some lost state of grace but rather to build upon a promising but incomplete and defective moral nature, to make it stronger and to help us to live in communities have grown, in complexity as much as size, well beyond families and tribes and even nations. But that situation came about because we live in a universe which, sometimes by sheer nastiness, elicits such moral responses at least from some evolving lines of creatures.

Meaning doesn't come to us when we sit on our couches, it leaks out of neither our innermost consciousness nor out of our genes, though both of those play a role; we aren't guaranteed to find meaning even by actively

seeking it but we are guaranteed not to find it if we don't seek it. The ways of seeking are many and, at the basic biological level, consist of those responses, artistic as well as practical, to problems such as occasional famines or to opportunities such as the newly discovered stuff which leaks out of very hot rocks and then cools into a hard and shiny form.

The language of 'emergence' used by Wilson in his first chapter is less apt than the Thomistic language of 'intention' in the sense of growth. Individuals developing during their lifetime can intend proper or improper paths through those lifetimes, though mostly we move one step at a time with only vague awareness of the path much beyond our front-most toe. Family lines can also intend, since it doesn't require consciousness, only a power to respond to the world by growing, developing, maturing, in external behavior and in internal characteristics as well.

Our particular human natures are odd in that our complex brains can 'make' minds which allow us to partially transcend our biological natures while we necessarily remain within the context of our environments. Yet, it's part of our human nature to live in a such a state of awareness that we also live in greater realms of Creation, some of which are described to us by mathematicians and theoretical physicists and some by philosophers and still others by poets and priests and musicians. Our sanity must be of a higher type, to consider not only our immediate or near-term biological needs even when supplemented by a conscious awareness of our role in the evolution of our genetic lines, but also to consider the greater possibilities, some are clearly good and some bad and some could be either, which lie outside the boundaries of any events or even any open possibilities in the history of life on earth to this time.

I've proposed that we have been given a very rough understanding of a greater story and of a greater set of possibilities from which we can choose while participating in that story, the story of the development of the greatest possible human community, the Body of Christ. This is seemingly a strange turn in a discussion of evolutionary biology from the sociobiological perspective and, like any other meaningful future we could imagine, we can't fully understand it but we can understand it well enough to test its narrative rationality and perhaps its desirability. That's pretty much what I've been doing for the past 25 years, writing novels and philosophical narratives which seek meaning in Creation as understood by this Christian. I've said before that I do philosophy and theology in the way of a novelist and I'll strongly claim this to be the best way during an age when we need

to make sense of a world which modern empirical knowledge shows to be richer and more complex than we can yet handle.

Unfortunately, one of the problems we've inherited in our biological nature is a tendency to remain within our comfort zone and so it is that most human beings, even those aware of our fundamental problems and opportunities – going far beyond even our specific political and economic problems and opportunities – will continue to follow old ruts and hope our problems will be solved by some sort of magic. Or maybe they're morally paralyzed by pessimism and fatalism and can do no better than to carry on as if our problems were merely results of cycles which will soon bring us to better times. See Chapter 409, *Individuals and Herds*, for a short commentary on a discovery of anthropologists of similar behavior on the part of Mayans who were aware of their destruction of their local environments and continued behaving the same old ways until they finished destroying their own civilization.

## 282 Do We Need Heart and Hands as Well as Mind to Understand Reality?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1370>. It was finished and uploaded on 2012/08/15.]

I've been delayed in my reading program, but I'm getting slowly back to work on Hans Reichenbach's *The Direction of Time* [122].<sup>1</sup> I've also gotten behind on my writing on this topic of time-direction though Chapter 472, *Why Does Time Move Only Forward?: Some Preliminaries* contains some comments I made after reading Hilary Putnam's preface for this the reprinting by the University of California Press.

So far as I can tell, a major reason I've falling behind in my readings partly because my mind and eyes are blurred by a minor sinus infection but the main reason is a reluctance to deal at this time with still another modern thinker, Hans Reichenbach, who tries to create an understanding of reality which involves only explicit and conscious cognition, abstract reasoning and schematizing and all that.<sup>2</sup> Pascal lost in his efforts to protect a

---

<sup>1</sup>Since first posting this essay on my blog, I've finished reading this book, though I very quickly browsed some sections. I began to think his solution, branches of entropic subsystems, had little to offer as a solution to the problem of the direction of time and a quick check into John Earman's *Bangs, Crunches, Whimpers, and Shrieks: Singularities and Acausalities in Relativistic Spacetimes* [31] told me that Professor Earman had a similar opinion. While not dismissing Reichenbach's book completely—he has some worthwhile insights, I decided to concentrate my limited energies on more materials more promising to my work, which is not that of an unbiased historical or philosophical analysis.

<sup>2</sup>This leads, oddly enough, to missing some points raised in later years by physicists,

respect for the heart in an age when men were sliding into a great error in understanding their own human nature and their own communal nature. A distorted version of Cartesian methodology conquered so that reason rules not only in its domain but in all domains of reality which modern thinkers recognize. But the tide of the battle has shifted, due more to the efforts of modern biologists than to those of theologians and philosophers, though the greater and more serious of novelists and poets and visual artists never lost their respect for a more complete understanding of how human beings understand.

My initial ways of discussing these issues just didn't feel right though I'd written a couple well-structured outlines and my initial short statements at the main levels of those outlines each seemed to be saying something meaningful. Yet, something was wrong. My outlines for much different versions of essays on this subject seemed well-organized and seemed to address important issues. But any attempts to expand those outlines into essays didn't work. The attempts didn't feel right because they didn't move along the paths I've following in my recent work. I was addressing technical issues at a detailed level and ignoring the limited idea of human understanding<sup>3</sup> found in Reichenbach's book and originating in that loss of respect for the role of the heart and hands in understanding reality.

To a thinker such as Reichenbach who was in tune with the Enlightenment phase of Modernism, this business of feeling would seem ridiculous. Reichenbach doesn't despise feelings as if we should be unfeeling calculators but he makes it clear that the understanding of reality should rely upon reason to the exclusion of feeling and doing. Just think matters through, organize those thoughts, and write a concise, tightly focused essay. Those of us who are taking the first steps in recovering a better and more complete human understanding of created being have to struggle not to find a more complete system of 'logic' so glorified by Reichenbach and other Modern thinkers but to find new and richer ways to discuss mind, heart, and hands as separate but complimentary aspects of human understanding. In passing, I'll note that, as I've written in the past, modern neuroscientists such as Gerald Edelman, Antonio Damasio, and many others have tried to restore respect for the importance of brain-body interactions and also

---

such as P.J.E. Peebles, who have realized that the universe has its own properties, even purely in the terms of physics, and can't just be built up from its 'pieces'.

<sup>3</sup>Limited but incorrect largely by way of incompleteness.

brain-environment interactions even in our abstract thinking.

I'll write more about this after quoting from books of three thinkers. The chapters which are the source of the quotes have titles indicative of this entire discussion:

- Hans Reichenbach's book: *The Direction of Time* [122]; chapter: *The Emotive Significance of Time*,
- Jacob Neusner's book: *Judaism in the Matrix of Christianity*; chapter: *The Doctrine of Emotions and its Long-term Uniformity in the Canonical History of Judaism's Ideas*, and
- E.O. Wilson's book: *Sociobiology: The Abridged Edition*; chapter: *The Morality of the Gene*.

I have already discussed the relevant ideas from Wilson's book in Chapter 281, *Social and Biological: Being Honest About the Basics of Human Nature*. That discussion dealt with Wilson's ideas in the context of his critique of a statement made by Camus, the novelist and atheistic-existentialist philosopher.

I'll be siding with Rabbi Neusner, and largely with Wilson, rather than with Professor Reichenbach, though, as always, I'll have my own ideas to add to the entire discussion, partly because of my Christian beliefs and my tightly related understanding of created being, which understanding might well be adaptable to Jewish thought. In fact, any sensitive reader of Neusner's books will realize that he not only invites Christian readers but also Christian readings and Christian responses. This points to one difference between him and Reichenbach and also Wilson, at least as he was presenting his ideas in the 1970s. Neusner invites other readings of what we might call the texts which help us understand our world while Reichenbach presents a more or less monolithic framework of a rationalistic sort. This framework limits the discussion greatly, enforcing the dictate that rules all non-rationalistic understandings out of court, and also limits Reichenbach's influence on many who might find some of his ideas to be at least stimulating. Wilson's prose presents a still different situation to the reader: at times, his presentation as such doesn't seem to invite responses, other than assent or angry denial, but his material and fundamental ideas do, perhaps because his ideas were themselves a result of honest responses

to certain aspects of this universe, what I consider a certain realm or ‘part’ of Creation.

It’s interesting to note that Wilson’s thought is largely in synch with the Jewish and Christian traditional ideas about the nature of this world and the nature of human beings, though he presents his ideas in such a way as to make them unattractive to many traditionalists. This agreement between Wilson’s thought and that of at least this Thomistically inclined Christian is a result of different, but ultimately compatible, responses to reality. Wilson, at least in that book published more than 30 years ago, was genocentric to an excessive extent but certainly not enough to overcome the great insights in his version of sociobiology, so closely allied to the already existing version of Robert Trivers, a man who’d been said by some to be a superior evolutionary thinker because he had also been a lawyer and was better than most biologists at distinguishing between good and bad arguments.

In any case, it seems that extreme forms of genocentricism have, in recent years, been calmed a bit by the criticisms and ongoing work of embryologists and others who have shown development of a complex organism to be one of, shall we say, development of a complex organism in which there is not so much centralized control as interaction, including interaction with environments. Genes are at many times the dominant interactors but cannot themselves control a complex development process in which they are one (somewhat) independent system interacting with the maternal signals, the ongoing somatic developments, and the environmental possibilities and constraints. Even the underlying chemical structures of genes are now known to evolve somewhat independently of natural selection and other macroscopic evolutionary processes—though clearly those processes do have the final say. Those who survive and reproduce successfully leave descendants. The point is not that evolutionary processes are overridden by mystical processes but rather that the genes themselves encode certain information which makes possible complex interactive development. Genes are not some sort of a complete and deterministic recipe book.

With a substantial groundwork laid, I repeat the question I used as the title of this essay: Do we need heart and hands as well as mind to understand reality? To anticipate the rest of this essay: Rabbi Neusner gives a strong, “Yes,” from a Jewish angle; I give a strong, “Yes,” from a sacramental Christian angle; Wilson gives a strong, “Yes,” from a sociobiological angle; Reichenbach says, “No,” from what seems to be an Enlightenment

angle. I'll start with Reichenbach's answer.

First, I'll note that Reichenbach doesn't really deal with the issue, so much as he assumes the answer he likes. To him, perhaps to many thinkers in the late stages of the Enlightenment phase of what we parochially call "the Modern Age," the answer was given by great, if also greatly defective, thinkers of the High Enlightenment in the 18th century, men who took up a certain line of philosophical thought without caring much or thinking about its incompatibility with Western Civilization. Here are two relevant quotes from Reichenbach's *The Direction of Time* [122].

If we could stop time, we could escape death—the fact that we cannot makes us ultimately impotent, makes us equals of the piece of lumber drifting in the river current. The fear of death is thus transformed into a fear of time, the flow of time appearing as the expression of superhuman forces from which there is no escape. The phrase "passing away", by means of which we evasively speak of death without using its name, reveals our emotional identification of time flow with death.

Dissatisfied emotion has frequently been projected into logic. In theories of the universe it often reappears in the guise of logical queries and pseudo-logical constructions. [page 4]

I don't really have an issue with his naive analysis of the fear of death—as a naive analysis, but, somehow, the judge of all reality has become not even the entire mind but only those parts of the mind which handle 'logic'. Emotions, as well as mental processes not logical in a scientific sense, apparently do no more than distort the legitimate effort to understand reality by way of logic.

The desire to survive death and to live eternally, in the sense of unlimited time, a desire obviously incompatible with physical facts, has thus led to a conception in which eternal life is not life in time, but in a different reality. In order to escape the "passing away" with time, a timeless reality was invented. [page 4]

Death or life after death isn't the subject of this essay but rather the claim that a more complete understanding of reality comes from mind,

heart, and hands. We need thought both practical and abstract, feelings which are properly disciplined for the moral ordering of our lives, and actions toward an ordered life and an ordered relationship with the physical realms of Creation. Mind, heart, and hands.

In *Judaism in the Matrix of Christianity* [97], Jacob Neusner's collection of essays, we can read:

The doctrine of emotions in the view of the sages who created Judaism remained always the same. The reason derives from the social realities that give meaning to emotion and definition to the possibilities of feeling. If we begin with feeling, we end up in society. [page 51]

In this way of thought, emotions are produced by ties or relationships and then help to strengthen and shape those ties, shaping them to what might be called a communal heart but also helping to give birth to a communal mind, an intellect. In Chapter 127, *Intelligence vs. Intellect*, I quoted Jacques Barzun:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand. [page 4]

We can return to Neusner's book to read:

In the language of theology of the Judaism of a later age the *Mensch* of the Yiddish language, the fully human person, must become the Israel-*Mensch*. And who is this? It is the Judaic human being harmonious in affection, action, and affirmation. Together these determine who is Israel, the Jewish nation—one by one and all together.

In the Western Protestant tradition of Edwards and Schleiermacher we take it for granted that emotions speak for the private

individual, not the nation. In the tradition of philosophy from the Greeks onward, moreover, emotions speak not rationally but irrationally. This other view, that of the ancient sages (a view that is also gaining currency in contemporary philosophy and psychology), sees the matter differently. It regards emotions as artifacts of culture and conceives that emotions lay down judgments. They therefore emerge as rational, public, and social, speaking not only for the individual but also to him or her. Feelings, too, define modes of symbolic behavior, as noted. When we examine the doctrine of emotions in the canonical writings of formative Judaism, we enter a world to which it is self-evident that feeling is subject to law and emotion is a matter of lesson and tradition. [page 51]

And:

[T]he heart belongs, together with the mind, to the human being's powers to form reasoned viewpoints. Coming from the sages, intellectuals to their core, such an opinion surely coheres with the context and circumstance of those who held it. [page 56]

I think Neusner would have made this particular statement still stronger, at least for my purposes, by bringing the hands into the above statement, but it's clear he does intend such an integration if we look at the quotes I supplied from his essay and certainly from the entirety of his essay.

I don't fully accept Pascal's famous claim: The heart has its reasons of which reason knows nothing. I believe the heart guides reason in many ways and also knows some things reason can't discover on its own, but I also believe that mind, heart, and hands can come to understand each other. In my way of thinking, those three human ways of knowing are different ways for a human being to learn how to participate in those divine acts which are called acts-of-being in my way of thinking, largely based upon Thomistic views of being. It's necessary that we human beings act according to all of these—mind, heart, and hands—but, if we were God, any of our acts would be all three at once. When God thinks, He also feels and acts. When God acts, He also thinks and feels. When God feels, He also thinks and acts. To do one is, for God, to do all three.

We are images of God, at least we can be such when we respond properly to our environments or—still better—all of Creation to the extent possible. We can become human persons, encapsulations of Creation, encapsulations of the thoughts God manifested and wished for us to share with Him, and when we do so we gain the attributes of a world: unity, coherence, and completeness. There are lots of triune attributes in Christian thought and at least some in Jewish thought and other traditions of thought, but we shouldn't think they map exactly to each other. Yet, a threesome, like a tripod, seems to be the simplest stable support in our concrete realm of being. And tripods clearly map to each other in at least some abstract ways.

I'll repeat the quotes from Chapter 281, *Social and Biological: Being Honest About the Basics of Human Nature*. These two quotes are from the first chapter of Wilson's *Sociobiology: The Abridged Edition* [151]:

Camus said that the only serious philosophical question is suicide. That is wrong even in the strict sense intended. The biologist, who is concerned with questions of physiology and evolutionary history, realizes that self-knowledge is constrained and shaped by the emotional control centers in the hypothalamus and limbic system of the brain. These centers flood our consciousness with all the emotions—hate, love, guilt, fear, and others—that are consulted by ethical philosophers who wish to intuit the standards of good and evil. What, we are then compelled to ask, made the hypothalamus and limbic system? They evolved by natural selection. That simple biological statement must be pursued to explain ethics and ethical philosophers, if not epistemology and epistemologists, at all depths. [page 3]

And:

Self-existence, or the suicide that terminates it, is not the central question of philosophy. The hypothalamus-limbic complex automatically denies such logical reduction by countering it with feelings of guilt and altruism. In this one way the philosopher's own emotional centers are wiser than his solipsist consciousness, "knowing" that in evolutionary time the individual organism counts for almost nothing. In a Darwinist sense, the

organism does not live for itself. Its primary function is not even to reproduce other organisms; it reproduces genes, and it serves as their temporary carrier. [page 3]

In other words, modern biological sciences including evolutionary biology support the idea that emotions aren't some sort of imperfection in the human being nor do they merely exist to give us epiphenomena to color our existence in a world which is 'just material', let alone 'only logical'. Most biologists who have had reasons to express opinions on the importance of emotion to thinking don't even consider emotions to be primarily short-cuts to conclusions we would reach by thinking if we had the time. There is that element in feeling but also in thinking and doing. They are different aspects of acts-of-being, more fundamental than even substance, and thinking can help us when our feeling is inadequate—as any Catholic would know from reading a guide to confession which will tell us an intellectual repentance suffices when we can't muster up the proper depth of feeling. Similar statements can be made about all these three aspects of human efforts to participate in God's acts-of-being: feeling, thinking, and doing. They can each help the others along and perhaps a resurrected and perfected human being would become God-like in that he would no longer feel, think, or do without doing and feeling and thinking, all three at once and in each and every act.

We are given a sort of concrete human nature, including a very complex brain, which allows us to shape ourselves to encapsulate some relatively greater or lesser part of Creation. We understand Creation, created being, by these active responses, those of Fred Astaire and those of Vincent van Gogh as well as those of Albert Einstein—a viewpoint advocated by such prominent neuroscientists as Gerald Edelman and Walter J. Freeman, both of whom have written books which provide pleasure as well as wisdom to the truly literate reader. The neuroscientists Jerome Kagan and Antonio Damasio are but two who've written accessible and widely available books on the irreducible importance of emotions to human life.

If we are to understand Creation, spacetime and matter and all other components and aspects, then we'll understand by shaping ourselves to encapsulate Creation. We won't understand Creation if we start by misunderstanding ourselves and trying to fit created being into 'logical frameworks'. We have no such 'logical frameworks' in our brains in which to fit Creation and have no reason to believe Creation could fit into any such frameworks

if they existed. In fact, even when we try in ways more proper to human nature, we're too small and too imperfect to understand much more than a vanishingly small bit as individuals and not much more even at the level of the community of the entire human race. But we're making progress in some understanding some parts and aspects of Creation, a surprising amount of progress given our small and imperfect selves.

Do those components of human understanding, feeling and thinking and doing, really respond to irreducible components or aspects of Creation? Let me first paraphrase Einstein in words he wouldn't use but I don't think he would object to the general thrust of my ideas: Our understanding of created being should be as simple as possible, but no simpler.

Reduce reality to its various components and aspects but stop reducing when you reach components or aspects which cannot be used to fully explain or to 'reconstruct' each other. At that point in the process of analysis, it's time to look for explanations which include all those seemingly fundamental components and aspects. You might be wrong and the next few generations might busy themselves taking your fundamental components and aspects apart to find aspects still more fundamental.

God acts and feels even as He does, and so forth. The Almighty is unified, and coherent and complete, in ways that aren't possible to us—at least in our mortal lives. Why can't we be unified in this way?

As noted above and in many of my essays on this blog, the concrete forms of being in this universe are the results of the fragmentation of more symmetric forms of created being, more abstract forms of created being. Physicists, in the Standard Theory of particle physics, have described an electroweak force which is the more symmetric entity which shattered into electromagnetic force and weak nuclear force as the universe expanded and cooled after the so-called Big Bang. The electroweak force can be described and understood in many ways but it's electromagnetic force and weak nuclear force which are manifested in our concrete realm as particular forms of that more abstract force. In a similar way, we are concrete creatures who have evolved and developed within a universe made from broken pieces of more symmetric, more abstract, forms of being. Feeling and thinking and doing are tightly related and can even help strengthen each other and can even cover for one another under certain circumstances.

As I said above: Reduce reality to its various components and aspects but stop reducing when you reach components or aspects which cannot be used to fully explain or to 'reconstruct' each other. We can replace

'reality' by 'this concrete level of being' and then we can understand, by analogy to modern physics, that we can construct plausible understandings of being in which feeling and thinking and doing are broken pieces of but one symmetric act-of-being, but those three components, again—in analogy to electromagnetic force and weak nuclear force, are irreducible components or aspects of minded creatures in this world of concrete being.

## 283 We Must Always Remember the Environment

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1379>. It was finished and uploaded on 2012/08/21.]

The blog of the public policy think-tank *The Independent Institute* has been running short essays by John C. Goodman, the author of a recent book, *Priceless: Curing the Healthcare Crisis*. The latest essay is *Can Entrepreneurship Be Copied?* at <http://blog.independent.org/2012/08/20/can-entrepreneurship-be-copied/> where we can read Dr. Goodman's claim:

In mathematics, Gödel's Theorem says that no complex, axiomatic system can be both consistent and complete. What I am proposing is something similar for social science. Although some habits of highly successful people can be identified and copied, not enough of them can be copied for each of us to become highly successful ourselves through copycat behavior alone.

This is Goodman's Nonreplicability Theorem.

I think the appeal to Gödel's Theorem is questionable but his claim makes an important point about entrepreneurs being able to act in ways often mysterious to the rest of us, at least until the action is over. I also think Dr. Goodman misses something important. We must remember that a human being isn't an individual so much as he's a partially formed entity which is actively responding to his environments, at least to the extent he can be said to be a free and moral creature. Those environments include all the human communities, families and churches and neighborhood and sports leagues and so forth, as well as his physical environments such as

a family farm or nearby forests or lakes or seashore or the ground which contains some mineral never before considered important.

The entrepreneur—indeed, as I said, any human being who is truly free and moral creatures—is what he is and is able to do what he does because of his active and intelligent and morally well-ordered responses to those complex environments. The entrepreneur is particularly inclined to work in regions of uncertainty to satisfy needs or desires of others in some sort of marketplace. He's a pioneer who may or may not settle down and establish himself as a fellow of great prosperity. He may even fail because he misinterpreted something in his environments or because he was unlucky or ended up competing against someone luckier or more capable. He differs from the rest of us in dealing better or at least more courageously with conditions of uncertainty and in responding to those conditions in such a way that he might add to some important aspect of the well-being of his communities.

## 284 Human Beings Are Different as Are Their Environments

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1387>. It was finished and uploaded on 2012/08/28.]

We're born with certain physical characteristics, some good and some bad, some allowing us to excel and some limiting our possible accomplishments. Modern psychologists have shown that the physician Galen was largely right in his general principles which he taught nearly 2,000 years ago. We are born with relatively well-defined temperaments and with other relatively well-defined personal traits. Freedom for a creature is built upon a foundation of more or less well-defined traits. Movements which can be truly labeled 'creative' are possible when a human being begins to respond to Creation, more firmly shaping his own (species) nature and his own particular traits, and thinking and feeling and acting in ways which lie in the sometimes large set of what's appropriate for a human being of his particular sorts of traits who lives in a specific context.

We now know that there are only so many resources available to the developing brain and a young man developing high-levels of skills in mathematics might be short of resources for developing the brain regions associated with social skills. We're not born as potential all-purpose supermen and superwomen. Nor are we born as well-shaped moral persons. Someone with the hormonal flows usually associated with timidity and shyness may well develop behaviors and attitudes which allow her to rule the roost and maybe the entire barnyard. Much of which is good for building on strengths and shoring up weaknesses comes from the wise guidance of adults trying to respond to the needs of the youth under their care in light of what is possible within and necessary for their human communities.

What does it mean to be different? Let me speak about the differences between human beings and members of other species. We share an immense amount of DNA with other species. Very roughly speaking, we share 95% of our DNA with chimpanzees. This should be taken as very rough because DNA is part of a very complex organism embedded in a family line which changes over time. It's not even clear how much of the DNA of humans or other species is active or even potentially functional; much is broken inheritance from ancient ancestors or of ambiguous status for unknown reasons. Much allows for multiple possibilities depending upon environmental signals or regulation by other genes acting for various reasons. Other facts enter into any measurement of our differences, as human beings relative to chimpanzees and also as individuals relative to other human beings. Yet, we can gain some insights by a simple consideration of that genetic difference between humans and chimpanzees. If we claim, just as a starting point, that we are '95% the same as chimpanzees', then it becomes obvious the other 5% is—to say the least—rather important.

Turning to comparisons of human beings from different ethnic or regional groups: the genetic differences might be small between desert-dwellers, descended from those selected Darwinistically as being capable of surviving in the desert, and mountain-dwelling Nordic peoples, descended from those selected for different survival characteristics, but those small differences might well be important in themselves and they can also produce large differences over the course of a lifetime. Small differences acting over a long time are important—this is, in fact, one of the basic principles of evolutionary theory and of the theories of many geological processes.

Do we think culture is unshaped by environment? Do we think Inuits and Hawaiians and Bedouins and Pashtuns developed cultures so well adapted to their environments only as a holding strategy while waiting for the British to bring them the factory system and Americans to bring them television? Do we think these peoples hold on to as much of their cultures as they can out of a misguided sense of nostalgia, an effort to get on a *National Geographic* documentary, or an obstinate refusal to become as good as an American from the (once?) booming suburbs of Atlanta, which refusal is perhaps motivated by a hatred of our freedoms and our goodness?

Once upon a time, Americans—at least many—were like Emma, the protagonist of the Jane Austen novel of that same name. She was good-hearted and dedicated to the propositions that she knew how everyone should live their lives and that those good lives she could envision were

mostly similar to how she would have lived their lives under the unlikely assumption that she would still be the same as Emma, the daughter of a modestly prosperous country squire, even if she had been raised in a farming family to have the skills and desires of a wife and mother of a similar such family. But Emma had good reasons to be fooled. She was a teenager and had observed that the young women from different circumstances than hers were still mostly like her. The more subtle, but often important differences, can sometimes be seen only by a mature eye. It was those smaller differences which made all the difference in that admittedly small region of English countryside, but a young woman with well-developed love for others and confidence in her immature insight could be excused for ignoring those small but very important differences. Americans are no longer like the Emma of the Austen novel. We have become as Emma would have been if she hadn't learned her lesson and had grown into self-righteous and perversely adolescent woman.

It's not likely that someone born into a desert town or a jungle village will even see the world the same way as someone born in a river valley town in New England. Moreover, someone born in Montana and accustomed to vast expanses of plains rising to high mountains won't see the world the same way as that New Englander. Richard Gregory has written of anecdotal evidence that the Zulus when they first emerged from their region of roundish huts set in rolling valleys were not subject to being fooled by those optical illusions where most human beings will wrongly see cleverly presented parallel lines as converging. Decades ago some scientists showed that kittens which didn't see vertical lines when they were growing up wouldn't be able to see poles when they were adults. And so they observed cats walking right into poles, multiple times, incapable in their maturity of learning how to see vertical lines.

Desert-dwellers almost certainly see the world differently from those who grew up in New England river valleys as I did. How about those who grew up in the bayous of Louisiana or the wheat-fields of South Dakota? Do the sea-coast dwellers of Great Yarmouth see the world differently from those who grew up near the beaches of Tahiti?

Are a given people musical, do they have rhythmical speech, because of inborn tendencies, or have they been shaped by generations of cultural formation beginning with the accident of a highly rhythmical and musical founder of their community? Or do initial accidents of culture and individual peculiarities enter into future Darwinian selective processes in a strong

and interactive way?

Do a given people literally have thick skin from growing up in a hot and dry land? Are they accustomed to sleeping on whatever ground is available and doing with little in the way of blankets when the night air grows frigid? Do you think this might affect their thoughts and feelings and behaviors? Do you think this harsh environment might have a major effect on who survives and upon who prospers the most amongst survivors?

All of this can be addressed from a different angle, as I did in Chapter 408, *The Need for Abstractions in Moral Self-understanding*, based on a blog essay published more than three years ago.

The details of [King Phillip's War] aren't at issue here except for a general background understanding. My interest lies in an important stream of thoughts and attitudes of New England European colonists which showed itself during the period of King Phillip's War, a stream which I think to represent a failed intellectual maturing process on the part of highly educated and intelligent men in confrontation with alien cultures. Instead of moving towards a proper abstraction that would have allowed a defense of their own culture but also an understanding of the human good in a different way of life, the European settlers raised their particular way of life to a self-righteous ideal. A conflict of cultures was seen as a war between God's servants, the White settlers, and Satan's slaves, the Indians. This stream, which may have been nascent in Puritan thought from the time they first stepped into that wilderness region of the New World, developed fully during the lead-up to the war as the Puritan leaders dealt with the growing resistance of the Indians to the expansion of settled ways of life.

A tolerance which is really masking a bigoted self-righteousness can lead to hatred and war, including genocidal war. At the very least, we will be disappointed if we expect the other to respond joyfully to our offer to help them become more like us. They will likely show at least confusion but may flame up with hatred which we'll misunderstand. They will probably harden their hearts even against good or necessary changes made obvious by their conflicts with us or by more peaceful interactions.

There's also a lesson to be learned about how to go about the human task of exploring God's Creation and coming to understand it. We are limited and prone to various sorts of mistakes even in our seemingly raw perceptions of our immediate environments. It doesn't matter in the end. It's simply another aspect of Creation to be studied and understood by the proper workers, physiologists and neuroscientists and instrument-designers and others. Those trying to understand at a more abstract level, theoretical physicists and philosophers and theologians and political theorists, should study the work of those scientists of perceptual organs and the brain, but should then go on with confidence that we can compensate for our limitations and defects when necessary. We can understand created being, Creation as a whole, if only in principle.

# 285 Qualities Traveling Without a Man

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1420>. It was finished and uploaded on 2012/10/18.]

## **The Death of Plato**

The town was on edge that fateful day  
when stepped from the train a frightening sight.  
Qualities had arrived without a man  
for they were traveling fast and light.

Intelligent and diligent, steadfast and true,  
successful and loyal, honest and brave,  
they were every good how but not quite a who.  
A form without substance, a clear-eyed knave.

[Attributed to a youngish man enduring the early stages of a spiritual conversion, circa 1990. An older man still suffering from a spiritual conversion has only begun to understand how such a creature as he described, such “a frightening sight,” could come into existence.]

Earlier this year, I published an essay about the general intellectual, but specifically philosophical, incoherence of modern Christian thought. That essay is included in this book as Chapter 615, *A Stage Lower than Hypocrisy*. I used a quote from *The End of the Twentieth Century* [87], a pessimistic evaluation of our current situation by the Hungarian-American—and devoutly Catholic—historian John Lukacs. The quote is:

[A]t the end of the twentieth century, many people respect religion as well as science, together; but the respect is faint. (This has to do with the fact that we have descended to a stage lower than hypocrisy, the problem being no longer the difference between what people say and what they believe; now the difference seems to be between what people think they believe and what they really believe.) [page 224]

This “difference between what people think they believe and what they really believe” is a still more general phenomenon than discussed in the above quote. It is a problem affecting more than the relationship between religion and science. I’m beginning to think this phenomenon is masking something deeper, something discussed by Jacques Barzun in *House of Intellect* [7]. I discussed this something deeper in Chapter 127, *Intelligence vs. Intellect*, where I quoted Professor Barzun:

We [in the United States] have in fact intelligence in plenty and we use it perhaps more widely than other nations, for we apply it with praiseworthy innocence to parts of life elsewhere ruled by custom or routine. [page 4]

He also noted:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

From all this, I concluded:

As a country, we’ve utterly failed to develop an intellect, that is a morally well-ordered understanding of our world. We don’t

really even seem to have done much to take the small, educational steps of developing a rational understanding of our relationships to Mexico or Cuba or even Canada. We're too smart and too proud to admit we're poorly educated adolescents—at best. In the sense of individual intelligence, we're as smart as we think we are, but we're pretty dumb and very ignorant in the sense of that intellect, that capitalized and communal intelligence, so important to being morally responsible members of these modern communities, so large and complex.

We've created those large and complex communities in various realms of human life, political and economic and cultural, but those communities are poorly founded—which is, at least for this discussion, the same as saying we haven't developed any understanding, any intellect or communal and capitalized intelligence adequate to the tasks of running such complex communities.

Much of our knowledge, much of our disciplined feeling, much of our proper behavior, is communal and not individual and must be developed at the communal level into which we must partially merge our individual selves. We prefer to imagine ourselves to be true individuals with our communal relationships being more contracts than parts of our being. As a consequence, we've lost most of our intellect while retaining a dangerously active individual intelligence. Similar statements can be made about our individual feelings and our communal feelings, our individual behavior and our communal behavior. For more than two decades, I've been bothered by a vague and unfocused version of this idea. For example, I wrote a conversion novel 20 years ago which was initially accepted for publication by a Catholic press and then turned down because a literary consultant advised them there is no market for serious literature in the American Catholic community. Over the years, I've met no more than a handful of seemingly devout Catholics who have any idea who Georges Bernanos or J.F. Powers or Flannery O'Connor were. You have to search hard to find any who've read any of the novels or short stories of such serious Catholic writers. Many of those same Catholics, some even trumpeting triumphalistic opinions have read all the books of Robert Ludlum, love the James Bond movies, and don't have a clue *A Christmas Carol* should be titled *An Xmas Carol*.

So far as I can tell, this is also painfully true for the entirety of the American citizenry, not just the Catholics amongst that citizenry. Note the shift in my language. Unlike that literary expert who had recommended my book not be published, I don't consider there to be such a thing as 'an American Catholic community'. We Americans are a the contents of a melting pot which continues to boil and continues to be stirred by forces set in motion by the explosion of too many individuals and small, unstable communities into the vastness of North America. For both good and bad we had become the people described by Wallace Stegner in his novel *The Big Rock Candy Mountain* which presented the more energetic of Americans as being restless, on the move, always in search of the poorly seen and seemingly undescrivable big break which would bring us to that Mountain, paradise on earth. We trek out toward it by paths which seem to be those of great individualistic opportunities. We are alive in many of the parts and aspects of our human natures which are individualistic, but we're greatly deficient in our intellects, our communal and capitalized live minds and also in the communal and capitalized parts of our emotional lives and our active physical lives.

We end up as strange creatures, many of us being seemingly mature men and women of active minds, disciplined emotions, and well-ordered habits and behaviors. All of this apparent moral order is individualistic and has a surprisingly weak influence on our communities. Something is terribly wrong with Americans and other Westerners in the 20th and 21st centuries, some deep lack of order, some hints of chaos which lie under the surface of our relationships with each other, with our communities, with Creation, and with our Creator. The simplest statement of the underlying problem, which is in fact quite difficult to state clearly, is: we form pseudo-communities bound together by easily breakable relationships, contractual relationships.

All of my novels have dealt with these issues, with one in particular being focused upon the problems of pulling our human selves together into a state of personhood, unity and coherence and completeness, in the modern West: *A Man for Every Purpose* can be freely downloaded at <http://loydfueston.com/downloads/aman.pdf>. It's interesting, at least to me, that in my novels I was able to deal 20 years ago with this general problem of the fragmentation of our individual selves due to our communal problems. It's taken these 20 years or so for me to rise to a more explicit awareness of these problems and the resulting damage to our own selves, most noticeably

our inability to achieve that state of personhood to even the small extent possible in this mortal realm.

The problem isn't with us as individuals but rather with our relationships, our communal selves. Without proper communities, we develop into very badly damaged creatures.

## 286 A Christian Sociobiology

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1425>. It was finished and uploaded on 2012/11/07.]

### 286.1 A Little Background

Reading the works of others and occasionally rereading my own works is a key part of my way of exploring Creation from a Christian viewpoint. Often, it's seemed that God's way of drawing me forward is to lead me to books which raise important questions or provide ways of answering questions I'm already dealing with. It's been remarkable how often I've drawn a nearly forgotten book out of a box in my storage or have simply picked a book from the library shelf thinking to divert myself. I'll soon find out I'm reading that particular book at the right time to advance my thoughts in a fruitful way. So it is that I found myself reading Abraham Heschel's *God in Search of Man: a Philosophy of Judaism* [71] and E.O. Wilson's *Sociobiology: The Abridged Edition* [151] at the same time. This might seem the recipe for cognitive dissonance, but, along with Wilson's *On Human Nature* [150], I've found myself cultivating some pretty fertile soil.

As background, the reader can turn to Chapter 172, *Frozen Soul and Other Delicacies* and Chapter 175, *More on Matter as Frozen Soul*.

The question I'll be dealing with in this short essay is: Can Sociobiology Help Us to Understand Man?

Sociobiologists have discovered that overcrowding will often lead to the breakdown of natural hierarchical structures, that is, to the breakdown of ritualized hierarchical behavior, in social animals. When this happens, something akin to what a political scientists call a tyranny might develop. Certainly, there will be at least a movement toward, into or through, a

radical state of disorder, whether or not a Napoleon is there to reestablish some sort of order.

The best empirical results in the study of the effects of overcrowding are based on observations of animals in the wild and also controlled populations such as cats in overcrowded cages seem to be in good agreement with history and with ongoing breakdowns in order in many countries. The sense of overcrowding for a particular population will have a strong genetic foundation perhaps modified by human selection in the case of pets or farm animals and perhaps even modified by particular conditions even in the wild. In some species, animals and family groups living in a region might tolerate each other's nearness when food is plentiful but they'll desire more space, perhaps even in location of dens for sleeping and raising young, when food is harder to obtain. Others such as baboons will demand foraging space during the day but will cluster in groups for protection against predators.

Regular readers of my blog or readers of any of my books will realize I have little patience for any reductionistic ways of thought, materialistic or idealistic—though it's often a good way of understanding much about the concrete particulars of even a state so sublime as motherhood. Reductionism is fine as a methodology which provides material for further analysis and contemplation.

I understand created being as lying on a spectrum of abstract being, ultimately the thoughts God manifested as the raw stuff of Creation, to concrete, thing-like being. This view of created being is what led me, mostly seriously but partly tongue-in-cheek, to describe thing-like being as frozen soul. Consequently, it bothers me not the least to think of genes and glands and neurons as being, in some sense, manifestations of what we might very loosely call raw moral-stuff, however crudely and imperfectly manifested it might be in mortal men, let alone sharks.

Let me finish this short introduction by providing a short answer to one question. Can the sociobiological viewpoint even can give us a sacramental way of understanding human nature?

We human beings are at least creatures of flesh-and-blood. What we are beyond that is a matter of our personal development which is itself something of a result of the exploration into human possibilities. Some of us aren't bothered by this sort of connection to very concrete, thing-like being. I, in particular, am not bothered because I think of the concrete levels of being are shaped from the stuff of more abstract levels, that stuff is shaped from the stuff of still more abstract levels.

I think our bodies are not merely flesh-and-blood, though we have to consider our flesh-and-blood natures before we can understand more. I also don't believe our bodies are united with souls composed of different stuff from thing-like being. Our bodies can be better considered as frozen soul, the concrete tip of an iceberg which is mostly abstract being not directly accessible to perception or measurement or experimentation. But, and this is a big but, the abstract which lies ever in what has been shaped from it becomes apparent in the concrete when we explore and analyze that concrete being in proper ways. With a disciplined effort, we can see the frozen soul in the mother so tenderly taking her newborn to her breast. In that baby beginning to suck and to perhaps pinch with toothless gums, we can see that which is a human animal being introduced to the first of many communities it will encounter and sometimes join.

If we pay attention to all of created being—living and nonliving alike, we can start to see God united with man, the Body of Christ with all its human members united with the Son of God Himself in perfect union with Father and Holy Spirit.

The great task of modern man is to learn how to write and speak and think and act so that we can truly understand ourselves and our various communities as participants in a story being told by God, the story of the birth and development of the Body of Christ. We must make these ways of writing and speaking and thinking and acting our own so that we truly become members of the Body of Christ. Sociobiological ways of thought, though sometimes presented in an anti-theistic manner, can help us to accomplish this great task of becoming God-centered members of the Body of Christ by understanding ourselves as intending such, that is, as growing into those proper roles.

## 287 Is Man a Cosmos?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1448>. It was finished and uploaded on 2012/11/27.]

In *Cosmology: A First Course* [84], Marc LachiÁlze-Rey writes:

The best definition of the cosmos is possibly the ensemble of relations between the constituent parts of the cosmos.

First of all, I'll point out that the larger context, the entirety of the introductory chapter, makes it clear that the cosmos is the parts as well as the relations between them.

In this essay, I'll be pointing out that the general idea expressed by Professor LachiÁlze-Rey is interesting in itself and also leads to other interesting topics involving complex entities in general, living and non-living. It's very much the same as ideas I've proposed in a greater context and I'll discuss that shortly after some introductory remarks.

Scientists, philosophers, theologians, novelists, poets, and others are engaged in a painfully slow process of developing concepts and words sufficient to integrate the claim of Lachieze-Rey and my more inclusive claim into our thoughts and feelings and acts. Once that thought and language have been developed, more abstract reasoning processes, including contemplation, will allow us to move from a universe to a world. As I define it, this universe becomes a world when seen in light of the Creator's purposes, when seen as a morally ordered story He is telling. In addition, I define a world, and also a person, as being unified, coherent, and complete. We're not yet at the point of making this part of our thoughts and feelings and acts. We are in fact rather early in our work of improving our minds so that we can understand all the new knowledge of Creation gained by modern empirical researchers in the context of being a true Creation, the work of a personal

God who is all-powerful, all-knowing, all-good. This is the same as saying we're still moving toward the state of a more fully enriched personhoods, where I think of human beings as potential persons both in their aspects as individuals and as communal creatures.

This modern cosmological view can help us to correct as well as enrich our views even of ourselves and our relationships to Creation and to God. It isn't some sort of spiritual stuff or spiritual relations we need to add in to move from the universe to the morally purposeful world but that humble art of narration, story-telling. This should hardly be a surprise to those who take seriously the Bible or St. Augustine or Cervantes or the recently departed Jacques Barzun; the reader who can follow Barzun's masterpiece of history, *From Dawn to Decadence* [9], and understand the underlying moral order bereft of any hint of moralism will be able to understand my claim in all its fullness, all its richness and complexity.

Human beings as human animals are comparable to the cosmos in the sense of a universe: we are "the ensemble of relations between the constituent parts of" ourselves, but 'ourselves' include much that lies around us, our communities starting with our families and also our other environments. We can become persons, analogous to a world, by living consciously in our morally purposeful narratives, including the greater one which is the world. Through this way of living, we can encompass the entire world, indeed the entirety of Creation—though only in principle or by sharing in the life of God in the world of the resurrected.

Let me summarize. As human animals, we are analogous to a universe in being not the sum of the parts but being the parts and the relations between the parts including our communities and environment. We become persons, like unto the world when we begin to encompass greater realms of created being, all the abstractions from which this concrete world was shaped, the abstractions which are themselves shaped from the truths God manifested as the raw stuff of Creation. When we reshape ourselves by proper responses to Creation, we become like the world, indeed like that entirety of Creation: unified, coherent, and complete.

Jesus Christ Himself is, in His immanence as a creature all that He has created along with His Father and their Holy Spirit. In principle, those mortal human beings who are developing, intending, toward a state of true personhood are also like this though far more limited in our capacity. Yet, if we accept His offer of true friendship, we will have this greater capacity through our communion with Him, through our sharing of the divine nature

of Jesus Christ.

## 288 Does Free-will Make Us Free? Does It Even Exist?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1458>. It was finished and uploaded on 2012/12/03.]

Freedom as we idealize it is not at all an instrument or an agent to achieve our desires, good or bad. The lesser freedom of the tiger or the grazing deer can do that for us. Freedom as we idealize it is an aspect of the state of personhood, a state in which we are unified, coherent, and complete in our human being. An animal cannot be free in a meaningful sense, not even a human animal who has failed to rise even partially to the higher state of personhood.

Freedom is not a frictionless movement through this world, through the various stories in which we participate, though those who are free might have that air and feeling of such movement.

What is freedom?

In Chapter 380, *The Size of Human Freedom*, I dealt with some false ideas which were based upon misunderstandings of the term ‘random’, misunderstandings which have more to do with ancient pagan superstitions than with hardheaded scientific attitudes or even scientific materialism of a cleaner sort, let alone with a more sophisticated philosophy whether materialistic or otherwise monistic, whether dualistic or something better recognizing the profound depths and complexity of created being.

In *Creative Evolution* [10], Henri Bergson brought us closer to a good understanding of freedom by telling us:

It is then right to say that what we do depends on what we are; but it is necessary to add also that we are, to a certain extent, what we do, and that we are creating ourselves continually.

This creation of self by self is the more complete, the more one reasons on what one does. [page 7]

Bergson got it partly right in the above quotation and got some of the other parts right in other ideas he expressed in the small amount of his writings I've been able to read. In *Time and Free Will* [11], he came a bit closer to a more complete version of the truth when he wrote:

[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work. [page 172]

Bergson has a reputation for holding a view of organisms which verges on vitalism. Perhaps he deserved that reputation. He certainly had powerful insights into the relationships between time and particularity—highly relevant to the current discussion, as I discussed in Chapter 366, *Creation and Freedom*. Bergson also has some very good intuitions about the general nature of freedom and some elegant expressions of the corresponding insights. (I do read him in English translations, so the translators should get at least some credit.)

If Bergson can be justifiably accused of holding a vitalist worldview, he can also be praised for understanding freedom in terms of human being, in terms of our basic human animal selves, instead of introducing a separate agent: free-will or some variant thereof. Being the nominal master, but truly servant, of something called 'free-will' doesn't seem much more free than being the servant of our environments. If we are to be free, we must be free as complex organisms, as human animals intending (growing toward a state of) moral order, intending personhood—unity and coherence and completeness. Bergson pretty much nailed the description of what we should be intending: "[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work."

The God of Jesus Christ, in His role as Creator and Sustainer of this particular Creation, is not Himself free in the sense of some modern thinkers, free to act in an arbitrary way. In the very act of bringing into existence a specific Creation, God in His transcendence freely accepted the constraints of acting as a Creator of that specific Creation. In ancient Hebraic terms,

still valid in their main thrust, God offered a covenant which He accepted. Over the centuries, Jews and then Christians have explored various aspects of divine covenants but it all collapses to God's willingness to create and sustain a very particular Creation, including a differently particularized concrete world, and that willingness of God means that He's willing to act in certain ways appropriate to such a Creator of such a Creation. Our freedom is analogous, except that our being, including the raw 'pieces' of our whole personalities in Bergson's terms, is given to us and our freedom comes when we intend to be, as some say, the best we can be. The best we can be is to be unified and coherent and complete, an artist and his work, not just the artist.

In simple terms, I'm free when I'm a properly rich and complex version of me, when I've done what I've been called to do in life, having become the sort of man who could carry out my mission or at least made a good try of it.

So, freedom seems to be a simple matter of truly intending to be the sort of man who can carry out the mission I feel called to. In a surprising number of cases, men and women seem to know what they are called to be and, in an age such as ours, are so often frustrated in their life's mission because of the decay of the imperfect but reasonably well-ordered West including those who are frustrated even in their parental duties by the mainstream redefinition of those duties to being chauffeurs and facilitators as their children participate in programs intended to shape them as proper American consumers, supporters and dependents of centralized powers. But shouldn't we be able to be what we should be just by a proper amount of planning followed by the necessary effort to reach our goals, to make some headway toward perfection, or at least a state of good-enough? Isn't it easy enough to turn away from a civilization decaying still more rapidly in moral and cultural realms than in economic realms? Isn't it easy enough to take that first step toward a better future for ourselves and our descendants?

Unfortunately not. As Kenneth Minogue told us in *The Liberal Mind* [95]:

One cannot organize a work of art; nor write poetry to rule. The man who sets out quite deliberately to maximize his own happiness [or freedom] is likely to fail. Whilst one may, perhaps, be able to create vast pools of technicians at will, one cannot create political stability or a nation of mystics. There are many

things in the world which we cannot attain simply because we want them; and some are beyond our grasp precisely because we want them too much. [page 157]

The humblest of lives is a work of art if properly lived. We may see patterns, the opportunistic grab at means to a life of freedom, when we look at the lives of some judged worthy to be described in the biography sections of our libraries and bookstores, but, in almost all cases, those patterns appear only in the rearview mirror. I will again quote Professor Minogue:

There are no means which serve the precise end of freedom, for freedom, like happiness, is not an end that can be pursued. [page 158]

How can we obtain freedom? Once again, Professor Minogue has wise words for us:

[Freedom] has always been attained because of a spontaneous growth of interest in truth, science, or inventiveness; a spontaneous growth of moral principles appropriate to freedom; a spontaneous construction of the political arrangements which permit of free constitutional government. Spontaneity indicates that free behavior has arisen directly out of the character of the people concerned, and that it is neither a mechanical process, nor a “natural” reaction to an environment nor a means to the attainment of some end. Free behavior, in other words, is its own end. [page 158]

This is very similar to what I’ve been advocating. To become truly free, we must turn toward a deeper understanding of man as he truly exists, a citizen of a universe described in certain ways by Einstein and in other ways by Darwin. We must return to being the sort of man foreshadowed by Augustine of Hippo, Thomas Aquinas, Galileo, Newton, as well as the likes of Cervantes and Bach and a host of early modern historians and literary exegetists and explorers and traders and even bankers. We must become men who pursue the truth for the truth’s sake, because it is the truth of Creation, the truth given to us by God to shape ourselves into His image. In terms I’ve used often: we must pick up our sticks and rocks, pretending

they are the tools we see our Heavenly Father using as He goes about His work. We must imitate His actions, learn to take His thoughts manifested in Creation into our own minds and let those thoughts become our minds. We must learn to love what is, just because it is the work of the Creator.

I'll make one matter more clear: we must turn to understanding ourselves not to control ourselves or to control potential criminals. We turn to such an understanding because the very effort will shape us into human persons, human animals who have become substantially unified, coherent, and complete.

When we do so, when we imitate our Maker in His work, we also imitate our Maker in His freedom. We learn to move freely, to think freely, to love freely.

It might seem odd that we learn to both imitate God and be free by studying the shape of spacetime or the strange nature of matter, by studying bones dug out of the sands and rocks of Africa, by studying the disedifying history of human communities and the often criminal nature of human individuals. It seems less odd to the extent we can recover a truer sense of this world as being part of a greater Creation, a work of the God of Jesus Christ.

## 289 Sex, Traditions, and the Modern Scientific Materialist

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1469>. It was finished and uploaded on 2012/12/17.]

E.O. Wilson is often a fount of common-sense bordering on wisdom; I don't have to fully agree with a thinker to consider him sane and insightful. Wilson is a bit of a biological Calvinist but Jean Calvin and Jonathon Edwards were certainly sane if, in my opinion, quite wrong about some important matters. Oddly enough, in *On Human Nature* [150], Wilson disturbs the flow of sane words and opinions, in spurts, when he comes to the chapter titled *Sex*. He knows that no species can survive, let alone prosper, if it begins to act in ways at odds with the genetic heritage of that species and, yet, in a few scattered paragraphs shows himself to be carrying one of those strange fevers of modern academia when he chants some strange odes to the modern belief that women can be happier and more fulfilled if they become more like their fathers and less like their mothers, at least as fathers and mothers were a generation or two ago. Maybe he has moved on but I'll continue to review *On Human Nature* [150] as originally published in 1978.

Over the three decades or so since *On Human Nature* [150] was first published, the scientific content has held up very well, the general (almost philosophical) comments nearly as well, and the paragraphs where he seems to pander to modern American feminism date the book, though those ideas are still set in the rock-like minds of many politicians and activists and more than a few academics.

The story seems to be:

No, we aren't absolutely bound by our biological heritage but

we are bound by the most fundamental parts of that heritage, especially those aspects of human reproduction which are the foundation of our social forms.

However, we should nevertheless contort ourselves in the interests of helping women to take on roles at odds with their role in reproduction.

And, no, the truer traditionalist position on the roles of men and women doesn't entail that women are restricted only to mainstream women's roles as captured on television in the 1950s and 1960s, those roles being themselves a product of the Industrial Revolution, rather than a heritage from traditions properly understood. At their best, traditions reflect human nature and should guide general expectations, where I understand traditions to be the result of the responses of ancestors to their situations. Traditions are better the more they develop to be themselves responsive to changes within some spectrum of morally well-ordered human communities.

For a better understanding of the non-traditional nature of the 1950s American family, see *From Cottage to Work Station* [17] by Allan C. Carlson which tells of the way in which the roles of women from adequately prosperous families were restricted to the home in response to the social and moral problems of the Industrial Revolution. These changes were largely led by women from families of newly prosperous American and British Evangelical Protestants.

If we were a race of more open-minded creatures, those smart women who wish to become mathematicians or historians or lawyers could do so and could have done so in all societies past the stage where nearly every woman had to be bearing and raising children for the survival of her family lines. More recently, public institutions, medical systems and schools and public playgrounds and so on, have expanded so that, in the early stages of expansion, women remained in homes no longer the center of care of the young and the old and the sick or the incompetent. Such thinkers as Betty Friedan have testified that, at least in prosperous families, the resulting homes and the resulting lives of women were barren in various ways. That seems right to me. My maternal grandmother was an old-fashioned housewife and my paternal grandmother was a farm-wife on a family farm. Most of their daily work—making clothes and repairing clothes, managing food in an era when they had at best simple iceboxes, growing fresh vegetables, raising chickens, feeding the temporary workers during harvest-time,

and so on—aren't part of the economy of the modern household. (I didn't distinguish between tasks of my mill-town grandmother and my Oklahoma family farm grandmother.) The changes to a more barren home-life for women were partly caused by the bloating of the welfare state, encouraged by Christian leaders, which had various effects, one of which was that, by at least the late 1960s, the large family became socially and economically non-viable for most, perhaps economically nonviable in farm-country because the family farm was itself becoming unenviable.

With children old enough to be in school and little league and at the Boys' or Girls' clubs, some women, by the 1950s or so, seemed to be stuck at home as bored and restless decorations, not equipped to even properly entertain themselves. There are also undoubtedly some legitimate complaints on the part of individual women in fields where their talents weren't recognized or rewarded. Modern politicians are good at promising to fix various problems with their governmental hammers. And they carried through as best they could; our moral and social structures were pounded by those and other hammers forged in the modern world and that pounding came on top of social and moral structures already weakening for various reasons.

Wilson admits that feminism has sometimes not been at all attractive to its purported beneficiaries when he acknowledges that the daughters and granddaughters of truly radical feminists on Israeli kibbutzim willingly adopted very traditional roles for themselves. Wilson even tells us that efforts to engineer human beings, as individuals or communities, to forms contradictory to our basic genetic traits will result in very bad things happening. Some bad things were happening as a result of the re-formation of the family in response to the Industrial Revolution—see the novels of Charles Dickens or Benjamin Disraeli to get some idea of why it was that those Evangelical Protestants wished to protect children from the social horrors of that period and why it was that women felt it necessary to retreat from devastated regions of the social landscape so they could better care for the children.

So it was that, when feminism went 'mainstream' in the 1960s, some bad things were happening already. The 1960s were, in various ways, loaded with problems caused by the inevitable breakdown of the moral order of American life starting from at least World War I and not some sort of fresh revolution from out of nowhere. There were legitimate questions to be answered and the type of facts and partially refined knowledge to be found in books such as *On Human Nature* [150] could have helped, and will even-

tually help, to find good answers. Feminism as supported by our corrupt political parties and academic centers isn't one of those good answers.

If we push too hard, we're more likely to destroy the human race than to 'perfect' it. In a slightly less extreme situation, we're more likely to badly damage a country, such as Russia, than we are to turn it into a workers' paradise, where the workers have been perfected to a state suited to the paradise as designed by their betters. In a still less extreme situation, we've delayed the age of marriage and child-bearing for many, partly as a result of our mandatory school attendance laws, only to find a number of teenaged women having babies in very imprudent situations and other women perhaps having too few babies to keep their family lines going. Of course, we've rendered ourselves stupid enough to consider this an excuse for more social programs, by government or churches or other agents of knee-jerk responses, rather than a serious reason to rethink matters before we destroy more lives or even finish destroying Western Civilization. The motto of our do-gooders seems to be: if it hasn't worked so far, then let's do more of it.

One problem we have is the inability of most human beings, whether a product of nature or nurture or more likely both, to distinguish between class characteristics and individual variations. This is one of the problems which could be eliminated, in principle, by a proper theory of created being, one which recognizes that each complex entity, and perhaps each particle or other 'simple' entity, is a mixture of being from different levels of relatively more concrete and relatively more abstract forms of created being. As it is, most human beings, feminists and evolutionary biologists and politicians, need to be able to slot each entity in a category from some preferred scheme set by occult processes of some sort. It seems impossible, and we can pray appearances are deceiving in this regard, to hold an overall view of human females which protects the vast majority of girls and women and at the same time treats those women wishing to hold down one of those unconventional roles as respectable individuals. We're dealing here with a problem I addressed with respect to a horrible series of events in the history of colonial New England. See Chapter 408, *The Need for Abstractions in Moral Self-understanding*. Unfortunately, as I noted above, human beings seem to have, at best, rudimentary skills for dealing with the totality of being, abstract to concrete.

In fact, if we remember Jacques Barzun's distinction between (individual) intelligence and (communal and capitalized) intellect, it would seem

that a true intellect of the sort which begins to emerge as a civilization develops is simply a better way to allow most men and women, boys and girls, to participate in a more complex civilization or more complex form of religious belief without using their individual intelligences in realms which are perhaps beyond their reach—at some point, each one of us goes beyond the capacity of our intelligence. See Chapter 127, *Intelligence vs. Intellect* for a discussion of the distinction between individual intelligence and communal intellect as found in Barzun's book, *The House of Intellect*.

One of the problems with the Enlightenment distortion of human thought, a distortion seemingly congenial to Americans—Joe Six-pack as well as Lefty Chapbook, is that we imagine that since we have strong and living intelligences capable of dealing well with metal-work or understanding the writings of established novelists or philosophers or putting together political coalitions, then that means we can move right on to understand the American role in Afghanistan or the revelations in the Bible or the nature of truth or time or space or whatever. So far as I can tell there are many who have minds competent at dealing with specific domains of concrete being, often more than one such domain. It also seems that there are few who have the native talent, fewer still with the developed talent, to deal with those more abstract realms of being, fewer than that who can deal with complex mixtures of concrete and abstract realms of being. One reason for some not developing such talents is the time factor mentioned above, especially in our busy-work era. Little more than a century ago, smalltown lawyers or country parsons or the non-idle rich could sometimes produce modest or more than modest works in biology or history or mathematics. Nowadays, we're far more limited in the development of our human natures, a complex issue beyond the scope of this essay.

It's disturbing when Wilson goes into tizzies approaching psychosis in the chapter entitled *Sex*. After arguing that we and other creatures are our bodies, a statement I'd agree with so long as bodies are understood as part of created being as I understand it, Wilson works himself up into his tizzies after discussing the justice of a fairly radical sexual equality, which mostly seems to mean that the traditional and pseudo-traditional feminine roles are to be jettisoned as much as possible because they're yucky and not very admirable. Then we can admit women to the status of true human being; they can fill the roles more suited to many men—but far from all men—and a few women. Yeah! What about all the common-sense statements that we can only do great damage to ourselves, our children, and our communities by

trying to make ourselves into creatures having characteristics inconsistent with our DNA, inconsistent with the history of the human race?

Liberalism, in its varied manifestations, has replaced the idea of the human being with that of radical individuals filling roles in liberal society, bipedal hairless apes being stuff to be shaped to fill those biologically implausible roles in sociobiologically implausible societies.

The various forms of traditionalism are the result of sociobiological processes in which family lines of human beings developed social, political, economic, and religious structures which allowed them to sustain and reproduce their individual and communal selves under particular conditions (which, to be sure, sometimes go out of existence before those structures). A lot can happen in such a complex process and much of that 'a lot' is undesirable in some meaningful sense. Some of that which may be undesirable, at least to our Western eyes, is also inevitable in a sense. Take Afghanistan. Most men lead very harsh lives as nomadic herders or farmers of unpromising soil. The wives of the men have even less fulfilling lives. Be realistic. That's what Afghanistan allows. The type of men we consider brutal and exploitive are the types who can survive in a harsh environment. To be sure, better is possible but better doesn't come with do-gooders imposing American middle-class life-styles upon poppy farmers and nomadic herdsman or bandits. Nor does it come at the points of American guns. Stay in Afghanistan or move there and those descendants who survive will tend to be like those Afghans who don't quite meet our standards. So far as I know, even the Macedonians and Greeks that Alexander the Great left to guard the trade routes merged into the native population. The same seems to have happened with the Mongolians left by the Khans to fill the same role.

So, some traditions are generally what they are because their setting allows the human residents a limited range of options. Some traditions allow more freedom to take advantage of new opportunities, but perhaps the members of that tradition don't find those new opportunities to be attractive.

We can take this away: traditions, living and always—ideally—being modified by talented thinkers and insightful spiritual guides and clearheaded men of action, are our guides for building upon our biological natures to achieve higher levels of community lives, lives reflecting higher moral order and also higher cognitive understandings of ourselves and other entities and aspects of Creation.

We can also take this away: we had a pretty good group of traditions in Western Civilization. They were far from perfect, and, as I noted above, we had problems living by those parts of the traditions which reflected legitimate group differences while also treating members of groups as individuals. Yet, we have lost a lot with our immoral efforts to impose dreams upon biological creatures and their communities. I think we'll gain still more if we respond properly to our problems and opportunities. The usual story told by traditionalists is that the Enlightenment thinkers did their damage by stepping outside of their own traditions, outside of their own moral communities. Supporters of the Enlightenment way of thinking will claim the traditionalists were inflexible and had become mere bigots. There's a lot of truth in both views and that situation leads to the conjecture that Western Civilization, at least in its Modern or post-Medieval phase, has run its course. We're entering a new phase of that story being told by God, which story is this world. The legitimate scientific knowledge and general commentary of E.O. Wilson and other clearheaded sociobiological thinkers can help us to tell our version of this phase of God's story and, by so doing, we better enter into this story as God's servants and friends.

## 290 How Can We Describe a Human Being?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1498>. It was finished and uploaded on 2013/01/17.]

I reread Jerome Kagan's *Galen's Prophecy* [80], a book about the struggle to make sense of such matters as temperament vs. character and the very nature of temperament, as part of an effort to gear myself up to write the sections on heart in my book on human nature (mind and heart and hands). Since our empirical understanding of these issues is far from settled, I'll be moving on to extend my overall narrative of Creation to encompass human nature, assuming that I can suggest a plausible overview that can help make greater sense of empirical facts, helping to turn them into knowledge and maybe greater understandings.

Many of Kagan's lines of argument deal with the confusion and lack of stability in ideas about human nature which have been created by efforts to impose upon the human being some *a priori* categories. This has produced some successes in studying thought, not many at all for feelings and emotions. Modern thinkers can see the error in this if only by reading a book in anthropology which points out that the basic emotions posited by ancient Greeks are different from those posited by Chinese thinkers through the centuries. Malays and others have still other schemes. Professor Kagan presents some representative examples in his book. Modern thinkers have done such things as adding a heretofore minor emotion (sympathy, David Hume) in a perhaps misguided effort to reach a highly desirable goal—seeing the good in emotions.

Empirical investigators have found confusion rather than certainty in the early stages of investigating even a so seemingly fundamental—falsely so—

concept as fear. Behavior and signs of emotion don't even work as guides because similar behaviors and, say, facial expressions can be generated by different brain-states and biochemical states. Moreover, similar brain-states and biochemical states can lead to different signs and behaviors of fear and other, maybe, emotions. The issue of subjective awareness of our emotions, which follows rather than leading changes in our various states of being, has something of an explosive effect, destroying most signs of tentative order.

This is hardly surprising to one who advocates that novelistic attitudes and forms of story-telling are our best ways of higher-level understandings of the world and the more complex entities it contains. As I see it, conscious emotions are part of our efforts to construct narratives to make sense of what has happened or is happening or might happen.

Professor Kagan makes a general statement about one aspect of these issues in the preface:

Some psychologists resist acknowledging the contribution of physiology because of a worry that if they let the camel's nose under the tent, he will soon be inside forcing all the residents to leave. I do not believe that the phenomenon of a shy or bold child will ever be understood with, or predicted from, physiological knowledge alone. Temperamental phenomena cannot be reduced to biology. Biological sentences cannot replace psychological ones, for the same reason that the language that describes the history of a hurricane will never be replaced with propositions descriptive of the single molecules of air and water in the storm because the former sentences refer to processes applicable to very large numbers of molecules. The camel will never become the only resident in the tent. [page xxi]

This is all very interesting and quite confusing since there is no way we now know about, as Kagan makes clear, to draw out any fact-based and plausible description of human emotions. He argues for the need to find such a description by empirical means; as I would say, we need to gather facts, analyze them and organize them into clean data and then into information, and then to create one or more systems of—perhaps competing—knowledge of human feelings. That is where we can begin serious efforts to understand our own selves, with poets or theologians perhaps leading the way.

I'll put in somewhat different terms a claim I made above: we need to have some plausible understanding of the world as a whole in order to understand the moral characters and other complex entities which play a role in that world, the universe seen as a purposeful narrative. I wrote several essays over the past six years dealing with this issue. Six years ago, I did so by way of a highly respectful critique of Jamesian Pragmatism—see Chapter 84, *What is Mind?: Pragmatism and Thomistic Existentialism*. A couple months prior to publishing that essay, I had published one dealing with the refusal of Henri Bergson to explicitly admit the existence of a world which was both itself an entity and 'container' of entities. That essay is included in this book as Chapter 189, *Henri Bergson: Almost Seeing a World*.

We should let the scientists do their work even as some of us start to construct worldviews considering what is solidly known about this world and, indeed, all of Creation and also what is plausibly conjectured. This is the realm of speculation, of the manufacture of glues to hold the mosaic together in tentative imitation of the unity which is to be found in this world and the greater unity to be found in all of Creation.

To do this and to help guide more specific and more empirical investigations, there is a clear need for a fresh understanding of being, what I, a Christian, would call created being. In terms used by Kagan in the quoted material: the camel has already entered the tent and he has two heads. Dualism is manifest as an ugly beast. Despite that analogy, it's a more subtle and much more attractive dualism than such intellectual and moral atrocities as the software theory of the mind or the information (DNA) theory of human identity, but it is an implicit dualism. Any form of dualism will threaten the unity of created being which would allow us to properly understand our world and all of Creation. Dualisms began as systems with the *a priori* categories: 'what we can understand by empirical means' and 'the rest of it.' Nowadays, there are more subtle and sophisticated forms of dualism or even manyism.

What reason has Kagan to claim some ultimate truth-value in the categorization of human nature into a category subject to 'biological sentences' and a category subject to 'psychological sentences'? He criticizes this way of thought when the *a priori* categories are more particular, such as any such categories of human emotions. What reason has he to even claim some ultimate truth-value in the categorization of atmospheric dynamics into a category subject to 'sentences about molecules of air and water' and

a category subject to ‘sentences about the history of a hurricane’?

I think his instincts are right. He has good gut-level reasons to think as he does, but he’s made a fundamental error of reducing a question of the nature of being, or of particular entities, to questions about human knowledge or human language. This is the original sin which leads to a corresponding fragmentation of reality. The world is divided into categories defined, in this case, by the attitudes which have led to the accomplishments and dead-ends of analytical philosophy. And these categories, though more mutable, aren’t so much different from the substance-dualism categories of body-soul, matter-spirit. I address the general issue of the modern fragmentation of knowledge in the freely downloadable book, *Four Kinds of Knowledge*[43], where I argue, however inadequately at times, for the ultimate unity of created being and, hence, of our knowledge of created being. I show the effects on human beings in the freely downloadable novel, *A Man for Every Purpose*[37].

In Chapter 475, *Physics, Politics, and Metaphysics*, I responded to an essay by Ken Masugi lamenting the tendency of modern political scientists to conduct only quantitative empirical studies to the exclusion of philosophical analyses and contemplations. I would recommend anyone interested in this subject to read my entire essay, but I’ll provide a quote summarizing much of my position:

In my critique of our general inability to understand created being, not just human politics, I’ve pointed to one way of expanding those limited understandings and maybe correcting those understandings by borrowing from those fields such as quantum physics and gravitational theory which have penetrated to some pretty abstract realms of created being from their particular viewpoints. Modern physics has shot past the limits on created being which traditional physics and traditional meta-physics had given us. We can expand our understanding of created being, including the possible sources of moral nature for a creature, and we can do that by trying to stand upon the foundations which physics and mathematics and other sciences have given to us and trying to see what lies beyond. What is the true nature of created being? Am I right when I say there is one spectrum of created being and that concrete being is shaped from relatively more abstract being itself shaped from still more

abstract being and so on until we reach the truths God manifested as the raw stuff of Creation? That is, am I right that we can consider matter as being frozen soul, in a semi-traditional way of speaking?

In other words, we should see depth of being in even the most concrete of nonliving objects and certainly in a human being. We see that human being as shaped from abstract realms of being which appear to us as layers 'below' his physical stuff. We also accept that all these layers of more or less abstract being come to us as manifested in that woman in front of us. The abstract is to be found in the concrete things which are shaped from the abstract as clay is still to be found in a vase. In Christian terms: as the Son of God became incarnate as a man, so does the raw stuff of Creation, manifested truths, become particularized as a man. In many ways, the two complex events are quite similar.

## 291 More About Our Inadequate Understanding of Created Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1522>. It was finished and uploaded on 2013/02/04.]

In Chapter 290, *How Can We Describe a Human Being?*, I criticized the psychologist Jerome Kagan for making a mostly valid statement in a slanted way: “Biological sentences cannot replace psychological ones, for the same reason that the language that describes the history of a hurricane will never be replaced with propositions descriptive of the single molecules of air and water in the storm because the former sentences refer to processes applicable to very large numbers of molecules.” In my opinion, he would have been on more solid ground if he’d written about being and not language.

Kagan was right in pointing to the importance of language, words and sentences and—I would add—stories, but he missed the point that problems in our mis-understanding about, or lack of insight into, created being underly our difficulties forming proper sentences to speak about, for example, complex systems which seem to have properties which don’t come from a simple summing of their members.

Let me quote a professor of physics, Robert C. Hilborn, from an introductory work, *Chaos and Nonlinear Dynamics* [72]:

[W]hy study chaos? To answer this question, we have to cast off the blinders that most twentieth-century physicists have worn. The blinders have kept our attention focused on learning more about the microscopic world that underlies the phenomena we observe. We cannot deny that this has been an immensely successful enterprise both in terms of what we have learned about the fundamental structures of matter and in the

application of those fundamental ideas to the practical needs of society. In this drive toward the microscopic, however, many scientists have lost sight of the complexity of phenomena outside the tightly controlled domains of laboratory experiments. In some sense we expect that this complexity follows from the fundamental microscopic laws and is, in some way, embodied in those laws. However, the fundamental laws do not seem to give us the means to talk about and understand this complexity. If we are to understand and explain the universality of chaos, for example, we need to go beyond the specific predictions made by the fundamental laws for specific systems. We must approach this complexity at a different “level of explanation.” Instead of seeing chaotic behavior as yet another tool to help us probe the microscopic world, we should think of this complexity as an essential part of the world around us, and science should attempt to understand it. Nonlinear dynamics and the theory of chaos are our first (perhaps rather feeble) attempts to come to grips with this dynamical complexity. [page 60]

Professor Hilborn speaks of a different “level of explanation.” That phrase has a pretty strong feel of moving in the right direction; it’s a way of speaking which is compatible with the idea that the primary issue isn’t “a way of speaking” but rather the nature of created being. The problems with language arise because there is a true problem, a serious inadequacy and misunderstanding, about the nature of created being. Our traditional understanding of created being isn’t rich enough, isn’t complex enough to handle our existing knowledge about the physical world or about human communities as they have evolved and developed in recent centuries. I’ve written about this again and again, because it is the foundation of any plausible understanding of God’s Creation. For example, I spoke of the need to have a proper grasp of the relationship between realms of relatively abstract created being and the concrete, thing-like created being of our world in Chapter 408, *The Need for Abstractions in Moral Self-understanding*, which deals with the problems the New Englanders had in dealing with the concrete humanity of the native Americans. I addressed the general issue of created being from a wider perspective in Chapter 169, *From Abstract Being to Concrete Being and Narratives*.

I cannot stress too strongly that we need a new understanding of created

being, from a metaphysical viewpoint and also from the viewpoint of all fields of study which deal mostly with concrete being and narratives. We Christians, in particular, need a plausible understanding of the story God is telling set in the context of all of Creation, all realms of abstract to concrete created being. That story will be our ways of stating the Creed and talking about Jesus Christ's life and living in imitation of that life.

This isn't to deny the existence and importance of language problems, lack of adequate words and—I'd add—lack of proper grammatical constructions. It is to say that the language problems are due to deeper problems: the lack of proper concepts for understanding created being. We probably have to work on both language and conceptual problems at the same time, each component of a proper understanding rising at different rates and then being used to pull up the other components.

We seem to be in a situation where the knowledge of theoretical physics and mathematics are inordinately important in moving forward from our current state of seeming chaos, but, as is often true with so-called chaotic systems, there is order underlying the confusion and that order is gradually coming into our human view.

In Chapter 90, *Shaping Our Minds to Reality*, I discussed an insight from John Polkinghorne, a physicist become Anglican priest, on the problems even physicists have in gaining a conceptual understanding of quantum mechanics. Polkinghorne's insight came from his short book, *The Quantum World* [117].

# 292 Creation Is Us, It Also Are Us

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1567>. It was finished and uploaded on 2013/03/14.]

What happens when someone loses a body part or use of and feeling in that body part? How completely can a human being adapt to a prosthetic device?

The article *Human Brain Treats Prosthetic Devices as Part of the Body* at <http://www.sciencedaily.com/releases/2013/03/130306221135.htm> tells us:

People with spinal cord injuries show strong association of wheelchairs as part of their body, not extension of immobile limbs.

The human brain can learn to treat relevant prosthetics as a substitute for a non-working body part, according to research published March 6 in the open access journal PLOS ONE by Mariella Pazzaglia and colleagues from Sapienza University and IRCCS Fondazione Santa Lucia of Rome in Italy, supported by the International Foundation for Research in Paraplegie.

The researchers found that wheelchair-bound study participants with spinal cord injuries perceived their body's edges as being plastic and flexible to include the wheelchair, independent of time since their injury or experience with using a wheelchair. Patients with lower spinal cord injuries who retained upper body movement showed a stronger association of the wheelchair with their body than those who had spinal cord impairments in the entire body

This leads me on something of a journey through my own developing thought.

If we are, as I speculate, to be truly unified beings in the world of the resurrected, we are most certainly not unified in this mortal realm. A baby is born with body parts connected by lines and networks of nerves to a brain which is a collection of brain-cells not yet fully functional neurons. The infant brain is more potential than true brain, but those cells have strange inclinations to reach out and to try to form connections. The connections which generate steady activity will be reinforced; the others will die, probably along with some of the brain-cells themselves.

There are also tentative connections to leg muscles and eyes and lips which connections are strengthened when used regularly as some sort of reasonable response to opportunities or problems. The baby learns that those funny things he'll eventually call fingers are somewhat responsive to his desires. He learns later on how to use his legs to crawl and then to walk. He learns what it means to feel pangs of hunger and his brain and glands react with initially obscure feelings of upset. By his active responses to his mother's breast, to his father's caressing hands, by his learning to pull back when gravity threatens to pull him down, that baby begins to unify his embodied self, a process that will, we can pray, continue as he forms his mind and his intellect, as he forms his individual and communal human being. Why would we think this process to have a firm boundary so that only the arms we're born with can be part of the brain's mapping of self? Why would we not think that our instruments become extensions of our bodies mapped into our self-images in a way similar to our arms and lungs?

I had written of this general issue years ago, in essays included here as Chapter 74, *Rules or Context?* and Chapter 106, *So What if the Human Mind is a Product of Evolution?*.

Over the past few years, I've been developing a line of thought: this world was created so that the Son of God could empty Himself to be incarnated in a creaturely nature and live, enjoy, suffer, die, and rise in a perfected human nature united with His divine nature. This Gospel story leads to our ongoing story, that of the development of the Body of Christ in this world. We are saved by, and only by, incorporation into that Body. We are perfected and completed, we become capable of sharing God's life in the world of the resurrected, by accepting as our own the communal human being of that Body. So it was that, in 2011, I wrote the original version of Chapter 613, *Does the Body of Christ have non-human components?*

where I discussed the possibility that the Body of Christ in His perfected, heavenly manifestation would include some of our technology. I concluded, “We Christians have a tendency to etherealize the nature of heavenly and of resurrected human beings. In fact, our resurrected selves are completed and perfected versions of our mortal selves. If our technology has become a part of us and our communities here on earth, even a part of the pilgrim Body of Christ, then we would be mutilated creatures if we were resurrected without it, without perfected and completed technology of the sort which can aid in that perfection and completion of a true human life and in that perfection and completion of the Body of Christ.”

I believe we are seeing a vast expansion of the possibilities of human being, individual to some extent and communal to a great extent. We’re also in danger of these processes of expansion being hijacked by those who would have us develop in ways that enrich them or increase their power. I’m optimistic about the long-run, not the short-run for sure, because of my faith in God and my belief that this world is the story of the Body of Christ. We could increase the odds of good dominating over bad and over evil even in the short-run if we were to get to work on understanding what is going on, which effort can be successful only if we have a good understanding of all of Creation and of the role of individual and communal human being in this story being told by God.

## 293 Communities Form by Way of Dependencies

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1576>. It was finished and uploaded on 2013/04/01.]

There is a short article, *Myth of Family Meals in Parent-Child Bonding Gets Debunked* found at <https://www.scientificamerican.com/article.cfm?id=myth-of-family-meals-child-parent-bonding-gets-debunked>, which speaks in a common-sense way though the title is rather misleading. What the underlying study and the article point out is that family meals are a result of healthy and strong relationships between parents and children rather than being a magical cause of such relationships. The article tells us: “Recent research in the *Journal of Marriage and Family*, however, found that most of the benefits of regular family meals were not actually the result of eating together. Rather, social scientists Kelly Musick and Ann Meier found, they stemmed from other factors in the family environment that facilitated regular meals, such as sufficient income, strong family relationships and authoritative parents.”

The study says more talking between teens and parents seems to take place in cars than elsewhere, but that doesn’t speak against a variety of shared experiences. Being together, sharing experiences, talking with each other, will—in most cases—strengthen a relationship. Eating meals together fall in such a category and so would raking leaves together or painting a room together.

But the question is, “What truly bonds human beings?” In this case, I’ll endorse an answer coming from sociologists and historians based upon analyses and contemplations of empirical information of a different sort

than that found in the studies discussed in the above-referenced article.

We form communal bonds by learning how to live with and within our dependencies upon each other.

By speaking of “authoritative parents,” not always admired by modern social scientists, the scientists who did the research are at least partially admitting such and maybe did admit such in the full report of their study. Parents don’t magically acquire some sort of authority by being anointed by some spirit from a better-ordered realm. Parents are authoritative because they are the ones who feed and house and cloth and teach their children or, at least, should have control over all those activities. This doesn’t mean parents always know the right way to care for and raise their children. There are others—such as grandparents and aunts and uncles, doctors, and clergymen—who can provide good advice or at least stories of how they’d formed families or seen others form families. It’s not necessary that the participants in this process of forming dependencies are aware of the material foundations of what should, we can pray, turn into loving relationships, but they have to accept, consciously or unconsciously, the bonds being formed by dependencies.

Anyone who’s observed a baby growing up in even the most loving family will realize that battles start early about who’s in charge; a baby thinks to control his mother and certainly her breasts for his own purposes. The mother teaches the baby that she’s in charge though greatly concerned about his needs and desires. These battles come and go throughout our lives and may even arise again in later decades when an elderly mother might be dependent upon those children who were once nourished at her breast and were taught the basics of human knowledge on her lap or as they watched how she went about her work and her socializing. Then again, even if Grandma is impoverished, Mom and Dad might be dependent upon her for advice in dealing with their own children. In the best of cases, much of this goes pretty smoothly, largely because the tendencies toward proper behavior are encoded in the different and differently activated genes of mother and father and children, in the genes of all human beings who are individual human beings and also inherently social beings.

As insightful thinkers such as Talcott Parsons (see [http://en.wikipedia.com/wiki/Talcott\\_Parsons](http://en.wikipedia.com/wiki/Talcott_Parsons)) and Robert Nisbet (see [http://en.wikipedia.com/wiki/Robert\\_Nisbet](http://en.wikipedia.com/wiki/Robert_Nisbet)) have noted: human beings

don't come together to be together, they come together to accomplish something. That something might be socializing around the campfire or it might be fighting a neighboring tribe or foraging for food. This is when everyone begins to see their dependencies upon the fellow with the good memory for generations of stories and the man who can take down a deer with almost each arrow and the woman who knows well which plants or mushrooms are poisonous. We form human communities by bonds of dependencies and not because of allegedly higher sentiments.

Dependencies are problematical in this age of the myths about free-standing individuals. Dependencies are also unavoidable and—certainly in my opinion—lead to great goods, but we're taught that we can and should free ourselves from any dependencies we don't choose for ourselves and we're taught to choose to be dependent upon the centralized powers, the national governments and corporations. We can have strong communities only if we're willing to become dependent upon those communities, families and churches or synagogues and local political communities and even nations don't form by magical processes but rather by hard work and the acceptance of dependencies. If we choose to teach our children to be dependent for their most important needs upon the central governments, the centralized school systems quite out of the control of families and local communities, the sports leagues, corporations which provide jobs and fast-food and hours of video or audio entertainment, then those children will form strong bonds to the gods of the marketplaces. If we teach them that they are bonded to their families and churches and neighborhoods only as a matter of sentimental choice, then they will form at best sentimental bonds, weak bonds, to these other communities. If we teach them, if we've made it a reality, that marriage is a contractual relationships where husband and wife aren't truly dependent upon each other, then they will form only sentimental bonds, weak bonds, to their spouses.

## 294 Reshaping Takes Time and Can be Painful

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1583>. It was finished and uploaded on 2013/04/04.]

In this preview of a *Scientific American* article, *Urban Living Raises the Risk of Emotional Disorders* at <https://www.scientificamerican.com/article.cfm?id=urban-living-raises-risk-of-emotional-disorders>, the question is raised:

[U]rban migration represents one of the most dramatic environmental shifts human beings have ever undertaken. So one might be tempted to ask: How are we adapting to our new digs?

Part of the answer is sad:

[M]emory and attention can suffer in urban environments, and psychologists have long known that city life takes an emotional toll. Urbanites are more likely to suffer from anxiety and depression, and the risk of schizophrenia increases dramatically among people raised in a city. Some researchers have calculated that children born in cities face twice, if not three times, the risk of developing a serious emotional disorder as compared with their rural and suburban peers.

In my way of thought, we can learn much from these sorts of studies but a greater understanding can come only with a greater understanding of the Creation which human beings, as individual beings and communal

beings, encapsulate when they shape themselves in response to their environments, then some totality of environments up to all of Creation. Proper responses, courageous and faith-filled, lead to explorations and speculations and deeper understandings which are set in purposeful narratives. It is in this very effort that human being expands, become richer and more complex, each individual and each community becoming more world-like, unified and coherent and complete.

A human being is more than an animal that can be shifted from one environment to another. His innermost individual and communal beings are shaped in many ways to correspond to his environment or multiple environments. As a result, he needs a story about his environments to understand those individual and communal parts of his own self.

I develop such a greater understanding from a sacramental Christian viewpoint in my recently released and freely downloadable book, *A More Exact Understanding of Human Being* [53]. Much of what I write can be used directly in a Jewish understanding and much may even be usable for various other sets of beliefs.

In one section of that book, I speculated a little about schizophrenia. I'll quote that entire short section:

I've made the claim that modern men have some schizophrenic traits. In my first explorations of this idea, I was following the insights in *Madness and Modernism: Insanity in the Light of Modern Art, Literature, and Thought* [126], by Louis Sass, a clinical psychologist who is also quite knowledgeable in the fields of literature and art and history and more. This book is a multi-disciplinary discussion of two parallel phenomena, modern styles of thinking and art on the one hand and schizophrenia on the other hand.

Yes, we modern human beings are all schizophrenics, in a manner of speaking, though most of us have lost contact with reality in its wider and more abstract respects, including its narrative aspects in this world, without being aware that something is wrong. Early in the process of developing an American character, Herman Melville, Nathaniel Hawthorne, Henry James, Sr., and perhaps others believed that Americans are morally insane, in rebellion against a world that doesn't quite meet American

approval—though most of us are in a cowardly or even unconscious sort of rebellion.

I could restate my major goal of my philosophical and theological efforts in this way: I'm trying to restore sanity to modern human beings, especially Christians, by turning their attention to God's Creation and by teaching them they should be responding to God's Creation, actively responding to reality and not to some self-serving understanding of reality. But let me turn to a discussion of schizophrenia as a specific clinical disease with a group of symptoms which leave the patient in a terrible state, though sometimes with a self-awareness of his or her state of absolute mess and sometimes even a humorous appreciation of the 'craziness' of his delusions.

If we read Professor Sass' book and pay attention to the stories told by some of the more interesting cases, we learn of someone who was apparently insane in an obvious way though given to a certain poetical way of speech (the daughter of James Joyce), and we learn of someone who had a grand understanding of the cosmos in which he was some sort of central figure wired to each part of this universe and controlled by all those parts—or maybe he controlled the universe, and we get more general summaries of those who simply constructed nonsensical narratives to make sense of their lives. I've spoken to some of those sorts of disturbed human beings, some are capable of living partially on their own, one might be walking past your house as you read this. One I used to talk to occasionally produced a narrative stream which made sense paragraph by paragraph but was eerie and nonsensical as the paragraphs piled up. She would sometimes reach a point where she was herself confused and not sure how to go on with her story which had the feel but not the formal and literary coherence of the more talented of modernist writers, such as James Joyce.

The other point I'd like to raise from *Madness and Modernism* [126] is the possibility, perhaps likelihood, that schizophrenia, as currently defined, developed in the industrial age, but I'd also like to note a seemingly conflicting claim by Julian Jaynes that ancient man was schizophrenic and experienced life as a narrative guided by voices in his

head. See the Wikipedia article on Professor Jaynes, at [http://en.wikipedia.org/wiki/Julian\\_Jaynes](http://en.wikipedia.org/wiki/Julian_Jaynes), for a discussion that seems pretty good to me and remember that Professor Jaynes is speaking about an age when human beings were being forced to live in radically new ways as human communities grew in size and complexity. This implies to me that schizophrenia is a disorder found in those who have trouble responding to complex social patterns, or perhaps to the ongoing development of complexity in social patterns. Those human beings are maybe dependent upon rigidly practiced habits learned from their communities. When those learned habits are inadequate during periods of rapid change—schizophrenia becomes common. Maybe. Such a speculation has the great advantage of being useful in understanding schizophrenia as a clinical disease and also as an extreme example of the breakdown in the modern mind, in its individual and communal manifestations.

Professor Jaynes didn't put his analysis in narrative terms, to my recollection of reading his major work on the subject 20 years ago, but it was clear the voices provided purpose and moral guidance—they were perceived as gods such as the ones which were some sort of manifest idealizations of human emotions and virtues in the *Iliad*. In fact, Jaynes thought the voices would appear as volition, the decision-maker for befuddled creatures which had not yet learned to integrate higher self-awareness and various sorts of abstract reasoning into their 'core selves' (my term). This can lead to my criticism of the common view of free-will which sees our moral freedom as being exercised by an agent which can then direct us. But who directs this free-will? Is it coincidence that free-will has been glorified in a modern age where it can be claimed that human styles of thinking and feeling and acting are schizophrenic? Against this sort of a fundamentally schizophrenic understanding of moral freedom, I would suggest that we have the real but limited moral freedom of organisms thinking and feeling and acting in specific contexts.

We respond to what lies inside of us and outside of us by trying to create a narrative of our own lives and, usually, at least an implicit narrative that corresponds to what I call a 'world', an entity which—in my highly abstract way of thought—is unified,

coherent, and complete. It is the universe, or some part of it, brought to moral order.

If the process of creating these narratives fails? It would certainly be plausible to get the sort of confusion and disturbance we read about in the *Iliad* or in the analyses of the American separation from reality we find in the writings of Tocqueville, Hawthorne, Melville, Henry James, Sr., and more recently Flannery O'Connor, Ray Bradbury, and Graham Greene (in at least the one novel—*The Quiet American*). But it seems to be a regularly recurring element, if often in the background, of serious American fiction or serious fiction containing American characters. It's a primary element of my novels.

All of my books, novels and nonfiction, have something to say about the disorder found in the modern human being as he struggles to make sense of a world which has been revealed as far more complex than we are currently able to deal with. See Chapter ?? , *Other Writings by Loyd Fueston* for a listing of these books and instructions on how to obtain them—most are freely downloadable.

We are rather confused barbarian children, without a civilization. To my mind, this is pretty much equivalent to saying we have no understanding of Creation which allows us to see purpose, to produce serious art and literature, to properly set goals for use of our technological and economic and political efforts. We are a people with many policies and programs and not a clue what to do with them. This might be why we have so many individual human beings and a good number of human communities who are lost in the cosmos, as the novelist Walker Percy used to say.

## 295 The Embodied but Constructed Self

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1595>. It was finished and uploaded on 2013/04/18.]

This article, *The Invisible Hand Illusion* at <http://phenomena.nationalgeographic.com/2013/04/14/the-invisible-hand-illusion/>, deals with a laboratory testing trick by which psychologists can make people feel as if they have an invisible hand. Ed Yong writes:

Hold your hand up in front of your face. It is patently obvious that the five-fingered thing in front of you is your hand, and the empty space next to it is not. But this ability to recognize your own body is more complicated than it first appears, and can be fooled through a surprisingly simple trick.

...

[A psychological ‘trick’ which had become a popular party trick] suggested to [Henrik Ehrsson from the Karolinska Institute] that even though we have a lifetime’s experience of owning our bodies, this seemingly ingrained feeling is actually very fragile. Our brain constructs it all the time using information from our senses.

And so it is that clever psychologists can make you think you have an invisible hand.

It’s odd to those who feel a need to think of a human being, their own self or another, as having some sort of well-formed existence given at conception or maturity or whatever. This is the mistake of thinking of an

empirical creature, a human being, as metaphysically grounded, a complete being thought of as perhaps a ‘person’. I might describe this as ‘backdoor’ Platonism, a replacement of an ultimately erroneous but plausible and rationally stated understanding of being by mere assumptions, prejudices of a sort guaranteed to decay into superstitions if held too firmly and too consistently.

We are embodied but our individual ‘selves’ are constructed by our interactions with our own bodies and with a lot of surrounding entities, some of them abstract and not embodied, at least not in a direct way. (Embodiment can be a misleading description of, say, a community but it is a valid description if properly qualified by references, for example, to past and future generations or even the me of last year and the you of ten years from now.)

We are, in some reductionistic but legitimate sense, mappings in our brains, mappings which include both our individual and communal selves. In one of my books, *A More Exact Understanding of Human Being* [53], I wrote:

In the December, 2007 edition of *Brain in the News* published by *Dana Foundation* (see <http://www.dana.org/>), there was a reprint of an article *I Feel Your Pain* originally published at <http://Salon.com/>. It seems that specific brain-cells have been found which respond to distress on the part of a nearby creature. True pain can be felt when we see others suffering.

Why not? The destruction by fire of cells on the tips of our fingers doesn’t magically lead to pain felt in our brains or in parts of the nervous system between finger and brain. There is no magical, nor metaphysical, foundation to the processes of pain in our bodies. It’s a result of biological selection processes which favored nervous systems which registered damage in such ways as to force the organism to react strongly. There is something real about pain but that reality is mediated by way of nervous system interactions more the result of tinkering than of design of the sort possible to modern engineers.

It seems quite reasonable that we would be made so that those brain-cells registering pain might well react to the pain of others, especially others who might be members of our communities. It’s this simple: if we build drones or other robotic

devices to monitor forests for fires, then any reaction tied to direct detection of a fire can also be activated if the robot sees another robot acting as if it detected a fire. In a human being, or another social animal, we can merely add a mapping ‘module’ in the brain to put ourselves in the place of another and that reaction is experienced as something akin to the pain we would feel if we were actually in that situation ourselves.

Tentatively, we can say that empathy is the response of certain brain-cells to certain sorts of stimuli. That stimuli can be directly provided by the surrounding environment or it can be provided by signaling of various sorts.

Is that really empathy? Is that what ties us together during times of distress and trouble? Is that what motivates some to take in orphans and others to go off to serve in regions just hit by natural disasters? Is that what leads Joe to feel sorry for a man who just lost his beloved wife even when he’s the jerk who cheated Joe out of a promotion? We seem to have a need for some sort of higher explanation, something that would raise our emotions—loves and hates—into a realm more pure than our world of flesh and blood, dirt and rocks. There’s no reason to expect such an explanation exists. Though the entities of this concrete realm be shaped from more abstract stuff, neither concrete entities of this world nor their complex aspects are to be found in some realm of ethereal being and beings.

This world seems to contain various sorts of two-edged swords. It’s hardly surprising that we come into existence as, shall we say, tentative individual persons and communal persons by way of processes which also leave us vulnerable to magician’s tricks and maybe to manipulation by various sorts of human predators.

## 296 I Have Stuff and I Am a Story

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1610>. It was finished and uploaded on 2013/05/07.]

In April of 2013, Ed Yong posted an analysis of the current state of research in the study of the human brain: *Neuroscience Can't Do It Cap'n, It Doesn't Have the Power* found at <http://phenomena.nationalgeographic.com/2013/04/10/neuroscience-cannae-do-it-capn-it-doesnt-have-the-power/>. It is statistical power that is missing. For reasons discussed clearly by Yong, results in neuroscience are often false or exaggerated. A study indicating that an anti-psychotic drug has a strong and good effect on schizophrenic patients might produce strong signals that it does have such an effect; follow-up studies might show only a weak effect or none at all. Think of it in terms of the underlying genes. If there is a gene which has a significant but small effect on the development of schizophrenia, then it might well be the case that ten research projects can look at that gene, eight failing to find an effect and disappearing without a ripple, one finding a weak effect and getting only modest attention, and one finding a strong effect and generating headlines. Overall, the statistics are true to the underlying significant but weak effect but the one research project which receives a lot of attention is the one which exaggerates the effect.

We should be careful when we read of results in the biological sciences in general and Yong tells us that this problem of statistical lack of power, playing hide-and-seek with an effect, occurs in medical studies in general, including “basic studies in cancer, heart disease and other conditions” and also psychology in general. He also states that geneticists are developing

methods using large amount of data (more possible in that field than in some others) which avoid low-powered statistics.

Another major reason, in my opinion, to be careful about many studies of the brain, to be very careful in designing new studies, is that a properly developed human brain is integrated with a human mind itself shaped by responses to other parts of that human body, to other individual and communal human beings, and to physical reality in general; maybe even to God. To indicate what I'm getting at, a human being who has developed schizophrenia or bipolar disease will have a brain which is malfunctioning in some ways and also relationships which are askew. Even in cases of extreme damage to the brain, cases where serious problems will develop even in a human being maturing in very good circumstances, what lies outside will have an effect on the details of the mental disturbances because that brain-mind complex which is disturbed has been shaped largely by responses to what lies outside. In fact, emotional or cognitive trauma can result in personality disorders in otherwise healthy human beings and those disorders might partially mimic a 'true' psychiatric disorder such as schizophrenia.

Our minds are encapsulations of our total context and our minds in this sense are shaped from our natural brain activities and also feed back to our brains. In their fundamental physical manifestations, our minds, including our sense of self—our stories, are representational maps within the brain rather than simple actions of brain-cells pre-programmed to form a human mind, and certainly are not brain-cells pre-programmed to cooperate with an immaterial soul or mind. A sound-byte: our minds are more outside of us than inside. Our minds are more than could be strictly predicted from a full knowledge of our brains but are such that, after formation, those minds can be understood so that we see they are shaped from relationships and narratives made possible by the evolution of the human brain at a species level over all the years of life on earth and by the development of communal human being over the thousands of years of human cultural development.

The human mind isn't the same thing it once was. A mind shaped in response to computers and electronic communications isn't the same as one shaped to letters written by quill pens and carried by couriers on horseback. A mind shaped to the theory of evolution and quantum theory, to Broadway musicals and personal libraries of recordings of all of Beethoven's known compositions, isn't the same as a mind shaped to Aristotelian or Christian-animistic understandings of Creation, to Sunday hymn-sings and performances by occasional traveling minstrels.

An understanding the human mind is something which itself moves with the effort to understand all that exists and is within the attention of our personal or communal selves, where communal selves in the modern world have elements from the entire world and many past ages of human life. There is much about the mind which can be understood at various levels of detail and specificity, but any true understanding has to be expanded to include the mind in context and mind as a story.

One of my books which is available for download deals with human being, individual and communal: *A More Exact Understanding of Human Being* [53]. The five parts of the book, intended to give an framework for understanding human being from a viewpoint which is respectful of both Christian teachings and empirical knowledge, are:

1. Making Peace with Empirical Reality.
2. The Human Mind as a Re-creation of God's Creation.
3. The Mystery of Human Feeling.
4. Human Acts as Participating in the Story Which is Our World.
5. Communal Men and the Body of Christ.

## 297 Could Government be in Our Genes and Our Environments?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1624>. It was finished and uploaded on 2013/06/06.]

In this short essay, *Classical Liberalism versus Anarchism* at <http://www.libertylawsite.org/2013/06/04/classical-liberalism-versus-anarchism>, Mike Rappaport tries to shift the focus in a debate about anarchism vs. classical liberalism. He quotes Robert Higgs, an advocate of anarchism:

My difficulty arises not so much from a dissatisfaction with government's being charged with protecting the citizens from force and fraud, but from a growing conviction that government (as we know it) does not, on balance, actually carry out these tasks and, worse, that it does not even try to carry them out except in a desultory and insincere way—indeed, as a ruse.

Truth be told, government as we know it never did and never will confine itself to protecting citizens from force and fraud. In fact, such government is itself the worst violator of people's just rights to life, liberty, and property. For every murder or assault the government prevents, it commits a hundred. For every private property right it protects, it violates a thousand. Although it purports to suppress and punish fraud, the government itself is a fraud writ large—an enormous engine of plunder, abuse, and mayhem, all sanctified by its own “laws” that redefine its crimes as mere government activities—a racket protected from true justice by its own judges and its legions of hired killers and thugs.

Rappaport, a legal scholar and supporter—in a manner of speaking—of the idea that the Founding Fathers of the United States did give us a Constitution which can be the foundation of a workable and morally acceptable government, concludes:

Even though I believe actual governments regularly take harmful actions—and this includes governments in the freest and most prosperous countries—I also believe it is very likely that the absence of government would be worse. Whether I am right or wrong, however, to me that is the question.

Rappaport is right to deny the anarchist position but he's a little off on the reason, or at least he misses the bluntest and most undeniable reason to accept the existence of government: they appear and develop and fall and disappear and then re-appear in history. They are a fact of human communal life.

To deny the roles, good and bad, which governments have played in history strikes me as one form of what Melville described as a moral insanity, a basic part of the American moral character: we're in rebellion against a Creator who didn't do work which was quite good enough for us. Melville said that Ralph Waldo Emerson (an ardent individualist) had some good things to say but he struck Melville as believing he could have had some good advice for the Almighty if he'd been present at the moment of Creation. Nowadays, we even have trans-humanists, who think to re-shape our race to higher standards, and computer geeks expecting the *Technological Singularity* (see [https://en.wikipedia.org/wiki/Technological\\_singularity](https://en.wikipedia.org/wiki/Technological_singularity)) when the computers develop intelligence so superior they simply replace us or maybe we merge with them. Anarchists seem a bit more sane largely because their rougher edges have been worn off a bit by decades of public debate.

But anarchy, as a political un-organization, is no more sane than any other doctrine which tries to design a new human being or a new form of human community, each being in conflict with what has emerged from the complex processes of evolutionary and development processes. We can do better and we should be moving forward but the denial of some fundamental behavior which has emerged again and again, always and everywhere, is a denial of the genetic and other inherited stuff which forms, to play off an insight of E.O. Wilson, both the theorists of economics and politics and

morality and also the communal relationships which they analyze or deny. This is not to be fatalistic, to accept as inevitable governments such as those Americans seem prone to form, though we might have to accept some monstrosities during the processes of evolutionary selection and development of what is selected. Think of the Bush and Obama administrations as being some sort of equivalent to the upside down creatures whose remains were found in the Burgess Shale or perhaps some horrible parasite that eats other creatures from the inside out.

The metaphysics underlying this form of moral insanity, the attempt to impose metaphysics upon the empirical realm rather than drawing metaphysics from concrete being or using this concrete realm to test our metaphysical beliefs, strikes me as strange. For years, I've been presenting in various ways and at various stages of development, a worldview in which empirical knowledge is structured according to Christian beliefs: a 'Christian anarchist', if such be truly possible, could only reject God's Creation while pretending to accept God. Metaphysical principles emerge as what's necessary to hold empirical reality together as God's story and governments, the organizing institutions of political communities, are part of our empirical reality, not some ephemeral mistake we can simply eliminate without harming our communal beings.

We men of the modern West tend to view the world is our enemy to the extent it doesn't behave according to one or another human scheme. Against this, I've tried to update a Thomistic insight, consistent with modern knowledge of the human being, including the mind which forms—so to speak—through the brain but rests upon the entire human being. To a Christian thinker of my sort, it is truly insane to try to beat the thoughts God manifested in Creation into a shape where they fit into our minds formed to human schemes which have ghostly origin. To be sane, to have a properly formed mind, indeed a proper formed human being both individual and communal, is to encapsulate some coherent understanding of God's Creation, of the thoughts He manifested in this realm of concrete being and in all the realms of abstract being from which our universe is shaped.

We human beings seem defective in multiple ways in our individual and communal beings, but we have to work with what we are and be careful not to turn legitimate critiques, such as those directed against governments, into a pretense that we improve ourselves by trying to become something different from what we've been shaped to be, from what is buried in our genes and our soma and what is found in our relationships with our envi-

ronments, including our social environments which are really our communal beings.

# 298 Slow Evolution of Traits But—Sometimes—Rapidly Changing Use of Those Traits

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1627>. It was finished and uploaded on 2013/06/10.]

The anthropologist John Hawks has published a short discussion, *Crazy evolution movies* at <http://johnhawks.net/weblog/topics/humor/evolution-wrongness-io9-2013.html>, which is really about wrongful understandings of evolutionary processes. He states:

To be fair, this scenario [of the evolution of intelligent apes in *Planet of the Apes* within 2 or 3 millenia] is quite consistent with some people's models of human evolution, in which human language and symbolic thinking arise suddenly in a single evolutionary spasm. Of course, those people are just wrong.

While this is true, there are phenomena which appear as all-at-once changes even though they are the result of underlying changes which come slowly and gradually or changes which serve one purpose and then suddenly are found useful in another way, sometimes in response to environmental changes. Human cultural evolution, tied to biological evolution in strange and complex ways—the time scales are dramatically different, involves aspects of human being, mostly communal, which can include rapid transitions after many generations of gradual changes. In fact, I'd think that after the evolution of general language capabilities, our use of language has sometimes gone through rapid transitions, as happened in the early Greek philosophers and more recently with scientists, especially mathematicians.

See my very short discussion of an insight of John Polkinghorne, theoretical physicist and then Anglican clergyman: Chapter 90, *Shaping Our Minds to Reality*. After talking about the experience of teaching new mathematical truths and attitudes (What is a vector? “‘But what is it *really*?’ they say.”) to young scientists, he speaks also of the difficulty physicists have in thinking in terms of quantum phenomena: “Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality.” Perhaps a “drawn out” process, but likely to be almost instant in terms of evolutionary time.

Even the physical world shows us such phase changes in which, for example, our universe showed itself as a different entity after a large drop in temperature as our universe emerged from a strange state (in current human terms) to one of thing-like being. The current state of our universe indicates that there was no slow transition, perhaps region by region, but rather an all-at-once transition from a radiation-dominated to a matter-dominated universe. The size of our universe and the finite speed of light give us tight constraints on possible scenarios if we wish to preserve cause and effect.

An example from a very specific realm of our thing-like universe, and which is easier to grasp, comes from an issue which puzzled Darwin himself. Darwin noticed that some hunting dogs had seemingly developed ‘gun-instincts’ in a spontaneous manner. Apparently, hunters with guns had started using dogs as retrievers only during Darwin’s lifetime and he noticed some of those dogs seemed to ‘naturally’ go into search patterns when a gun was fired nearby. There is no way for this sort of change to have occurred so rapidly by evolutionary processes of selection; some behavioral tendencies of these dogs were suddenly used for a new purpose, in response to an environmental change. This is strange but roughly understandable to someone who has observed dogs well enough to see the complex ‘scripts’ of behavior which they have as a result of their evolution as sophisticated social animals. Those scripts can be used for new purposes or maybe even mixed with other scripts or otherwise rebuilt. As a past dog-owner and trainer of those dogs, I’ve found it is surprisingly easy to accidentally teach dogs strange behaviors or strange versions of desired behavior.

Human beings and chimpanzees and perhaps some other species have some basic mental skills which allow them to keep in mind objects not physically present and to manipulate those objects in a way that can be seen as the solution to a problem. For example, a stick with a branch which

is currently out of sight but was recently seen by the human or chimp thinker can be imagined as a way of reaching something placed a few feet out of reach by hand. Human beings engage in such thinking on a regular basis while chimpanzees do it in some situations in the wild but can be stimulated to do it in sophisticated ways in lab settings. This mental skill is considered by neuroscientists to be one of the foundational skills, perhaps the primary such skill, for more abstract forms of reasoning.

Human beings have much higher levels than chimpanzees of abstract reasoning skills of various sorts and we have some such skills not yet found in other creatures and not likely to be found. (Some animals and some birds and apparently some lower species have serious levels of number awareness but that's far from the skills necessary to do double-entry accounting or number theory, though the very low-level brain structures might be similar.) Some such skills certainly existed before the appearance of 'modern' human beings, by which I mean to include some near cousins such as the Neandertals so well-defended by Hawks. There was tool design which at some points was probably partially conscious and deliberate but was likely first elicited by environmental clues, perhaps the handling of rocks already in useful shapes. There was painting and some sort of religious practice and burials. There was co-evolution of domestic animals along with our human family-lines, which probably involved some conscious decisions by the human partners at least at the later stages of this co-evolution. This all occurred along with an ongoing slow evolution of a brain complex enough to support a human mind of the sort shown by Plato or Einstein, minds capable of seeing larger scale meanings. Some such evolutionary processes are ongoing though it's not possible to predict where we're headed.

As I've claimed, in line with St. Thomas Aquinas in the 13th century and neuroscientists such as Walter J. Freeman in recent decades, our mind-like attributes result from our active responses to what lies in our own bodies and also outside of ourselves. This assumes an evolved brain of great power. It's not clear to me how to talk about nature accidentally producing the possibility of an Einstein, but the result was that: a brain capable of forming minds which can, in principle, expand out to encapsulate all of the universe and all of the abstract being from which it was shaped. That brain existed in, again so to speak, a proto-Einsteinian form for some tens or hundreds of thousands of years, but a powerful mind such as that of Shakespeare which helped to shape a civilization can only develop when there is a complex enough human situation, technology and literature and

religious beliefs and so on, to which such a mind can respond, bootstrapping itself to some extent. Civilizations formed when the pieces existed and some minds became consciously aware of the situation and the need to find a greater meaning in which that civilization could be placed. In a strong sense, our total minds, individual and communal, can be no better than our environments would allow. In Christian terms, we can think no thoughts not found in Creation, though perhaps not realized in our concrete universe. See Chapter 127, *Intelligence vs. Intellect*, for a discussion of intellect as the “communal and capitalized form of live intelligence” in the words of Jacques Barzun.

Excuse the complexity of my language, but I’m saying something complex because I’m speaking in a world where nearly everyone, explicitly dualistic or not, thinks of mind or at least truth as coming from ethereal realms. If I could simply develop ideas from the basic insight that our minds develop as we respond to our environments, counting our own bodies as environments, then I could, in principle, develop a solid and clean understanding of human being, individual and communal. Download a book I recently published, *A More Exact Understanding of Human Being* [53], to read my most complete effort to date to do exactly this.

Unfortunately, I’m writing in a civilization which has a less exact and quite inadequate understanding of mind as something we have and of knowledge as something to be put in the pre-existing slots of that mind. Truths come to us from undescribed regions and also have to fit into pre-existing slots.

I’m assuming many of my readers have inherited these wrongful ideas of mind and knowledge and even truths; I’m trying to explain why it is that I would claim a modern sort of mind, one similar to that of Richard Feynman or that of Serge Rachmaninoff, first showed itself around the sixth century before Christ when we see signs of what I’d call meta-reasoning or abstract reasoning in the assembly of ancient and more recent writings into a coherent whole as the books of Moses and other writings, the creation of Hindu theology by the Sanskrit speaking peoples, similar efforts in China, and the beginnings of systematic thinking about the world in the form of primitive natural philosophy and sophisticated forms of poetry in the region of Greece and Asia Minor. This happened because higher-level abstractions were necessary to the understanding of new forms of human relationships including those connecting human beings and physical reality.

In historical terms, and most certainly in evolutionary terms, complex

civilizations came together very quickly, however long the underlying evolutionary and developmental processes took. The temperature of water drops slowly but ice can appear all of a sudden. Most phenomena in evolutionary biology don't involve such dramatic all-at-once phase transitions, but I'm claiming that civilization and civilized minds appeared all-at-once in terms of the time-scales of evolutionary biology. In fact, most evolutionary biologists seem to support the idea that the behavioral and cultural traits of animals can go through rapid transitions though the underlying biological traits have to already exist and would have developed slowly by processes of selection. The human skills allowing symbolic thinking, the construction of complex narratives, the use of rhythmic language, and so forth evolved slowly and likely were in use by unknown geniuses many generations before Homer wrote the *Iliad* but there were truly revolutionary changes in the usage of these raw skills from those archaic geniuses to Homer to Virgil to Shakespeare to T.S. Eliot. The transition to Homer was very important and we may be going through another such transition as we try to understand an unbelievably complex human civilization and Einsteinian/Darwinian universe. We don't have a clue how far these developments of evolved skills can go though I've speculated the basic human ability to encapsulate concrete reality in our own minds allows us, in principle, to encapsulate all that concrete, thing-like being is shaped from.

Moreover, I've claimed in other writings that we are now in the process of making a transition to far more complex forms of human communities and we're going through a painfully rapid transition similar to what resulted in the dramatic appearance of a 'civilized mind' around the sixth century before Christ; it was at this time that complex communities became aware of their communal human being, first in the individual and communal self-awareness of a small number of geniuses.

As a simple pointer to what's involved, I've claimed that our moral language is inadequate because it's only as complex as earlier, premodern, stages of human communal life. For example, we've used Euclidean reasoning to form concepts and analogical ways of speaking about our moral lives. We think in terms of linear paths through a Euclidean sort of space. I'm speculating that the sheer mass of humanity and of the relationships most of us have to handle, personally or through others, distorts our moral spaces in a way analogous to that of mass distorting spacetime in our Einsteinian universe.

# 299 Sex and Categorical Reasoning in a World of Evolution and Development

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1648>. It was finished and uploaded on 2013/07/11.]

Let me recount some of the ways in which we modern Christians are confused:

1. We are still trying to apply categorical reasoning to creatures and relationships in a world of evolutionary and developmental processes.
2. We have no way, even in principle, of saying which of our ancestors was the first creature to fall into the category of 'human being'.
3. We have males and females being formed by way of events in the womb and the early years of life in which males, for example, are masculinized in some ways and de-feminized in other ways and there's good reason to believe that much can happen which doesn't produce a categorical male or female or perhaps does produce a human being who can seemingly be categorized in that simple way but is attracted to members of his or her own sex.
4. Sometimes, perhaps most of the time, sexual attraction to members of the same sex might be at least partly voluntary, but we just don't know. Ignorance is a poor justification for continuing our old ways as a whole and a worse justification for throwing out all our ways. We don't want to throw out the baby but we do want to throw out the dirty water.

5. Americans who claim to be traditionalists have come out strongly against same-sex marriage but haven't been protesting much against women in near-combat roles and aren't now protesting against women being assigned directly to combat units. Apparently, traditional men in the United States don't mind being protected against foreign soldiers by women carrying guns but feel their traditional manhood threatened if two women are allowed to form a legal relationship as spouses.
6. We also have Western Christian traditions of sacramental marriage which **don't** depend upon any 'official' recognition of the marriage because, as the teachings of the Catholic Church go, the sacrament of marriage involves only a man, a woman, and God; Christian ministers are witnesses and not participants in the Sacrament of marriage; the Church and State provide at most a recording service and a way of helping to handle disagreements about responsibilities to children and disagreements about matters of property or finances. The canon law of the Catholic Church is a strange read on this topic, descending through various ceremonies and relationships, starting with a marriage ceremony in a Mass and ending with a suggestion of sorts that, if no other witness can be found, not even an anthropologist from Mars, then the man and the woman should marry themselves, but only with a bishop's permission. That, minus the bishop's permission, was actually the tradition in much of Christian Europe prior to the Reformation and Counter-Reformation—move in together, form a union of man and woman in economic and social dependency upon each other, start a family, and get the marriage blessed when the first baby is baptized.
7. The Church of Rome (as a diocese) has, from ancient times, followed Roman traditions in which the patriarch had to approve and 'enact' the marriage and, to protect women and children as men became more mobile in the late Medieval Age, Roman ways were extended to all Catholics by the Fathers of the Council of Trent and various Popes.
8. Modern Deistic and atheistic thinkers tried to convert human relations from sacramental bases (yes, all human relations are sacramental, even when evil and exploitive and even when there is no corresponding Sacrament to be celebrated in a liturgy or at least recognized

in catechisms) to a contractual foundation more consistent with the Enlightenment's positivistic and radically individualistic theories of human nature; indeed the men of the Enlightenment thought of all forms of being, including any which might be divine, in terms consistent with their understanding of human nature. (See Chapter 156, *Einstein and Bohr's debate on the meaning of reality*, for a very short discussion of Einstein's version of this way of thinking about being in which entities are well-formed and independent; relationships are fully external to the entities and don't cause fundamental changes to them.)

9. Catholics and others who try to defend at least some part of their traditions in the 21st century have reached a point where they live according to rather incoherently diffuse understandings of modern empirical knowledge of concrete realms of being and then claim to hold moral and theological beliefs supported by pre-modern understandings of those same realms of being. Adam and Eve were special creations in the Garden of Eden except when we are being treated for cancer or waiting for a transplant of an organ from a pig.
10. Having failed to develop new understandings of created being, including human being, even with the vast piles of modern empirical knowledge; that is, having failed to respond creatively and honestly and energetically to the Creator and the ideas He manifested in Creation; modern Christians are starting to respond instead to the initiatives of those who propose programs and understandings of human being which can't possibly be seen as consistent with any possible Christian views.
11. Those who are part of the intellectual establishment of Christianity, though having failed to respond to God's Creation, seem blind to the need to nurture or find thinkers who can respond properly. "We're the experts and we're determined to remain in control even if we do nothing useful during this time of crisis."

In recent months, I've noticed that conservative Christian thinkers are increasingly prone to negotiate away their traditional positions on marriage and other sexual issues. They have shown no such willingness to consider the possibility that the world is proving to be richer and more complex

than those traditional positions would allow. In other words, believing their traditions hold God's ordained truths, they are willing to negotiate away the manifestation of those truths in our laws and social customs but they aren't willing to consider the possibility that their understanding of God's world might need to be updated to consider a mountain of inconvenient empirical facts or perhaps they simply have not the personal characteristics to respond in a creative manner to our problems and opportunities.

We have no right to voluntarily adopt human customs at odds with the truths God manifested in Creation but we do have a right and a strong obligation to honestly and courageously explore that Creation and to try to come to an understanding true to it, an understanding which sees Creation as unified and coherent and complete.

I've found myself to be increasingly unable to defend understandings of human morality which depend upon inherited mistakes such as the use of categorical reasoning in a world of evolutionary and developmental processes. Like it or not, we live in Darwin's world and not Plato's world, though we should remember the great amount of wisdom contained in the thoughts of that courageous Athenian. I've also decided it to be unwise and even hubristic to think I can come to any firm conclusions at this time about issues such as sexual relationships involving men who feel like men but are attracted to other men or men who feel like women or women of similar sorts. There are confusions inside at least some of these human beings, confusions of a genetic or developmental nature. There is much work to be done in trying to make sense of our own human beings and our world and it will be hard to do this work since we are still being flooded by new empirical facts, some of it at least partly digested to the state of knowledge. It's understandable but not justifiable that we Christians protect our selves rather than trying to properly understand and channel this flood of new knowledge or sometimes false knowledge.

We modern human beings can reasonably anticipate some medical miracles from—perhaps—infusions of 'good' genetic matter, such as perhaps in Huntington's disease (which destroys regions of the brain) or other disorders caused by relatively well-defined genetic problems. Why are we not willing to wonder if the complex genetic factors and developmental processes of sexual identity and preference might not play an important role? We can learn from *Huntington's disease* at [https://en.wikipedia.org/wiki/Huntington's\\_disease](https://en.wikipedia.org/wiki/Huntington's_disease) that "Expansion of a CAG triplet repeat stretch within the *Huntingtin* gene results in a different (mutant) form of the pro-

tein, which gradually damages cells in the brain, through mechanisms that are not fully understood.” Do we tell victims of this disease they should overcome their problems by way of freely willed efforts?

A recent study of brain development processes, *Unique Epigenomic Code Identified During Human Brain Development* at <http://www.sciencedaily.com/releases/2013/07/130705102037.htm>, speaks of the complexity of these processes, in the context of mental disorders, but similar comments apply to a multitude of variations which occur during the development of a human being:

“The human brain has been called the most complex system that we know of in the universe,” says Ryan Lister, co-corresponding author on the new paper, previously a postdoctoral fellow in Ecker’s laboratory at Salk and now a group leader at The University of Western Australia. “So perhaps we shouldn’t be so surprised that this complexity extends to the level of the brain epigenome. These unique features of DNA methylation that emerge during critical phases of brain development suggest the presence of previously unrecognized regulatory processes that may be critically involved in normal brain function and brain disorders.”

At present, there is consensus among neuroscientists that many mental disorders have a neurodevelopmental origin and arise from an interaction between genetic predisposition and environmental influences (for example, early-life stress or drug abuse), the outcome of which is altered activity of brain networks. The building and shaping of these brain networks requires a long maturation process in which central nervous system cell types (neurons and glia) need to fine-tune the way they express their genetic code.

[See the article, *Epigenomics*, at <https://www.genome.gov/27532724> for an explanation of the epigenome which is, for my current purposes, a further complication of the ways in which our genes work, but note that this page explains that the workings of genes can be altered by a variety of outside factors, such as the chemicals we’re exposed to in our daily lives or, as I’ve noted in past discussions of research in this area, the eating habits

of our grandmothers—see Chapter 267, *Our Grandchildren Are What We Eat.*]

The masculinization or feminization of the brain involve complex brain development processes as well as complex development processes in glands and other parts of the body.

The point of all of this, and also the point of the pre-modern Christian understandings of human sexuality, is that our bodily stuff, brain and muscles and glands, define our possibilities including the ones we realize in becoming ‘me’, but modern empirical knowledge tells us our pre-modern understandings were overly simplistic and sometimes just plain wrong. We are being forced, by knowledge of God’s Creation, toward a richer and more complex, though not yet coherently organized, understanding of our bodily stuff and also of our relationships to other human beings and to the rest of Creation and to our Creator.

I’m not willing to reconsider any serious issue on the basis of current misunderstandings of God’s Creation, misunderstandings of human being both individual and communal, misunderstandings of the relationship between abstract and concrete forms of created being. I’m willing to respond honestly and courageously to God’s Creation, in full faith that whatever might be true, for example, of apparent confusions in human sexual nature and sexual attractions, it will prove to be consistent with God’s story in which the Body of Christ is developing, a Body in which God’s friends will retain their individuality but will also be fully that complete (communal) man, the perfect Christ, in St. Paul’s terms.

In other words: I’m willing to consider the possibility that we Christians have gotten some important ideas about Creation wrong but I refuse to believe, or to act as if, our views about Creation are true to God’s thoughts but we have a right to compromise on issues of moral truths for political and other reasons which are apparently more important than presumed moral truths.

# 300 Empathy and the Evolution of Human Communal Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1659>. It was finished and uploaded on 2013/08/02.]

Eric Michael Johnson posted an essay on empathy, *We Contain Multitudes: Walt Whitman, Charles Darwin, and the Song of Empathy* at <http://blogs.scientificamerican.com/primate-diaries/2013/07/19/the-song-of-empathy/>. In this essay, he notes the confusion which followed the publication of *On the Origin of Species* when “critics claimed that Darwin’s theory divided moral sentiments from divinity and pitted science against humanity,” but the poet Walt Whitman claimed “the world of erudition, both moral and physical, cannot but be eventually better and broaden in its speculations.” From this, Johnson notes that “Whitman’s vision of empathy was one that embraced a Darwinian nature.”

I would endorse claims that Darwinian insights on evolution (both what Darwin got right and the open questions to which he directed our attention) brings us closer to the truth; this is almost a tautological statement since those Darwinian insights are drawn directly from empirical observations. Whatever is true at the larger scale or in the more abstract realms of created being, it has to agree with concrete reality. The entire truth is greater than what we can know from empirical observations unmediated by the proper speculations, but it can’t be different. The traditional Christian way of expressing the underlying truth about being which corresponds to knowledge is: grace completes and perfects nature, grace doesn’t destroy or replace nature. Metaphysicians and theologians, as well as historians and educators, need to accept the truths of this concrete realm before going on

to realms of moral purpose or realms of abstract being from which I claim our concrete world is shaped.

Accordingly, I'd strongly endorse claims that our understanding of empathy has to be grounded in concrete reality so that it can be coherently discussed and explained in the complex narrative of life on earth.

My problem with many discussions of empathy is of another sort. (Mr Johnson's discussion in his essay is a pointer of sorts to a talk he was to give and was not presented as a complete discussion of his speculations on the nature of empathy and I'm not criticizing him for the necessary blank spots in his expressed thoughts.)

Evolutionary researchers, in the North Dakota badlands and in the quiet study in Cambridge, have developed serious skills in seeing how important traits or bodily structures can arise for one purpose and 'suddenly' be used for another purpose as well—in fact, this sometimes has to be a matter of speculation in the face of, for example, specialized organs or brain regions which would have been useless for their 'ultimate' purpose until fully shaped by evolution. It seems to me that empathy is likely to be a problem which can be dealt with in such a way, developing a coherent narrative understanding if not a cause-and-effect relationship which would be satisfying to a dedicated physical determinist.

How do we feel pain? How do we feel happiness, in our hearts or in our feet? How do we feel ourselves to be a certain 'me'? How do we feel the oneness with a surgical scalpel or with a scroll saw or with a cast-iron frying pan?

Modern brain-scientists have discovered the rather remarkable fact that we don't inhabit our bodies directly. We inhabit our bodies by way of maps built up in our brains. Human beings, chimpanzees to a lesser extent, have a far more sophisticated map in their brains than any other known animals. Our maps, and those of our chimp cousins, can generate at least something of a sense of 'me'. Some human beings seem to barely have a sense of 'me' and others seem to live full and rich lives, even to indulge the most selfish of pleasures, without being aware of being a 'self' with a history and a future—I don't know if chimps have a sense of a future self and many human beings seem to be bereft of that trait or at least a bit thin.

We also know that barbarians, especially during particularly harsh times, were notably bereft of empathy—at least most of the time—but also notably indifferent to their own sufferings. Do our 'parts' tend strongly to become harsh in unison? As we become hardened by acceptance of suffer-

ing during famine and wars, do we also grow hard toward the suffering of others? This is hardly a new suggestion nor an implausible one.

It would seem likely to me that empathy is some sort of new-use of the feelings we have for our own bodies and for tools or prosthetics which become as part of our own bodies. It would be a weaker mapping, less intense than the mappings resulting from various signals of nerve irritation, destruction of flesh, disruption of sexual or other relationships tied so strongly to our various glands. It would be a virtual pain, arising in the brain based upon visual or auditory nerve signals.

I published an essay on empathy in April of 2013, *The Embodied but Constructed Self*, which is included as Chapter 295. In that chapter, I claimed, “We are, in some reductionistic but legitimate sense, mappings in our brains, mappings which include both our individual and communal selves.” I referred to my book, *A More Exact Understanding of Human Being* [53], where I wrote:

In the December, 2007 edition of *Brain in the News* published by Dana Foundation (see <http://www.dana.org/>), there was a reprint of an article, *I Feel Your Pain* which was published at *Salon*’s website, <http://Salon.com/>. It seems that specific brain-cells have been found which respond to distress on the part of a nearby creature. True pain can be felt when we see others suffering.

Why not? The destruction by fire of cells on the tips of our fingers doesn’t magically lead to pain felt in our brains or in parts of the nervous system between finger and brain. There is no magical, nor metaphysical, foundation to the processes of pain in our bodies. It’s a result of biological selection processes which favored nervous systems which registered damage in such ways as to force the organism to react strongly. There is something real about pain but that reality is mediated by way of nervous system interactions more the result of tinkering than of design of the sort possible to modern engineers.

It seems quite reasonable that we would be made so that those brain-cells registering pain might well react to the pain of others, especially others who might be members of our communities. It’s this simple: if we build drones or other robotic devices to monitor forests for fires, then any reaction tied to

direct detection of a fire can also be activated if the robot sees another robot acting as if it detected a fire. In a human being, or another social animal, we can merely add a mapping ‘module’ in the brain to put ourselves in the place of another and that reaction is experienced as something akin to the pain we would feel if we were actually in that situation ourselves.

Tentatively, we can say that empathy is the response of certain brain-cells to certain sorts of stimuli. That stimuli can be directly provided by the surrounding environment or it can be provided by signaling of various sorts.

Is that really empathy? Is that what ties us together during times of distress and trouble? Is that what motivates some to take in orphans and others to go off to serve in regions just hit by natural disasters? Is that what leads Joe to feel sorry for a man who just lost his beloved wife even when he’s the jerk who cheated Joe out of a promotion? We seem to have a need for some sort of higher explanation, something that would raise our emotions—loves and hates—into a realm more pure than our world of flesh and blood, dirt and rocks. There’s no reason to expect such an explanation exists. Though the entities of this concrete realm be shaped from more abstract stuff, neither concrete entities of this world nor their complex aspects are to be found in some realm of ethereal being and beings.

That leads to the question: What selective advantage is there in empathy? After all, empathy can be disturbing and sometimes in such a way that any plausible response, other than hardening ourselves or fleeing out of the sight or sound of someone embarrassed or in great pain, might endanger our own survival or that of some in our family-line.

Empathy might simply be associated with community formation and strengthening of human bonds in general. If so, it might be possible to test for strength of an empathetic feeling or tendency to act in response to another’s distress and relate it to various sorts of proxies for nearness of genetic relationship, such as being raised in the same household/village or physical resemblance or similarity to an infant. Some sort of empathy would likely come from even baby eyes, present in so many mammal young.

If I’m right in speculating that empathy is an offshoot, of sorts, of our sense of personal and individual self, then we could see empathy as an

important part of communal being of the sort hinted at in the Biblical concepts of the People of Israel and the Body of Christ. By way of such mappings of the individual beings of others, especially those in our tighter-knit communities, we might even come to some understanding of how it is that we can shape each other by way of love of a true Christian sort and by acts of corporal charity and prayer.

# 301 If Monogamy is (or isn't) the Answer, Niels Bohr Knew the Question

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1662>. It was finished and uploaded on 2013/08/07.]

I've often referred readers to Chapter 156, *A Christian View of Einstein's and Bohr's Debate on Reality*, for a very short discussion of Bohr's insights into the primacy of relationships over stuff—in fact, it's not clear to me that Bohr fully realized the implications of his stance but that's true of many a pioneer thinker.

Evolutionary selection isn't for some sort of freestanding entity which meets some sort of abstract standards of good quality, but rather for entities which can properly fill certain roles in evolving and developing relationships with other members of its own species, with members of other species, with the dirt and rocks and air of the earth. Over time, these capabilities to form these proper relationships are manifested in our genes and our flesh-and-blood. And then, the world changes and most dinosaurs aren't able to form proper relationships; the smaller feathered dinosaurs along with primitive rat-like mammals and reptiles and others take over.

The above stated view isn't a matter of new knowledge so much as it is a restatement of old knowledge, a restatement which likely will make more sense of the world and allow us to move forward in a better way as we explore and try to understand the entirety of Creation. This is a return to more traditional ways of understanding Creation and also a denial of the autonomous individuality which underlies so much of the political and economic and other thought of the past few centuries or so.

There are a great variety of human relationships; I would even claim that our individual characters don't have such a great variety and rich personhood is a possibility for human beings only within the context of these various relationships, such as those a farmer can form with his family and neighbors, with his animals, and with the soils and trees of his property. A man might love and well serve his wife and children and feel close to the other doctors in his clinic including even the ones he doesn't like; he might be devoted to his patients, even the most obnoxious. A woman might be devoted to the various personalities and cities and even technology of her major area of study—perhaps the city-state of Florence in the 15th century; she might also love her husband and children though her 14 year-old daughter is in trouble at school at least once a week.

How did the human race develop its tendencies toward certain forms of relationships, such as monogamy? There have been and are human societies which encourage or at least allow polygamous relationships, but they are not, over the long-term, the most successful of societies. Some of those polygamous societies simply adopted legal polygamy as a way of taking care of the needs of widows or of dealing with a surplus of women. The latter problem seems to have occurred in the Near East and Middle East during the Biblical ages and during some ages since then. It's easy to understand how a surplus of relatively young women could develop during violent ages, even when women had high rates of death during childbirth; it's also easy to understand the adoption of the only obvious solution but polygamy has remained an option for powerful males in some societies in the Southwestern regions of Asia and in the closely related regions in North Africa.

On the whole, monogamy has been the norm for most of the human race in recent millenia. We can adjust to polygamy when necessary or when it's to the advantage of powerful males in a rigidly hierarchical society, but monogamy—with cheating—seems so predominant that it's likely found in our inherited genome and phenome as well as nearly all of our inherited cultural traditions.

How did it become the norm?

From the article *Evolution of Monogamy in Humans the Result of Infanticide Risk, New Study Suggests* at <http://www.sciencedaily.com/releases/2013/07/130729161558.htm>, we learn:

Until now, a number of hypotheses have been proposed to

explain the evolution of monogamy among mammals. These include:

- [(1)] Paternal care, when the cost of raising offspring is high
- [(2)] Guarding solitary females from rival males
- [(3)] Infanticide risk, where males can provide protection against rival males

In that same article we can also read that the third option seems to be the winner, though the first option might reinforce monogamous tendencies:

The threat of infants being killed by unrelated males is the key driver of monogamy in humans and other primates, a new study suggests.

From another recent article, *Monogamy Evolved as a Mating Strategy: New Research Indicates That Social Monogamy Evolved as a Result of Competition* at <http://www.sciencedaily.com/releases/2013/07/130729172244.htm>, we learn that the second option is definitely the explanation for the development of monogamous tendencies found in many mammal species:

Social monogamy, where one breeding female and one breeding male are closely associated with each other over several breeding seasons, appears to have evolved as a mating strategy, new research reveals. It was previously suspected that social monogamy resulted from a need for extra parental care by the father.

What gives?

First of all, we must always be cautious when we read articles that are summarized descriptions of projects complex in both the ways in which information was gathered and also the ways in which that information was analyzed. The article might be too highly summarized or it might be inaccurately summarized. In this case, the problem seems to be partly that different groups of species are being studied. The research summarized in the first article looks at a variety of **primate** species. The second article looks at **mammals** where females occupy territories and males move into the territories of one or more of those females.

The issue of infanticide, so important to the study summarized in the first article needs some elaboration. A male who is newly dominant or newly the 'owner' of a group of breeding females will gain some advantage by killing the youngest offspring of the females if those females will then become fertile and receptive. I've read this is certainly true of chimpanzees and of lions. Apparently, it tends to be true of primates though I don't know how true it is of human beings.

I don't know enough to generalize to, for example, herbivores which form large herds. So, I won't generalize though I will say I've never read of bison or elks or other herbivores using infanticide to gain a breeding advantages.

My main point is: the world is more a story than a collection of stuff interacting in ways which can be understood piece by piece but don't form a greater whole. It is a tangle of relationships extending over space and over time—modern insights into the nature of spacetime remain valid but under most conditions, pre-modern forms of analysis remain proper as is true for most realms of physics in which 18th century physics is still assumed and used. So it is likely we will be able to understand much by understanding stuff as if it were freestanding entities entering relationships which don't change those entities in a fundamental way. Yet we should be very careful about thinking as if stuff is primary over relationships as it is likely that the human race has reached levels of number and complexity of relationships such that new forms of, say, political behavior are coming into view. Moreover, this is likely tied to knowledge of being in its deeper aspects so that we need new ways to understand such complex entities as family-lines which have evolved over the millenia.

In such a world as this seems to be, all the smaller-scale stories take place within a larger series of events which seem to be a coherent narrative, within networks of relationships extending over large regions of space and long durations of time.

Let me make my point by way of analogy to a narrative on a smaller scale. The life of Albert Schweitzer, a very complex and very noble man of great accomplishment in a variety of fields, seems impressive enough as it would typically be presented in a popular biography. Yet, once we start to develop a deeper understanding of reality, we realize there is so much that seems almost arbitrary in such a life. If we move on, we can find that Schweitzer was a true man of Western Civilization, if one born in the twilight of at least a major era of that civilization. He wasn't just a smart and talented man who chose by way of some autonomous free-

will to become an organist specializing in Bach, a Lutheran theologian who struggled toward an intelligent (if I think wrong) understanding of Jesus which differed from the secularist and traditional Christian understandings alike, a physician-missionary to Gabon, and—partly to tie it all together—a philosopher who preached a reverence for life. Though I think he went off-track in some of his thoughts, he was a man who was truly a giant of the West. In order to understand Schweitzer, we have to take the West seriously: Western music as well as the struggle to understand Jesus of Nazareth and the various claims about Him, Western medicine as well as the Western efforts to bring corporeal goods to other regions along with or sometimes apart from the Gospel, the efforts of so many Enlightenment and post-Enlightenment thinkers to ‘save’ the moral teachings and cultural accomplishments of Christianity while easing back on or even eliminating what were seen as theological embarrassments, and the tendency of all of this to go bad and even lead to exploitation of the simple Christians in the West as well as native peoples outside of the West.

Even Schweitzer had lost sight of the purpose of the West: to explore God’s Creation, make sense of it, and to bring that sense of it to fruition in one’s own land and also in the lands of others. In other words, Schweitzer’s very life and work, when seen in light of a robust understanding of the Christian civilization of the West, were proof that Jesus of Nazareth was the Son of God come to offer a share of life with God, though Schweitzer’s life was particularly defective because of his refusal to see that his house was built on the truth of the Gospel or on sand. His house was built on that truth of the Gospel that Schweitzer himself had so much trouble accepting and it was so built because Schweitzer was a man of the West who was born into that particular house.

The science which grew up in the Christian West has shown too much about the contingency not only of the existence of this universe but also of the contingency of spacetime, of matter, of other fundamental aspects of concrete being as it exists in our universe. We now know that God was a true Creator and not a pagan god working within a given structure or with given stuff. An overall understanding of Creation is necessary to make sense of the various levels of understanding of life on earth, of this expansionary phase of our universe, of the universe seen as a purposeful narrative, of the various levels of abstract being up to the most abstract level which is the manifested truths from which all else is shaped.

In other words, those who tried to de-Christianize the West have suc-

ceeded and we are starting to learn that there is no meaning to all this marvelous knowledge we're gaining of so many parts of this concrete realm of being. The theoretical physicist Eugene Wigner (Nobel Prize in Physics in 1963) referred to the "unreasonable effectiveness of mathematics" in solving the problems of physics. The more difficult the problem, the more remarkable and more "unreasonable" the effectiveness.

We have no way of speaking of mathematical groups as being and thus we have to consider the remarkable and unreasonable effectiveness of group theory in solving problems in quantum theory. Abstractions such as groups just come from nowhere, ghostly tools to work upon our knowledge of the wood and rock of this world though having nothing inherently in common with that wood and rock. As just one example of the corrosive effects of the post-Enlightenment and willfully non-Christian thought which has seemingly taken over the West, those trying to make most sense of the groundedness of human being, including the human mind, in stuff are forced to pretend there is, after all, a Platonic realm of abstractions which we flesh-and-blood creatures can magically access to acquire particular abstractions that we might use them in understanding the stuff of flesh-and-blood. This is even worse than assuming we can use Anglo-American thought to readily understand all cultures and political systems around the globe.

The most hardheaded of empirical thinkers becomes a dualist of the most unconscious sort and also a dualist who possesses a truth independent of concrete being, a truth which can't be verified or denied by empirical knowledge.

Against this, I'll argue that Bohr's insights into the fundamental importance of relationships, even with subatomic particles, should guide our efforts to understand, for example, relationships between a breeding male and a breeding female, even if they happen to be human beings. Darwinists often give me the impression of being perhaps even more confused than Wigner, who was—we must remember—a great physicist and a man who made a serious and respectable effort to understand why the abstractions of mathematics are so effective in solving problems in this concrete realm. But Wigner could only call that effectiveness "unreasonable" in the end in the same way that evolutionary theorists are so good at finding stories and other forms of explanation, species by species and even at higher or lower groupings but deny there are deeper reasons for the evolution of, say, monogamy. For now, my point isn't even such a deep reason as the existence of the God of Jesus Christ. Go with Einstein's somewhat pantheistic

faith in reason: it all makes sense because it's all part of a coherent reality, and then try to figure out how our abstract reasoning processes, including group theory but also various literary theories, are connected to concrete forms of being.

Is my claim perhaps true: created being is created being is created being? Is it true that if we know it, even if it includes the 'impossible' imaginary square root of negative one, then it's manifested in some realm of created being and, if it seems useful in this concrete realm, then perhaps concrete forms of created being are somehow shaped from those imaginary numbers and those principles of group theory and even from the truths which are manifested so obscurely in our greatest novels and poems?

# 302 Wise Blood, Wise Genes, Wise Immune System

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1666>. It was finished and uploaded on 2013/08/09.]

Good news from genetic research. At least it's good news for those of us who believe in the value, and truth, of moral purposefulness. An article from July of 2013, *Be Happy: Your Genes May Thank You for It* at <http://www.sciencedaily.com/releases/2013/07/130729192548.htm>, tells us:

People who have high levels of what is known as eudaimonic well-being—the kind of happiness that comes from having a deep sense of purpose and meaning in life (think Mother Teresa)—showed very favorable gene-expression profiles in their immune cells. They had low levels of inflammatory gene expression and strong expression of antiviral and antibody genes.

As for those who had what some, simplistically to the point of wrongly, would label as 'materialistic' values? Well, they don't do so well:

[P]eople who had relatively high levels of hedonic well-being—the type of happiness that comes from consummatory self-gratification (think most celebrities)—actually showed just the opposite. They had an adverse expression profile involving high inflammation and low antiviral and antibody gene expression.

The right sort of values and the right sort of happiness seems to have a very good effect on our immune system and its responses. At the same time:

And while those with eudaimonic well-being showed favorable gene-expression profiles in their immune cells and those with hedonic well-being showed an adverse gene-expression profile, “people with high levels of hedonic well-being didn’t feel any worse than those with high levels of eudaimonic well-being,” Cole said. “Both seemed to have the same high levels of positive emotion. However, their genomes were responding very differently even though their emotional states were similarly positive.”

So, those people with “high levels of hedonic well-being” were as happy as those with high levels of “eudaimonic well-being,” but their immune systems were not well-balanced.

“What this study tells us is that doing good and feeling good have very different effects on the human genome, even though they generate similar levels of positive emotion,” he said. “Apparently, the human genome is much more sensitive to different ways of achieving happiness than are conscious minds.”

We can be bereft of well-ordered purpose but still happy but our genes and the immune system responses they control won’t be so ‘happy’. This is a little different from what I would have expected, but in the same ballpark. After all, a major thrust of my work is to restore an understanding of the reality of purpose at the level of Creation as well as a need for purpose in ordering our lives, most certainly in ordering of a sort as complex as a civilization. Purpose, a focused narrative understanding of what it all means and why we are here, is a civilization in a real sense. With the loss of belief in a Christian understanding, a Christian purpose for our lives and for the very existence of Creation, Western Civilization is unraveling. But apparently, as individuals, we can be happy even while we have selfish values but our bodies won’t be so happy. Our bodies, or perhaps our blood—as Flannery O’Connor would have stated matters, can we wiser than us, even when it comes to moral issues. (See Miss O’Connor’s novel *Wise Blood* for a tongue-in-cheek exploration of the idea.)

This is, in fact, the meeting point of the most brutally honest forms of evolutionary theory and traditional Christian, certainly Thomistic, understandings of morality and human being in general. To be sure, a Christian would suggest some corrections to rigidly genocentric attitudes but those

corrections are strongly implied by the discovery that our way of being happy affects the expression of those genes—is it not expressed genes which are directly subject to evolutionary selection process? As the prominent sociobiologist E.O. Wilson told us in *Sociobiology, The Abridged Edition* [151]:

Camus said that the only serious philosophical question is suicide. That is wrong even in the strict sense intended. The biologist, who is concerned with questions of physiology and evolutionary history, realizes that self-knowledge is constrained and shaped by the emotional control centers in the hypothalamus and limbic system of the brain. These centers flood our consciousness with all the emotions—hate, love, guilt, fear, and others—that are consulted by ethical philosophers who wish to intuit the standards of good and evil. What, we are then compelled to ask, made the hypothalamus and limbic system? They evolved by natural selection. That simple biological statement must be pursued to explain ethics and ethical philosophers, if not epistemology and epistemologists, at all depths. [page 3]

In that same book, Professor Wilson also wrote:

Self-existence, or the suicide that terminates it, is not the central question of philosophy. The hypothalamus-limbic complex automatically denies such logical reduction by countering it with feelings of guilt and altruism. In this one way the philosopher's own emotional centers are wiser than his solipsist consciousness, "knowing" that in evolutionary time the individual organism counts for almost nothing. In a Darwinist sense, the organism does not live for itself. Its primary function is not even to reproduce other organisms; it reproduces genes, and it serves as their temporary carrier. [page 3]

The suggested Christian correction here is that the organism can change the expression of its genes and that organism lives not for genes alone but rather for the family-line, genes and communities. But, again, the main line of narrative of sociobiology is correct.

Self-centeredness, whether it leads to hedonic values or the dark and wrongheaded forms of existentialism, leads to erroneous conclusions and

also to unbalanced expressions of genes controlling the immune system. Those who hold to greater purposes, to the purposes of their genetic family-lines in the true if incomplete terms of sociobiology can be as happy as the self-centered pleasure-seekers and also can have healthier immune systems.

See Chapter 281, *Social and Biological: Being Honest About the Basics of Human Nature*, for a discussion of the sociobiological insights set in a greater, strongly Christian, context. For a take on human being in its entirety, you can download *A More Exact Understanding of Human Being* [53].

## 303 Communal Being and Communal Sin

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1690>. It was finished and uploaded on 2013/09/09.]

My understanding of communal being is more exact and more explicit than the traditional understandings of our social natures. This is to say that traditionalists are vague enough about their understanding of our communal ties that they sometimes speak as if not so far from various sorts of radical individualists. No matter how committed to communities as far more than just voluntary gatherings of individuals, they have little in the way of concepts and words to talk about communities as being real. All it takes is to acknowledge each of us has communal being and we're on a different plane of understanding.

How can this be? Is there some magical and invisible stuff which ties us into true communities?

We are entities created by relationships, starting with God's love for us. We are entities shaped by relationships, including very importantly the love our mother bears for us when we are in her arms and we suck at her breast. Our beings are altered by these relationships, as I've claimed in various writings. See two of my freely downloadable books for reasonably complete views of my understanding of our human nature: *Human Rights: An Evolutionary and Christian Perspective* [47] and *A More Exact Understanding of Human Being* [53].

Human being is both individual and communal.

We sin as individuals. We sin as members of communities and are tied into even the sinful communal acts we disapprove of and maybe fight against.

We inherit some share in the sins of our fathers and the sins of our neighbors and those of our leaders. More than that, those sins lie upon our communal beings as our individual sins lie upon our individual beings.

If we tolerate or even prefer leaders who lie or wage criminal wars, those sins are absorbed that much more deeply into the deepest regions of our beings. If we nurture jingoistic rage or ecstasies in our individual selves and our communal selves, if we ignore or downplay the damage we do in the rampages generated by those rages and elations, we commit mortal sins and willingly take on evil characteristics. How many cheered or at least felt good as they watched us pulverize Baghdad and then went to church the next Sunday, feeling so good and holy and not even realizing that Catholic and Protestant traditions both teach that such a direct attack on a civilian target is a major sin?

Being a member of a community is to be part of multiple organs or cancerous organs or parasites of the Body of Christ as it develops in this mortal realm. You are shaped as members of communities and, if some of your communities do evil—certainly if they celebrate the evil they do, you are being shaped as a member of a community which is evil. There are few, if any, morally pure communities, but we who are adults in 2013 have lived through a period when we have, unless willfully blind and ignorant, learned that Lord Acton was right in warning about the dangers of power. In Chapter 445, *Are Serious Historians Conspiracy Nuts?*, I wrote:

Lord Acton had said, “Power tends to corrupt and absolute power corrupts absolutely,” and also had noted that powerful and centralized governments tend to attract men with the moral characters of gangsters.

It’s hard to separate ourselves from most of our human institutions and sometimes worse than staying and trying to protect your own self and those around you as much as possible. We have to morally muddle along at times and even to fly blind at times.

There is a small example of our moral decay which says much about this issue. Students in religious education no longer memorize Bible verses. Students in public and other schools no longer memorize important speeches or parts of the *Declaration of Independence* or the *Constitution* of the United States. Instead, they go home to fill their empty memories with biographical knowledge of disordered cretins in the entertainment industries; they

fill their hearts with the lyrics of songs about sexual violence and recreational drugs and disordered teenaged anger; they shape their habits to their own immediate desires rather than learning the habits and customs of their traditions.

As for me, I make a deliberate effort to read good historical books and also biographies of great political and military leaders even when I grow weary of the subjects of government and economics and warfare. They had clay feet and a normal, but usually not excessive, share of moral failings. I pray the Psalter (by way of the traditional liturgy of hours), go through periods of reading the Bible and the writings of holy men and women. I try to fill my head with what is good and noble, to shape my habits and other acts to what would make my better ancestors proud.

When modern men and women fill their own beings with trashy thoughts and feelings, when they allow their children to be also filled with trashy thoughts and feelings, they show they are truly brothers and sisters, voluntarily share the communal being, of the political and military and business leaders who have committed so many crimes and other sins in recent generations. Too many modern men and women shape their own selves to desire what is morally unhealthy and then claim they're good men and good women and on their way to Heaven, so long as they sit and cheer for war-crimes and violent sports rather than committing crimes with their own bodies.

They are members of the modern herd which moves to the rhythms and words of a great civilization sunk into moral degeneracy.

## 304 What Makes a Male, Genes or Developmental Accidents?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1698>. It was finished and uploaded on 2013/09/30.]

What is a male? Is any human being with XY genes a male—the ‘Y’ chromosome being the carrier of genes which mostly lead to male development and the maintenance of male characteristics? (There is a recent discovery that the ‘X’ female chromosome actually can play a role in the development of males; this might greatly complicate the issue.) So, what is necessary for one who is fully and obviously male? Do environmental factors influence male-ness? Maybe we should consider epigenetic processes? (See the *National Institutes of Health* web-page on *Epigenomics* at <https://www.genome.gov/27532724> for some background on this important complication which is neither quite ‘nature’ nor quite ‘nurture’ as those terms are conventionally used.)

I discussed this and related issues in a Christian context in Chapter 299, *Sex and Categorical Reasoning in a World of Evolution and Development*, but I wanted to give notice to an article published by Ed Yong in early September, *The Tenuous Beginnings of Men* at <http://phenomena.nationalgeographic.com/2013/09/02/the-tenuous-beginnings-of-men/>. This article discusses an interesting and disturbing phenomenon in which a genetic male carrying a particular mutation in a specific gene which is a “master switch” for the masculinization processes might or might not develop into a fertile male; if not, the embryo will develop into an infertile and partially developed female. Yong has this to say about the somewhat disturbing news (which was actually known before but some scientists have now provided a good explanation of

the workings of this defective switch):

Daughters inherit many things from their fathers, but a select few get something unusual—a Y chromosome. Women typically have two X chromosomes while men have an X and a Y, but some XY people are born with female genitals and a uterus. They’re almost always raised as girls from birth, and their hidden Y chromosome only becomes obvious during puberty. That’s because they don’t develop working ovaries, and without these organs providing a flood of hormones, they don’t menstruate, grow body hair, or develop larger breasts on their own. They’re also sterile.

This condition, known as Swyer syndrome, is often caused by changes to SRY, a gene on the Y chromosome that acts as a master switch for maleness. Human embryos develop into females by default, but SRY diverts them from this course. It switches on many genes that transform an embryonic ridge into testes instead of ovaries. But SRY can pick up mutations that interfere with this role, and prevents it from launching its male-making programme. As a result, embryos develop into baby girls despite their Y chromosome.

But sometimes, fathers and daughters carry identical copies of SRY. He develops into a typical fertile male. She grows up as a sterile female. How can this be?

The interested reader can follow the link to the article for the easy-to-follow scientific explanation. I’m trying to understand why God would have created a world, why He would be telling a story, in which such disturbing strangeness can occur. Didn’t He create them male and female? Does He create some of us as male only to let them fail to develop as males?; being genetic males though having a specific genetic problem, those XY human beings also fail to develop into females: “[T]hey don’t menstruate, grow body hair, or develop larger breasts on their own. They’re also sterile.”

This most certainly doesn’t argue conclusively against traditional sexual morality and may not argue against it at all in the end—my personal belief at this point, but it does demand of us a different, more complex story of human being, a story more consistent with empirical reality, a more “exact”

story truer to reality. (There is also an issue of humane understandings of the sexual development problems or non-conventional sexual attractions.)

My use of “exact” comes from this quote:

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man. [Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: “Broadening the Horizons of Reason. Prospects for Philosophy”.]

We need to pay closer attention to God’s story, out of respect for our Creator and out of respect for our individual and communal selves. (Those seemingly different forms of respect actually overlap a lot given our creaturely natures.)

We can only write our currently best version of God’s story, that is—come to a plausible understanding of God’s Creation, if we accept empirical reality and tell the story so that this world is within that reality and Creation as a whole contains this concrete realm of being. This story must be plausible in terms of current knowledge of empirical reality rather than plausible in terms of ancient or Medieval knowledge of empirical reality. We will be able to write this story only as we begin to understand modern empirical knowledge in light of our very small stock of Christian truths. If we do it well, that story will be the foundation of a new Christian civilization or, equivalently, form the basic thoughts and understandings of the citizens of that civilization.

# 305 An Enriched Moral World Makes for Enriched Human Beings

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1735>. It was finished and uploaded on 2013/12/03.]

I begin by reminding myself and my readers that all of my thoughts, even those of a moral nature, are based upon my particular understanding of created being and Creation as a whole, an understanding I have described as an updated Thomism or a relation-centered existentialism. In a sense, I view reality through the eyes of:

- a St Thomas Aquinas who anticipated modern scientific understandings of human nature and the human mind—see Chapter 83, *Is Christian Morality a Natural Morality?* and succeeding chapters in Part III, *The Human Mind as a Re-creation of God's Creation* and
- St John the Apostle's who taught us that relationships (ultimately love) are primary over stuff and did so centuries before the radical quantum theorists taught us that same principle though mostly dealing with physical objects—see Chapter , *A Christian View of Einstein's and Bohr's Debate on Reality* and other chapters in Part IV, *Love and Stuff*.

In Chapter 468, *Christian Traditionalism: Moving With God's Story*, I claimed that Christian thought can be brought into line with Creation, a manifestation of certain thoughts chosen by God and expressed in narrative form, a place of evolution and development and then once

again quoted the historian Carroll Quigley—see [http://en.wikipedia.com/wiki/Carroll\\_Quigley](http://en.wikipedia.com/wiki/Carroll_Quigley) for background information:

The truth unfolds in time through a communal process.

Right now, the truth is emerging in a communal process from which the Church and the ruling elites of the West and many other communities are staying aloof. Over recent centuries, we've seen great advancement in understanding various realms of Creation. Physicists and chemists, biologists and sociologists, novelists and poets, painters and architects, and many others, have explored reality and experimented more than a little. Not all of it has been successful, even in the hard sciences where verification and replication can eliminate a lot of spurious or fraudulent results. Theologians and many philosophers, clergymen and teachers, politicians and managers have tried to cover up any evidence that their ways of thinking and feeling and acting are inadequate to our world as we now know it and as we inhabit it.

As we understand more deeply and more broadly, the human mind will change rapidly because it is an encapsulation of our successful responses to our world and the abstract realms from which this world was shaped. As mankind learns more, the individual intelligences of men and the intellects of human communities reshape themselves in response—not to the new knowledge as such but to reality as mediated by that knowledge.

I've been making efforts to provide a deeper understanding of created being, including human being in its moral aspects. This loosely defined project seems to be maturing in some sense though it might take a year to produce a book representing even the first overview of a new understanding of human morality, itself pointing to the moral purposes of God in His freely chosen role as Creator of this particular Creation.

Human thought can be enriched by new knowledge. The world as understood by human beings changes and we change as a consequence. Yet, we can also change the world in objective ways. Our power to so change the world is far less than that of the Creator but it is a significant power in a local way, at least under some definition of 'local'. Human beings both widen their responses to created being in this thing-like world and also begin to respond to other realms of created being, such as that of abstract mathematics or that of the possible forms of substantial being which lie on

the other side of the event labeled the ‘Big Bang’. In the process we change ourselves, other creatures around us, and the world we inhabit.

This new knowledge can be new empirical knowledge, in which I include much of mathematics. It can also be new speculations, which may lead to a new understanding of old knowledge or an integration of new knowledge; that knowledge reworked, in a manner of speaking, by speculation might include revelations from the Bible or by way of the Christian Church—however understood.

The world changes, becomes a new place.

We shouldn’t underestimate the effects of these changes on human nature, our individual natures and the nature of the Body of Christ. We are born raw stuff and become more particular human animals, and maybe even human persons, by proper responses to what lies inside of us and around us. As our understanding changes—of our own selves, individual and communal, and of what lies around us—we change in an objective way. We aren’t better revealed in the way of a magician revealing a card—we are responding to Creation in a different way, richer and more complex, than before learning more about Creation. We can learn more about the viewpoints of those in other cultures or times; we can learn more about politics or history or literature; we can learn more about technology or mathematics or space sciences; or we can learn more by acquiring skills of playing the piano or painting landscapes or making furniture and thus learning more about our bodies and about the stuff around us.

During the times of rapid change in human accomplishments of all sorts, the more creative among us come to the fore—or maybe are prevented from doing so in societies refusing to change, choosing death over new forms of being. During these times of change, established knowledge and traditional forms of understanding have been overrun by what is newer and not yet fully made a part of our understanding. One of the major problems with modern Christianity is that neither the leaders of Christianity nor the ordinary believers have much respect for truly creative thinkers. As we pass through a period of dealing with knowledge about a richly complex Creation, those leaders and believers are seeking simple explanations; in this they are no different from most human beings confronting a world they don’t understand. I read recently that Zbigniew Brzezinski noted that American Exceptionalism can be seen as a response to the American entry into an international sphere which we don’t understand. I’d add that we don’t try very hard to understand and just go for the simple explanation: all these

problems can be solved in simple ways if only everyone would listen to us Americans. Since they don't listen to us, we'll go over there and rebuild their countries and any resistance will show they're evil, that they hate the simple goodness that is the Land of the Free and the Brave.

Facing up to the complexities of reality seems a much better option and a more pious response since the Creator is the one who works with quantum events and the bending of spacetime; it is the Creator who tells our story in part by way of evolution, so nasty and bloody at times. We should not think our inherited understandings are inherently better than what can be developed from proper speculation upon modern empirical knowledge. After all, the best of those traditional understandings come from human beings such as Isaiah and Jeremiah (great political analysts) and Plato and Aristotle and Augustine and so forth. They are the results of magnificent human speculative efforts working on available understandings of the Bible and also available understandings of the empirical world. Even our understanding of God's revelation that He is Father and Son and Holy Spirit in one God is colored by the thoughts of not only Paul the Apostle but also Athanasius and the Cappadocians and Augustine and so on.

How many the agents who bring us these new understandings: poets and prophets, theologians and philosophers, physicists and novelists, biologists and historians, and so on. Architects and painters and furniture-makers and road-builders at least strengthen ongoing trends and may well be responsible for moving into new territories—for good and bad as is true of all creative efforts, conscious or unconscious.

In past generations, these changes often happened as if by magic; we can call it the magic of the Invisible Hand. In fact, that will ever be the ultimate situation in this mortal realm and perhaps even in Heaven: as we act, the results will be unforeseeable but often have been more richly interconnected human communities, cultures and civilizations gaining some proper or hubristic control over nature by way of first disciplining our individual and communal selves to some sort of higher and better moral order. We must act according to the best standards of our age. We must act in unison with our feelings and our thoughts; we must move forward as unified individuals forming relationships which give us also the stuff of unified communities. The Body of Christ is the ultimate community, the one we should always keep in mind and heart and even hands.

Let's see if we can figure out some better and more exact ways to talk about our current situation and what we can do about it.

## 306 Enriching Our Moral World: Maybe Size Does Count?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1749>. It was finished and uploaded on 2013/12/18.]

The reliable science-writer, Ed Yong, published an article in November of 2013, *Bigger groups mean complex cultures* found at <http://www.nature.com/news/bigger-groups-mean-complex-cultures-1.14158>, which leads off with the insightful paragraphs:

Humanity's success depends on the ability of humans to copy, and build on, the works of their predecessors. Over time, human society has accumulated technologies, skills and knowledge beyond the scope of any single individual.

Now, two teams of scientists have independently shown that the strength of this cumulative culture depends on the size and interconnectedness of social groups. Through laboratory experiments, they showed that complex cultural traditions—from making fishing nets to tying knots—last longer and improve faster at the hands of larger, more sociable groups. This helps to explain why some groups, such as Tasmanian aboriginals, lost many valuable skills and technologies as their populations shrank.

“For producing fancy tools and complexity, it’s better to be social than smart,” says psychologist Joe Henrich of the University of British Columbia in Vancouver, Canada, the lead author of one of the two studies, published today in *Proceedings of the Royal Society B*. “And things that make us social are going to make us seem smarter.”

In this study, ‘group knowledge’ was better passed on when there was a greater number of instructors and a consequent greater variety of ways and levels of competence in models of how to do things. I think that, more generally, we’re looking at a better group memory when we have a richer body of instructors or, probably, a richer body of accessible knowledge in various forms. Another way to state matters is that individual intelligences might remain the same when men gather in groups, large or small, but the intellect of a larger group will be greater, all else being equal. For an explanation of individual intelligence and intellect, see Chapter 127, *Intelligence vs. Intellect*, which was a response to Jacques Barzun’s *The House of Intellect* [7], a book which deserves to be republished.

In Chapter 638, *We Need to Act in the Spirit of St Benedict, Not Just to Mindlessly Repeat His Acts*, I discussed this issue in terms of a Benedictine response, viewed as at least a partial retreat from an increasingly disordered West. I consider the Benedictine response to the collapse of moral order in Rome to be first of all a spiritual response putting God first and doing what was needed to advance this story God is telling: the growth and maturing of the Body of Christ so much as that can happen in this mortal realm. While retreats from a greater society might sometimes be necessary, there is always a very big price to be paid. In addition, it occurs to me how strange it is for Christians to be retreating from a Civilization built by Christians for Christian purposes; maybe we Christians should have worked harder to maintain and advance Western Civilization so that it might have remained ours.

# 307 Modern Ideologies as Misunderstandings of Human Communities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1785>. It was finished and uploaded on 2014/03/09.]

In Chapter 141, *A Brain Shaped to Geometric Thought?*, I responded to evidence that the brain does abstract from physical distance to derive, for example, an idea of emotional distance. This isn't a matter fully understood, though the scientists seem to believe, as do I, that human beings have learned to unconsciously and consciously use the physical skills of their brains to abstract from distance in such a way as to make it a powerful source of metaphors and I'd even say a source of metaphysical insight. I'd say that this process works because distance is a concrete manifestation of abstract forms of mathematical being which are also part of Creation. Those abstract forms can be made a little more concrete as emotional distances or the distance between the states of being of a complex system including those such as human communities which are far from fully quantifiable.

Our use of distance in the abstract, distance between points or regions of abstract spaces, is a very deep matter indeed and one which has proved to be of great use and also fruitful in truths. We are able to design machinery, regulate oil refinery production to supply and demand involving complex groups of possible products, carry out certain analyses at the highest levels of theoretical physics and chemistry, conduct with a lot of qualifications some good analyses in politics and other social sciences, and so on. From there, we have learned general skills of abstraction, abstract skills of generalizing.

So it is that I set out, with my tongue lightly in cheek, to first ask: What is patriotism and what is jingoism? This is a specialized form of the question: what is a good and disciplined way to describe and analyze the processes by which individual human beings come together to form communities?

The sociobiologists, such as E O Wilson, present solid arguments that our tendencies toward moral behavior are part of our physical makeup, selected over the years to improve the chances of successful reproduction of the genes of our <b>family lines</b>, not of our individual selves. Whether or not we feel close to our families, we tend to act in their ‘Darwinian’ interests because we are made to endure even great suffering to help bring children into the world and to help raise them so they can bring more children into the world. And so on. We act in favor of our family-lines (far more accurate than speaking of genes which are only part of our makeup) largely because of intermediary factors, such as sexual desire. When we speak of family-lines instead of genes, this is very similar to the view in the Old Testament. I discuss these issues in a little more detail, from a Christian viewpoint, in Chapter 286, *The Body of Christ: A Christian Sociobiology*, and Chapter 289, *Sex, Traditions, and the Modern Scientific Materialist*.

True morality rests upon that physical foundation, genetic and somatic and relational, but has been subjected to various selective processes at the social level. Great thinkers and saints can present new possibilities but these are then subjected to those various selective processes of God’s world, selective processes which—after all—produced the likes of Isaiah and Jeremiah and the Buddha and Socrates even before the Son of God became incarnate as a man. Aristotle was a noble gentleman of the ancient Greek sort and gave true nuggets of wisdom to mankind as well as a system which is worth studying but is not true by Christian standards. (See the writings of Alasdair MacIntyre for the gory scholarly details.) Taken naively, the current trends of history would indicate that Christian teachings are also fading in importance; certainly, Christian civilization seems to be close to flatlining. This is but one sign of the failure of Christian intellectuals and Christian leaders in general to deal properly with the questions of the modern age; we live in a world described by Darwin and Einstein and their successors, we Christians profess belief in a system of thought in which the Creedal truths have been combined with a largely early modern view, in part ancient and Medieval views, of God’s work as a Creator. With a few notable exceptions, such as Joseph Ratzinger, few Christian religious thinkers or

teachers take science seriously outside of liking those shows about the so-called Big Bang—which they often misinterpret as a creation event rather than a phase change. Spiritual books and homilies give the impression we are descended from a couple who were part of a special creation rather than being descended from an ancestor common to men and chimpanzees. Those two stories imply radically different understandings of sin and other aspects of human nature.

In any case, we are bound primarily to those in our family lines and bound with decreasing strength to those who share our genes to a lesser extent. Sort of. This is to say that genetic relationship can be coherently argued, as Wilson and others have done, as the primary factor in the binding of living creatures into various sorts of favorable activities toward one another right up to the behavior of social creatures which can be labeled as ‘moral’.

We don’t have the ability to detect genetic relationships directly though there have been research claims that, as one example, human beings detect (by smell?) enough about each other’s immune systems to bias them toward mating choices which might be more likely to produce children who survive diseases and parasites. Yet, I’d say it seems most likely for now that we ‘detect’ close genetic relationships by way of observing facial and other external features and by way of being familiar with other persons at a young age, but too great a familiarity activates an instinct against incest—not an all-powerful instinct, at least not at a conscious level, since Abraham and some Pharaohs married half-sisters or sisters and many in history, including Charles Darwin, have married first cousins.

On the whole, this issue of the evolution of moral nature is a problem for idealists. Moral nature and abstract thoughts, if not the moral creature and abstract thinker, will remain—if only implicitly—in the domain of non-being or special creation long after other forms of dualism die. I recommend we take seriously the idea of a self-contained Creation, a realm of created being which we can’t escape. In particular, I claim with no qualification that created being lies upon a spectrum of abstract to concrete, with concrete forms of being coming into existence largely as the result of ‘abstract’ relationships. Human communal being is real—the Body of Christ is real—even if a bit more abstract and somewhat invisible to creatures yet in this mortal realm; yet, we can conceive with our minds what our eyes can’t quite perceive if we but acknowledge the reality of what lies in front of us.

Much of what happens to bind us to others and into complex communities doesn't involve signs of any sort of direct kinship but rather is the result of proxies. The oversized and soft eyes found in mammal babies draw us toward human babies in our own communities and also toward puppies and bunnies and even calves. Some evolutionary biologists have argued that romantic love between mates, found in various species but most explicitly in humans, is the result of a transfer of that love of one's offspring to one's mate. If this were true, it would be plausible human females with such crippling gestations and giving birth to such slowly developing babies might be selected to have many of the characteristic of youngsters, large and soft eyes as well as soft skin. This would tie males to them more strongly. The (quite defective) monogamous nature of human beings, even males who would seem to have better reproductive strategies if we watched most other species, is itself an evolved human behavior which is not the result of morality but rather leads to moral rules reinforcing successful reproductive behavior. That there might be a divine purpose taught to us by Jesus Christ and taught since then by the Christian churches doesn't undo the path behind us as I tried to warn my fellow-Christians in Chapter 643, *Repeat After Me: The Church Has Accepted Evolution and Our Ancestors Were Sex-Crazed, Killer Apes*.

This is deep stuff, not simply the rearranging of the deck chairs which most Christian thinkers engage in when dealing with moral and social and political and theological issues. It requires a lot of study of modern empirical knowledge, a lot of contemplation, and a sustained effort to develop complex and long lines of thought.

For now, let me leave this part of the puzzle of community-formation by claiming we are drawn to form communities with others by a force which is actually our desires and is stronger as genetic relationship (by way of various proxies) grows closer though the distance measurement is likely complex and the basic metric of the state space might make the metrics of the two theories of relativity look quite simple in comparison. (In fact, I'm beginning to wonder if the concepts of state-space and metric might need generalizing, though not sure what that might mean.)

We are looking at a situation where evolution has produced tight bonds between human beings closely related. This isn't a situation entirely promising from the Christian viewpoint. Secularists in the post-Enlightenment world are in the same boat—partly because modern secularized views are little more than diluted or deformed versions of Christian teachings, though

sometimes becoming photographic negatives of a sort. How do we move toward an inclusive Body of Christ if we have strong desires to, for example, protect and nurture our own children even at the expense of the children of human beings relatively far away in physical distance and distances of other sorts? It doesn't work to do what Christian leaders and charitable groups are inclined to do—throw together human beings from a variety of cultures and ethnic groups and pray that brotherly love develops—see Chapter 275, *We Prefer to Cooperate With Those Like Ourselves*, and Chapter 218, *Networks of Public Spaces Rather Than One Square* for discussions of some sobering facts about multicultural neighborhoods as discovered by Robert Putnam, a Harvard professor and collectivist liberal who was very upset with his own research results.

We shouldn't even think of despairing because there are various ways in which the various bonds of human communities can be extended in sometimes modest ways which can be powerful over a long enough time. Yet, we should respect nature, moving forward slowly and carefully; history tells us of many occasions when groups seemed to have assimilated to a common culture but genocidal rampages or lower-level violence interrupted those movements toward multicultural Heaven on Earth.

In analogy to modern theories of gravity and consistent with what I said above about the metrics of state-spaces, I'm proposing that our deepest inclinations, those treated by sociobiologists and brain-scientists, cause our social state-space to bend, causing us to slide toward great masses; if we passively allow ourselves to slide close to that great mass or if we fail to successively struggle against the slide, then we add to that mass and help to further bend our social spacetime. As we merge into that mass, we perhaps will even change what had been deeply held moral beliefs. The attraction between human beings is inside of us and likely doesn't produce anything physically detectable, like an electromagnetic field or a spacetime bent near a black-hole, but that attraction is real and so are the communities which result if we respond properly to our attractions to other human beings. Again, abstract being is real including invisible sorts of attraction between human beings.

A theory should be as abstract as necessary but no more abstract and it has to abstract from a realistic understanding of concrete being as we know it—of course, we can also build upon existing abstractions which we accept as at least plausible. Download *A More Exact Understanding of Human Being* [53] for a summary of my understanding of human being

in the concrete and the abstract. This understanding is the foundation of my ongoing efforts. In particular, I discuss both individual and communal human being.

What is the difference between legitimate patriotism and the illegitimate form of patriotism which we can call 'jingoism'? I think the problem is somewhat similar to that of sexual love and sexual lust and greatly similar to the common failure for communities to distinguish between truly dangerous aliens and aliens who could be accepted as trusted friends or neighbors.

Patriotism is dominated by processes of inclusion, of bonding, of concrete attachments, though the alien can't be admitted if he endangers what it is that the patriot loves—that alien must be loved as a Christian brother, or at least a fellow human being, at a distance. Jingoism is dominated by processes of attraction toward oddly abstract ideas or entities, ideas and entities which often have a doubtful reality—some abstractions are delusions rather than real abstract being. On the human level, jingoism is dominated by process of exclusion, of refusal to bond beyond a certain population of human beings and institutions accepted as friendly and trustworthy and worthy of something akin to love. I suspect that ethnic forms of jingoism develop largely because groups are pulled together and begin to push against or hate the other when there are too many differences in culture or appearance—as noted in the essays about unwise forms of multiculturalism I referred to above.

So let's move forward and try to find a way of thinking and speaking of patriotism and jingoism, that we may test my claim that modern ideologies, including some of the "good ones", are based upon misunderstandings of human communities, typically the denial of the reality of human communal being.

In Chapter 418, *As Go the Immune System and Neurological System*, I discussed the speculations by evolutionary biologists that the immune system spun off the neurological system. After all, "that primitive immune system was largely a set of cells which tried to distinguish between 'self' and 'non-self', between what was supposed to be inside that particular organism and what was an invader. Somehow, that effort to distinguish between 'self' and 'non-self' led to a central nervous system, ultimately thought, as well as to defenses against diseases." I went on to discuss how government might well be something like an immune system in human communities and to ask "[a]s we mature towards the Body of Christ, is our government going to split into a policing (immunological) system which operates with some

independence but under conditions where it has only as many resources as it needs for the task at hand and a planning and thinking (neurological) system which plays a role in the ongoing functions of the parts of the Body but also plays a central role in understanding the environment of that Body and planning for the future?"

Here's where I see a problem in radical forms of liberalism, including libertarianism: it denies the reality of communal human being. Thus it sees no cultural ties or heritage which are beyond voluntary acceptance or rejection, not even that of families. Some might think that the more modern collectivist liberals have adopted a belief, a poorly formed belief perhaps, in communal human being, but this would be wrong. Collectivist liberals try to force individuals into tight relationships controlled by central powers, but the forms—if not always the reality—of those relationships are contractual and voluntary, deformations of the relationships accepted by classical liberals but essentially the same. Modern collectivist liberals and the citizens of societies they control travel as herds but those herds don't honestly respond to objective reality, in terms of immediate experiences or in terms of disciplined traditional knowledge or modern empirical knowledge. Those herds change direction, change relationships between the members of the herd, mostly according to changes in opportunities to feel good about themselves. The classical liberals, including libertarians emphasize the individual's feelings of self-goodness while the collectivist liberals, including modern warmongering 'neo-conservatives', emphasize some sort of shared but not truly communal feeling of self-goodness and recently this has decayed into outright jingoism.

Yet, I think even those who fail to recognize the reality of communities desire to belong to some community or communities which might exist only in their dreams or in something they read, perhaps in the books of Isaiah or Matthew. I maintain that this desire comes from the most basic level of what we are as human animals, before we're even able to consciously evaluate the goodness or badness or mediocrity of communities—probably some are never able to do this in an intelligent manner.

I'll end by pointing out that my understanding of human being as individual and communal, both real and not just ways of speaking, slowly emerged after meditating upon the insight of the philosopher Kurt Hubner that the real debate between Einstein and Bohr over the nature of reality was: "Einstein was claiming that reality consists of substances which remain unaltered by their relationships with other substances while Bohr was

claiming that it is the relationships which are primary and those relationships bring substances into existence.”

See my short discussion of this issue in a chapter coming from one of my first internet writings: Chapter 156, *A Christian View of Einstein's and Bohr's Debate on Reality*. I point out the similarity of Bohr's 'radical' position to the teachings of the school of St John the Evangelist in a chapter based upon another early essay: Chapter 157, *Quantum Mechanics and Moral Formation*.

# 308 Unreliable Memories, Minds Like Silly Putty

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1795>. It was finished and uploaded on 2014/03/28.]

In Chapter 502, *We Need All Sorts of Mavericks in This Dynamic Creation*, I argued the need for certain sorts of flexible and creative thinkers to respond to new opportunities and to deal with problems which have developed in our understanding of Creation or any significant part of it, such as the understanding of human origins and the reasons we are as we are. In this essay, I'll be dealing with the need for certain types of what might be called reliable thinking on the part of all morally responsible citizens of this world. The meaning of 'reliable thinking' will be developed in the rest of the essay.

It takes a healthy mind to make serious sense of the world about us, however provisional and ephemeral that sense might be. Reality is what it is, what the Good Lord created it to be, modified by His acts and ours and those of other creatures to the extent of freedom exercised by various creatures, from the limited freedom of a bacteria to the moral freedom of social mammals such as wolves and gorillas right up to the self-aware and self-critical moral freedom allowed to human beings. The world, even insofar as we contribute to its being, dictates to us. We don't impose our ideas upon the world which is a story being told by God. This doesn't mean we are powerless; it does mean we, so to speak, must play the game by its rules, by rules laid down by God, by rules which must be read out of the game as it is going on.

Without memories which correspond to reality—though not necessarily memories accurate in the way of computers or of scientific recordings—and

without minds which can make some sense of what goes on around us in terms of that same correspondence to reality as we know it up to that time and as we update it based upon the experiences of that time, we are confused puppies in a world grown awesomely complex in terms of huge and varied human communities and in terms of a physical universe we now are forced to deal with on terms of modern science and technology. Simple world? We have houses filled with devices designed allowing for quantum mechanical effects, hospitals with diagnostic equipment which also considers relativistic effects. We are starting to diagnose disease, and very tentatively to treat disease, by use of genetics. I'll mention only one community problem: the American democracy, and most others, are farces in that so much is decided and perhaps has to be decided by political machines well before the voters march into the booths to choose between Tweedle-dee and Tweedle-dum. The reality of our political situations in the modern West is a bit different than what we pretend.

Some of those mavericks I discussed in Chapter 502, *We Need All Sorts of Mavericks in This Dynamic Creation*, need to get to work on these problems, but there are some steps we could take in the context of our current mess to at least minimize the damage we do to our own individual selves, to our communal selves, to our children, and to the rest of the world. Taking these steps will require more awareness of reality as well as more moral courage than men and women of the West have shown in the past couple of centuries.

I speak of 'practical' steps we can take, but choosing the path we step along will require abstract thinking as well as practical thinking and the application of proper habits. I'll speak a little to the nature of abstract thinking before moving on.

The adoption of abstract modes of reasoning, which I think to have developed in a recognizable and self-sustaining form in the fifth or sixth century before Christ, has not gone so well. In fact, with the modern return to barbarism as described by Jose Ortega y Gasset (*The Revolt of the Masses* [60]) and others, we have perhaps regressed more than a little over the past two centuries. See Chapter 260, *Much of Our Knowledge, Much of Our Thinking, Much of Our Moral Structure Lies Outside of Us*, where I wrote:

I'm not really pessimistic—in the long term. In *The Revolt of the Masses* [60], Jose Ortega Y Gasset told us the growth

in prosperity and changes in attitude freed men from parochial lives but only tainted good had come of that release from restrictively local lives. The leaders of the West failed to even try hard at fulfilling their duties to teach the wisdom of the West to these masses or to help them to mature into morally well-ordered adults in this radically new historical situation. Few, if any, leaders rose from the masses themselves to try to develop the sorts of moral characters and minds which could bring about moral order in the new communities which were growing up willy-nilly.

God's story moves forward. The Body of Christ is forming slowly by painful processes. Some legitimate organs, such as the American government, have decayed into cancers or parasitic organisms preying upon the greater body. The human race which is the mortal stuff of that Body is only reluctantly, and under great pressure, accepting the need to mature and to grow into something not yet seen. We will move forward along with God's story. What choice have we?

Early in the 1800s, Jefferson was claiming that the hardheaded skepticism of illiterate peasants in Europe had become in most Americans an invincible ignorance based upon "a perverse form of literacy." The still bigger problem was the loss of any desire to work to reach higher levels of reading skills or reasoning skills or storytelling skills or general understanding of Creation or any substantial part of it. Apparently, a people who came suddenly into a prosperous state in the midst of a civilization which once existed largely in the Cathedral cities and some courts didn't understand what a civilization is. They knew nothing of the sheer human effort of building and maintaining that civilization—most of that work occurring in the true foundation of a civilization, the minds of its citizens. The technology necessary for the physical infrastructure of a civilization can be grasped by such a people as Americans, but the moral and political infrastructure is transparent to that people. Morality, especially when it was still in its strong and traditional form, seemed as much a part of nature as the desires and needs it helps to bring into a proper order for practical as well as spiritual purposes. One particular aspect of this problem I've explored in depth is the need for an understanding of the world, of all of Creation for Christians. A true civilization is an attempt to live out a story

corresponding to a people's understanding of their own role in some great scheme of things.

To be sure, those who came from parochial and uneducated populations have acquired skills and understanding sufficient to read advertising copy or fill out most forms even to doing the arithmetic of tax forms; they have developed some interestingly dangerous skills to manipulate virtual objects on a screen and to drive cars or airplanes. They have not learned to evaluate the quality and reliability of information; they have not learned how to browse the shelves of a library to find at least good background books (even biased books often fill that role in a more than adequate way); they have not learned how to think in historical terms, that is, in terms of reality. The universities graduate a small number of dedicated and highly skilled historians and physicists and chemical engineers each year; the majority of graduates don't seem capable of finding their way to good information once they are no longer guided by professors or teaching assistants. Some of those in my family from my grandparents' generation left school at 6th grade but were capable of reading serious books, thinking through difficult lines of thought about this country's actions or the relationship between capital and labor, and had a healthy skepticism—not cynicism.

Modern inhabitants of what was once the great Christian civilization of the West have no abilities to look into the activities of their own minds, including memory formation. We have minds and memories ready made for manipulation by marketers of the latest and greatest in junk food and gadgets and even excessive versions of useful technology. In general, modern minds are somewhat like silly putty and there is some testimony from American thinkers over the past two centuries that we proudly led the way and I'd claim we still do so. We Americans are proud of our minds of silly putty. Push the mind of an American against a cartoon image and it picks it up, colors and all. The minds of men from other regions of the modern West seem little better in this year of 2014, though Jefferson had claimed to have seen that healthy skepticism in the French peasantry when he was resident in that country. According to Jacques Barzun, the French peasants who were literate in past centuries, apparently a higher percentage than we or Jefferson have imagined, could read books beyond the skills of modern day college professors.

This is a problem, an important problem. An alarmist might look at what has been done to the American mind and other minds since at least World War I when the fathers of corporate marketing joined with Wilson

to remove from the American mind the simple inclination to mind our own business. There are other strands to this story, the failure of Americans to live up to the promise of this country while pretending we have done so, but I'll only mention in passing the issues of education and desire for financial security. There are still other problems with the American mind and the underlying American moral character; I've discussed some of them in the past. In any case, the world was to be ours to improve as if it were a car engine to be tinkered with and made more efficient.

Serious thinkers, such as Tocqueville and Hawthorne and Melville, had already raised questions by the 1850s about the seemingly weak attachment that Americans had to any part of reality they didn't wish to recognize. Melville had considered it to be a rebellion against God, on the part of those brave and honest (Captain Ahab) as well as those cowardly and false-faced (Emerson and Thoreau and most Americans).

I'm going to respond to a couple of recent articles about how easy it is for experimental psychologists to manipulate the formation of memories or even the recall of true memories. These experiments are, to be sure, carried out in laboratories, that is—under somewhat artificial conditions, but there is a lot of substance to this work even when it involves a bit of showmanship worthy of Harry Houdini whose tricks were, in turn, as sophisticated as these of experimental psychologists. So far as I can tell, these experiments correspond closely to the real world, however stylized and (falsely) neat those experiments are.

Ed Yong lets us in on some truly weird science in an article, *Out-Of-Body Experiences Make It Harder To Encode Memories* found at <http://phenomena.nationalgeographic.com/2014/03/11/out-of-body-experiences-make-it-harder-to-encode-memories/>, about the effect of out-of-body illusions:

When Henrik Ehrsson tells me that his latest study is “weird”, I pay attention. This is a man, after all, who once convinced me I was the size of a doll, persuaded me that I had three arms, and ripped me out of my own body before stabbing me in the chest. Guy knows weird.

Ehrsson's team at the Karolinska Institute in Stockholm specialises in studying our sense of self, by creating simple yet spectacular illusions that subvert our everyday experiences. For example, it seems almost trite to suggest that all of us experience

our lives from within our own bodies. But with just a few rods, a virtual reality headset, and a camera, Ehrsson can give people an out-of-body experience or convince them that they've swapped bodies with a mannequin or another person.

These illusions tell us that our sense of self isn't the fixed, stable, hard-wired sensation that it seems. Instead, our brain uses the information from our senses to continuously construct the feeling that we own our own bodies. Feed the senses with the wrong information, and you can make the brain believe all manner of impossible things.

I've dealt with these sorts of interesting and disturbing experiences, some occurring because of stress or near-death experiences and some induced by experimental psychologists. The interested reader can check out Chapter 8, *Staking Your Faith on Gaps in Empirical Knowledge*; Chapter 250, *Preliminary Thoughts on the Evolution of the Human Mind*; Chapter 106, *So What if the Human Mind is a Product of Evolution?*; and Chapter 111, *So What if the Human Being's Mind is a Product of Development?*

In those essays, I claim that these sorts of odd events shouldn't be disturbing or shocking in a creature who develops his sense of self by various mapping processes occurring in the brain.

In the article, *Your Memory May Be Edited* found at <http://www.scientificamerican.com/podcast/episode/edited-memories/>, we learn:

Our memories are inaccurate, more than we'd like to believe. And now a study demonstrates one reason: we apparently add current experiences onto memories.

An author, in particular, would certainly not be surprised to learn about this mixing of past and current experiences in our memories. In fact, I'm dealing with this in a novel I'm finishing up and will be putting on my website for free download—perhaps in a month or so.

The article ends with words which might indicate real problems with human beings finding the truth about anything substantial or at least real problems in remembering the truth the next day:

The researchers note that recent and easily retrievable information “can overwrite what was there to begin with.” Consider that next time you hear eyewitness testimony.

All of this is interesting and very important and likely to be well-founded—Ed Yong is very reliable and *Scientific American* editors are generally reliable in vetting scientific work to ensure it was properly peer-reviewed and that the authors have taken adequate measures for others to reproduce the results. These revelations about the unreliability of our *individual* memories are truly weird. More objectively—they indicate to me that we don’t form objective memories so much as we write our own story and the stories of our communities and even a story of our entire world and are constantly revising those stories to reflect something which impressed itself upon our memories.

But. . .

What is to be done?

To a certain extent: nothing different from what we’re already doing. Scientists have known for centuries our direct observations of nature cannot be taken for truth. Various disciplinary ‘tricks’ are used even for casual observations and measurements and instruments along with elaborate statistical analyses are more typically used. Medical clinicians and novelists and musicians and machinists have been adjusting their efforts for centuries to compensate for wrongful perceptions of various sorts. Over the centuries historians have especially made various successful and unsuccessful efforts to adjust for a variety of biases, including those prior assumptions that blind a researcher or theorist to even obvious facts or lead them to exaggerate the importance of other facts—which may, in fact, be illusions or delusions. In ways sometimes similar to those of novelists and poets and musicians and sometimes similar to those of scientists and technologists, some philosophers and theologians have also tried to adjust for temporal and spatial and cultural distortions, generally for the weaknesses and imperfections of communal perceptions as well as for those of individual organs—eyes and ears and brain.

What’s remarkable is our ability to be aware of our weaknesses and incompletenesses, our errors of omission and commission. This comes about when we are properly objective, that is, when we look for truths outside of us rather than imagining we have some entity, call it mind or soul, with a magical ability to directly find or know truths.

In the past, I've pointed out two important facts to keep in mind when trying to understand our human selves in light of these sorts of glitches in our perceptions and our thinking but also in light of our historically demonstrated ability to move toward significant truths. As I stated at the very beginning of this essay: "In Chapter 502, *We Need All Sorts of Mavericks in This Dynamic Creation*, I argued the need for certain sorts of flexible and creative thinkers to respond to new opportunities and to deal with problems which have developed in our understanding of Creation or any significant part of it, such as the understanding of human origins and the reasons we are as we are." At the same time, I had also claimed—if not quite so strongly—that we need properly dynamic communities. There is also the need for stability in the thinking and feeling and acting of those communities.

For the individual, the strongest advice for avoiding the misshaping of your mind by external or internal factors is simply to be aware of what is going into your mind and how it settles in, to respond to reality honestly and bravely, and to make honest self-evaluations every so often. There is probably more advice to be given but I don't think there is anyone who yet possesses the knowledge to give authoritative advice. We need to get to work understanding how our minds are shaped and how they can be better shaped. My exploration of this general issue is generating a number of essays and plans for books over the next three to four years or more, on top of the books and essays available on my websites or described there. These issues are discussed in various chapters, including:

1. Chapter 403, *Differential Geometry and Moral Narratives* and
2. Chapter 125, *The Mind and Reality: William James and Me*.

# 309 Bad Ideas Also Have Consequences

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1806>. It was finished and uploaded on 2014/04/24.]

Larry Cahill, a distinguished brain-scientist, recently published an article in which he discusses the need for recognizing the differences between male and female brains by first discussing some bad medical results due to the assumption that there are no such differences and, thus, medicines will affect both the male and female brain in the same way and to the same extent. The article, *Equal ≠ The Same: Sex Differences in the Human Brain* found at <http://www.dana.org/Cerebrum/#sthash.G1drT73T.dpuf>, begins with a comment by the editors of *Cerebrum*, a magazine of *The Dana Foundation*:

Editor’s Note: While advances in brain imaging confirm that men and women think in their own way and that their brains are different, the biomedical community mainly uses male animals as testing subjects with the assumption that sex differences in the brain hardly matter. This month’s *Cerebrum* highlights some of the thinking and research that invalidates that assumption.

The article begins with an example of women being harmed by the assumption that there is no difference between male and female brains:

Early in 2013, the Food and Drug Administration (FDA) ordered the makers of the well-known sleep aid Ambien (zolpidem) to cut their recommended dose in half—but only for women. In

essence, the FDA was acknowledging that despite extensive testing prior to the drug's release on the market, millions of women had been overdosing on Ambien for 20 years.

Cahill concludes “the biomedical community has long operated on what is increasingly being viewed as a false assumption: that biological sex matters little, if at all.” As the tale goes, this began largely as a result of simplifying assumptions that only the regions of the brain involved in regulating reproduction were inherently masculine or feminine. I would imagine that those who regarded women as less cognitively capable thought of them as having weaker brains of the same sort as men rather than different brains than men. According to the author, and agreeing with my own readings, the opposite problem arose in modern academia:

[S]tudying sex differences in the brain was for a long time distasteful to large swaths of academia. Regarding sex differences research, Gloria Steinem once said that it's “ anti-American, crazy thinking to do this kind of research.” Indeed, in about the year 2000, senior colleagues strongly advised me against studying sex differences because it would “ kill” my career.

In other words, science—even crucial medical research—is subject to deformation by ideologies. It's all seems needless because the world is moving toward a more open view of possible male-female roles. Why not just let matters develop by treating each other, male or female, with proper tolerance and openness? Well, neither men nor women do well—in the short-term—at the task of responding honestly and courageously to reality, as I will discuss later. In any case, men and women alike were having trouble accepting that there were, and are, many women with both talent and ambition for science or engineering or business management or politics or carpentry or dentistry. Being radical individualists and fearing the human cultures which do use both greater and lesser differences between men and women to shape them to roles, modern feminists could only go from one extreme, women who had to work hard and 24 hours a day at being child-bearers and child-raisers and homemakers and women who seem to have been trophy wives of prosperous middle-class and upper-class men, to another extreme, every man and woman for themselves as equal competitors or victims in the marketplaces which have become the true (but false) homes of modern human beings.

Human cultures use all human traits to shape a human being to roles. This can be a cruel process as it is in American education. The American school system uses the social instincts of young children to homogenize them, gathering them in herds and going over the heads of some and dragging others down in the apparent belief that a mediocre mind along with enthusiasm for mass-culture is what's needed for boys and girls to mature into good men and good women. If we've tended to place too much emphasis on sports, we at least display some common sense when we see sports as something good for all but also the special domain of the talented athletes, that is, those with a work-ethic which complements raw talent.

We modern Americans remain descendants of the New England puritans. We don't conceive ourselves to be embodied creatures but rather do we misconceive ourselves to be something like 'personalities' accidentally attached to bodies and most certainly only accidentally embedded in particular cultures or particular environments of this planet. We float free, not constrained by our particular traits or circumstances.

Against this view, I hold that the Body of Christ itself comes to exist as men and women push themselves to limits so surprisingly far out as to seem we are constantly re-inventing our very selves, but when we do it right we are still shaping ourselves by responses to a Creation, including our own human being, which is ever revealed as far richer and more complex than we could have ever imagined. God's imagination is far greater than even the sum of human imaginations over the ages.

We err greatly in thinking to understand our world by way of schematic knowledge, though schemas can be a necessary aid to a creature struggling to know and understand. I discussed some of the problems of schematic knowledge in Chapter 299, *Sex and Categorical Reasoning in a World of Evolution and Development*.

Still, we modern men and women know much, by human standards, about the thoughts of God as He created and shaped this world and all of Creation, before and alongside and within this world. We can, in principle, share **all** of the thoughts of God specific to His acts as Creator. This is part of what it means to share His life after our resurrections—to share His thoughts, as well as His feelings and His acts.

Some of God's thoughts are built into the basic operations of our brain by way of natural selection and all the other processes of the evolution of life. Others we can learn by paying attention to both our 'instincts', to evaluate for rejection or further nurturing, and to our individual and

communal 'rational' or conscious thoughts. Much of what we instinctively know about men and women as different varieties of human being is true but still conditioned by the context of human life in a particular time and place. Because public life, including the arts and the sciences, were once dominated almost completely by men, we have a record of the arising of abstract thought and of a variety of artistic skills over the time of human civilization, as that arising occurred among men.

The male mind has expanded greatly from crafts and agriculture and warrior-centered poetry to now encompass much that would be far beyond the most vague understanding of a Homer or Aristotle or any of the craftsmen or scholars of ancient China. I would imagine the female mind is making a similar expansion, a little delayed because of the need, not to be denied, for women to play a different role than men in reproduction. So it is that women, who are now playing a more active role in that expansion of the human communal mind at the same time they develop their own minds, are starting from slightly different regions than men and will likely move over different but largely parallel paths to those of the male minds. The communal mind, ultimately the mind of the Body of Christ, will include all of this diversity and richness. Read deeply into these speculations and try to imagine the complexity of such processes and the little likelihood that male and female minds are, in general, the same though there is sure to be a lot of overlap.

In any case, there is no way to anticipate the movements of such complex processes in which facts emerge as strongly as do patterns, but even most of the patterns can be seen only in the rearview mirror. We can only pay attention to living men and women and try to respond to them as individuals while also remembering that there are both differences and similarities. Either differences or similarities between men and women could be seen to dominate the processes by which the human mind is expanding to encapsulate ever greater regions of Creation; we shouldn't allow ourselves to be blinded by initial impressions or impressions at particular points in the processes by which individual men and women develop, such as the great differences during adolescence, and the processes by which individual and communal minds are expanding in that effort to better and more completely encapsulate Creation. We most certainly would be unwise to think we can anticipate much of the development of the communal mind of mankind, that which is ultimately the mind of the Body of Christ.

When we pay insufficient attention to Creation, most especially to hu-

man being, we rebel against God, filling in the gaps of our knowledge with ideological distortions or superstitions or simply random nonsense. We can harm our fellow-humans in this rebellion, forcing some of them into roles which are uncomfortable or demeaning or which simply don't allow the development of certain classes of individuals. At the same time, categorical knowledge, including knowledge of the differences between the ways of thought of an American man and a Chinese man or a Japanese man and a Japanese women, can be an efficient conveyor of past knowledge or of past needs. We should be careful to preserve, if possible, what is true and good and beautiful in our various human traditions.

Let me return to the article for a short discussion of neuroscientists straying away from empirical investigation and making assumptions, perhaps necessarily so to start their research:

Despite the fact that most neuroscientists still overwhelmingly use only males in their studies, other neuroscientists have generated considerable data demonstrating sex influences on brain function at all levels, including the molecular level and ion-channel level. Very often these sex influences are completely unanticipated by investigators. Crucially, animal research clearly demonstrates that mammalian brains in particular are filled with sex influences that cannot be explained by human culture. Thus animal research proves that the human mammalian brain must contain all manner of biologically based sex influences—from small to large—that cannot be explained simply by human culture (even though there are certainly cultural contributions in many cases). Animal research has torpedoed the “it's all human culture” ship that ruled the academic seas since the 1970s when it came to sex differences.

It might have been necessary to make simplifying assumptions when first starting to explore the workings of the human brain, but assumptions have a way of turning into accepted dogmas. In this case, the assumptions had not had time to show as mistakes before the entire subject of differences in the male and female brains, and the minds made by those brains, had become “distasteful to large swaths of academia.” Moreover, the scientific enterprise has been changing, not always for the best but probably sometimes, or even most of the time, for the better. For example, the male dominance

in mathematical physics while probably being partly a matter of fewer opportunities for women has to be set in a greater context—the men doing high-level work in mathematical physics and related fields of more abstract mathematics worked as loners relative to the modern situation where even theoreticians seem to be pulled onto teams and to be attending conferences regularly. It might be that men could dominate in that past situation and won't in the current situation, though the current understandings of differences in the male and female brains suggest men will always dominate in the particular fields of abstract mathematical sciences. What's seems even more clear to me is: the future will be far more complex than, far different from, what we could imagine. Academics, especially in the social sciences, seem to be much like generals in always fighting the previous war.

We cannot deny and should celebrate that we are intelligent and intellectual creatures in a Creation which, as I noted in Chapter 502, *We Need All Sorts of Mavericks in This Dynamic Creation*, is dynamic in two ways:

1. it is dynamic in itself, and
2. it seems still more dynamic because of the various ways in which our knowledge of this dynamic Creation has grown and deepened and become more sophisticated—at a very rapid pace in recent centuries.

When we pay inadequate attention to empirical reality, when we override what seems true for ideological or other reasons, when we rebel against the Creator, we harm others and ourselves as well as damaging the growing and maturing Body of Christ. The problem seems to be that few human beings, whether due to nature or nurture, seem capable of flexibly and intelligently responding to God's Creation, on the various levels of concrete or abstract created being; most human beings need scripts or recipes to function. This shouldn't be a problem because we have different roles in life and those with the calling to be pioneers will give the settlers new land and new materials to work with; the real problem is that those who don't have the talents for gaining deeper and truer understandings of Creation have been encouraged from the time of the Industrial Revolution to believe they have some sort of right to understand Creation in their own way. That "their own way" might be a very bad way of understanding God's acts and thoughts as Creator is seemingly irrelevant. It seems vaguely undemocratic and unfair, un-American to those in the United States, to so much as suggest they

can't vote intelligently for modern leaders of the American Empire when they can't even locate on a map the countries we've invaded and occupied and devastated in recent decades. See Chapter 308, *Unreliable Memories, Minds Like Silly Putty* for a rather sharp discussion of this issue including my take on Ortega Y Gasset's insights into the failure of Western leaders to properly integrate the bulk of Western men following their release from parochial and limited lives during the Industrial Revolution.

This is sanity in its entirety, mind and heart and hands: to be in synch with reality as it can be best understood in our time and culture. See Chapter 127, *Intelligence vs Intellect* and Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?* for background on my use of these terms. Better still, download the book. *A More Exact Understanding of Human Being* [53]. It is also a part of sanity to recognize when the best human understandings available to us need to be enriched or enlarged and to be open to the efforts of those who are trying to do so.

This is reality: over many generations, many human societies have developed very useful and largely true stereotypes about men and women. This is also reality: we are individual beings as well as being members in all senses of greater communities. In both our individuality and our communal roles, we all differ from stereotypes, even those women who long from their youth to be wives and mothers and homemakers and take on jobs only when necessary for special needs or when the children are grown. In general, we should act toward men or women as they present themselves, so long as they present themselves as morally well-ordered and this remains true even if some part of their lives are morally disordered by traditional standards. Sometimes, we might even play a role in nurturing the development of their human being or offering to nurture different and perhaps richer developments of their human being. If they present themselves in a morally disordered way, we can only be charitable while properly protecting ourselves and others near to us. We should also leave other valid possibilities open in some ways which cannot be predetermined nor can I currently describe them in explicit, non-narrative terms.

I started by discussing the article, *Equal ≠ The Same: Sex Differences in the Human Brain* found at <http://www.dana.org/Cerebrum/#sthash.GldrT73T.dpuf>. I give my overview of the situation: In the latter third of the 20th century, (many, though not all) feminists engaged in an intense effort to replace stereotypes containing substantial amounts of truth by stereotypes largely devoid of truth. We should be able to throw off any

wrongful categorical and stereotypical understandings of male and female roles—again, see Chapter 299, *Sex and Categorical Reasoning in a World of Evolution and Development*—without falling into new understandings which are even worse than most modern human schemes to understand human being have proven to be.

## 310 Socioeconomic Inequality and Achievement

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1828>. It was finished and uploaded on 2014/06/11.]

Kimberly Noble, MD and PhD, pediatrician and neuroscientist, has written the article, *Rich Man, Poor Man: Socioeconomic Adversity and Brain Development* at [http://www.dana.org/Cerebrum/2014/Rich\\_Man,\\_Poor\\_Man\\_\\_Socioeconomic\\_Adversity\\_and\\_Brain\\_Development/](http://www.dana.org/Cerebrum/2014/Rich_Man,_Poor_Man__Socioeconomic_Adversity_and_Brain_Development/), which is posted at the website, <http://www.dana.org>, of *The Dana Foundation*, a foundation run by neuroscientists. There is good stuff in the article which has a properly optimistic tone as it explores the idea that we can help people from impoverished backgrounds by providing some sort of enrichment for the environments in which their children develop. I would even add that I think brain plasticity indicates some possibility of helping the likes of adults in the early stages of dementia or those recovering from some sort of brain injury or those who have given themselves an impoverished life-style (couch-potato or failure to develop job-skills or whatever).

But the article is confusing because there's no clear understanding proposed for human nature, even a conventional theory of nature and nurture isn't put forth. The article is written as if we can significantly raise the achievement level of children living in perhaps barren cultural conditions even as they remain in cultures which, for example, have little or no respect for books or learning. This is not to say that illiterate parents can't nurture a respect for learning in their children. I've read that a number of Chinese immigrants to the United States in the 20th century were themselves illiterate but taught their children respect for learning and would even keep the

children's chores light so they could study or read or practice music. The article also doesn't even mention genes or epigenetic effects. Like it or not, families of adults with talents for abstract thinking tend to produce children with similar talents. There has also been some strong evidence that a child's metabolism is shaped partly by the habits, good or bad, of not only mothers but even maternal grandmothers. Wildlife biologists have even speculated that grizzly bear mothers, responding to their own situation, send signals to their sons in particular causing them to grow big, even by grizzly standards, if the species is dominant and the males will be able to eat plentifully of meat or to stay relatively small if there is a dangerous competitor such as white men—the native Americans of the Rockies and California weren't much of a challenge for big, predatory bears. Is it possible that children, especially boys, have slightly different personality characteristics depending upon their mother's environment—big and aggressive in a violent setting or perhaps smaller and more sociable in a peaceful setting?

Dr Noble doesn't say anything unreasonable. Some might wish to leave out hard truths to encourage optimism, but reality tends to bite, if only eventually, especially when true reforms require hardheaded perseverance over a lifetime or even over multiple generations—a situation likely to prevail when we deal with the characteristics of truly civilized human beings whose achievements are dependent upon at least some abstract reasoning skills as well as a large body of knowledge and customs.

The short *Editor's Note*, or introduction, of the article, *Rich Man, Poor Man: Socioeconomic Adversity and Brain Development* at [http://www.dana.org/Cerebrum/2014/Rich\\_Man,\\_Poor\\_Man,\\_Socioeconomic\\_Adversity\\_and\\_Brain\\_Development/](http://www.dana.org/Cerebrum/2014/Rich_Man,_Poor_Man,_Socioeconomic_Adversity_and_Brain_Development/), is:

Here's a disturbing statistic that made headlines this past January: The richest 85 people in the world now hold as much wealth as the poorest half. Keeping in mind the goal of closing the ever-widening gap between the haves and the have-nots, our author examines new research that ties family income level and other factors to brain development. While socioeconomic adversity may not solely determine a child's success later in life, its significant role in helping children develop language, memory, and life skills can no longer be ignored.

Children can't learn well, if at all, if they are hungry and cold, but they

are also not likely to learn well if they don't wish to do so, if they don't have the ambition to read books or at least to satisfy parents or other relatives or community leaders who value learning. Are there also children who haven't the ability to read well or to think abstractly, even with dedicated teachers who have good resources at their disposal? Are those children likely to come from family lines of human beings with similar lack of ability? A difficult question which is silently avoided in this article and perhaps to good purpose, but part of my mission is to reach a better understanding of human being and I can't ignore the entire bundle of often inconvenient questions connected to developing that understanding.

There are certainly some skills necessary to success in education which can be nurtured to at least some extent. Modern men, and their corporations and governments have acted as if determined to destroy one particular ability before it shows as a developed skill. This is one which has been discussed often. Our entertainment systems, general life-styles, and even some of our educational programs act to retard or even destroy the ability to concentrate beginning with the simple self-discipline to sit still while learning. This is a tricky matter because, as one complicating example, I knew plenty of young men who, as teenagers, had trouble sitting still in the classroom or concentrating on history or biology but could work intensely for hours figuring out how a car engine worked or how to make a proper joint on a piece of furniture.

There is little evidence that Americans in general are much interested in high achievement outside of sports or the acquisition of wealth and most have retreated to the couch in front of the television by their 20s, out of shape and reconciled to a very modest prosperity.

What does this mean? Can we blame the residents of for-ever impoverished regions of the earth for lack of moral order or for not delaying satisfaction or something of the sort? The sad fact that so many middle-class Americans of all ethnic groups seem to willingly travel a downward spiral into inner-city culture or the like certainly tells us that we have the freedom to damage our moral character. Until recently, it looked as if Americans would remain prosperous indefinitely. Somehow, we've created a society in which the children from those modestly prosperous households, having attended school systems rich in physical resources, are looking at relatively bleak futures. At best, we seem to be a people whose prosperity, however modest, is dependent upon some corporation or high-achieving individual giving us a chance in life; we don't seem to have the inner resources to

make it on our own. That's a bad way to express matters and the actual situation is quite complex but I'll discuss some of the issues contributing to the complexity.

Do we, as individuals or even as members of 'nuclear families' have much freedom to move from disordered environments toward a state of greater moral order which, in the modern West, has usually brought greater material prosperity as well? It's easier to travel to the 'larger' regions of disorder in most state-spaces which are likely to correspond to human social systems, which is to say that it takes a number of generations to build a civilization or a culture but only a small number of years to destroy it.

The article. *Rich Man, Poor Man: Socioeconomic Adversity and Brain Development* at [http://www.dana.org/Cerebrum/2014/Rich\\_Man,\\_Poor\\_Man\\_\\_Socioeconomic\\_Adversity\\_and\\_Brain\\_Development/](http://www.dana.org/Cerebrum/2014/Rich_Man,_Poor_Man__Socioeconomic_Adversity_and_Brain_Development/), speaks truths in a way that can be misleading as it deals with human beings as if mostly freestanding individuals though there is recognition of the mother-child relationship, but that has been accepted by nearly all exponents of radical individualism—it's apparently something we can outgrow to become healthy freestanding individuals. It would also seem, from the presentation and perhaps from the assumptions shaping the research protocols, that inheritance plays little or no role in shaping the mental development and consequently mature capabilities of a human being. It is comforting to modern men to take each child as a fresh start of sorts and often dispiriting to realize that child is a member of specific human communities including a (genetic) family-line.

Biology, narrowly conceived, isn't the only problem. Some cultures don't value human development as Greeks did, as Jews and Chinese do, and as, once upon a time, modern European men did. Some cultures and family-lines might well be made up of human beings with limited capacity for higher learning. Still, all human cultures are rich and complex in some significant sense and all human beings have something to offer their human communities. It's probably best that educators and the researchers and others who support them be optimistic but perhaps intense disappointment should be avoided by prudent constraints on the hopes that a child can be 'raised' from the low achievements of her parents and other adults in her culture—we should at least be aware that any noticeable improvements (of a lasting sort) might occur only after a few generations of effort. We modern men aren't good with this business of gradual change. As the economist Thomas Sowell, himself a high-achieving African-American, has noted: it's

not just coincidence that Jews recover so quickly after periods of the most intense adversity—Jews, as a people, have been literate for thousands of years. Yet, we modern Americans expect rapid improvements within a year or two of the adoption of a new fad in educational technology. And some have managed to find statistics indicating such improvements were occurring even as the situations of inner-city African-Americans, and other groups, have gone from bad to catastrophically bad.

Dr Noble points to one factor, experience with language, which is surely important, but it should be seen in the complete setting I've recommended, the setting few have: an understanding of being and of human being, communal and individual. That includes all that pessimistic stuff about the genetic limitations of all human beings, limitations acceptable when I can't run fast enough to make the Olympics or sing well enough to ever be the soloist in even a small church community but not so acceptable when some children can't learn mathematics, others can't read complex novels or history books, others can't acquire the practical skills necessary for business success, and some can't seem to learn much of anything in particular.

Dr Noble's article speaks of experience with language in these terms:

In a recent study in our lab, we examined brain volumes in a group of 60 socioeconomically diverse children ranging from 5 to 17 years of age. We found that, as children get older, higher SES children tend to dedicate relatively more neural real estate to areas of the brain that support language development, in comparison to their lower SES peers. This suggested to us that something about the experience of growing up in a higher SES environment likely leads to a greater investment in language-related regions of the brain.

Indeed, this something is almost certainly experience with language itself. It is well established that children from disadvantaged homes tend to hear fewer words—an estimated 30 million fewer words by age three than their higher-SES counterparts, to be precise. Lower-SES mothers are also more likely to speak to their children in a directive rather than conversational manner, and to use less complex speech patterns and fewer gestures. It is likely that differences in maternal speech input result in a cascade of effects that are directly relevant for the development of a child's language-supporting cortex dur-

ing infancy. Much as greater exposure to music may increase an individual's perception of speech years later, greater social engagement with interactive adults may lead children to have improved abilities to perceive and discriminate among speech sounds. Thus, one mechanistic pathway would suggest that socioeconomic disparities result in large differences in quality and quantity of linguistic exposure, which in turn lead to differences in the development of language-supporting brain regions—and, finally, to the often-reported SES disparities in children's language skills. [See original article for footnotes.]

This is good to know, but is consistent with all of my criticisms above. Some language impoverishment problems might be due to genetic issues, including epigenetic effects which can only be dealt with over generations. If so, the children having less ability to use language in rich and complex ways won't have lasting benefit from being placed in an environment in which others use language in such ways. In fact, the result might be frustration and resentment.

Some language impoverishment problems might be due to cultural impoverishment which also can only be dealt with over generations. Thomas Sowell, the economist mentioned above, didn't explicitly justify his cautious optimism (at least in any of his books I've read) that great improvements are possible for the development of minds in African-Americans but seems to feel it's at least quite possible that the current impoverished state of the 'African-American mind' is due to some problems of an epigenetic and cultural nature, but he knows well that African-Americans, even under optimistic assumptions of long-range potential, aren't about to catch up anytime soon to Jewish-Americans or Chinese-Americans in fields such as physics or philosophy or medical research.

Do we modern Americans or other modern men have the stamina to stay the course and help children of low-achievement and from low-achievement cultures to advance at least somewhat? Do we have the truer love and tolerance to accept it when some children and some cultures don't prove able to reach the achievements of, say, the Americans of Ashkenazi Jewish descent? Are we capable of building societies which offer rich and dignified lives to all?

# 311 We Human Beings Are a Particular Type of Organism, an Organism Sometimes a Student

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1835>. It was finished and uploaded on 2014/06/20.]

I've written before of the modern tendency to use glossy pictures and even fast-moving images to teach, even to teach subjects requiring some concentration and some use of abstract reasoning. This is absurd. It's been known since at least the work of the English psychologist Richard Gregory, see [https://en.wikipedia.org/wiki/Richard\\_Gregory](https://en.wikipedia.org/wiki/Richard_Gregory), that the human brain—like the brains of monkeys even more than apes—places a priority on colors and movement as a means of detecting food, dangers, and sex opportunities. (The latter might be less important for humans since color doesn't indicate fertility for human females as it does for chimpanzees and other close relatives.)

I don't really have a good handle on the history of the efforts to understand the nature of human acts of perception and cognition and how they interact. I know a little bit about the modern effort and I know how St Thomas Aquinas anticipated much of the general findings—see *How Brains Make Up Their Mind* [35] by the neuroscientist and philosopher Walter J Freeman for an excellent overview of the Thomistic understanding. In any case, I do know that Richard Gregory played an important role in the modern re-discovery of the active nature of human perception and how it interacts with thinking.

The main thrust of Gregory's work was the nature of perception, which he saw as an act like unto cognition rather than a passive reception of images

or other stimuli. Since there are only finite resources in the human brain, which is already an energy hog, the aggressive stimulation of the visual regions will come at the expense of other regions, such as those with which we reason in abstract ways. One might think that many subjects would be better taught with textbooks and other materials not being distracting to the higher-reasoning regions of the human brain, but nowadays those glossy pictures are found even in high school math books. Much is taught through videos or through rapidly changing images on the computer monitor. This isn't to say that electronic technology, even fast-moving videos, are never good in education, but it is to say that it is often no good and we should have educators who understand enough to be able to make plausible judgments in specific cases.

This is the problem. Education, though a little more solid when I was in elementary school in the 1960s, was the domain of faddish thinking by way of ungrounded speculation for the entirety of my career as a student. Some of the fads were plausible answers to the wrong questions, such as the phase of short readings with each student working through the file of readings at his own pace. That seemed plausible to deal with the problem of varying levels of skills and talents in the typical classroom but it was really, in my opinion, a gutless dance around the problems of the ideologically driven age-cohort school system: The children advance at different rates, some eventually catching up and some never catching up, but we modern men of the West wish to socialize them as a herd so we sacrifice better education for all but the middling students who move at a rate acceptable to education college theorists.

Now, some researchers have spotted another possible problem, though it's not a settled issue. In the article, *What's Lost as Handwriting Fades* at <http://www.nytimes.com/2014/06/03/science/whats-lost-as-handwriting-fades.html>, Maria Konnikova begins:

Does handwriting matter?

Not very much, according to many educators. The Common Core standards, which have been adopted in most states, call for teaching legible writing, but only in kindergarten and first grade. After that, the emphasis quickly shifts to proficiency on the keyboard.

But psychologists and neuroscientists say it is far too soon to declare handwriting a relic of the past. New evidence suggests

that the links between handwriting and broader educational development run deep.

Children not only learn to read more quickly when they first learn to write by hand, but they also remain better able to generate ideas and retain information. In other words, it's not just what we write that matters—but how.

The article speaks of some respected researchers who think it will not turn out to be true that handwriting is nearly this important in the educational process. We'll see, but we should be asking how major standards were promulgated on the basis of untested speculations that handwriting is unimportant in the education of children. I know that my best learning experiences have occurred when I used lots of pencil lead and lots of sheets of paper to do problems in mathematics or science or when I took notes during lectures on any subject—even when I never used those notes to study.

This is a general problem in the West. We think to be a 'scientific people' by which we are claiming to think in line with sciences dealing with the observable and, often, also quantifiable aspects of reality. In reality, we have been partially freed from traditional ways of thought and feeling and acting, some of which ways carry true knowledge and wisdom, some of those ways point to truth but need to be adjusted to reflect more recently discovered knowledge about reality, and some of those ways reflect knowledge best discarded but for those scholars needing to study the history of human thought.

We are a people with a strange mixture of scientific, magical, ideological, and other beliefs of a good and not so good sort. This comes out in our educational system, one in which people who feel awfully good about themselves and greatly overrate their understanding and intelligence have conducted experiments upon the youth of the United States and many other regions of the West as well. The experiments, on the whole, are failures. The peoples with old-fashioned ideas about learning—immerse yourself in the material, dig in, work till you're drenched with sweat—out-perform those who have been softened in brains and often bodies to the standards of the modern American middle-class. Those more successful peoples include the ethnic Chinese and Japanese, traditional Jews, some eastern Europeans, and some immigrants from impoverished regions, though I've heard expressions of concern that more recent generations of even Chinese-Americans

might be moving toward the trashy attitudes of the American middle-class of European descent.

The loss of respect for the activity of handwriting follows upon a similar loss of respect for such activities as memorizing addition or multiplication tables. To be sure, that was an activity useless to me since I could already handle addition and multiplication of all those relatively small numbers well before I had to endure hours of useless practice each week, but that points back to the problems with age-cohort education. We prioritize socializing, and I would even call it brainwashing, and that is perhaps the original sin of American educators. By high school, I wasn't in the same classes as the fellows I would join for pick-up baseball games or card games in after-school hours—the only effect of age-cohort education for me was the slowing down of my mental development and perhaps of my emotional development.

In any case, though I was lucky enough to be ahead of the sheer stupidities of New Math, I can remember the upset and the complaints of some parents who had at least vague intuitions this New Math stuff wouldn't help their children to so much as balance their checkbooks. And I wish to say that memorizing addition and multiplications tables was good in itself though I didn't need it at the time I had to endure it. In any case, though few know this, the New Math programs back in the 1970s were adopted over the protests of various societies of mathematicians and most likely the protests of a lot of individual mathematicians and scientists and engineers and maybe some humanists possessing at least a broad understanding of mathematics.

Human beings are the result of specific processes of evolution. Those processes have somehow produced a very complex brain which allows us to shape minds, abstract relationships between us and other entities as well as 'global' regions of Creation; we shape those minds by active responses to reality. Yet the shaping process itself is a somewhat ad-hoc process as we would expect from the most basic understanding of natural selection and other evolutionary processes.

Those who claim to have knowledge of some sort of education science overrule those who have knowledge of the specific fields of knowledge and ignore those specific fields which tell us much about the human being, an animal capable of transcending in some ways that animal status by way of processes we only partly understand, an animal capable of acquiring high levels of skill in passing on and gaining abstract knowledge of the bookish sort. He is a very particular sort of animal not 'designed' to be an animal

literate in well-defined ways with well-defined additional cognitive skills in logic and mathematics and higher-level music, but rather an upright primate with skills and aptitudes selected for survival and reproduction yet capable of abstract reasoning and able to develop sounds and alphabets to communicate the number of enemy warriors approaching and also the concept of rational number. The Pythagoreans were even capable of reacting in disgust and fear against the possibility of an irrational number.

But all of this came about by development processes, some linked undoubtedly to ongoing evolutionary processes. These were development processes which occur as the human being responds to the world around himself as well as to his own body. They are also processes which themselves are the results of specific events in biological evolution.

The mathematical truths which are part of Creation shape the mind of the mathematician or even the minds of those who make instrumental use of mathematics; the mind of the student, the potential mathematician or physicist or accountant or carpenter, doesn't access realms of abstract truths apart from this mortal realm. He accesses realms of abstract truths through this mortal realm and by way of specific events in this mortal realm. He doesn't impose order upon chaos but rather draws principles of order from that (seeming) chaos and uses it understand that chaos—a fascinating process of often unstable iterations occurring over generations. He has the brain suited for such a world and for such activities within the world; that brain “makes up a mind” as Professor Freeman has it. Without understanding that brain, how it operates and how it interacts with the world outside of itself and how it interacts with the realms of truths it posits with increasing certainty, we can't understand how to educate children or even how to further educate our own selves.

# 312 Human Communal Being and the Shaping of Human Individual Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1846>. It was finished and uploaded on 2014/07/14.]

Human being is complex, as is true of most interesting entities. Even God's simplicity, touted rightly by ancient and Medieval theologians and their not-so-worthy successors in modern times, is only a way of speaking against very specific types of errors. Mostly, they were concerned in ages which saw change lead eventually to decay that God not be seen as a being moving, however slowly, towards decay and death.

More generally, interesting and rich entities seem to be highly organized systems of sub-systems, some of which are simple and some of which are complex. These sub-systems interact to produce various sorts of—speaking anthropomorphically—simple and complex communities.

I've written a little about the real nature of simplicity of complex entities, human beings or human societies or other organisms or parts of Creation—see Chapter 641, *Enriching Our Moral World: Simple Is Digested Complexity*.

Responding to a *New York Times* overview of some recent literature discussing and, sometimes, advocating one or another position on how to raise morally well-ordered children, Razib Khan wrote an short essay in April of 2014, *It Takes a Village More Than Parents* at <http://www.unz.com/gnpx/it-takes-a-village-more-than-parents/>, which provides some well-grounded cautions:

Two insights from behavior genetics can shed light here. First, shared-environmental effects are often the smallest portion of the variation in behavior. This is the part which is due to the family home and the parental influence. Second, the proportion of variance explained by shared-environment tends to go down as people get older. So parental influence tends to diminish.

Obviously part of the reason you behave as you do can be put down to genes. Or more precisely genetic dispositions which express themselves. And another portion can be chalked up to what your parents teach you. But a large proportion, in fact in many cases the largest proportion, is accounted for by factors which we don't have a good grasp of. We don't know, and term this "non-shared environment."<sup>1</sup> In *The Nurture Assumption* Judith Rich Harris posited that much of non-shared environment was one's peer group. This is still a speculative hypothesis, but I do think it is part of a broader set of models which emphasize culture and society, and how it shapes your mores and behaviors, as opposed to the nuclear family.

Khan was responding to a *New York Times* article by Adam Grant: *Raising a Moral Child* at <http://www.nytimes.com/2014/04/12/opinion/sunday/raising-a-moral-child.html>. One claim that struck me regarded the difference between shame and guilt:

Praise in response to good behavior may be half the battle, but our responses to bad behavior have consequences, too. When children cause harm, they typically feel one of two moral emotions: shame or guilt. Despite the common belief that these emotions are interchangeable, research led by the psychologist June Price Tangney reveals that they have very different causes and consequences.

Shame is the feeling that I am a bad person, whereas guilt is the feeling that I have done a bad thing. Shame is a negative judgment about the core self, which is devastating: Shame makes children feel small and worthless, and they respond either

---

<sup>1</sup>This might actually be genetic or more broadly biological; epigenetics, epistasis, and developmental stochasticity. [From original article.]

by lashing out at the target or escaping the situation altogether. In contrast, guilt is a negative judgment about an action, which can be repaired by good behavior. When children feel guilt, they tend to experience remorse and regret, empathize with the person they have harmed, and aim to make it right.

The author, Adam Grant, quite plausibly concluded: “If we want our children to care about others, we need to teach them to feel guilt rather than shame when they misbehave.” Discipline is needed but the right sort, the sort which makes it clear the child can become a better person.

One part of Grant’s discussion of this issue struck home for me in a rather personal way: “The ashamed toddlers were avoiders; the guilty toddlers were amenders.” That’s me, an avoider, and even now I have trouble facing up to my own weaknesses and figuring out how to amend; I also have trouble confessing to even non-moral failings, such as lack of knowledge of some matter that I feel I should know about or simple errors of judgment or mistakes in carrying out a task. This is a common American trait, in my experience, and Grant’s discussion raises obvious questions about the possible prevalence in this country of parents who raise their children to feel shame rather than guilt.

Another result from these particular experiments and studies discussed by Grant is the evidence that children learned generosity better when they saw adults being generous **without** preaching generosity. Preaching the moral lesson would decrease the effect of seeing generosity in action, though some effect remained.

On the other hand, as a modern thinker appreciative of the mind and its importance to some extent in many individual lives and its great importance in our communal lives, I think that preaching is distinct from the types of conversations—not to be forced—which can lead to understanding and to the type of mind which can respond more flexibly to the world. Stories might be even more effective in reinforcing lessons taught by action.

From here, I’ll be making a general critique which applies to nearly all human thought, including modern human thought, on the nature of human being in its various aspects. And ‘critique’ is the right term—I’ll propose no answers and don’t think anyone can yet properly phrase questions which might lead to plausible answers. I’m working on those questions and hope to generate a framework for proper discussion of human nature, individual

and communal, so that I can fill in the rough outline in my book: *A More Exact Understanding of Human Being* [53].

Much modern thought assumes a sort of reductionism, but one allowing a privileged position to being as organized in human individual being although there is no evidence from empirical science and even surprisingly little from the Bible or serious literature and history that such privilege is justified. Under bad circumstances, which might be due to genetic or environmental traits, we are deeply fragmented creatures though always—so far as I know—striving to pull ourselves together or at least justifying our fragmentation in terms that salvage something of an ‘I’. There is the literature on the so-called split-brain. (See the article *Split-brain* at <https://en.wikipedia.org/wiki/Split-brain>.) There are also creative works, such as *Dr Jekyll and Mr Hyde*—where the fundamental fragmentation was caused by a poorly formed conscience but Stevenson added an factor of a drug. I’ve also written a book *A Man for Every Purpose* [37] in which there was a fundamental cultural division—Mom was a Norwegian Lutheran and Dad was a Jamaican of Pentecostal practice—and an added factor of a terribly painful, mind-twisting disease.

But my goal is not so much to cast doubt on the reality of human individual being as it is to open up human minds to the possibility—as a Christian, I’d say certainty—of the reality of human communal being.

Most reductionists (see the article, *Reductionism*, at <https://en.wikipedia.org/wiki/Reductionism> and probably most Nominalists (see *Nominalism* at <https://en.wikipedia.org/wiki/Nominalism>) would deny on principle the reality of human communal being. “Sure,” they might say, “there are ways in which groups of people act as if they form a true entity, but this is just a way of speaking ‘as if’, for convenience, for shorthand.” But most reductionists and nominalists accord an unwarranted privileged position to individual human being, to the ‘I’ they feel to be.

To me, it seems the reality of a community is no more, and no less, puzzling than the reality of a fragmented man of biological pieces yet being a true, unified entity—if far from perfectly so. For both an individual human being and a communal human being, empirical reality seems to push upon us the necessity of treating as a real entity what acts as a real entity.

As a Christian, I believe in the reality of human communal being because the Body of Christ is the ultimate human community where each member remains an individual and yet is entirely the Body, that is, entirely Christ. That Body of Christ can’t come into existence unless it be possible for

human beings to form true communities of a lesser sort in this mortal realm.

This is background to informally justify my claim that our human communal being is real, yet, I think there to be a difference: I think human communal being is still more of a potential at our birth than is our human individual being. We human beings have communal being in us when born, but some can be forced into a life largely lived as a loner perhaps because of some disaster or a psychological disability. The possibilities for human community, though constrained are great if not necessarily infinite. We can live in a tribe of shared thoughts never questioned or as a more cosmopolitan person with at least the possibility of both a well-developed individuality and also a rich and complex communal life. Even when we speak of a type of life, tribal or cosmopolitan, there are uncounted ways of actually manifesting those sorts of lives.

This is the point I'm driving at: we can't analyze the development of the total human being as if there is some sort of preset 'configuration' of a human being with a contribution of, say, 40% from individual factors and 60% from communal factors. My feeling is that not only do those percentages change in different sorts of communal life but also the very structure of the total human being.

The reader should consider my understanding of created being as levels or realms beginning with that which God first created: the raw stuff of created being, the truths He chose for Creation. From this raw stuff, He shaped successively more concrete layers of being culminating in this concrete, thing-like world of narratives, even of moral order and disorder.

This forces, or should force, a different understanding of not only being but of also knowledge of created being—see *Four Kinds of Knowledge* [43] for my understanding of the actual unity of knowledge of created being and the practical need for specialized fields of knowledge. This situation leads to both problems and opportunities for those wishing to explore God's Creation, whether as physical explorers on the ocean blue or scientists probing the elementary constituents of matter or philosophers exploring various realms of created being from speculative versions of various viewpoints. I deny the modern—often implicit—viewpoint that the divisions between metaphysics and particle physics and farming are true and absolute: when one field of knowledge advances ahead of others, those other fields of knowledge can borrow true insight at an appropriate level of abstraction and travel down the road of concretization toward their own subject matter.

This is my general suggestion for developing a Christian understanding

of Creation which respects both Christian revelation and modern empirical knowledge: let's borrow from those fields of empirical science which have advanced far more rapidly than Christian thought in recent centuries.

I'm the early stages of studying and contemplating relevant fields of mathematics and also reading works of history and literature which might lead to inspiration and insight as I try to understand on its own terms a Creation which can now be seen as far more rich and complex than prior generations of men could have imagined. I'm groping my way in what is, for now, a foggy region.

## 313 The Interior Richness Which Lies in a Civilized Man

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1875>. It was finished and uploaded on 2014/09/01.]

Peter Frost, dissident anthropologist, wrote about some issues in the matter I've considered in earlier chapters—the formation of complex societies. See Chapter 509, *Mathematical Models of Human History: Are They Plausible?*, and Chapter 510, *A Different Model of the Growth of Centralized States in History*.

Frost's article, *The Agricultural Revolution That Wasn't* at <http://www.unz.com/pfrost/the-agricultural-revolution-that-wasnt/>, looks at the broader issue of how large groups of people form from bands of hunter-gatherers.

Frost has this to say about the general conditions of human life as complex, large-scale human communities (civilizations or proto-civilizations) were developing:

About 10,000 years ago, the pace of human genetic evolution rose a hundred-fold [see original article for reference]. Our ancestors were no longer adapting to slowly changing physical environments. They were adapting to rapidly evolving cultural environments.

What, exactly, caused this speed-up? The usual answer is the shift from hunting and gathering to farming, which in turn caused other changes. People were becoming sedentary and living in ever larger communities: villages, towns, and finally cities. Farming also produced a food surplus to be stored for future

use, thereby providing powerful men with the means to bankroll a growing number of servants, soldiers, and other hangers-on. Thus began the formation of early states. And thus ended the primitive equality of hunter-gatherers.

But is that the whole story? Was farming the trigger for this chain of events? Or did something earlier get things going? More and more anthropologists are taking a closer look at what happened just before the advent of farming, a period called the “Broad Spectrum Revolution”[.]

If you haven’t been keeping up with at least the general discoveries in the overlapping fields of genetics and paleontology, you might wish to reread the above quote and think about it, especially the discovery that the older claim that we are stone-age ape-men in civilized drag is only a highly qualified truth. In the above quotation, Frost makes it sound as if natural selection continues to work as it always did but now the selective processes are relative to the ability to survive and reproduce in a complex human community in which individuals are sheltered from predators and some natural disasters. In fact, this is clearly true, but the power of selection seems diluted by the survival beyond the age of reproduction in a civilization of many not adapted to civilized life. Charity, the need for large amounts of labor who might work more effectively if they aren’t ‘cultured’, and perhaps other factors allow the reproduction of many who simply don’t get this business of civilization.

With my limited knowledge of the workings of genes, I have to believe that keeping so many alive at least long enough to reproduce, diluting the effects of bad luck as well as lack of fit to civilized life, has to increase the variety in the human gene pool.

Frost also tells us:

Farming thus came on the heels of a broader cultural, behavioral, and even psychological revolution. It is this broader change, rather than farming alone, that probably caused many supposedly farming-related events, such as the rapid spread of certain agricultural peoples into territories that formerly belonged to hunter-gatherers.

Frost tells us that some hunter-gatherers were, and are, willing to retreat rather than become part of this new-fangled way of living:

One of my professors, Bernard Arcand, would talk to us about the hunter-gatherers of Upper Amazonia and their indifference to farming. They saw it as something akin to slavery and couldn't understand why anyone would want to stay put in one place and toil in the fields all day. Attempts to teach them the benefits of farming typically failed. Benefits? What benefits?

There has to be a change in mental makeup before farming becomes possible. People must become willing to exchange short-term pain for long-term gain. They must accept monotony and sedentary living. They must live in larger communities with people who are not necessarily close kin. And they must get used to bland, nutrient-poor food.

Some of those who don't like civilization live down the street. Some are in our armies or in our more dangerous occupations and may well more than pull their weight, yet, on the whole, we've got a real problem in the modern world. This "change in mental makeup" is rather extensive and has to take place deep within us and also in our more superficial aspects before civilization takes and we settle down as men and women capable of behaving properly and amusing ourselves properly—to put it in a grossly oversimplified way. We have to learn how to gain some richness in life by way of active participation in various arts or religious rites or storytelling or . . . If there are some who have mental makeups not suited to life in a complex civilization, then they might simply be passive creatures who watch the spectacles around them or on their video screens or they might engage in various activities such as crime on one scale or another to gain the goods and at least qualified prestige they can't gain by making music or art or producing artisan-quality furniture or supervising a complex industrial process or taking proper risks in new business ventures or . . . People not capable (for whatever reason) of actively amusing themselves, in substantial solitary or communal activities, might be ready for such exciting activities as wars; they might participate in riots—perhaps starting as demonstrations for a good cause; they might engage in sex for excitement (see Chapter 617, *Raising the Ante on Passion: Nabokov and Gibson*); they might use drugs to escape life in a community unsuited to their needs or desires; and so forth. Some of these activities are self-destructive and some do serious damage to

individual others or to communities; some may even be parts of sociopathic behavior.

We don't seem to be a happy people. We flock toward entertainment of a juvenile sort, often enough a perverse sort. We glorify those who refuse to grow up and become morally responsible civilized men. We are half-assed citizens of complex states requiring far better than that and then we have the nerve to get upset when our governments fill up with self-serving scoundrels. We Americans and some other men of the West perhaps show our worst sides, at least over the past 60 or 70 years, in the behavior we put up with, and often cheer, in our leaders when they operate in the international realm. We react self-righteously to imagined or wrongly attributed acts against us and then don't even feel bad about the thousands or hundreds of thousands who are killed, the communities left without fresh water or power systems, and so on. We drink another beer and just remember they "hate us for our freedoms" and feel to be a righteously exceptional people—see Chapter 465, *Dumber Every Day, With Beer in Hand and War on TV*. We common folk send our pennies and dollars over to help Haitians or Indonesians after some natural disaster or to help others to build schools and hospitals and churches even as we remain blind to our politicians' and bankers' theft of the wealth of entire countries.

It could be argued, even by those so suspicious of the central-planning mentality as I am, that we need some conscious awareness, if vague, of what is wrong and of where we can head and how we can better form our children and our own selves to take proper advantage of the complex and multi-sided benefits of civilization. In fact, in saying this I speak not of central planning but rather of numerous individuals and communities engaging in well thought-out experiments in living and in making our livings.

I'm going to end with a suggestion I'll pursue in my next essay, which I'm writing in response to some good analysis and speculation in another essay by Frost, *Does Natural Law Exist?* at <http://www.unz.com/pfrost/does-natural-law-exist/>, just published on Ron Unz's website today (2014/09/01). My suggestion is that participation in more complex communities, of which civilization is the most complex we know, actually requires a greater and richer development of the individual, including a richer sort of self-directedness which is tied to higher level thinking skills capable of dealing with messy situations which can't be handled by simple rules-based thinking. This isn't a plea for any sort of radical individualism, for sure. I know quite well a lot of human beings can't do the research and inde-

pendent thinking necessary to understand the complex problems of modern human life, but those who can't should have rich enough, complex enough, thoughts to be able to recognize those who have bothered to learn about these issues and can maybe generate some ideas, if they be no more than an interesting creative movie or a piece of folk music that speaks of the experiences of an American soldier or Marine in Afghanistan. By now, a lot of smart men and women who aren't scholars or creative artists or theologians should realize those in authority in the institutions of our age are not up to the job of dealing with our problems.

## 314 Natural Law or Natural Suggestions or Natural Illusions?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1879>. It was finished and uploaded on 2014/09/08.]

Peter Frost has published a good essay in which he deals with human moral nature. The essay, *Does Natural Law Exist?*, can be found at <http://www.unz.com/pfrost/does-natural-law-exist/>". I vaguely anticipated this discussion in Chapter 313, *The Interior Richness Which Lies in a Civilized Man*.

Frost defines natural law as teaching:

All people are born with a natural sense of right and wrong, and it is only later, through vice or degeneration, that some can no longer correctly tell the two apart.

There are both pagan and Christian justifications for such beliefs and, as Frost notes with obvious respect, they were once quite plausible. Despite my belief in absolute truths, I claim that natural law instincts are the result of human evolution, that is, the shaping of our ancestors in response to their environments. Any particular manifestation of natural law is the result of human being responding to our world in philosophical and theological and political and pedagogical ways. These responses are necessarily limited by the current understandings of our world and—at least to a Christian—of all of Creation. This creates the likelihood of “fighting the previous moral equivalent of war” each time that something changes drastically or each time we reach a point where small changes have built up without proper responses. We love security and stability and only start changing when forced to do so, not when change first seems plausible and desirable. This is

not to deny that the understandings produced in certain ages were insightful and powerful, maybe even the best understandings possible to those ages.

In that spirit Aquinas is acknowledged by Frost as having provided:

a compromise that divided Natural Law into general precepts and secondary precepts. The former are known to all men but can be hindered “on account of concupiscence or some other passion.” The latter “can be blotted out from the human heart, either by evil persuasions [...] or by vicious customs and corrupt habits, as among some men, theft, and even unnatural vices, as the Apostle states (Rom. i), were not esteemed sinful.” [See Frost’s article for reference to quote from Thomas Aquinas.]

I’ll continue developing this theme but Frost seems to reason as if the enhancements made up to now to human understandings of our own moral natures and to the rules which might govern those natures—if such rules exist—were the only ones possible and, if they fail, will force us to deny that there is a possible understanding of absolute moral truths and a possible manifestation in our own natures.

Since I began thinking seriously about these issues, perhaps 25 years ago, I’ve had a problem with the status of natural law though I accord it the respect that Frost also accords; in addition, I think natural law reasoning—properly implemented—is the proper way to understand the ‘best’ which human beings can achieve. We simply have to recognize that our understanding of human moral nature and of moral truths are tentative in the same way as the physicist’s understanding of physical reality.

Frost points out, consistent with the complaints of many social conservatives, that Christian moral thought and moral action has decayed from its prior glory into a rather weak-kneed effort to avoid insulting others. After speaking of anthropologists who wish to avoid being judgmental about such behaviors as cannibalism, Frost tells us:

The noble savage is still alive and well. Strangely enough, this kind of thinking has seeped even into the missionary mindset, as I discovered during my last few years at the United Church of Canada. I was surprised to learn just how little our mission work involved teaching of Christian morality:

“Do you talk to these people about the Christian faith?”

“Not unless they specifically request it.”

“Do you at least have Christian literature on display?”

“No, we’re not allowed to do that.”

Things aren’t much better in the fundamentalist churches. I remember attending a Pentecostal presentation on “the cause of Third World Poverty.” I thought the talk would focus on cultural values. Instead, we were told that the cause is . . . lack of infrastructure. The Third World is poor because it doesn’t have enough roads, bridges, and buildings.

Much of the problem with modern Christians didn’t start as a loss of faith but rather, in my usual terms, as a refusal to make peace with empirical reality. As such thinkers as Melville and Hawthorne noted, this is essentially a rebellion against the Creator. This was my theme as I began to think through these issues in a more organized way 25 years ago, but I myself was having trouble making peace with metaphysics, more generally—with abstract thought. Peter Frost seems to me to have a greater respect for past accomplishments of abstract thinkers than I had but he seems to think that the recent failure to make better sense of the world after Darwin and Einstein means that it’s not possible to do again what Aristotle and Augustine and Aquinas did for their ages. Yet, he sees much with great clarity:

Christianity has been killed by its success. It has so thoroughly imposed its norms of behavior that we now assume them to be human nature. If some people act contrary to those norms, it’s because they’re “sick” or “deprived.” Or perhaps something is misleading us and they’re really acting just like everyone else.

In terms suited to my analysis, Frost’s insight becomes:

Christians had inherited an understanding of reality, a world-view, which was well-tuned to reality—as it was known and understood around 1700 or perhaps 1800. In recent centuries, knowledge of empirical reality increased rapidly and Christian leaders, intellectual and spiritual, utterly failed to produce an updated Christian understanding of Creation. What we have

is a patchwork of dissonant beliefs, the revealed truths of the Bible expressed in words whose meanings have changed over time and especially under the pressure of the modern enrichment and complexification of our knowledge of Creation along with that knowledge itself. Some of the Medieval Scholastics, including Aquinas, claimed quite plausibly that most of what we know of God comes to us through His effects in Creation or, as I prefer to state it: most of what we know of God comes through our proper sharing in the thoughts He manifested in created being.

Done properly, as Augustine and Aquinas did in their historical contexts, recovering a good understanding of Creation is a more complex process than imposing our thoughts upon Creation and more complex than simply taking our more or less direct knowledge and understandings of empirical reality as being normative or as being dismissive of the very possibility of absolute moral truths. We need to make better use of that empirical knowledge by seeing in it better knowledge of the abstract being from which the concrete is shaped. We need to see more clearly, as one example, that realm of abstract being we can sort of see in the equations of quantum mechanics and can with, far greater uncertainty, conjecture from the relationships in general relativity and in evolutionary biology and also history.

See my freely downloadable book, *Four Kinds of Knowledge* [43], for my understanding of the actual unity of knowledge of created being and the practical need for specialized fields of knowledge; it is that practical need which leads us to specialize as physicists or anthropologists or philosophers or retailers or plumbers. Frost is open to the goodness and truth in ways of thought outside of his field of anthropology and the closely related fields of evolutionary biology and genetics, but he has to rely upon specialists in fields such as metaphysics who have not done a good enough job of making sense of the whole ball of wax in light of the discoveries in recent centuries of biology and mathematics and so on. Those who think of themselves as modern, scientific-minded men and women don't see that any effort to understand this universe without having a good understanding of what Christians call created being—that greater understanding being of Creation as a whole, is much like the effort of physicists and other physical scientists to understand the things of our world one by one without having an understanding of the nature of this world in its more or less purely

physical aspects. It was Einstein who gave us a universe with his general theory of relativity and allowed the development of more unified and more consistent and more complete understandings of the concrete realms of Creation. It was Einstein's work including his work, and the work of Bohr and Schrodinger and so on, in quantum mechanics which pointed to realms of more abstract being from which concrete being is shaped. We should never forget that Plato and others anticipated some of this but we should also never forget that this deeper understanding of thing-like being gave us the possibilities of more exact understandings, more convincing understandings of both concrete and abstract being.

Christian theologians and philosophers have failed to make peace with empirical reality, that is—with God's Creation, starting with this concrete realm of thing-like being and that failure has led to utter cluelessness in any efforts to restate Christian truths and to reformulate Christian speculations so that they are consistent with what we now know of the Creator's actual work. As a result, Christian thinkers including philosophers and theologians have turned their fields into the studies of past creative efforts and have failed to deal with our new knowledge of the thoughts which God manifested in this concrete realm of Creation, have also failed to move on to dealing with more abstract realms of Creation. Metaphysics and the higher level forms of theology which are founded upon metaphysics are effectively discounted as important parts of Christian thought.

It might seem funny to accuse theologians and philosophers of the mistake of undervaluing metaphysical thought, abstract thought in general. They seem quite comfortable with Plato and Aristotle, Plotinus and Augustine, Aquinas and maybe a good selection of modern philosophers. The problem is that Aquinas was right when he told us that the first science (metaphysics) uses the positive sciences (physics, biology, and so on). Modern empirical knowledge indicates rather strongly that, for example, matter is far richer and far more complex than the Greeks or the Medieval Scholastics or Kant and other Enlightenment philosophers thought it to be. For now, our best understanding of matter is given to us by way of quantum physics and related specialized fields. This means that even the Christian understandings of the Sacraments, in which matter play a central role, are nothing more than fairy tales, once plausible understandings kept alive by the barbarian and semi-pagan descendants of Augustine and Anselm and Aquinas and Galileo—I agree with Stanley Jaki, the Benedictine priest and polymath, who claimed Galileo to be a better Christian theologian than the

Churchmen who opposed him. In any case, how can a sacramental Christian speak rationally about the Real Presence upon the altar if he doesn't really understand what bread and wine are and has not a clue about their relationships to the ever more abstract realms of being which culminate in the truths God manifested as the raw stuff of all created being?

To me, on a quite conceptual level, moral philosophy and theology is a bit like mathematical physics or similar sorts of sciences; this is to say that moral thinking should include a respect for empirical reality but also analyses and speculations which try to draw out the abstract being from which our messy world of things was shaped. (See Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality* for another effort to explain my thoughts on this and related issues.)

And there's the rub. Metaphysics does matter. If you've tried to make sense of concrete, thing-like being entirely on its own terms, you've missed much of what it is. Remember that protons and electron and neutrinos and so forth are manifestations of some strange, abstract sort of being which we can't perceive but we can think about it using the equations of quantum mechanics and by trying to form concepts based upon those equations. In other words, we have to move to a realm at least one step more abstract than those equations to find a realm of created being in which the qualitative and quantitative are one. In Chapter 90, *Shaping Our Minds to Reality*, I responded to some comments made by John Polkinghorne, Anglican priest and respected physicist, on the problems modern physicists have in understanding the fundamental nature of 'quantum levels of reality', a problem basically caused by our difficulties in shaping our thoughts to reality. We try instead to force our pre-existing schemes of thought even upon strange, new facts from empirical reality.

I'm certainly not saying that moral rules can be derived by contemplation of metaphysical realms—that is one major mistake made by even some great thinkers over the centuries. It's also a mistake to take empirical reality as being normative or anti-normative. Much of my work has turned into an effort to show the possibility of an answer which makes sense of this concrete realm as a part of a greater Creation. Human nature is embodied but our very bodies were shaped from all that concrete created being shaped in turn from abstract forms of being which we can sort of see, almost against our wills, in quantum mechanics and the general theory of relativity and in the evolutionary and developmental narratives given to us by modern biology and other sciences. I use the historically proper definition of science as

a disciplined field of study and so the prior statement refers also to history and the study of the human arts and even such ‘practical’ fields as politics and business management.

Metaphysics can guide us, even in understanding empirical reality because the concrete created being of empirical reality is shaped from more abstract forms of created being and those more abstract forms of being can be reached and somewhat understood by way of abstract reasoning, metaphysical and mathematical and logical. At the same time, we aren’t born with minds which can magically receive metaphysical or mathematical or logical truths. Because of very complex brains and bodies suited to those brains, we can shape minds by way of responses to reality. We can shape powerful and insightful minds by way of honest and courageous responses. The same can be said of moral natures.

Though human minds develop by way of responses to a messy world, they do reach truths, even truths so extraordinary as “There are infinities larger than the ordinary infinity of 1,2,3,4, . . . .” Human minds have not drawn these truths out of some Platonic realm we can magically access through mind-stuff, nor have they drawn these truths out of concrete, thing-like being in a direct way. They have worked slowly, over the centuries, in response to hints of the abstract being from which rocks and rattlesnakes are shaped. They have worked recursively, applying their speculative ideas on abstract being to concrete being and starting to adjust their speculations when necessary.

As we shape our own individual and communal human beings, we create richer and more complex forms of created being. There is something new under the sun, not only with the potential of each individual human being as he develops through his life but also with the potential of each human community. We can certainly see great good which was shaped in ancient Athens, a different great good which was shaped in ancient Jerusalem, and still something different again—great and good—which was shaped in ancient Rome.

Our moral natures develop in a similar way to the parts of our minds which search for mathematical truths. Our moral natures are shaped as we respond, actively respond, to a messy world but we, through our minds and moral natures, also can reach truths which seem extraordinary to those still capable of wonder. It’s a process quite different from simply applying a pre-existing schema about proper forms of, say, sexual relationships. We are particular creatures with particular sexual natures, particular forms

of care for our young, and this makes our sexual natures a bit, shall we say, empirical rather than ethereal. But, my general worldview leads me to propose our empirical sexual natures are shaped from more abstract created being, itself shaped from still more abstract created being and going right back to the truths God manifested as the raw stuff of Creation. It's only possible to see those truths with a mind of the sort which forms by way of good training in the context of a sufficiently rich and complex human community, ideally, a civilization. Even then, things can go horribly wrong.

Some truths can be deployed as lines in a formal proof leading inevitably to a set conclusion, but the greater part of truths in this Creation, so far as I can tell, are of the sort to be shaped into rich and complex forms of complex being. An example? How about the abstract forms of being we know only through the formalisms of quantum mechanics. From such abstract forms of being are shaped the components of matter and energy. As Aquinas said, to the annoyance of many: "Things are true." They aren't true in the sense of being the conclusions to arguments or of being necessary or absolute. They are true in being shaped from successively more abstract realms of created being, culminating in the truths God manifested as the raw stuff of Creation.

Here are links to four chapters in this book in which I've dealt with realms of abstract being as part of the goal of understanding human being:

- Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality*,
- Chapter 305, *An Enriched Moral World Makes for Enriched Human Beings*,
- Chapter 475, *Physics, Politics, and Metaphysics*, and
- Chapter 468, *Christian Traditionalism: Moving With God's Story*..

## 315 Do We Need Conflict to “Drive the Rise of Ultrasociality”?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1889>. It was finished and uploaded on 2014/09/19.]

Please accept my apologies for any confusion or incoherence. This is a line of thought in the early stages of development.

Razib Khan, a geneticist, published an article in his blog which I’ve discussed before—see Chapter 509, *Mathematical Models of Human History: Are They Plausible?*. Khan’s article, *Modeling World History in Math Is Possible* at <http://www.unz.com/gnxp/modeling-world-history-in-math-is-possible/>, is a commentary upon an article summarizing results of a research project, an effort to build a simple mathematical model of the development of complex societies: *War, space, and the evolution of Old World complex societies* at <http://www.pnas.org/content/early/2013/09/20/1308825110>. That simple model is very convincing in some ways, but I’m now going to provide the beginning of an argument that we need far better understandings of human nature, of individual and communal human being. I’ve been trying to make this argument and even trying to provide pointers to one possible better understanding over the previous 8 years but I’m now trying to put more energy and time into this general effort.

Khan’s article briefly discussed another idea which supplements the main theme that much of the pattern of civilization birth and growth on Eurasia and north Africa can be explained by the raids and invasions of nomadic, horse-borne warriors from the grasslands of central Asia. The sedentary, prosperous peoples under attack either developed their own complex, centralized societies or did so under the rule of those nomadic warriors. In

addition, Khan tells us:

A second broader issue that Turchin has promoted is the idea of inter-group competition driving the rise of ultrasociality. In other words, cooperative societies stocked with highly social and altruistic individuals simply eliminated earlier forms of social organization which relied more on individual self interest. He is keen to not allow the argument to reduce down to ‘group selection,’ but rather to focus on the abstraction of multi-level selection more generally. Conflict and warfare are obviously key drivers of this culturally Darwinian process. But I wonder where that leaves us at the end of history? Perhaps without an external threat imposing cohesion and inducing norms to regulate and punish selfish strategies anomie will reign?

I’m not sure how to proceed; regular readers might have picked up that this is the primary goal of my efforts—trying to figure out how to develop proper and properly rich and properly complex ways of describing and analyzing human communities. All of this within the context of a worldview which is a response to both Christian revelation and modern empirical knowledge. See Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality* for some discussion of this problem. I’m proposing that the concrete, thing-like being of this world is shaped from more abstract forms of being including that described in the formalisms of modern physics and mathematics. This wouldn’t end with one level of abstract being generating our concrete, thing-like stuff but would work level by level back to the truths God manifested as the raw stuff of this Creation. At various levels, some different sorts of created being become one in analogy to similar unifications in particle physics. The chart in Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality*, displays in a very simple way what is involved in this way of thinking about created being.

So, let’s consider biological selection processes, including “multi-level selection” processes. In at least a trivial way, but I think a meaningful way, those processes take place in a space of some abstract sort, but not a space necessarily more abstract than those an engineer will assume when he designs a machine of complex motions nor more abstract than a space in which an economy operates. In the case of a space describing human nature, through which the factual path of human evolution has traveled,

we would have the characteristics—cognitive power, hand-skills, language skills, social inclinations—of the individuals.

So we have perhaps something like an  $f(x_1(t), x_2(t), \dots)$  in which time perhaps plays the role of an independent parameter. This can be readily seen as—possibly—a manifold which may not have much in the way of fully quantifiable geometric properties but might be ‘solvable’ in terms of qualitative properties. I’m proposing such is true—see Chapter 144, *Adopting Mathematical Reasoning in Non-quantitative Fields of Thought*. The current thinking, even among some of the founders of group-selection theory, is that the selection processes upon ‘ultrasocial’ creatures are not group processes but rather multi-level processes in which individuals are selected for their social inclinations and behaviors. Seen from my more abstract perspective, the distinction between ‘group’ and ‘multi-level’ might be more a matter of choosing how to state the problem.

Evolutionary biologists and geneticists have become experts in some very advanced statistical techniques but they might wish to think where physicists would be if they just analyzed the data of quantum events and gravitational events by statistics rather than moving to greater abstractions. All sciences have their own proper ways of exploring and analyzing the empirical world, but I suspect we’ll be finding that practitioners in many fields of study would be wise to treat their data in terms of state-spaces with the potential to borrow from the powerful, and often qualitative, techniques of modern geometry—many of those techniques being already well-developed in the physical sciences including engineering. This might be one way of dealing with evidence that individual entities in a grouping might be part of higher level entities with their own separate, if sometimes more abstract, existence. Looking at the geometric structure formed by all those functions mentioned above, the small regions formed around points would be the individuals and would be described by many of the quantitative and qualitative tools of basic differential geometry while the communities would be the global properties explored over the previous half-century or so by mathematicians.

The issue which motivated this essay is the importance or even the basic role of conflict in the evolution and development of human social traits and of specific forms of community. Do we need conflict between communities or between communities and individual outsiders, war?, to draw our communities into more tightly bound forms? If so, can we divert our aggressive tendencies in more fruitful directions? Wars might be more a

cancer than a healthy part of the evolutionary and development processes, but that is a very uncertain line of thought. Wars, violent behavior in general, might also be indications of an underlying need not being otherwise met; in other words, we might be able to overcome our 'need' for war by proper understandings of our own human nature, individual and communal, and by proper responses to the world in light of that better understanding of our own selves. Currently, we have no satisfactory ways of discussing this or related issues which allows much in the way of convincing descriptions of the situation. We certainly have little clue about how to replace war by better behaviors.

I'm producing no more than suggestions, not even well-formed potential answers to the question raised in Turchin's research and Khan's article and I don't plan to provide an answer anytime soon. There's too much basic work to be done in understanding the nature of this concrete world and its relationships to the abstract realms of being from which it was shaped. As I've already mentioned, the most successful works of this sort already in a mature form are the mathematical formalisms of quantum mechanics and general relativity and little work has been done in even speculating on other realms of abstract being which generate the other aspects and traits of this concrete realm of created being. See Chapter 90, *Shaping Our Minds to Reality*, for my responses to the difficulties a Cambridge professor had in convincing elite physics majors that a vector isn't an arrow, at least not to a theoretical physicist, but rather a mathematical object with certain transformation properties. John Polkinghorne, who was an Anglican priest when he wrote about that problem, also noted that physicists still don't 'understand' quantum mechanics and won't until it becomes a part of their basic thought processes. I claim physicists will understand quantum mechanics when they accept it rather than trying to 'explain' it in terms of a less adequate understanding of physical reality. I'd suggest that many similar 'bits' of understanding will occur when empirical scientists in many fields accept the reality of the abstract being from which concrete, thing-like being is shaped. Our abstract thoughts are no more and no less than approximations to that abstract being.

Communal human being is built upon genetic family lines and individual human being is a particularization of such genetic family lines. Communal human being culminates in the Body of Christ but there are a multitude of communal structures between the individual and the Body of Christ. It's not even a simple building process since an individual will be a part of a

multitude of communities which play the role of organs in a living creature. The Body of Christ is a complex entity though it might have some aspects which can be modeled well without considering its complex make-up, especially in early stages of human social evolution when we deal with very simple egalitarian hunter-forager societies or tribes/kingdoms with well-defined hierarchies. Simpler sorts of mathematical models—simple in the sense of non-complex though they might be complicated—might work well for looking at the global or communal aspects of early human being. Looking at human being in this more sophisticated way won't even shoot down any ideas of hierarchies being adequate for organizing and running human communities, it will simply render hierarchies irrelevant—in the Catholic Church as well as in political communities. This isn't to say there won't be any authority, but it will be the authority of a smaller-scale community which has a particular role to play in a larger-scale community.

We need more sophisticated models of human nature, richer and more complex, to understand such complex communities as the nation-states of the United States and Russia and China in 2014. Such models are also needed for the other various communities, inside and cutting across nation-states, such as the religious communities of Christianity and Judaism and Islam and others. Even such ephemeral communities as those of physicists or musical composers could be better understood. Political scientists and economists and historians and other social scientists have done some good and convincing work in understanding aspects of these various communities but no one can really speak intelligently of what it is that forms when human beings gather, in some way if only through journals or over the Internet, to some purpose general or specific. I suspect we are seeing the concretization of abstract being of a certain type but this becomes more plausible if some more sophisticated model, of the type I'm advocating, is shown to work in modeling the evolutionary and developmental processes of something which can be labeled 'human being'.

As it is, we're stuck in a rut where we try to understand even very large-scale human communities by way of phenomenological models or by way of reasoning which pretty much assumes a community is some simple additive function of its individual members. I claim that a community is neither separate from its members nor is it just the sum of those members. It is more like the physical universe which is both what it contains and also has its own properties—see Chapter 193, *A Universe is More than it Contains* for a discussion of PJE Peebles' point that straightforward applications

of physical laws show that, in a universe governed by general relativity, the law of the conservation of energy doesn't hold for the universe as a whole even if it holds at all regions in that universe. (Or read Peebles entire book, *Principles of Physical Cosmology* [109] if you wish.) Even more to my point, spacetime at the level of the universe (and in some sorts of fairly small regions, such as black-holes) is non-Euclidean though it is Euclidean in most small regions. This is one sign of a manifold in the sense of differential geometry. To stay with physics for a moment: physics can be Newtonian at small regions while Einsteinian at larger regions because what happens in the small happens, so to speak, on a Euclidean plane tangent to the manifold which has the properties described by the general theory of relativity. Something analogous would be true under the very vague model I'm proposing the human nature, individual and communal.

Let me discuss briefly a particular problem which shows the difficulties of taking a community as a straightforward sum of individuals. A people can be nonviolent and well-meaning in the small but, in the large, as a people, can be murderous and thieving war-mongerers. In recent centuries, some of the most violent nations have been those with populations made up of individuals who are law-abiding and even somewhat gentle by historical standards: Germany in 1914-1945, Japan in the 1920s through the 1940s, Great Britain during the years of Empire and a bit beyond, the United States through much of its existence as loosely connected colonies up to now and still going strong though maybe about to run out of gas. We Americans tend to be generous and even somewhat self-sacrificing as individuals or as small communities such as church or synagogue congregations, fraternal organizations or professional societies. We are quite likable much of the time, genial, and inclined to get along with others. As a nation, we have proven ourselves from at least *King Phillip's War* (see [http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://en.wikipedia.com/wiki/King_Phillips_War)) to be a people not only violent but self-righteous in our violence. See Chapter 408, *The Need for Abstractions in Moral Self-understanding* for a discussion of this issue in a way important to the general effort to understand how communities are formed and deformed.

As I noted above, there is not complete separation of individual and communal human being nor is communal human being just a sum of individual human being. The evil done by the American state in such places as Korea, Vietnam, Afghanistan, Iraq, Libya, Syria, Ukraine is generally supported by majorities of the American people at least until they are personally hurt

in some way, though those American citizens are rarely full of hatred. Yet, we Americans are often self-righteous and morally irresponsible in forming viewpoints—see Chapter 465, *Dumber Every Day, With Beer in Hand and War on TV*. I also had discussed this general issue of American moral irresponsibility (and failure to develop the character traits important for life in complex communities) in Chapter 313, *The Interior Richness Which Lies in a Civilized Man*. The brutality of Americans as a people certainly draws upon moral weaknesses, including cowardice, of individual Americans but it seems to be the trait of an entity which is not just a sum of those individual Americans taught by war-profiteers and morally-twisted ideologists to fear anyone they wish to attack. Our predatory economy and polity seem to be as much the cause as the effect; they are global properties of an ill-formed human community.

We Americans have utterly failed to shape a morally good national community but we really can't even describe such a community in a plausible way—nor can the best of social scientists. Sometimes we can see somewhat firm outlines of such a community in history but no one has succeeded in abstracting from this historical knowledge much in the way of useful knowledge. We can't identify with certainty aspects of communities subject to study in numerical terms nor in more general mathematical terms—see Chapter 144, *Adopting Mathematical Reasoning in Non-quantitative Fields of Thought*. Models such as that of Turchin and his colleagues would show the growth of the historically unique American Empire as colors on the globe and would probably have trouble dealing with the premature ending of this Empire because this mismatch between a parochial population with local virtues and a nation-state with great, worldly power isn't something that such models could deal with. There is nothing in models such as those used by Turchin and his colleagues which indicates how a people well-behaved as individuals engage systematically in brutal warfare. Communal human being is completely separated from individual human being. It's as if the universe not only had its own properties but worked in such a way as to have nothing to do with stars and galaxies and gas clouds and so forth. In fact, simple physical cosmological models can be built upon such a basis and provide some serious insights but ultimately they don't depict the universe in its completeness: an entity on its own and also made up of all those stars and so forth. Even more to the point, it's as if we were to treat an human being as a freestanding entity having nothing to do with all those genes and metabolic processes.

I suggest that this is a clear case where our conceptual and mathematical understandings and related tools in social sciences are grossly inadequate, not at all capable of dealing with our human world grown so immensely complex and so immensely massive in terms of a 'mass' which bends our human spaces; neither I nor anyone else can currently define that mass. We need new understandings and tools and we need specifically to have understandings and tools which recognize the existence of local (individuals and—maybe—small communities) and global (larger human communities) aspects to the totality of human being.

## 316 The Demonology of Sexual Behaviors and Preferences

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1906>. It was finished and uploaded on 2014/11/19.]

The world is what it is and we Christians, of all human beings, have to accept it and work with it. For example, against the various do-gooders including those who think themselves Christians, I believe the Body of Christ has to be built of the human material which is us, the material created by God through some evolutionary and developmental processes which can be ugly even when things go well and can be quite ugly when things go wrong. In the way of this world, some of those processes can seem pretty when things go very badly—Baudelaire was not entirely wrong in claiming to see a certain sort of beauty in some evil things and evil acts. A pretty face truly can hide an evil mind or heart.

I'm less concerned about evil in my writings, including this one, than I am about the need to make peace with empirical reality, the one created by God, and not to pursue dreams of a world designed according to our desires or ideals or dreams. If evil exists or threatens to come into existence, then we need to deal with it. (It's not a problem of theodicy: I have no problem at all with the suggestion of Martin Buber, Jewish scholar, that God can create a world in which evil exists without at all affecting God's all-goodness. Satan isn't needed.)

So, what are we to make of a free-thinking paleoanthropologist who tells us *Yes, Demons Do Exist?* (See <http://www.unz.com/pfrost/yes-demons-do-exist/>.) What does Frost mean by 'demons'? We can find out in the first paragraphs of his article:

Are we being manipulated by microbes? The idea is not so

wacky. We know that a wide range of microscopic parasites have evolved the ability to manipulate their hosts, even to the point of making the host behave in strange ways. A well-known example is *Toxoplasma gondii*, a protozoan whose life cycle begins inside a cat. After being excreted in the cat's feces, it is picked up by a mouse and enters the new host's brain, where it neutralizes the fear response to the smell of cat urine. The mouse lets itself be eaten by a cat, and the protozoan returns to a cat's gut—the only place where it can reproduce (Flegr, 2013). [Links for this and other references can be found in the original article.]

*T. gondii* can also infect us and alter our behavior. Infected individuals have longer reaction times, higher testosterone levels, and a greater risk of developing severe forms of schizophrenia (Flegr, 2013). But there is no reason to believe that *T. gondii* is the only such parasite we need to worry about. We study it in humans simply because we already know what it does in a non-human species.

Recently, there has been some joking, as well as serious commentary, on the Internet about a “dumb virus”. This isn't a cognitively impaired microbe but rather one which can alter our intelligence levels. See this abstract, *Chlorovirus ATCV-1 is part of the human oropharyngeal virome and is associated with changes in cognitive functions in humans and mice* at <http://www.pnas.org/content/111/45/16106.abstract>, where we can read:

Human mucosal surfaces contain a wide range of microorganisms. The biological effects of these organisms are largely unknown. Large-scale metagenomic sequencing is emerging as a method to identify novel microbes. Unexpectedly, we identified DNA sequences homologous to virus ATCV-1, an algal virus not previously known to infect humans, in oropharyngeal samples obtained from healthy adults. The presence of ATCV-1 was associated with a modest but measurable decrease in cognitive functioning. A relationship between ATCV-1 and cognitive functioning was confirmed in a mouse model, which also indicated that exposure to ATCV-1 resulted in changes in gene

expression within the brain. Our study indicates that viruses in the environment not thought to infect humans can have biological effects.

Frost also talks about the sexually transmitted infection caused by the bacterium, *Chlamydia trachomatis*:

Chlamydia is a major cause of infertility, and this effect seems to be no accident. Its outer membrane contains a heat shock protein that induces cell death (apoptosis) in placenta cells that are vital for normal fetal development. The same protein exists in other bacteria but is located within the cytoplasm, where it can less easily affect the host's tissues. Furthermore, via this protein, Chlamydia triggers an autoimmune response that can damage the fallopian tubes and induce abortion. This response is not triggered by the common bacterium *Escherichia coli*. Finally, Chlamydia selectively up-regulates the expression of this protein while down-regulating the expression of most other proteins. (Apari et al., 2014).

But how would infertility benefit Chlamydia and other sexually transmitted pathogens? Apari et al. (2011) argue that infertility causes the host and her partner to break up and seek new partners, thus multiplying the opportunities for the pathogen to spread to other hosts. A barren woman may pair up with a succession of partners in a desperate attempt to prove her fertility and, eventually, turn to prostitution as a means to support herself (Caldwell et al., 1989). This is not a minor phenomenon. STI-induced infertility has exceeded 40% in parts of sub-Saharan Africa (Apari et al., 2011).

As it turns out, pathogens might also be able to change human sexual habits and sexual orientation. After a couple of disturbing paragraphs—when understood in the context of human moral freedom, Frost tells us: “Both male and female homosexuality seem to have multiple causes, but it's likely that various pathogens have exploited this means [changing sexual preference] of spreading to other hosts.”

In his conclusion, Frost writes:

This is a fun subject when it concerns silly mice or *zombie ants* [see [http://en.wikipedia.org/wiki/Ophiocordyceps\\_unilateralis](http://en.wikipedia.org/wiki/Ophiocordyceps_unilateralis)]. But now it concerns us. And that's not so funny. Can microbes really develop such demonic abilities to change our private thoughts and feelings?

It surprised me a little when I read that conclusion and its concern for privacy and then I remembered yet again that I live in a world in which even our most fundamental understandings of Creation have been restated in terms compatible with a radical individualism—even when that restatement is so much at odds with Christian doctrines.

A Christian believes in a Trinitarian God, Father and Son and Holy Spirit in one God. Three Persons sharing one nature. Human beings are an image of this God. But how could that be? Certainly, a modern individualist, even if Christian, should recoil at the deep conflicts between such views and their belief in their own individual, private selves. Human beings, to modern liberals—including both collectivists and libertarians, are freestanding entities which engage in contractual, voluntary relationships. We exist as fully-formed human entities and then choose to form friendships and political or economic or cultural relationships. Even collectivists have no concept of communal being, only that of entities being connected in the way of cogs in a machine.

So goes the modern liberal worldview and the strange belief that privacy should, or even could, be of primary importance in a world in which entities penetrate each other or live inside each other in various ways, including the way in which human and non-human entities exist in our all-too human empathetic and sympathetic faculties.

Can freedom exist without privacy?

To orthodox Christians, Father and Son and Holy Spirit can be free despite having no 'privacy'. They share all thoughts, all feelings, all actions. Yet, each is God; each is free.

I'm not presenting arguments but rather conclusions forced by the basic assumptions of orthodox Christianity, Trinitarian Christianity true to its traditions and its historical descriptions.

To be sure, we aren't God though maybe, by the mercy of the Almighty, destined to share in His life. In this world, we develop by processes which can be damaged without some significant amount of privacy. Loss of this privacy would lead to a failure of development of our individual human

natures as improper social development, or genetic problems—including any introduced by microbes, would lead to a failure of our communal human natures. We need some significant amount of freedom for both individual and communal human natures to develop properly. I'm not upset about my privacy being violated by infectious agents and, in principle, I'm not even upset about my privacy being violated by my fellow Christians because the nature of the Body of Christ, if He is to share the life of God and to be as God, tells us we won't have privacy in the modern sense if we are resurrected by God to share the life of Jesus Christ.

The implication that infectious agents can remove a significant amount of our moral freedom is more disturbing and will require some serious research and contemplation by Christian moral thinkers. Freedom is entangled with privacy in this mortal realm but is ultimately something quite different from privacy—if not, then we orthodox Christians are wrong either in our understanding of God as Triune or else wrong in our belief that we are, somehow, the image of God and we are part of one perfect Man—the Body of Christ.

I'm holding on to my belief in orthodox Christianity and am working to understand the world, as known to us through modern empirical sciences including all disciplined human studies.

So freedom remains a problem. How can we have any true freedom, even if limited, if a stray virus thought to have been adapted to infecting pond algae can make us dumber, if a bacterium can force some women to lead disordered lives by sterilizing them, if other microbes (discovered or only conjectured) can change us from heterosexuals to homosexuals or from bisexual women to obligatory lesbians? True it is that a 'heroic' effort can help us to remain within the boundaries of Christian moral teachings but calls to such efforts on the part of parents and clergymen and teachers have failed and such failures have motivated many Catholics and Baptists and others to join in the call for changes in what they were taught to be absolute and unchangeable truths. More fundamentally, we still need to understand why it is that some need to put forth a 'heroic' effort to behave as demanded by Christian tradition and, indeed, by any straightforward reading of the Bible. We still need to understand why it is that some will never feel as they are told they should feel, even with a 'heroic' effort.

Will we go to Hell because we caught a flu-like illness that has a side-effect of changing our sexual preference? A seemingly silly question but what's truly silly is that Christian moral thinkers, and moral thinkers of

other dispositions, have no way of answering this question outside of perhaps a blanket dismissal any sort of normality, a trivialization of sexuality and of any other particular aspect of human being. The previous statement covers those who advocate tolerance of homosexuality and other forms of sexual practice condemned by Christian teachings. Traditional Christian and Jewish moral thinkers have claimed the Biblical condemnation of homosexuality may have begun with disgust at certain sexual acts but have been seen to be more fundamentally concerned with respect for the importance and goodness of sexual acts between man and wife, mirroring in some way certain acts of God toward His creatures.

What does all of this mean?

It means that modern Christian moral thinkers (including artists) and teachers are standing upon shifting sand which is almost washed out from beneath their feet. This is not to predetermine what the results would be of refounding Christian teachings of human nature, including sexuality, upon more solid ground. I'm strongly inclined to believe the old rules will be mostly reconfirmed but that is a matter beyond human certainty until we go through the process of examining our mountains of empirical knowledge of human nature and bravely, with faith in the Almighty, asking the appropriate questions—no matter how difficult or uncomfortable. When we know a little better what a human being is and what it means to be male or female or to have male or female sexual preferences, we can better understand claims about what a human being should be. And we can better understand why there is a significant difference between 'is' and 'should' in many areas, at least in this mortal realm—I've denied in the past that there is, or could be, an ultimate difference between 'is' and 'should' but that's a discussion beyond the scope of the current essay.

I'm certainly not claiming that Christian moral teachings are suddenly wrong; I am claiming means that explanations of those teachings not stated in terms of acknowledged reality are implausible and cast doubt upon the teachings, even those which seem to be clearly stated in the Bible. It means young people, and many not so young, who are trying to form or recover an understanding of the world or their own human being or the human being of their children will find tales of a special creation of human beings and a fall from grace at the same time Christians have been forced to acknowledge the truth of the evolution of human beings from creatures which were also the ancestors of chimpanzees. Yet, Christian moral teachings are founded upon the misunderstanding of the story of Adam and Eve: we have an

identifiable pair of ancestors who were created in a state of grace and fell by way of a freely made decision.

Is it any wonder that young men and women raised as Christians often conclude that Christian leaders are just being mean to homosexuals or to men or women who married and then fell in love with someone not their spouse or grew bored with their spouse after their children grew up? Is it any wonder Christianity has lost so much credibility as a guide to human conduct?

Reality, the reality created by the God of Jesus Christ, is biting back and the leaders and teachers of Christianity can do no better than to back up claims that they are the teachers of the great truths with absurd discussions based upon superstitions which are the decay products of scientific knowledge and philosophical speculations which were once valid. A lot has changed in the human understanding of empirical reality, that is, of the provisional human understanding of the thoughts God manifested in His Creation.

# 317 The Modern Failure to Deal with Large, Complex Human Communities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1943>. It was finished and uploaded on 2015/01/06.]

See the commentary, *Notable: Bigger groups make less social time for red colobus*, at <http://johnhawks.net/> at the website of the anthropologist, John Hawks. Professor Hawks discusses an article summarizing research on troops of red colobus monkeys in Uganda. The research article provides empirical evidence that, for this particular primate, greater group size can reduce socializing because of the greater need to move about to gather food. For monkeys as well as men, there are only 24 hours in the day. Think of this trivial truth in light of a complex human community where “making a living” covers a lot of ground, education when young and, at various times and in various ways, participation in the lives of overlapping communities of a political or economic or religious or cultural nature.

I’ll move to more speculative realms of thought, seeing what can be made of this empirical data within the context of my Christian understanding of monkeys, of men, of this world, of all of Creation.

Of course, the obvious difference between men and monkeys is that men supposedly are more rational and can work to make their lives better in various ways. Obvious, maybe in theory and in the practice of better ages and better communities than those of the modern West. Not so obvious in light of the growing incoherence in the political and economic and other communities of the West, including that community which is Western Civilization itself.

The world is too much with us. There are only 24 hours in the day and we are given only our three-score and ten years on earth. We must make choices and set priorities. Are we to be active political animals? Are we to be devoted to demanding careers? (This latter was, and sometimes is, more possible for men in ages or social groupings where the wife takes on the role of building and maintaining family and other relationships as well as running the household.)

Though it might be coming to an end very soon, modern men of the West have been rich enough to be able to afford to waste much time (not in the useful way of creative writers or artists) and to teach their children that they can go to school for seven hours a day and practice/play a demanding sport a couple hours a day and play the guitar another two hours and watch three hours of videos each evening and spend many hours on their cell-phone and. . . Then you can look at the school-day and see it is typically a smear of diluted learning and shallow socializing and the satisfying of bureaucratic rules and. . . There's always time to do many things and much time to play our roles as vulnerable consumer widgets but not enough time to do the important things right—which often means intensely.

There have been some strange life-styles made possible, though only for a decade or two in all likelihood. Think of all those people, mostly but not all young, who seem to ignore all traditional and more earthly forms of socializing to engage in socializing by way of cell-phones or video games or Facebook and similar stuff.

Speculatively: I think that, faced with the need to choose activities, modern human beings—at least those of the West—have chosen a way of socializing that numbs them rather than truly engaging them in a rich, complex human life. Deeper engagement in careers in science or art or literature or house-building or teaching is sacrificed, often under pressure from exploitive political or economic systems. I've read testimony that some in the younger generation have good formal skills in many areas and show no real life inside of them—they make better physics students than physicists in one such testimony, at least so long as being a student is defined in terms of textbook learning and the corresponding tests.

Within our limited lives, many make their choices according to this pretense that each of us can be whatever we want and we can be that soon. In recent years, we've seen a lot of damage being done to individuals and communities by the shallow sorts of men and women who are devoted to feel-good busyness rather than to accomplishment. In particular, a great

deal of harm has been done by the ambitious but mostly untalented human beings who have chosen to devote themselves to careers and volunteer-works which allow them power over human communities and human individuals. Politics, in the United States and other Western countries, is dominated by those with little in the way of knowledge or intelligence or the intellectual skills which can help the less-intelligent to function by way of thoughts and rules of behavior developed by the great thinkers and doers of a human community and filtered through communal consensus. (For my use of ‘intellect’, see Chapter 127, *Intelligence vs Intellect* and, for the greater context of a complete human nature, Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*. Better still, download my book on the subject: *A More Exact Understanding of Human Being* [53].)

In a world where human beings tend to be busy rather than engaged, those with the talents of being busy dominate over those who might do their work in more appropriate ways only to emerge from, say, their cubicle at CIA with an intelligent analysis of the shooting down of flight MH17 over the Ukraine only to find the busy little bees have already set a disastrous policy in place. It doesn’t take long for a busy little bee to generate a flashy presentation using all sorts of graphics, to-do lists, and have-done lists.

How have we arrived at so basically incoherent an understanding of human nature? How have we constructed human communities so fundamentally incoherent? How have we built so many political and economic and cultural communities and institutions dominated by those not good at much except acting beyond their competence? By way of what I call “the poisons of individualistic ideologies.” As I will explain in the essay I plan to finish and publish soon, a creature both individualistic and communal which pretends to be radically and almost solely individualistic will greatly deform itself; that deformed creature will live in small-scale communities partly deformed but at least somewhat conforming to human nature; these deformed individuals and small-scale communities will start to gather together in ways which seem voluntary and, in any case, correspond poorly to the needs and legitimate desires of better-formed individuals and small-scale communities (such as families and economic groups). The resulting large-scale communities might well be absolute disasters, as is true of the economic and political communities of the West.

From there, our communities at all scales will grow still more incoherent and the individuals in those communities will be more deeply deformed over the years. Until the breaking point comes. And it might be almost here for

the West.

# 318 The Invisible Hand, the Invisible Heart, the Invisible Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1962>. It was finished and uploaded on 2015/02/03.]

Adam Smith famously took a new approach to the ancient problem: how to describe and understand the mysterious workings of created being in which ordered forms exist or even can be seen coming into existence. Those ordered forms can be forms imposed upon concrete matter—concrete entities such as stars or human beings, the latter being Smith’s primary interest. Those ordered forms can also be relationships between concrete entities.

As I see it, the above problem is pretty much the problem of understanding the formation of complex entities, human beings are of particular interest to we who are human beings, in this particular world as shaped by the Creator from more abstract forms of being. The evolutionary and development processes which have shaped human beings on a species level and an individual level have produced actual creatures which have the characteristics of persons in analogy to the three Persons, Father and Son and Holy Spirit, who are the one God. There is much for Christians to do in developing a new, richer and more complex, understanding of Creation—including a specially focused understanding of human being. There are many who are fighting battles to defend tradition because of what is clearly good and true in it and many fighting to take down tradition because of the many outmoded speculations—often masquerading as theorems of a sort. Few there are who are willing to pay attention to God’s revelations as they

emerge in this age when men have developed remarkable skills and technologies for the exploration of certain realms of created being. Fewer still there are who can even realize we are watching new forms of created being emerge as human communities grow to tremendous sizes and to surprising degrees of complexity. This is partly because nearly all men, especially those who are highly educated, misunderstand the nature of the human mind and misunderstand the nature of created being and of human knowledge and of the relationships between created being and human knowledge.

Men of the West were disturbed greatly by the discoveries of Galileo and his successors that matter and energy don't behave the way that contemplation upon experience would indicate. They would be still more disturbed by relatively recent discoveries that matter and energy are something different from what even Galileo and Newton thought them to be. The same can be said of the more recent discoveries about the nature of space, time, infinity, and mathematics as a whole.

It will be still more disturbing when men, especially Christian men, face up to the discoveries by Darwin and his successors that God's ways of shaping human being are strange and indirect, not so amenable to the forms of analysis preferred by traditional philosophers and theologians and historians and politicians and so forth.

Adam Smith was active during a period when physics stood about halfway between Newton and Einstein; Erasmus Darwin was writing a poem about an emergent form of evolution but his more hardheaded grandson, Charles, wasn't yet born. Within the limits of Smith's possible understandings of this concrete world, human communities as well as the physical stuff increasingly important in the Industrial Revolution, Smith managed to come up with vague language about the nature of forms and how they come into existence. It wasn't so much Smith's terminology which was good as was his prophetic success at capturing the spiritual essence of the formation and operation of free markets as they were in the second half of the 18th century in Scotland and England. He also saw into the future to some extent, predicting that the British colonies on the east coast of North America would become so powerful and wealthy as to likely overshadow Great Britain herself in the next century or so. (In line with some of my recent writings, Smith had not a clue that his specific theories about markets were mostly relevant when discussing a small sub-population of the human race—Europeans and especially those of the northwestern regions, a people very much skewed to individualistic traits.)

We should honor Smith for being a courageous and insightful pioneer of the modern world—his insights can be seen as prophesies of more exact forms of thought not only in the social sciences but also in the physical sciences. See this short introduction, [https://en.wikipedia.org/wiki/Ilya\\_Prigogine](https://en.wikipedia.org/wiki/Ilya_Prigogine), to the thought of Ilya Prigogine, a physical chemist and Nobel laureate who was a pioneer of concepts we can loosely describe as those of self-organizing systems. We should bear in mind that qualitative reasoning which can point toward more exact forms of thought are also important in physical science and are not just a fuzzy-minded child growing up into a tough-minded adult—qualitative reasoning remains important even in quantum mechanics and gravitational theories but has to always adjust to the results of explorations amenable to quantitative exactness. The global, often qualitative, aspects of a complex entity remain as important as its local, largely quantitative, aspects. Abstract being continues to exist even in the most concrete of things.

Though I've made some attempts to move toward a more exact understanding of created being on the "local" level and Creation on the "global" level, I've often worked on a higher level of abstraction than did Adam Smith. I usually work at a level which is necessarily qualitative because it is above the level of the more particular forms of being, including those of quantitative mathematics and the sciences which study concrete and 'mostly' particular being. (I put the scare quotes on "mostly" because quantum mechanics explores forms of being, energy-matter in this concrete world, which range from the very concrete to the not so nearly concrete; something similar could be said about other modern theories of physics with respect to spacetime.)

The type of analysis made by Adam Smith is still necessary for making greater sense of the discoveries of geneticists and anthropologists and historians and mathematicians and others, but Smith didn't get it quite right. He couldn't have gotten it right and needed to courageously do it the best he could, though it is also true that the better understandings of human being I've used as a starting point can be found in the ancient traditions of both Jewish and Christian thinkers. Men are hearts and minds and hands and yet one—defectively but truly. Men are born as communal beings as well as individual beings, or, as I prefer to put it, we have both individual and communal being. Smith, the radical individualist of northwestern Europe, was perhaps blind to knowledge emphasizing communal human being too strongly.

At the same time, we are a multitude of individuals, who remain such, and each of us is also, incompletely and defectively, our communities. We are told by the Bible and commentators from Judaic and Christian sources that we are images of God. Christians believe God to be Father and Son and Holy Spirit in one God—three individuals, who retain their individual Selves, but each is also fully and perfectly the one God.

# 319 Individualism: A Trait Become a Disease

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1965>. It was finished and uploaded on 2015/02/06.]

It's not the failures but rather the great successes of the West which have left it as a hollowed-out and collapsing civilization, that is, our successes as individualists and our successes in nurturing our individualistic inclinations and pushing them ever further at the expense of our communalistic inclinations.

It's not hard to understand.

1. Human being is both individual and communal and both of those parts of human being start with traits encoded in genes and then refined by the development of a human being in a specific context within a particular culture. (The genes evolve, of course, within a total environment which includes culture which leads many to talk as if we are pure individuals but are subject to selection within an environment which includes cultures and communities and, thus, leads us to act **as if** we have communal being as well as individual being.)
2. Different ethnic groups subject to different evolutionary histories, cultural and 'natural', lie on different points on a spectrum from individualistic to communalistic. A community will itself have a spread of traits so that some strong individualists might be born into the most communalistic of peoples.
3. Northwestern Europeans are radically individualistic as opposed to, say, Chinese who are radically communalistic. (Actually, it is appar-

ently more accurate to say the most strongly communalistic of Chinese, and a few other peoples, are those who have been rice-farmers for centuries.)

4. It would seem that the genes and culture of Northwestern Europeans have evolved in unison over the past millenia or better.
5. The thinking class of those northwestern Europeans, and some other Europeans as well, had developed within the priesthood and also, more freely, among the laity once education was more widely available. That thinking class seems to have been still more inclined to radical individualism than their fellow-Europeans and they developed political and economic ways of thought which assumed that it was a metaphysical truth that human being, if not deformed by culture, was radically individualistic. This started with Hobbes' observation of the nearly sociopathic inclinations of many of his fellow Englishmen and his missing observations of rice-farmers in the south of China. Locke and Smith and Jefferson and Rousseau and Mill (both father and son) and the Classical Liberals in general, most especially the ones proudly bearing the label 'Libertarian', glorified what was a good trait so that it seemed good to make individualistic traits strongly dominant, and sometimes absolutely dominant, over any communalistic tendencies.
6. European political and religious leaders, unlike those of most regions and most certainly unlike the Confucian rulers of China, enhanced their power by weakening other forms of human community, even the family. The Catholic Church, though biased toward the less radical individualism of Italian culture, also was guilty in treating human communities as nominal entities, as mere gatherings of individuals. Though partially true in corresponding to an imbalance in the human being of Europeans, that reinforced the evolution and development of a still greater imbalance of individual over community, though some communities claimed the right and had the power to control individuals.
7. The result was the war of all against all seen by Hobbes. Europe became a continent filled with unbalanced, murderously competitive communities of closely related peoples fighting themselves and those other peoples to whom they were closely related. Those peoples, once

they had achieved what seemed to be high states of civilization, waged a prolonged war of extraordinary brutality; starting in 1914 and calming down for periods, but fully active again in some regions by the early 1930s and for much of Europe by 1939 or so. After the Cold War and its proxy wars in Asia and Africa and Latin America, the Europeans started actively fighting each other again in the Balkans, often to the profit of American politicians and arms-manufacturers, in the 1990s. Sociopaths had come to almost complete power over political and economic and cultural institutions.

8. Along side these ultimately pointless wars, the West had to endure a prosperity of an deeply unattractive type. Westerners gave birth to start-up companies more often than to babies and the babies who did come were often raised in institutions or by women who spoke Spanish as their primary language.
9. We in the West have passed on our moral rot, of the radical individualistic species, to some other peoples who seem to have had inadequate defenses. Maybe they also were inherently unbalanced in the direction of individualism over communalism?

Peter Frost has published another frighteningly insightful article about the ongoing self-destruction of the West and the spread of our moral disorder to some other peoples. In the article, *A Faustian Bargain?* found at <http://www.unz.com/pfrost/a-faustian-bargain/>, he discusses the Parsi, a once proud and prosperous people who are non-breeding themselves out of existence as a result of their adoption of Western understandings of the good life. Please read it. It really is frightening to a thinking man.

Technicians, including many who present themselves as deep thinkers in the fields of economics and politics and sociology, tell us that our ways of life, our political and economic and cultural infrastructure, needs some fixing up. Replace a few support beams, put up a few more walls to keep the government out of some rooms, and throw on a coat of paint. In fact, the West is rotting, has been showing signs of decay since at least the 1800s. The West showed florid disease symptoms in the American War Between the States and the brutal and criminal war against the Filipino people, in the events of 1914 through 1945—both the wars and the economic collapses, in the political and financial corruption of the United States (existing from before the War Between the States but developing to absurd levels over the

20th century) and the turn to a brutal and criminal imperialism. Even the most ordinary observations in our towns and urban neighborhoods should tell us of demographic problems and of decreasing moral order in the youth of the best of families.

It would be evil to even try to rebuild the West as it once was. It would be an act of rebellion against God, an effort to push the Body of Christ out of the way so that we men can climb back up the ramp of decay to build another civilization subject to the same sort of decay as we've seen in recent centuries. It was a good experiment and the age of Enlightenment and a seemingly healthy form of radical individualism produced some darned good science and music and literature and art, even some interesting philosophy and theology. The experiment went bad, though not how or when most traditionalists imagine.

We are so many herds of individuals with no internal structure to those herds, no lasting relationships. Each head of Western human animal can move freely about inside the herd and form relationships as he wills at the time.

That herd isn't part of the Body of Christ, though once it was the major part of the Body in its pilgrim, mortal life. That herd is marching toward the permanent grave and not toward Heaven.

Am I saying the typical American or European of northwestern European descent is a radical individualist? To this point, I have at least implied that to be true. Now it's time for me to make an important correction.

Our rebellion against reality, against God the Creator of this reality, is soft and half-hearted. We can't ridicule what is holy in our traditions because most of us are more individualistic than, say, Chinese but not nearly as individualistic as Hobbes and Locke would have us be, not nearly as individualistic as the Mills were and would have us be. We want our communities, strongly bound in their own ways though perhaps a bit more weakly bound than those of Chinese and certainly African tribal peoples, but we've been taught to desire the fruits which might come to a courageous Bohemian. We've been seduced into inappropriate ways of life by those who are even more radically individualistic than the great majority of northwestern Europeans. We're destroying ourselves and only a small number of men and women are benefiting, those men and women who are radically individualistic to the point of sociopathy.

Though I strongly criticize the tendency of modern men of the West to develop certain traits into sociopathological conditions, though the West

probably has a disproportionate number of men and women who have sociopathological tendencies, on the whole, the individualism of the peoples of northwestern Europe is a good and useful trait so long as it isn't developed to an extreme and so long as economic and political and cultural systems of an individualistically inclined people aren't forced upon other peoples. The Body of Christ is going to be a complex melding of valid human traits, in their various manifestations along spectrums of possibilities. We need team-players and we need healthy individualists.

# 320 In a Complex World, the Community Must be Smart for the Individual to Be Smart

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1984>. It was finished and uploaded on 2015/03/13.]

Fred Reed is a smart and insightful man. Courageous as well, caring more for truth than for conventional opinions and public myths. And a friendly, neighborly sort of fellow so that just “Fred” is usually sufficient.

In the recent article, *The 145 Solution: Sapience, not Sentience* at <http://www.unz.com/freed/the-145-solution/>, Fred writes:

If fourteen percent [of American voters] are illiterate, a larger number must be nearly so. People who can barely read don’t. People so little engaged as to think Iraq attacked New York—forty-six percent!—vote almost at random, or in the direction in which they are shooed by cunning electoral mechanics and fixers.

The educated and thoughtful may have no idea of the night in which the rest live. We tend to associate with people like ourselves. Consequently if you know where Iran is, you probably don’t know anyone who doesn’t. But—a pre-Copernican quarter of the population believes that the sun moves around the earth? As we said in the Sixties, that’s a whole nuther head-space.

Thus a test of literacy, or more correctly of competence to vote. It might involve reading a paragraph of prose at the level of

college, or of what used to be the level of college, and answering questions about it. There might be questions such as how many Congressmen are there, name a country bordering of Iraq, list three rights guaranteed (ha!) by the First Amendment, and when did World War Two take place.

When we address the sheer ignorance and functional stupidity—on mostly public matters—of the American citizenry, voters and non-voters alike, there is so much to write about or talk about as to be overwhelming. When we add in the moral issues: self-righteousness to the point of antinomianism grounded upon ignorance of much including the wider possibilities of human being, we come to the real horror. I addressed this horror to some extent in Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*. I've also pointed to Graham Greene's novel, *The Quiet American*, where he claimed that we Americans feel the world exists to give us opportunities to feel good about ourselves. (The novel was a story about a romantic competition of sorts and was also a political thriller about terrorist, that is—criminal, acts that American government agents were committing in Vietnam by the early 1950s.)

A digression on the title of this essay. Historically, the Antinomians were a sect originating in Germany in the 16th century. They took the Protestant doctrine of faith so literalistically as to claim that the moral law was not obligatory on those who have a Christian faith; in the United States, this often means simply those who have come forward at an Evangelical revival and declared their faith in Jesus Christ. Whatever nuances might have been in Luther's writings and sermons were wiped away and "faith alone" assures salvation and frees the true believer of moral obligations. (Sometimes it might be a Gnostic doctrine of "knowledge of the divine alone," but I'm not sure I would consider either flavor to be truly separate. And, no, I'm not denying that most American Christians, Evangelicals and Catholics and others, are well-behaved in their own neighborhoods and workplaces, only that they hold themselves and the United States above moral rules when dealing with other peoples.)

In various essays, I've dealt with the problems of misformed minds in the modern world, especially American minds. For example, in Chapter 308, *Unreliable Memories, Minds Like Silly Putty*, I more or less claimed Americans have willingly allowed themselves to be turned into compliant objects for

the propagandizing of primarily the American government but also other American institutions.

Morality in a complex world is dependent upon intellectual understandings, not just because the social and cultural worlds of men are complex but also because the world becomes complex when men learn more about God's Creation of which we are a part; simplicity returns with a greater understanding—see Chapter 641, *Enriching Our Moral World: Simplicity Is Digested Complexity*. But the world is recursive in some crucial ways and intellectual understandings of the better sort come only with the application of certain moral characteristics—honesty and humility. We must be honest and open in dealing with reality. We must be humble enough to realize there are few answers inside our heads and those few answers are sometimes unreliable instincts about how the world works, though reliable enough to have aided in the survival and reproduction of our ancestors. We must also expend a serious effort if we would wish to understand a very complex world which often seems so messy as to be unordered—curiosity can energize the actual effort and even turn it into a game, though a quite serious game.

Most Americans are muddleheaded thinkers because they imagine the world to be transparent to their penetrating minds. They don't think to seek information and this is true of most of the smart Americans I know. They certainly don't seek to find new ways of thinking or to refine their existing ways of thinking. From their ignorance and muddled thought comes the self-righteousness that hardens into outright antinomianism, perhaps the "invincible ignorance" which Jefferson detected in Americans, or at least overlapping with it. This is both a general view of the world and also a way of dealing with aspects of the world, human and non-human, which don't act according to our American standards. If the Russians don't accept that we good Americans just want a strong presence on their border to do some more good, then they must be evil; and certainly we would never suspect that our American leaders are up to more or up to something different than their words indicate. If the world doesn't have enough petroleum which can be cheaply extracted, then we'll plan on an economy which can continue to grow by using petroleum which is expensive to extract and refine; we certainly won't consider improving our school system to nurture the better quality minds which might find new ways to provide abundant energy. We like our current school systems with all those pep rallies and homecoming games. We like our library systems all the more as they get rid of all

those hard-to-understand books and replace them with thriller novels and computer terminals and DVDs.

What is the problem? Is there something unique about the United States, something exceptional? Was that something never as good, as promising of greater good, as was advertised by many? Or did that something go bad in some way? I think the West as a whole went wrong first in intellectual and cultural matters; the moral problems followed from there though, as I said above, all human characteristics are intertwined and all are involved when things go well or badly. Americans are leading the charge into regions of moral and intellectual incoherence but most European peoples aren't so far behind us.

We human beings can usefully and in substantial truth be described as mind and heart and hands. (See Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*, or download my book, *A More Exact Understanding of Human Being* [53], for a discussion of this issue.)

But it's the mind which is of greatest concern here because it is the beginning of the peculiar form of American decay—it has been said that Americans are the first people to pass from a state of barbarism to a state of decadence without passing through a state of civilization in between. I think it largely true and largely true because of the weakness of the American mind, a mind which functioned well in parochial circumstances but doesn't function so well in the fluid and dynamic cosmopolis, let alone a globe of civilizations and cultures not linked to specific civilizations.

But we each and all have two intelligences—individual intelligence and intellect or communal intelligence. I consider the intellect to be the communal intelligence of real communities and do not use the word as merely a way of speaking of our collection of long-lasting customs and the stuff in our libraries and the other stuff in our art museums and so forth. But I'll start with words from a serious thinker who seemed to advocate a view of the 'intellect' which is profound and insightful but—perhaps—more in line with mainstream understandings of human nature. In *The House of Intellect* [7], Jacques Barzun tells us, first:

We [in the United States] have in fact intelligence in plenty and we use it perhaps more widely than other nations, for we apply it with praiseworthy innocence to parts of life elsewhere ruled by custom or routine. [page 4]

Later on that same page, Barzun goes on to tell us the difference between that intelligence we Americans have “in plenty” or at least had “in plenty” in the 1950s and the intellect which we largely lack:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

I’m a little uncertain about the exact meaning of Barzun’s words. I agree with him to a large extent but it’s possible I go where he wouldn’t travel: I believe the intellect, “the capitalized and communal form of live intelligence”, to be the (abstractly) observable aspects of a true communal mind which is subject to evolutionary and developmental processes which ultimately leads to the mind of the Body of Christ. It’s quite possible Barzun believed communities to have only a nominal existence.

In any case, I think that Barzun would have agreed that much of our moral reasoning, certainly when it covers very complex issues, is ‘done’ at the communal level. This isn’t to say that individuals minds aren’t working hard, maybe just to spin their wheels, but it is to say serious thinking is done, at the very least, in conversation with Jeremiah and St Paul and St Augustine and Shakespeare and Melville and Minogue and many others—a complete list will include geneticists and evolutionary thinkers and brain-scientists and many others as well as far more prophets and poets and theologians and philosophers. Even a book which is morally questionable to a Christian, but also honest, such as *Madame Bovary*, should be part of the Christian’s deeper thought processes and likely will be, for good or ill, if he’s read it.

There are certain core parts of any communal mind which come from the individual intelligences of those more gifted in speculative or practical reasoning, with the curiosity of individual minds driving much of the development of that communal mind and sometimes providing for less talented thinkers to overachieve. Americans can admire great doers, entrepreneurs

and politicians as well as athletes and soldiers. Americans can admire those who are driven by the heart, missionaries and certain poets and musicians as well as mothers and teachers. Americans seem to try to admire great thinkers, even turning Einstein or Watson and Crick into celebrities of a sort. Americans can't figure out why great thinkers are of great importance because of the reasons I gave above—basically, they think their empty and unexercized and perhaps untalented minds are as capable of getting to the truth as all those analysts at the CIA and the DIA and all those universities. They think it a waste of time to check out a book or two on the history of Iran or that of American diplomacy and military interventions overseas. After all, the world is transparent to their minds; if Iranians act in ways that make no immediate sense to the average American suburbanite, then those Iranians must be irrational and up to no good. Since the world is transparent to our minds, then any confusion we see is clearly irrationality or immorality. And we don't let any wise-guys try to talk about, say, the different understanding of Iranians which is held by retired CIA or DIA or State Department officers who actually learned the languages and histories of the peoples in and around Iran, who interacted with some of those peoples in hostile or friendly situations. Certainly, we Americans react strongly against anyone who starts a conversation with words such as, "I read a history of Iran which is down at the town library and..."

When we don't admit into our own minds the knowledge of serious historians and military or civilian intelligence analysts and diplomats or soldiers with boots on the ground experience, we show that there is no American community mind. Furthermore, we show ourselves to be rebels against reality, against the Almighty who made and sustains that reality. (Herman Melville made this latter claim against Americans back in the 1850s.)

## 321 Worldviews and Human Identity

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2080>. It was finished and uploaded on 2015/07/14.]

In the past few months or so, I've tried to allocate more of my mental energies to studying mathematics and history, concentrating for a short while (4 or 5 substantial book's reading time) upon some histories of the ancient Celtic peoples (Gauls to the Romans) and the Germanic peoples of the era of the Roman Empire and succeeding centuries as Europe was being born in a 'civilizational' sense.

One claim by some historians is striking: in formulating newer, more complex **sets** of ideas about the ways in which the larger peoples have formed. It seems that, for example, Roman Gauls formed as various groups of Celts were assimilated to Roman or Latin culture. Large but not overwhelming numbers of Germanic peoples moved in as the Roman Empire concentrated its energies on dangers from the East—the Sasanian Empire of Persia and then Arab raiders followed by Mohammedan armies. Over a number of generations, these Germans, along with many of the Romano-Gauls formed something of a Pan-Germany (Germany and France and Belgium and other countries) by way of a mixture of migrations, political takeovers, and linguistic/cultural takeovers. Some of the movements of 'Goths' and 'Vandals' in the first millennium AD did correspond to large-scale migrations though apparently not nearly all of the people who had lived with and around the migrants. As it was, the Goths under Theodoric (first Germanic Emperor of a major part of Europe) had a wagon train behind them of 2,000 vehicles or more—miles of wagons bearing supplies as well as those not capable of walking hundreds of miles in a year or two.

Some centuries later, a political takeover in which elites replaced elites and left the workers in place is documented in excruciating detail—the Norman replacement of the Anglo-Saxon elite. I’m personally a member of peoples formed by an earlier linguistic/cultural takeover: those descended from early farmers of England who became Brythonic Celts and then Anglo-Saxons (without the Normans much disturbing the general culture or language) and those similar peoples in Ireland and the Highlands of Scotland who became Gaelic Celts. (Those early farmers were also the result of such processes with much of the culture and perhaps some languages and perhaps some or a lot of genes coming from the first agricultural peoples of modern-day Turkey.)

This wasn’t greatly surprising to me, partly because I’ve trained my own self to accept the world as it is—perhaps with some goal of making it a little better. Still, I was a little surprised to read of the likelihood that some of these cultural/linguistic takeovers were rapid and the (almost) certainty that there was at least were rapid transformations of some cultural aspects tied to what I’ll label “interior human character traits” as these ‘peoples’ were forming.

This is disconcerting to see solid evidence that fundamental human attachments can be so shallow as to be changed during a march from the Balkans to Italy. It certainly makes such dystopias as *1984* more plausible. Yet, my understanding of how this comes about leaves open better possibilities.

I’ve updated the Thomistic understanding of being and of mind and have tied them together far more tightly than was possible before modern science largely confirmed the Thomistic understanding of mind-formation (see Walter J Freeman’s *How Brains Make Up Their Minds* [35]) and also came to strongly support the understanding of being held by St John the Evangelist: relationships are primary over stuff; relationships create and shape stuff. See Chapter 83, *Is Christian Morality a Natural Morality?*, and the next five essays I published for my take on Thomistic theories of the mind by way of discussing Freeman’s book. See Chapter 156, *Einstein and Bohr’s debate on the meaning of reality* and Chapter 157, *Quantum Mechanics and Moral Formation* for short discussions of being under the related understandings of the ‘radical’ quantum theorists (such as Niels Bohr) and the school of St John the Evangelist.

Chapter 61, *Imposing Ideals Upon Empirical Reality is Insane and Not Noble*, relates a much more recent version of my highly empirical Christian

worldview. I feel my stance to be far more consistent than the empirical stances of St Augustine and St Thomas Aquinas and Galileo and John Henry Newman but I live after Einstein and Bohr—they made it possible to be more consistent. Years earlier, I had written an essay which became Chapter 100, *What is Mind?: Can Inadequate Formation Mimic Mental Diseases?*, which developed some of the fundamental ideas showing up in that recent essay—the earlier essay had explored the failure of many to pay proper attention to the world around them, that is, to reality. The underlying idea for this line of thought is, simplistically, that our minds are more or less accurate images of what lies around us, some portion of the thoughts God manifested in Creation. In greater detail and unapologetic Christian form, that underlying idea is this:

The human brain is a complex organ of a physical creature. Shaped at the species level by the contingencies of evolution and at the individual level by the contingencies of development (including both environmental factors and our decisions), the brain has additional constraints coming from our own limited natures and also the limited range of possibilities manifested in this particular, concrete world. Yet, that brain forms (“makes up” in Freeman’s terms—again, see *How Brains Make Up Their Minds* [35]) a mind which can rise to somewhat understand more abstract and general levels and that understanding is recursive in allowing a better understanding of concrete reality.

The first sentence of the above paragraph starts with the stuff of the human body, but we have to concentrate on the remainder of the paragraph, the relationships and processes which create and shape stuff, starting with the divine love which brought into being the raw stuff of Creation.

Totemism is usually more obvious in boys than in girls—boys used to pretend to be bears or gorillas until the Western entertainment industry pushed stranger or more horrible ‘games’ into their heads; girls used to play house. Yet the more general version of totemism, shaping the mind and sometimes the entire human person to what lies outside and is of interest, can be seen as the clue to understanding the human mind. The brain is primed from conception in healthy embryos to shape (or “make up”) a mind as an encapsulation of what that human being has

chosen to respond to or been forced to respond to. Our understandings of reality, when the result of ongoing and honest responses to that reality, are like unto an ancient hunter's understanding of that animal he 'emulates' to better anticipate its behavior, that is—to better understand that animal. That understanding is dynamic and not a mere image and it is a means to changes in heart and hands, that is, feelings and emotions and well as behaviors, habits and others.

Another complication: the human being is both individual and communal and the same is true of the human mind. See Chapter 127, *Intelligence vs. Intellect* for an early development of this idea in the context of responding to *The House of Intellect* [7] in which Jacques Barzun makes a similar but more qualified claim.

Now we're ready for my response to the ease with which human characteristics and beliefs can shift so rapidly so that Eurasian nomadic horsemen can 'become' Goths or Vandals or vice versa and, more horribly, so that 'nice' human beings can learn to peacefully accept rule by Nazis.

Most of our worldview, our larger-scale understanding of "the universe and all that", comes from our community. We become vulnerable when our communities decay and maybe leave us in the presence of a powerful worldview, perverse or noble. We also are vulnerable when our communities are such as not to have such a worldview, an understanding of the universe or of all Creation as being unified, coherent, and complete in a particular and rational and plausible and emotionally satisfying way. A simple, peasant worldview held by a farming folk of limited experience (the Goths and their traveling buddies) can be destroyed when those folks are suddenly exposed to a wider and more complex world. Such destruction can also occur when facts and information about reality pile up without anyone making sense of them within an existing worldview capable of handling those facts and that information (modern Christians). In such states, we are like soft clay and can be easily shaped in response to a madman or a noble genius or anyone else who responds in an energetic way to a world suddenly richer and more complex.

The Germanic people of the period 0-500AD or so were shaping themselves in response to the Romans (including the Gauls or Romanized Celts) and their civilization and shaped themselves into the individuals belonging to the partly new peoples: the Franks and the Goths and so on.

The leaders and intellectuals and artists of the Christian peoples of the modern West have failed to respond to the rich and complex, sheerly wondrous, knowledge we have of Creation; they failed to make greater sense of it and to reconcile it in a worldview explaining how this world of quantum uncertainty and biological evolution and curved spacetime and frighteningly complex human communities is the work of the Triune God, Father and Son and Holy Spirit. The children of those Christians are shaping themselves and their communities in incoherent and desperate responses to the world as modern empirical researchers have shown it to be; those children respond also to the pleas of political scoundrels and various other sorts of exploiters as well as to the pleas of those non-Christians who are trying to make good, but non-Christian, sense of the world as we now can see it more clearly than could prior generations.

## 322 We Should Ask First: Are Human Beings Made for Democracy?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2098>. It was finished and uploaded on 2015/09/28.]

I don't get it. What world do political theorists and philosophers, political commentators of all sorts, live in? For decades, their fellow practitioners of the humane arts and sciences, the historians, have been trying to deal with the realities of human biological existence—William McNeil, the distinguished historian from U of Chicago, was well-known for trying to deal with climate, disease, early human material culture as revealed by archaeologists, and even evolution and genes to the extent possible. More recently, the geneticist Bryan Sykes and a variety of historians have dealt more directly with genetic information in the context of human history as well as with updated (and sometimes dramatically changed) knowledge from archaeology, paleo-climatology, paleoanthropology, and other fields. I've been reading books by some of those historians: Barry Cunliffe, Peter Heather, Norman Davies, and others as well as some books by archaeologists and linguists. I'm also keeping up with the writings of bloggers who deal with anthropological issues, especially those issues falling under HBD (human biodiversity)—look up Peter Frost (currently on hiatus but his past writings are still readily available), Razib Khan, Steve Sailor, the Jayman, and follow their links to others or do your own searches. Razib Khan also has up a number recommended books including many good works on history. For now, I have a clear interest in the European peoples of Indo-European

cultures and languages.

Political scientists and philosophers?

(Warning: my discussions of this general issue cover what I know and that means: a little bit of the political thought of the West, mostly restricted to the Anglo-American regions of space and time and thought. I also have an aware citizen's knowledge of what passes for political discussion in this age of decayed minds and weak moral characters.)

Some political scientists have shown a fondness for quantitative models before their time in that field but neither political scientists nor political philosophers have shown much inclination to question the foundations of their thought in general—at least not any thinkers who have made an impression upon the mainstream of modern human culture. I'm sure those political thinkers will claim to accept Darwinian insights in general, but you wouldn't know it from their teachings and discussions of politics. Even Plato and Aristotle seem to have been nearly delusional about some aspects of human nature relative to the authors of the Old Testament. Despite the distorted understandings some have of Biblical teachings on human nature—largely due to irrational and literalistic readings, the authors of the Bible said much that anticipated the Darwinian understandings. The insights of Plato and Aristotle were many and profound and true but were founded upon deeply erroneous assumptions of the nature of human individuals and human communities. In the centuries since Aristotle? Progress in political thought seems sometimes to be the substitution of Roman gentleman or Germanic/Celtic warrior (the truly free) or—God help us—American bourgeoisie for Athenian gentleman as the true human being and the true political actor. Some will endorse Hobbes and some Locke as expressing deeper truths, but the first was a pessimist who assumed a static and idealized model of human individuals and communities and the second was optimistic. Neither seemed to have considered the possibilities of evolution or true development, both assuming some model of human nature which holds for all men and all peoples in all times and regions.

The more prominent political scientists and philosophers seem oblivious to the issues geneticists and evolutionary biologists are actively addressing—the whole bundle of human biodiversity (HBD) matters, such as the real pace of human evolution (very rapid since the formation of more complex human communities circa 10,000 years ago) and the consequent differences between the 'pools' of rapidly evolving human groups. Let me provide a tentative list of questions we need to answer before we can discuss

higher-level political issues:

1. What are the true characteristics of human nature?
2. Are there really uniform characteristics across individual men and across ethnic groups?
3. What do individual men really need and desire in their political and economic lives?
4. What do communities need and desire?

If we could answer such questions, we might be able to come to understand why it is that few peoples in the world seem much interested in political systems which came to be in the western and northern regions of Europe in recent centuries. We might come to understand why efforts to force into democratic 'molds' the governments of Southwestern Asia and other regions have so badly failed. We might even come to understand how it is that the American republic has come under the dominance of political machines and their clients while most political scientists and philosophers continue to blabber on about "American democracy."

Returning to the above list, the reader might notice the belief I express, if somewhat implicitly, in the fourth question: communities have a real existence. Based upon my understanding of history and human biological nature, I could have expressed the third and fourth questions as part of a group beginning with: What is the balance between individual being and communal being in a human animal? Is that balance the same for Irishmen and Italians and Nigerians and Malaysians? Also: Does the balance change if that human animal succeeds in becoming something like a human moral person? Does the balance change as the human mind expands in active response to God's Creation?

It wouldn't matter if someone were to approach these issues with a different overall understanding of created being and a different initial assessment of human nature. The goal should not be, and could not be, to eliminate a metaphysical understanding of the being of which the human animal is part. The goal is to take your metaphysical understanding, try it against the details of empirical reality, and reject or adjust as you think appropriate. It is true that the metaphysical understanding of men and their communities (how can there be such understandings?) as ideal creatures independent of

the surrounding being with its evolutionary and developmental flux will be ruled out of court as soon as the basic questions are asked.

Because reality so quickly teaches the open mind, it's not so much a problem that political scientists and philosophers initially approach their task understanding human animals as radical individualists of perhaps an Athenian gentleman sort or a modern WEIRD (Western, educated, industrialized, rich, and democratic) sort. It's a great problem that they never test their basic assumptions against the reality of enfleshed and biologically diversified human animals, just as great a problem that they never test those basic assumptions against the seeming (and true, as it turns out) reality of human biodiversity.

I would suggest, against the position (circa 1993) of Fukuyama (in *The End of History* [58]) and likeminded thinkers, that the 20th century and, even more so, the 21st century have indicated that democracy is a failed system. Is this because the typical human being has not the right characteristics for this form of government? Is this because it's not possible for the typical human animal to understand our political and economic systems, or to properly estimate the moral character of the candidates for public office in this complex and confusing world? Have our educational systems failed? Our cultural systems? Our religious institutions? Our families? Or is a mass democracy simply bound to destroy itself through the fear that allows the destruction of our own freedom by our own leaders and the theft of our own wealth by our own leaders? Or were we always in error in idealizing political systems?

There is a lot that needs done to either start fixing our broken systems or to start to move towards new ones by way of intelligent guidance, or sometimes wise non-guidance, of evolutionary and developmental processes. It would help if we had political scientists and economists who move beyond study of the prisoner's dilemma and the writing of pseudo-philosophy which is little more than attempts to justify systems of knowledge which have proven to have little to do with reality.

All that I said above can be used with relatively few changes to speak about the mismatch between reality and Christian theological and philosophical systems. When we consider the importance of such thinkers as Augustine and Aquinas and Newman in political thought and political acts, then we can foresee the likelihood of a very complex history of human thought. And I can foresee the likelihood of realizing those three thinkers in particular were far more empirically-minded and closer to the truth than

the thinkers preferred by the political thinkers of the modern West.

## 323 Virtual Reality as Darwinian Selection for Reality Orientation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2119>. It was finished and uploaded on 2015/11/21.]

Wayne Allensworth has a frighteningly interesting commentary on virtual reality, an addictive abuse of technology which might generate still more problems than what we're seeing from our better established abuses of technology ('ordinary' video games, cellphones for 4 to 104, etc), *Disconnected: Our Virtual Unreality* (found at <http://www.chroniclesmagazine.org/2015/December/39/12/magazine/article/10829745/>) where he writes near the end:

Alistair Charlton of the International Business Times recently quoted a subject who had tested VR sex. VR pornography, he said, will "probably spell the end of civilization. I just know some people will never, ever take that thing off."

My take on these matters is simple: charitable concern and actions for others can do only so much and, if we do other than cut off those who sink into such a hell, then we're merely wasting resources better used for the healthy among our children. So far as I can tell, we who are concerned about saving a civilization and its healthier children have to let Darwinian natural selection and other related forms of selection take over. In other words, if human beings insist on letting themselves be passive victims of exploitive technologies, let them perhaps live and die in modern-day equivalents of opium-dens.

When it comes to saving civilization and those, currently dwindling, healthier children, we can choose from two basic responses:

- Bring a better moral order to society by way of central powers. This would necessitate some sort of criminal prosecution against many in the entertainment industry (including mainstream news organizations) and would leave someone or some small group of someones in charge of Western culture.
- Restore healthy processes in smaller communities by way of which economic and cultural ‘systems’ will organize themselves in accordance with some plausible and intelligent moral order—that is, allow the Invisible Hand to work while recognizing it isn’t a magic force and that Adam Smith was observing an economy organizing itself in the context of a society populated by those who didn’t necessarily believe in the Christian creeds but did act according to some version of Christian moral order.

I’m putting my money, of which I have none left, but also my life on that second possibility: the rebuilding of Christian Civilization by way of individual and small-community effort. My regular readers may remember that I consider Christian Civilization to be the totality of the Body of Christ of which the Church Herself is but an organ, albeit the central organ and organizing organ of that Body. I’m one of those pessimists who think we’ve destroyed too much of the foundation of Western Civilization—an early version of a true Christian civilization, not by failing to keep up our infrastructure or by putting up Modernist buildings—those were, at worst, symptoms of decay and not the source of decay. No, we’ve destroyed too much of the foundation by corrupting our own selves and our children. Most of the capital of a civilization is found in the minds and moral characters of its members.

As it is, few Christians of higher intellectual competence bother to read the Bible—as did the great physicist James Clerk Maxwell and other serious scientists from prior centuries; few Christians or non-Christians in the West of any level of intellectual competence bother to read demanding works of the West other than work-related manuals or papers; few even read demanding works of a secularist sort or demanding works of anti-Christians. Modern anti-Christians or—still worse—those indifferent to the issues of serious theological belief, live in what a Supreme Court Genius might label as the penumbra of the teachings of Rousseau or even of serious writers of a Unitarian mindset such as Locke or Dickens. There is no Christ in

*A Christmas Carol*, but only feelings of good-will connected to roasted turkeys and eggnog and medical care for all; it be a very bad sign indeed that so many alleged Christians wish to beat up on store-clerks who say, “Happy Holidays!” and then go home to watch *A Christmas Carol* with their children. This shows a serious lack of intellectual development or of any sort of spiritual insight.

Let me tie together the pieces of this essay: those younger human beings (and a few older ones) addicted to video games or cellphones or the still worse life of virtual reality are true children of the West, for the modern West is a virtual reality which, so long as it had Grandma’s bank accounts to run off, could shelter us from past or present realities. Unsheltered by that inherited wealth and by the inherited moral order we seem by our acts and words to greatly despise, then—as individuals and as communities, we might well prove ourselves to be Darwinian failures. God’s story will go on and I believe more strongly with each day that Christian Civilization will move East, to be centered perhaps in Russia and perhaps somewhere in the Pacific Rim. (The West coast regions of a fragmented United States are one specific possible location—or perhaps South America for those who believe in Nostradamus and who believe he really predicted the Pope would move to that continent at about this time.)

## 324 Yes, Genetics and Evolutionary Biology are Relevant to Our Political and Social Problems

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2127>. It was finished and uploaded on 2015/12/01.]

I've been reading a fair amount of works of narrative history lately, most dealing with the history of the Celtic peoples—especially those of the British Isles; lately, I've been reading more general histories of the British peoples for greater context. For decades, some prominent historians have been integrating archaeological and linguistic knowledge into their analyses of history and doing so in a properly skeptical way, skeptical but also openminded. More recently, there is greater or lesser use of genetic analyses from peer-reviewed scientific communities—to be sure, even peer-reviewed work can be subject to changes of both claims as to underlying facts and, most certainly, changes in interpretation. One main line of recent genetic/historical research has tried to determine who the European peoples are. It turns out there is a base of genes from the Neolithic modern humans of Europe; there are also elements of what seem to have been peoples who had come from the steppes of Western Eurasia—modern-day Ukraine and southern Russia; along some geographic bands (coast of Spain, Portugal, and France up into the British Isles and also up through Europe into northern Germanic populations), there are also genes coming from peoples from northern Syria and the adjoining regions of Turkey—the “First Farmers (of Western Eurasia)”; there is even a few percent of Neanderthal genes in modern Europeans.

The basic story seems to have stabilized most recently, but there was confusion from genetic analysis as well as from archaeological and linguistic analyses of, say, the events underlying what might be labeled the Indo-European phenomena of (mostly) prehistory. These phenomena were the partially mysterious events of the creation of a family and subfamilies of languages and cultures which spread from Ireland to India and Western China, from the toe of Italy to the northern borders of Scandinavia. These phenomena were also the corresponding spread of a warrior culture which seems to have been, more basically, a patron-client or master-vassal culture. As it turns out, these cultures and languages spread partly because of invasions of large numbers of peoples and sometimes by invasions of smaller numbers of bands of warriors who brought no families or women with them and sometimes by processes of cultural imitation.

I'll provide a list of books covering these subjects in the order in which I read them, giving titles and authors only as they are readily available in bookstores or major library systems:

- *The Horse, the Wheel, and Language* by David W Anthony.
- *War! What is it good for?* by Ian Morris.
- *The Ancient Celts* by Barry W. Cunliffe.
- *Empires and Barbarians: The Fall of Rome and the Birth of Europe* by Peter J Heather.
- *The Fall of Rome : and the End of Civilization* by Bryan Ward-Perkins.
- *African Exodus: The Origins of Modern Humanity* by Christopher Stringer and Robin McKie.
- *Languages of the World: An Introduction* by Asya Pereltsvaig.
- *Archaeology and Language: The Puzzle of Indo-European Origins* by Colin Renfrew.
- *Deep Ancestry: Inside the Genographic Project* by Spencer Wells.
- *On the Common Ancestors of All Living Humans* by Douglas L T Rohde (to be found on Internet in pdf file).

- *First Farmers: The Origins of Agricultural Societies* by Peter Bellwood.
- *The Seven Daughters of Eve* by Bryan Sykes.
- *Druids: A Very Short Introduction* by Barry Cunliffe.
- *Saxons, Vikings, and Celts: The Genetic Roots of Britain and Ireland* by Bryan Sykes.
- *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* by Gregory Cochran and Henry Harpending.
- *Britain Begins* by Barry Cunliffe.
- *The Barbarian Conversion: From Paganism to Christianity* by Richard Fletcher.
- *Population Genetics: A Concise Guide* by John H. Gillespie.

There are many others, including some works on evolutionary biology or genes and some on historical works which might or might not deal directly with the new knowledge of human origins and human blood-based nature, but such knowledge is becoming part of the basic thought processes of those educated in recent decades, which group includes older thinkers who take care to keep up with new lines of research. It is those historians, or at least some future group of historians, who will help the scientists in providing a narrative structure which will turn all this knowledge of human biology into deeper understandings of human being. Philosophers, novelists and poets, theologians, the better sort of political and economic actors (are there any in the West in 2015?), and others should also join in. But, so far, few have done so.

In addition to these books, I've been reading the blogs of John Hawks (see <http://johnhawks.net/weblog/>), Razib Khan (see <http://www.unz.com/gnxp/>), and Peter Frost (see <http://www.unz.com/author/peter-frost/>) on a regular basis, the blog of Steve Sailer (see <http://www.unz.com/isteve/>) on a less regular basis. (Sailer deals with the current situation, modern politics and culture in light of genes or HBD—Human Biodiversity and that's of lesser interest in light of my current work. I have my reasons to be more concerned with the view out the rear-window than with the view to the front.)

As a rule, the modern historians (Heather and Ward-Perkins and Cunliffe for sure) are respectful and also properly skeptical toward genetic research. Why should anyone be skeptical toward facts? Simply because their meaning is determined by greater contexts, as is said in the old warning: theories determine facts. Actually, ‘global’ facts such as narratives also determine ‘local’ facts. Genetic analyses of peoples in Europe or elsewhere tell us where our ancestors came from only when we understand fully which peoples were living in various locations at the crucial times of history and prehistory. (Prehistory can be reconstructed, but history is human documentation at least in the form of myths of origins or legends of ancestors.)

Recently, some geneticists published work they did trying to answer the question: Where did the first out-of-Africa migrants cross to Asia? One possibility is close to the Mediterranean, maybe even where Moses and the Israelites are said to have crossed when leaving Egypt. There are other possibilities, including places where the waters are too deep now but were far more shallow during periods when huge glaciers had absorbed much water and brought the sea-levels down throughout the world. A somewhat naive interpretation of the results led to the conclusion that they had taken the northern, ‘Israelite’ route, but some commentators pointed out that this assumed the people living nowadays in northern Egypt are direct descendants of people living there 40,000 years ago or so. The people currently living in northern Egypt might well be descendants of some people who crossed further south by way of some people who crossed back into Egypt. (In fact, there has been large-scale movements between Asia and northern Africa over the centuries.)

Historians, as well as historically sophisticated geneticists, are generally skeptical because they have studied the movements of peoples by way of ancient histories and legends and archaeological evidence and know better than to assume something of that sort—likely enough, some of them or some of their teachers or mentors had themselves made naive or implicit assumptions in the past. In some cases, we now have accurate knowledge of the movements and locations of peoples from thousands or even tens of thousands of years ago; thus it is that the indigenous peoples (think Cro-Magnon) of the British Isles, ancient Anatolians mixed with Mediterranean peoples, Scandinavians, Saxons and other Germans, and Normans (a Scandinavian people—mostly) can be mapped and set in historical context with a high degree of confidence. Thus it is that historians can understand how it is that Portuguese and other Spanish peoples can have Anatolian (‘first-

farmer') blood along with a fair amount of shared genes with the Celtic peoples of the British Isles. Thus it is that they can understand the linguistic claim that the poetic name of Portugal (Lusitania) seems to have come from a Celtic word.

All of this is necessary background to understanding why it is dangerous for Europeans and North Americans to allow large-scale immigration of peoples who evolved in far different environments and, thus, have characteristics not suited for the political and economic and social communities of Europeans, especially those communities which have evolved and developed along with the individual Northwestern Europeans. Peter Frost summarized some of that background in a recent essay, *A Pauper's Death* found at <http://www.unz.com/pfrost/a-paupers-death/>, by way of discussing a strange genre of rock-and-roll (black metal) and the ongoing national and ethnic suicide of the Norwegians, with other Sweden and other Northwestern countries and peoples following.

This all leads to the point raised in the title of this essay: our biological natures need to be considered in discussing our current political and social problems and in developing policies. More broadly, the question could be asked with respect to philosophers and theologians and researchers in the 'softer' human sciences and even writers of poetry and imaginative fictions. This, in turn, leads to the question: Are even the best traditional understandings of human nature, individual and communal, roughly equivalent to the more exact understandings of modern science—including the work of those historians who, with seeming competence, blend 'traditional' historical knowledge with archaeological and genetic knowledge, who blend 'traditional' analytic techniques with those of modern physical science?

Why does this proper use of modern science not show up in the works of most serious journalists, even those who can truly be labeled 'journalist-historians' (other than a few such as Steve Sailer)? Is it not relevant to the unfolding immigration disaster in Europe that Northwestern Europeans are radical individualists with internalized moral systems and high degrees of trust in their societies while most peoples of Southwestern Asia and Africa are **deeply**, that is—genetically, tribal in their characteristics? See Frost's essay, *Western Europe, State Formation, and Genetic Pacification* (found at <http://www.unz.com/pfrost/western-europe-state-formation-and-genetic-pacification-3/>), for a discussion of the 'pacification' of the males of (mostly) Northwestern Europe—that title seems to be a mistake if only because the Spanish,

and Basque, peoples seem not to have been so much ‘pacified’. Peoples who haven’t gone through this process require a, shall we say, strong leader to keep the young men and sometimes the older men under control. Even Saddam Hussein at his most brutal wasn’t so bad, or at least not so rationally brutal, as some of the kings of England and France, Germany and Norway during the centuries when those states were growing and—along with the Catholic Church—were pacifying their populations by removing certain genes from that the population, that is, by killing violent criminals—at the site of the crime or in prisons or on the scaffold. Men who were often themselves violent wished to destroy any ‘commoner’ versions of themselves in the interests of a peaceful and prosperous state. I repeat: they changed the characteristics of Northwestern Europeans by ruthless, year-in and year-out, executions or other sorts of killings of men who had committed violent crimes such as murder or rape. As a result and by the time that Northwestern European systems of justice became more gentle (circa 1800), the men of that region had become quite peaceful, in the sense of following ‘national’ laws and customs, even when dealing with the murder of a loved one; men of Northwest Europe (with some exceptions such as some populations of Gaels) no longer sought to carry out personal acts of revenge—they cooperated with systems of justice to an extent beyond the imaginations of even the prophets of Israel.

Is not this knowledge relevant to our fuller understanding of the dangers and opportunities which come with immigration? Is it not relevant to our efforts to understand the utter failure of the United States in its sometimes well-meaning and sometimes outright criminal efforts to reshape the world to American standards?

We should remember that the horrors of the Dark Ages (perhaps 600-900AD), such as famine and poverty and constant violence at the level of individuals and ‘states’ or tribes, came about because of the failure to assimilate huge numbers of German barbarians into Roman ways. We should remember that we Americans have failed to assimilate a very large number of African-Americans though they and their ancestors have been here for centuries. We farming and manufacturing Americans also failed to deal fairly with and to justly assimilate the nomadic and semi-nomadic Amerindians<sup>1</sup>. It might be that geneticists and evolutionary biologists and at least some

---

<sup>1</sup>I’ve since read *1491* [93] by Charles Mann and learned how densely populated much of the Western Hemisphere lands were and how settled many of the populations are. Like most of my contemporaries, I viewed Amerindians through the eyes of those who saw

historians are right in claiming that evolution is for real and human characteristics are biologically based—farming peoples have genes for one set of characteristics, tribal peoples from tropical and subtropical regions have different genes, and tribal peoples from the Americas who lived nomadic and semi-nomadic lives for centuries have still different genes. Not all peoples are just chattering-class Americans who had the bad luck to be born in the wrong situation or with the wrong color of skin or the wrong facial features. The differences are more than skin-deep and need to be considered before we go over there or invite them over here. It's those who think we're all the same who are the bigots—the proof being that 'same' refers to the characteristics of chattering-class Americans.

---

them after suffering through devastating epidemics and being forced from their farms and villages and towns.

# 325 The Philosophies of Liberalism Are in Conflict with Reality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2131>. It was finished and uploaded on 2015/12/21.]

Paul Robinson is a professor at the University of Ottawa. At his website, he states: “I write about Russian and Soviet history, military history, and military ethics.” His general view of the politics seems to be describable in non-standard terms as “liberal realism”. For example, while making it clear he is far more liberal than Putin, he acknowledges there are good reasons for at least some of Putin’s ‘non-liberal’ actions. In this essay, *Democracy ≠ Liberalism* found at [https://irrussianality.wordpress.com/2015/12/18/democracy-\\$neq\\$-liberalism](https://irrussianality.wordpress.com/2015/12/18/democracy-$neq$-liberalism), I think his realism is revealed to be that of someone who is a true believer in liberalism and only compromises his ideological purity to the extent of allowing others time and space to catch up with him and the other enlightened ones. In other words, he assumes the liberal philosophy to be true, to be a valid and accurate depiction of human beings, individual and communal, and apparently believes that the troubling existence of non-liberalism—which he conventionally labels as ‘conservatism—is a matter of primitive human behaviors and attitudes. Eventually, such conditions will go away with enough. . .

Prosperity?

Education?

Something, anyway.

Imagine that we could measure the inclinations of human beings on a scale of individualistic to communalistic. Doesn’t it seem true to observa-

tions that some individuals are inclined to be free of nearly all communal constraints and are willing to pay the price and others want the security of communities which are constraining to the point of smothering and most are in between those extremes. And, again, we ‘truly’ modern human beings—certainly academicians at major universities—claim to believe in evolutionary biology of a sort which combines Darwinistic natural selection with the insights of genetics; Darwin himself had no way of knowing how inheritance worked.

So it is that human beings attain reproductive success and pass on their own characteristics by proper (or at least not overly bad) responses to their environments, but the environments of any social creature reflect at least partly their ‘communal situation’. In the case of human beings in major parts of the world, the culture has become an increasingly larger part of their environment and evolution, adaptation to specific environments including culture, has accelerated. See *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending for a very accessible discussion of this issue. See the writings of the anthropologist Peter Frost at <http://www.unz.com/author/peter-frost/>, for more specific and more tightly focused analyses on this topic.

There is, in fact, a deep problem in assumptions that human life will be completed and made at least a bit more perfect if we all behave and feel according to a particular human philosophy of a particular historical period and a particular people—those of northwestern Europe over the previous millennium or less. Yet, modern liberals think themselves to have discovered some key to important aspects of human nature which leads to a vault of true treasures: absolute truths beyond modification by mere facts of history or evolutionary biology or anthropology or genetics. To a liberal, to a true follower of Hobbes and Locke and Mill and the economists of Classical Liberalism, the individual human being is bedrock human reality and communities are voluntary arrangements—though perhaps necessary for caring for the young or even feeding ourselves. Communities are an external environment of sorts, a breeding ground and source of nourishment for individuals. This remains true of even collectivistic liberals who use central powers to correct sub-optimal environments or their accumulated effects on the insides of individuals.

Suppose Hobbes and company were wrong or at least that they wrote about human beings of their own sort, those at the extremes of individual characteristics and inclinations within a population itself extreme

in this way relative to Chinese and Indians and Africans and all others. Suppose, if only in the way of a Devil's advocate, that the accumulating facts and understandings well-stated by Peter Frost (see <http://www.unz.com/author/peter-frost/>) are a better reflection of human reality, a reflection of a human reality of greater diversity, not diversity in the sense of individual preferences in the marketplaces of a liberal society but a true diversity in human characteristics and inclinations, a diversity which has resulted from events in the empirical world of Darwin and Einstein. Suppose further that the school of thought to which Frost and Cochran and Harpending belong is right that there are also true groupings of human beings, those who are from family-lines which have evolved in response to particular, largely local and peculiar, environmental conditions. One example used well by Frost and other scientists is the difference between wheat farmers and rice farmers. Wheat farming can be productive, can lead to prosperity and reproductive success, when practiced in the way of 'individuals', that is, by loosely bound communities of nuclear families in which individuals aggressively express and sometimes realize their personal preferences. Rice farming is much more a communal activity and rice farmers with characteristics of, let us say, "submission to the community" gain greater reproductive success than to those with characteristics of a more individualistic sort. The so-called "Tragedy of the commons" (see [https://en.wikipedia.org/wiki/Tragedy\\_of\\_the\\_commons](https://en.wikipedia.org/wiki/Tragedy_of_the_commons)) may be strongly true for the wheat farmers of northern and western Europe (and North America and so on) but not so true for the rice farmers of East Asia—they feed themselves and their families by way of the commons.

Other things are true of many aboriginal peoples who were still under selection pressure for nomadic ways of life and not for any sort of settled, agricultural way of life.

# 326 Darwinism is Fine so Long as I Can Still Believe All Human Beings are Just Like Me

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2134>. It was finished and uploaded on 2015/12/28.]

Most modern Americans don't truly believe in biological evolution because it conflicts with a once plausible idea which remained strong in ghetto-Christianity after the separation of Christian understandings of Creation from mainstream science and philosophy; the idea is "human beings came into being once and for all and nothing can undo that". Most Westerners, including most Christians, have accepted the factual claims and core theories of evolutionary biology, "sort of" and "kind of" and "in some ways". Believers in so-called 'Creation Science' and others who accept a literalistic understanding of the creation stories in the book of Genesis are not so large a group and not so much a problem. The true problem comes from those "sort of" believers in evolutionary biology, some Christians but many mainstream secularists of a radical sort. And many others. The strength of this idea even in open enemies of Christianity points to the partial-truth in claims of this sort: "Marxism (or another secular faith of the modern world) is a desacralized Christianity." I suspect at least some of those in other faiths or from outside the West are simply confused by the Christian claim to believe in evolutionary biology at the same time that they also believe in human homogeneity.

I suspect there to be a plurality, and maybe an outright and strong majority, of educated Westerners who accept that man evolved up to some point maybe 100,000 years ago. They probably know, at least approxi-

mately, that Human ancestors had already separated from our chimpanzee cousins something like 5,000,000 years ago but believe them to have evolved in stages, shedding their ‘ape-like’ characteristics. At some magical point, something like that 100,000 years ago, some generation became true human beings and selection on our race came to an end, except for traits considered superficial such as skin color or hair color. In fact, these ‘superficial’ traits in particular are probably related to issues of reproductive success which is as important as natural selection in the sense of survival—the ‘point’ is to survive to reproduce.

The fact that modern liberals, as one example, would define human beings as possessing a certain chattering sort of intelligence and a variety of rights, while Christians might define human beings as having some special relationship with God is immaterial. In fact, I would guess most Christians would—if honest—admit to defining human being in a way more similar to what is implied by the American *Declaration of Independence* or Locke than by what is assumed by St Paul.

It would seem that most modern Westerners think all human beings were made for the same general sorts of lives, political and economic and cultural. By sheer coincidence, these are lives approved by the various ideologies of modern liberalism, ideologies which reflect the preferences of a vocal and strong-willed minority of those descended from the peoples of Northwestern Europe over the previous five to ten centuries. This is the region which was studied by two famous and important residents: Adam Smith and Karl Marx as well as by Hobbes and Lock, Quesnay and Rousseau, Mill and Say, von Mises and Hayek. Yes, by sheer coincidence, all these thinkers in a small school of students indistinguishable from each other in the eyes of an anthropologist from Mars and hard to distinguish in the eyes of an anthropologist from China, decided that the traits and inclinations of Northwestern European man (and North American man before long) were the signs of the realization of true, complete and perfect, human being. This true human being was seen as a radical individualist who formed communities by contract or, in more general terms, by way of a marketplace conglomeration of wills. It’s hardly surprising, given the feverish devotion of most—liberal and conservative—to individualism that even the family has now been redefined as a small community of individuals who choose to love each other and—maybe—live together.

This glorification of the individual along with the denigration of community isn’t a break with the traditions of Western Civilization, no longer

Christian Civilization, but rather a continuation along the path we've traveled for several centuries, a path first seen and advocated by at least the Renaissance and perhaps implicit in the Nominalism of Medieval Christian thinkers. (I personally read signs of radical individualism out of Dante as well as—more expected—Milton.) You could claim that it is a break with the deeper and more ancient trends of the West, but that is largely meaningless in light of the dynamism of both communal and individual human being. (See *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending for a start on recently discovered facts about the speedup of human evolution about 12,000 years ago—the time of the Neolithic Revolution (see [https://en.wikipedia.org/wiki/Neolithic\\_Revolution](https://en.wikipedia.org/wiki/Neolithic_Revolution)); this speedup in human evolution has run a race of sorts with cultural evolution.)

Individualistic assumptions drive our politics and distort our political relations. If you take seriously international neo-liberalism, if you take seriously the glorification of individual involvement in politics at all levels, if you take seriously the glorification of career over family and other traditional communities, or—mostly certainly—if you take seriously the claims that each of us becomes some sort of entity only accidentally tied to a particular body, Zulu or Chinese, Kung or Igbo, Arab or Germanic, male or female, biological or 'techno-enhanced', then you are a thoroughly modern Milt or Millie.

(Warning: It would seem that elites in the West have often preached "Radical individualism and liberty for me and serfdom for thee.")

When these individualistic assumptions show too much sign of stress, many modern thinkers retreat not, choosing instead to stand upon a bedrock of a basic dualism, an assumption that there is a 'me' inside of my body but independent of it and nothing, not brain structure nor skeletal muscle mass nor sex organs, can change that. This is not to deny the reality of a variety of experiences of being out of synch with one's body—many of us will have those sorts of experiences, perhaps in dreams or perhaps as a result of stress and exhaustion during combat. Heck, part of the initiation rituals of peoples with Shamanistic religions involve the deliberate creation of such states so that a warrior can discover if he be an eagle or a war-stallion. Shamans themselves are said to sometimes nurture experiences of being feminine, perhaps to be closer to the maternal gods than men could ordinarily get.

So it is that I ask: What is this true 'me'? Modern man doesn't worry

the issue too much, so long as he can sustain the illusion that this 'me' is linked inextricably with his desires, at least his desires of today, if they be no more than a respectable middle-class life with some good football on television or if they be an effort for a man to become a woman or a woman to become a man. This implies, at least to an honest and faith-filled sacramental Christian, that this true 'me' inside must be free of capture by mundane reality, by matter and its relationships including for sure those which are revealed in the disturbing processes of evolutionary biology. In other words, this modern attitude which is held by nearly all including nearly all who call themselves 'Christians' is the ultimate rebellion against God as Creator. (This is a rebellion already seen by Herman Melville in the 1850s or so and explored in some of his writings and, most of all, through the character of Captain Ahab who seems to have been intended as a courageous version of Ralph Waldo Emerson.)

What is this true 'me'? To a Christian, it might be a soul. To many sorts of tougher modernists, it might be a will. To softer modernists, it's a so-called will which is actually desires untrained to higher purposes, individual or communal or idealistic. To those in the sexual revolutionary armies, it might be a 'me' that is female and stuck in a male body. To elaborate a little on the last, there is little doubt that male sexual development (to-date, more deeply researched than the female sexual development which is assumed to be, and might prove to be, simpler and more straightforward) is complex and things can go wrong that result in partially masculinized bones and muscles; it can even happen that the body is properly masculinized but not the brain so that sexual desires might be directed at members of the same sex. (Such desires might come for other reasons, but that's of little interest to me in this essay.)

Developmental problems in a biological creature are far different from the problems of a female 'person' stuck in a male body or vice versa or the strange variations found in the thoughts of those attempting to justify even the most dangerous and exploitive sort of sexual behavior. Restating our sexual problems in terms of our biology doesn't lead to easy answers but it allows us to move on. By this I mean we can move on from the local problem of a human being's sexuality to a more global context, the entirety of a human being in his individuality and communality.

The very way in which even the most important of sexual moral issues are discussed in individualistic terms by those who claim to be traditionalists lets us see how much the liberals, that is the heirs of Hobbes and

Locke, have won the war to control public language and concepts. It hardly matters whether those liberals call themselves libertarians or (free-market) conservatives or (collectivist) liberals <sup>1</sup>. The very fact that these institutions have been so badly damaged with the individuals moving on to malls and political conventions is evidence that communities have real existences somewhat separate from those of individuals, that is, they can't just be reconstituted according to the desires of even the most devout of Christians. The very fact that psychologists have begun to speak of large percentages of badly damaged individuals in the younger generations lets us know of the wounds from even partial separation from communities of various types and at various levels (that is, human communal being is federal and there are communities of communities). Much of the damage of radical individualism shows in the form of neurotic disorders such as narcissism but our problems with certain types of 'non-profit' and exhibitionistic crimes at least hints of more serious damage to some and perhaps the likelihood that those 'merely' neurotic disorders might fester and turn into still more serious conditions.

If only Christians could be true to their alleged faith in the all-powerful and all-knowing and all-loving Creator of this world. If only Christians could truly accept the facts of this world, including those sometimes nasty facts in evolutionary biology. But a similar comment could be made about that large group of secularists who were happy enough to use science to pound upon Christian teachings but are oblivious to the growing body of evidence that we humans are not a homogeneous species, one species but not homogeneous and not capable of simply moving into each other's neighborhoods without badly damaging what is good in those neighborhoods.

Too many Christians believe in biological evolution so long as it doesn't interfere with a traditional understanding of the story of Adam and Eve. Our hearts and livers may be the product of evolution but we have souls which were the result of a once and for all special creation of human being. From that point, we have all been more or less fallen versions of Adam and Eve and have all been capable of full moral awareness and of being self-governing.

Too many intellectually inclined conservatives believe in biological evolution so long as it doesn't cast doubts upon traditional schemes of morality

---

<sup>1</sup>'Collectivist' liberals are the heirs of Hobbes and not some sort of special creation of the Late Modern Age; collectivism is that of Leviathan who protects the radical individual by crushing families and religious communities and ethnic communities and so on.

in terms of the categories of virtues and vices—all Chinese and Nigerians must have the same moral character as did those butchers and pin-makers studied by Adam Smith in Glasgow and London, the same mix of potential for specific sorts of nobility or degeneracy. Once the apeman evolved into Aristotle, the highest and final state of human being was reached.

Too many libertarians and collectivist liberals believe in biological evolution so long as it doesn't cast doubts upon the claim that all human beings are alike even if they evolved in dramatically different environments in the 50,000 years or so since a surprisingly small group of modern human beings were gathered in the northeastern part of Africa, some to go onto the Eurasian continent and some to turn back into Africa.

## 327 Are Communities Real Entities or Just As-if Entities?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2161>. It was finished and uploaded on 2016/02/12.]

The answer is: communities are real entities, just as real and just as strange as the abstract forms of being, quantum wavefunctions, from which concrete being is shaped. But no more real nor more strange.

To see the reality of communities (and some other ‘abstract’ entities), we can return to my basic claim about being, one compatible with the teachings of St John the Evangelist in the Christian Testament and also with quantum physics and its basic understanding of concrete matter. I wrote briefly about the first in one of my first blog posts which is published in this book as Chapter 157, *Quantum Mechanics and Moral Formation*. I wrote just as briefly about the second in another early post which is published in this book as Chapter 156, *A Christian View of Einstein’s and Bohr’s Debate on Reality*.

This is how I’ve been writing and speaking:

1. Relationships are primary over stuff.
2. Relationships form stuff; stuff doesn’t come to exist and then start forming relationships.

I’ve generalized the second claim so that stuff is being—abstract as well as concrete. This is where we find hints of greater understandings than what is possible with the conventional split between being which is concrete and then abstractions which **describe** relationships between concrete being. This seemed pretty reasonable in the centuries before Darwin and

Einstein, before we began to realize that concrete stuff comes into being as the result of a ‘collapse’ (truly dangerous word) of something strange which we describe in terms of the wavefunction of quantum physics. Then again I say that wavefunction is a real form of being and our description is like the description of oxygen or more complex concrete entities. That wavefunction exists as does oxygen. And, of course, complex entities don’t just come into existence ready to love each other, to worship God, to build cities. Love comes from neural and hormonal activity directed toward, first in the opinion of many evolutionary theorists, offspring and only gradually toward mates; after many millenia of showing signs of burying loved ones as if preparing them for an afterlife and of showing related signs of gradual awareness of divine forces (maybe fertility goddesses at first), human beings developed instincts conducive to animistic paganism; and anatomically modern humans existed for as much as 100,000 years of technology at the same level as archaic human beings such as Neanderthals before starting to farm and to build cities. So far as the last goes, there is some serious evidence that farming and urban living led to an acceleration in human evolution—especially in abstract reasoning skills. Those modern human beings who retained primitive technology developed by apish human lines might not have had minds of the sort we’d recognize as being fully human.

My viewpoint is generous with the name of ‘being’ rather than stingy. One way of explaining this summary is to say that all that is not God is created by Him; there are not abstractions separate from God and from Creations but rather abstractions accessible to a concrete, flesh-and-blood creature just because those abstractions are also creatures. If they were not part of Creation, how could a creature access them?

Is the thing-like being of this world really so concrete? Equivalently, are the abstractions which develop in the adolescent brain real being? Do our mental conceptions deal with abstract being as real as the concrete being our hands and eyes deal with? Are the mathematics which seems to come to apish creatures of flesh-and-blood as if by magic true being, an abstract form of being? Was Dr Johnson’s common-sense (common-foot?) rebuttal of Bishop Berkeley’s claim about being as valid as it was painful? Would Dr Johnson have said his beloved Anglican Church wasn’t real because he couldn’t literally kick it with his foot? He could have kicked Winchester Cathedral; he could have kicked an Anglican bishop or a devout widow; he couldn’t have kicked the Anglican Church as such. Certainly, he couldn’t have kicked the seemingly more vaporous Body of Christ, which he believed

in though he might have differed from me in the particular definition of that Body.

What would Dr Johnson have said about the Body of Christ, or any of its particular communal members—such as the Anglican or Catholic or Orthodox churches? If pushed to speak about something so dangerous—and not just because of the religious conflicts still remembered in terms of blood and mutilated human beings, he might very well have spoken in terms similar to those his Deistic (or atheistic?) friend, Adam Smith, had used in discussing the economies of Scotland and England and perhaps much of Western Europe. The Invisible Hand was perhaps partly a metaphor to Adam Smith, but it's effects were observable, for real. If it was truly a metaphor, it was one meant to speak of real relationships among human beings, individual and well as communal (beginning with families and partners). Those relationships organized economies as if by magic. We can believe in magic or we can hold the belief which is the modern equivalent of magic: it just happens and so we'll wave our hands about and move on. Some Medieval thinkers claimed a man couldn't be made of soul and body where soul is of a different sort of being from body; assuming such plays too loose with the concept of being. I'd say the same about abstractions and thing-like being—ultimately, they have to be derived from the same sort of proto-stuff which is some sort of abstract being, such as the wavefunction of quantum physics.

The economic relationships observed by Adam Smith shaped a true economic community into being.

Unfortunately, the invisible forces of magic have been banished only to be replaced by a dullness of thought, not what Adam Smith would have wished upon us. We think that so long as we deny magic, we are being rational and scientific. The simple, including those who choose simplicity, just wave their hands; the more sophisticated write and speak vaguely of self-organizing forces, imagining that such is sufficient to explain how millions of human beings can act as if one, how the populations of United States or Russia or Vietnam can act 'as-if' those states have a true existence and only as-if. To be sure, there are many, especially knowledgeable historians and novelists, who accept reality and do write and speak of nations and other communities as having true existence. That existence is sometimes a lot more fluid, more ephemeral, than some would admit, but those nations and other communities can show signs of unity and coherence and completeness during their existence, momentary or long-lasting. It is

sometimes appropriate to speak of real effects as being caused as if by an entity, but sometimes ‘as-if’ should be ‘is’.

In our ordinary discourse we have little power to think or speak of such matters as entities which remain themselves while being fully members of one or more communities. We know only about individuals integrated into Soviet or Borg-like collectives or else communities which are nothing but voluntary and contractual gatherings of individuals. I suspect that family-centered liberals, whether free-market ‘conservatives’ or big-government liberals or free-market and big-government whatever, have done nothing—or at least have been able to do nothing—to protect the family just because its very existence is in conflict with their more deeply held beliefs. To them, communities at all levels and scales are nominal entities just existing to serve freestanding individuals. These very modern thinkers and doers wish mostly to keep these individual human beings free from membership in any community claiming to have real existence—including religious communities such as the People of Israel or the Body of Christ.

Naming something doesn’t always indicate true existence of that something, but any something which is named builds up evidence for real existence the longer that name, or similar names, is used and the more essential it becomes to general human understandings of their world, including our own human being. I claim that some named but invisible entities, such as ‘mind’ or ‘soul’ and ‘community’ and many mathematical entities, have existence as real as that of matter which itself comes mysteriously from some sort of particularization of what is named as ‘quantum wavefunctions’, mathematical functions which are—in my opinions—real being, though a bit abstract to say the least.

# 328 Empathy as a Fundamental Human Way to Understand Ourselves and Other Complex Entities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2185>. It was finished and uploaded on 2016/02/22.]

I'd like to return for a slightly different discussion of the subject of Chapter 251, *Darwin, Einstein, and the Totemic Mind*:

In the totemic mind of ancient hunters of elk, we see the possibility of modern hunters of the secrets of God's Creation, hunters who carry out their quest in the acts of shaping their minds to embody the very actions and traits of what they study. There is nothing mystical going on here, simply normal events in a universe which rewards, at least with survival and perhaps reproductive success, those who are able and willing to reshape their minds to encapsulate their environments, to put themselves in the place of their prey for greater success in hunting, more recently to put themselves in the place of Nature in pagan terms or of the Creator in Christian terms. It's interesting that Einstein was an atheist more than not but one of his speculative strategies was to put himself in the place of the Old One. At other times, he'd ride a wave of light, putting himself in the place of a photon.

To understand the other, radically other or slightly other, we must be

able to put ourselves in their place. Criminal investigators know this as do fighter pilots and anthropologists. Of those three, I suspect fighter pilots are the best at the task.

Empathy isn't some kind of sentiment but rather a serious effort by a human being, mind and heart and hands, to take on another identity. After all, the most economical understanding of 'self' in light of modern neuroscience is as a narrative of sorts we create in our brain, a narrative that shades and shapes, blackens and deforms, all of our relationships with our own bodies and with all that lies around us, material and immaterial alike. This is a crude description of mind, easily expandable to include moral and other forms of reasoning, as well as such relationships as loves of various sorts. More generally, it is a description of 'person' and not just of 'mind'. We are closer to our own bodies and our own perspectives than we are to those of our friends or someone from Greece or Russia, but a strongly empathetic brain works in both cases to create a model which might be described as a 'person'. I also claim this process is what makes us our communities. To a Christian, this process culminates in the state where we are fully Christ, that is—the Body of Christ, and yet remain our individual selves.

All of this could be labeled 'mystical' if you are so inclined, but it can all be described in terms of modern knowledge of what we Christians call Creation, knowledge which was abstractly anticipated by mathematical work in the 19th century—work used by Einstein in describing a Universe which is one though the individual galaxies and planets and living creatures retain their individual being and even physical properties not quite those of the Universe. (See Chapter 193, *A Universe is More than it Contains*, for a very short discussion I'm working to enlarge as part of a new book which might prove to be multiple volumes.)

Unfortunately, Americans don't seem to be able to deal with their own brain processes well enough to see themselves honestly and clearly; brain-washed by the gray water of modern liberalism, right and left, we don't have any plausible understanding of the parts of ourselves which are the public political communities of the United States. We wander around as if billiard balls which bounce off of other billiard balls or the cushions of the table but never enter into truer relationships. We behave in such a manner because we've allowed ourselves to see ourselves as hard, unyielding individual entities and because we are daily trained by schools and the entertainment industry and the words of our leaders, cultural and religious

as well as political, to behave in such an atrocious manner.

When it comes to alien communities, whether those of Eastern Europe or of Detroit and San Francisco—I grew up in New England, Americans seem to have very little ability to piece together an understanding rational enough and coherent enough to be labeled empathetic. Perhaps, we do have some limited ability to understand our own emotions and those of others.

Our inability to see ourselves truly even in our individual selves, our inability to see ourselves as communal human beings as well as individual human beings, our inability to put ourselves in the place of the alien others—even as our leaders unleash brutal military power against them—are incapacities quite intertwined. We need, first of all, to realize we don't inherently or naturally exist as anything which could be truly called a 'person'. We create even that persona, our own higher selves, by way of constructing that narrative I proposed above, a narrative which can be regarded as a model in our brains, a model of our brains and our livers and our toes and our relationships with pets and the landscape and our cars and with other human being whether individual or communal. Once we admit this and begin to integrate it into our ways of thought and feeling and behavior, then we can move on to establish better relationships with our own communities and with alien others, individual and communal.

# 329 Human Moral Order: Developing Better Tools for Understanding

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2240>. It was finished and uploaded on 2016/06/28.]

For background, I'll make these three claims without trying to justify them:

- Human beings don't come together just to be together or for any other sentimental reason; human beings come together to do things and because they are dependent upon each other, perhaps as a result of doing things together.
- Most moral behavior is learned within the context of a specific set of communities of various types and scales (such as nation and town, parish or local community, and Christianity as a whole) and is manifested in response to particular cues; members of different morally well-ordered communities may come into conflict over specific issues (even one so simple as: should retail prices be set high and negotiated or set at some 'fair' and non-negotiable price?).
- Individual moral behavior does not readily generate small-group moral behavior and has little obvious effect on large-group moral behavior.

That last claim tells us we have a deep chasm to bridge. Let's try to at least produce a conceptual design of that bridge by stealing some sophisticated ideas from abstract regions of modern mathematics—though the

first stages of this design will involve mathematics not nearly sophisticated enough to produce a real bridge.

We should always remember that individual human beings are, for the most part though not the totality, the building blocks of all human communal being. Thus it is that we must always qualify the third point above; individual moral behavior ‘first’ creates communal moral behavior which then guides further development of individual moral behavior. Communal moral behavior, indeed communal human being, reflects also principles of order which are part of our world and which we know in specifics only as it emerges. Those principles can be derived from more abstract possibilities which can be understood in terms of modern abstract mathematics.

The American physicist John Wheeler once summarized general relativity, Einstein’s theory of gravity, by saying that matter tells space how to shape itself and space then tells matter how to move. Maybe we can play around with this metaphor. In prior years, I expressed the stolen and re-used idea as:

Human beings tell moral space how to shape itself and moral space then tells human beings how to move through life—how to act.

Now, I’m more likely to claim:

Individual human moral actors tell their communities how to shape themselves and those communities then tell individual human beings how to move through life—how to act.

Remember these processes aren’t fully controlled by the human will; they reflect abstract principles of order which we don’t understand very well at all. We need to work toward such an understanding.

We can see readily that the processes which bring order to human being, individual and communal, are recursive processes which began, back in the mists of time, as a bootstrapping of sorts. Human moral order has its beginning in the processes of self-organization which brought about some sorts of complex chemicals (perhaps early forms of DNA or RNA), the precursors of life. From there, we move by nasty processes and cooperative processes through cells and colonies of cells and organisms of multiple cells and societies of organisms. The problem at hand is: how to develop a

disciplined body of words and concepts to describe human being and its acts, individual and communal, in all of its complexity?

This is a problem I'm dealing with in a book I'm writing. It's not a problem to be solved in the way of a high school algebra problem, but rather a problem of developing concepts and terms to deal with dynamic processes in a population of complex entities. Nor am I claiming that it is possible to develop a fully quantitative, closed-form answer to: "What is the meaning of life?" Even as a Christian who believes in absolute truths, I see life as a process to be described and understood as it happens because life is ultimately something God shares with us and something we can learn to share with God. Non-Christians should be able to easily translate this into their own terms.

I'll provide a simple statement of the a first stage in understanding human being.

Imagine a manifold,  $U$ , which represents, is a model of, some well-ordered community. The 'points',  $x$ , of  $U$ , are actually themselves complex individuals in that community. Those points can be mapped to a manifold,  $V$ . Think of  $V$  as a Euclidean or Cartesian  $n$ -dimensional coordinate system for now. The points of  $V$  are themselves descriptions of complex states of being (think:  $x(1), x(2), \dots, x(n)$ ).

We can give our imaginations a bit of free-play—without going beyond the freedoms which are allowed by modern, abstract mathematics. In particular, we can think of the second manifold— $V$ , as having an  $x(1)$  which involves a fully quantitative description of some aspect of individual human being while  $x(7)$  is a partially ordered and qualitative description of, for example, a woman's goodness or saintliness. Another variable, say  $x(99)$ , might represent a characteristic set by a 'random' (that is—factual) process.

Now, let's add a little to the basic model. I spoke of mapping points, individuals, from the global manifold, communities, to a manifold which provides some description of the actual state of being for individuals. That is, for an  $x$  belonging to  $U$ ,  $f(x)$  is a well-defined 'point' (which will actually be some more or less complex set) on  $V$ . This  $f()$  is a mapping in the intuitive sense and not a function which grinds up numbers and outputs one or more numbers. (In a more sophisticated model, that well-defined point of  $f(x)$  would be a region of states of being over which an individual's characteristics roam; that is, even if a woman is on a clear trajectory toward goodness, she might regress a little at times.) It's best, for both reasons of the underlying being and also for better use of the mathematical concepts, if there is a

well-behaved inverse function going from  $V$  back to  $U$ . Let's designate this as  $g(f(x))$ , partly for typesetting reasons but mostly because it might not be exactly an inverse but only 'approximately' due to uncertainties in the state of being and also possible uncertainties in the 'location' of that individual in the community.

So, let us think of the real being of a community and underlying individuals. How does this system ever come into being? Can we think of a poorly ordered group of individuals and a mapping,  $g(y)$ , where  $y$  is approximately  $f(x)$  and allows a bootstrapping of a community? Or do we think of  $U$  as already existing as a result of ancient evolutionary events which we may or may not ever be able to reconstruct? That would leave the bootstrapping process to specialists and allow us to work with the current world of individuals and communities. For now, it's probably best to think of  $U$  and  $V$  as both already existing, realizing that both communities and individuals are the result of ongoing dynamical processes.

There is much to be explored in this effort to bring some discipline to our understanding of human being, discipline which works with rather than suppressing the richness and complexity of concrete human being, individual and communal. Moreover, there is the complication that I already know there are more powerful and more flexible ways of combining individuals into communities or breaking up communities into individuals. I don't have a good handle for now on those ways and, in any case, see great advantages in working toward more powerful ways of thought as a process of climbing a long stairway by aiming at one landing after another. If you know as much or more of mathematics as I currently do: think of these more powerful ways as drawn from algebraic topology and category theory and other abstractions of abstractions of . . .

So it is that my next post will discuss the problems of seeing moral order as arising in a world of evolutionary and developmental processes which can be very nasty indeed. But those processes at their nastiest lead to some sort of order. How can moral order arise from forms of order based upon a struggle to eat before being eaten or to reproduce faster than your neighbor? I won't have any good answers, but I'll try to produce some insights which might lead to a good understanding in a year or maybe a century.

# 330 Human Moral Order: Building Upon General Forms of Order

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2244>. It was finished and uploaded on 2016/07/12.]

Let me start by discussing war, a situation in which leaders of states often try to impose their will by wreaking havoc and unleashing forces of disorder, all the while thinking they can keep matters under control. Anthropologists, working with archaeologists and other pre-historians, now have strong evidence that the average level of violent killing (typically, over a generation or so) is lower when states are in power, even during the 20th century with its huge wars, than it is in small-group, pre-civilizational human societies. Tribes and still smaller groups kill members of other human groups, sometimes members of their own group, at surprisingly high rates, though small numbers obscured this from careless observers, such as Margaret Mead, who lived with tribal peoples for short periods of time. The standard reference on this topic, which I haven't yet read, is: *War Before Civilization* [81] by Lawrence H Keeley. (I have read books which summarized Keeley's findings and relied upon them.)

As a speculation, I'll claim that the violent attitudes of the historical books of the Bible show us tribal jingoism evolving into a sort of early state jingoism, far from ideal but a major way down the path toward a greater order, one more clearly moral in a global sense and one which, even in the near-term, allows ordinary human beings to make a living and maybe even seek prosperity for themselves and their children. By 'global', I refer to the development of a sense of moral order which extends to human

groups other than our own; this isn't a once and for all leap to a Christ-like sense of responsibility for all human beings—such is nice as a prophetic statement but any effort to practice such a global morality under current circumstances, and maybe any circumstances which could ever be in this mortal realm, is merely a deluded form of messianism.

Consistent with the above discussion, some commentators, including some I read regularly on the Internet, maintain that the most basic concepts of just-war theory, including that of criminal war, make only limited sense in the real world, and are unenforceable—perhaps just because of the practical difficulties in setting up strong moral constraints on the behavior of states and other holders of great power. There are other arguments, including those involving knowledge in complex, evolving situations. I won't even try to complete a catalog of practical arguments.

A good book for putting things in perspective is one about Catholic and Protestant just-war theory written by a Mennonite theologian who was an advocate of radical nonviolence and definitely didn't believe in just-war theory: *When War is Unjust: Being Honest in Just-war Thinking* [153] by John Howard Yoder. He came to the conclusion that just-war theory is intellectually coherent but inconsistent with the example set by Jesus Christ and, in practical terms, isn't possible given the politics of the modern world.

Before going on, I'll note that none of this implies that pre-civilization tribal peoples are nasty, confederated tribal peoples a little less so, vassal-based kingdoms less than that, and so on up to the liberal, kind of meritocratic, certainly bureaucratic, welfare-warfare states of the modern West. We modern peoples are raised so that we are gentler than our tribal ancestors but that can also mean our virtues are softer. By confederated tribal peoples, I refer to such large and partially organized masses such as the larger groups of Celts or Germans as they entered central or western Europe in historical times—the *Franks* are one good example for which solid facts are known (see <https://en.wikipedia.org/wiki/Franks>). This part of the process is important for a deeper understanding. The German peoples were not somehow born as members of well-defined tribes, let alone as members of a greater nation of Germany. The great tribes, Franks and various '-goths' and Vandals and others, were coalitions which gathered around successful small tribes. This is a process which worked well when it was gradual and slow and not so well when various ambitious men tried to force the process to keep moving toward ever larger 'nations'.

What Keeley and other anthropologists or pre-historians see and some

others don't is the evolutionary and developmental nature of the human social world. More exactly, they see that sort of progress and regress as being of a more substantial, and less formal, sort than have mainstream modern thinkers from at least the time of Thomas Hobbes (see [https://en.wikipedia.org/wiki/Thomas\\_Hobbes](https://en.wikipedia.org/wiki/Thomas_Hobbes)). This mistake largely resulted from a mistaken view that all 'true' human beings were pretty much the same but for God granting better opportunities to some, and—at the same time—giving them the duty to convert, say, Southern Asians into Englishmen. This sort of attitude, is a failure to see the depths of human being and the consequent depth of environmental (including cultural) shaping. It might well be due to the misunderstanding of the book of *Genesis* as a transparent revelation, thus a book susceptible to literalistic readings. The founders of modern liberalism shared a basic understanding of the origin and nature of man with Biblical fundamentalists of the 20th and 21st centuries. Man is a special creation. Our parents were fully modern human beings at the time of that creation and we are the same, members of a never-changing race.

Man was always man. Nigerian man is no different from Norwegian. Adam, in his Nigerian and Norwegian nature, was little different from Hobbes and Rousseau and the mathematically-inclined Philosophes. When we seem different, it is because our flawed wills or perhaps our environments keep us from being Adam. It is a fixable problem when a tribesman from Australia or Kenya or Siberia fails to be pretty much the same as Johann Wolfgang von Goethe, or at least his man-servant. Thus it was that modern liberalism is founded upon the Biblical literalism which is so viciously attacked by most modern liberals.

Modern liberals most certainly underestimate the sheer bulk of the heritage of both good and bad thoughts they have from their ancestors, the efforts and sacrifices of those ancestors in building the modern West, and the similar efforts and sacrifices necessary for any primitive people to adopt some sort of civilized life.

As a result of this shallow understanding of human being, many modern humans hold, if only implicitly, a view that some call the magic-dirt theory. Select an arbitrary group of human beings, a dozen from a tribe in Africa and a dozen from a primitive farming village in the interior of China and a dozen Brahmins from Myanmar and a few dozen from other random spots. Put them in Danbury, Connecticut and pretty soon they'll all be good Yankees feasting on New England pot roasts, rooting for the Red Sox, and arguing about the relative merits of the political wisdom of Donald Trump

and Hillary Clinton.

This is a very particular universe in a Creation still more particular. The particularity becomes downright peculiar when we take a look at complex, concrete entities in this universe. Human beings are most certainly complex, concrete, and peculiar. The ways human beings have traveled were most certainly complex, concrete, and peculiar. And “ways”, plural, is the right term. About 50,000 years ago, there were only a few tens of thousands modern human beings, with perhaps some scattered outlier groups but most seemingly resident in northeastern Africa. They split into two groups, some staying in Africa or even turning to move back into tropical jungles or savannas or forestlands or mountainous regions or deserts. Others left Africa.

One subgroup of those who left Africa are called the Ancient Northern Eurasians (ANEs) by anthropologists. Those ancestors of ANEs stopped for a short break in the Near East where they mated with Neanderthals—or perhaps some of their females were raped by our all-too human cousins who were quite robust and all too inclined to kill mammoths and wild cattle at short-range with thrusting spears. Tough guys, though there is no reason to believe they were inherently more brutal than we are.

In any case, our ancestors continued into Eurasian regions, bearing problems and advantages gained from their Neanderthal genes—both included changes to our already inadequate immune systems. Those human beings earned their designation as ANEs by moving north into the great steppes of Asia, perhaps moving south again as glaciers advanced, moving north and south until the glaciers left for then and now but likely not for ever. Some moved east, apparently picking up women from the proto-Han, and moved across the Bering Strait land-bridge to become the major of perhaps 3 groups of founders of the American Indians. Other ANEs moved into northeast Asia to become Siberians or Mongols. Some moved west to the regions north and mostly west of the Black Sea, herding animals including horses, domesticating a single stallion (DNA evidence says one stallion was the male ancestor of all domesticated horses), developing metal technology and wheeled vehicles, developing a patronage-based chieftain system, and moving into more western parts of Europe over a couple thousand years or more to become Celts, Gaels (apparently a separate variety of ‘Celt’), Italic-speaking peoples including Romans (close cousins of the Celts they came to hate and fear), Germans, Scandinavians, Slavs, and perhaps others. These were the western branch of the Indo-European peoples and that Western

branch used their chieftain-centered political system to great advantage in conquering vast regions—as their cousins, the Aryans or Sanskrit people, did in conquering major parts of modern-day India.

This ends a near comic-book summarization of the early history of some Indo-European peoples. Their history was, as the saying goes, particular and peculiar and became more so as the western movement led to mating and other less attractive forms of interaction with the ‘aboriginal’ peoples of Europe, usually called hunter-gatherers with some geographical descriptor of east or west. Even the mating was often in the form of rape, or at least incorporation into the harem of a warrior, after the aboriginal men had been killed. Nasty, and the same probably was true of those ancestors of many American Indians when those ANEs made off with women from the ancestral population of Han Chinese.

The kinder, gentler social systems of the modern West—which systems are decaying rapidly—are the result of specific streams of events which involved peculiar peoples responding to particular opportunities and problems in their specific, peculiar, particular environments. Some of the Anglo-Saxon, Danish, Norman, and mixed-British kings were more brutal than Saddam Hussein and Muammar Gaddafi. Some were as sadistic, perhaps as paranoid, as Stalin. Yet, they played major roles in the narrative that led to the British Parliament and the American Constitution. And their role was often positive if only in their suppression of other brutal, raping, looting warlords. There is some goodness, however limited, in the basic order established by a brutal warlord. Despite the bloody wars waged by the Romans, it’s likely that they left the world with more healthy and reasonably prosperous human beings by way of the suppression of non-state forms of violence.

After some unknowable point in time, the order of what would become the Anglo-American regions of the West had clearly changed (if only temporarily) into a recognizably moral order. We in the West are falling into disorder, even as we support strange forms of alleged human rights which involve behaviors which become prominent in periods of decadence. We in the West then condemn those, such as the Russians and Chinese, who are rising into greater forms of order not so different from the past which led to the liberties and wealth of our past few centuries; we condemn those peoples because they don’t celebrate forms of disordered behavior.

It’s strange that we might be entering a period when it will be possible to deal with issues of the order proper to a particular complex entity—

mathematicians and scientists have developed powerful tools of thought which have risen to levels of abstraction which can be labeled as ‘qualitative’. My obsession: to lay at least a part of a foundation for ways of discussing human being or even the entirety of Creation so as to properly respect qualitative aspects and parts as well as quantitative aspects and parts, that is—to properly respect both abstract and concrete forms of being.

# 331 Can Good Individuals Form an Evil Country or an Evil People?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2264>. It was finished and uploaded on 2016/08/30.]

It's not plausible that morally well-ordered communities will be composed of a population containing a high percentage of morally ill-ordered individuals. One problem is that a morally well-ordered community with even a substantial minority of morally ill-ordered individuals would be a flock of sheep with the wolves living in the flock. But it seems plausible to me that morally ill-ordered communities might form from a population of morally well-ordered individuals. (I simplify greatly as there are a large number of possibilities involving well-ordering and ill-ordering at various levels of human being.)

I'll point to an earlier essay where I wrote of the foundations of good order, even if that good order doesn't rise to the higher level that we moderns would recognize as truly moral. See Chapter 330, *Human Moral Order: Building Upon General Forms of Order*.

The order of swarming sharks precedes the order of the wolf-pack which precedes that of paleolithic human tribes which precedes the political order found in larger tribes and raiding bands of the iron-age Indo-Europeans and other like peoples on horseback which precedes. . .

The earlier forms of order involve the construction of hierarchical relationships and peer relationships based upon various factors including physical power, charisma, cleverness, and even sheer narcissistic ego on the part of would-be leaders. See Chapter 428, *Be Obnoxious and Be Our Leader*

for a brief discussion of that latter factor.

Let me make a broad reference to the writings of Hannah Arendt who was Austrian and Jewish. Professor Arendt was a sometimes controversial (she had substance and courage) philosopher and historian of modern totalitarianism including that of the Nazis. Having interviewed Adolf Eichmann, the logistics genius behind the Holocaust and related horrors after the Israeli prosecutors did their preliminary interrogations, she claimed he was one of the nicest men she'd ever met.

In *In Retrospect: The Tragedy and Lessons of Vietnam*, Robert McNamara (with Brian VanDeMark) wrote in similar terms of himself and the other high-level officials who made the 'authoritative' evaluations of the situation in Vietnam and made the recommendations to the President as to future actions. Those well-dressed and well-credentialed men and women were nice people who were really worried about crossing items off their to-do lists so they could get into their nice cars and drive along nice highways to their nice homes where their... They hadn't bothered to read reports in front of them which—McNamara verified this in the still-private papers of President Kennedy and President Johnson—gave undeniable evidence that those officials in Washington were forcing the US military to fight a truly criminal war.

The nice Germans of the 1930s and 1940s, the nice Americans since at least the days of the Indian and then African slave-trades and the Chinese opium trade, were living in acceptance of the evil which their countries were doing. In the case of the Americans of the Northeast and the Midwest, they enjoyed for decades a tremendous era of booms—punctuated by collapses, but the upward trend was strong over the 1800s—and those booms were financed at least in a major part by that trafficking in human beings and by that trafficking of opium into China against the wishes of the imperial government; we even participated in minor ways in crushing any uprisings by the peoples of East Asia when they tried to push the criminal and exploitive sea-devils (Europeans as well as Americans) out of their countries. In a manner of speaking, we Americans were profiteering sidekicks of the British gangsters in our exploitive adventures in East Asia, especially China. It must also be noted that, whatever the efforts of Americans opposed to the African slave-trade, that trade went on so long as it was protected or at least tolerated by the British and then it ended when the British navy began to hang, upon capture, officers of slave-trading ships and to bring the rest of the crew to Great Britain for trial.

In many ways, Americans have been a country of good individuals, certainly when we responded generously to natural disasters or other problems but even when some of us were off in various regions stealing and killing and engaging in various profitable activities, such as drug-smuggling or human-trafficking. Something very similar was true of those Germans of the 1930s and 1940s. I'm sure most were nice, or at least silently and cowardly well-wishing, to their Jewish neighbors right up to the arrival of the Gestapo trucks.

So, yes, good human beings can come together to form communities which are criminal, even to an extent where they can be, at least sometimes, described as evil.

I'm dealing with various issues of this sort as I continue making some baby-steps towards understanding the reality of human being in its individual and communal forms. I plan on posting the book of this short journey on the Internet—God willing—before the end of 2016. It is important to deal with some issues beyond the scope of that baby-step book that I might prevent some fundamental errors.

My first efforts will cover some very basic definitions of individual and communal human being, touching very lightly upon complex entities in general. The emphasis will be upon providing ways of speaking rationally and with proper piety of 'communal being'; I use scare quotes only because I think in terms of human communities and human individuals but also in terms of the universe and all the individual entities which are part of the universe but don't fully define it or constrain it in the way of much modern thought to be only the sum of stars and gas clouds and so on. (See Chapter 193, *A Universe is More than it Contains* for a discussion of a claim made by a prominent physicist-cosmologist.)

The universe is not just a way of speaking about an assemblage of lesser physical entities and a human community is not just a way of speaking about an assemblage of individual human beings. More than that, the formation of human being—that is, the relationship of individual human beings to communal human beings—has to be understood in dynamic terms. Those dynamic terms are oh-so important but are at least a second-stage of knowing, of responding with mind and heart and hands to the way things are and not to the way we assume abstract entities to be based upon modern thinkers, many of high-quality and fruitful of insight but far too inclined to believe that human communities are nominal entities, just voluntary gatherings of the only true human beings—individuals. In this age, to

speak of the universe in such terms, as only a name for an ad-hoc gathering of stars and so on, would invite ridicule from scientists who know well that the universe is a somewhat abstract entity with its own properties apart from the properties of what it contains.

In an analogical sense, the book I'm currently writing is about pre-Galilean kinematics as opposed to Galilean dynamics.

The universe is for real and so are human communities. And so I can see the possibility, however dimly for now, of speaking rationally of human communities which are evil though 'made up' of nearly all good human individuals. And that possibility arises by abstract ideas out of the fields of abstract mathematics which are used to understand assemblages of entities, possibly themselves complex, as being evidence of a single, complex 'communal' entity. I'm extending the ways of thinking developed by Bernhard Riemann (see [https://en.wikipedia.org/wiki/Bernhard\\_Riemann](https://en.wikipedia.org/wiki/Bernhard_Riemann)) and used with great effect by Albert Einstein to describe the universe as an entity on its own. Einstein was himself a philosophical sort of physicist but his theory of General Relativity (see [https://en.wikipedia.org/wiki/General\\_relativity](https://en.wikipedia.org/wiki/General_relativity)) described possible quantitative models but my claim is that this form of mathematical (mostly geometric and topological) reasoning can be abstracted to deal with qualitative forms of being and with forms of being, including human being, which is a complexity of quantitative and qualitative parts and aspects.

I'm not writing about proofs nor about quantitative calculations. I can't prove the Body of Christ exists, however tentatively in this mortal realm, but I think I can take first steps in providing ways of talking about it in rational terms, that is, terms rational in the context of solid modern knowledge about many parts and aspects of God's Creation. And I certainly can't calculate the number of members of the Body of Christ, nor the percentage of living human beings who will rise from the grave to share the life of Jesus Christ and His Father and Their Holy Spirit, but—again—I think I can take first steps in providing ways of talking about it in rational terms.

# 332 Are Warlords and Their Top Warriors Responsible for Our ‘Smart’ Genes?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2293>. It was finished and uploaded on 2016/11/22.]

I might be adding 1 to 1 and getting 5, but...

In recent years, I’ve been reading a bit about human ancestry, especially that of those peoples with languages and cultures and at least some substantial amount of genes which came from some (proto-)Indo-European people. These peoples include Europeans, Iranians, northern Asiatic Indians, and some others. In December of 2015, I wrote three essays on the general issues:

- Chapter 324, *Yes, Genetics and Evolutionary Biology are Relevant to Our Political and Social Problems*,
- Chapter 325, *The Philosophies of Liberalism Are in Conflict with Reality*,
- Chapter 326, *Darwinism is Fine so Long as I Can Still Believe All Human Beings are Just Like Me*,

The first of those essays includes a bibliography which provides a list of most of the relevant books I had read to that time, all recommended by some respectable scholar and all containing a good body of knowledge as well as a sophisticated understanding of the issues; those books include some ‘mainstream’ history works which written by historians who had considered

this new archaeological and genetic knowledge. The books and writings on that list disagree on some issues, though some of the disagreements have been settled by more recent work. A lot of leads and links to various books on genetics and history—or both—and religion, as well as some commentary by a highly-regarded geneticist and commentator, Razib Khan, can be found at *Gene Expression Blog* at <http://www.unz.com/gnxp><sup>1</sup>.

In addition, there are some study results published in the past two years or so which bring the interested student of human being pretty much up to date on European descendants of those Indo-European peoples (there is also significant ancestry of European peoples from Anatolian first farmers and those already resident in Europe as of 10,000BC or so):

- *Massive migration from the steppe is a source for Indo-European languages in Europe* at <http://www.biorxiv.org/content/early/2015/02/10/013433>,
- *Ancient DNA shows European wipe-out of early Americans* at <https://www.sciencedaily.com/releases/2016/04/160401144502.htm>, and
- *Familial migration of the Neolithic contrasts massive male migration during Bronze Age in Europe inferred from ancient X chromosomes* at <http://biorxiv.org/content/early/2016/09/30/078360>.

It seems pretty plausible to me that this all supports the possibility that those who led long-distance military raids or outright conquests and those who managed the logistics of a large migration of families and their goods and animals probably had high levels of intelligence of the sort allowing for political and military organizing and for tactical and strategic thinking. Some of those family or tribal leaders might have been brutish in some ways but all of them would have had to take care of the needs of their warriors or more diverse followers. Some might have had specifically technical intelligence so that they understood the metal technology behind their weapons, tools, wagon, gear for horses, etc. Some maybe were just good at selecting good blacksmiths, leather-workers, horse-breeders, and so forth. (Analogously, some have claimed that Genghis Khan was competent

---

<sup>1</sup>Khan stopped posting at <http://www.unz.com/> but he can be found easily on the Web.

as a military leader but a genius as a political leader who picked out and nurtured great generals.)

Politics. Military matters. Organizing human communities and inspiring them to follow.

I'm not at all discounting the increase in intelligence as blacksmiths and other technicians became important and gained greater reproductive advantages, but they were probably selected in a social environment for which the war-lords and their greatest warriors were disproportionately responsible. In other words, as a speculation by an outsider knowing just enough to be dangerous, I'm suggesting that it was the warlords and great warriors who were the driving force behind the increase in human IQ, at least once the process first began; this speculation includes the idea that those warlords and warriors were the best customers of many of the blacksmiths and other technologists. The evidence indicates that the leaders of those military or migratory events gained reproductive advantages both by way of killing resident males and taking the girls and women and also by way of setting up their descendants in positions of power and wealth.

Interesting ideas to a Christian who believes in the Body of Christ, the idea that the friends of Christ are destined for an everlasting life of peace and fullness of our human nature. Why do we travel through a world where violence and disease and natural disasters are so common? The prophet Jeremiah asked such questions of God and records no revealed knowledge; he and many others have had to travel on, wondering and often mourning, but always struggling to keep the faith and to work towards God's Kingdom. We're farther along on in the journey and have great empirical knowledge of our past but still no convincing way of explaining why God makes us travel through such a wonderful but often distressing world to get to an everlasting life of peace and fulfillment of our legitimate desires.

To pile on a little, we have to remember that the book of Genesis tells us that it was the first murderer who founded civilization and technology. Maybe those ancient authors knew a lot more than we often think, even if they lived before the days of archaeology and genetics.

Food for thought, at least for those of us who wish to deal honestly with the Creator and His Creation, accepting what He actually did and working to build the Body of Christ in full recognition of the tough facts rather than just trying to jump toward some utopian state in this mortal realm.

## 333 The Amoral Roots of Moral Order

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2322>. It was finished and uploaded on 2017/01/17.]

Or...

Are they? That is, are the roots really amoral? More appropriately, do we humans see wrongly when we separate moral order from other sorts of order, raising moral order to angelic, ethereal realms? Once upon a time, when the West was truly Christian, we Western men did that with human nature. By tying Christian beliefs into these confused beliefs, we sought to protect “human dignity” from any hints we’re cousins to chimpanzees, more distant cousins to bears, still more distant cousins to alligators and eagles and sharks and so on. We paid a price: when we try to see ourselves as not quite creatures of this world, by trying to see the world of the resurrected as a realm of pure spirits rather than a completed and perfected version of this world, we badly damage the credibility of revealed truths—directly and indirectly by ceding our central role in a civilization which then advanced by leaving behind its Christian foundations. That the West has no other foundations and is now something of a low-flying castle in the sky is largely the fault of Christians who failed to see God’s Creation as it truly is rather than as we would wish it to be for our comfort and convenience.

I’ve dealt with these issues, but I risk repeating earlier thoughts because of the problems being caused by both Western Christian leaders and the so-called power-elites of the West as they thrash about, trying to save their own power and wealth—even at the risk of destroying what is left of the West, what could be used as part of the foundation for reforming or rebuilding a once great civilization which promised even more greatness. Powerholders

in the Vatican and other powerholders in Western Christianity have joined with the various sorts of neo-cluelessness in idealizing morality and human communal structures. In this way, they seek to hold onto power they no longer are capable of even understanding, let alone using properly.

This incoherent behavior of those who hold power in the West comes from a strange way of thinking among many in the West over recent centuries, even some who were extremely intelligent. In the spirit of the times, I could claim those many in the West, including most Christian leaders and intellectuals, apparently acquired their understanding of order and moral order from some book titled: *Order and Moral Order for the Totally Clueless Who Wish to Remain Totally Clueless*.

Life didn't jump from an oceanic swarm of eat-or-be-eaten critters up to Francis of Assisi, George Washington, and Albert Einstein. It also didn't jump from the common ancestor of humans and chimpanzees to human beings of such high achievements and (mostly) good moral order. It didn't jump from early hominids to Hammurabi, let alone to da Vinci or Goethe.

Civilized human life partly developed by way of barbarian warlords who could organize military raids and handle the logistics of taking captives to the slave-markets, by way of similar men building irrigation systems with labor extracted from human beings without a hint of representation, by way of the brutal conquests of the Chinese emperors as well as Mongols or Manchus and by way of decentralized conquest of European lands by Indo-European warlords. . .

Humans can only develop into civilized human beings, their tribes into civilizations, if they have the proper characteristics. The family lines of those particular humans gain those characteristics by way of natural selection, including selection for good social characteristics in the cases of human beings, voles and some other rodents, elephants, whales, and so on.

There is a nasty matter which arises just because the political theorists and practitioners of recent centuries, non-Christian and anti-Christian as well as Christian, have ignored the realities of evolution in positing that the abstract reasoning abilities of all peoples and of all individuals in those peoples have risen in unison. It's likely that many peoples are missing either the abstract reasoning ability or the proper emotional settings to be properly disturbed by, say, brutal war crimes committed by the leaders of their tribe or kingdom or empire or state.

In general, it takes a high level of reasoning ability to understand the huge and complex human communities of the modern world, to be even

potentially self-governing in a meaningful way rather than just being cattle to be manipulated by political machines or demagogues.

Geneticists tell us that a high percentage of Y-chromosomes in Western Europe, China, and probably most regions of civilized order came from a small number of men who were almost certainly great military and political leaders, though I'd guess that many blacksmiths and horse-breeders and others who had knowledge and skills important to the warriors also left a fair number of descendants. At the same time, political and military power seems to have given reproductive advantages to male-lines over many generations, so that the paternal lines of even successful merchants and technologists might have dwindled; many of those other men might have left us most of their genetic heritage through their daughters.

It is hardly surprising that the order of Indo-European warlords established the foundations of what would become Christian Europe. It is hardly surprising that the real but incomplete morality of warrior-bands is still with us in the West. It is hardly surprising that modern attempts to idealize morality as something above and beyond this Einsteinian and Darwinian universe is entangled with forces of moral breakdown, that is, idealists threaten the real foundations of higher morality and that could lead to a breakdown of higher morality.

The rise in IQs across Eurasia occurred rapidly over the past 10,000 years in apparent synch with the development of more advanced stone tools and weapons and then the development of metal technology, of semi-nomadic agriculture leading to true agriculture, of organized warfare and also the organized movements of somewhat larger groups of peoples—logistically complex movements since women and children and elderly men were in the migrating groups. All of this seems to have also been entangled with the development of harsh forms of order imposed by warriors, including the organization of larger-scale agricultural operations with the likelihood that clueless subsistence farmers were rounded up with threats of spears so that they could dig the irrigation ditches and settle into regions under the control of one warlord or another—the ancient works of Hebrew scripture give us stories of such complex events and make us aware that much suffering came with the benefits of urban living with its technologies.

It's far from clear that modern Western forms of liberal social organization and their associated forms of liberal morality will last. It's far from clear they are the best of currently possible ways to organize our human communities and to develop our systems of morality with rights and duties.

It's quite possible that we of the modern West have misunderstood the nature of order and of moral order so that we have simply exploited the material wealth and ordered communities we inherited, turning those communities into unstable forms so that the next few generations will inherit a civilization in ruins.

# 334 Freestanding Individuals Form Herds, Complete Human Beings Form Communities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2333>. It was finished and uploaded on 2017/02/07.]

['Complete' in this essay refers only to the willingness of a human being to acknowledge his communal human being as well as his individual human being and is no claim that we human beings can ever be complete in this mortal realm.]

In Chapter 538, *Looking Backward, Moving Forward, Moving in Circles*, I questioned liberalism: is it ever good? Conservatism and progressivism can take on corrupt or misguided forms, but liberalism denies the reality of human communities, of communal human being, by declaring the sovereignty of individual human beings. I would suggest that there is no such sovereignty on the part of either individual human beings or communal human beings. Rather is there a complex entity which can be conceptualized as a surface with each small region being an independent entity.

I use 'surface' as an simple concept which can point to the truer, more complex concept of 'manifold'. A manifold can be as many dimensions as you wish. The surface of a globe, a 3-dimensional ball, is a 2-dimensional manifold which is pretty much a Euclidean plane in small regions (street maps are a good rendering of the reality) while any attempt to flatten out the entirety of Earth's surface or even large regions will lead to Euclidean planes which distort various parts of that surface.

I claim this is also the case with human communities and the small regions which are individual human beings—communities are analogically

manifolds with individuals being the small regions which are individuals. More radically, and mostly beyond the scope of this essay, I claim that the mathematics which can help describe the basic stuff of this concrete universe and the shaping of that stuff into complex entities is part of the being of that stuff and those entities.

But there is no way to claim the egg or the chicken, the individual or the community, comes first. In fact, it would seem to be the wrong way of speaking when it comes to human being, individual and communal, which is the result of very complex evolutionary and developmental processes. Individual and communal human being developed together and neither can really exist without the other; it's possible that we can find or at least hypothesize a species where we can observe individuals starting to form communities—some have claimed this is true of jellyfishes which are colonies of specialized individuals rather than true organisms.

If an individual human being doesn't have rich and satisfying communal relationships, he will be open to other offers, in a manner of speaking. The offer might come from an unordered group of human beings, street gangs of the non-criminal sort or at least not being involved with the worst sorts of crimes. It might come from a religious group, perhaps one that draws that relatively isolated human being away from what is left of his family or ethnic ties—for good or bad or both.

Human beings can be said, analogically, to clump together. Since human beings, individual and communal are dynamic entities, it is perhaps best to imagine a flow like that of healthy blood through the arteries and veins. Under good circumstances, the components of the blood will flow relatively freely in synchronization with each other, in chemical and mechanical and electrical relationships which establish that synchronization. But there is more involved, that more being well beyond the scope of this essay and being the study of theorists in the mathematics and sciences of complex systems. A school of fish can move as if directed by a single mind able to change the direction of each and every one of those fish as if by instantaneous communication and response. Rapid it is but not instantaneous; in fact, that tightly synchronized school is really a global entity which comes into existence as a result of only 'messages' and responses between each fish and the ones near it.

But the reality of human communities is richer and far more complex than the reality of schools of fish. We'll move on to more realistic but more ambiguous ways of dealing with human being.

It is better to think of human beings as needing social ties, strongly desiring them. We will form social ties even if we leave behind those to which we were born. If our lives at home, in our extended families, in our neighborhoods, in our ethnic communities, in our communities of worship, are weak or nonexistent, then we'll form attachments as we can. We Americans, probably the citizens of most countries in the West, are mobile and have regularly left behind all those ties, supportive and inconvenient as they are. Even when we live in the same town or small region for all of our lives, we are still mobile in place, if you allow such a strange but empirically justified idea.

When I was young, fourth or fifth grade, I was making my way through a collection of young-person's biographies (George Washington, Ben Franklin, some Amerindian leaders, and so on) when I happened to fall into a conversation with classmates during some sort of indoor recess; I learned I'd have to start watching *The Monkees* television show to be a part of their conversations. My fellow-youth in my hometown were far more interested in those rock-and-rollers than in George or Ben or Crazy Horse. It was only later that I learned I was cheated by a rapidly progressing process of separation from my ancestors from the British Isles. It was decades later that I learned my father's family had so effectively left behind even valid rumors of their roots as to have thought of our (probably) Saxon name, Fueston, as being some sort of Anglicized French name; a few years more and I learned that our Y-chromosome (paternal-line chromosome) is Irish Gaelic by way of Scotland, not French and not Saxon. It's hardly surprising that there is nothing left of extended family relationships with either my mother's or father's family. I've noticed that, like many American parents, mine were willing to break ties with their families while expecting their own children would retain good family ties.

But my ties to my peers in my hometown have always been weak, though I have a couple of nearly 60 year-old friendships. I was precocious when I was young though apparently not enough to make me freakish even in a country where intellectual talent is regarded with suspicion. I was actually interested in those academic subjects which so frustrated and bored nearly all boys and girls. Never once in my childhood in the town where I was raised, only occasionally after my return as an adult, did I hold conversations with fellow residents which dealt with those matters of deeper interest to me. It wasn't that I disdained the conversations about Sandy Koufax or about our families and friends and dogs, but I was forced to wrap the entirety of my

public mind and public interest around those topics as well as various topics of absolutely no interest to me, including *The Monkees*<sup>1</sup> and *Laugh-In*, and never once talked to another human being about my interest in physics (of which I knew nothing other than a few historical facts) and mathematics (little different) and history.

Being rather social in my general inclinations, I badly hurt the development of my talents in mathematical sciences by joining the march of the herd. Some sort of toughness or self-respect was missing or immature in my young self.

Though the particulars of my case might be peculiar, so to speak, this is a story repeated in the mass-consumer societies of the United States every day. I'm sure it's a common sort of story in most human societies, at least if they are in some state of ferment, in some state corresponding to a movement forward. And, in fact, this situation shouldn't be seen as thoroughly negative or even mostly negative. So long as a society is stable, preferably in a morally well-ordered way, most—though not all—young human beings can form healthy communal relationships though they might seem at first to just be joining the march of the herd. It can be negative, leading young men in disordered societies toward some sort of involvement with crime. It most surely led some German young men in the 1930s to follow groups of friends or even strong-willed individuals into Nazi activities. Lt Col Dave Grossman (in his book *On Killing*) relates, from the actual battle reports, how some American soldiers initially tried to stop the killing of unarmed civilians at My Lai but most of those joined in as they were caught up in the emotions, the blood-lust.

On the other hand, we can read in histories that those Germans and other Europeans under Nazi occupation bravely worked in the underground or in rescues of would-be victims of the Nazis so long as a substantial group responded to the leadership of a some strong-willed and moral person, perhaps a priest or minister or rabbi—there were more Jewish partisans and others 'hiding' in Nazi-controlled regions than we might think. We can see local churches or social clubs responding to the needs of the hungry or homeless, perhaps in a far-away region hit by a hurricane or earthquake. There are individuals, even some who are loners, who have acted in heroic

---

<sup>1</sup>For what it's worth: I did think some of their music was good-quality popular music, though I'm not sure how such a judgment would hold up in a society in which young people grow up with rich folk music as well as the likes of 'classical' music which can satisfy mind as well as heart and hands (or feet).

ways; sometimes perhaps those human beings are helped a little by their lack of attachment to groups of human beings not responding properly. Mostly, we are at our best when we are members of communities, usually complex networks of communities, which themselves have clear thoughts, strong feelings, and good habits—all three of which are ordered to some system of moral order.

Our moral communities and, hence, our moral individual selves can be so easily deformed, even during the sorts of turbulent times which are leading to good times of strong moral order.

Day-to-day in our hi-tech American lives, what's important is those little pressures to pay attention to things of lesser importance, once the silly entertainment (*The Monkees*) of a sort which is actually good in proper amounts (the problem with TV is that it is so seductive, sit down at 7 and you come to your senses at 11) and, more recently, morally despicable entertainment. Lt Colonel Grossman, mentioned above as author of *On Killing*, was an Airborne Ranger in the US Army and later a psychologist specializing in the training of soldiers and he thinks only morally irresponsible parents would allow their children to watch *Rambo* or similar sorts of stuff. And that sort of stuff has gotten worse in its cynicism and its advocacy of hate and other emotions which are natural but not to be nurtured. It's amazing that so many who have made fortunes producing or acting in this sort of moral trash parade about in public as they pretend to some sort of moral superiority. That stuff isn't just despicable in abstract judgment. It eats away at our individual and communal moral characters. It can even help to make some of us, or some of our communities, outright evil.

We need to do the many little and bigger things which form and strengthen communities, caring for those close to us or—a lesser moral duty—for those poor people in our larger communities or in another parts of our countries or even those on other continents. We need to fill our minds and hearts with good stuff and to shape our hands to good habits. We do these good things by becoming members of morally well-ordered communities; by doing these good things, we shape our communities to a better moral order. It takes generations. Complex human communities, entire civilizations or lesser moral communities, can be destroyed in only a few years but it will take generations to rebuild them—if they are rebuilt at all.

By failing to take these steps toward individual and communal moral order, we become morally weak, as I was as a boy under peer-pressure (unconscious on the part of those peers who were very good young people)

to watch a lot of television and as were those Americans who engaged in hot-blooded murder of unarmed human beings in My Lai. We attach ourselves to groups which are themselves morally unordered, perhaps even morally disordered, even when most or all of the members of those groups are individually morally well-ordered or at least okay-ordered. You might even say we too readily join the herd-like groups worshipping the Lord of the Flies.

Those of us who are Christians believe that the ultimate community is the Body of Christ and, yet, other communities are also potentially good, many of those communities realize some or much of that potential in this world. I've claimed in some of my writings that these communities, economic and political and academic and professional and ethnic and work-centered and so on, will go with us to Heaven where they will be perfected and completed. Heaven will be one community of the friends of Christ and yet that one community will be a symphony of many communities, allowing the fullness and perfection of human life to be realized.

## 335 The Life of a Human Animal Begins at Conception. And Ends at Death. Maybe.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2409>. It was finished and uploaded on 2017/06/06.]

In the essay, *When Does Human Life Begin?* (see <http://www.theamericanconservative.com/articles/when-does-human-life-begin/>), Brook Stanton makes a clear and forceful statement, with highly summarized arguments which are really—and he admits so—references to well-established facts and theories of modern biology: human life begins at conception. He doesn't show awareness that there is some, if not total, truth in the claim that there are no facts without theories; that is, even raw or brute facts are interpreted by our perceptions and conceptions of what the context of those facts is, what the world is. By the end of his short essay, Stanton does show an awareness of the importance of philosophy in forming greater understandings, based upon the idea that "Accurate science should be the starting point for resolving the philosophical question, not the reverse." Not entirely true. I would urge reading of his entire short essay because of the complex evaluation I'm making of the truth and insights of that essay, as well as the misleading nature of his viewpoint. Let me first quote the beginning of Stanton's essay and then I'll move on with my explanations:

The question of when a human life begins is a strictly scientific one and one for which the scientific community has had an empirical, internationally acknowledged answer for a very long time.

For more than a century, the field of human embryology has documented that in human sexual reproduction a new, whole, individual, living human being begins to exist at “first contact” between a sperm and an oocyte/“egg” (the beginning of the process known as fertilization.) Immediately when these two mere cells make first contact and fuse, organism proteins and enzymes specific to humans are produced. One new single-cell human being with his or her own new, unique, and complete set of human DNA begins to exist. This is an internationally recognized empirical fact that has been documented by the Carnegie Stages of Early Human Embryonic Development since 1942, and updated every year since then to the present by the international nomenclature committee (FIPAT). The 23 Carnegie Stages cover human development during the eight-week embryonic period, and a new human being is represented by Carnegie Stage 1a.

Stanton notes that the life of a human being, new and unique, begins at conception. True enough. Sort of. At least in most cases. Stanton doesn't seem to know about infrequent situations which don't follow his simple understanding. For example, there are human beings who are chimeras, results of the mergers of two different fertilized egg-cells, mergers of two organisms with two different unique sets of DNA. So far as I know, more than two are even possible. In the article, *Chimera (genetics)* at [https://en.wikipedia.org/wiki/Chimera\\_\(genetics\)](https://en.wikipedia.org/wiki/Chimera_(genetics)), you can learn that some of those with mixed sexual characteristic are chimeras and even that a female chimera might have given birth to children carrying DNA which was not that found in most of her body. Moreover, lesser forms of this phenomena often result in strangeness in blood type when one embryo picks up only some cells from a sibling sharing the womb. Even at a basic ‘factual’ level, the world is altogether too complex to be understood at all without, yes, philosophical or theological principles which can answer such questions as:

- Is a human chimera one human being or two? (Or more?)
- Is a human chimera carrying both male and female sets of DNA a man or woman? Or something else?

We need to acknowledge empirical facts but acknowledging only those which are convenient to our arguments will just put us deeper in the intellectual quicksand we've created in this Modern Age. We'll probably just repeat the stages of the Enlightenment when a promising intellectual program went bad. It wasn't just the Enlightenment which went bad; Etienne Gilson made the well-justified claim that the Catholic Church failed to respond properly to the problems and opportunities of the modern world and the Church's intellectuals and other leaders led the Church into an intellectual ghetto. This problem, spread to many parts of the West, seems to be one of the problems which Stanton is addressing.

I'll write in this context of the life of a 'human animal' to keep important terms clean—I'll explain more fully below, but the term "human being" covers "human animal" and also "human person."q

I'll retreat to a more basic level for now, so that I can lead up to my conclusions about the importance of acknowledging empirical reality, not just 'facts', and the need to see that greater reality by way of the philosophical and theological explorations Stanton would push off to some undefinable time when we have a very good understanding of physical stuff at a factual level.

Yet, Stanton is right—in a way—that this issue can be clearly settled by empirical science; he doesn't seem to realize that is true only if that empirical science is done and understood in a greater context in which ordinary and scientific words and concepts carry the proper moral meanings, as they did for nearly a thousand years in the West right into the early stages of the Enlightenment. He is right that we have to be clear about those empirical facts, but he doesn't show enough awareness of the history of science to realize there is no objective schema given to us that makes sense of the findings of even physics, let alone biology. Think about a puppy and colt and ask yourself what is different about human babies that makes each one different and gives it greater worth than other animals. To say simply that human babies are members of our species is to forget that such feelings develop naturally for those who are members of our local communities, communities upon which we are dependent, whether clan or tribe or urban neighborhood. There is no intuitive understanding of ourselves as members of such an abstractly defined group as a species. Ask yourself also, what biological facts can define the magical point in time when a member of the genus *homo* (see <https://en.wikipedia.org/wiki/Homo>) gained this special status so that he was of greater worth than the mastodons or cave-

bears living nearby. Or his cousins, the chimps and gorillas and other great apes. There is even confusion in the terminology as the word, hominid, originally referred to modern and archaic humans and maybe chimpanzees and now refers to gorillas and the other great apes as well. These changes reflect the desires of scientists to make some issues more clear—is such a desire no more than a reflexive response to empirical facts?

Modern human beings are still so close to chimpanzees in terms of that magical DNA and in bodily structure and in physiology that the famous anthropologist from Mars might well classify us as different subspecies rather than two species, assuming he even classifies living creatures in quite this way. Our very fine-grained understanding of *homo sapiens sapiens* as a species separate from our close relatives (by standards of DNA) is itself based upon a moral, philosophical and theological, understanding of human being based upon our own feelings but also upon a variety of empirical facts folded into those understandings—facts not fully reducible to that DNA which Stanton proposes as a clean starting-point.

As the anthropologist John Hawks (see <http://johnhawks.net/weblog/>) has noted that we think of *homo sapiens neanderthalens* (see <https://en.wikipedia.org/wiki/Neanderthal>) as being a non-human species though scientists define him as a subspecies of homo (humanity). We are partly him (maybe 2-3% of the DNA for most Europeans, a little more for many Asians, and 0% for sub-Saharan Africans). The decision as to whether that fellow, robust but no more so than some of our sturdy friends, was our brother or a distant cousin is philosophical and moral and might be of some importance as scientists are recovering better sets of Neanderthal DNA and might be able to fertilize the egg-cell of a living woman to produce a human creature who is at least significantly Neanderthal; ‘progress’ in this sort of activity might even allow the creation of an embryo which is fully Neanderthal. This might well happen and I’d like to hear how ‘only’ empirical facts can tell us if this creature should be accorded full human rights.

We need better philosophical and theological understandings than we have rather than trying to gather ‘empirical facts’ without any such understandings, though Stanton is right that we can only have those better understandings if we pay better attention to empirical facts.

At the risk of being repetitive, I’ll try to deal with some word issues I mentioned above. I use ‘human being’ to include the state in which we are born, ‘human animal’, and also the state which we can reach if we establish

the proper relationship with God or at least His Creation: ‘human (moral) person’. As persons, we become true ‘images of God.’ That seems to me to be a state we really can’t reach until we fully share the life of God in the world of the resurrected. If we don’t respond properly to God or at least His Creation, we remain human animals. In all cases, it is appropriate to consider all of us, from conception to death or beyond, as human beings. We start out as human beings who are ‘merely’ human animals and then, if we respond properly to the Creator or at least His Creation, we can begin to become human persons, images of God in the Person of the Son of God. As human animals, we are images of God in the sense that each bit of created being and all of created being is an image of God, a manifested thought of God in another way of phrasing matters.

I’ll repeat one of Stanton’s strongest statements from the quotation above:

For more than a century, the field of human embryology has documented that in human sexual reproduction a new, whole, individual, living human being begins to exist at “first contact” between a sperm and an oocyte/“egg” (the beginning of the process known as fertilization.)

Fair enough. Sort of true enough, but not fully true—remember those human chimeras and that hypothetical Neanderthal who might soon be among us in an ambiguous moral status. Yet, it is very good that Stanton and his associates acknowledge the importance of the empirical knowledge about human beings. We need to go beyond, first of all, realizing that the very processes of evolution and of genetics blur the distinction between species and obscure the meaning of ‘unique’ and ‘individual’ when we try to deal with certain issues on the basis of ‘only’ empirical facts.

Moreover. . .

Without philosophical and theological thought, how can we reduce the “problem” of the beginning of human life in this way and then deny that the death of that human being, the decay of his flesh—including his DNA, is the end of the existence of that human being. At least to a Christian, this way of ‘solving’ the problem is a bargain with the devil. A real solution to the problem would involve an understanding of why this newly conceived human animal might have a claim to be of greater worth than the embryo of a wallaby or a cobra. And then it might be possible also to understand

what the death of that human being might bring to an end and what it might initiate. And we might be able to deal with that Neanderthal, a member of *homo sapiens neanderthalens*, who might be conceived before long in a test-tube and then born from an artificial womb or the womb of a woman of the subspecies, *homo sapiens sapiens*. We might be able to deal with that very small number of human beings whose bodies are a mosaic involving both male and female sets of DNA or, more generally, a mosaic of two originally separately conceived human beings.

For the past twenty years or more, I've been engaged in a struggle which overlaps that of Stanton and his associates: I've been trying to re-understand the world in **explicitly** Christian terms. The God of Jesus Christ is the Creator of this world and of the greater Creation which this world is part of. This world, indeed—all of Creation, is a manifestation of thoughts of God.

Modern science tells us that relationships are primary, they create stuff. This is the reason for the strangeness of quantum mechanics and biological evolution alike. The strangeness appears because we try to see thing-like being as existing and then forming relationships. And that's strange in itself because Christians were told that relationships create and shape stuff by St John the Evangelist centuries before Darwin and Einstein and Planck and the other modern re-founders of biology and physics. That is, St John told us that God didn't create the world, explore it to understand what He had made, and then decide to love it. The world came to exist because God already loved it, had already formed the relationship of Creator to Creation. A human being is of greater worth, to God for believers and to some group of other human beings for all of us. Such an understanding as this has to be introduced at an early stage when empirical facts are yet being gathered—for one thing, some facts can be—and maybe have been—gathered by acts destructive one of those human embryos.

A world reduced to “empirical facts first and then we'll discuss philosophy when we've got those facts in hand” is bound to be a disordered world, a world of quicksand when you explore for meaning or moral purpose. It would perhaps be even better to see it as a world in which seekers of greater meaning or purpose will ever travel in circles, chasing their own shadows.

When will we have ‘enough’ empirical facts in hand to connect beliefs in moral purpose to those facts? The context of a human life, its meaning if you will, is needed for the task of understanding any part of that life. If we start talking about the beginning of life at conception in terms of DNA, we

better have some answers at hand when someone asks why that human life doesn't come to an absolute end when that body created by the DNA, even the DNA itself, begins to decay at death or even before. We better be able to produce some morally decent understanding of those human chimeras and that hypothetical Neanderthal.

Within the Christian Worldview I've developed, there is an obvious answer that tells us what is the 'true' meaning of a human life: it is God's love for us which brings us into existence and shapes us and maintains us in existence, that is, the Almighty's love for each of us as individuals and for us as communal human beings, including the entire species or—far more importantly—for those who are to be saved as members of the Body of Christ. We are special because we can respond to God in a special way and can share His thoughts as Creator and maybe even share His life in some meaningful sense. When we die and our bodily stuff accelerates its ongoing decay, then we will exist again if God chooses to direct that particular love for me or thee at a, so to speak, small spot in the world of the resurrected, the world of the true friends of God. We will find ourselves in our proper spot in that world on the other side of the grave.

If we choose to deal with empirical facts, imagining that we can ever do such a thing without a philosophical and/or theological understanding of what a fact is and what matter is and so on, we'll soon enough find ourselves, at best, in a world of pagan tragedy, a world of moral despair though possibly adopting a noble sort of fatalistic acceptance of that moral despair. Even worse, we might find ourselves in a world such as the one we've actually created over the past two centuries when the Enlightenment—originally, a good thing on the whole—went bad and took science with it on a path of radical secularism which included the belief which made possible the suicide of the West: the idea that we can produce a valid understanding of this world by the reductionistic path of putting all philosophical and theological considerations aside and then simply gathering up empirical facts. To be sure, the Enlightenment also went bad because of those who adopted idealistic ideologies, seen as above empirical reality and capable of providing judgments upon that reality. Perhaps this latter problem is the one Stanton wishes to solve, but the real problem is a disengagement of ways of gathering knowledge and understanding knowledge which can be only partially separated into empirical research and philosophizing or theologizing and then only by ignoring the intertwined and even recursive nature of all of these ways of thought.

In his article, Stanton advocates a very good idea: we need to have the empirical facts in hand to understand the world and—I would add—all of Creation. When that idea is allied to the belief that we need to go through this exercise and come to some allegedly objective scientific understanding before trying to gain any philosophical or theological understanding, then we arrive back at the point where the Enlightenment had gone bad and was going worse, circa 1800. We can do no better than to reinforce that environment which Nietzsche described so well in the colors of nihilistic despair.

## 336 What is the Totality of a Human Life?: Individuals and Communities.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2413>. It was finished and uploaded on 2017/06/13.]

A life is made up of moments and events but it's not merely the sum of the moments and events in the way that a universe isn't just the sum of the matter and energy and other specific things it contains and a community isn't just the sum of its members and their individual to individual relationships. A life has properties beyond and different from those moments and those events it contains and the same can be said for a universe and a community. All of these complex entities, a human being's life and his communities and the universe—in fact, all of Creation, are intertwined.

In the strangely limited discourse of modern human beings—even modern Christians, a life or a universe or a community is made greater by 'purpose'. True enough but not enough. Purpose is typically seen as outside of us or our communities or our universe, something not at all directly perceptible and something we strive toward; modern empirical knowledge tells us this is the problem with such worldviews as that of Creation science. A true enough criticism, but not enough of a criticism. Creation scientists are trying to do something proper but they don't do it well enough. Purpose is in the entirety of complex entities which means it is found in some way, if only partially so, in the individual entities which make up those complex entities—especially if those individuals retain their identity in a strong sense. But purpose is outside us in the sense that it is in our communal being—we belong to communities which are purpose-driven perhaps more

than most individual human beings; purpose is also outside us in the sense that God's world—indeed, all of His Creation—is ordered to the purpose of the Almighty. Purpose is outside of us but also inside of us because it flows through all of our human being and also provides a dynamic structure to all of our human being..

Nearly all people living in coherent, well-ordered communities will internalize that coherence and that order, taking in the purpose of their communities in some form they tailor, or sometimes butcher, to their own perceived needs and status. For all but a small percentage, this communal coherence and order will supply what is needed for purpose, along with some understanding of the world and of that community's place in the world. This sort of communal purpose, which has to be personalized to truly be embedded in a human being, is part of a larger package—a worldview at the largest scale.

With such a package, a worldview as true as possible given Christian revelation and also the current state of human knowledge about God's acts as Creator, communities at all scales and individuals can adopt the higher order of that worldview into their communal and individual human being.

Without such a package, a worldview or even some lesser version corresponding to a culture rather than a more complete civilization, most human beings seem incapable of engaging in much coherent thought about the world outside of their direct experience, their day-to-day lives. More generally, not just the thoughts (part of mind) and purpose (part of heart) but also moral habits (part of hands) are formed for all to some extent and for most to a great extent by community standards. Or it could be that, in the event of a decay in the coherence and order of communities, all are left somewhat formless by lack of community standards and most are left largely blind in terms of road-maps through a confusing world. Some who are more creative and more capable of dealing with abstractions might find a good way (Augustine of Hippo) or a bad way (Karl Marx) through a world in decay, even a world in which the processes of decay are working but haven't done much damage yet. Yet, as bad as some of the thoughts of Marx are, it's likely that more damage has been done to Western Civilization by the more ordinary exploiters, such as corporations selling entertainment products which disrupt the intentional (growth) processes of young children learning how to concentrate. And so on.

This much is clear to me: even many of those human beings who are the "good stuff" are not capable of properly forming that good stuff or

of finding new ways through the vast expanses of a decaying civilization. During periods of civilizational or even local decay, it becomes difficult and sometimes nearly impossible for most citizens to even see clearly any possibility of major forms of good, purposeful lives; and, in fact, it might truly be nearly impossible to realize those sorts of lives. So it is that, in particular, the possibilities of Christian forms of life have become nearly impossible for parents or pastors to even see, let alone realize, in a West which is the ruins of a Christian Civilization taken over by secularists who are at least sneeringly indifferent to any religious institutions or practices which are not subordinate to secularist forms of liberalism. It's quite sad that this sort of a takeover of the Christian West by secular liberalism was made possible by Christians who collaborated with their enemies and paid little attention to the damage done to their own human being or that of their children.

In fact, all forms of liberalism, including seemingly conservative forms of classical liberalism, are bound to find themselves working against any form of traditionalism since all liberals—whether serving the markets or some sort of collectivist dream—are in conflict with communities which always have some sort of traditionalist inclinations. There are reasons that the better sorts of classical liberals, such as Hayek and Friedman, denied being conservatives by any definition. In their ways of thought, human beings were mobile workers or perhaps members of a cosmopolitan intellectual and artistic elite. Arguably, anti-traditionalism defines liberalism even better than the original liberal program of turning individuals into freestanding, contract-making entities of a vague sort; after all, some newer branches of liberalism free individuals from traditions to entrap them in various schemes of highly engineered collectivism.

To be sure, the world changes and sometimes too fast for most communities in a region to survive, though it remains true that a period of resting in traditionalist communities—even rigidly authoritarian traditionalist communities—is less damaging to most human being than is a radical destruction of traditionalism and all it carries, including the possibilities of necessary change from a stable starting point. Letting intentional (growth) processes work at the level of individual human beings and at all scales of communal human being gives us progress which might be truly such. And those processes will interact—in theory—with the evolutionary and developmental processes of God's Creation.

In my recently posted and freely downloadable book, *The Shape of Re-*

*ality* [56], I made some progress in supporting a claim I'd been making for a few years: modern mathematics and some of the sciences have concepts and tools for addressing many problems of being which are at the root of a lack of understanding of the complex entities of God's Creation. In particular, I'm concerned with the development of words and concepts, largely abstracted from mathematics, which allow us to think clearly about communities as being real and not just voluntary gatherings of radically freestanding human beings. I made some steps in that direction in the book referenced above.

The modern ideologues, especially liberals of all sorts, have taken away our sense of community, our beliefs that our individual selves and our communal selves are real and interact without one necessarily overwhelming the other. In a similar way, they have taken away our sense of a meaningful life, our beliefs that the moments and events of our lives are real and so is the totality of our lives. To elaborate on a claim I made above: the illiberal ideologues of the modern world, such as Karl Marx, made inroads in the former Christian West only because of the seemingly gentler and more gradual ideas of extreme free-marketers and a variety of activists thinking of themselves as being social reformers.

Much of the damage to individual human beings comes by way of the destruction of communal human being. As I claimed above: all human beings to some extent and some human beings to a nearly full extent are dependent upon their communities to help them "engag[e] in much coherent thought about the world outside of their direct experience, their day-to-day lives." It is this coherent thought, and the related feelings and behaviors, which shape moral character—among other good things.

## 337 What is the Totality of a Human Life?: Individual and Communal Intent

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2417>. It was finished and uploaded on 2017/06/30.]

In Chapter 336, *What is the Totality of a Human Life?: Individuals and Communities*, I explored some issues related to meaningfulness, using terms which might allow a slightly more disciplined discourse and thought than what is currently used by knowledgeable and insightful thinkers as well as many others.

I think it necessary to delve a little more deeply into the individual and communal aspects of *intent*. See Chapter 83, *What is Mind?: Is Christian Morality a Natural Morality?* and, if you desire, some following chapters which discuss the book, *How Brains Make Up Their Minds* [35], by the neuroscientist and philosopher, Walter J Freeman—see [https://en.wikipedia.org/wiki/Walter\\_Jackson\\_Freeman\\_III](https://en.wikipedia.org/wiki/Walter_Jackson_Freeman_III). In that book, Freeman tells us:

An intent is the directing of an action toward some future goal that is defined and chosen by the actor. It differs from a motive, which is the reason and explanation of the action, and from a desire, which is the awareness and experience stemming from the intent. A man shoots another with the intent to kill, which is separate from why he does it and with what feeling.

An intent might not even be consciously seen though the goal of that intent is being actively sought: a seed and then a seedling tries to grow and

develop its fullness of leaves and flowers and then sets seeds to reproduce. The directedness of intent doesn't necessarily involve consciousness, at least not within the full context of Thomistic thought of traditional biological or legal thought. The growth processes of all organisms are intentional. The cells of a crocodile embryo in the egg don't just proliferate in any which way, but rather proliferate in an organized way toward various long-range goals but immediately toward the goal of becoming a somewhat more mature organism: an active baby crocodile. A man who regularly drinks to the point of inebriation and then drives can be said to 'intend' to commit vehicular homicide. Whether he is driven by various problems including some rare genetic disorder or whether he simply likes to drink to excess so that he's willing to risk his own life and the life of others, he intends the development of a very dangerous habit.

Consciousness can be very good, even self-consciousness can sometimes be good—though not at all times. Musicians and craftsmen and athletes and professional mathematicians consciously develop their skills but then lose that consciousness in the very processes which are the deployments of those skills.

Jascha Heifetz practiced and thought about music and about the physical acts of playing the violin. His intent was to become a skilled violinist and he achieved true greatness. That greatness involved more practice on a particular piece and the development of an awareness of that piece that he might anticipate some very difficult acts of bodily movement. The actual playing involved a losing of himself in the music and necessarily so as the conscious regions of the human brain don't work fast enough to actually think about such rapid movement of hand and the bow which had become part of his hand.

Evolution gifted human beings with a brain which reached conscious and even self-conscious awareness of self and surroundings. That allowed awareness also of the future and of future possibilities better than those of present possibilities. Our ancestors had become capable of planning beyond such acts as the simple food-hoarding or the positioning of dens or nests for easier care and more secure protection of young ones. Consciousness and self-consciousness can guide us into a future by setting goals and forming the habits of mind and heart and hands which make it more possible to intend toward a goal such as singing well enough to be part of a good-quality choir. Even at such a higher-level, cultural process, most of our thoughts and feelings and acts won't be consciously guided in the way of our setting

a practice schedule. We become part of a choir by losing ourselves even in most rehearsals, learning to respond by habit to the hand movements of the choir director and the voices of the surrounding singers; I'm told I have a decent voice at that lower-level and I seem to have pretty good relative pitch, but I was surprised to realize I intend to the goal of singing as well as my limited talents allow partly by focusing on high-quality voices in a nearby range. I've also realized I instinctively stop singing when my sinuses are irritated so that I can't hear my own voice clearly. Having come to realize these and other facts about my own self, I can use rationality in the light of conscious awareness and self-conscious awareness to do a little better—it won't take much to reach the limits of my modest singing talents.

We modern human beings, both individual and communal, have the capability of attaining to a far higher level of consciousness—which is different from saying we can 'control' our economic or political systems in the way imagined by Marxists or Central Bankers. As communities and as individuals, we can intend good futures, proper growth and development toward a better state of human being and we can do this best in a conscious manner. Yet, there is little evidence in the United States and in other parts of the West that even the best-educated of our leaders have attained much self-awareness in an individual or communal sense. To a certain extent, this is caused by the reductionism I've discussed before—see Chapter 674, *A Very Simplified View of the Woes of Christianity—Now and at Two Earlier Times*. In this and other writings, I dealt with the error of reductionism, that is—reduction to atoms or elements. For some reason, some are inclined to think that only individuals are real and communities are nominal, though few would claim that only hydrogen and oxygen are real and water is a substance which exists only in name. Others have a sort of reverse reductionism: they recognize complex entities, such as human communities—such as those of politics and economics, and think those entities overwhelm the individuals and reduce them to mere components fully controlled by the larger-scale forces of human history. We need a balanced, and necessarily complex, understanding of the reality of both individual human being and communal human being.

If communities are real human being, they must have their own intents, their intentional movement and development are toward some goals which might be quite difficult for individuals to perceive, though it might also be difficult for individuals to see their own goals—however much they might delude themselves. The ultimate community is the Body of Christ, more

complex and more complete in its human being than the greatest of civilizations in this mortal realm.

How in the world could all of this work in providing us with a necessary understanding of the growth and development of human being, individual and communal? I've written of some of the qualitative ideas which can be drawn from modern mathematics—see my freely downloadable book, *The Shape of Reality* [56], ideas which lead to plausible discussion of the reality of human communities on a more or less static basis. Now I'm writing about a complex entity (a large-scale community) which has intents—which involve the dynamic processes of growth and development; that large-scale community which is the pilgrim Body of Christ, or most certainly any community on the scale of a civilization, is composed of smaller-scale communities and communities of all scales are composed of individuals and each of these smaller-scale communities and each of these individuals have intents, directed movements and developments toward goals. Speaking simply, the major intents of each of these human communities and individuals is towards the goal of achieving a properly rich and complex human being.

Below the grand level of a civilization, Christ-centered or not, lie various levels of communities and the human individuals who are the members of this great complex of communities. So it is that we have major parts of the human race intending toward human being communal and individual which exercises high standards as researchers and teachers in mathematics and house-builders and doctors and priests and so on. The Elks and Lions and Moose try to build fraternal bonds by way of both recreational and charitable activities. This is also the case for a large number of groups at various churches and synagogues. Volunteers and paid employees help those in need at the Red Cross and hospitals and food-banks. Policemen keep order and, along with firemen and paramedics and others, try to maintain public safety. Does anyone really think that all of this will go away if we enter the World of the Resurrected, that we strive to become not only good human beings but also good electrical engineers or metal-workers or full-time moms only to become generic angelic critters.

As some Christians have claimed: we work toward a Christ-like state by being better parents and better retail clerks and better volunteers on the committees of our town governments. We are what we achieve and will remain such even as we share God's life in the World of the Resurrected.

Communal intent is an important issue for a charitable reason: in the strongest Christian terms, it allows the weaker among us and even those

with various sinful tendencies to be saved as members of the Body Christ and as members of lesser communities within that Body. In this-worldly terms, a weaker statement could be made which would be of great importance to Christians and to other advocates of civilization(s); short of truly terrible crimes, a man with violent tendencies could be taught habits which could—no guarantees—help him to live up to better standards than might be natural to him. It would then be up to God to complete the processes involved in bringing a person with some level of sociopathic tendencies to salvation. In any case, the progress of penitentiaries from therapeutic institutions to institutions of simple incarceration to pools of cheap labor and probably a bit of all of those at most times, is just one of many examples of liberal institutions failing to help either the alleged freestanding individuals or the societies viewed as contractual gatherings of such freestanding individuals.

It's arguably the case that the 20th century and the early part of the 21st century were settings for a war between those trying to teach us that we're either freestanding individuals (the West) or mere components in collectives. We lost touch with even modest efforts to reach a more balanced understanding of human being, such as the teaching of Edmund Burke and others that we're tied to not only other human beings currently alive but also to those dead and those not yet born.

How does this all come together? Sure, we can speak and write of an invisible hand, but Adam Smith and others used that concept to point to a still mysterious factor in human communal life. There has been little progress toward a better understanding, though some progress has been made in terms of potentially useful mathematical techniques by theorists of 'complex systems. I'm proposing a way to move forward, one which points to a need for some sort of shared coherence, unity, and completeness of human being at the level of communities and individuals. So it is that I'd combined those three important criteria of individual or communal personhood, coherence and unity and completeness, with the concept of intent to produce the concept of growth toward some state which is more coherent and more unified and more complete, a state which allows, for the individual, survival and perhaps reproduction and perhaps even enjoyment or something akin to it. Something of the sort is also true for communities, but I'll leave that for the contemplation of the reader as this essay has already grown in complexity and confusion. For good and bad, the reader is seeing the actual act of philosophy, the development of ideas in real-time.

A bit more simply, intentionality is the path from here to there, whether the particular complex entity knows it is moving and growing towards a goal or whether it is constituted so as to move and grow *as if* it knew all about that goal. Humans, individual and communal, share many unconscious processes with rattlesnakes and even stars. A healthy human baby is starting on a path where he seeks proper nutrition, proper exercise, and proper stimulus to grow to a healthy strong adult. When we consider his communal human being, at first only a seeking of something he desires but doesn't know, then we can begin to see more in the way of higher consciousness—as is true of a grizzly bear cub out for the first time from a winter den and eating tender spring grass and running about with a sister or brother and exploring sunlit regions and all the bushes and trees and rocks and fleeing rodents he notices. And the very process of noticing something and then investigating and then more actively noticing lots of somethings will lead to more focused attention and better vision as well as some sort of global understanding of his small part of Creation.

This is a mess inviting the sort of mind, Plato or Riemann, which can find simplicity and elegance in the midst of confusion. My proposal is to use 'intent' as the organizing concept, especially for human beings, but also many other living organisms. Various levels of communities and their member organisms actively, if not always consciously, show intent toward the goal of being better or at least more mature versions of themselves. I'm proposing that not only are communities real, but so are the intentional processes of both individuals and communities. As such they can be studied and discussed and understood by way of disciplined concepts and analytic techniques, many of which can be drawn from modern mathematics and the physical sciences. Again, this is not to reduce human being to a determined thing nor is it to claim some sort of dominance for quantitative mathematics—though those sorts of mathematics will have an important role to play.

## 338 What is the Totality of a Human Life?: Unity, Coherence, and Completeness

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2421>. It was finished and uploaded on 2017/07/11.]

In Chapter 337, *What is the Totality of a Human Life?: Individual and Communal Intent*, I proposed that ‘intent’ in the sense used by Thomas Aquinas and by biologists and lawyers is a way to help us understand human being in its totality, encompassing individual and communal manifestations of human being—and probably divine human being as well.

These basic points come from my still developing worldview:

- It is our natures as human animals, lived out in some sort of common life, which unites the small, flesh-and-blood communities of human being.
- It is a common understanding of higher, abstract realms of created being which makes possible larger-scale, more abstract communities. Ultimately, a very large-scale community, an instance of communal human being, needs something like a—possibly only partially shared—common understanding of all that exists. The ultimate community, being the fullness and completion of human being in union with God, is the Body of Christ. This Body looks like a civilization with the Christian Church as the central organ, not much like a ‘pure’ church. [Common understanding isn’t a purely ‘rational’ state but rather a state of the entirety of human being: mind and heart and hands.]

It is by way of proper intents that we can truly realize that communal understanding of created being, can encapsulate it in our own being. This is a—usually—slow movement and slow development. It takes years for even a mathematical genius to truly think like a mathematician. It takes years to turn a young man into a soldier. It takes years of effort to learn how to raise children—one reason for the importance of Grandma and Grandpa.

In a more general way: there is not a sudden qualitative change—disruption?—from lower human animal to some sort of higher human animal centered on God or at least on the entirety or part of His Creation. We are a part of this physical universe, this world when the universe is seen in light of God's purposes. We moved from a 'pure' animal intelligence which is a, shall I say, direct encapsulation of experience of responding to opportunities and dangers. Human beings have more complex brains, including regions which allow enough of a concept of past and future that we pass on traditions and plan for what might come. Perhaps building upon this raw human understanding of the flow of time, we have a capacity for abstract thought of a more general sort.

It's not only thought (mind) but also heart (feelings) and hands (behavior and habits) which make up human being. The heart and the hands must also be appropriate to the community, especially such a complex community as a civilization. Yet, as I've said before: it is the mind which leads the way into a future, especially a future in a complex civilization which demands consciousness and rationality. And so it is that I'll move on, finally, to talk a little about the unity, coherence, and completeness of human being, individual and communal—where there is a larger-scale community (even a civilization) at issue.

There is clearly some sort of balance among, roughly speaking, human beings who are individuals or small-scale communities or large-scale and—often—centralized communities. Is balance the right word? Is there a better word which communicates the dynamism involved?

A mess of sorts comes into view. Human being is mind and heart and hands even when we consider human animal nature; when we consider human personhood or human (complex and rich) communities, human being has to be unified and coherent and complete—at least in terms of some sort of intentional trajectory or growth and development heading toward some goal, some desired state of human being. Keep this in mind. I'll propose the use of intents, deciding upon future goals and moving toward them, growing and developing; the trick will be to somehow allow proper freedom

to individual human beings and various scales of communal human being while keeping it all together—in a loose manner of speaking.

Let's try looking at an important stage in the development and growth of the Christian West, which development and growth were toward some only partially seen goal of becoming a truly Christian community in politics and in economics and in art and in music and in all other domains of human life.

Very roughly speaking, the peoples of northwestern Europe in the early Medieval Age or later were baptized, typically for the convenience of their leaders who were impressed by the qualities of the Christian kings and lesser nobility of the Anglo-Saxon world. There had been intermarriages and trading arrangements and even some peaceful transfers of territory and those probably increased. Countries grew closer or even absorbed each other by way of treaties or conquests. Unity and coherence were generally increased—often greatly so—by methods not always so consistent with Christianity. More importantly, most individuals and most smaller-scale communities found themselves suddenly in a world which was centered around this God-man who seemed so strange to warrior peoples and farmers worshiping fertility goddesses and gods of death. The overall structure of divinity in this new world was still stranger with a Father and a Son and a Holy Spirit—no goddess to have borne the Son and so on. It took centuries for a religious conversion to take hold, a conversion brought about by admiration for a people who were Christian (the Anglo-Saxons and some related peoples mostly in the British Isles) and by a need for political unity and coherence.

Was completeness served at all? Only in the long-run as those continental Germanic peoples built more complex communities with a greater variety of human being partly by developing richer and more complex forms of art and music and philosophy and theology and so on. But all roles in these larger-scale communities were made richer and more complex—to the confusion and frustration of many not prepared for these roles which seemed to them merely alien and confusing.

It's likely that those continental Germanic leaders who, for example, accepted baptism for themselves and their peoples from St Boniface (an Anglo-Saxon nobleman and cousin to those continental Germans), were adopting a more complex view of the world around them (did they grasp the concept of Creation at all?) which brought them immediate gains in unity and coherence and completeness at the level of confederations of tribes

(something like proto-states and proto-archdioceses) and a lot of longer-term gains for their successes at that same level. They also damaged the unity and coherence and completeness of smaller-scale communities and of individuals which found themselves with goals inconsistent with these new-fangled goals of Christianity. In the long-run, those smaller-scale communities and individuals also had a chance for greater unity and coherence and completeness or, at least, their descendants had such a chance.

It's not as if the larger-scale quest for unity and coherence and completeness always dominates, or should always dominate, the smaller scale entities including individuals. In fact, it's not likely that such aspects realized at the larger-scale will filter down unless, or until, the smaller-scale communities and the individuals are prepared for what is essentially a re-organization of some fundamental aspects of their own human being. What about changes which occur at some lower level: the tribal level which still exist in many parts of the world or the level of professional communities which has played so great a role in good and bad aspects of Western enlightenment or the level of individuals? I'd advocate these changes from below as better than changes from above—usually. Best of all would be changes which occur gradually and steadily at all levels and scales of human being.

But all of the movement through time which I've described above adds up to such a mess. . .

Through time.

We need a way to guide this movement, this growth and development, by allowing individual human being and all scales of communal human being to move toward goals appropriate for those individuals and communities.

There is no such way to control this messy complex of intentional movement, growth and development, at all scales of human being. There may well be a variety of ways which work at one scale or another and which work at various levels of consciousness. Even those must work successfully in the way of open systems existing in complex environments, responding to those environments and—at least in the case of earthworms and human beings—greatly changing those environments as part of the response to opportunities and problems.

Let's return to the messiness of this complex of processes. I'll make a few general claims and a few claims about the most important, and most dangerously out-of-control, community in our age: the United States of America. Then, I'll leave all of this to stew in the back-regions, yes—unconscious regions, of our minds.

- When intents on one scale differ from those on one or more other scales, unity and coherence and completeness can be damaged—perhaps fatally.
- When intents of one important community differ greatly from those of other communities and individuals on various scales, unity and coherence and completeness can be damaged—perhaps fatally.
- When intents of one or more important communities are unrealistic, unity and coherence and completeness can be damaged—perhaps fatally.

Western (Christian) Civilization is in bad shape, largely because one of its energetic frontier regions, the United States, has behaved badly, incompetently and criminally at times through 1988 or so and incompetently and criminally on a consistent basis in the years since. This goes beyond sad; the American people have trusted blue-blood criminals and their allies and those people have not only murdered and stolen (perhaps committing some of the spectacular crimes of the 1960s and onwards), they have also destroyed the United States and the West which needed it by moving the United States toward goals which are immoral and also inconsistent with American capabilities and inclinations and talents.

It is in barbaric but promising regions such as the United States, that a weakening civilization can revive. For that to happen, the people(s) of those energetic frontier region(s) must have conscious and unconscious intents which are consistent with the needs of the civilization which is their greater home in nearly all human aspects: spiritual and cultural and intellectual and political and economic and so forth. The American leadership became full of something smelly and empty of appreciation for reality by at least the years following World War II, years in which the powerful financial interests and allied groups were exaggerating the power and danger of communist countries and distorting the relationships between Chinese ‘communists’ and Russian communists, setting up the CIA as a servant organization of those financial interests, squeezing most productive business interests out of the circles of power, destroying the local political machines in the interests of the two national political machines, etc. Al Capones with higher IQs, social connections, degrees from Yale and Harvard and Cornell and so on.

We have to note at this point that the bulk of the leadership of United States had set off on a new course (and old course for those who know about

the Northeastern fortunes made in the ‘China’ (opium) trade and the slave trade in the first half of the 19th century). Seemingly respectable men, such as John McCloy, General William Donovan and the Dulles brothers—with the help of the British spymaster William Stephenson, unleashed energetic and ambitious blue-bloods upon the world. Those young men used such criminal activities as drug-smuggling and arms-smuggling at least as sources of wealth for those they thought themselves to be manipulating. Those young men probably carried out at least some of the (mostly 1960s) murders of public figures who endangered their perceived interests. They probably destroyed Nixon when he tried to set his own course of action. In their more mature years, they tied Reagan up in knots, brought promising (soft-boy) thugs such as Bill Clinton into their circles, and so on. In general, they corrupted the country—the energetic frontier region of Western Civilization—and prevented it from carrying out its possible mission of reviving the West, a noble mission indeed for those who admire that quite imperfect Christian civilization. The United States could have rescued the West and have been the core region during a new phase of Western Civilization, not necessarily a phase which would have excluded the possibility of a related civilization in Eastern Europe or more foreign civilizations in China or in India or in . . .

What happened to the United States leadership, leading to immense damage to the common citizen’s interests as well as the unity and coherence and completeness of the United States, was in line with the three ‘bad things’ in the list above. The American leadership acted as if the United States was a power unto itself, forgetting that our country is not a civilization and not even a freestanding part of Western Civilization—which is impossible, in any case. That leadership also came to be dominated by financial interests which became dominant over all productive industries but for weapons-manufacturers; those financial interests became enamored over the prospect of controlling the American economy and political system (partly by their dominance in the intelligence services as well as among the President’s top officials) and soon enough were dreaming of that worldwide empire from the nightmarish scenarios proposed by the eccentric Brooks Adams (brother of Henry Adams and grandson of John Quincy Adams—see Gore Vidal’s novel, *Empire*) and Halford MacKinder (see [https://en.wikipedia.org/wiki/Halford\\_Mackinder](https://en.wikipedia.org/wiki/Halford_Mackinder)). (For what it’s worth, Brooks Adams saw that such a world-spanning empire would need to control the coastal regions of East Asia, Shanghai, and not just the

heartland of the Eurasian landmass. The American thugocracy seems to share that insight—wherever they got it from.)

On the whole, that American thugocracy, has unrealistic intents—they think to grow into something like a world-spanning Roman Empire. For geographical reasons, because of the nature of the American Project (so to speak) and the resulting American peoples, for demographic reasons, because of the (easily distorted or corrupted) idealism of the American peoples and people, the United States makes a good fortress and not so good a cosmopolitan center for any sort of overseas empire. More than a century ago, Lord Acton—not really a fan of empires—advised Americans to focus their imperial ambitions on the Western Hemisphere. I don't know if he would have been comfortable with the conceptual structure of intent, of growth and development, but he certainly was aware of the geographical and other specific barriers to a stable and prosperous American overseas empire.

Would an Empire of the Americas have truly become the core region of a revived West? Maybe not. Maybe it would have become a separate civilization, though I think it quite possible that the West, centered in Europe, might still have been re-energized.

In any case, I think that many foreigners—including Vladimir Putin—retain a respect for the basic American intents, the currently stymied efforts of most American human beings, individuals and communities, to grow and develop into a peaceful and prosperous people, a people willing to defend their own true interests but one wishing to order their individual and communal lives to something like Christian standards. To be sure, there are many Americans no longer certain of the truths of Christianity and many believers who don't know how to set proper goals or to grow and develop toward them, but that's a problem which we can deal with if we can figure out how to correct or replace a leadership class which is not only criminal and seemingly incompetent but is also driving toward goals not possible for the United States to realize, goals which would mean the formation of an imperial structure, political and economic and social, which would mean an end to the United States as most Americans wish it to be, even as that empire was doomed to failure. We are seeing hints of a terrible future and those hints have been with us during nearly two centuries of imperialistic behavior in the Americas and a century or so of imperialistic behavior overseas—think Morgan and Rockefeller, Roosevelt and Mahar. Again, see Vidal's *Empire* or even the entire series of novels, *Narratives of*

*Empire*—see [https://en.wikipedia.org/wiki/Narratives\\_of\\_Empire](https://en.wikipedia.org/wiki/Narratives_of_Empire).

The United States has failed, at least for now, as a great power just because we have that thugocracy, leadership class, with unrealistic intents for themselves and this country and those intents are also out of synch with those of most American human beings, individuals and communities.

## 339 What is Man? And All That?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2534>. It was finished and uploaded on 2018/07/30.]

Liberals lie. And I include libertarians among liberals. Perhaps they lie first to themselves, but they lie. All liberals, from Hobbes to Locke to Jefferson to von Mises to Nozick and on to the collectivist enablers or advocates of a 'liberal' and totalitarian order. The biggest part of their lie is the one which claims man to be a secular creature who worships God (or—historically—what anthropologists and archaeologists call the "moral gods") only as a matter of choice—worship isn't seen by liberals as an inherent part of human being as is engagement in marketplace activities and some level of political activities. All but true extremists, anarchists, agree that some minimal system of justice is necessary along with defense against foreign peoples.

As the past few centuries have passed, it would seem that nearly all liberals—including not a few Catholic bishops and leaders of other Christian communities, not a few Christian thinkers—have accepted this radical separation of religion from the "more important" parts of human being. As far as free-market (classical) liberalism goes, the major scholars themselves admit that that form of capitalism is more revolutionary and sometimes more destructive of human institutions than is Marxism and other isms of the modern world. For example, feminism and homosexualism and other forms of anti-human thought developed in the context of Western societies as they mutated first into classical liberal forms and then into collectivist liberal forms.

Liberalism is founded upon myths of political communities (Hobbes and

probably Locke and the Founding Fathers of the US) or economic communities (von Mises and Hayek); both forms of communities are actually fully voluntary (contractual) gatherings of individuals in the ideal. Those myths weren't meant to be taken literalistically but, in the Augustinian sense, are to be taken literally. That is, there was never a specific event or even series of events in history which corresponded to some sort of contract, political or economic, between individuals but the general idea is that individuals are real and communities are but nominalistic entities formed by the wills of individuals and breakable by those same wills—or, more likely, the wills of descendants of those original individuals. See Chapter 674, *A Very Simplified View of the Woes of Christianity—Now and at Two Earlier Times* and Chapter 545, *Civilizational Decay as a Loss of Shape* for my rough, non-scholarly take on the ways in which this misunderstanding of human being, indeed—all of created or contingent being, developed in the West during centuries when Christian thought seemed dominant.

In fact, the histories of human communities in the Mesopotamian or Mediterranean communities from which the West largely came indicate a primary importance to the temple (priests and worship) over the palace (kings and political activities) and the marketplace (merchants and economic activities). This isn't to deny that human beings gathering for "collective worship of moral gods" needed police and soldiers of some sort as well as merchants to trade, say, surplus grain or goats for agricultural tools and weapons. This is to say that there is a lead horse (or 2) in the largest of teams, though as the team forms, all the horses need to work together. And we should be clear that much came to the West from those ancient communities, ancestral to the Hebrews and other Semites and also to the Indo-European peoples—including Greeks and Romans, though in a somewhat different and less restrictive way.

Even so far as the Indo-Europeans on the Russian and Ukrainian steppes are concerned, their dominant male-line DNA (R1b) evolved on the slopes of the Ararat range of hills and mountains as—so to speak—Abel the pastoralist who looked upon, and raided, the various members of the tribe of Cain—such as Semites, farming the river valleys of that northern region of Mesopotamia. The Bible and empirical evidence gathered by archaeologists and other empirical scientists or historians indicate that it was the tribe of Cain which initiated outright war against the tribe of Abel—perhaps for good reason. The later-emerging Indo-European peoples, the Slavs, have a high percentage of R1a male-line DNA; that line evolved on the plains

of modern-day Iran, east of Cain and Abel—so to speak. For what it's worth, R1a is also a much more common Y-chromosome than R1b among the Iranian peoples, some tribes of Afghanistan, and the higher castes of India.

These peoples, genetic lines, have heritages and are not some sort of accidental groupings of generic humanoid. Other peoples, other genetic lines, have different heritages and are also not some sort of accidental groupings of generic humanoid. (I'm not slighting the other peoples who contributed genes to the Indo-European family-lines, including most especially the ones coming in through the mothers of those peoples, but I'm trying to keep the story simple and true though it be impossible to tell the entire truth without a multitude of volumes each hundreds of pages long.)

In this very interesting and probably very important article, *The Mutant Says in His Heart, "There Is No God": the Rejection of Collective Religiosity Centred Around the Worship of Moral Gods Is Associated with High Mutational Load* found at <https://link.springer.com/article/10.1007%2Fs40806-017-0133-5>, we learn that individuals inclined to “collective worship of moral gods” are genetically healthier than those not so inclined—the immune system is of particular importance. Those not so inclined to that worship have the same sorts of loads of genetic mutations as schizophrenics, autistic peoples, and homosexuals. This isn't a proof that the God of Moses or the God of Jesus Christ, or those “moral gods,” exist; it just means that human nature, think especially of personality/social characteristics, evolved to live in complex communities centered around that collective worship. As a speculation, I would suggest that our form of abstract reason is also that appropriate for a world created by, or at least controlled by, “moral gods” or even the God of Jesus Christ.

We know that men are:

1. political animals,
2. economic animals,
3. family-centered animals,
4. beer-brewing animals,
5. rational animals, and
6. so on.

How about adding two to the list, two certainly found in the Hebrew and Christian Holy Scriptures:

1. worshipping animal and
2. believing animal?

In fact, I'll continue to make the claim that human beings are, first and foremost, religious animals. The authors of the above referenced article, *The Mutant Says in His Heart, "There Is No God": the Rejection of Collective Religiosity Centred Around the Worship of Moral Gods Is Associated with High Mutational Load* found at <https://link.springer.com/article/10.1007%2Fs40806-017-0133-5>, have already made this claim plausible by showing that those human inclinations to worship and believe are, like reason or abstract intelligence, so basic to the core of human nature that defects in the complex systems of genes which regulate such characteristics are associated with health problems, often severe health problems. As a car engine with a defective alternator might sputter or might shut down completely, so it is with human beings bereft of some basic religious inclination. I simplify their results because I'm starting a journey in a manner of speaking and I just wish to know what I should pack and in which direction I should head to get to the point of understanding human nature. As an example of an interesting complication, the article indicates that the inclination to believe and the inclination to worship have separate probabilities of heritability, indicating they are separable though we might suspect strongly they are linked. So long as we humans retain our curiosity, the world will continue to offer us interesting problems, some suited for academic study.

It would seem possible at this point that there are no such genes, such core constituents of human being, which play a similar role for the traits of economic man or political man. It might be that economic man and political man arose in the context of religious communities and does so now; this would be consistent with the claim of some that religion supplies the individual moral characters and the communal moral relationships which make stable and complex communities possible. After all, the anti-religious stream of the Enlightenment has conquered the West for now and as religion is driven more and more out of communal (public) life, our economic and political systems are. . . shall we say—fraying? They would fray if they

were dependent upon a set of damaged or suppressed human traits more fundamental than are they to complex human communities.

If true, this would mean that all forms of modernism, liberal and socialistic—as some have claimed before me, were based upon psychoses—dangerous fantasies, basic misunderstandings of human being which were then developed into the systems of Hobbesian justification for radical individuals living in a society controlled ruthlessly by Leviathan, for Locke’s gentler and more optimistic form of individualism, Marx’s ‘liberation’ into a society in which everything is owned in common by radical individuals, John Stuart Mill’s classical liberalism which became a bit of a proto-identity political system with his blessing of Harriet Taylor’s feminism, von Mises’ radical individualism so well suited to Central European intellectuals, and so on. These thinkers were an intelligent lot and insisted on using their intelligence to develop complex and sophisticated systems on the basis of assumptions of human being in its cosmopolitan, late-Enlightenment form seen as political or economic or both—as if the latest growth of a plant could be chopped off, separated from stem and root, and put forward as if the entire plant, capable of sustaining and propagating itself.

Never were those men who built the glory that was Greece and the Grandeur that was Rome seen as the ones who came together to “collectively worship moral gods.” Those men who were the prophets of God in Israel and Judah were shoved into the shadows, embarrassment that they were to those preaching political man and/or economic man as the true Man. As time went on, they had also to ignore the scientists with dirt under their fingernails, the dirt of Babylon and Jerusalem, for those investigators of reality had early on seen hints of the apparent primacy of temples over palaces and of their great importance even after the palaces and bureaucratic mazes are built.

I can’t produce the detailed, scholarly arguments but I feel it likely that this error, this placing of political and economic traits ahead of religious traits, was willful and conscious on the part of many thinkers. Yes, I am claiming many of those thinkers were conscious liars and not just the self-deluded sorts of liars, sons of Satan in old-fashioned language. These men such as Hobbes and Locke and von Mises were truly modern, exerting their wills in order to conquer reality, seeking to change human being into something more acceptable to them by promulgating the idea that, for example, the European men who’d built the Christian West were (maybe) fundamentally political or (maybe) fundamentally economic animals but Christian (a

particular form of religious man) only as an accident of their history. And we're beginning to pay the price for allowing some clever but not wise, and not moral, thinkers and doers to try to change human being into what it is not. It's easier to damage individual or communal human being than it is to improve it.

In any case, we will continue to pay that price for a while because those thinkers have pushed their ideas into the minds and feelings and behaviors of a good number of Westerners: Christian leaders and theologians, educators and "producers of culture," were somewhat willing victims and then began themselves to prey upon the minds and moral characters of the youth and of the mature humans as well as they tried to adjust to a world which was so rapidly changing. Those responsible for guarding the traditions of mankind tried to do so in unintelligent ways, protecting what needed changed along with what was meant to be permanent and what was still good; as those sorts of projects failed, Catholic and Protestant leaders as well as literary critics and academics and politicians went over to the enemies of tradition.

In the end, the title of this chapter—*What is Man? And All That?*—doesn't cut it. To understand Creation and creatures, including human creatures, we must have some small understanding of God even in His transcendence and some great understanding of God in His freely chosen role as Creator of a particular Creation in which arose this peculiar world.

# 340 The Historian and the Psychometrician on Collapse of Innovation and Problem-solving in West

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2582>. It was finished and uploaded on 2019/01/07.]

In *From Dawn to Decadence: 1500 to the Present* [9], Jacques Barzun wrote about a gradual and long-term decay of the West. He wrote that only about 50% of French peasants in 1500 were literate but also noted that those peasants were reading novels far too complex for most (nearly all?) modern-day college professors. Quality of literacy decreased from 1500 among peasants but there was an ongoing explosion of creativity by engineers and scientists, poets and novelists, musicians and painters, and so on. But... He also claimed that the last burst of high-level creativity in the West (as of 2000 or so) came in the generation active around 1900. This generation included Einstein and Planck—physics, Camillo Golgi and Ramon y Cajal—pioneers in neurobiology, Johannes Brahms and Antonin Dvorak—musical composers, Joseph Conrad and Leo Tolstoy—authors of fiction, Otto von Bismarck and Peter Stolypin—political leaders and serious men of serious accomplishments.

Barzun's book might have been the high-point for an entire category of books by morally and intellectually serious historians such as Jose Ortega y Gasset, Oswald Spengler, and others who analyzed the political and literary and cultural signs of some sort of decay in intellect and in forms of human order in the West over recent centuries.

More recently, intelligence researchers led by Michael Woodley of Menie have found ways to estimate IQs over time by proxy measurements. For example, there is a high correlation between IQ and reflex speed; beginning in the early 1800s, the second of those attributes has been measured accurately in increasingly large test-populations for certain populations in Europe and some other parts of the world.

In *The Genius Famine* [21], Edward Dutton and Bruce G Charlton wrote about the nature of geniuses—high IQ plus a personality verging on psychotic. On the other hand, Michelangelo as portrayed in the highly-regarded historical novel, *The Agony and the Ecstasy* [129] was self-sacrificing toward family and friends but learned how to push human beings away when he needed time and space for accomplishing some great work of sculpture or painting or architecture or military engineering. Pope Julius, and others I believe, accused him of having a *terribilita*: “An effect or expression of powerful will and immense angry force (as in the work of Michelangelo).” (From *Terribilita* at <https://www.merriam-webster.com/dictionary/terribilita>.)

In any case, these human beings of very high intelligence and autistic characteristics—whether those personality traits be inherent or self-trained habits—are becoming increasingly rare, especially in the United States which has academic results at or nearly at the bottom of developed nations for all levels of academic talent; the American results are particularly bad for highly talented students and many of those students, including me, go on to frustrating lives of—often—low achievement. Genius can’t be created in someone not born to it, but it can be destroyed in those born to it by bad environments such as American schools or American culture in general.

While its true that the good students aren’t necessarily the creative geniuses, even when they have extremely high IQs, it is true more often than these authors think that creative scientists are surprisingly people-oriented and also surprisingly as diligent as those who are the “prize pupils” by way of diligence and hard work and an IQ at least reasonably high, but with few signs of creativity. Take modern physics. We can see Dirac and others who are “on the autistic spectrum,” but we can also see the highly-sociable and non-conformist Richard Feynman as well as conformists—right down to their well-tailored suits—Murray Gell-Mann and Julian Schwinger. A very important corrective can be made to the portrayal of Albert Einstein in *The Genius Famine* [21], who was quite talented in languages and did

well in school. Corrected facts and a better understanding can be found in this *New York Times* article from 1984, *EINSTEIN REVEALED AS BRILLIANT IN YOUTH* found at <https://www.nytimes.com/1984/02/14/science/einstein-revealed-as-brilliant-in-youth.html>.

High-level geniuses seem, according to histories and biographies I've read, to be more complex than the models used in *The Genius Famine* [21] or the next book to be discussed. At the same time, it supports the general viewpoint in those books that the world doesn't much appreciate or support geniuses if even highly sociable geniuses have to develop 'autistic-like' strategies for getting their work done.

In *At Our Wits' End: Why We're Becoming Less Intelligent* [105] by Edward Dutton & Michael Woodley of Menie, the authors write about the disappearance of geniuses and about the more general background to a developing problem with dramatic drops in average IQ in the West since the Industrial Age began, circa 1800. IQ measurement began in earnest in the 20th century, but there are physiological attributes—such as reflex speed—which correlate well with IQ and were measured from the beginning of the Industrial Age by men with skills in physiology and physics and instrument-making. In addition, a simple graph in *At Our Wits' End: Why We're Becoming Less Intelligent* [105] showing significant innovations in science and engineering by year (sometimes to solve existing problems and sometimes as a result of exploration of this world—and drawn from a standard 'timeline' history of modern science and technology) indicates that such innovations peaked in the West around 1850.

The two sets of analyses, those of Barzun and similar 'literary' thinkers and those of Woodley and similar 'quantitative thinkers, agree to a frightening extent: the West is in deep trouble. It's the sort of deep trouble which will lead to a large decrease in population over the next few generations. This might well start at any time. Expect violence and disrupted economic systems and all that comes from those sorts of disorder, including famines and epidemics and many men and women leaving no descendants. Barzun spoke of the West recovering from this sort of a situation before and guessed that, if we recover at all, it will come after—perhaps—a century of suffering and will start with some young men who discover some long-abandoned library and are fascinated by those works which are demanding—think of the so-called Renaissance which was really a revival of and end to the Medieval period and a beginning of the Modern Era. (Unfortunately, those particular young men mistakenly thought the horrible years behind them to have been

typical of the entire Medieval Era and didn't know only a century separated them from the High Middle Age, an age of prosperity and learning and high art.)

Historians, economic and other types, have discussed these sorts of situations before. In *A Distant Mirror* [135], Barbara Tuchman gives a good description of the problems during the century of troubles following the High Middle Age and, in *Farewell to Alms* [22], Gregory Clark presents graphs and economic discussions of cycles in civilizational capabilities of the West from the Middle Ages up to the Industrial Age and beyond. The general scheme of those historians, complementary to that of Barzun and Woodley of Menie, is to think in terms of prosperity leading to population growth, disproportionately great among those with lesser capabilities, putting stress on an economy and causing a great loss of population, a "Darwinian cleansing," which opens up opportunities to those in who are laborers and craftsmen and merchants.

If we Christians wish to live up to our self-righteous claims to be the servants of God, we must start working towards some better way of handling our prosperity and our losses of prosperity, some way which avoids the loss of genetic quality during periods of increasing prosperity while honoring the sacredness of each human being as an adopted child of the God of Jesus Christ. We need to recognize that this Western Civilization which has been destroyed, largely by our drop in intelligence, was a substantial part of the communal Body of Christ—to which we have a great duty, to say the least.

I discussed these matters from a slightly different angle and also provided links to prior writings on the general topic in Chapter 696, *Here Be Dragons*.

## 341 What is a Person?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2612>. It was finished and uploaded on 2019/03/27.]

There is something describable by the term ‘human nature’ and something else describable by the term ‘human personhood’. We’ve confused the two greatly in our modern world, so intellectually challenged in nearly all fields of thought but science and technology and so morally challenged in all fields including science and technology.

To orthodox Trinitarian Christians, Roman Catholic and Russian Orthodox and Lutherans and others, it is the most fundamental truth of all truths that God is three Persons, Father and Son and Holy Spirit, in One God. God is three Persons in One divine Being, one divine Nature.

‘Human personhood’ as I understand it is a peculiar set of relationships, first of all with God or at least with God’s Creation, second of all with other individual creatures in that Creation; these relationships are the sort which can make a human being a friend of God, capable of sharing His life. ‘Human nature’ as I understand it is our basic, thing-like human animal beings, in themselves noble enough that they are capable of conceiving of moral truths and other sorts of truth, divine being and maybe divine Person-hood. To avoid confusion, remember that human nature can refer to the characteristics of those bipedal, beer-brewing animals which belong to a certain branch of the family of *Hominidae*—see the side-bar at [https://en.wikipedia.org/wiki/Homo\\_sapiens](https://en.wikipedia.org/wiki/Homo_sapiens), or it can refer to a specific particular member of `<em>homo sapiens</em>`.

So this much we Christians know:

- The Father is a Person.
- The Son is a Person.

- The Holy Spirit is a Person.
- Father, Son, and Holy Spirit are one God, one divine Nature.

and,

- Each individual human being is a human person only as an image of God, by way of God's offer of friendship and that individual's acceptance of that offer.
- Each individual human being is inherently, by birth, a human animal.

We should be careful in assuming we mortal human beings are persons and generous in speaking of efforts by our own selves and by others to accept God's offer of friendship. We should look for signs of the development of that relationship between God and all those we care about, especially those for whom we have some responsibility.

This is the way in which person was defined in the 1913 edition of Webster's dictionary[140], along with an example of (mis-)use by John Locke—a man who, in my opinion, gifted us with a lot of bad understandings of man as an individual and as a community:

**person** 3. A living, self-conscious being, as distinct from an animal or a thing; a moral agent; a human being; a man, woman, or child. [1913 Webster]

Consider what person stands for; which, I think, is a thinking, intelligent being, that has reason and reflection. –Locke. [1913 Webster]

Good try, I would think, but meaningless more than wrong. Or “not even wrong” as some would say. Or even, “It doesn't fly in the modern atmosphere.” But one criticism: our self-consciousness is more often than not distorted rather than true, leading us—for example—to justify what our body was already doing as being the result of an act-of-will. This is why I've downgraded will in my anthropological thinking and completely thrown out 'free-will'. We have the inclinations of a human animal, including the inclination to explore the world and think about it and to project our own selves into possible futures. We can consciously form habits of good behavior. Our wills are constrained by our human animal nature and our minds

work best when working toward the future. In person-hood, however defective and incomplete during our mortal life, we at least see and feel hints of a greater unity, a perfection and completeness possible only to those more fully in communion with God than is possible in our mortal lives.

Too many Christians talk and act as if this sort of situation, where traditional understandings don't work, indicates problems only on the side of the modern world and its thinkers. Too many other Christians and far too many non-Christians talk and act as if this sort of situation, where traditional understandings don't work, indicates those traditions have no validity whatsoever and need to be jettisoned in favor of a non-Christian or anti-Christian worldview.

Words, their meanings and their usages, seem to develop into customs—something which meets some combination of need and various desires. The word 'person' was taken over by well-meaning human thinkers and actors and feelers, such as pro-life activists who needed some way of expressing their moral intuitions about the value of human life. The problem is: rattlesnakes and human beings are both mortal creatures which arose from the dust of the earth, so to speak.

There is much about human animals to make us unique in the animal kingdom—whether it be the case that the differences are qualitative in new attributes or merely quantitative in attributes shared with other animal species. There is also the Christian revelation that human beings belong to God in a special way, by way of an offered adoption, an adoption made possible when the Son of God took on a human nature. He was one of us, yet He brought His divine Person-hood into union with a particular human being—Jesus of Nazareth. Since He was one of us and yet not a human person, we have another line of argument that we are not inherently persons—at least if we wish to protect the meaning of Person-hood when we think of Father and Son and Holy Spirit.

Still, as I wrote, if not inherently persons—we are unique in our totality and in, for example, the level of our abstract reasoning powers even if chimpanzees possess some of those powers.

To summarize:

We become Person-like by responding properly to God or, at least, God's Creation. We become human persons by forming good, loving relationships with the Triune God. We become friends with Him. We learn how to share His Life, though He Is

and we will be mortal creatures sharing divinity and sustained by the Almighty for time without end.

Our person-hood and our life after death doesn't come because we possess some immaterial soul which is inherently part of each of 'us'. Rather is it the case that we're born as human animals and ascend to a higher spiritual state by way of accepting God's offer of friendship.

## Part VII

# The Narrative We Know as a World

## 342 Introduction: The Narrative We Know as a World

In this part, I've collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in ain of Sand* at <http://loydf.wordpress.com/>, I deal the narrative level of this universe, a level at which God's purposes are manifest and the universe becomes a world, unified and coherent and complete.

## 343 Sleepwalking Into an American Empire

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=42>. It was finished and uploaded on 2006/10/01.]

I know just enough about history and economics to be dangerous and what I know leads me to the dangerous thought that a sufficiently large political entity with a centralized government will tend strongly to evolve into an empire, no matter its pretenses to being a republic. It may have initial periods of freedom, but the power and wealth at the centers will be too much a prize for ambitious souls, whether they be virtuous pagans or toads. If no Caesar or Genghis Khan shows up, the prize will still draw the attention of those smaller, toad-like men who will forge a political machine. In either case, the sinister version of the invisible hand of Adam Smith will be moving and it will be organizing the efforts of some sort of ambitious men to the purpose of controlling that power and wealth and further concentrating it.

As is my wont, I'll digress (seemingly) to point out a way in which the United States in post-Lincoln era is similar to the late Roman Republic:

Large-scale wars and long periods of preparatory periods for war, along with the economic advantages of victory, perverted the economy into a highly liquid form, creating great wealth of a certain, morally destructive sort. Agricultural land and other productive assets were turned into commodities to be bought and sold by speculators. Human beings became commodities not much later than the farm-land. (I actually believe we began the process of becoming an empire with the Louisiana Purchase and the rarely-told betrayal of the American Indians which was

part of that Purchase. But that's too complex a story for this blog entry.)

Some say there are more chattel slaves in the world than there ever were, though it's true that the vast majority for now are held in Islamic countries. But we in the West seem well-advanced in our efforts to turn the defenseless into commodities, even to the point where we are harvesting cells and organs from embryos bred for that purpose. More broadly, we value comfort and presumptive security to an unhealthy extent, ignoring the warnings of Benjamin Franklin and others that such attitudes will lose us our freedom. As events are working out, those who die soon will probably die with some substantial freedom of a formal sort. Beyond that short time-frame, the freedom—even in the most formalistic sense—of the average American citizen is pretty much lost, absent a courageous choice I mention later. But most Americans will be little concerned with a loss of their freedom. They will be much more concerned with loss of luxury goods, and we have guaranteed that loss—for most Americans – by selling off our productive capacity to gain spending cash in the short-term.

In fact, there is a strong connection between the conversion of productive assets into commodities and the conversion of human beings into commodities. Human beings are not autonomous agents who float freely between different ways of living and different ways of making a living. Nor is farm-land simply two feet of good soil in a certain location. It is literally the ground upon which particular families will form specific ways of life and will unite to form larger communities, political communities and communities of worship. When farm-land becomes a commodity, so do specific ways of life. In general, when productive assets become commodities, stable ways of life are destroyed. Moral structures are destroyed. And those defenders of corporate capitalism who claim to be moral conservatives will wonder why people with shattered families and communities do not adjust to being well-behaved hotel maintenance workers or competent nuclear engineers or whatever. Those defenders of corporate capitalism who claim to be moral conservatives seem to miss the fact that human beings do not readily take to being treated as commodity items. And the essence of corporate capitalism is the conversion of many aspects of human life into commodities.

A population of farmers who lose their land to speculators will not be magically transformed into a mobile force of generic workers. They will be a population of human beings no longer inhabiting the environments in which

they were formed, for which they were formed. They will be so many Antaeuses separated from the ground which gives them their strength. Their children will tend to be ill-disciplined and socially maladjusted. Even the adults will be demoralized creatures who will seem to have lost their moral focus, their social habits, even their ability to function well in practical endeavors. They will be melting down into a proletariat mass just as the Roman plebeians did when they lost their farms and their shops to the speculators and industrialists of their days.

We have no excuse for not seeing these terrible possibilities. A knowledge of ancient history is not necessary for this insight. We saw the destruction of an already damaged people when large numbers of Southern Blacks left their impoverished but morally structured communities in Alabama and Mississippi. They streamed north to become commodities of a sort in Detroit and Philadelphia. They left the outer regions of Hell to enter the fires of the depths of Hell in the inner-city ghettos. Middle-class youth from the nicest suburbs are taking to the depraved and exploitive culture of the inner-cities with an ease that should frighten us. Have they skipped many of the stages of destruction to move right to the state of illiterate and morally disordered barbarism? I fear so.

A liquid economy and a powerful government will draw ambitious men towards that government where they, and the political machines they form, will tax heavily and build up welfare systems, including programs such as Social Security. They will tend strongly to make the disenfranchised masses dependent upon the central government. Our relationships of dependency form our true loyalties. Power-seekers act as if they know this, but we've collaborated with them in making us dependent upon central powers. It's remarkable that Christians supposedly conversant with the letters of St. Paul could have so willingly and enthusiastically made themselves and their children dependents and beneficiaries of the principalities and powers of this world. It's remarkable that followers of a God who accepted crucifixion for their sake could so easily sell their souls and their children's souls to escape the ordinary difficulties of the world, however harsh those difficulties sometimes are.

A powerful government with lots of liquid wealth to tax will also build large armies and navies. At that point, an empire is well advanced in its formation, though the actual process is complex and very few of the servants of the embryonic empire will even realize they are such. They may even imagine themselves to be defenders of traditional values or freedom or

something else they don't understand.

Soon, we Americans will face the choice Hannah Arendt predicted for us several decades ago, even before we began selling our children's futures to the up and coming Asian countries: we can sink into poverty or we can complete our evolution into an empire and use our military power to steal what we need to maintain our living standards. Then again we could accept an honorable poverty and begin the difficult and demanding task of building this country into one we could proudly leave to our children and grandchildren. I'm not betting we'll have the courage or integrity to make this last choice. I'm not even sure our current political systems would allow us such a choice.

# 344 More on Empires: We Americans Are Not a Wealthy People

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=44>. It was finished and uploaded on 2006/10/20.]

In my first posting on the American Empire which is taking a somewhat more definite shape, I noted the relationship between liquid wealth and the growth of central powers. Those central powers, in the case of the United States—an unholy alliance of politicians and corporate capitalists, will see liquid wealth as so much booty to control. Morally, they are cowardly versions of Genghis Khan, gaining control by destroying true economies and stripping future generations of their productive capabilities.

There are two reasons for doing this. If wealth can be made liquid, that is, transformed into cash and stocks, then the looters – investors and politicians alike—can claim to have increased wealth and then can take their cut. In fact, it is not likely wealth has been increased, though a certain (and unknowable) amount of liquidity can help local economies that need to trade with each other to meet true human needs.

The frenzies on Wall Street and in the corporate suites to cash in as soon as possible make an interesting counterpoint to our country's inability to create enough jobs to cover even the growth in the native population let alone all the immigrants coming to help the plutocrats by dropping wages. It is interesting how well men will pay themselves for selling this country's productive capacity, its economic future, to countries run and inhabited by men with more energy and intelligence and foresight than Americans have.

This dismantling of an economy by speculators is perhaps inevitable as

soon as the citizens of a country agree to a cash-based, speculative economy. And we should always remember how politicians feed the frenzy of the markets. Those in positions of public trust are also stealing from the future generations of this country to build up a cash economy. How else will they get the taxes to increase their own power and to create classes of dependents? How else will they build up welfare systems and systems of public works? How else will they build great armies and navies to project their wills throughout the world?

And it might well be the case that the great armies and navies of the United States will survive as the general population begins to feel the effect of having been dumbed down and de-skilled, of having the productive capacity of this country sold to companies in Shanghai and Tokyo and Seoul. Those armies and navies, and the politicians who control them, will have to learn the skills of any imperial military and government that wishes to survive: having grown by dissipating the economic strength of their core region, they will have to learn how to steal what they need to maintain their power and their personal life-styles.

## 345 Writing Serious Books During an Age of Illiteracy

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, found at <http://http://loyd.wordpress.com/?p=7>. It was finished and uploaded on 2006/11/22.]

Back in the year of our Lord 2000, Jacques Barzun published *From Dawn to Decadence: 1500 to the Present* [9] which tells the story of those centuries in terms of a steady drop in literacy levels over these past 500 years. True it is that some regions of the world have seen increases in the percentage of human beings able to read and somewhat understand advertising and political slogans. This is not literacy. This sort of low-level reading-skill exists for the convenience of corporate advertisers, politicians as dumbed-down as the electorate, and—of course—that portion of the electorate which values the illusions of security which sometimes come to those who give up their freedom.

Ultimately, those exploiting and those exploited have been one in the United States. There are signs that we are splitting into more rigidly defined classes but the exact nature and membership of these classes is not yet settled. In a word, we are becoming the sort of rich vs. poor society we imagined we could never become. For now, those classes are defined by the growing divide between wealthy and poor families, which divide is ordinarily masked by the use of individualistic statistics. High-earning women tend to marry men who earn still higher incomes.

Unlike the situation in European societies before the great drive for equality, the wealthy and powerful classes of this end-times for liberal democracy and corporate capitalism are as illiterate as the slum-dwellers. Equality meant first that the lower classes stopped aspiring to middle-class virtues and the members of the middle classes no longer work so that their

children or grand-children can be artists or writers or scholars—as was true of that lawyer named John Adams.

According to Barzun, French peasants in the early modern period read novels which are too difficult for modern readers who are considered to have high skills of literacy. The educated and wealthy classes in the West chose not to proselytize higher culture and then they chose to drop down to trash culture, not the healthy and vulgar culture of peasant peoples but trash culture. The literati of Western Civilization at the beginning of the third millennium of the Christian Era are incapable of reading any book which requires a serious amount of discipline or knowledge. Despite the airs they put on, they are ignorant of literature and lack the skills of reading difficult books just as much as they are ignorant of science and mathematics and philosophy and lack the skills of reading any of the more substantial works of science and mathematics and philosophy.

Our literary people delude themselves with their calls to straightforward writing as if Hemingway were the only competent writer in history—actually, it's doubtful if Hemingway were the straightforward, simple writer he sometimes seems to be but that's beyond the scope of this chapter. We modern people call for plain writing, at the sixth-grade reading level or less, because we're not capable of reading Melville or Cervantes or Sterne, Plato or Augustine or Nietzsche. Our calls for plain prose are the calls of people with minds inadequately formed to read any richer prose, any prose which allows for deeper thought.

In the modern world where all men are equal, all men are equally ignorant and equally illiterate. We have a right to sit passively in front of electronic boxes and to be entertained by various products of corporations which wish to reach the greatest number of consumers, a goal inherently in conflict with any possibility of reaching the richer layers of human mind and soul of particularized human beings. We have a right to scan prose with little in the way of content, using even books to keep our monkey-eyes busy that our brains not begin to form in particular ways. There are no generic human beings, though a flexible and open-minded human being can admire many things which are human but not his in particular. But those who allow themselves to be degraded into pretenses of generic human beings make better targets for both centralized political powers and corporate economic powers. In terms of my discussion in *To See a World in a Grain of Sand* [41], they fail to become true human persons.

As Michael Polanyi tried to teach us, knowledge is personal – possessed

in a true form only by persons. Even technical knowledge becomes true knowledge only when it is personal. One of his examples, one he knew well, is the training of a surgeon. As I recall, he noted that the first look inside a human body after years of seeing color-coded organs in text-book pictures is shocking. He said that the medical student observing an operation or participating in an autopsy sees a jumble of similar colored organs just flopping over each other. Today, that situation might be different with all the computerized imagery which is available to anyone on the Internet and which is certainly used in high school and college courses touching upon anatomy. But it's still ultimately the same. Reality must be experienced directly, if only by our gazing eyes.

A more important example, which is common to all of us—if we were to simply think what we do in daily life—is:

When a student finds himself becoming a true surgeon, he no longer acts or thinks—during the operation—as if the scalpel were a tool he is holding. The scalpel has become an extension of his hand.

A book is an extension of the mind of an attentive reader—one reason to be careful of what you read. Your thinking processes are not tools of a supernatural mind which exists independently of those thoughts. Your mind is its thoughts. Moreover, you are your mind, including its thoughts, and you are your body including all that is labeled 'appendage' or 'peripheral'. This includes, in a qualified way, the physical tools you are accustomed to use, the clothes you wear, the furniture you sit in, and the recreational devices you use.

Though I have no intentions of drawing a detailed road-map in this context, this entire way of thinking leads to the realization that most modern people—certainly our self-proclaimed literary elite – are a people who are prisoners of their own minds. I imagine they think themselves amongst the great souls who escape Plato's cave with all its illusion, if only for a short while. In fact, they are imprisoned in that cave which is one constructed by human beings unwilling to deal with objective reality because it lies beyond their complete control. I'm not sure that's how Plato viewed matters but I'm not worried by that since I'm not—to my knowledge—in complete agreement with any human thinker. In any case, the cheap and trashy forms of imaginative fiction of our age—science fiction and elvish fantasy

and especially the sex- and species-bending forms of those genres—are truly ours. That is, they are magic—works appropriate for people who are bored or frustrated by the struggle to understand reality and to shape it in appropriately human ways; they rebel and retreat into magical attitudes. As I noted in *To See a World in a Grain of Sand* [41], scientists of recent decades have joined in this retreat into magical attitudes. Another description for this magical view held by modern people is: adolescent power fantasies.

And this provides an over-simplistic but indicative description for the worldview of many modern people, including the overwhelming majority of our cultural, political, social, and religious leaders: the world can be shaped by man and, in fact, we are duty-bound to do so.

The more traditional view, amongst Christians and Jews and pagans alike, is that man shapes the world in powerful but limited ways and most of those limitations are those imposed by the objective laws of God (or the gods) and nature. A healthy imagination is formed within those laws. This doesn't mean that a healthy imagination is formed rigidly, but it does mean that it is formed according to those moral purposes that pagans as well as Christians and Jews can see in the workings of nature, those purposes which run with the grain of the universe as the Mennonite theologian John Howard Yoder put it. We Christians have faith that Christ's life and death tell us otherwise inaccessible truths about that grain of the universe. In any case, a healthy imagination must conform itself to what can be known of the laws of nature and nature's Creator.

A false imagination can violate even the rules of its proper playground—what-could-be, but it is part and parcel of the modern imagination to violate what-actually-is. And the line is not always clearly drawn. For example, I would classify the sometimes silly fantasy of *One Hundred Years of Solitude* by Gabriel Garcia Marquez as a legitimate, in fact—great, exercise of the human imagination. On the other hand, the sex-bending and species-blurring fantasies of the science fiction vein and also the dungeons-and-dragons fantasies and nearly all Christian fantasies are exercises of unhealthy, non-humane imaginations.

And then there are the more typical books on the best-seller lists. They are simply barren of thought and imagination. The appropriate description would be: “Boring!”. Banal. Mindless. The sorts of books written by people who think the essence of reading is to pass eyes over a page of text offering no challenges or obstacles. Published American fiction books are ephemeral, lacking in meat or even hearty vegetables.

So, what will happen to someone who strives for better than that, for an author who prefers Melville and Cervantes and Sterne, Austen and Hawthorne and O'Connor, to the stuff which fills the new book shelves of our modern barns of books? I've read as much as two pages of some of the books by modern best-selling American authors—some best-selling authors from Europe and South America are still worth reading. For the most part, I've not found a reason to continue reading any of those books by American authors, including those who receive rave reviews from critics who claim to be inclined to literature. Any history of American literature will tell you ephemeral trash has always sold better than good books.

I confess that I've over-simplified a bit. The historical novels of Gore Vidal are well worth a read, as are the novels of Wallace Stegner and Wendell Berry, but those men are not of the current generation. Mark Helprin's *Winter's Tale* was a powerful work of the human moral imagination and most certainly the most recent truly creative and profound work of fiction I have read by an American, but that book seems to have faded into the dimness of history, or even some pre-historical Golden Age. Going back a little, there were a number of worthwhile mystery writers (though not my favorite read) and historical novelists. Some writers I would classify as middle-brow, such as Lloyd C. Douglas, produced some interesting books – *Magnificent Obsession* veers at times towards the status of an experimental novel and one far more interesting than those of Coover or Updike or Cheever.

Few American authors have made a living by writing works of fiction which have proven to be of interest to anyone more than a few years after publication of their last book. There are certainly no American authors publishing worthwhile books in the mainstream of the American publishing industry—unless you consider as mainstream those smaller publishers who put out the works of Wendell Berry and perhaps one or two others.

Yet, after fifteen years of failing to publish a novel—with honest agents and editors telling me Americans can't read demanding books – I still refuse to give up. And the situation is still worse than that. One older agent wrote me that he could remember when there were people in the American publishing industry with minds that were developed well-enough to read books of the sort I write, but he claimed to know not a single person at that time (mid-1990s) in the publishing industry who had a well-developed mind. And I did read one literary biography of Melville which claimed that middle-class magazines appreciated the greatness of *Moby Dick*, giving it good reviews.

Melville's career was—arguably—destroyed by the Manhattan literary elite and also by his publisher's decision to stick to an expensive edition of his works. A sturdy but cheaper edition might well have sold well since insurance agents, retailers, undertakers, and metal-workers were apparently more willing, and better able, to deal with the ambiguities and complexities of *Moby Dick* than the literary elite were.

Finally, with the help of Stanley Hauerwas of Duke Divinity School and the open-minded generosity of the folks at the publishing firm of *Wipf & Stock*, I was in print with a book on theology and empirical knowledge titled: *To See a World in a Grain of Sand* [41]. I fear that book will prove too difficult for most modern theologians, philosophers, and scientists to read because of the decay of the imagination in modern man. When modern minds are seemingly well-formed at all, it is usually a rigid formation to the limited and defective structures of text-books – secondary works and not primary works of the human mind and imagination. Creative thinkers, such as Nietzsche, can be appreciated after a generation or more of plodding scholarly study. I fear that such efforts will tend to distort any true creativity, deforming it so that it becomes amenable to the mental exercises of those who think reality is constructed the way a toy-truck might be constructed from an erector set.

As might be guessed by those who struggled through to this point, I have no intention of cheapening or distorting what I wish to say in order to make it possible for the small minds of our literary elite and academics to handle. This is a matter of principle, but also a practical matter of politics and economics and life-style. For all the self-righteousness of the literary left about our current political situation, they are amongst the criminals who put us in this situation which they claim to despise at times, and they are also their own victims. I'll give merely a hint of what I mean:

Anyone who seriously thinks of either George Bush or Rush Limbaugh as a conservative knows little of deep-politics, of political philosophy if you will. They are a people adapted to an age and country where the average reading level of the newspapers is said to be fourth-grade and I would propose that the literary and popular novels of our age and country are no better. They are a people adapted to a utilitarian politics of looting by way of legal government programs and not to a politics of freedom or a politics of principle.

If you dumb people down by teaching them to read adolescent literature, don't be surprised if they think at that same level when it comes to political and moral issues. Don't be surprised if the authors and editors and publishers of those dumbed-down books settle in at that same level of thought.

## 346 Nurturing Evil

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=9>. It was finished and uploaded on 2006/11/30.]

Some Christians might have given this essay a title like: *Inviting Satan Into Your Soul*. I believe Satan to be a way of speaking literalized into an excuse for those without the courage to see the human face of modern evil. And, so, I speak of a nightmarish perception of that human face, kind and gentle, bearing the nicest of smiles. In the modern world, good under formation is often far uglier than that face of kinder and gentler evil. We modern human beings, Christians and pagans alike, can deal with that pleasant face of war-criminal presidents or Nazi bureaucrats but we would just as soon obliterate those uglier faces, perhaps the more so if we suspect that Jesus bears those uglier faces, distorted by genetic defect or some other suffering in this world which we consider a botched creation.

And what has this discussion of evil to do with literature? Everything. Somewhere, Dostoevsky said it is the job of authors in each generation to name (and describe) the Satan of their age. In my imaginative works, some technically classified as novels and some as philosophy or theology, I've named the Satan of the modern world: nice people organized into nation-states and corporations. That is, nice people who have ceded both their minds and their souls to various sorts of incorporated organizations, commercial and political. They do not think thoughts inconvenient to their role in these organizations and—ultimately—that means they do not develop any possibilities for deeper moral integrity. In fact, ultimately—as Hannah Arendt pointed out in her last work, *The Life of the Mind* [5]—it means they don't think.

It's hard to write meaningful works of literature which can appeal to such a people just because our major form of literature in this age remains

the novel and that is a work of moral exploration. A people who have ceded their minds and souls to that unholy alliance of nation-state and corporate capitalism are not a people capable of exploring their own moral natures. In fact, they will shy away as if they were vampires confronted by the rising sun.

True life scares the morally decrepit as health can sometimes scare sick people (see Thomas Mann's *Magic Mountain* for a mythological exploration of this theme). To live is to live in peace, to live truly is to live in the Peace of Christ, And those prospects frighten us modern human beings. Even to be a virtuous pagan requires a reorganization of the soul which would cause us to change our priorities and, perhaps most painfully, to become more active in our thinking, including our moral analysis and decision-making.

A true novel deals with exactly the issues which middle-class people have avoided since 1900 or so. I don't know what is the underlying cause, whether there was true willfulness involved or simply the laziness of human beings descended from creatures who needed to seek some rest from the difficult efforts to survive and to successfully reproduce. In any case, I have accepted—in my various writings – the claim by Hannah Arendt that most of the evil in the modern world has been executed by nice middle-class human beings who simply don't think. They are like Captain Ahab, the captain in *Moby Dick* who claimed to be sane in his means, it was his ends which were mad. Of high capability in practical matters, insane in moral matters. After all, the morality of concrete creatures living in a world which is a story is the setting of purposes, of ends, of goals. Practical intelligence is still important as a way of helping us reach those goals, but practical intelligence by itself leads to a sort of madness which can be seen in *Moby Dick*, most especially in the horrible scene of carnage after some whaling ships discover a nursing ground of whales.

As a side-issue which I'll not explore in depths, I'll note that I do have a serious problem with that single, highly restricted form of novel which might be considered most conventional. It is best adapted to the exploration of the insides of the European or American bourgeoisie, a type of human being inhabiting a society structured to the needs of industrial production. There is much to say about the historical development and rapid rise of the bourgeoisie but I'll stick to my promise and avoid digression.

There are greater opportunities to discuss moral issues in the more loosely formed works of fiction, such as *Moby Dick*, *Tristram Shandy*, *Don Quixote*, or some modern novels such as *The Stone Raft* by Jose Saramago.

To stay within the form of the novel as so well, and somewhat rigidly, developed in the West during the nineteenth and twentieth centuries is to stay within the possibilities of the morality proper to the middle-class during the early stages of industrial capitalism—more broadly within the early and liberal stages of modern fascism, but that’s another discussion I’ve touched on lightly in some works including my only published book to-date: *To See a World in a Grain of Sand* [41].

I’ll move on to discuss our current situation which is that of a fairly advanced state of moral disintegration. We imagine ourselves to be autonomous agents, a fiction accepted as such or as a truth by various economic and political thinkers depending upon the quality of their minds. I’m not convinced it was even useful, or morally desirable as a fiction, but I’ll let that go for now. The point is that we think we somehow stand outside the world we inhabit, judging which desires we should nurture or even create in ourselves. After making our judgments by way of some implausible attribute we label as ‘free-will’, we can choose a bundle of worldly goods that will best satisfy our chosen and innate desires.

This is a strange view of human beings, a stranger view when we realize that we consider ourselves, products of such a strange way of thinking and behaving, to be the best human beings in history—at least as a collective called ‘Americans’. The ‘Americanist heresy’ in Catholic terms, is the belief that Americans as a group are something uniquely good in history. It held in the United States even when most Americans were aware of their sinful natures as individuals but now it has infected the minds of most Americans, and probably most in the West, so that we now have lost sight of our inadequacies as individuals. Our idea of tragedy is not a disaster which comes from an effort to live up to, or directly violate, an objectively valid law. Our idea of tragedy is the failure at times to satisfy our desires. Our idea of comedy is not a direct recognition of the humor of the human condition through pain and suffering as well as through good times. Our idea of comedy is cheap laughs.

We are morally unstructured. We could not be otherwise because we believe that we make laws ourselves, limited only by our subjective feelings, our squeamishness. We can make laws because we are autonomous agents, constrained only by our own decisions as to the desires we will try to satisfy and our decisions as to the prices we are willing to pay to satisfy those desires. Without objectively valid laws, there are no purposes and thus no true narratives, no novels, and certainly no epic poems.

We are not a people capable of even reading *Don Quixote*, let alone producing a modern answer to that great work of art, a work which could explore true moral structures, in our insides and in the world, through a seemingly undisciplined romp through early modern Spain. We are not a people capable of reading Captain Ahab's confession that he was competent in practical matters and insane in moral matters because we can't understand how moral matters could lie beyond and outside practical matters. A cowardly form of prudence is our only virtue.

No longer practiced in the arts of forming and exploring purposes, we have become slaves of our own practical genius (at a time when it has decayed into a state of senility) and our moral views are formed by what is possible. We no longer believe, or can even state, that the greatest art of a mortal creature is the living of a good life directed towards a good death. We will corrupt ourselves, even scavenging parts from unborn babies, in order to extend our purpose-less lives for a few short years.

It is very hard to even open people's minds to the greater possibilities of moral nobility because one of our greatest tools for moral exploration, the novel, lies beyond the understanding of all but a few readers.

# 347 Principalities, Powers, Invisible Hands, and the Modern Author

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=10>. It was finished and uploaded on 2006/12/04.]

We live in a weird world. And one very difficult for a writer to deal with if he has ambitions to speak truly about the story I call the world. We modern human beings literalize metaphorical and even mathematical ways of speaking while we're incapable of exercising the imagination that would allow the formation and understanding of new metaphors. For now, mathematicians and other scientists seem to be able to exercise their peculiar, and very important imaginations, though some popular-level books written even by serious scientists would lead me to fear that scientists are just the other side of the same coin on which we find the Biblical Literalists and so-called Creation Scientists. We might be seeing the end of a major phase of creative scientific thinking as literalization continues to strangle the modern imagination.

As far as I can see, an author can speak about demons and angels and ghosts, gods for that matter, and risk being taken as a believer in those entities. Or that author can be openly skeptical so that he loses many valuable ways of speaking about complex events and about the moral meanings which inhere in even the most geophysical of events. I'm assuming in my fictional and non-fictional writings that this dilemma is not simply a passing phase but is rather a sign that God is forcing us to grow up in some important ways. We are to leave our pagan ways behind, or else we risk falling back into a world dimly lit by pagan thought. Even Christian-

ity would be re-paganized to a dangerous extent—though Christianity has never been fully de-paganized.

In some of my novels, especially *A Man for Every Purpose* – available for free download at <http://loydfueston.com/downloads/aman.pdf>, I try to point out the sheer reasonableness of our environments and the magic which comes in as a man tries to make sense of it, seeing first a universe and then a world if he's able to bring a sense of moral order to that universe. The true magic of literature lies in those processes of seeing a universe and then trying to bring a sense of moral order to the universe. This is no less true of philosophy, science, mathematics, and any theology which tries to understand God through His Creation.

What has this to do with Principalities, Powers, and Invisible Hands. Simple. They are ways of speaking, as I noted in *To See a World in a Grain of Sand* [41] with respect to the Invisible Hand of Adam Smith. Some modern scholars have even claimed that nearly all (maybe all?) of St. Paul's references to Principalities and Powers are references to pseudo-entities such as the invisible hand, which is really a way of speaking about the way that a society informally organizes itself when the members of that society share a system of moral beliefs and behaviors with that particular mix of moral order and disorder. (I'll speak only to the order in this sort of a mixture.)

In my first published book, *To See a World in a Grain of Sand* [41], I discussed the true nature of the Invisible Hand and also emphasized that we see invisible-hand effects not only because of the moral order but also because that moral order is shared by a high percentage of the members of that society. It's quite possible that the United States was doomed, that our moral order would have decayed, even if we hadn't so many home-grown exploiters destroying moral order for fun and profit. We don't share a moral order across all regions and across all ethnic groups and across all levels of society. This is not to imply that any particular region or ethnic group or level of society has a greater degree of moral order; it is only to say that we don't share the same view of moral order.

As I discussed in *To See a World in a Grain of Sand* [41] and in some of my entries on my two blogs, *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/> and *Acts of Being* at <http://loydfueston.com/>, I have seen Satan in the genial faces of the modern middle-class, nice and empty of thoughts. There is still the problem of depicting the working of this Satan in the world. This Satan does not appear directly, a warrior of

evil, who confronts us face-to-face. In fact, this Satan does not appear at all in causes but in the effects of his invisible hand. This is to say that this saint is a pseudo-daemon in the same way that centrifugal force is a pseudo-force. There is no daemon (force) but only the appearance of a daemon (force) because of some effects. We feel centrifugal force as if there were really a force pushing us outward when we ride a merry-go-round—in fact, the inertial efforts of our bodies to continue moving in a straight line causes this illusion of an outward-pressing force. We think to perceive Satan, personalized evil in general, when we see the results of a particular social mammal species—man, as individuals interact in a way that is not morally structured in a proper way.

That's a mouthful but anyone who has even the most intuitive—but not superstitious—idea of Adam Smith's Invisible Hand or St. Paul's Principalities and Powers will understand the general concept. The problem seems to be that we have no good ways to speak of the evil, or other effects, that results when real-world entities chaotically interact and produce seemingly simple effects. In the cases that concern me now, we see morally ill-structured, unthinking human beings interacting and thinking themselves innocent of the results. Unthinking human beings do not foresee the evil possibilities in, say, the restructuring of human dependencies that comes with the adoption of something like the Social Security system in the United States. Soon enough, people are dependent upon the central powers and not upon families. When families begin to break up and, as an example of one specific effect, young people are disordered in their sexual behavior, we think that Satan must be behind it because we are nice people taking care of our legitimate needs and desires.

And the problem of a modern author is made more clear. How do we speak in such a way as to tie the large-scale evils of the modern age back to the unthinking actions of human beings acting as atoms in social collectives? We are willing to accept the good effects of our social collectives but we are blind to our responsibility in the evil effects our collective actions.

I've just about said as much as I wish to say in this blog-entry but I'll make a couple historical comments to help my readers understand what I'm saying.

Without giving many details, I'll claim that an important part of the process by which the Roman Plebeians were pauperized and made politically impotent was the construction of a large welfare system and the growth of a large body of civil servants that would be labeled 'social-workers' in the

modern world. The overall process was made possible by the destruction of the normal, flesh-and-blood dependent relationships of those Plebeians (ultimately of the Patrician families as well), and the construction of those welfare systems was made possible by a conversion of a stable economy into a highly liquid economy which could be exploited by financial speculators and politicians in the central government wishing to collect large taxes to fund both their welfare and military expenditures. (This should be sounding familiar at this point.)

Franz Jaggerstatter was a man executed by the German Army during World War II because he refused to serve in the Austrian Army, telling his judges that God would not approve of his fighting for an evil government, or words to that effect. Gordon Zahn, an American who taught at the University of Chicago, wrote a book about Jaggerstatter – *In Solitary Witness*. In that book, we learn that, following the Nazi take-over of Austria, Jaggerstatter dropped his involvement with fraternal and charitable movements because they had become fronts for the Nazi efforts to make people dependent upon them. He refused to participate in the sorts of charity which forged bonds of dependency between the Nazis and his fellow-citizens.

## 348 My Ends are Mad and Now I'm Also Stupid

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=51>. It was finished and uploaded on 2006/12/16.]

In *To See a World in a Grain of Sand* [41], I noted that Melville thought Emerson and Thoreau to be morally insane – Hawthorne and Henry James, Sr. agreed. Melville noted in one place that the morality of those Cambridge sages was a spiritualized materialism that masked a total lack of charity, a total lack of love of others. Captain Ahab was seemingly intended to be a more courageous and more consistent Emerson: “My means are sane, it is my ends which are mad.” So said the prosperous captain of the Pequod.

Melville feared that Emerson and Thoreau were typical Americans, perhaps a bit more advanced than the ordinary citizen, but not much different in their hearts. In simple words, Melville feared that the Americans of his time were highly competent in pragmatic, worldly matters but morally insane.

Since Melville’s time, the American situation has developed in a very strange direction—though one predicted in a general way by clear-headed thinkers who knew history, such as Hannah Arendt. We were like Ahab, or gave a good impression that we were. We were competent sailors, whalers who brought back shiploads of whale-oil to light the great houses in Newport and Boston that the genteel amongst us might continue their gradual decay from the King James Bible and *Pilgrim’s Progress* and Shakespeare—however Bowdlerized—to our current state where those with doctorates are generally upset and confused by a sentence with more than one subordinate clause or so much as a single comma outside of a list of the starting rotation of their favorite baseball team. True it was that the construction of

many of those houses in New England and New York was actually funded by similar practical skills in the capture and transportation and selling of human beings—to his credit, Lincoln knew this and he really wanted to be merciful to the Southern states out of simple justice. He knew the Southern states had simply lost in a game of musical chairs where all the participants were evil in some substantial way.

Both industries played a role in the formation of the American character. Melville knew that well. He worked in the whaling industry and was an opponent of the slave-trading industry, though also strongly opposed to imposing the end of slavery on the South by means of external force of a legal or military sort. So far as I can tell, he felt this would do little good for the freed slaves or for the moral character of Americans.

No one who has intelligently read *Moby Dick* could believe that it was a modern discovery that the whaling industry was an immoral operation. As the scene of slaughter in the great whale nursery shows, Melville knew that it was an industry in which prosperity was had by those who were ruthless and unscrupulous. Perhaps they had not nurtured such vices before they set sail but circumstances can tempt us into corruption and we have to have the proper sorts of habits and attitudes and beliefs—moral character—to resist temptations or at least enough prudence to avoid it.

The sheer cruelty and ultimate stupidity of a hunting industry which rewards those who exterminate entire family lines of a species, entire regional populations, and maybe the entire species, isn't a discovery of the modern environmental activists. Nor was the evil nature of slavery a discovery of the generation of Lincoln and Garrison. Some Southern leaders, as I remember matters, had tried to end the slave trade by a provision in the Constitution and New Englanders and perhaps others in the northeast states had helped to kill the possibility—money was still to be made in the capture and selling of human beings. Lincoln himself later suspected the sudden surge of New Englander and New Yorker support for abolition in the 1850s was due to the new economic needs of the New Englanders and New Yorkers. They'd invested huge amounts of money in the upper Midwest and were afraid they'd not get proper returns if the Southerners were to control passage on the Mississippi River. It wasn't that New Englanders and New Yorkers had suddenly discovered the humanity of the slaves of Southern slaves so much as they'd discovered the importance of barges on the Mississippi River.

In any case, it's hard to imagine better cases than the whaling and

slave-trading industries of practical intelligence and moral insanity. And we are talking about two major industries of 19th century New England and New York, two industries which provided a lot of the money to build up the fledgling industries of those regions becoming so prosperous. It also spotlights that the shortsightedness of American leaders who are currently kicking the debt cans down the road are true descendants of the Founding Fathers who kicked the slavery can down the road, knowing full well they were building up a large population of peoples who would be very difficult to assimilate into European-American society.

After deciding how to make their livings on purely utilitarian grounds – what can bring in a good return on a modest amount of capital and a large investment of labor?—those New Englanders and New Yorkers then started the strangest sorts of moralistic dances. When the slave-trading industry became very dangerous because the British Navy was hanging officers on slave-trading ships and imprisoning the men at the same time that the mines and industries of Minneapolis and Chicago promised better and safer returns, those citizens of the Northeast of the United States changed. Oh they changed. The people of Boston had not only sought jobs in the slave-trading industry, they'd also tarred and feathered William Lloyd Garrison more than once for his opposition to the slave trade. All of a sudden, those in the northeast states looked South to see the suckers who were holding the hot potato and saw them as being the most evil human beings the world had seen. So far as I can tell, the transition took only a few years—at most. Morally insane and also wretchedly shallow. And the true evil of the Southern slave-owners, in the eyes of New Englanders and New Yorkers, was the power they might have to prevent high rates of return on investments in the upper Midwest.

One of the marks of our practical intelligence and moral insanity is the tendency to first decide how to make our livings to secure our comfort and safety and then to start thinking in a moralistic manner about our chosen situation. This can be difficult when you chose to make your living by the brutal and large-scale slaughter of species of animals known to be vulnerable to extermination. It can be even more difficult when you chose to make your living by capturing human beings, transporting them across the ocean under miserable conditions, and then selling them as if they were cattle. But those New Englanders and New Yorkers had good teachers in these mysterious arts of justifying evil by way of feeling good about yourself, Emerson and Thoreau among others. And maybe Emerson and

Thoreau were simply children of their times, not creators but expositors of commonly-held feelings and ideas. And maybe they were abolitionists but that was a matter of sentimentality and not a matter of good moral reasoning upon true moral principles.

Well, not we've advanced to a new stage. Not only are we morally insane, we are also stupid when it comes to the practical arts of making things. All those factories built by whale-blood and human-blood are being turned into condos or art coops. Our stores are filled with a vast array of goods carrying the inscription: "Made in China." Our colleges are dropping the standards for graduation even in such modern subjects such as computer science. We depend upon the Indonesians and the Taiwanese to do the difficult work of design and manufacture for our electronics industries. Our novels, magazines, and newspapers are written at a sixth-grade level and good readers retreat to earlier times or else read the latest novels from Chile or Columbia or even oft-maligned Portugal. I could go on, but I've spoken on these matters elsewhere and so have many others.

A people long insane in moral matters and more recently rendered stupid will be incapable of seeing their own situation. There have been a few maverick thinkers, such as Paul Craig Roberts—the supply-side theorist from the Reagan administration, who have been warning us for a while that we were selling off (cheap) or otherwise wasting our productive capabilities. More recently, I read an editorial in the Springfield Republican in which an economic journalist wrote of his realization that the great results on Wall Street are due to the speculators liquidating our productive capabilities to provide short-term gains. In some of my writings, I've been pointing out that this liquidation of a large economy provides the conditions for the development of a central, imperial government. Though it's far from clear that our corporations have made profits in many a year—the ones officially in the red are simply those who were not able to sell off enough assets at discount to the Asian entrepreneurs. And the politicians have a major stake in such a system where the huge cash flows in the marketplaces provide the taxes which power the growth of the welfare and military systems that define an empire.

Morally insane and now stupid in the ways of the world. Except for those scoundrels who work on Wall Street or in those massive buildings in Washington, DC. They're morally insane and stupid in the ways of doing things that increase true wealth but they're very smart when it comes to seizing control of assets build up by prior generations and liquidating those

assets to fund their schemes.

## 349 Morality and the Modern Novel

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=12>. It was finished and uploaded on 2006/12/21.]

A novel is a means of exploring human thoughts, feelings, and actions as set in specific environments. There is no other justification for the novel in its standard modern form, though many books labeled as novels are no such thing. Reading novels is now no more than a habit of barbarians living in the midst of the rubble and not even understanding the conflict between the very existence of narratives and the disordered social, political, and economic activities of our modern lives. Narratives are the unfolding in time of some sort of order. The most interesting novels deal with struggles for order. This is true also of such narratives as the tales of the physical order which emerges in the form of galaxies, indicating some underlying truth about the narrative nature of this universe.

Even at his most tendentious, Tolstoy managed to stir up our interest in his characters. This is because Tolstoy understood one thing and he understood it well: in an unsettled world, moral integrity is always a matter of conversion where there is a conflict between inside and outside. Whether we speak of a conversion to a state of virtuous paganism, such as the one that was fostered in the Patrician youth of the Roman Republic, or a conversion to a God-centered state such as that which intensifies upon entry to a monastery, that conversion process is extended over time. But there may well be moments when the outside world relaxes its pressures and often, in the case of a novel, that is when the end should come.

An alert reader can disagree with all of Tolstoy's strange theories of history and with his unorthodox interpretation of Christianity, but it doesn't

matter so much because Tolstoy understood that one truth about the nature of moral integrity in an unsettled world. He understood, in too pessimistic a way, what Robert Louis Stevenson dealt with explicitly in *The Strange Case of Dr. Jekyll and Mr. Hyde*: by itself, underneath the best behaved of human beings lie deeply disordered parts.

What can we say about those modern middle-class people as described by Hannah Arendt in her analyses of the holocaust and other horrors of the modern world: nice and having no real moral integrity? She hit the nail on its ugly head when she said that Adolf Eichmann was a nice man who would have fit in quite well in an American suburb. Eichmann was the career bureaucrat who was in charge of rounding up the Jews and transporting them to the death-camps. He didn't hate Jews and did what he could to help them escape until the regulations were tightened up. Then. . . Well, he had his career to worry about and he had a strange sort of moral integrity in which obeying the laws of modern nation-states and the regulations of modern bureaucracies is so important as to justify work in support of truly evil actions.

Every nice middle-class person of the modern world knows that morality starts with paying your mortgage and your taxes. And there are children to educate that they too might have good careers. I've written elsewhere about this situation. For now, I'll only add that such a people can no longer recognize the reality of moral struggle. To admit that morality is a struggle and not a simple obedience of the law is to admit discomfort and potential disruption of a life of well-planned comfort and security. A true novel becomes a painful reminder that the modern middle-class live in a fragile oasis. And that oasis is nearly destroyed, though few there are who have eyes to see.

To his credit, Philip Jose Farmer in his otherwise over-rated *Riverworld* series (but I'm not an admirer of the sci-fi genre), played up the moral conflicts in the 'resurrected' Hermann Goering. Human life, despite the idiocies of the modern glorification of absolute evil, has to have some sort of moral order. Evil is not an alternative moral order but rather disorder of the sort which puts us on the path to non-existence.

And what about that strange character of history and *Riverworld*: Hermann Goering? He was a legitimate hero of World War I, a brave pilot of the Flying Circus commanded by the Red Baron made famous to Americans by Snoopy. Goering was in some serious sense a military man wishing to have good order in his life. And yet he found himself as one of the major

protagonists in a tale of horror and disorder. He collapsed into a state of drug-addiction and mental disease. He was heading towards a state of total disorder, that is, a collapse into non-existence. He was not happy with his work or his life but he seemingly had nothing in the way of moral gumption. So, he injected narcotics in his efforts to mask the conflicts he couldn't deal with.

People who are morally well-ordered, or at least wish to be, know the fear of non-existence. As a Christian, I would claim that worldly moral order by itself is only a temporary and inadequate resting-ground on the path towards non-existence. In any case, the novel's strong point is what some literary critics and scholars seek to deny. The novel is not a form of narrative oriented to exploring conflicts within some set scheme of moral in conflict with a hostile world. That is a tragic, or fatalistic, view that is in deep conflict with the Christian view that the price of redemption has been paid and salvation is available to those who would accept God's offer of friendship.

Fatalism is a part of many Christian heresies and is also part of the beliefs of various sect-like branches of Christianity. But Christian moral beliefs have no part of fatalism and thus making our way in the world is a matter of exploration and not a matter of following some sort of guide we can pull out of our pockets whenever we have to make a decision. Christians have rules to be sure, but even those rules aren't fully describable in terms of positive law or bureaucratic regulation. Christian rules help to make some sense of this messy world which is still being born; they do not help us to pretend to impose an unrealistic order upon that world. Christians, or others with the courage for moral exploration, consider it interesting to behold a novelistic display of the imperfect inner order of a man and the imperfect outer order of his environments or world, not in the way of passive entertainment but rather in the same way that we take a more concrete interest in the moral struggles of our parents and children and friends.

In fact, in the greatest of novels—even those concentrating upon external actions—the main struggle is between the inner and outer man. Can Lord Jim reconcile his feelings of being a brave and competent man with his actions the one time he was in a position—or so he'd thought at the time—to be a hero? Can Emma learn to see her actions in the light of the high moral standards she holds internally? Is Ishmael to die with the heroic and morally insane Ahab? Is he to share in the fears and death of the pagan

harpooners? Is he to join with the mates in less meaningful fears or perhaps a fearlessness founded upon ignorance of the humanly legitimate reasons for Ahab seeking death in defiance of what-is and the pagans accepting death in great fear? Ishmael's means of salvation seems to be one of the most profound jokes in all of literature for salvation of a sort comes by way of a coffin intended for the corpse of a barely reformed cannibal.

With this sort of overview, we can perhaps begin to understand a point raised by Lionel Trilling, one of the last of the morally sane liberals of the Modern Age. Professor Trilling noted that all great modern writers shared one feeling—dislike of the modern world. We can understand both that dislike and the dislike reciprocated by the middle-classes of the modern world—when they bother to read a worthwhile novel and find out how it attacks their delusions. Serious modern writers, even non-novelists, sense the disconnect between the assumptions of modern middle-class life and those of the vocation of a serious writer. The first disconnect is between a dream-world created to shelter the cowardly against real storms and the confused and multifarious world being explored by the honest writer, Christian or non-Christian, Marxist or Catholic traditionalist, wealthy writer of good-selling books or impoverished and unpublished scribbler.

Even those like Melville, or myself, who delude themselves into thinking the world will accept their criticisms, quickly find they've crossed some sort of a divide that separates them from people unwilling to consider life as a moral adventure of sorts. Oddly enough, Christian novelists, such as Flannery O'Connor, or those hoping to find a reason to accept Christianity, such as Hermann Melville, find themselves in the company of willfully perverse moral explorers such as the French Symbolists of the 1800s. Together, they look back across that divide upon people whose virtues are those necessary to secure their prosperity. When that need seemed to match up with Christian moral values, there was at least a possibility of some pretense of true morality. When the marketplace frenzies more recently reached a very high level, there is a need to encourage any or all activities that generate cash-flow.

Because of this need to keep the cash flowing, we've found ourselves in a very strange position: even those who have chosen to live in perverse ways, homosexuals first of all, demand the right to be nice middle-class human beings with all the benefits of prosperity. Mr. and Mr. Middle American. Wherever she is, Gertrude Stein must be laughing so hard as to hurt. Moral rebellion domesticated to the needs of American prosperity. Soon, S&M

parlors will be found in the best of shopping centers.

I guess that those nice, middle-class homosexuals must also be allergic to the moral explorations of true novels. If they read Andre Gidé, it must be in a strange mood analogical to the nostalgia that wannabee moral conservatives feel when they read Jane Austen. I don't know if the mass of respectable American homosexuals, married or not, have yet discovered that novelists are their enemies. They will be feeling the need to short-circuit this process of moral exploration because of what might be found. Like other nice middle-class Eichmanns, they will be pretending to read books pretending to be true novels, even pretending to be courageous and creative novels. And the novel will continue to decay into strange forms which are uninteresting to those with spiritual or moral courage—check the new novel shelves of your local barn of books.

I'll propose an answer to the question implied by Professor Trilling's observation that serious writers dislike the modern world. Serious writers are, pretty much by definition, sensitive to moral order no matter what their personal lives or sexual tastes might be. Some might be better labeled as miner's vultures rather than miner's canaries, but they're all sensitive to those poison gases given off by the presence of millions, perhaps billions, of Dr. Jekylls. Using Biblical imagery, we modern people are white-washed sepulchers, clean and bright on the outside and full of filth inside. Even those who pretend to be Christians have followed the revival-tent model of spiritual conversion: proclaim the Lord's name and you've already got your ticket to Heaven. You can then return immediately and blindly to enjoying a prosperous life.

But we're too nice to think of ourselves as morally gutless. We feel good about ourselves. We're exactly the people Hannah Arendt described when she spoke of all those nice middle-class people who actually did the work for Hitler and Stalin and even that lesser devil, Cecil Rhodes. We're nice on the outside and have no moral integrity, no moral order on the inside. As I've pointed out several times, and many of the things I say bear much repeating, Adam Smith feared that a prosperous commercial society would weaken its citizens until they would become exactly what Professor Arendt would see two centuries later: genial people with no moral guts.

And that leads to my current explanation of the decay of the modern novel: we modern people shy away from moral explorations the way a vampire shies away from the sun. Our human selves would not necessarily melt away under the light of self-examination, but our illusions and

self-righteousness would melt away and we would be as naked as Job. It's mystifying that so many claim to be Christians, even Biblical Christians, and yet fail to see the nakedness which is a part of being a creature.

To open our eyes and to see more truly would bring pain. We would learn the truth of the unique evil of Americans discussed by Solzhenitsyn in his introduction to the abridged version of *The Gulag Archipelago*: we commit fewer crimes than other powerful peoples but we walk away from those we do commit and immediately forget them, pronouncing ourselves to be pure. He was wrong but only in thinking it to be unique to Americans. It is unique to modern middle-class human beings. Our prosperity has made us into wretched, spineless creatures. We seduced ourselves into the delusion that we could be moral simply by adopting the virtues which are useful in sustaining that prosperity. And, thus, it's strange from a wider perspective but makes sense in the modern perspective that defiantly active homosexuals can be as virtuous as anyone else. After all, they can pay their mortgages and taxes, they can pursue their careers in a dedicated and professional manner. They can buy lots of goods. [Apparently, Solzhenitsyn's introduction is no longer published, at least not in American editions. Only the Soviets are evil in the latest version of history according to the American publishing industry, a branch of the propaganda ministry for Oceania. It's good that we're such a free, and well-trained, people that we don't even have to be told what to do by our masters. As we sit at our desks in publishing firms or local newspapers, as we teach in schools or write popular history books, we are mature enough to censor inconvenient truths from our own works.]

When the German middle-class found they could sustain their life of safety and comfort only by collaborating with the Nazis, they quickly accepted their situation. After all, serving Hitler didn't present any real conflict with the primary moral values of the modern middle-class life. They could still pursue success in their careers or their simpler jobs. They could pay their mortgages and their taxes. They could encourage their sons to go off to fight bravely in the German Army. They could dress up nicely and go to church on Sunday.

For fifteen years, I've been writing novels that explore various aspects of this moral confusion of modern human beings. Not a one of those novels has been published and now I can understand why. The modern advocates of 'do anything so long as you don't hurt anyone else' are really no different from the moralistic middle-class Christians who did so much damage to Melville's

literary career. They think to protect their delusions by pretending their beliefs and behaviors are beyond questioning. All moral problems have been solved – aren't we a prosperous people? We can just settle down to enjoy prosperity knowing we've earned it by hard-work and a deep-down goodness.

## 350 What is a Conservative?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=54>. It was finished and uploaded on 2006/12/29.]

This will be a short one and necessary only because there are so few who really care about ideas nowadays. We think in terms of policies, of immediate flows of cash and the resources which cash can buy in the modern world. And so it makes some limited sense in the context of our times that most people are called conservatives if they favor the policies of the liberals of yesterday.

Admittedly, many of them have the good intention of trying to return to a period when moral order seemed to be better-established. Few of them, including the professional commentators know enough (reliable) history to even realize, as one example, that the suburb which seemed a stronghold of moral order in the 1950s was invented as a desperate move to protect children and their mothers from the marketplaces of the industrial age. I tell this story in my first book, *To See a World in a Grain of Sand* [41]. I won't tell it again here. Marketplaces are necessary and good but we should not be living in them. When we do, those marketplaces will grow at the expense of the human institutions which are the foundation of morally well-structured societies. Extended families and local communities and communities of worship will be perverted into supports for the marketplaces.

The term 'conservative' means only one who conserves. It can be allied to the 'radical' cause of returning to the roots, of religious belief or moral traditions, or it can be allied to yesterday's liberalism. Most who call themselves conservatives are nothing more than old-fashioned liberals who want to crawl back up the slippery ramp. Then the next three generations can live through a replay of the 20th century. I hope we have better options than either staying at the bottom of the ramp or trying to crawl back up

that particular slope.

## 351 Literacy, Context, the Bible, and Modern News-media

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=18>. It was finished and uploaded on 2007/01/11.]

It takes sophisticated reading skills to properly deal with the Bible – Old Testament and New Testament alike. And it's important to deal with the Bible, even for non-Christians and non-Jews, because it's a very fundamental part of Western Civilization in all its aspects. Unfortunately, the Bible demands still higher reading skills than even complex novels such as *Moby Dick* or *The Life and Times of Tristram Shandy*. And few nowadays can read those novels even as a difficult task, let alone for pleasure.

For example, many modern readers and writers believe that a story should be told from one point-of-view. This isn't really a belief as much as it's a cover for our low-levels of reading and narrating skills. The man with one eye convinces himself that those with no eyes and those with two eyes are both freaks. In this case, the partial blindness is induced and nurtured by our upbringings and poor educations in a deteriorating culture.

In many of the psalms, the point-of-view switches from the psalmist to God to omniscient observer and then to whatever. In *Moby Dick*, the first-person point-of-view dominates. Ishmael is telling the story, but there are some weird shifts, such as the transition to what I call locally omniscient point-of-view during the night watches on the deck. The observer is not truly omniscient but he is able to hear the words of the mates and Captain Ahab as each is alone on deck.

To read the Bible properly requires high reading skills and a flexibility of mind which can be nurtured by those skills. In recent centuries, the Bible has typically been read with a certain inflexibility of mind that can also be

found in many evolutionary theorists, philosophers, and physicists.

Despite the primitive origin of certain parts of the Bible, it's a literary masterpiece which is complex beyond the writing skills of any human being. This is not to say that God wrote it or even dictated it. It's better to consider the bible to have been a conversation involving many authors and God. This isn't to say that any of those human beings necessarily spoke with God in the way of two human beings sitting on facing chairs. In line with my Thomistic form of existentialism, I would say that we hear God in a different way: we learn to both speak and listen with God. We hear God by participating in His act of speaking to us, so to speak.

The book of Genesis can only be read intelligently if you realize that it is itself a critical work, a meta-book if you will. The so-called Creation stories play games with pagan views of the Cosmos, often turning them upside-down to make the point that all human beings are called to worship God, even to set aside a day of worship.

The writers of the books of the Bible give fairly clear signals when they were switching point-of-view or when they were switching from, say, myth to history. Even when a modern reader admits to the value of these different styles, he might well have some sort of belief that myths teach—at best—general truths while historical narratives give us a stream of snippets which can be fairly labeled as 'facts'. Skeptics, including some evolutionary biologists and philosophers, agree that texts can be read only in that limited way, as myths or facts, and then go on to deny that the Bible teaches us any useful truths not found in the general literature of our race. At this point, the public discourse about the Bible sometimes breaks down into simple assertions that the Bible is literally true or that it is not really true at all.

The uses of different literary style are not pre-defined. We sometimes try to think in ways that are caricatures of forms for presenting legal arguments or techniques for presenting mathematical proofs. Lawyers and mathematicians themselves don't think that way in their primary or creative work. They do research and they develop their lines of thought the same way that the rest of us do, which often reduces to muddling through by trial-and-error until something feels right. A legal argument or a mathematical proof is what's written after the answer is already established.

Exploration and experimentation. And context. There is no such thing as a legal argument free-standing and independent of a particular tradition of justice. There is no such thing as a mathematical proof that is free-standing and can be directly read using only basic mathematical skills—a

huge volume of proofs provide the foundation for each other.

Let me give an example of a textual problem: Are the birth-narratives in Luke historical or mythical? Read Luke 1–3:22. Now read John 1:1–34. You arrive at the same scene where a seemingly ordinary man has been revealed as the Beloved Son from God. How are we to understand this at least well enough to make some narrative sense of the mission of this Jesus of Nazareth? I'm not talking about reaching conclusions about any claims He was both God and man. Just to make sense of the stories of His miracles and His refusal to triumph over His earthly enemies by earthly means presents a difficult problem. Those stories need some context and, for right or wrong, the authors, editors, and redactors Luke and John decided to provide prologues before telling us about the earthly mission of Jesus. The stories of that mission are 'raw' in a way that indicates historicity.

The prologues? John's prologue is a theological and spiritual poem. Luke's prologue is formed of narratives of the conceptions and births of John the Baptist and Jesus of Nazareth. They serve the same purpose. This is a complex matter where more than casual speculation is needed, but my point stands: these are very complex texts assembled from different sorts of texts and, often, the meaning comes from the entire assembly. In nearly all cases, the small pieces of Biblical text, even the clearest of revelations, are still enriched by the greater context.

Human beings with low levels of reading skills and under-developed conceptual thinking skills don't understand, perhaps couldn't even guess, that there is such a thing as meta-narratives. The books of the Bible are mostly such rather than being straightforward narratives. Primitive texts can be assembled into those meta-narratives the way that most of us assemble words or phrases into sentences of greater or lesser complexity. Some of the texts in the Bible give clear signals, sometimes 'rawness', that they are historical but even those are assembled so that the meaning is explained or enriched by relationships to other texts, sometimes historical but sometimes didactic or poetic or mythical.

We should be aware of the sinister aspect of this sort of insight into the nature of texts. When seemingly plain sentences are assembled into large blocks of text, they can also develop higher meanings—or lower meanings in the sense that they are immoral. We should look for more sophisticated ways of reading the great books, especially the Bible, but we should be aware that a sophisticated reader will begin to see frightening meta-meanings in some texts.

For example, read the articles and editorials expressing the moral outrage of the Western press against the brutality of the Chinese government in 1989—the massacre in Tienanmen Square, Beijing. The context is provided by reading the Western newspapers, or watching the television news, over a number of years. The Western news-media had generally done their best to justify or ignore the murder of tens of millions of Chinese peasants by the Maoists especially during the 1960s. Then the Maoists were overthrown by some tough men, capable of brutality, who had sometimes suffered in the same slave-labor camps as those peasants. In an effort to secure their hold on China, those men gave orders that resulted in the murder of about 100 Western-style intellectuals.

A few years after the massacre in Tienanmen Square, we watched as innocent people were burned to death in Waco—as a result of a full-scale military assault on a civilian compound. That assault was ordered by President Clinton and Attorney-general Reno. The victims this time were human beings with strange religious beliefs and leaders who were seemingly unlikeable and very possibly dangerous to their followers and perhaps their neighbors.

There was no moral outrage on the part of the media about Waco, though the American government used flame-throwing tanks upon men and women and children, far beyond the brutality of the Chinese government. Apparently, the editors of the New York Times and the Washington Post and the talking-heads on television think Western-style intellectuals are true human beings to whom all others have moral responsibilities but they have their doubts about Chinese pig-farmers or village shop-keepers and also about religious nuts in Texas. Or maybe they no longer even have doubts.

There are no clearly-defined borders between our various problems: political, religious, moral, cultural. We don't even understand our problems because we can no longer read the greater and lesser texts which provide meaning and context for those events and groupings of people we call 'Western Civilization'. We can't even read the news in today's newspaper in the context of what was printed last week. And we read the Bible and our histories in such a strange way that we don't see the truth in Tertullian's assessment: Christians multiply when they accept martyrdom. The opposite message is also taught: the population of God-centered human beings shrink when they try to triumph by earthly means or when they try to fit into an increasingly hostile nation.

## 352 Chaim Potok and Moral Courage

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=20>. It was finished and uploaded on 2007/01/17.]

Chaim Potok wrote interesting and substantial books, and there are few such books published in recent decades. I've only read the two novels *My Name is Asher Lev* and *The Gift of Asher Lev*, and I confess to having read them four or five years ago. That length of time won't be a problem so far as this discussion goes. It was, in fact, a time necessary for contemplation on the moral meaning of those novels.

In those books, Ascher Lev begins life as a quiet fellow, seemingly little different from the other Hasidic youth of his community – until he shows a talent for art and also shows the genius that draws him on to greater and greater risks with his art. If you read those novels, pay attention to the conversations between Asher Lev and the Rebbe. There are strong hints that these two men, one a dedicated artist who rejected much of his Hasidic tradition and the other a leader and founder of a major Hasidic community, are great-souled folk little understood by those around them. One is a man who rejected the comfortable and secure path of remaining in his community and leading the life he'd been raised to live. The other took great risks in gathering a folk and coming to a new land decades prior to the setting of these novels.

But the question that these novels raised in my mind, and a question raised by many other works and personal observations is: why is moral courage so rare in the modern world?

I think it interesting that there are those two seemingly so-different characters in these novels who show the courage to break away from the

path upon which life set them. Lev Asher has a soul set on fire by artistic visions and the Rebbe and leader of the Lev family's Hasidic community has a soul set on fire by visions of God. The Rebbe is from an earlier generation, raising the question in my mind: Did moral courage disappear amongst religious leaders during an earlier generation? How long will it be before it disappears in the artistic and scientific and literary communities? (I think we've passed that point for the most part but form your own opinion.)

By the end of the second novel, there are hints that the Hasidim in this community are going the way of other Americans and Europeans, those of Christian or 'mainstream' Jewish descent. This is to say they are becoming creatures of the marketplaces, men who live to buy and sell goods rather than Jews who engage in trade to allow them, or their sons, the freedom to study the Torah. They're men of lukewarm souls rather than the other two sorts of men: those who have a greatness coming from a personal courage and those who develop a significant amount of courage and greatness when inspired by the likes of the Rebbe. Sometimes courage can be inspired by God or can even result from someone being led into a life he didn't foresee. Don't underestimate the number of Jeremiahs amongst the courageous creative personalities of history.

You duped me, Lord. You tricked me into taking on this dangerous life of a prophet.

Perhaps I'm reading too much into these novels but great novels deserve to be stretched just as we stretch what we know of history in our efforts to understand those failures of courage on the part of so many nice human beings who proved willing to serve Hitler. I've spoken in my book, *To See a World in a Grain of Sand* [41], of Hannah Arendt's discussion of the nice, middle-class Germans who filled the Nazi bureaucracy but she also had some harsh comments about nice Jewish leaders. She claimed in her books on the Nazis (the third volume of *The Origins of Totalitarianism* and *Eichmann in Jerusalem*) that many Jewish leaders turned entire communities of their followers over to the Nazis in return for safe passage out of Nazi territory for themselves, their families, some of their friends, and sometimes their money. Those Jewish leaders were probably not much like the Rebbe of the Asher Lev novels and probably a bit like the retailers who are prominent in that Hasidic community by the end of those novels. And a bit like the

members of Lyndon Johnson's cabinet as described by Robert McNamara in the book he co-authored with Brian VanDeMark: *In Retrospect: The Tragedy and Lessons of Vietnam*.

In fact, if there had been more men like the Rebbe amongst those Jewish leaders of the 1930s, or amongst the Christian leaders of that period, Hitler's schemes to corrupt the Germans into carrying out his morally insane programs would have simply fizzled. Similar statements can be made about the bloody mess in Vietnam and probably similar statements will seem appropriate about the bloody mess in Iraq once we know more details.

Such lines of thought lead me to see a danger in the modern democratic movement, actually the dangers of modern marketplaces—commercial and political. Modern history indicates that a mass of human beings will choose leaders who flatter that mass of men and pander to its desires for safety and security, also pander to its desires to see geniality as moral integrity. There seems to be no chance we will choose a man who will make moral demands upon us and raise us to at least the possibilities of a true moral integrity.

In my opinion, the United States has had only one great president: George Washington, but he's not an exception to the rule we prefer scoundrels as our leaders because he wasn't really chosen by the American citizens. He had the courage to risk life and fortune for political independence and was already in a position of leadership before those citizens first voted. And he showed enough courage in office to, among other efforts, make a serious attempt to help the Amerinds form their own nation in the lower Mississippi River Valley. He was beaten back and came to be despised for that stand and other moral stands. Greed has never been a weak force in the American soul. Washington left office as one of the most unpopular men in American history and regained his popularity only when he had no power to make moral demands upon the American people. It's interesting that George Washington was himself a greedy man, but he was quite capable of suppressing his own greed when it came into direct conflict with his moral principles.

So, why is moral courage so rare in human history? I think the answer is simple. Morally unformed human beings tend to be genial. We genial men like to see ourselves as having true moral integrity, of being able to pay a price to live up to our principles. The fact is that human beings are not born with moral integrity. It's hard-won by enduring great hardships in the

right way or by being subjected to the proper training over a good number of years. Some are able to win moral integrity by persistently acting as if they have it. The inspiration of artistic visions or the hunger to live in the Presence of God can motivate a man to set out on a path where he'll pay prices he's not prepared to pay as yet. So far as I know, the Rebbe took on his mission knowing the prices he would pay and the rewards he might reap. It's Asher Lev, on the human level, who plays the part of the duped prophet, Jeremiah. Various societies of virtuous pagans, the Romans of the Republic and the Apache who vainly sought to defend their land against American imperialism, are just two examples of societies which knew how to toughen up their young men.

Americans had it good for too long and we didn't have the sort of morally well-structured society which would have encouraged the formation of strong moral characters in young men and young women, but especially young men. If the maternal natures of young women are properly nurtured, the experiences of child-bearing and child-raising will complete the formation of their moral characters. It'd be nice to have more authors who can depict moral struggles in a way that might inspire the youth of our day, but we also need readers who can realize the Asher Lev novels are not just some sort of National Geographic tour of Brooklyn. There are serious moral dramas being played out in the pages of those books.

## 353 Poverty and the Christian Life

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=63>. It was finished and uploaded on 2007/01/22.]

The Bible makes it clear: we must be poor in spirit. Poverty of this sort, the true poverty which can be found in the lives of some who are poor and also in some who are prosperous, doesn't dictate some sort of extreme asceticism, voluntary or forced upon us. Our Lord Jesus Christ lived in a state of poverty which apparently allowed good food and good drink—at least for His followers though He might not have had much to drink Himself.

I suspect a certain poverty, allied to a humble spirit, is necessary for true family life, for true community life of any sort. In that sort of a spirit, the individual is more likely to realize he's an individual in a strongly qualified way. In particular, all members of a well-ordered extended family, including even the patriarch and matriarch, will recognize their dependencies upon each other and may well become comfortable with those dependencies.

A proper and balanced poverty of spirit is intertwined with closeness to one's immediate social groups and physical environments so far as I can tell. This would be hardly surprising that we would be at our human best when we live the way that God's evolutionary processes prepared us to live. And our best is not at some super-human level. We are at our best when we fill our proper role in our communities, as St. Paul taught the Corinthians and Romans. If our role is to serve others in need, then we should be cheerful in doing so. If we have the role of teaching, then we should sacrifice our own projects if that is necessary to help our students advance.

If we would be poor in spirit, we must recognize our dependency upon God, upon our fellow human beings, and also upon the non-human creatures

and trees and soil of our environments. We also must be willing to pour out what we have for those who are dependent upon us and also for those who need to be dependent upon us.

A modern individual can't be poor in spirit because he's raised to seek independence of an impossible and undesirable sort. He tries to be free of dependencies upon other flesh-and-blood human beings. This forces him to accumulate wealth in ways that are harmful to him and to human communities. Instead of being dependent upon relatives and friends and neighbors, he'll accumulate retirement accounts and other investments. He'll seek, by his votes and other political means, to obtain promises of government benefits. These efforts won't truly free him from dependencies. He'll merely become a center of desires dependent upon various corporate and governmental agencies. In Biblical terms, he'll become dependent upon the Principalities and Powers of the world. Rather than a humble dependent creature, he'll become a prideful slave.

# 354 Satan and Other Fictitious Moral Forces: Part 1

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=21>. It was finished and uploaded on 2007/01/30.]

I'm interested in the literary representation of evil, in the Bible and in great novels or poems and in political writings such as those of Karl Marx from the upside-down Hegelian left or Eric Voegelin from some sort of Neoplatonic right. Sophisticated or playful representations of evil have largely disappeared from our more serious literature, except for the writings of a few thinkers such as the political philosophers Eric Voegelin and Bertrand de Jouvenel or the novelists Flannery O'Connor or Graham Greene. Most modern writers who recognize the existence of evil are lacking in the fullness of imagination that shows a deeper understanding of the nature of evil – William Faulkner and Stephen King are two radically different examples. I'm concerned about this because I think that a lack of realistic representations of evil makes it hard for us modern men to understand evil.

Before I speak of literary matters, I'll have to divert to discuss some aspects of the human imagination, specifically—the need to develop it. The richness or poverty of the imagination, also its development in purely visual forms at the expense of abstract thought, plays a major role in how we represent of evil and consequently how we see or fail to see the potential for evil in our own actions. For all the books and movies and documentaries about the Nazi genocidal programs, few human beings seem to understand what Hannah Arendt called the banality of evil—the nice, middle-class Germans were the ones who executed the nightmarish schemes of the rather stupid Nazis. A similar claim can be made about the war which the United States waged in Vietnam and about other important events in this modern

age. We are blind to the evil which comes from the ordinary activities of our business and political lives and we tend to see that evil as concentrated in super-human entities, whether Satan or Hitler.

How did this happen? With a little imaginative effort and some knowledge of history and evolutionary science, a plausible story can be told to explain the moral failings of modern men and to even give hints of paths out of our bloody morass.

Man evolved as a social being, hence as a moral being, in small-scale societies where actions nearly always had a direct and discernible moral meaning. Somehow, man developed some brain regions that allowed him to keep in mind objects which were not present, to plan out actions, to see possible patterns in events or things which are not immediately related to each other. Man became an abstract thinker though he had evolved as a creature suited for foraging and likely traveled as much as 40-50 miles on a typical day. But we can't just sit around most days and then go out and move 40 miles over difficult terrain when the mood strikes us.

In the same way, our mental abilities must be exercised for us to develop the higher-level abilities of abstract thought. We have to develop the disciplined ways of thought which allow us to categorize our own actions in terms of their direct moral implications but we also have to develop the higher-levels of imagination that allow us to see how our seemingly moral actions can work to evil purposes when we unite in various sorts of masses. It can even be surprisingly difficult to see the long-range impacts of allowing ourselves or our children to be addicted to various substances, such as tobacco or excessive amounts of sugar or salt. It's still more difficult to foresee the results of activities or what we might call passivities.

We should not have needed doctors to tell us that smoking damaged lungs and other organs. Observations of the sorts which underly much pre-modern knowledge should have been sufficient. We shouldn't need brain-scientists to tell us that watching television is an addictive activity that is learned by way of pain and horror—watch the face of a child seeing a violent television program for the first time, where violence can simply be a fast-moving and noisy show. The addictive process for television-viewing isn't so much different from the one where children learn to enjoy breathing hot tars and nictines into their tender lungs.

The brain is an organ just as the heart and the skeletal muscles are. Specific mental skills require development, often full development can only happen when the proper stimuli are received during periods usually labeled

windows of opportunity. Certain basic language skills must be developed when the child is young or else those skills will never develop properly—if they develop at all. There have been some spectacular cases where life in the wilderness or isolation as a result of deliberate abuse have resulted in young children not being exposed to rich human language. The best of medical care and remedial teaching can't raise some of those children above the type of language used by chimpanzees and gorillas in laboratory environments—though some creativity sometimes appears spontaneously, language is no more than a set of signs.

So far as I can tell, from the historical evidence and from observing children who are exploited to become consumers of elaborate entertainment, imagination needs nurturing at crucial times of development as much as basic language skills. I don't know how narrow those windows of opportunity are. Nor do I know if remedial stimulation of the imagination can revive some potential in a human being who spent much of his life in the wasteland of modern American culture—watching television, listening to pre-recorded music, and getting exercise only in little-leagues or other activities organized and run by adults. I also don't know if there are many human beings who simply don't have any potential imagination to develop. I doubt if there are, but I don't know.

I do know this: bereft of imagination, human beings inhabit local environments and struggle to make even the slightest sense of streams of events, or even of rumored things, that lie beyond direct observation and description in concrete terms. Even vast amounts of knowledge will not allow a human being to see human history or the physical universe or the possibilities of moral order which would make a true world of that physical universe, if that human being has no well-developed imagination.

It's passingly odd that a creature evolved for life in simple environments and small groups has any capability of living in a cosmopolitan society, of envisioning even multiple environments at once let alone a universe or a world or a stream of events we call history. Given the necessary flexibility of complex language and imagination, it's hardly surprising that language skills and imaginative skills are both only potential in a newborn and need to be developed into specific bundles of capabilities.

# 355 Satan and Other Fictitious Moral Forces: Part 2

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=23>. It was finished and uploaded on 2007/02/09.]

By the term ‘fictitious’, I mean something similar to the ‘fictitious’ organizing force that Adam Smith called the invisible hand. The phenomena are real but the term is not an explanation. It’s a description which allows concise reference to some very complex events. We are social creatures and tend to interact in such ways that higher-level organizations form without our consciously willing this to happen and certainly without our being able to plan on specific forms of such organization.

To speak of these higher-level organizations as if they were independent of the actions of the individual human beings can be dangerous in allowing us to pretend that the invisible hand or Satan is responsible for the good or evil that’s done by us working together in specific ways and as if for a specific purpose. The satans of an age are a reflection of the particular forms of moral disorder found in that age just as the moral structures which arise are a reflection of the more benevolent invisible hands of an age. In general, the principalities and powers are the particular forms of moral order and disorder found in that age. There are no equations that tell us how the Presbyterian moral behavior of the residents of Glasgow organized into the morally well-ordered economy observed by Adam Smith but it’s not just coincidence that such an economy resulted from the interactions of human beings under strong social pressure to conform to certain standards of behavior.

To be sure, it’s not only the actions of men but also events in our physical environments, such as volcanoes, that cause the large-scale flows of events

that we call history. History follows some cycles though the patterns are complex and overlapping so that prediction is still less possible than it is for a hurricane season. There is interplay and always some disruption due to new factors, such as the mobility that destroyed local societies and made possible world wars in modern times. One of the patterns in history since the invention of writing is cyclical changes in quality of reading skills and the tightly related quality of abstract thought.

From my sparse knowledge of the Bible, Old and New Testament, I think there was a sustained era of high-quality thought and high-quality literacy from the period in which the Torah was assembled and redacted (perhaps 500BC) and the fall of Rome. A period of low quality of literacy and abstract thought followed. There was then a rise towards the high point that was the 13th century and a rapid descent to the century of stupidity and disease and warfare that ended the Middle Ages and which colors the entire period in the thoughts of many poorly-educated human beings. This horrible century was about 1350 to 1450. A new cycle of higher-quality literacy and abstract thought followed and—according to some historians—peaked quickly in the 17th century. We've been on a slow decline since then. The pattern is erratic enough to be seen in its particulars only in the past, but rises and falls seem very likely though we can hope they're not inevitable.

It's during low-points that human beings fall prey to pagan images of personalized evil or to irrational understandings of invisible hands, not even noticing that the evil of their age is caused by their frenzies and their willingness to unite into evil mobs—no matter how nice and gentle they might be as individuals. It most certainly doesn't matter that the modern form of mobs is well-organized bureaucratic hierarchies. In an era that can literalize forces which act to evil purposes, an era which can personalize those forces, Hitler can play the role of Satan. In most eras, he would have been no more than a crank unknown outside his own neighborhood.

If Hannah Arendt is right in her analysis of that Holocaust, it might be that Hitler's right-hand man, Heinrich Himmler, was the true genius of Nazism because he consciously used the unconsciously self-organizing middle-class masses of Germany to carry out Hitler's schemes. Under this way of looking at matters, Himmler was a good political entrepreneur nudging the invisible hand in a certain direction. Without that nudging, Hitler would have quickly failed and would have been labeled a mediocrity who simply was sucked into a moral vacuum at the top of German politics. We

might not have even learned he was serious about the evil schemes he wrote about in *Mein Kampf*.

The only useful positive lesson I can see from the so-called Enlightenment is:

Individuals can look beyond their immediate horizons and gain an understanding of the larger-scale political and social and economic ‘forces’ of their day, an understanding which might allow them to move those forces in a better way.

True it is that the Philosophes of France had not only wrongful ideas of human nature but also an exaggerated idea of what can be changed in society but those Deistic Philosophes who were the majority of Founding Fathers of the United States were more realistic about the need to conserve social and political structures in order to bring about any useful changes. A small group of men of more than ordinary moral integrity offered their fellow-citizens a better future. Unfortunately, those citizens chose a different path, trying to sell their freedom back to their own government in return for promises of financial security—as Nathaniel Hawthorne told us in the forward to the first edition of *The Scarlett Letter*. It was a reprimand and a warning that we ignored.

In his evil way, Himmler was much like those Founding Fathers. At the risk of his own life, he ignored Hitler’s orders to give the good government jobs to the true-believers amongst the Nazis. Himmler instead did what he could to conserve the short-sighted and self-centered moral and social structures of the German middle-class, allowing them to pursue their careers and pay their bills while serving Hitler. Of course, few of those nice middle-class lawyers or house-builders saw the horrors which resulted from their little acts of competence. Those lawyers and house-builders acted to organize themselves so that they nearly reached one of the most evil goals in human history.

How can we avoid the blindness, how can we overcome the self-centeredness, which allowed the German middle-class to serve Hitler while thinking they were acting in a proper way? I’ll suggest one part of the solution: we can pay attention to the world around us and we can learn how to pay attention by trying to improve the quality of our literacy and our thinking skills.

Literature does far more than provide a few moments of diversion. It nurtures those higher-level skills of perception and cognition which can help us to understand the larger-scale forces which currently threaten us, threaten to kill us or to use us as tools towards some evil purpose. With some understanding, we can maybe nudge these forces in a direction that will make our societies a little better, if only far in the future. So far as I can tell from the books and movies of our age, we have fallen into a fatalistic attitude that is little different from an outright belief in the dark and ancient vision of warfare between gods and demons, with human beings as no more than pawns. Read the *Iliad* for a powerful description of such a world. It's a horrible and false view of God's world. Neither pagans nor Christians should wish to return to such a world but we continue to let our literature decay, allowing our minds and souls to follow.

As local populations of human beings, or even as an entire race, we can be overwhelmed by climate changes or an incoming meteor. We can sometimes be overwhelmed by social changes which we couldn't foresee clearly. But we have a responsibility and a duty, to God and to future generations and to ourselves, to pay attention to the world around us, including the social forces which can destroy social and moral structures.

Paying attention to our world means, first of all to live up to our immediate moral obligations but also to learn how to correctly perceive the larger-scale forces which we could label as 'principalities and powers' or 'invisible hands' or 'social and political movements' or even 'Satan'. These are fictitious forces but they are real phenomena, large-scale phenomena which are the result of the efforts of all of us. Though individual moral actions can be overwhelmed by volcanoes or wars, we can sometimes nudge our societies in a slightly different direction. But we can't carry out our moral responsibilities unless we take care to develop our minds and souls, our imaginative and moral capabilities, to the point where we can perceive and understand these large-scale forces.

## 356 Moral Order is a Story and Not a Legal Code

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=24>. It was finished and uploaded on 2007/02/19.]

About ten years ago, I read a book which frightened me a bit: Jane Healy's *Why Johnny Can't Think*. Professor Healy, who was a junior-high school teacher as well as a college professor, spoke about the dangers of our ways of life, based upon teaching experience—her own and that of others, based also upon her readings in neurosciences and interviews with developmental specialists in that field. She tells a story which perhaps reaches a climax in her printing of pages from national achievement tests for elementary students, two tests about 20 years apart—mid-1960s and early 1980s from my memory. In the earlier test, students were expected to draw conclusions, largely from contextual clues, about Vincent van Gogh's philosophy of art, about the relationship between the color of a star and its surface temperature. In the later test, students were expected to order food from the menu of a 'prehistoric' fast-food restaurant. Dino-burgers or whatever.

She spoke of ill-behaved students, illiterate in a deeper sense, and difficult to the point of impossible to educate. Professor Healy discussed the usual causes. Modern children watch television or play little-league baseball under adult supervision rather than engaging in imaginative free-play or heading out to organize their own games of capture-the-flag or pick-up baseball. They listen to pre-recorded music instead of singing along as Mom or Aunt Millie plays the piano. Education has too much visual glitz of the sort which distracts the attention, activating visual systems in the brain and shutting down the regions of higher thought. This problem is aggra-

vated by fast action, such as you find in *Sesame Street* and other so-called educational shows.

There are other problems but one that interests me here is the lack of a context for the lives of these children. Professor Healy spoke, in the early 1990s, of children who knew all about the characters of the television show *Roseanne* but didn't even know what country their grandparents came from; nor did they know a bit of the history of their own community. I can speak more graphically than Professor Healy did. Modern children inhabit an alien region of stories about sophisticated cannibals and robot-men and drug-addicts rather than a world shaped by stories of family and local community and religious tradition. I admit that some families, even during the best of times, will have drug-addicts and alcoholics. Those sad stories have to be folded into the honest stories which we adults use to shape our moral lives and to view God's world, but children don't need to hear about either psychiatrist-cannibals or Uncle Tom who drank himself to death at 40. It's impossible to protect them from all rumors, and perhaps undesirable, but children don't need to know the details of those sorts of adult problems.

They do need to know about Grandpa coming over from Poland, not knowing a word of English. But he picked up a shovel and went to work as a common laborer and ended up owning a paving company. They need to hear about the heroic struggles of the Polish people to preserve their identity though they inhabited a great flatland open to invasion. They should hear about Great-uncle Stan dying at Guadalcanal or Dad taking a bullet during the Tet Offensive. They should learn of George Washington and Nathaniel Greene, Abraham Lincoln and Ulysses Grant, FDR and George Patton. Most of all, Catholic children should learn about Jesus Christ and St. Paul and St. Faustina and Pope John Paul II. Protestant Christians or Unitarians or Jews or others can supply their own list.

I've made it clear in various writings that I'm not a big believer in the understanding modern human beings have of recent histories nor am I a fan of Lincoln or FDR. Yet, children should receive the idealistic version of history before they learn the harsh realities. Why would we think those children would be able to eventually understand failure to meet moral standards if they'd not first been taught those standards in terms of stories? We have to be careful, of course, and not to overdo matters. The deification of Lincoln has likely caused as much moral decay as Hollywood has caused in recent years.

When I was growing up, my beliefs of the world were formed by a reading of a large collection of idealistic biographies of great Americans written for children in fourth-grade through sixth-grade. Short and usually consisting of one story from the childhood of those men and women, they gave a flavor for nobility of character even if it was sometimes mostly in the imagination of the writers of that series. I can remember reading of the young Thomas Jefferson taking slabs of bread and ham to an escaped slave hiding in a nearby cave. Israel Putnam had a great time sledding during a Connecticut winter. Dolly Madison prepared in some unremembered way to one day risk her life to save the contents of the White House as the British soldiers were approaching with the intent of burning it to the ground.

I moved on to read somewhat more complete and more realistic biographies and histories as well. There was a great feast in the Hubbard Memorial Library waiting for a hungry mind and soul. There were novels about the Colonial Era in North America, about mountain-men and great explorers. There were histories of Amerind nations and of the westward expansion of the European immigrants. There were stories of war and disease. Some of that was disturbing to an unguided youth first confronting the realities of human nature but it was exhilarating in its own way, and I would later learn that most of those mainstream works were still whitewashed versions of history.

I was in somewhat better shape, intellectually, than most children in more recent years but I was morally ill-formed, or perhaps softly formed. There were some fragments of stories in which my life, my story, was embedded, but there was no overall story to make sense of things. Not only was there no strong story of Christian salvation through the Blood of the Cross, there was not even the sort of family or community story which helped virtuous pagans, such as the Romans or the Apache, to form their children into strong and noble men and women.

Systematic discussions of morality or ethics are important in an advanced society but they are meaningful only if they build upon deeply-held stories which give meaning to the life of the individual and to the life of his communities. Book-knowledge isn't enough, especially when it isn't a part of the child's blood and flesh, and that includes both inheritance and experience. But book-knowledge provides a background and a context for Grandpa's heroic life. All of this should come together in communities of human beings who share stories and live according to those stories as best as they can.

The overall structure of our moral lives is formed by the stories we accept, that we tell ourselves, that we live as individuals and as members of communities. All of the pieces have to be in place, that is—we must have individual stories which make sense in the light of our communal stories. But the process is recursive and those communal stories make sense of the individual stories which are lives and the lives of those we love and even those we live with even if we find it hard to love them.

## 357 Where are the Conservatives Nowadays?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=79>. It was finished and uploaded on 2007/02/28.]

I want to speak about a claim in Chapter 350, *What is a Conservative?:* Most modern politicians or thinkers who call themselves ‘conservative’ are better described as ‘right-wing liberals’.

By definition, conservatives conserve, but those—Rush Limbaugh is a good example—who call themselves conservatives are mostly concerned with the marketplaces. The marketplaces don’t conserve and we shouldn’t want them to do so. Marketplaces innovate, sometimes by bringing the products of one continent to the residents of another and sometimes by encouraging the development of new products. This is good, but marketplace forces are also dangerous and shouldn’t be unleashed without constraints. We modern human beings often try to put constraints on the marketplaces, especially with the bureaucracies of the central governments but that often makes matters worse. We fight various large and abstract institutions by pitting them against each other and often that merely makes the surviving institutions stronger. In my terminology, governments operate in the political marketplaces which are still more dangerous regions than the economic marketplaces.

Conservatives, if the term is to mean anything, must conserve specific flesh-and-blood traditions. There are obvious exceptions in intellectual and artistic traditions where some of the traditions are in the form of abstractions, but those are few. Even the Christian Church, in Her Roman center and other branches alike, is held together by liturgical and other practices as well as by more concrete manifestations of belief. Good theological and

philosophical systems are necessary to keep the Church healthy but simple beliefs and concrete activities as mundane as church picnics are the mortar for the imposing edifice.

In politics and economics, social systems in general, big institutions with abstracted moral duties are more often the enemy than the friend of truer forms of human intercourse and human freedoms within those legitimate forms of intercourse. This may be especially true in the case of capitalism because of the very strength of this system: it innovates more rapidly than any other known system. Innovation is not always good. Innovation brought us the polio vaccine but it also brought us electronic entertainment which seems as addictive as heroin and arguably as destructive though the damage might be more subtle. On the hand, the damage is to the mind and soul and, by definition, human beings whose minds and souls are badly damaged may not be much aware of their own state—or they might try to suppress their awareness of their damaged state. They certainly can be more easily exploited by the gods of the marketplaces.

Capitalism itself is not a problem so long as ownership laws are such that the property and other productive assets are not fully fungible, not convertible into a form of ownership where those properties and assets are owned by abstracted entities like our modern corporations. At least not all of them. Moral structures will be dissolved so long as a large percentage of our productive assets are controlled by abstract entities, corporations and central governments, rather than being owned by flesh-and-blood human beings who are morally responsible for their actions, flesh-and-blood human beings who have not the desire and maybe not the legal power to sell what came from their ancestors and should go to their descendants.

There are better possibilities in a layered system in which most productive assets, and the corresponding owners and workers, are enmeshed in local economies and a handful of companies interact with companies from other local marketplaces. There could be multiple layers going up to a continental or cross-oceanic scale. The idea would be similar to the layered risk-sharing in insurance or mortgage banking but the goods rather than risk would be distributed.

In any case, I don't see how anyone can delude themselves or others in thinking someone a conservative for fighting to preserve corporate capitalism, a form of economic organization which has proven itself better able to chew up local communities, extended families, and religious communities than Stalinism or Maoism. Corporate capitalism has proved itself to be

more effectively corrosive and anti-traditional in practice than communism was.

Recently, a traditionalist American rabbi noted that moral corruption can be worse than genocide: destroying someone's soul [and mind] is still worse than killing them. I would go further than the implications of such statements. Moral corruption is not a disease of corporate capitalism, it is the essence of corporate capitalism. Moral structures have to be destroyed for the market to continue advancing into ever more extreme products and services. Else, how can the flows of cash, to tax-collectors as well as corporate investors, continue to rise? Human beings must be turned into fanatic consumers if the Gross National Product is to continue rising.

There aren't very many conservatives in the modern world outside of Hasidic or Amish communities. Rush Limbaugh and George W. Bush are most certainly not conservatives if the term is to retain any rational definition.

Am I a conservative? Not really. There are no true conservatives today, outside of members of some small ethnic communities, because there are no social or moral structures worth conserving. There are foundations and there are building materials and those can be best used by radicals who see the value in those foundations and have the courage to experiment with the building materials.

## 358 All that We Deserve, But We Can Do Better

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=39>. It was finished and uploaded on 2007/03/05.]

It's considered to be something of a truism in certain intellectual circles that a nation will get the government and the leaders which its citizens deserve. To take a shot at both left-wing and right-wing liberals, this would mean we Americans deserve both Bill Clinton and George W. Bush.

We could also say our literature including history and popular science, our journalism, our popular music is also what we deserve. This is not a compliment, but we shouldn't either take insult at honest evaluations nor should we get depressed about it. We should do something about it.

Start the easy way. It'll be more pleasant. Listen to some easy jazz, maybe some Louis Armstrong or Ella Fitzgerald. If you feel close to some sort of ethnic group, listen to some folk-music from that group. Some easy-listening classical music might also be good – Mozart or Haydn or maybe Bach. Then move on to singing along or singing by yourself. Did you once play an instrument? It's time to start again or maybe just pick up a recorder or check out piano lessons for adults.

Read a good book. Start with some that are relatively easy to read. I was a typical college graduate in the early 1980s when I decided to rebuild my mental strength and I went right to Melville's novels and serious works of history and philosophy. And the Bible. My brain hurt a lot. Most should probably take it easy and get hold of some serious but pleasant reading, similar to the way you should start a physical exercise program. *A Confederacy of Dunces* by John Kennedy Toole is an easy read. So are the various humorous novels by Evelyn Waugh. I'm not a mystery fan, I enjoyed

the novels of Dashiell Hammett—though they are a bit dark and depressing. Raymond Chandler's novels are also supposed to be more meaty than the run-of-the mill detective books, though those who know literary folk will realize they often read the simple sorts of detective books as mind-candy of a sort. There are a multitude of novels of various sorts in the typical public library including some of the middle-brow classics of earlier decades.

Try some serious but easy-reading history books or biographies but I'd advise skipping most newer ones. The literacy level of American newspapers is said to average out at about fourth-grade level and the histories and biographies I've checked on new-book tables don't seem much higher than that. I would recommend a visit to your public library where you should be able to find biographies of great Americans by Freeman and Flexner, histories and biographies by Page Smith, histories by Barzun and Lukacs and Boorstin and more than one Grant. The intellectual histories by Berlin and Arendt and Toulmin are also quite rewarding to the reader with a strong or strengthening mind.

Do we deserve better than our current politics and literature? Only if we act as if we deserve better and to act in this way will require a sustained effort. So far as I can reconstruct the years of my personal intellectual revival: it took about five years before I could read a sophisticated book and reach the true depths and riches. This was just as true of the Bible as it was of *Moby Dick* or Freeman's biography of George Washington. We need to decide if our minds, and the cultures they form, are worth saving, if we will put out so much effort as we're willing to put out to buy a bigger house or a more luxurious car.

## 359 Problems in Environmental Ethics

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=76>. It was finished and uploaded on 2007/05/22.]

In one of his essays, Wendell Berry—farmer and poet and social critic, told us: if we find moral ways to make our livings, our environmental problems will also be solved. We should order our lives first before worrying about technical problems. Our technical problems aren't even real in the sense that they wouldn't exist if we were living morally well-ordered lives in morally well-ordered societies. For example, let's take the automobile and truck component of our pollution, which we now worry about in regards to global-warming.

We err greatly in thinking we should deal with this specific problem of pollution from internal combustion engines as a problem in engine design or maybe as a problem in new sorts of fuel. In fact, the excessive use of these vehicles has destroyed many of the natural familial and communal ties between human beings. Our love affair with cars and our moral problems are tightly connected and those moral problems include our high crime rates as a mere symptom. If large-scale use of automobiles is a problem, we should step back and try to imagine, and then to build, lives where the automobile is less prominent. The excessive use of motor vehicles has allowed us to escape our human ties whenever the urge hits us or whenever a problem arises. By letting the engineers and policy-wonks turn this problem entirely into one of developing 'better' technology, we turn ourselves into playthings of bureaucrats and ambitious politicians.

Modern liberal political systems have grown largely by taking advantage of the inevitable problems in human families and local communities. King

Louis XIV of France, one of the most competent despots in modern history, specifically increased the power of his central government by helping free citizens from problems which arise in a certain percentage of natural human groups—that percentage might well be different in a morally well-ordered society than it is in a disordered society. Conquest by attrition. And it doesn't save us in the end to allow ourselves to be turned into modern-style individuals who, with a few interesting exceptions, merely enter the mobs of modern life to be herded by one group of exploiters or another, eventually to be herded into the slaughterhouse.

When we think of our relationship with our fellow-humans, our fellow-animals of other species, and the earth itself as being a series of technical problems to be solved by scientists and engineers and government bureaucrats, we give up any claims to be morally well-ordered creatures. There are two errors in moral thinking we make when we do this:

1. We think of morality as being something pure, something which comes from another realm than that of our needs for housing and nutrition and good health.
2. We think of morality as being something that merely places a few constraints upon us as we live our chosen lives.

In fact, human moral order is very particular to our specific species with our ways of reproducing and forming families, our ways of forming larger-scale communities, our ways of learning, our inclinations to make tools, our musical and poetical skills. We form certain types of societies and certain types of individual relationships, but those societies can be reshaped by techniques which are honored above traditional ways of life, above the respect for the future which is proper for a mortal creature.

Our respect for the past, our realization that we hold property and ways of life in trust for the future, should hold us back from doing much we would do. Moreover, it should render us willingly dependent upon particular human beings: parents and children and neighbors. We prefer the illusory freedom which comes when we transfer our dependencies to centralized governments (social security programs) and to corporations (providers of jobs and products and services). Again, Louis XIV in a brilliant and conscious manner, other modern leaders more or less responding to short-term needs, have played on that desire to be free of concrete, flesh-and-blood ties.

We must remember that, even in the best of times, some human beings are being abused in one way or another inside of their natural relationships. When those problems are solved by ceding local authority and local power to even the most benevolent of public officials, a centralization of power will result. Power, like any other weapon, exists to be used. And it will attract exactly the sorts of ambitious human beings we should most fear.

So, we have gained an illusory freedom, which our grandchildren—if not us—will discover to be slavery. That illusory freedom has come at a huge cost even in the short-term. The sorts of governments which provide large-scale welfare programs (and the allied military programs) and the sorts of corporations which provide cash-paying jobs and ever-growing selections of goods work only in cash-flow economies. Home economies are the enemies of the gods of the marketplaces because the services a mother provides to her children can be replaced by services provided by a public, profit-seeking corporation. The same is true of the favors traded by friends or brothers. Neighbors and brothers who trade favors, one does the plumbing and the other the carpentry, are also enemies of a government needing to maximize tax revenues.

We have destroyed the moral order of our societies by destroying the natural structures of human life. We have also paid huge costs in terms of our physical environments. Traditional societies have also damaged their environments to be sure, but not to the extent of a society which has given up direct moral constraints to pursue economic growth. This is not a new situation. Until I read Tocqueville's *Democracy in America*, I'd thought that the farmers of New England had stripped the land of forests. While farmers had taken out many, it turns out the government of Massachusetts had aggressively finished the job in the early 1800s by requiring local towns and cities to clear forests and burn the trees to make potash for exportation. Even before that, our politicians had developed a hunger for cash and were anxious to turn those farmers from their efforts to largely feed themselves and to then use barter to get most of what they otherwise needed. And so it was that farmland was taxed at levels that led in the short-term to the rebellion led by Daniel Shays and in the long-term to the farmers being forced to turn to cash crops. All the while, the state government of Massachusetts was destroying the forests to gain cash that they might 'modernize' and start providing more services. Now that government is more likely to pass regulations restricting freedom in an alleged effort to protect the environment; the one constant goal is for the further concentration of power and

wealth at the political centers.

More recently but nearly a century ago, the Supreme Court of the United States awarded human rights to corporations. The sorts of right-wing liberals who call themselves ‘conservative’ also apply that label to the revolutionaries of that 1920s Supreme Court. Still more recently, while the US was flush with war-loot under a different name, the Eisenhower regime began to pave this country so that weapons and soldiers could be moved around in the event of a nuclear war. All those highways also allowed corporations to consolidate production, to buy-out smaller local firms or drive them out of business. Soon, Americans were jumping into cars each morning during the work-week to head off to the factories or office-buildings, jumping into those same cars each week-end to head off to the beach or the mall. A generation more and everyone was driving their children to and from little league and birthday parties at special children’s playground.

If we had enough moral integrity to return to a moral human life, our use of cars would no longer be excessive. Of course, there’s a major problem: we’ve sold productive assets to the corporations and allowed the government to grow into a monstrous bloated beast. They need us to be dependent upon them. They need us to be holding onto our corporate jobs. They need us to be paying taxes to support our wars and our highway systems and our own pensions and medical benefits. If we were to try to return to a better moral-order, one which would solve our most serious environmental problems as a side-effect, we would go bankrupt as a society. We can’t grow our own food. Even most of our local farmers are dependent upon chemical companies and the the seed subsidiaries of agri-corporations and tractor manufacturers. We can’t build houses without those tools which are more and more often made in China or other Asian countries and then imported by our corporations. We don’t even produce our lumber locally—we need to buy from behemoth corporations which have tree plantations as large as our smaller states. We can’t make our own clothes and we have allowed ourselves to grow dependent upon international pharmaceutical companies. To a shocking extent, we can’t even amuse ourselves without a DVD player or a \$200 trip to a ballpark.

To truly solve our environmental problems, we would have to put some moral order in our lives and here’s the real catch: moral order is something that develops. Often, it can then be nurtured and kept alive for many generations—with some inevitable adjustments to changing circumstances and just to allow for human freedom and creativity. Moral order, like the

higher cultures of which it is a basic aspect, can be destroyed quickly but it takes a number of generations, and the proper circumstances, to re-develop. That period of redevelopment can involve pain, sweat, and sacrifices for the benefit of future generations. We aren't the sort of creatures who are willing to do such a thing. We're barbaric children who specialize in looting from the civilization we inherited.

We can avoid facing up to our need for self-discipline and sacrifice to restore moral order, and other aspects of culture by telling ourselves there are technical fixes to everything. There are human beings who want to smoke and eat high-fat foods and expect doctors to provide drugs and operations to clear their arteries and fight off diabetes. There are others who want to sit and watch TV all evening and seem to figure the ensuing dullness verging on stupidity might lead to Alzheimer's but that's the job of drug-companies and doctors to cure them.

We're inherently disordered creatures, though not inherently immoral. We don't wish to make the sacrifices to order our lives, by either noble pagan standards or Christian standards. We wish to pursue comfort and safety and pleasures. We wish to sit in front of the television set all evening, to give up our church membership and our close ties to family and childhood friends, to consume whatever glitzy product is displayed for our monkey-like pleasure on television. If our families are destroyed, we expect social workers and policemen and other civil servants to cure the damage. We wish to have unnatural lawns of the sort seen at country clubs and office campuses. We wish to grow our food with machines on huge fields using huge quantities of fertilizer produced from petroleum. If our waterways and soils are poisoned, we expect engineers to clean the waters and to develop milder forms of poison for maintaining the turfs on our lawns and golf-courses and playgrounds.

We want to talk about ourselves as if we are responsible, moral adults, but we don't really want to order our lives to make that talk a reality. We want to live disordered lives when disorder appeals to us, and then we want some technician with magical powers to fix the problems we bring upon ourselves and our world.

Moral structure isn't a decoration on a society organized to the demands of political ambition or wealth acquisition or bureaucratic rationalism or technical quality. Moral structure in a society, and the corresponding moral integrity in the citizens, comes first. Since moral structure brings also the habits and attitudes conducive to proper economic development—

punctuality and discipline and obedience to true authorities—then, all else being equal, prosperity and technical advancement and other good things will follow.

## 360 Problems in Medical Ethics

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=77>. It was finished and uploaded on 2007/06/01.]

If we are to be moral, then we must give first place to the demands of our moral beliefs. If someone claims to be moral but acts according to his professed beliefs only if there is no price to be paid, the best you could say is: “He’s a nice man.” Not a man of strong moral character, a nice man.

Hannah Arendt, the Jewish philosopher and analyst of modern totalitarianism including that political system which built Auschwitz, made the claim that modern middle-class human beings are nice and not moral. Flannery O’Connor, the American novelist, was getting at pretty much the same point when she said that Americans are not moral nor compassionate but only squeamish. Two centuries ago, Adam Smith interrupted his boosterism for modern liberalism to express the concern that a commerce-centered society might tend to produce citizens who were genial without having much moral integrity. We show the truth of these claims in our actions in recent decades the medical field. I don’t make this claim about only Americans but about most modern human beings.

We’re generous with our spare cash, sending lots of it to tsunami victims in southeast Asia or to starving children in Africa. There’s certainly nothing wrong with that, except that our cash flow economy is sustained by a liquidation of the productive assets for which we were only stewards and not true owners. We risk poverty and slavery for our children and grandchildren in order to have nice houses and to be able to contribute a few bucks to a charitable cause. I’ll pass over that for now and speak of the more basic problem: we talk a good talk about being a moral people but we’re always willing to take the moral short-cuts when we would have to pay a price.

What would it take to overcome our niceness and to develop a truer moral integrity? Right now, it seems to me that we have to make at least two changes in our ways of thinking and in our general attitudes:

1. We should overcome our squeamishness, develop a detachment to our own troubles and the troubles of others.
2. Second of all, we'd have to re-member that we are mortal creatures. We should live a good life that is conducive to a good death and the good death we envision should tell us much about how to live during our few years in this world.

As terrible as pain is, our primary goal should not be to avoid pain, our own or that of others, nor to end pain. Our primary goal should be to live a good life and die a good death. We should also teach our children and others those fine arts. And they are arts, not matters of technique. Proper health and proper deaths are not a matter of the right drugs or the latest surgical techniques just as leading an ecologically responsible life isn't a matter of having the right techniques for removing nitrous oxide from our engine emissions.

When we turn over control of our ways of life to engineers and bureaucrats of private or public institutions, we concede our power to live morally responsible lives and to think and feel in morally responsible ways. The same is true when we turn over control of our bodies and those of our children to doctors and nurses, technicians and hospital administrators.

# 361 Technology is a Two-edged Sword

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=78>. It was finished and uploaded on 2007/06/08.]

In recent days, we've learned that scientists have managed to trick skin cells of adult mice into returning to the state of embryonic stem-cells. The full report for experts was published in the inaugural issue of the journal *Cell: Stem Cell* on June 7, 2007. The work was discussed in an interview, *We Can Get Cells That Perfectly Resemble Embryonic Stem Cells* with the lead author, Kathrin Plath. Here's the first question and her answer:

What is this new technique?

We take fibroblasts which are basically skin cells, put on four factors, which are transcription factors, bound to specific science [sic, presumably is supposed to be sites] in the genome (DNA) and turn off their expression. If we put these four factors on fibroblasts, the skin cells, then we can get cells that perfectly resemble mouse embryonic stem cells.

We have been very amazed that we can put these four factors and reverse the phenotype of a skin cell to that of a mouse embryonic stem cell. We're now going to try and work on human cells. We'll try to understand the mechanism. This is very exciting. I think it opens up a new field of research.

There is that important technical matter which Professor Plath discusses in the second paragraph of her response: the technique is proven to work for mice and not yet for human beings though I have little doubt that it will. It may take some time to perfect the technique for human beings. There are

also some background technical issues which I'll discuss very briefly though I'm not an expert.

From Wikipedia article on *transcription factors* at [http://en.wikipedia.org/wiki/Transcription\\_factors](http://en.wikipedia.org/wiki/Transcription_factors) :

In molecular biology, a transcription factor is a protein that works in concert with other proteins to either promote or suppress the transcription of genes. Hence transcription factors control when and where genes (and the proteins encoded by those genes) are expressed.

There is not a strict one-to-one relationship between our DNA in total and our own beings. A human being's DNA holds the possibilities for a lot of different particular cells and even a lot of different and only potential human beings. Transcription factors are involved in the process of regulating genes—shutting them down or toning down their effect or the opposite. But even a 'fully configured' human being develops partly as guided by his or her mother through the egg-cell and through various interactions in the womb. Any given human being also develops in response to his or her environment and as a result of his or her specific responses. Still, our DNA provides our possibilities and puts many constraints upon us. For example, intelligence needs to be nurtured and many potential geniuses in all fields never develop, but the best of environments won't allow most of us to catch up with someone like Einstein whose brain had a capacity for extraordinarily rich connections between the higher regions of the brain.

Our DNA has a huge number of genes, not all of which are expressed or active. Manipulation of transcription factors allows changes in the population of expressed genes and also allows changes in some details of expression. Manipulation of an embryos transcription factors can basically allow manipulation of the attributes of that embryo, such as intelligence or strength. To be sure, it would be easier to make a potential Einstein dumb than it would be to turn the average embryo into an Einstein.

And so scientists are a bit closer to the goal of manipulating the expression of genes. In this case, the goal is to produce cells with all the properties of embryonic stem-cells and to produce them from cells in the body of the patient. In a morally well-ordered society, this would be good news. If similar techniques can work on human beings, doctors could produce healthy stem-cells from our own bodies to replace cancerous blood or bone-marrow.

Transplanting embryonic cells derived by moral methods could be unqualified goods in treating Parkinson's and other diseases where such cells can be implanted in damaged regions. Not all diseased organs can readily use those types of cells to replace damaged cells, but I've been following these medical research programs at a casual level and it seems to me that brains show signs of being able to do so. There are techniques for growing certain 'body-parts' including heart-valves and probably blood-vessels and the production of embryonic stem-cells from the patients own body would reduce rejection risk among other benefits.. Undoubtedly, embryonic stem-cells derived from cells in our own bodies could be used to treat many medical problems.

The techniques themselves would seem valuable as the reader could gather from my discussion above. If the activity of specific genes could be modified or even shut-down, a condition like Huntington's could be better treated. The mutated genes (so-called stutters or dangerous repeats in the case of Huntington's) could possibly be shut down and healthy genes perhaps inserted. Possibly the mutated genes could even be altered to a healthy state. Maybe immune cells could be grown from those embryonic cells to fight specific pathogens—we all have immune systems which are weak against some bacteria and viruses and strong against others.

This is where bells and whistles should be going off in our heads. The technology that manipulates genes to ease or heal diseases is the technology that manipulates embryonic human beings to produce creatures more useful to the powerful. Complacent masses of stupid and strong human beings could be produced for going down into the mines or out into the fields. Human beings with high levels of talent could be produced in states where they would be wholly dependent upon their masters or unlikely to rebel because of physical or emotional crippling.

There are two kinds of technology: that which is inherently evil and that which is potentially evil. This is, of course, looking at the glass as being half-empty but we need to start looking at the potential for evil in the best of our technology. The potential for evil in any technology is clearly high when society is not morally well-ordered. If we are to have a moral society, we have to put moral order, what is right, first. We have to be willing to forgo the short-term benefits of some potential technologies, to delay the implementation of other technologies if we're unsure of their moral status, and to simply constrain ourselves to the appropriate use of all technologies.

And don't accept the self-praise of scientists who claim they're more

moral than other ‘classes’ of human beings. As I pointed out in my book, *To See a World in a Grain of Sand* [41], the actual behavior of scientists, and engineers, in modern times have shown they’re willing to develop dangerous or even evil technology so long as they’re well-paid and sometimes so long as their more favored research is funded. Let the wealthy and powerful throw gold coins in the much of the sty and scientists and engineers will be there alongside MBAs and lawyers to get what they can. This is true of all of us. There are factories dedicated to the production of chemicals useful only for burning human beings alive. It took the combined efforts of scientists, engineers, financiers, government regulators, plumbers, electricians, common laborers, and many others to build and operate those plants. And some in each of those categories have the integrity to refuse to work on projects with evil goals or even evil side-effects.

Right now, scientific and technological research has become a loose gun from a moral viewpoint. Morality doesn’t rule—the chance to make a financial killing draws scientists and engineers onward as it also draws politicians and businessmen and lawyers and those who play the lottery. We’ve become the Americans described all too well by the novelist Wallace Stegner: we’re rootless in a profound way and will spend our lives moving towards some illusory big deal, some big rock candy mountain. Right now, stem cell technologies seem to be awfully big and sweet. It’s likely many huge fortunes will be made and we no longer even have a way of speaking about right and wrong in our public discourse.

## 362 What to Do About Our Wrongful Priorities?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=79>. It was finished and uploaded on 2007/06/19.]

In terms of the Christian worldview I've developed, our duty can be stated clearly: we must learn how to move with the grain of Creation. We can't do so by way of simple recipes, but there are some guidelines, though there is one major problem that few recognize and for which there is no proposed solution. I'll discuss that last.

First, we have to re-gain a proper Christian perspective of our own minds. We have to develop those minds, not just use them to recycle prejudices which were once plausible but no longer are in light of modern empirical knowledge. By advocating systems in which revealed truths are mixed with ancient and no longer valid forms of knowledge, we cast doubt upon those revealed truths. We most certainly don't want to pick up the newer and quite impious prejudices which are held by the modern secularists who have all the intellectual and spiritual vices and few of the virtues of their Enlightenment fathers, but we can't let ourselves be chased out of God's world into some sort of illusory supernatural world which doesn't really exist. We have to learn how to think creatively and how to think in a properly disciplined manner. We have to be willing to honestly confront the new knowledge coming from quantum mechanics and astrophysics, evolutionary biology and neurobiology, history and economics. We have to remember that these are modern developments within the very sciences which St. Augustine of Hippo and St. Thomas Aquinas—among others—tried to integrate within what I call a worldview. There is no special piety attached to fifth century biology or thirteenth century astronomy nor even

to the speculations based on those ‘specific sciences’ as Aquinas labeled them. There is great value even in the world-oriented speculations of Augustine, Aquinas, and other Fathers and Doctors of the Church as there is in the similar speculations of the great Hellenistic philosophy.

We have to remember that faith is necessary for understanding, but we must make that effort to understand Creation as well as God’s self-revelations. Otherwise our faith will leave us strangers in God’s world. We will be disoriented ourselves and our children may well drift away. We claim to have a special relationship with a God we proclaim as the Creator of this world and then we’re indifferent to that world, but more and more we’re also indifferent to God Himself. We care little about science, history, mathematics, and other forms of human knowledge which have expanded so much in recent centuries. We expound systems of theology based upon ancient systems of thought which aren’t wrong so much as they’re far too small to be useful in describing God’s Creation as we can now see it.

A Christian worldview is made up of empirical knowledge and speculative knowledge as well as revealed knowledge and it’s speculative knowledge (including metaphysics) which binds the system together however much revealed knowledge is the most important of all. A worldview gives us a concrete and human way of understanding God’s purposes and of understanding how we must live to play our role in meeting those purposes. It’s somewhat amazing at first to discover that a Catholic theology which utilizes modern empirical and speculative knowledge leads to a ‘proof’ (that is, a successful test of the consistency) of the revealed truths of Christianity. Theologies, such as those of Augustine or Anselm or Aquinas, which utilize older and now discredited empirical and speculative knowledge provided equally valid ‘proofs’ within the context of those earlier systems of knowledge of Creation.

We can ascend through Creation, considering empirical knowledge as being natural revelations of God acting freely and contingently as Creator, and we reach the Transcendent God revealed in the Bible inside of stories and then systematized and clarified in the Creeds and other core teachings of the Church. We must always be careful to protect our understanding of God’s freedom, of His necessary Being, of His all-powerfulness, by recognizing that He didn’t have to create anything. Given that He did create, He didn’t have to create any specific Creation nor did He have to shape this particular world.

Second, with our revived minds including our better stock of knowledge,

we have to make the effort to truly think our situation through and to foresee possible problems. Somewhere I read about a warning made by a radical secularist in the early 1800s when marriage was first becoming a matter of civil law. He warned his Christian friends that when the state regulated marriage, it would regulate it to its own purposes and not to Christian moral purposes. It took 200 years for that warning to really hit home and... It still hasn't. We Christians are expending a great effort to return a non-Christian society to Christian standards of behavior at a time when Catholic requests for annulments are swamping the diocesan bureaucracies and divorced Protestant ministers are far from a rarity. Under these conditions, Catholics fighting for a married priesthood are effectively fighting for a divorced priesthood.

Western societies are no longer Christian in any true sense and this has occurred at least partly because Christian leaders have been stupid and cowardly and have sold out their Lord for short-term advantages. Christian leaders are not unique in this: union leaders made their peace with large corporations which then turned around and began selling jobs overseas to fund their bloated executive pay packages and to allow the Wall Street investors to cash out all those productive assets which belonged to our children. But the union members who held their jobs and those on retirement plans also did well—the union retirement funds were very large investors in those firms which sold the jobs of young and unborn workers—and more than a few gray-haired workers a little too young to have benefited from the fraud.

Third, we have to stop being hypocrites. We claim to be carrying our crosses when we bear natural ills of the sort born nobly by many dogs. Far too often, we claim to be carrying our crosses even when we're accepting the benefits of a medical system which is increasingly evil by Christian moral standards. We truly carry crosses when we voluntarily take on sufferings or hardships for the sake of God and God's children. And we're not preparing ourselves for the likelihood that we're entering a new period of martyrdom, but one unlike any yet seen. We'll have to be willing to accept a proper Christian death rather than to enter the buildings of a medical system already heavily compromised by abortion and research on embryos or parts torn from embryos, by gratuitous levels of painful and degrading research on our fellow-animals. Whether we are morally corrupting ourselves by torturing monkeys or rats to ease our own pains is an open question but I suspect that such experimentation trained doctors and scientists to ex-

periment on human embryos which don't seem so much different from the embryos of those monkeys and rats.

Fourth, we have to deal with a moral problem which isn't new so much as it's intensified seemingly beyond solution by modern technology, communication and transportation, and the political and economic systems which that modern technology has made possible, nation-states and industrial capitalism. Arguably, these systems developed by inevitable processes because of our gigantic moral problem:

We are creatures whose moral natures are adjusted to families and tribes and other small groups and yet we live in political and economic marketplaces which span nearly the entire globe. We don't know how to organize the institutions of those marketplaces to meet moral goals and our 'best and brightest' experts say it's immoral to impose moral structures on agencies which they favor.

Right-wing liberals wish to place constraints upon the political gods of the marketplaces and left-wing liberals wish to force the commercial gods of the marketplaces to act towards certain goals which are often noble in themselves. Each one thinks it wrong, even immoral, to place moral demands upon their favored gods, and an absolute necessity to place moral demands, of abstinence or directed activity, upon the gods they don't like so well.

We've lost control of our lives because we live in environments to which we're not suited. We've shown little capacity for organizing large-scale institutions, governmental or private, which retain moral structure as they grow. And, as they grow, as money and power accumulate, our governments and corporations start attracting men and women who place a high priority on money and power. This is why I call those institutions 'gods'. They are formed as if by the magic of an invisible hand but actually by man's social interactions. The trouble is that our ways of interacting are proper to the formation of moral communities at a level where nearly all members are in flesh-and-blood contact.

I don't know how to deal with this fourth problem, even in theory. I speak of re-establishing local communities and that is necessary. We need to rebuild truly moral human lives and those have to take place in environments in which the normal human being can live a moral life. Few

of us have the moral courage or strength of Cato or George Washington, Dorothy Day or Pope John Paul II. And, yet, our populations are huge and currently are being fed only by the beast itself. I don't know what suggestion to make to turn us towards some sort of a society where most of us live normal human lives and no one is allowed to live at levels of power or wealth which allow them to treat others, or the earth, as mere objects to be manipulated for political or financial goals.

Over the course of my remaining years, I'll try to deal with this problem, among other interesting and important problems. Prayer will be as important as study.

## 363 Rules of Life

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=80>. It was finished and uploaded on 2007/06/29.]

Catholics and others interested in the history of European culture know that religious orders are governed by rules of life which are devoted mostly to practical aspects of regulating our lives that we might better serve God and our local communities. For example, St. Benedict, who'd set out to be a hermit, couldn't drive away the men who wanted him to be their leader and he was forced to produce a rule of life for the first community of monks in the tradition named after him—the Benedictines. Yes, the liqueur is named after the religious order because they invented it amongst many other foods, drinks, and technological items in pre-modern European history. Despite the prejudices that tell us those Medieval monks were superstitious men, they were actually the ones who safeguarded and enriched and passed on much of the Roman culture during some difficult years of political, economic, and social breakdown.

*The Rule of St. Benedictine* was the key to forming men into monks who were parts of communities which functioned like well-disciplined military units. It wasn't like the modern age where those who accomplish much can assume fame as a reward—we know few of the names of those who accomplished so much in the various Benedictine institutions. There were other orders which had rules of life to help them carry out their duties to God and man, including many in the Eastern tradition whose rules actually preceded that of St. Benedict. In fact, St. Benedict wouldn't have claimed either to be shaping the future nor to be original—he borrowed much from the Desert Fathers of the East and put together an eminently practical rule to allow men to live properly ordered lives. And women had started to form communities under the same rule even during St. Benedict's lifetime.

I emphasize the word ‘practical’. The *Rule of St. Benedict* contained rules for advancing the spiritual life, rules very similar to the 12 rules of modern programs to help alcoholics and other addicts. They’re not the same, but very similar, making us wonder if the path towards holiness might involve the breaking of habits of mind and body as dangerous as those of alcoholism. But St. Benedict wasn’t a teetotaler, even though he wouldn’t have encouraged excessive drink. How do we know he wasn’t a teetotaler? One of the concerns of the *Rule of St. Benedict* is the fair sharing of the wine: brothers who do the physical work should get the greater share rather than the abbot and the cellarer (manager of provisions).

Practical. We all need practical guidelines to become God-centered human beings and we modern human beings are trained to think in ‘spiritual’ terms when it comes to our duties to God and to our fellow-men as children of God. Vague claims of deep love don’t feed our neighbors as we were told in the James and those vague claims don’t discipline our prayer-life or rebuild our ties to family members, neighbors, or friends. Sometimes, raising some aspects of life to a spiritual level is a good strategy for making them irrelevant. This seems to have been the case in recent centuries for those aspects of life which ground the more complete God-centered life.

I’m working out my thoughts as I write but I’m going to publish this right away because I think there are no rules that cover all needs but I think there’s a need for each human being who wishes to be a Christian to pray hard on this issue:

How should I be living to better serve God and neighbor?

A Christian life should be balanced between:

1. Meeting practical needs;
2. Prayer and worship;
3. Serving our fellow-men, perhaps mostly our own children especially when they’re young; and
4. Enjoying God’s Creation.

All Christian religious orders, which usually have some sort of lay membership, have tried to balance our duties to worship God, our practical

needs and those of our dependents, and a proper human desire to enjoy life. Benedictine monks try to develop lives centered around the worship of God but often they've done that partly by serving God's people as teachers or lawyers or engineers or benevolent land-owners. Some monastic orders have harsh ways of life, but that's a special calling and not one to be undertaken without careful discernment.

We are finite human beings and we need to learn the wisdom that is part and parcel of the ways of formation and of ongoing life in the stable religious orders, even those which are currently troubled to some extent—sometimes a great extent. Each of us, not just those of us who are Christian, needs to sit down quietly when we come to feel our lives are out of control. We need to think as if we were discerning a call to some form of religious or missionary life. That's not far from the truth because any sort of Christian life will share some aspects of eremitical life, some aspects of monastic life, and some aspects of active religious life (such as the life of teachers or medical missionaries). I don't think that Jewish life is much different in this regard, nor Buddhist life, nor the life of a virtuous pagan—of whom there seem to be few in the modern world outside of military organizations.

Originally, I'd intended to give some specific guidelines for rules of life. I decided to hold back mostly because I'm not yet confident I can recommend any guidelines for establishing a rule of life appropriate to anyone—even myself. In some ways, I've isolated myself from mainstream life because I don't have a normal job or a family of my own and yet I'm not a vowed celibate or member of a lay community. There are reasons for my somewhat strange situation and I suspect there to be many men and women in similar situations in this day and age though most are probably forced to hold a conventional job and to live as if they truly feel a part of this Promethean world in which men think they can make laws rather than obeying either God's few directly revealed laws nor that greater body of laws which can be read—with much difficulty—from His world. Somewhere, I believe in a book by Bertrand de Jouvenel, I read that Rousseau once warned that when men come to think they can truly make laws rather than interpreting the laws of God's nature, then hell will break out on earth.

The only way to return this man-made hell to a truly natural state is to turn to God, open our ears to the sounds of His world, and start to live according to His natural and scriptural revelations, most especially those revelations which came to us in the life of our Lord Jesus Christ.

I would encourage any who read this to think about modest but serious

changes to their daily and weekly schedules. Don't think about your ultimate fate beyond this world. Don't even get excited about noble ideas or feelings. Think practically. How should we regulate our eating habits, our working habits, our reading habits, our athletic and music habits? Wendell Berry, farmer and Christian thinker and environmental essayist and poet and novelist, has told us we'd solve our ecological problems more or less automatically if we could find moral ways to make our livings. I think the same could be said of our moral and spiritual problems and I suspect Farmer Berry would agree.

I realize there are various third-orders, laymen's associations, and local clubs which try to help various men and women and children to live Christian lives in the midst of a world which is increasingly disordered. I don't think they're up to the task, but I'm open to good arguments to the contrary and I certainly would encourage anyone to join these various prayer groups and social action groups and others with noble goals. Mostly, I'd like to encourage all of us to start thinking towards the specific goal of organizing our lives to be as Christian as possible given our circumstances. If that's not good enough, then we start thinking in the terms given us by Farmer Berry: how can we make our livings so that we can live God-centered lives? I suspect we're going to be driven to that because it is that 'practical' question of making our living that will drive our lives and our moral problems, and ecological problems, seem to indicate we're not making our livings in moral ways. We can't just accept jobs and careers offered us by the gods of the marketplaces and then think we can organize our family lives, our worship, and our recreation in moral ways.

In other words, if you feel the need to re-orient your life and the lives of those dependent upon you, don't think of spiritual goals or ethereal landscapes: think of your day to day lives and how you make your living, how you shop, how you enjoy your leisure time.

# 364 Human Rights Should be Restricted to Human Beings

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=91>. It was finished and uploaded on 2007/08/27.]

I'm not arguing against proper treatment of animals and, in fact, I'm not arguing about animals at all. I'm arguing against the extension of human rights to corporations which began at least in spirit as long ago as Abraham Lincoln's successful arguments before the Illinois Supreme Court when they decided that state-chartered corporations were not bound by local laws and ordinances if those restricted the 'rights' of corporations under their charters. Since both local political entities and state-chartered corporations are creatures of the state government, this wasn't an illogical decision, and it may have been the right technical decision. If so, a legislature dedicated to a democratic republic should have changed the law.

Somewhere, Bertrand de Jouvenel, a classical liberal himself, points out: when General Motors have the same rights as you, they have more rights than you. And the use of plural pronouns for General Motors isn't just a European eccentricity, it's a recognition of the true nature of a corporation. It's a gathering of human beings for a common purpose. In the United States, such gatherings are usually chartered by a state government or the national government. Far too often, corporations are no longer gatherings so much as they're shields to allow morally irresponsible investors and executives to benefit from amoral behavior punctuated by increasingly common acts which are downright despicable.

In *From Cottage to Workstation* [17], Allan C. Carlson presents evidence that various sorts of cooperative arrangements worked as well in the early years of the Industrial Revolution as industrial and financial corporations.

It's not clear why corporations overwhelmed other arrangements, though some partnerships survive and even prosper in some parts of the American economy. It's not clear, but I hold the theory that corporations have one major advantage over other sorts of ownership arrangements: individual decision-makers and passive investors are shielded from personal moral responsibility for their actions. In many cases, they're shielded from personal legal responsibility.

I don't believe that either corporate executives or government officials are smart enough to be running a conspiracy but it has worked out just as well as if it were a managed conspiracy—call it the sinister invisible hand if you wish. That 'unconscious conspiracy' reached its plateau with the New Deal of the Roosevelt administration which made the United States safe for large corporations by making individuals dependent upon the Federal government, 'freeing' Americans from dependencies upon family, neighborhoods, church communities, fraternal associations, and so forth. Americans were 'free' to move wherever a corporation moved the jobs to. Without Social Security, they would have remained close to the families they depended upon, but we have all decided we'd prefer to be dependent upon the Federal government rather than our families and neighbors and church communities.

Pat Buchanan, a moral man dedicated to the defense of the American middle-class and working-class, has written a good discussion of the dismantling of the US corporate economy—see <http://www.chroniclesmagazine.org/?p=294>. As Mr. Buchanan points out, we Americans enjoyed some very pleasant decades as an alliance of corporate interests with our national government produced prosperity without taking away the freedoms Americans truly desired and without acting aggressively to destroy families and local communities. We seem to have reached the end of the line in this regard as corporate decision-makers are finding it hard to generate the profits to satisfy Wall Street and to pay themselves huge bonuses – for a while, they've been generating false profits by selling American productive assets and jobs to countries with cheaper labor costs. They may have now reached the point where they have to outsource all professional jobs and all but their own management jobs to keep the scheme going. They may have also reached the point where many of these companies are only nominally American. If all the work, including management, is being done in Shanghai, formal incorporation in Delaware may be about as meaningful as formal incorporation in Aruba by an American

insurance company or bank. Let the government of Aruba try to tighten up regulations or increase taxes and we would see how meaningful corporate domicile is when assets and workers are somewhere else.

Many of us Americans have realized in recent years that our country is about to hit some sort of bottom. I suspect we're in a situation more analogous to the collapse of the Roman Republic into the Empire rather than the collapse of the Roman Empire 500 years or so later. This sort of a collapse from a democratic republic into an empire was made possible by the conversion of American privately held assets into corporate assets and to the corresponding conversion of all economic activities into public activities. These conversions exposed all American economic activities to taxation even services once provided by mothers to their children, by adult children to their parents, by neighbors (perhaps in exchange for a couple beers or a bag of home-grown peaches), and so forth.

In any case, this has all become possible because of the extension of hard-won human rights to corporations. There are some who call themselves conservatives while being right-wing liberals and those often glorify the Supreme Court of the 1920s for making it official that corporations have human rights in the U.S. The left-wing liberals prefer to glorify the next period of government activism, the New Deal. In fact, the Judicial activism of the 1920s on behalf of corporations and the Executive/Legislative activism of the 1930s on the behalf of the welfare state were two wings in a single movement, however unconscious on the part of those who led the herd forward.

I doubt if Americans have the heart or the guts to force any true reforms upon our country. Given that our productive assets have moved overseas and the government has all the powers of a police state, there probably is little we can do to stop our final collapse to a full-fledged empire. To refuse to accept our roles as citizens of the American Empire would be the same as accepting our role as impoverished creatures unable to feed ourselves or to supply ourselves with clothing or good shelter. But we can be happy to know the number of millionaires and even billionaires has exploded in the United States and in the world as a whole.

Maybe we can't do much to save ourselves or our children from either proletariat status in an empire or from extreme poverty—the natural resources of this country are great but few there are who can grow food or butcher animals or make soap or make clothing. I'm not advocating each household return to some primitive self-sufficiency but rather a certain sort

of regional self-sufficiency expanded from the current recommendations of the 'eat local' movements.

Our parents and grandparents shouldn't have allowed corporations to grab hard-won human rights. Seeing the early stages of decay into an empire, we should have had the guts to fight the situation when we could have won that battle. And, yet, those were pleasant years as we slid down the slippery slope. True it was that even the most decent of Doris Day movies was enticing us to live a life-style a little better than was healthy for us and our children and the Cleavers lived oddly apart from any relatives in a town that seemed to have been manufactured rather than being a result of some human history. But we didn't have enough money to harm ourselves too much and extended families and other local communities were dissolving slowly and mostly in the interests of a better climate in California or a good job in Westchester County. That didn't seem so evil.

As they were helping us to free ourselves from some drudgery of a more locally sufficient life, the American governments, the corporations, and the unions were working hard to grab assets from families and local partnerships that they might be used more efficiently. Several generations of Americans benefited though it now seems that we were selling future generations of Americans into slavery or poverty, or both.

Few are the commentators or public leaders ready to acknowledge that a moral economy is dependent upon the decision-makers being morally responsible for their actions. We shouldn't have granted those hard-won human rights to corporations.

# 365 Crises in the History of Christianity

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=106>. It was finished and uploaded on 2007/08/30.]

There are actually three crises which concern me:

1. The attacks upon Christianity as being the cause of the decay of the Roman Empire—which Gibbon and some other modern scholars revived. I believe these attacks in their original form peaked sometime before the theological career of St. Augustine, Bishop of Hippo in North Africa, but they remained largely unanswered when Augustine took on that task. The charges against Christianity were closely related to a general pagan assault upon Christian beliefs which portrayed Christianity as a dark religion which taught the world is evil. Some cultured pagans thought of Christianity as being an enemy of human civilization. St. Augustine wrote *The City of God* to counter this attack. This counterattack had more positive content than the ways of thought defended by Celsus and the other pagans and that Augustinian synthesis of the Bible and the best of pagan thought provided much of the form and content of Christian thought in the centuries since.
2. The loss of respect for the mind in Christian thought which occurred, oddly enough, at the end of the High Middle Ages, approximately 1050-1250. This is odd because that age was one of the intellectual high-points of human history—philosophy and theology were thriving and so were optics and statics and even evolutionary biology to some small extent—St. Albert the Great, the teacher of Aquinas, was

overly enthusiastic in seeing the transformation of one species into another [24].

St. Thomas Aquinas mounted an effort to make sense of Creation in the light of God's revelations—though he was, to be sure, more concerned with God's revelations. This effort was partially directed against the advocates of the view that preachers needed only to be 'spirit-filled'. Well-developed minds were at best optional if not actually harmful to evangelical and preaching duties. Some scholars think that Aquinas wrote *Summa Contra Gentiles* to foster respect for Christianity among non-Christians who apparently thought of Christianity as a collection of superstitions.

3. The fragmentation of knowledge in the modern world where Christian thinkers and spiritual leaders have shown themselves incapable of providing a unified account of God's Creation in light of His revelations. The best most can do is to wave their hands weakly and say, "There is no contradiction between the first verses of the book of *Genesis* and modern physics, no contradiction between the story of Adam and Eve in the book of *Genesis* and evolutionary biology."

In fact, we modern Christians live in a world of multiple systems of truth which is impossible if the God of Jesus Christ exists. Mere assertions by the shepherds that those worlds are ultimately one or weakly compatible seem meaningless to many of those sheep who are wandering away, including all those young men and women who watch documentaries on our apish ancestors without having a way of seeing a story which includes both those knuckle-dragging creatures and Moses in front of the burning bush.

Take an intelligent young woman, well-formed in her faith, whether Reformed or Lutheran, Catholic or Orthodox. Put the Bible in front of her along with a pile of popular science books, pre-selected to screen out those with ideological biases. Let's assume there's a book on the so-called paradoxes of quantum mechanics, one on the evolution of human morality, one on cosmological physics. Let's see if she can readily see those science books as being compatible with the Bible.

This fragmentation is at least partly, I think—almost entirely, the result of that loss of respect for the mind on the part of Christians as Christians, even those who have minds well-developed to the needs of their vocations in the sciences or literature or business or other fields. And then there

are the specialists in theology or pastoral care who seem mostly indifferent to the empirical knowledge of God's Creation except when it's put into sound-bytes on a televised documentary with lots of colorful images.

I've tried to address this need for a story of empirical reality in light of Christian truths, starting with my first published book, *To See a World in a Grain of Sand* [41], and going on to many postings on my blogs. In Chapter 567, I write about my motivations in this effort. Only time will tell if I've made a serious contribution to filling this need for a Christian worldview, but I hope I've at least asked a few of the right questions.

I'll wrap up by talking very briefly about what happened with the earlier two crises:

1. St. Augustine of Hippo successfully provided a story of human history (including the physical and biological sciences of his day). This led into the formation of Christendom during the Middle Ages. Whatever one might think of a triumphalist Christian politics, there's no denying the accomplishments of the Medieval Church, starting with the saving of Roman technology and various bodies of ancient knowledge and moving on to the formation of uniquely Christian cultures that were as rich and accomplished as any in history.
2. The efforts of Aquinas to salvage the Christian mind failed. So far as his thought goes, two of the greatest of the modern Thomists, Etienne Gilson and Alasdair MacIntyre have both claimed that Thomistic thought was misunderstood or deliberately deformed for the years between John of St. Thomas, 1589-1644, and the late 1800s, but I don't see much evidence Aquinas was understood by many in those early centuries after his death in 1274. Franciscans at Oxford, such as Duns Scotus and William Occam, used powerful intellects to attack the idea that mind was important in Christian life and they seemed to have won then and now.

## 366 Creation and Freedom

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=109>. It was finished and uploaded on 2007/09/22.]

Henri Bergson tells us [10]:

Why, in other words, is not everything given at once, as on the film of a cinematograph? The more I consider this point, the more it seems to me that, if the future is bound to *succeed* the present instead of given alongside of it, it is because the future is not altogether determined at the present moment, and that if the number taken up by this success is something other than a number, if it has for the consciousness that is installed in it absolute value and reality, it is because there is unceasingly being created in it, not indeed in any such artificially isolated system as a glass of sugared water, but in the concrete whole of which every such system forms part, something unforeseeable and new. This duration may not be the fact of matter itself, but that of the life which reascends the course of matter; the two movements are none the less mutually dependent upon each other. [page 339]

I've tried to restore the Biblical sense that this world is a story being told by God and that leads me to be sympathetic with what Bergson is saying, at least what I think he's saying, though he frames the point in dualistic terms. As I understand him, he's claiming that there are two ways at looking at the one being of this universe, both looking at the same phenomena, one from a materialistic viewpoint and one from an 'immaterial' viewpoint, but his stronger claim is that time would occur 'all at once' in a fully determined

universe. I think his point is analogous to the claim made by some quantum physicists:

If there were 1,000 particles exactly the same, they would be the same particle.

Some sort of freedom of individual ‘things’ and also of individuals points of space and time seems to be part of a universe of development, a universe of stories. There’s a specific phenomena, not yet fully understood, which may provide an example of this. A press release from the National Institute of Standards and the University of Colorado (1995/07/13) starts out:

Physicists in Boulder, Colo., have achieved a temperature far lower than has ever been produced before and created an entirely new state of matter predicted decades ago by Albert Einstein and Indian physicist Satyendra Nath Bose.

Cooling rubidium atoms to less than 170 billionths of a degree above absolute zero caused the individual atoms to condense into a “superatom” behaving as a single entity, said Eric Cornell and Carl Wieman of JILA, a joint program of the Commerce Department’s National Institute of Standards and Technology and the University of Colorado at Boulder. [see *NIST/University of Colorado Researchers Create Bose-Einstein “Super Molecule”* found at [http://www.nist.gov/public\\_affairs/releases/super\\_molecule.cfm](http://www.nist.gov/public_affairs/releases/super_molecule.cfm). In the original blog essay, I relied on a press release no longer on the Internet. This reference is to a later article updating to later events.]

What’s happening, by some interpretations, is that those nearby rubidium atoms are put into the same physical state and become one atom in some important ways. It’s as if nature herself can no longer distinguish between these atoms in the same state. Also, for the benefit of those who had never followed these experiments: those scientists ‘froze’ those atoms by hitting them with lasers to hold them in place. An absolutely motionless atom would be at a temperature of absolute zero.

Returning to Bergson, I read that quote from *Creative Evolution* as a claim that a fully-determined world would happen all at once. The true state of the universe would be like a fully recorded movie – to use Bergson’s

own example. The universe, from a creaturely viewpoint, would be complete in the same way that a reel of film is a complete movie. Time is an illusion when a movie is shown to creatures such as us—each and every frame in a reel of a movie exists before you see the lion roar. A fully-determined world would be in a radically different state from that of an open world moving through time with some freedom—even if the formal laws of motion (such as those of Newton or Einstein) were the same in both of those worlds.

I think this is an interesting and fruitful attempt to explain why and how time is different from space though modern physics tell us they're part of one structure. Independent existence is important to each atom and to each point of space for our universe to be what it is, but time as we know it introduces freedom and openness of a special sort. It's not just a fourth dimension of space though it's a fourth dimension of a structure, the other three dimensions being space. There are speculative theories in modern physics which strongly imply that our world may have been created from something which has no time and no spatial dimensions as we know them. This universe may well be shaped from some strange stuff that I call the Primordial Universe. In the worldview I'm constructing, this Primordial Universe is a manifestation of the truths God chose for Creation, though there might actually be any number of phases between that Primordial Universe and the beginning of the expansionary phase which is this universe. That beginning is, of course, often called the Big Bang.

I'm circling around the immediate problem: why is time different from space? Einstein taught us that space and time are intertwined even to the point that current cosmological physics, based upon the general theory of relativity, ties together time and the expansion of space. Even if time were somehow created by that expansion of space, time is still very much different.

Our freedom lies in time. It would perhaps be useful, though ultimately wrong to say we are enslaved in our spatial dimensions. Our better understanding, intuitive and scientific, of space relative to our understanding of time is perhaps one reason for our difficulties in believing in our own freedom when we think in cause-and-effect terms, rationally thinking through our relationships to other things or living beings and even our relationships to physical forces. There might be lifetimes of philosophical contemplation in this problem, but I'll move on for now.

Time, at least in this universe, is tied up with entropy, a measure of the relative mix of order and disorder defined in terms of information science

or statistical physics—those two different approaches provide pretty much the same definition. Our freedom might be tied up with entropy, but that creates a problem for Christian thinkers, one I discuss in Chapter 191, *What are the Thermodynamic Properties of Heaven?* Actually, it points to a number of interesting problems we should welcome if we really value freedom, which has to include freedom of the mind in empirical matters.

This is not to advocate the false freedom of atheism or even agnosticism. It's not mind but a sense of gratitude and a sense of justice which determine if we believe in God in at least a provisional sense. A human being with a creative mind and a sense of gratitude will enjoy exploring God's Creation and his own relationship to God without feeling a need to be creative at the price of ingratitude. Nor will that creative thinker feel his faith threatened with the discovery of nasty parasites or poorly understood phenomena in deep-space.

As I try to move more deeply into the issues I've been exploring in my various writings, I'll be writing about open problems more than solutions. In many cases, I may not even have speculative solutions though I may have some to at least start off the process of thinking towards solutions.

If we were to do our best to open ourselves to God and His Creation, we'd accept problems, even welcome them instead of fearing them. The world is mostly a story being told by God, a morally ordered narrative, but we face puzzles often. It might well be that such a situation is necessary for creatures such as human beings to be free. Our freedom is maybe a set of learned skills rather than some sort of metaphysical attribute. If so, the learning takes place during evolutionary and developmental processes. In fact, we know that confronting difficult moral choices is a part of growing up—even in a well-ordered society where most questions are answered by a constrained set of options.

If freedom is for real, we should expect new problems to emerge, problems which deny solutions by our established ways of thought and behavior. John Henry Newman told us that even the most absolute of truths have to be continually restated because those truths are necessarily expressed in human words and concepts which are continually changing. I'm saying that our need to deal with changes in our concepts and language represent a still deeper need to deal with changes in our understanding of Creation. Moreover, I suspect that our difficulties in understanding Creation might point to a certain freedom in even the most frozen of physical entities in Creation. It's possible that our freedom lies in our interactions with our

environments just as much of our thought seems to lie in those interactions. (See Chapter 78, *A Review of Adaptive Thinking, Part I...* and the three succeeding chapters which contain the parts of a review of Gerd Gigerenzer's important book.)

## 367 Of One Mind

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=106>. It was finished and uploaded on 2007/11/24.]

In *The City of Man* [92], Pierre Manent tells us:

The experience of modern democracy puts before us a strange contradiction: democratic man is the freest man to have ever lived and at the same time the most domesticated. It will be said that the difficulty is quickly clarified: he can only be granted, he can only give himself, so much liberty because he is so domesticated. One has to ask how, since the dog whose contentment the wolf envies is not unaware of the collar to which it is tethered, modern man is so sure of being ever more free if in reality he is ever more subjected. [page 181]

The situation is still worse than we might first think. This domestication of modern, democratic man is related to the fact that he values a peace that can be obtained only by a uniformity of opinion. Manent discusses this problem elsewhere in his book. To my knowledge, the strong tendency of modern, democratic man to brainwash himself in the interests of mainstream views was first noted by Tocqueville in *Democracy in America* which was published back in the 1830s.

Roughly speaking, Manent's complex analysis boils down to the sad fact that the modern democratic system can hold together only if we are all tolerant of other's beliefs in such a way that we end up compromising our understanding of the 'good'. Effectively, we throw away the very concept of truth in order to live in peace with neighbors who hold a radically different idea of a good life.

Modern democratic man doesn't seem capable of the true tolerance which can allow the growth of Bohemias. That is, any Bohemias, existing or developing, will be turned into tourist centers complete with coffee-shops and T-shirt booths. Sexual perversion is domesticated so that Oscar Wilde becomes one half of Mr. and Mr. Middle-class America. Creative efforts which might be legitimate but are certainly dangerous, such as avant-garde music or literature, became subjects for grant applications to various sorts of suits who commute from exclusive suburbs to their comfie offices at the NEA or the Ford Foundation.

This ongoing and relentless effort to homogenize all thoughts and all ways of behavior results in minds and hearts of mush. After all, we're very particular creatures even in the way that we think about and live out the most absolute and transcendental of truths—for example, each cultural realization of any form of Christianity has different ways of submitting to the Creator. Even with the Mass to unite Catholics, Orthodox, and some other ancient traditional forms of Christianity, Roman Catholics who are Italian have different ways of praying from Polish Roman Catholics. The Coptic churches, Catholic or Orthodox or independent, are different from all other Christian churches in many of their ways. Benedictines have different ways of life from cloistered Dominicans and Calvinists find both ways to be strange.

What is the common ground for all of these manifestations of some understanding of Christianity? A sort of abstraction which requires no serious effort to be turned to easy-to-digest goop. Things get worse when we Christians try to talk to Jews as if we don't really believe Jesus of Nazareth was the Son of God. The goop becomes still more bland when we try to find common ground with Buddhists and Hindus and animist pagans.

This isn't an argument against tolerance. In fact, I'd favor an open-mindedness which doesn't turn Puerto Ricans into wannabe middle-class white Americans who dress in funny and colorful clothes a few times a year. Aren't those spicy foods so interesting? And that music has such a good beat.

Me? I listen to so-called World Music radio shows every so often and I can appreciate music from Puerto Rico and Senegal and the various tribal lands of South Africa partly because it's so exotic and partly because of the similarities which often show with an ethnic form of music to which I have truer attachments—Celtic music. Some of the revivers of Celtic traditional music learned how to play percussion instruments with bare hands from

Africans or Jamaicans.

All forms of ethnic music, all forms of literature are in danger in our world. Democratic man would turn them all into mass-merchandized products. All ways of life which are interesting and rich are in danger of becoming villages at some theme park.

# 368 Good and Evil: Simpler Than We Pretend

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=118>. It was finished and uploaded on 2007/11/30.]

More than 1500 years ago, St. Augustine of Hippo told us that evil was not a positive force but rather a privation in being. He reasoned that all being comes from God and has to be good. He had, so to speak, a devil of a time justifying the existence of Satan, a being who was totally evil because Satan's substantial being couldn't be evil because it comes from God but Satan could will to be evil because his will comes from. . . Never mind.

It's quite true that being comes from God and has to be good. What we Christians haven't yet learned from St. Thomas Aquinas and from the subsequent explosion in empirical knowledge is:

Substantial being in this universe is not immutable. At any given time, it exists in a specific state but that state evolves through time—to better or worse states. And most complex things or living creatures are born in rather vague states where they are bundles of potential more than particular entities.

A human being isn't born with a sturdy moral backbone. He develops one through proper exercise just as he strengthens the bones of his legs by stressful exercise such as running or playing tennis. I wish I had a much stronger moral backbone and I fear that I'm nearly an invertebrate in some ways. I was raised in the United States, the great Melting Pot—where boys are melted down so they can flow into the mainstream so good a target of profiteers—political and commercial alike. You shouldn't expect those boys to emerge from that pot as men with sturdy spines. What you

get are the sorts of creatures which Adam Smith feared might emerge in a prosperous society centered on commercial activities—men genial and having little moral integrity.

Is it so bad to be living in a society of genial men and women? Ask the Jews who survived the Holocaust. In a series of frightening books, Hannah Arendt, the Jewish philosopher and historian, was forced to the conclusion that most of the evil of the modern world was carried out by nice, middle-class men. The dedicated Nazis were too stupid to carry out such a complex operation as the Final Solution. Heinrich Himmler quietly disobeyed Hitler's orders to fill the good jobs with true Nazis and instead provided good careers and benefits packages for the likes of Adolf Eichmann, a man that Professor Arendt described as one of the nicest men she'd ever met. It was his misfortune to be in a job where he had to round up Jews and transport them east. He felt sorry for them and, when it had been possible, did his best to allow them to escape the roundups. Eichmann truly couldn't understand why so many Jews, and others, hated him so much that they hunted him down in South America, kidnapped him, and transported him to Israel for trial. By the time, he was hung, those prosecutors and interrogators who had worked on his case, as well as those few like Hannah Arendt who'd been allowed to talk for him, had to face some difficult questions. How could such a nice man have done so much evil? How could he have so efficiently and so energetically applied his logistical and bureaucratic genius to an evil cause which had actually disgusted him?

Perhaps being nice and genial isn't enough? Perhaps it takes a bit of backbone, some guts, and a bit of stuffing in the chest to do what's right when a price is to be paid? Perhaps we should be raising boys to have the courage appropriate to men and girls to have the maternally directed courage appropriate to women? Females are probably in better shape, all else being equal, because experiments have shown that the hormonal flows after giving birth will reshape the brains of females of other species of mammals and there is general evidence that human mothers also go through drastic changes of this sort. A modern mother might well go against her upbringing and defend her children to the death long after the modern father has cut and run, perhaps to go overseas in uniform to defend the interests of his masters.

We aren't born saints and we aren't born with moral integrity. The virtuous pagans of the Roman Republic worked hard to toughen up their sons as did other pagans such as the Apaches. I could imagine Geronimo

converting and becoming a martyr for Christ while I have trouble thinking of the typical Christian priest or minister accepting the sufferings inflicted on the early martyrs. I can imagine Geronimo telling Hitler to go to hell while so many clergymen and other baptized Christians collaborated with the Nazis to keep alive their careers, to be able to pay their bills and take care of their children, to retain their social standing. Are children better off receiving toys and nice clothes through the paychecks of a Daddy who's a cowardly collaborator with evil?

Robert McNamara speaks in similar ways of genial men without moral integrity in his book about how bad things really were in the war of the American government against the Vietnamese: *In Retrospect: The Tragedy and Lessons of Vietnam*. He was allowed access to the Johnson and Kennedy libraries and found facts that confirmed his worst fears: he and the other top American officials had been conducting that war as if a business venture, worrying about to-do lists and career prospects, while forcing American soldiers to systematically wage a brutal and criminal war against the civilians of South Vietnam, the supposed beneficiaries of our fighting. The evidence that the war was being conducted in a criminal manner was in reports and memos sitting on the desks and conference-room tables of those nice men in Washington. I think we should worry a lot about the image of nice men conducting a criminal war from comfortable offices in the United States and then driving home in their nice cars to their nice houses in nice neighborhoods. And what nice meals they'd eat that evening as they gathered with their nice wives and nice children. Enough said.

And yet we follow that most modern of all theologians, Flip Wilson, in his pontifications upon the cause of the evil we do: "The Devil made me do it." The modern Devil, at least the one resident in Europe and North America, is a cowardly and spineless sort of demon who can be seen very easily: walk over to the mirror and look at the wretched coward you've become so that you can be a better citizen of the marketplaces of the modern world.

A traitor to your own children whose brains and souls are twisted and deformed by the entertainment industry and other exploiters while you're so willing to send young men off to take rifle in hand and go kill strangers on the other side of the globe when it suits your owners in Washington. A traitor to God, you serve the gods of the marketplace so enthusiastically in your work and your consumption while begrudging a little time and effort to your Creator. Still more a traitor to your children, you raise your sons

to be as spineless and as prone to violent desires as you sit and watch men brutalize each other on the football field or in Rambo movies.

We're born as bundles of possibilities, and each of us is shaped into a particular form by our responses to our environments. We're born as battlegrounds of order vs. disorder in a world which is a larger scale battleground of the same sort. It's our job, as pagans honoring Nature or—far better—Christian honoring Christ, to choose order, to order our internal being and, consequently, our future actions even when we are surrounded by disorder, even when that disordered environment extracts a great price from us. The same baby boy might grow into a coward prone to collaboration with evil or into a man with at least some excuse for a spine, a man who at least truly desires to do what is right even when a great price must be paid. Maybe that baby boy could even be raised to be a noble and virtuous pagan or—far better—a saint.

The world of God is naturally good in its substance but moral goodness has to be developed. We have to work to develop our moral integrity, our moral spine, the stuff in our chests as C.S. Lewis might have said. A morally evil human being is the result of a failure for moral goodness to develop in that human being. He is impoverished in his moral character. There is privation in his human being but he might well be as nice as Adolf Eichmann.

Moral goodness is not something we simply fall into so long as we don't murder or rape on a regular basis. Moral goodness has to be chosen as a goal. It has then to be nurtured with the realization that we might have to pay a big price to do what is right.

It's been said that all that's necessary for evil to conquer is for good men to do nothing. It would be far more accurate to say that all that's necessary for evil to conquer is for men to fail to pay the price to become good men. Goodness is a much deeper matter than the superficial signs of niceness and decency. It's not something we fall into but rather something we have to choose.

## 369 The Instability of Evil

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=120>. It was finished and uploaded on 2007/12/05.]

In Chapter 368, *Good and Evil: Simpler Than We Pretend*, I noted that St. Augustine of Hippo taught that evil is a privation in being rather than a positive substance. I also noted that a creature in this universe, this phase of God's Creation, is not a firmly defined being of immutable substance but rather a series of states of being which necessarily change as that creature moves through time. We're not creatures formed once and for all at our conception, creatures who then move through God's story, dying as the same creatures we were at conception. We're creatures who are formed by our participation in God's story, by our responses to our environments, including our fellow-creatures, and by our responses to God.

If evil is a privation in a creature which doesn't have immutable substance but rather a past, present, and possible future consisting of states of being, then we would expect a creature who chooses evil to be unstable, moving through a biography which is a story of decreasing order and coherence, of dissipation of being. Death would seem to be the fate of all deprived being, the fate of all entities which are not their own act-of-being. A radical deprivation of being would seem to imply a relatively rapid death. A lesser deprivation of being would allow a more natural movement towards natural death, and a lesser deprivation is the condition of all creatures in this universe. Any possible fullness of being comes from Christ infusing Himself into us, from Christ making us part of His Body.

St. Augustine had a way of justifying the continuing existence of those who choose evil, during this mortal life and in a never-ending Hell on the other side of death. He speculated that Satan, and evil men, have good substance which comes from God but a free will which is somehow independent

of God as it chooses evil.

Unfortunately for that line of thought, modern brain research places the will, actually our entire moral nature, firmly in our biological substance. (See *How Brains Make Up Their Minds* [35] by Walter J. Freeman or my reviews of that book starting with Chapter 83, *Is Christian Morality a Natural Morality* and the ensuing chapters with the major title *What is Mind?*.) But clearheaded thought based on unbiased observation would have told us much about the real nature of human morality if we modern men were inclined to engage in such activities. Centuries before the discovery of the cell or the invention of brain-scanning devices, St. Thomas Aquinas understood the biological underpinnings of human nature and provided a framework for understanding human moral nature, a framework which Professor Freeman adopted for his understanding of his own research results and the research results from other brain scientists.

The moral will and other aspects of the moral nature of a creature are found in its substantial, God-given nature and not in some eerie entity which seems merely a hand-wave of an explanation for the mysterious freedom we have been granted by the Almighty. When a creature wills evil, when he wills moral disorder, he begins to nurture a cancer of sorts in his own nature, his own substantial being. He begins to empty himself of his partially ordered being.

Let me try saying this in somewhat different words. We aren't born as God wishes us to be but rather as potentially that which He wishes us to be. That which He wishes us to be is a creature in a state of being which is God-centered and hence good. Nature is good in its own lesser way but nature in this mortal realm is a battleground for a war between order and disorder which can't be won by any creature. To be God-centered is to say "Yes" to that grace which can perfect nature and bring us into a state of perfect order, the Peace of Christ. But even to say "Yes" to what is good in nature can bring a man to that state of being which we can call "noble". This is a state that calls to mind such great men as the Emperor Cyrus, Julius Caesar and his opponent Cato, Chief Joseph of the Nez Perce, and many others who can be found in the history books. When grace completes nature, we get St. Paul, St. Francis, Dorothy Day, and others.

Now think about the evil ones of history, remembering as a guiding insight the insanity of Nebuchadnezzar, his mental and emotional decay into a beast of the field after his efforts to claim divinity. Hitler began a rapid decay into insanity during his years in Vienna which began in a

conventional way for an artist with ambitions greater than his talent and eventually he entered a slide into hatred of Jews, perhaps because those who fed him during the tough years were charitable Jews. His decay was probably accelerated by abuse of the same sorts of amphetamines preferred by Skinheads and Neo-Nazis in our age. There's more than one way to damage your human stuff.

In the novel *The First Circle*, Solzhenitsyn speaks of stories he heard from fallen members of Stalin's government: Stalin was so ego-centric that he fell into a catatonic state from shock when Hitler beat him to the punch, that is, when Hitler betrayed Stalin while Stalin was still biding his time before betraying Hitler. (The real story is more complex but beyond the purposes of this blog entry.) And Stalin was a fairly conventional sadistic barbarian rather than one who worshiped evil in the way of Hitler. Still, a sadistic barbarian is evil enough to slide into insanity by way of moral decay.

To think rightly is to move with the grain of God's world, that is, to shape yourself to think the thoughts God wishes you to think. The virtuous pagans got this only partly right but they sometimes did as well as possible without the more direct revelations from the Transcendent God. (The truths in pagan philosophy come from their clear understanding of many of the aspects of God's contingent acts as Creator. That is, they saw God but only in His freely chosen role as Creator of this world.)

To choose evil is to move against the grain of God's world. To choose evil is to choose to think wrongly. Why do those who speak of God as all-powerful think that there are no immediate consequences to such disobedience to God's commands which are implicit in Creation or those which are explicit in His revelations? Why do they think that we have substantial existence apart from God so that we, or Satan, can continue to exist after pulling away from He who is the source of all being? To sin, to rebel against God in specific ways—perhaps misbehaving sexually, might leave us as no more than disobedient or spiteful children of a gracious Father. An ordinary sinner has not moved away from the source of being so much as he has allowed himself to be distracted by that which is not good. I speak not of such sinners but of those who choose a radical rebellion against God and against the natural good.

If being comes from God, if God-given being is itself good, then to choose a privation of being—evil—is to move away from being, to move towards oblivion. If Satan had existed as a creature of this universe, if he had chosen

evil over good—that is, oblivion over God-gifted being, he would have long since ceased to exist or at least would be a shadow not able to do much. At the risk of being redundant:

To choose evil is to reject the good, including God-given being.

To choose evil is to move towards wispiness and non-existence.

The logic of my argument forces me to speculate that we have only two choices: good or evil. To choose good is a more specific decision than we morally spineless modern men would think. To just set out to be passively good, to be a nice guy, is to choose evil, though a lesser sort of evil, but it's not to choose good. Adolf Eichmann, nice guy and logistical genius of the Holocaust, showed a great stupidity in not even understanding why so many hated him. He was on a more gradual incline towards non-being than Hitler, making him more useful to the more rapidly decaying Nazis, but Eichmann was following them at a slower pace.

We should be careful about literalizing apocalyptic pronouncements, but I think it meaningful that the cowardly and faithless are grouped with more active sinners such as murderers and fornicators in the condemnation found in Revelation 21:8. We should also remember that Holy Scripture gives credit to those with a more aggressive sort of courage, King David in the Old Testament and St. Stephan in the New Testament, but the main thrust is to advocate the courage which shows up as a quiet persistence in attending to God and His commands. If we persist in moving towards God, He will make up what still is lacking in us, whether it be courage or eloquence. We should persist in worshiping and obeying God and we should persist in seeking human moral good. To do otherwise, even when our environments allow us to relax, is to choose evil and the path of decay into total death—oblivion.

## 370 Good and Evil: Evil, Inc.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=121>. It was finished and uploaded on 2007/12/06.]

I've spoken about the nature of evil as related to the individual creature in Chapters 368, *Good and Evil: Simpler Than We Pretend*, and Chapter 369, *Good and Evil: The Instability of Evil*. But evil takes shape on a large scale far too often, especially in this modern age of genocidal wars, this age where slavery has once again become common, and this age which has been so creative in its forms of economic exploitation at the level of megacorporations and countries. Evil seems to be larger-than-life at times, but ancient literature tells us that this feeling has been around even during ages which had far smaller populations and institutions.

Even much of what I said about evil and the individual moral actor actually has to do with the mass movements of recent centuries. But mass movements are funny in that they both do and don't have a true reality. Moral actors are always individuals, despite our pretensions with such invitations to evil as limited-liability corporations. When we place too much weight upon the institutions, we collaborate in the dreams of those who are as greedy as Hitler and as cowardly as those who appeased Hitler. Those dreams are for power without responsibility, that is, decision-making power without individual moral responsibility. (I paraphrase Winston Churchill who said—and I quote from memory: “Journalists are like the harlots of every age. They seek power without responsibility.” Journalists have lots of company.)

But there are not just institutions out there. There are some vague forces, too readily seen as invisible spirits, good or evil. We don't have too much of a vocabulary or many concepts available for talking intelligently about what's really going on with these 'spirits of the age' or 'gods

of the marketplace' as I call them in imitation of Kipling. Mathematicians and other scientists are developing tools under research projects with key phrases like: complexity theory, chaos theory, self-organizing system theory, and so forth. There are a number of tools which are fairly mature and useful, at least from my outsider's viewpoint. They are useful in various sorts of studies of real-world systems which have a factuality and complexity that renders them unpredictable and generally beyond complete understanding, but substantial understanding can lead us to a clarification of various problems in, for example, communication between two systems (a country might be an example of a system for these purposes).

At the same time, mathematics can only model some of the aspects of real-world systems. Corresponding concepts, expressible in literary terms, need to be developed before we can really start talking intelligently with the development and operation of complex human systems. This is true of all such systems: social, political, and economic. We do have one conceptual tool which was expressed as a simile: human economic systems formed by men interacting as they satisfy their individual desires organize as if guided by an Invisible Hand.

This is a literary expression which has proved to be of great power in allowing some imaginative insight into the nature of what would now be called a self-organizing system. One of several mistakes made by Adam Smith has led to a lot of bad thinking over the years: he wrote as if a self-organizing human system was guaranteed to end in a morally stable form.

In anticipation of this discussion about complex human systems, I've already claimed that there are neutral pseudo-forces which operate when men interact, socially or politically or economically. When the underlying populations of men have morally well-structured characters, there is a high probability—not certainty as I may have implied in some places—that a morally well-ordered society or polity or economy will emerge. If the underlying populations of men are willfully evil (such as Nazis and some other perverse populations in history), no morally stable society or polity or economy can develop though that population of evil men might keep things going so long as they can conquer healthier human societies and live off the loot or the efforts of slaves. A population of men who are evil by being morally spineless will create systems that decay much more slowly than the systems of willfully evil men—to be good is a positive matter and not a mere 'absence' of evil.

The West has decayed because we rejected the concept of good as the goal of a worthwhile human life. We pretended that the neutrality of self-organizing systems somehow made it likely that morally well-ordered human systems would develop as liberal politics (right-wing as well as left-wing) and liberal economics (right-wing as well as left-wing) expanded by insulating decision-makers from moral responsibility for their decisions. Modern forms of ‘democracy’ and corporate capitalism are highly desirable from the viewpoint of both exploitive men and morally spineless men.

Depending upon our view of empirical reality, we could see these systems as being the result of the actions of angels and demons. This viewpoint is undeniably bad in at least one way: it allows us to protect ourselves from our moral responsibilities as individual citizens just as CEOs are protected by corporate laws from moral responsibility for their decisions and actions so long as it’s within the scope of their duties. (Why is it that so many self-labeled libertarians seem to think corporate forms of organization and the laws extending human rights to corporations are natural to human societies whereas the income tax laws are artificial and the result of one group of human beings imposing their desires on the general population? A little thought tells us that laws allowing the operation of General Motors are licenses for the transfer of income and power from one group to another—usually the general population to a small group defined by their ambition or their grandfather’s thefts.)

When we see angelic forces in the societies of men, we’re really seeing the self-organizing efforts of morally well-structured men as they go about their political and social and economic activities. When we see Satan, we’re seeing the self-organizing efforts of willfully evil or morally ill-structured men as they form Nazi states or societies that exploit children or deform those who try to choose family attachments over modern mobility and selfish ambition. (I confess that I was not one of those who chose the moral path. I entered the corporate life and am stilling paying for that non-decision made by default because of my lack of moral spine and moral consciousness.)

This is the moral problem of mankind, one which we can finally see in brutal clarity:

We have trouble even seeing the larger-scale movements which are the formations and movements of nations and markets and displaced human beings. These movements are not mystical or supernatural but are the result of self-organization driven by

the interactions of individual human beings who are the citizens and producers and consumers and migrants.

Am I making a claim that sin is to be found in social structures? No. In fact, I've already argued that the self-organizing forces are morally neutral. The moral content in societies and polities and economies which form comes from the moral natures of the individual citizens. There is a sense in which there is sin in social structures but it's a reflection of the sins of the men of that society.

The dominant form of sin in the modern age, and perhaps most ages, is the simple refusal to become even a virtuous pagan let alone a Christ-like man. To be good requires an effort, most especially in an age where life seems safe and comfortable so that men travel the wide and easy road unless they have the personal wisdom or the guiding wisdom of others to move off that road for at least a time of training in the tougher virtues. We don't feel the temptations to steal or kill in order to eat or to feed our children. Not tempted to the more obvious sins of this sort, we prepare ourselves for lives as well-fed bureaucrats and other workers in the marketplaces of our ages. Not having exercised our moral character, we modern men of the West occasionally face a morally difficult situation and find ourselves in the same position as those who try to run a marathon after spending a life on the couch. This was true of the ordinary German citizen in the 1930s and was also true of those Americans who managed the war in Vietnam.

A good man has a moral character that is gained by effort not by a lucky avoidance of temptation. A just society is formed by the interactions of good men. Jacques Barzun was persuaded to collect some of his essays, against his will if I recall correctly, and he chose for one of those collections this title: *The Culture We Deserve* [8]. The culture we deserve, the government we deserve, the economic system we deserve.

We're no better than our children who anger us so much when they try to claim the rights and privileges of adulthood before they're willing to even try to take on the responsibilities of adulthood. We want to be taken seriously as moral creatures but we don't take the initiative to form our own moral characters or the moral characters of our children and the others around us. When we live through periods of prosperity, we become soft in body and mind and moral nature, preferring to take it easy. If you value what is right and what is true, what is good, then you work to become a

good man or a good woman even if your environment leaves you the option of sitting back and taking it easy.

We're a sociable race. We cooperate with each other in the small in such a way that we form societies and political entities and economies in the large. Soft, genial human beings form societies which are gentle and charitable so long as things go well but those sorts of societies can be perverted by the iron will of a Hitler or a Lenin. Evil men form predatory, conquering nations. Good men form just societies.

# 371 John Howard Yoder: Discipleship as Political Responsibility

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=124>. It was finished and uploaded on 2007/12/27.]

This essay is my response to a wonderful and important book, *Discipleship as Political Responsibility* [154] by the Mennonite thinker John Howard Yoder.

In speaking of the temptations which the crowds presented to Christ, to make Him King after He multiplied the bread on the mountainside and again after His triumphal entrance into Jerusalem, Yoder says:

[T]he political temptation is not yet over. What was his prayer all about when, in the night of temptation, he prayed, “If it be possible, let this cup pass from me” (Matt. 26:39). What would it have meant for him to want the cup to pass from him? What would have enabled him to sidestep the cross? “Edifying exegesis” has hardly ever asked the question. For “political exegesis” this question is central. How could he have avoided the cross? We do not know in detail what other way of acting he considered in that hour. But we can hardly be wrong in assuming it would have required a holy war. [page 56]

I can suggest another meaning to our Lord’s words—“If it be possible, let this cup pass from me”. As a human being, I will die one day, but I won’t truly know death because I’ll cease to exist at my death until God resurrects me—if He chooses to resurrect me. To die is to cease to exist

as a mortal creature and, by definition, we can't know death just as we can't truly imagine or think about something coming into existence from nothing. Whether something is coming to be from nothing or disappearing into nothing, we can't imagine non-existence and we can't experience it.

The Son of God knew the true horror of death because He, true God in His immortal nature, experienced the death of His human nature. In a sense, He experienced non-existence. It would be reasonable that He, in His human nature, was terrified by that upcoming experience. Only His love for the Father would have led the Son to accept His mission on earth and then to go through with it.

On the other hand, I'll agree with Yoder's instincts that the life and death of Christ was soaked with political meaning, just as it was soaked with moral and social meanings. The primary meaning came from the true nature of Christ's act of submission to the Father's will – this was the reason for which He came and not to save us or to teach us moral or political lessons. The world was created so that Christ could be crucified. I know of no other possibility consistent with the all-powerfulness of God who knew all that would happen before He created the world.

Jesus' cross was not some unexplainable and undeserved evil that came upon him accidentally, like a disease, a storm, or an earthquake. Jesus wasn't facing some inescapable suffering. On the contrary, Jesus' cross was a form of suffering that Jesus could very well have avoided. It was the cost of his obedience in the midst of a rebellious world. [page 60]

Almost. As I pointed out above, this act of obedience, this sacrifice of His holy self to the Father's will is the point of it all, of all Creation. The rebellious world was created so that Christ could be crucified, could sacrifice Himself in obedience to the Father.

I do wish more Christians would pay attention to the valid accusations that we speak cheaply of 'carrying our crosses' when we merely bear the natural ills of mortal life. As Yoder points out, to 'carry our crosses' means to willingly take on avoidable suffering and death in order to do our duty to God, which includes our political and other duties to our fellow-men.

The essence of following Jesus is not grasped if we view it primarily as a commandment to become the same as Jesus, or to

act the way Jesus did; rather following Jesus really means basing our action on our participation in Christ's very being. . . . Following Jesus is the result, not the means, of our fellowship with Christ. It is the form of our Christian freedom and not a new law. [page 61]

Also quite true and this is part of the reason I remain a Catholic though disenchanted with the oh-so human American Catholic Church. Our fellowship begins with giving ourselves over to Christ in the Eucharist, when we invite Him in. Once He's infused us, we can move on to become His disciples. He is truly and really here with us, offering us a true fellowship, and He is present on the altar in a special way.

The state represents human activity outside of faith; through its sword God acts. The church is the form of human action within the context of faith; through its cross God acts as well. Only the Christian cannot do both of them at the same time, as God can. The state is there for the sake of the church and not vice versa. [page 62]

I'm very uncomfortable with this conclusion, though my discomfort doesn't come from one aspect. My discomfort also, most certainly, doesn't mean Yoder is wrong because I believe he's right in part, but only in part.

I'm more optimistic about the possibilities of government than Yoder might be but I go beyond him in my discomfort with centralized governments, especially if they receive their power directly from submissive individuals. Local governments, though they can be abusive as well, have much potential for doing good at the human scale. And we have to remember that families and church communities can also be abusive and exploitive. We have to realize that those who call on a central power to handle a local problem might be suffering greatly but we also have to remember that they open the door and let them into our communities. Anything which grows beyond the human scale, government or business or even sports teams as we're learning, creates a pool of wealth or power which is guaranteed to attract the attention of the greedy and the overly ambitious.

I have a different way of viewing these problems than did Professor Yoder but my way of looking at political and social matters, a more Catholic and distributivist way, came into focus under the implicit criticism of Yoder

when I first read some of his key books about five years ago. At the very least, Yoder has put up a challenging analysis that can force all Christians to be honest with themselves and perhaps most especially Catholics who tend to be too optimistic about centralized power and centralized authority, though American Catholics tend to ignore authority when it speaks inconvenient words. More importantly, authority has its proper scope and a wise human authority leaves as much as possible to local authorities. Rome hasn't always been wise in this regard for sure, though Rome hasn't been nearly as abusive of her authority as some would think.

My current position, and still tentative, is that Yoder is more right about the state as we know it than he himself seems to believe, though I think, in later years, he came to question his own early teaching that a Christian could work in the welfare agencies, or other 'non-sword' agencies of the state. As the United States has been steadily mutating into an empire, the welfare systems and such programs as urban renewal have been of central importance in consolidating the power of the state over its own population while the sword has been rarely used internally. Dorothy Day was more consistent in seeing the State as the enemy whether it was sending soldiers overseas or sending out welfare checks. I don't know if she ever thought about the difference between centralized political power and distributed political power but she understood the evil that comes from centralized political power. (Though she was surprisingly submissive to her bishop's authority even on prudential matters.)

Evil typically grows along with piles of power or wealth, though it's present even when the stakes are small. Those piles of power and wealth attract the greedy and overly ambitious but the centralization of power draws our governments away from us, protecting decision-makers from moral responsibility of the sort that comes when you have to look into the face of those you've harmed or those you're taking money from. Idealists of various stripes might not like this but there is a look-in-the-face aspect to moral politics and moral business management. Tip O'Neil was not stating a fact so much as he was making a moral claim when he said all politics is local. (I'm not sure if he was aware of the truth of matter but I do know he was a con-man playing to a sentiment he didn't give a damn about when it came to his own life, living away from his legal residence when active in politics and moving to Cape Cod as soon as he retired.)

I'm inclined to think Yoder's position about the State and Christians in the New Testament was a little simplistic for a reason he admitted but

then dismissed: the State in the New Testament was the Roman Empire.

Let me digress. The Mongol Empire was a simple beast from political and economic viewpoints. You had one political genius, Genghis Khan, who had a particularly great talent for finding and developing military geniuses. You had mobile herdsman prepared to fight blitzkrieg style wars against empires and other sorts of states which weren't prepared to defend against such warriors.

The Roman Empire was a different beast. Starting out as a republic aching to be an empire, much like the United States, The Roman Republic won several wars that left all competitors prostrate. Gold and other fungible assets flowed into a society founded upon agriculture and some significant competence in various industries that produced tools and weapons and other practical goods. With a highly liquid economy, the central power was able to increase taxes, building welfare systems that secured them the direct loyalty of citizens as individuals. Speculators got to work liquefying all assets, even farmland and family businesses. The central power increased taxes, built up its police powers and established a large professional military class. By the time this had happened, the fascist state – adolescent empire, had gutted itself economically, having reduced much of its working class, tradesmen, and craftsmen to poverty. The state couldn't support either its welfare programs or its military and began to expand beyond its already distant defensive boundaries in order to find fresh sources of loot and steady streams of taxes. The Empire had matured and was now stealing what it could no longer make or grow.

Around 1970, in a manuscript she hadn't quiet finished, *Life of the Mind*—finished by the consciously light hand of Mary McCarthy, Hannah Arendt saw the U.S.A. as having largely completed such a process and predicted that early in the 21st century, Americans would have to choose between poverty or a conversion into a full-scale, brutal empire. Make of this what you will.

There aren't demons involved here nor is human government inherently evil. The problems are at the human level: greed and moral laziness and shortsightedness. Distributed government can be very good indeed, but liquid wealth will destabilize it. Local leaders, unless bound by very strong traditions such as those of the Amish or Mennonites, will sell out the future generations to get a share of the revenue generated by the greater taxing power of a central government. Parents will jump at the opportunity to better their situation in the short-term even if it means they're conceding

power over their children to public authorities and even if it means they're liquidating assets that future generations will need in order that the current adult generations might have more luxuries.

(For those who take life as a spectator sport, we're about to see one of the greatest shows in history: the United States, government and citizens, have sold off the future to get current revenue but many of those assets which hold the key to the future are being bought by another young, potential empire—China. The American State may have given China the power to make the US the shortest-lived great empire in history. China would then have a chance to storm onto the world's stage as perhaps the greatest power in history.)

We don't have to fear or fight demons. We have to fear our own laziness and lack of vision. We have to fight against the tendency towards moral decay when times are good. We have to develop our minds and our moral characters so that we can see and understand what's happening, what's been developing for decades, and then have the courage to do something about it.

The State as we know it in the modern world is a bloated and cancerous organ of the earthly Body of Christ but that organ, government, is a foreshadowing of an aspect of that Body when it's fully realized in the world of the resurrected. The Church (as opposed to Yoder's 'church') is a foreshadowing of the Body as a whole, to be sure. For various reasons, the Pilgrim Church isn't capable of carrying out all the functions of the Body of Christ—that's possible only when Christ Himself is heading the Body. He will take over as our one and true High Priest, leading us in worship and prayer, and He will also be King.

[As of 2011/04/20, I've developed a more complex understanding of the Body of Christ in which the Church is the most important organ, that of worship and direct communication with God, but other organs exist to serve other human needs. Our political and economic and artistic activities seem to me to be efforts to meet true human needs. I don't think God will take us into the world of the resurrected and then mutilate us. We're a certain type of creature because that's how He wants us, and grace will perfect and complete us, not change us into creatures without the needs met by political and economic and artistic activities.]

## 372 The Faster Christians Die...

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=116>. It was finished and uploaded on 2008/01/02.]

Tertullian, a Father of the early Church, told us, and I quote from memory:

The faster Christians die, the faster grows the Christian Church.

Pope Benedict XVI spoke about this quote not too many months ago and it's returned to my attention every so often, returning strongly when I started writing a little about my situation as an impoverished artist, fed and housed by the generosity of my sister. I'm not a martyr though I feel it my duty as a Christian to paint myself into a corner of sorts, convincing myself that I will accept martyrdom if – God forbid—I'm ever in a position where I could only escape by denying my God or my duty to do justice to my God and my neighbor.

I've written in various places about our lack of responsibility when it comes to developing our own moral character or that of our children. When times get soft, we become just like an athlete who sits on a couch and drinks beer when the coach isn't around. In fact, most human beings in history have not shown the initiative to develop moral character unless forced to do so by hostile circumstances. Our pot-bellies and sagging biceps in this prosperous age should embarrass us but they don't. So long as our prosperity and our gentle circumstances have lasted, we've convinced ourselves that our lack of criminal activities is due to our moral qualities in the same way that the beer-drinking, TV-watching athlete could convince himself that his endurance is good because he hasn't yet collapsed on the way to the refrigerator.

Let us face up to the Gestapo when they come for our Jewish neighbors. Let that flabby athlete chase a deer through the woods when the grocery stores disappear.

Some there are who love so much that they can let themselves grow soft and will still accept suffering and death to do what's right by God and neighbor. Most of us aren't like that and we need to develop that love by way of doing our duty to God, charitable work and fasting and prayer. Even when it isn't fun. Most of all when it isn't fun. Good runners win their races by practicing on the days when they don't want to do it and when nothing is going right. Good Christians win their far more important race by training even it seems needless and even harmful.

I imagine that the form of modern martyrdom will be different from that of past ages, taking such mundane and humbling forms as the willingness to suffer from painful and degrading diseases when morally-tainted cures are available. "He who endures to the end will be saved." Matthew 24:13 He who endures to the end will probably reap a harvest of souls for the Lord Jesus. So Tertullian told us and he lived in an age when martyrs were not so rare and when souls were being won even amongst those who did the torturing and killing. Isn't it likely that the winning of Saul's soul began as he supervised the martyrdom of Stephen who prayed for the souls of Saul and the others who made him the first Christian martyr?

How many of us are prepared in body and mind to endure to the end? How many of us are prepared to win souls for the Lord Jesus?

How many of us are more concerned with social respectability than we are with serving God and neighbor, with rendering justice to our Maker?

I'm ready to admit I'm a coward who shies away from even the thought of suffering. I'm ready to admit I don't love God or neighbor nearly as much as I should. This cowardice and this lack of adequate love are just aspects of the sin that is us. We don't sin, we are sin. We don't commit cowardly acts, we are cowards. We don't fail to love, we are empty of love.

We passed through a long period in the West when those in power and those holding wealth seemed to respect Jesus Christ rather than hating Him, to respect His followers rather than hating them. But nothing had really changed and now we Christians are gradually and reluctantly learning that Christ was serious in His warning:

[Y]ou will be hated by all for my name's sake. [Luke 21:17]

This is not to say that the hatred will be at a constant level in all historical periods, nor does it say that the hatred will always be expressed in acts or even words. The period which is ending was one in which the enemies of God worshiped the State or other gods of the marketplaces, as did the Caesars and their retainers, but they formed pragmatic alliances with Christian churches and other Christian groups for much of this period. Those Christians were willing to let our Lord be turned into a moral teacher for factory workers who might otherwise suffer hangovers too often.

The situation has changed. Various empires, not just the American Empire, are toddling about or crawling about on hands and knees. This is serious business for those who seek wealth or power and Christians are often seen as nuisances, though sometimes Christians are still seen as allies useful for morally forming the ordinary citizens that they can better serve the modern Principalities and Powers, the gods of the marketplaces.

As a rule, the leaders of Christianity have not a clue what's going on and they continue to support legislative and social programs which feed the various beasts growing towards adulthood. Some of those beasts tend to be relatively tolerant of those living inside the boundaries of the core nation of that empire. Some of those beasts are rational and seem to be aiming for a prosperity that will support large tax revenues.

There are so many Christian clergymen with so many degrees: are all of them ignorant of the historical ties between the war-powers and welfare-powers of empires as they develop? We'll soon need our shepherds to be better formed for the coming hard times because none of the beasts will be overly tolerant of Christians who profess their faith and act accordingly.

Yet there is hope:

If we love God and neighbor, if we try to endure, the Lord Jesus Christ will supply what we need, even the courage to accept avoidable suffering and death for the sake of Christ.

## 373 Keep the Imagination Sane

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=118>. It was finished and uploaded on 2008/01/04.]

About 15 years ago, I went for a ride with a friend who was searching for antique furniture in regions north of the Quabbin Reservoir. In one of the places we stopped, I found a loft filled with old books that were no longer easy to sell according to the proprietor. I bought a few early editions of works by Nathaniel Hawthorne including two 1870s editions titled the *American Notebooks* and the *English Notebooks*. The *American Notebooks* include various letters, one of particular interest was written while he was at Brook Farm, the commune established by some of the Transcendentalist preachers and intellectuals with whom Hawthorne was friendly. The letter of interest was dated September 25, 1841. In responding to some news of lectures and demonstrations of ‘magnetic miracles’ (hypnotism or actual use of magnets?—I don’t know), he had this to say:

Keep the imagination sane,—that is one of the truest conditions of communion with heaven.

In the years since Hawthorne walked the soils of New England, there has been a decay that would lead me to also advise: Nurse the imagination back to health. Much of what I try to do in my published nonfiction books, my blog entries, and my unpublished works—novels and nonfiction—revolves around the imagination. I worked hard to bring my own imagination back to life and I urge others to do the same. I try to offer materials that can help to nurture the imagination, by way of advice or motivation or substantive imaginative material.

Along with Nathaniel Hawthorne, I’ll advise all who will listen:

Keep the imagination sane,—that is one of the truest conditions of communion with heaven.

# 374 C.S. Lewis and the World God Didn't Create

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=119>. It was finished and uploaded on 2008/01/08.]

Hermann Melville once noted that Ralph Waldo Emerson, the Sage of Cambridge, had some good things to say but gave the impression that he would have had some good advice for the Almighty if he'd been present at the moment of Creation. I get that same impression from the writings of C.S. Lewis—especially his fictional writings.

I can almost imagine Lewis saying:

Not bad, Lord, but you need to get rid of those bones in the sands of Africa and forget about this four-dimensional space-time business. Then you could add a few wise wizards who cast spells with literary style and a host of evil scientists scheming to corrupt all of Creation. A much better world it would be.

On the other hand, Lewis wasn't in rebellion against the most important of Christian truths as was Emerson. Lewis also didn't seem to be aware that he was in rebellion of a sort against God as Creator.

Before going on, I will say that I have few serious problems with Lewis' expressions of the revealed truths of Christianity though I don't consider him to be particularly profound in any aspects of theological or philosophical thought. He was a good popularizer of some difficult ideas, a good teacher. In fact, his appreciation of the goodness of the material world, of sacramentality, and the Sacraments, didn't really fit well with his pessimistic views of those fields of thought and research, physics and evolutionary biology, which have been so much more fruitful in modern times than the fields that

Lewis preferred. I don't celebrate that, being a novelist and a philosopher and theologian who specializes in studying the created world. I have a foot in each camp, that of Einstein and Darwin and also that of Lewis and Tolkien—more appropriately, that of Melville and Flannery O'Connor. I'll also say that Lewis was far from unique among Christians in rejecting the modern project of empirical knowledge-gathering and advocating a return to a magical view of reality, though most of those Christians are happy enough to accept the medical miracles and other wondrous technologies of this modern project.

Lewis was convinced that truth could not be embodied. (This was the issue in his debate with G.E.M. Anscombe, though I think she took an overly weak position on the embodiment of truth if she really was a Thomist—she really wasn't that much less in the truths-vs-things dualist camp than was Lewis.) In Lewis' view, the truths we know come to us from some better place than this physical world, Presumably, from inside his own mind formed by exposure to the insides of the heads of other men and recorded in classic literature. He seemed to view the world as a strange sort of place, itself having no direct part in truth but being a setting for stories populated by beings concerned with truth. This is certainly preferable to the modern skepticism about truth, but it isn't good enough for a Christian.

I'll side with Aquinas: things are true. They're true because they're manifestations of thoughts of God. I suspect Lewis, and perhaps Professor Anscombe as well, would be upset or at least mystified by my claim in various writings that not only are things true, but those statements that we consider absolute truths are thing-like—they're created by God. To understand this claim, at least as I understand it, requires enough knowledge of the expansion of mathematics in the modern world to push through to a parallel expansion of metaphysics. Hellenistic metaphysics and Hellenistic mathematics were Siamese twins of a sort, but our modern view of metaphysics hasn't expanded as our modern view of mathematics has. In fact, few there are who appreciate the great but still incomplete expansion of metaphysics to be found in the works of Aquinas. I'm not sure that Professor Anscombe even understood that this expansion had occurred in the works of that poet of the Eucharistic Presence.

In his fictional works, Lewis presented the empirical knowledge of physics, evolutionary biology, etc. as the evil magic practiced by demonic men while good men, and even Christ the Lion, used white magic. He couldn't deal with modern empirical knowledge. To be sure, it's hard to

re-form your mind and acquire radically different skills past the adolescent years. Faraday, one of the founders of modern electromagnetic theory, received most of his education as an adult and is said to have been incapable of following Maxwell's work in turning Faraday's most important results into a mathematical system. In any case, Lewis seems to have viewed the modern project of gathering empirical knowledge (sometimes excessive and to no clear purpose, to be sure) to be some sort of conspiracy by evil scientists, a conspiracy intended to devalue literary knowledge.

Modern empirical knowledge speaks of a world and implies possible ways to speak of the plenitude of Creation. These modern possibilities are disturbing to those who try to think in conventional terms, even terms developed by the greatest of pre-modern thinkers. Lewis preferred a magical world of his imagination to the universe of Einstein and Darwin, though this latter universe seems to be the physical aspects of the world God created. It isn't wise to prefer your own world over the one created by God, nor is it a sign of the truest sort of faith.

As Nathaniel Hawthorne said,

Keep the imagination sane,—this is one of the truest conditions  
of communion with heaven.

A sane imagination works with God's world rather than feverishly creating a world populated by fantastic creatures with natures not even consistent with what we know of God's world. This is not to say that fantasy is not a legitimate literary genre. It's a minor genre, but it's a legitimate genre with great power to teach moral lessons or to create playgrounds for the human imagination. Fantastic literature ceases to be legitimate when it becomes an effort to create a view of reality rather than just being a home for comments upon reality, perhaps on moral problems. (It's quite possible that Tolkien was operating within the legitimate domain of fantasy literature and not trying to provide a larger-scale understanding of the world in *Lord of the Rings*. He supposedly made claims to that effect, but I'll leave that discussion to others who might care about the topic more than I do.)

We Christians should choose to be sane and to develop our thinking abilities and our understanding of the story which is our world, a story which includes our apish ancestors as well as the evolution of stars and galaxies in the early years of the expansion of our universe. On the other hand, the most important part of that story is the life and death and resurrection

of Christ. Lewis appreciated this, even if he did try to turn Christ into a magical lion.

## 375 Looking for Creativity in All the Wrong Places

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=127>. It was finished and uploaded on 2008/01/08.]

A news story about an international meeting of the Jesuits, <http://www.zenit.org/rssenglish-21429>, includes these paragraphs:

[Cardinal Rode, prefect of the Congregation for Institutes of Consecrated Life and Societies of Apostolic Life at the Vatican] also mentioned the “feeling of ever growing separation between faith and culture, a separation which constitutes a great impediment for evangelization,” saying this is another phenomenon that worries him.

“A culture immersed with a true Christian spirit is an instrument which fosters the spreading of the Gospel, faith in God the creator of the heavens and of the earth,” he said. “The tradition of the Society [of Jesus—the Jesuits], from the first beginnings of the Collegio Romano always placed itself at the crossroads between Church and society, between faith and culture, between religion and secularism.”

“Recover these avant-garde positions which are so necessary to transmit the eternal truth to today’s world, in today’s language. Do not abandon this challenge. We know the task is difficult, uncomfortable and risky, and at times little appreciated and even misunderstood, but it is a necessary task for the Church.”

With all due respect, why would anyone expect creative thinkers to appear inside of an ossified human institution of any sort? The various cultural groups and other groups of the modern West are suffering the sort of rigidity that kills or isolates and starves true creativity.

When the members of a culture can no longer recognize good, creative thinking, they can always rely on the sorts of credentials that show well on a resumé. On the whole, Jesuits have shown no ability to deal with the problems facing Christian thinkers in this age, but they have plenty of degrees and awards. As a consequence, it's natural for the leaders of a troubled Catholic Church to look to them to do something creative in an age where Christianity desperately needs good creative works.

But, again: why would anyone expect such over-educated denizens of a textbook world to be good, creative thinkers? At the risk of sounding egotistical, those looking for a creative thinker working in those important and dangerous positions, at "the crossroads between Church and society, between faith and culture, between religion and secularism" should read my books and my blogs and not worry about Jesuits until they begin to respond to my efforts or those of other truly creative thinkers. The creative thought we need in this age will come from outsiders and lone-wolves and not from men formed to institutional standards and having minds formed to textbook standards. Once upon a time, Jesuits managed to be outsiders even as they were members of a vast army of scholarly priests. That time seems to have passed and the current members of the Society don't seem to be the ones who could make that time come again.

# 376 My Satan, My Tempter, My Opponent

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=120>. It was finished and uploaded on 2008/01/11.]

Busyness.

I've tried to speak of the typical misdiagnosis that Christians make of our moral decay. We haven't decayed into materialists. I'll present just one common-sense test of my view vs. the standard view. Materialists necessarily recognize the objectivity, 'absoluteness' in a sense, of laws at least in a limited domain, the domain of physics – so to speak. Modern human beings don't recognize the objectivity of laws even when it comes to material objects, perhaps because of the very successes of modern technology that seems to promise to make matter do whatever we want it to do.

What modern human beings lust after is transactions, not things. Children don't place a materialistic value upon those piles of imagination-killing toys they get on birthdays and on Christmas. They follow their training and enjoy mostly the processes of getting gifts. The unwrapping of a gift is more important than its use. The gifts themselves are often beside the point and will be set aside to gather dust until given away to some charitable agency. An appreciation of things, of material objects, would be tied to some understanding of those things as intractable objects following laws which we can't change and would show in at least a sporadic care for and maintenance of those objects. We know that's not the general situation because parents are always complaining that children nowadays don't care for their belongings. In my generation—born 1955, you'd better oil and lightly sand your baseball bat at the end of the season. You better put it away someplace safe because you weren't like to get another unless you got

a paper-route or lined up to get on the buses going down to the tobacco farms.

It's busyness that we seek and busyness is a sign that the gods of the marketplaces are being served. One of the very bad aspects of the modern world is that busyness is being served by our church communities as well as by our political parties and our commercial entities. We judge our prosperity by the GNP which is a measurement of marketplace activity and we don't even have a concept of what a good, stable life might be. We measure, however vaguely, the health of a church community by its busyness. We measure the worth of our lives far too often by the busyness of those lives.

We deform political life so that it's no longer a way for the citizens and traditional institutions to shape certain aspects of their lives. Nope. Politics is a forum for the overly-active, a forum which generally excludes participation by those who consider politics important but not the main activity of their life. It's possible the main danger the public square presents to Christians is not the stripping of spaces once dominated by churches and crosses but rather the way in which the public square keeps us moving about so that we can't be at peace even when we return to our quiet places.

But it's not just the public squares that are that sort of a danger. Even our institutions which serve God, such as our churches, have become our satans, our tempters, our opponents. They serve the needs of the gods of the marketplaces and work to draw us out of our neighborhoods and our more organic relationships. They serve the needs of those gods by teaching us a worthwhile life is measured by the number of our transactions in the modern marketplaces.

# 377 A Necessary Requirement for Moral Self-government

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=122>. It was finished and uploaded on 2008/01/22.]

If we are to govern ourselves, we must nurture a sense of self-responsibility that leads us to find out what our elected representatives are doing in our collective name. We must even be willing to write-in a candidate or to hand in a blank ballot when the political machines present us with the usual choices between scoundrels. Absent this sense of self-responsibility, self-government is doomed to failure. Those who vote do so under the influence of political propaganda and merely act to confirm the power of those who value politics in and of itself.

A pretense to self-government becomes a farce in which the culpably ignorant are used by cynical or conveniently ignorant politicians. This pretense to self-government also becomes a moral farce, allowing voters to ignore war-crimes and other crimes committed by our government in our names. We also don't examine the motives of those who push domestic programs known to be highly questionable or downright harmful. By the early 1960s, experts, such as Jane Jacobs, were writing of the damage done to already troubled neighborhoods by so-called urban renewal. Large chunks of important cities were converted from impoverished neighborhoods to instant concrete slums which were more congenial to pimps and drug-dealers than to couples trying to start families. Family and community ties were destroyed, lives shattered, and huge amounts of tax-payer funds wasted.

But, some would protest, most voters have not the time or the skills to make independent checks upon the words and actions of their leaders, most importantly upon the context of those words and actions. This is where we

need a return to local politics supplemented by some form of federalism or distributivism. What can be done locally should be done locally and that includes the development of a local political leadership which then selects the representatives of their communities in the next layer up of government and is responsible for checking on their actions. A similar sort of system in our economic activities would do wonders to avoid the horrors which we've inflicted upon ourselves by allowing investors and corporate managers to abstract away the moral responsibility of those who are the stewards of our productive capital.

## 378 The Foundations of a Successful Totalitarian Society

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=123>. It was finished and uploaded on 2008/01/29.]

Recently, a short part of an interview with Ray Bradbury was quoted during a side-discussion on the nature of censorship on the newsgroup comp.lang.lisp. In that interview, Ray Bradbury pointed out the obvious about *Fahrenheit 451*: the totalitarian society in that book was built from the bottom up and not from the top down. (As I recall, the movie version was faithful to the book.) The populace, educated and not educated alike, had become a herd of creatures with very narrow perceptions and limited thinking skills and no moral will which could separate a human being from that herd when appropriate.

Television was the proximate cause of the decay in *Fahrenheit 451*, an implausible claim if taken too literally. As I've pointed out in the past, Jacques Barzun has documented in a plausible way that the past 500 years of history in the West is a tale of decay in our quality of literacy—which implies a corresponding decay in our quality of abstract intelligence. (See *From Dawn to Decadence* [9].)

We have to be careful in assigning too much direct power to television, but visual technology in general is dangerous to human beings because of the importance of our visual systems in seeking food and sex and in sensing danger—we're primed to look for interesting sights and rapid movements. The regions of our brain associated with abstract reasoning will shut down in favor of the visual regions. After all, you don't want to be gazing at the stars and pondering the meaning of life when you're waist-deep in alligators or when that blond two caves down is waving you towards her.

But the major fault lies in our moral characters, particularly our lack of initiative in taking responsibility for the formation of our own selves and the formation of our children. We're lazy, a desirable trait in a world where human beings have often had to work so hard as to die of exhaustion at young ages. Take advantage of chances to rest and recover from the effort to survive. When we live under easy circumstances, we often take it too easy. We modern men are hardworking in some ways, but we readily turn off our minds and souls and turn our eyes and bodies over to the gods of the modern marketplaces. We lust to be passively entertained. This is hardly a new insight into human nature.

Back in the 1830s, Tocqueville published *Democracy in America* in which he expressed the fear that Americans would form what we now call a totalitarian society because he saw that Americans ignored any facts or thoughts which were in conflict with the mainstream views in this country. We want to be able to simply go with the flow. Tocqueville also feared this would prove to be a trait of modern democratic human beings of any country. I'll leave it to the reader to think about this. I have modest goals in this posting.

I merely wish to suggest that Ray Bradbury was right about the decay of mind and moral will in the modern world but wrong about the violent repression of those who wish to publish or read good books. Tocqueville was right when he conjectured that Americans would need no censors or national police to collapse into a totalitarian society just because the vast majority of Americans could, and do, ignore any facts or thoughts which aren't in complete sympathy with the mainstream American views. Modern journalists and novelists and all other sorts of intellectual fluff-producers from our age are moving along with the American herd even if they occasionally lift their heads to bray out a discordant sound.

## 379 There Are Various Charisms in the Body of Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=135>. It was finished and uploaded on 2008/02/12.]

Why is it that Christian thinkers have failed to respond to the opportunities and problems presented by modern empirical knowledge? There have been a dearth of creative Christian thinkers over the past five centuries or so, perhaps because of the general cultural decay narrated so powerfully and elegantly by Jacques Barzun in *From Dawn to Decadence* [9], but Christian scholars and leaders in our modern world act as if unaware that we, as the earthly body of Christ, have suffered a severe failure of imagination.

We all have our own roles to play, our own charisms. I spent more than ten years writing creative fiction of the sort which has had few readers in recent centuries and nowadays has no publishers. Now I also write philosophy and theology in the style of a novelist who wants to say things that don't seem possible with the language of our age. Often I can't even think these things and can only grasp at vague and sometimes nightmarish images. The future, even as defined by the imaginative possibilities of the present, is never clear to men. More than that, I too am a child of my time, the product of modern American education and also the a resident of a time and place where shallow literacy is appreciated and glorified and any works demanding a deeper literacy are ignored in a way that should give good lessons to any future Stalins. [During 2010, I was reminded that both Alexis de Tocqueville (*Democracy in America*) and Ray Bradbury (*Fahrenheit 451*) had projected the possibility of the United States becoming a totalitarian country in response to demands of the citizens to suppress thought and creative activity. Bradbury came to feel, by at least 1950, that

television would play a key role in our decay into a totalitarian state.]

I try to speak directly about God's world but often find I can think and speak only in circumlocutions. It takes so many words to say something which seems a simple truth of this universe because I speak in terms of basic concepts better suited to a universe which doesn't exist, a universe men once imagined into existence because it was a good encapsulation of what was known in past generations. I speak modern American English and that's a language ill-suited to purposes of exploring and describing God's world as it objectively exists. American English is better suited to speaking of a fantasy world we prefer to God's world. Read *Moby Dick* and think of Captain Ahab as a man who didn't much like the world as God created it, but Ahab was too honest and courageous to lie to himself. Instead, he attacked God's Creation, trying to penetrate to God Himself, perhaps to drive a harpoon into the heart of the Almighty. Melville deliberately, in the 1850s, created an American with all the bad attitudes some conservatives think to have arisen in the 1960s. Besides hating Creation and the Creator, Ahab also intensely disliked the constraints on his individualistic self to the point of hating the family and local communities which would bind him,

To be sure, mortal men will never see this universe better than through a glass darkly, let alone the world which is the universe as seen in the light of God's purposes. Yet, we do have the duty to try to understand the world, however strong the guarantee of failure. After all, this world is the manifestation of certain thoughts of our Lord when He shaped this world from the underlying stuff of Creation, what I call the Primordial Universe. And, to be honest, it can be great fun though also horrifying and full of pain.

It's my calling to speak the circumlocutions that allow a narrative to be built from bits and pieces of modern empirical knowledge: history and physics and biology and literature. From this mess might coalesce a stream which would be a story, unified and coherent and complete in the context of this age, given our needs, which dictate what part of God's world we explore, and what we can discover during those explorations.

We need fresh ideas for dealing with the problems that God has thrown at us and our minds are not so inventive as to produce anything so disturbing to our rigidities of mind as knowledge of our environments and, in modern times, knowledge of vast expanses of time and space in this universe. A good understanding of the problems, such as those which quantum mechanics presents to our understanding of mundane reality, will itself pro-

vide the creative possibilities for resolving the problems. In other words, the problems God throws at us are the thoughts He wishes us to have as our own. We just hear God's messages as static because we'd prefer to listen to recapitulations of earlier messages as interpreted by our ancestors. Of course, I'm speaking about messages which are so-called 'natural revelations' such as those which came to the great pagan thinkers and which fill many pages of the works of St. Augustine of Hippo and St. Thomas Aquinas.

One reason for preferring modern empirical knowledge over the fantasy worlds oddly preferred by some Christians is:

As Creator of this world, God was more creative than J.R.R. Tolkien or C.S. Lewis could possibly be.

And that is the issue:

The 'weirdness' of quantum mechanics and the dark mysteries of biological evolution are the result of God's creativity and man is most creative when he remains true to what he knows of that divine creativity. That we have no poets and novelists up to the task of creating new forms of literature from this new knowledge, or more likely—no publishers or editors up to the task of evaluating truly creative efforts, says something about our culture and our inability to respond as better generations responded to new knowledge of God's world. (In fact, I consider *Moby Dick* to be a darned good critique of the modern mind and its dual attributes of moral insanity and instrumental competence though there are now serious doubts about that competence.)

As I've pointed out repeatedly and repetitively in various writings:

- Modern physics and mathematics have implied an expansion of metaphysical thought;
- Modern evolutionary biology and modern studies of human histories have implied a return to the Biblical view of God as a story-teller; and

- Some nastiness in human history explored by Hannah Arendt in her efforts to put the Nazi genocides in context has not yet been properly considered by moral theologians. (I refer to the ‘banality of evil’ which is really the tendency of ‘nice’ human beings to do the work of corporate evil while simply taking care of their day-to-day concerns. This isn’t necessarily an evil so much as it’s an incapacity of men to deal with the scales and complexities of human communities which have developed in the modern world. We need to consciously get to work to develop that capacity.)

If we are to break through the various barriers in our minds, we’ll need poets and novelists and musicians and painters to start bringing new ideas into the mainstreams of human cultures. Those artists may very well pick up ideas from philosophers or theologians or they may discover them on their own, though our current impasse would indicate we need philosophical theologians who can give us a good worldview to make some sense of modern empirical knowledge in light of Christian revelations. Even if the artists get their inspiration from philosophical thought, they’ll enrich that thought in the process of showing the beauty that lies in any valid way of looking at God’s Creation, no matter how abstract and austere the early statements of that way might be.

Those new ideas have first to be generated in the minds of those oriented towards experimental thought. And many of these experiments might be good and useful even if largely erroneous in their underlying ideas. Even if we assume some sort of good and useful Christian thought lies in the fantasies of Tolkien and Lewis, they don’t speak the truth so well as did Tolstoy in *War and Peace* despite the sheer wrongheadedness of his philosophy of human history. But he was apparently struggling with the problem I’ve discussed often in my writings—the relationship of men to the large-scale movements of our age, many of which have done great evil.

It’s the responsibility of creative thinkers to help both sheep and shepherds to see how the earth has been changed by a better understanding of God’s world, an understanding not yet integrated into our greater ways of thought. We need to look forward to better possibilities than those we’ve chosen in recent centuries. It’s not the world which has failed men, but men who have failed to do their duty by the Creator of the world. It’s not that empirical knowledge of that world is evil but rather the imaginations of men are proving to be inadequate to the task of making sense of that

knowledge in light of Christian revelation. We do evil with our eyes shut and our minds in self-induced comas.

But that doesn't have to be. Our imaginations and our minds can be exercised and strengthened. I still think I was right in the bibliographical essay of my first published book, *To See a World in a Grain of Sand* [41]. We should nurture our imaginations by reading the great creative fictions of the West, such as *Moby Dick* and *Don Quixote* and—to choose a more recent example—*One Hundred Years of Solitude*.

## 380 The Size of Human Freedom

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=136>. It was finished and uploaded on 2008/02/19.]

Way back in the mid-1970s before the sexy term ‘chaos theory’ had ever driven books onto the best-seller lists, I took a course with a decidedly un-sexy title: *The Qualitative Analysis of Ordinary Differential Equations*. In that course, we learned how to analyze potentially unstable systems such as a planet orbiting the sun so that it never repeated the same path twice, as is true for the earth and its siblings. As it turns out, it’s possible—with a lot of simplifying assumptions—to make statements about the stability of the planet’s orbit given the mathematical techniques available to an undergraduate math or physics major. Ultimately, the field is very difficult and relies on techniques and disciplined attitudes beyond that of most undergraduates and certainly beyond the typical reader of gee-whiz pop-science books. Unfortunately, the field has acquired the title, *chaos theory*, as misleading a name as special or general relativity theory.

Chaos theory deals with imperfectly stable systems just as Einstein’s theories of relativity deal with absolute invariances, geometries of space-time, relationships between objects or even those relationships which define our universe.

Would you like to make a chaotic system in the lab, or in your basement workshop? Take two pendulums of different period, that is, different length of the wire or rod holding the bob. Connect them with a chain or rope and set one in motion. The movement of the two pendulums will be chaotic. It will be unpredictable by human techniques of mathematical physics though that movement will be well-determined so far as we know.

The unpredictability is seen only as shadows, if you will, against the backdrop of what can be rationally stated regarding these systems. If we

hadn't known the Law, we wouldn't have known (understood) sin. If we hadn't known the physical laws which give some ordered structure to physical reality, we wouldn't have understood the disorder studied in *chaos theory*. The term 'disorder' in the previous sentence is in the context of human mathematics. To say that we can't predict the future of even simple physical objects isn't the same as claiming that there is some sort of irrational or mystical elements entering into that future. It is to say that there are elements which don't fit into human mathematical and metaphysical structures as well as facts which are simply unknown to us.

To play off the example of the pendulums, there is a general principle advanced first, so far as I know, by the philosopher Stephen Toulmin in the early 1960s or thereabouts:

Apparent randomness will arise in the real-world when two well-determined and independent systems interact.

At the time he wrote, he was concerned about a simple model of evolution, one reduced to the interaction of two particular systems: the DNA of an organism and its external environment. This is a useful simplification for some analyses but—of course—the real world quickly gets more complicated and also more complex in basic ways. When we've dived into contemplations of this sort of situation, it does become surprising that order can be seen at all even when it has to be there.

In the mid-1960s, an interesting proposal was advanced independently by the great Russian mathematician, A.N. Kolmogorov, and the American high school student, Gregory Chaitin. They proposed to define a random number in terms of what is now called *algorithmic complexity theory* rather than just taking it as a naive concept which is typically treated as being some invasion from irrational realms. I had a very highly regarded mathematician as my professor for a year of probability theory and stochastic processes, a Professor Kempermann, and I remember him saying, circa 1975, that randomness is not necessary in mathematics but is useful mostly for pedagogical purposes. All of probability theory can be enfolded into a fully deterministic measure theory. Marc Kac, a highly regarded measure theorist at Cornell, reacted to the early work of Chaitin and Kolmogorov by saying: Now we know what a random number is, a fact.

A fact. Facts are scary in a way, but not because they're irrational. Anyone who's read my first published book, *To See a World in a Grain of*

*Sand* [41], and some of my subsequent writings on my blog might suspect that facts play a very important role in my understanding of God's Creation, far more important than axioms and basic truths, because those statements and things we regard as 'systematic' truths are drawn by God from an absolutely infinite realm of raw facts which would be so unorganized to us that we couldn't see them if God were to set us down in what I call the Primordial Universe. The Primordial Universe is my effort to speak rationally about some very complex questions raised by these mathematical issues and also by the meltdown of things into elementary particles and then the meltdown of those particles into some very strange and general sort of substance as we travel backwards in time towards and beyond the so-called Big Bang. I also came to feel we should speak rationally about the human ability to discover higher orders of infinity which seemingly can't be embodied directly in our physical universe—meaning they couldn't be embodied directly in any sorts of relationships between human brain-cells.

God is the Creator of that absolutely infinite ocean of facts, which I call the Primordial Universe, and God is also the only entity who can make a true random number or act in a truly random way just because such acts would require an absolutely infinite mind. God is the Master of Facts and the axiomatic systems of most systems of human thought are special sorts of facts. They're specially shaped rocks selected from a field of randomly shaped rocks. They fit together to form elegant structures but they're not the foundation of Creation – that absolutely infinite field packed with randomly shaped rocks is the source of the components of specific worlds within Creation.

Gregory Chaitin worked on defining randomness from his high school years in the mid-1960s until 1990 or so. The answer proves to be that a random number is all of them. That is, all of them in a measure theoretic sense.

So what does 'random number' mean?

Following standard mathematical procedures, I'll discuss only numbers between 0 and 1. A non-random number is one that has a pattern that allows a shorter encoding than a simple listing of all its digits. For example, 0.1111... can be encoded as either  $(1/9)$  or by the words: "An infinite number of 1s after the decimal point." Either encoding is clearly shorter than a listing of an infinite number of 1s. The number 0.1111... isn't random. It's somewhat amazing that all numbers with patterns, including those which can be 'built' from axiomatic systems, form a set which is infinitesimally

small compared to the set of random numbers, those without patterns.

Let's make a stab in the dark at the possible meaning beyond mathematics. What lies outside the realm of entities with elegant patterns? Our moral lives? Our creative lives, including our creative corporate lives by which we form useful collectives of various sorts? Our very lives? Maybe even life in general? Or at least the higher forms of life which exhibit some sort of moral and social characteristics?

Don't those aspects of our lives have the feel of factuality? To be sure, we don't operate with total freedom.

Only God can make a random number and only God can act in a truly random way.

The most random act we know of is the 'selection' of the extraordinarily unlikely initial conditions of our universe. I'm not sure if we can even try to describe God in His transcendent and necessary being which is His own Act-of-Being, the supreme Act-of-being. Because we can know God as Creator through His effects in Creation, we can come to some substantial understanding of God in this freely-chosen role, can even come to shape ourselves in imitation of Him. God in that role, God as Creator, acted randomly, factually and not according to any possible logic or axiomatic reasoning.

Factuality, metaphorically drawn from the set of numbers between 0 and 1 which have no pattern, may be our way of understanding and describing God's freedom as Creator. I'll provide a short outline of what might be involved in dealing with reality from this angle:

1. God, as Creator of this world, works in the domain of absolute infinity.
2. God, in His transcendence, is pure existence—His own Act-of-being—and it might not make sense to speak of such matters as infinity with respect to the transcendent Lord.
3. Creatures move around in domains restricted by the lesser infinities associated with that elegant realm of mathematics.

Factuality bursts into this creaturely realm. That is, freedom shows itself but we have trouble seeing it. After all, pure freedom doesn't belong to creatures, can't belong to us, and we shouldn't wish for it,

God can be absolutely free because He's pure existence. He has no structure as such, no substance or body parts. He is the source of all that we as creatures can reach by the efforts of our own minds: the truths of a philosopher and those of a mathematician, the substance of our bodies and that of the perfected bodies of the resurrected.

The movement from a view of Creation built from that elegant subset of the foundations of Creation to the entirety of the foundations would seem to me to be analogous to the movement from the Law as tabulated and elaborated by men to the Law who was a Person, the Son of God.

In that case discussed with such energy by St. Paul, there's a movement from line-drawings which help men to behave a little bit like God towards the concrete reality of Christ-like being. In the other case, there's a movement from the scaffolding necessary for elementary thought to the more complete realm of factuality which includes that scaffolding. When we make that latter transition, the possibility arises of seeing God's world, in principle, in a way similar to the way that He created it. We learn to imitate God in this way, just as a child watches her mother and then cares for her doll as she sees Mommy care for the new baby in the family.

In both cases, knowing the greater reality exists doesn't negate the value of the smaller reality. It doesn't even necessarily help us to see the greater reality with any clarity. In any case, grace still completes nature in this way of viewing our mortal world and the entirety of God's Creation. Grace completes the Mosaic Law into the Sermon on the Mount and grace completes the mortal bodies of those who belong to Christ into resurrected human beings with the same freedom as the resurrected Lord.

# 381 Open Borders in the United States and Tibet

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=137>. It was finished and uploaded on 2008/04/17.]

I'm not an expert on immigration issues, but I've been trying to catch up on the issue as part of my duty to know what's really happening in the United States. Recently, I've also been trying to figure out what's going on in Tibet though I'm pretty well convinced it's not our business. I did learn about China's construction of a technological wonder, a railroad over the Himalayas, allowing a flood of immigrants into Tibet—mostly Han Chinese from what I've read.

One blog by a leftish sort of British lady clarified matters a little. She expressed great wonder at the railway line (far beyond the capacity of 'Big-dig' Americans) and she was surprised that even the tour guides at Tibetan temples seemed to be Han Chinese.

So far as I know, the recent problems began when individual members of an ethnic group, Han Chinese, migrated into Tibet in search of economic opportunities—seemingly at the expense of members of another ethnic group, Tibetans. There's a complex history behind all of this, and apparently Tibet has conquered and dominated major Chinese regions for longer periods than China has ruled Tibet. I've even read that the Dalai Lama during the conquest of China by Kublai Khan, the son of Genghis Khan, was the adviser to the Mongol emperor, helping him to set up political and legal systems in which Chinese were second-class citizens. I'll ignore this complex history and not try to enlarge my knowledge of it. After all, I am an American and I have a simple point to raise.

There are lots of protesters in the Western countries who are very upset

with the Chinese dominance of Tibet, but the current civil unrest which has broken into violence and threats of greater violence in Tibet seems to have a proximate cause—the influx of Chinese laborers and the threats to jobs and to local cultures. Aren't those the complaints of some Americans worried about the loss of their jobs to cheap immigrant labor from Mexico and other countries? Aren't those the complaints of some Americans worried about the damage done to American cultures by large numbers of unassimilated immigrants in our midst?

Tibetans should worry about threats to their ability to make a living, to feed their children and maybe offer them some opportunities in life. I'm willing to assume that Tibetan culture is rich and has great value just by knowing how long it's been developing at a high level.

I don't understand why there are some of an activist frame of mind who support the Tibetans in their struggle to survive economically and culturally while despising Americans who seem to be in a similar struggle.

## 382 I Wish I'd Said That

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=138>. It was finished and uploaded on 2008/04/19.]

Actually, I have said some things very similar to some of Pope Benedict's gentle but firm admonitions on his visit to the United States. I don't get this kind of press coverage, but I don't expect to get as much notice as the Pope. I do have one advantage over the Pope, besides not being hemmed in by various political and diplomatic considerations. Let me provide a couple of quotes. A Catholic news-site, <http://www.cwznews.com/news/viewstory.cfm?recnum=57886>, quotes Pope Benedict, in his talk to the American Catholic bishops:

America's brand of secularism poses a particular problem: it allows for professing belief in God, and respects the public role of religion and the Churches, but at the same time it can subtly reduce religious belief to a lowest common denominator. Faith becomes a passive acceptance that certain things "out there" are true, but without practical relevance for everyday life. The result is a growing separation of faith from life.

and also:

Is it consistent to profess our beliefs in church on Sunday, and then during the week to promote business practices or medical procedures contrary to those beliefs? Is it consistent for practicing Catholics to ignore or exploit the poor and the marginalized, to promote sexual behavior contrary to Catholic moral teaching, or to adopt positions that contradict the right to life of every

human being from conception to natural death? Any tendency to treat religion as a private matter must be resisted.

I've made similar statements, but I've gone far beyond Pope Benedict in arguing, right or wrong, that a lot of the problem comes from inadequate Catholic responses to modern empirical knowledge and sheer Catholic ignorance about the simple fact that a human theological system, even when built to explain revealed truths, includes a lot of human speculation and also includes—implicitly or explicitly—a lot of the content of empirical knowledge during the time when that system was first built. Far too many Catholics, scholars and priests and laymen, are lazy even when hardworking. That is, they want to just coast on fundamental matters and not have to think hard about those fundamental matters. They want to believe that God created a world which was fully understood in all important ways by men who lived centuries ago. God's story ended a long time ago and we only have to finish off by celebrating the Sacraments for a few centuries longer. Such thinkers learn by way of textbooks the thoughts of St. Augustine and those of St. Thomas Aquinas. Such a way of reading profoundly creative thinkers distorts their thoughts so that even the word 'the' in those works becomes a lie. As a specific example, it has a way of converting complex human speculations, such as Augustine's understanding of man's sinful state, into 'revealed truths', such as the doctrine of 'original sin'.

How can an ordinary laymen, or even the ordinary priest, live his life in the secular aspects of his life when he can't make sense of that longer part of his life in terms of his Christian beliefs? If the Catholic Church and her separated sisters have no anthropological or moral teachings that make sense of our evolutionary heritage or our various genetic or cultural constraints, what is that ordinary layman or non-scholarly priest to do when he has to make sense of the pain of the good son who claims he feels like a woman? What sense can Satan-mongerers make of all that is known of the relationship between specific brain structures and addictions or even the plausible possibility that obsessions—including those to kill or rape – might involve brain-seizures? What is there in the talk from the pulpits or in those CCD books or those books by or about ancient saints that can make sense of a claim that a microscopic hunk of cells should be treated with the respect to a human being?

If we can't express our beliefs in the language we speak during our hours outside of churches and prayer-group meetings, then the domain of those

beliefs will begin to seem more like dreams or fairy-tales than reality.

## 383 Still Fighting Last Year's War

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=139>. It was finished and uploaded on 2008/04/21.]

Let your minds be at rest. The battle to keep sexual predators out of Catholic seminaries is going well. Of course, the shepherds and moral guardians of the Catholic Church were apparently not up to the task of judging the moral integrity and sexual maturity of young men who applied to enter the seminaries—by all reports, the selection process had to be bureaucratized and modernized by retired FBI agents and other advisers. Apparently, there are few Father Browns (of Chesterton's mystery stories) who can see deeply inside a man by hearing even a false confession. Apparently, few have read G.E.M. Anscombe's warning that a society is in deep trouble indeed if it needs resumés (let alone lie-detector tests) to identify good men. A Church, or a church, is in far greater trouble in those circumstances given the role of clergymen even in a non-sacramental branch of Christianity.

We shouldn't worry. The bishops and their bureaucrats are honestly admitting that the selection of candidates for the priesthood was botched in past years and the American Catholic bishops sat quietly and humbly as Pope Benedict reminded them of this, as if they were likely to forget with all the days they spend with lawyers and victims advocates, not to mention the ongoing flow of money out the door.

But the battle is going well and now there are record numbers of Catholic baptisms in the United States and the pews aren't so empty as some would have feared even a year ago. What's that you say? Those who are baptized and catechized and confirmed rarely show up at Mass the Sunday after being

confirmed as adult members of the Catholic Church? They feel they've done their duty, having satisfied some sort of imaginary requirement for being married in a Catholic Church. Grandma handed them a nice card with a small wad of cash in it. The envelopes from aunts and uncles, family friends and Dad's business partner, have been opened and the cash spent or deposited. There doesn't seem to be much point in wasting part of a Sunday in Mass.

You want your children to grow up to be practicing Catholic Christians? Well, you increase the odds of that happening if you move to Mexico to raise them. You have a much better chance of seeing them as knowledgeable Catholic adults if you raise them as Evangelical Protestants and hope for a conversion process that will lead to a serious effort to educate themselves.

You don't really want your children to grow up to be serious Catholics knowledgeable about their own faith? It's easy enough to meet that goal as well. Just raise them in a typical American parish, send them to CCD, and coach them through their confirmation. By that time, they'll be well-inoculated against any idea that the Catholic faith has much to do with the real world or intelligent efforts to understand that world. Heck, even if you send them to Catholic schools, you don't have to be discouraged by any signs of faith when they're young. That will wash out very quickly with just a year of public school or, for that matter, a year of working in the real world. And, so, tomorrow's battle is already well under way and being lost with resounding success as those on the losing side gather regularly to pat each other on the back and give each other awards as Catholic educators and humanitarians.

The Catholic faith isn't being competently nurtured in young American Catholics nor are others being evangelized. There are a huge number of casualties in this war for minds and souls and the ordained hierarchy of the American Catholic Church is working hard to do what they did so well with the problem of sexual predators in the priesthood: they're covering up the problem as long as possible. They spoke to Pope Benedict publicly about the large number of baptisms and the need for more priests. The diocesan newspapers will soon be giving us tallies of young adults being confirmed. To be sure, outside of the Hispanic parishes, the number of adults who are baptized or received into the Catholic Church at the Easter Vigil isn't so impressive and isn't so conducive to self-congratulation, but, all told, statistics can be quoted out of context to prove that the American Catholic Church isn't so moribund as rumor would have it. And no one in the pews

of a Catholic Church is reading the reports of the Pew Foundation which paint a very bleak picture of Catholic demographics and forecast even worse over the next generation or more.

Dare I think any bishops are honest enough and insightful enough to need to cover up the bad situation? “Guys, we might be lucky. We might make it to retirement before anyone notices we’re not very good at doing our primary work: teaching and evangelizing.”

## 384 Why We Shouldn't Explain Away 'Evil'

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=146>. It was finished and uploaded on 2008/04/24.]

As my allergies ease and I get over a funk about the decrepit state of the 'Catholic mind' in recent centuries, I'm starting to clear out some old business and getting ready to move on to new business including regular commentary upon issues being raised by modern researchers in the various fields of empirical knowledge. In browsing my file of notes about interesting articles and comments on the Internet, I came to a quote I lifted from a collection on history as a field of study compiled by the historian Clyde Wilson:

History is a great drama beginning and ending in the mind of  
God. -Aquinas

Aquinas was sane in the strongest sense of the word, that is, he accepted—as the most natural of assents—the reality outside of himself. He never so much as flirted with epistemology (the legitimate areas of which are nowadays are part of neuroscience) and he never fell into the trap of creating theodicies—strange efforts to explain away God's responsibility for His own Creation. And, in his sanity, St. Thomas pointed us to a task for the Body of Christ – understanding that drama from a human viewpoint in such a way that we make sense of the best empirical knowledge available to us in light of Christian truths. All Christians have a duty to try to learn the best human telling of the story and to make it their own, but few there are who are driven to create a new telling to accord with changes in empirical knowledge.

The all-powerful God is in charge and we're characters in a story which began in His mind and will end in His mind. If we're creatures of sin, that's because God wished to tell a drama featuring such creatures and not because our ancestors had any power to 'rebel' and to change God's story. This doesn't release us from moral responsibility. If we're sinful creatures, that's what we are, but we're also moral creatures. We move with limited but real freedom within the context of this story God is telling, this story which is human history but is embedded in a story which includes stars and gas clouds and orcas. A more rational understanding of God's drama, an understanding that necessarily includes the best available empirical knowledge, is more important in telling us who we are than any long gazes into a mirror.

## 385 Is this evidence against free-will?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=147>. It was finished and uploaded on 2008/04/25.]

Over the past decade or more, neuroscientists have found strong evidence that we start to act before we're consciously aware of our own actions. This is a problem to those who believe in free-will in the sense of a power of an autonomous agent. It isn't much of a problem to one who accepts the views about moral nature which were taught by St. Thomas Aquinas. I've discussed this Thomistic view of man as an intentional moral creature in various chapters in Part III, *The Human Mind as a Re-creation of God's Creation*, including my discussions of *How Brains Make Up Their Minds* by the brain-scientist Walter J. Freeman who has adopted much of Aquinas' teachings about human moral nature. Those discussions can be found in Chapter 83, *Is Christian Morality a Natural Morality?* and succeeding chapters.

There have been recent articles on various Internet science sites about a new set of experiments which haven't really introduced anything new but they did tighten up the acceptable results, making it a little more certain that we act as organisms and not as bodies under the control of an independent soul or free-will or whatever. It seems pretty clear that at least for those simple decisions which can be tested under laboratory conditions—such as decisions to move a finger—the regions of our brain associated with consciousness don't become active until the decision has been made by other brain regions and the action has started.

An article summarizing these recent experimental results can be found at *Brain-scanner Predicts Your Future Moves*

found at <http://www.newscientist.com/channel/being-human/dn13658-brain-scanner-predicts-your-future-moves.html>.

These new experimental results are important for technical reasons but don't really matter to those who have been following earlier experiments and the speculations based upon the results. Scientists are just tightening up results and closing possible loopholes. There are some interesting issues which need to be explored but a Thomistic intentionality can easily form a framework for such explorations and for the statement of rational understandings of human moral nature.

What good is consciousness when it doesn't control our actual physical actions? Some of the less rational sociobiologists had proposed many years ago that we're fooled by our 'selfish genes' into rationalizing our unconscious actions which are supposedly geared almost entirely to the reproduction of those 'selfish genes'. Professor Freeman provides the rational proposal that our consciousness can act as a censor upon our actions, being able to stop actions started by our unconscious selves. In addition, and in line with the Thomistic understanding of 'intentionality' (which is not that of modern subjectivists and feel-gooders), I would say our conscious selves play a major role in shaping our future selves, that is, our future actions. We can evaluate our own actions in context and work to change the way we act in that same context in the future. As a simple example: a young father might work to change the way he speaks when he's with his young children. I'm not writing mostly about eliminating obscenities but rather about the need to speak to young children in a way that nurtures their development, including their moral development.

Thomistic intention is less our vague goals of raising children to be competent and loving adults and more those first steps to discipline the relatively free behavior of a bachelor so that it becomes the self-sacrificing behavior of a father.

This leads to another good quote from the collections of quotes on history, as a field of study and contemplation, provided regularly by Clyde N. Wilson. See the *Chronicles Magazine website* found at <http://www.chroniclesmagazine.org> for Professor Wilson's blog entries.

The value of history... is that it teaches us what man has done  
and thus what man is. -R.G. Collingwood

History tells us what man is not by documenting his noble aspirations

or claims to noble feelings. History tells us what man is by telling us what man has done. At the same time, we have to remember:

Mere facts are meaningless. History becomes such when it facts are organized into a coherent story, a morally ordered narrative.

The moral order of a narrative might be defective, but it must be present for that narrative to make sense to the human mind and it makes sense by playing a part by helping to shape that mind. Such is true also of our understandings of our family and individual stories. We must learn what our ancestors once knew and what many still know if they're lucky enough to grow up with some intact traditions: our attachments to family and culture and language are not mere accidents but part of our moral beings. In knowing these various histories and biographies, and knowing them in a properly human way, we shape our minds and prepare the way to shape our future actions towards more clearly defined moral purposes.

Professor Collingwood was right. What man does tells us what he is. Moreover, that's true of human societies. We need our legends and sometimes even our idealized views of our past and our leaders but we must understand what we've actually done, as nations and as families and as individuals. Our honest but respectful understandings of our ancestors form perhaps the dominant part of our moral characters. We modern Americans are falling into moral disorder and one of the major reasons is our lack of concern for our histories which is a lack of concern for who we are and a corresponding lack of love for our ancestors and our own selves.

## 386 Finding Moral Ways to Make Our Livings

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=140>. It was finished and uploaded on 2008/04/27.]

The farmer and poet Wendell Berry has told us we'd solve our environmental problems if we found moral ways to make our livings. I'm beginning to feel guilty because I've been thinking about this bit of advice for nigh onto ten years and haven't come up with much. It's not that I make my living in an immoral way. When my corporate career floundered, I decided to start studying and writing rather than rescuing that career or finding another way to make a high income. I've lived with a gradually decreasing standard of living since then, bottoming out only by the generosity of my late parents and my sister and some friends.

I'm also stuck. I'm not able to make the sorts of changes in my life I'd like. If it were up to me, I'd be studying and writing and gardening on a small plot with a small house somewhere in a rural area. I'd be trying to train myself to live on a daily diet which has little pre-processed food in it, to purchase fewer useless things of the sorts which fill American houses, to treasure and care for the things I do possess.

As it is, I am trying—with only partial success—to live more simply. It's a matter of attention as it always is for human beings who've gone astray. We're creatures of moral intention and that means we're creatures of moral actions, not of noble sentiments or grandiose plans of reform. In Thomistic terms, intention means not what it means to modern moral philosophers or psychologists but rather what it means to lawyers when our imperfect human systems of justice are functioning fairly well. If you drink and then get behind the wheel of a car, you act with (Thomistic) intent to kill. If

you discipline your children with insults or use of subjective guilt feelings, you act with the intent of crippling their moral development.

We modern human beings are sleepwalkers, moving through the marketplaces of our lives in a state akin to that of hypnosis. We need to wake up, to become aware of the world we and our parents have made, to understand our positions in that world and to live as much as possible as morally well-ordered creatures.

And we have a chicken-and-egg problem.

We can't just decide to pay attention and find ourselves suddenly awake and alert. In a sense, that sort of alertness is part of the goal, part of a state of being we can't achieve perfectly after a life of practice. I return to the Thomistic idea of intention.

Take a short time each day to just think about what you've done that day and what you plan to do the next day. Look around at the products you use and think of how much time it took to earn the money for those, to shop for them, to use them.

Just a small example: maybe you'd be better off using handkerchiefs and bandannas rather than running through boxes of disposable facial tissues? Certainly, disposable tissues can be useful to stop the spread of serious colds or other respiratory infections but would we be better off with washable cloth when we simply clear our noses after working in a dusty cellar or walking in the April clouds of pollen?

Pay attention to the little things. Think of it this way for now: we forge our own chains a little link at a time.

I'll leave matters there for a while. I'm not sure I'll come up with any answers to help me or others to actually form new ways of living. We need to feed and cloth and shelter ourselves, we need to provide ourselves with entertainment and some luxuries, but we need to do so in moral ways, ways that better reflect the sorts of creatures we are. We need to dare to change our lives and to start forming new ways of living. We need courageous experimenters and it'll probably be easier for some of us to adopt the spirit of innovation if our various crises continue to grow. We may soon have the painful benefit of courage born of desperation.

## 387 Modern Bioethics: They're At It Again

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=146>. It was finished and uploaded on 2008/05/30.]

It's been a while since I've so much as mentioned cloning, stem-cell research, or like matters. Recently, some members of the English Parliament wanted to make it illegal to form a animal-human hybrid and also wanted to drop the fetal-age of abortion from 24 weeks to 20 or less. (See *Animal-Human Hybrids, Other Embryo Research Debated* at <http://news.nationalgeographic.com/news/2008/05/080519-AP-hybrids.html>.) The would-be reformers failed to ban animal-human hybrids and are likely to fail to drop the age at which a fetus can be aborted.

I'm not going to bother to discuss the specifics of this news story. I'm going to try to make a pitch for moral sanity on a more general basis.

In my first book, *To See a World in a Grain of Sand* [41], and in various other writings since, I pointed out that Adam Smith's optimism about moral self-organization of a complex human economy or society was based upon his observations of societies which had very rigorous public moral order: that of the Presbyterian Church and that of the Anglican Church in the mid-1700s.

Human beings acting towards similar goals, such as increasing material prosperity, will tend to organize and the results will definitely have some marks of moral order. After all, what is moral order if not the organized efforts of a community to meet some goal which is at least plausibly good? That good might be simple survival to be achieved by the clearing of farmland or the formation of organized hunting bands and foraging groups. It

might be the gathering of money-men and ships-owners at a coffee-shop to discuss the insurance of ships and cargoes. It might be a complex undertaking by bankers and lawyers, managers and engineers, real estate brokers and insurance brokers, employment placement firms and architects, to turn a new venture into a major manufacturing operation.

Or it might be a small community organizing to build a house of worship or to maybe organize a new town.

But there is also the defective moral order of men grouping together to form conquering armies that they might live off the work of others. There is also the moral order of a patrician clan of the Roman Republic which was based upon demanding codes but was far too lacking in charity by Christian standards and far too harsh modern post-Christian standards.

In the modern West, we've inherited a political and moral culture that we've largely dismantled because the various restrictions got in the way of our immediate desires. For example, we want safety and security of the sort not really to be found for long in this world. In an effort to gain this safety and security, we've adopted national welfare, retirement, and health-benefits schemes that transferred the dependencies, hence—the loyalties, of American citizens from families and local communities to the central governments. This also allowed corporations to 'rationally' organize the American economy to the purposes of those who truly hold power, the politicians and bureaucrats who can put you into jail or shoot you for not paying taxes of questionable constitutionality. A corporate economy of the American sort, converted even the activities of homemakers and mothers into taxable cash-flows, rendering the most personal of human transactions subject to taxation. As a side-benefit to those greedy for money or power, this situation allowed an international community of corporate executives and investors to seize control over the property that Americans used to make their living, often transferring it indirectly into the countries with the cheapest, trainable workforce. (That is, rather than maintaining or replacing steel-mills in the U.S., corporations bought steel from the Koreans or Chinese, giving them the money to expand and modernize their mills.)

We're physical creatures needing food and shelter and clothing to survive. One of the few valid insights of the liberal school of political philosophy (Hobbes through Locke through many others) was the realization that a 'right' to property is necessary for any sort of true political freedom. When we Americans and others in the modern West allowed corporations and bankers to gain control over our farmlands and small shops and small fac-

tories and even our homes, we basically sold ourselves into slavery, though some lived early in the process and got the profits for selling their children and grandchildren into slavery. Our jobs were transferred overseas to those who were willing to work hard for less money than what's needed to support an American standard of living. There was more going on than even that, but that's the most readily describable part of the looting of our civilization by our mostly home-grown barbarians who piled up huge private fortunes or political empires or both at the expense of other Americans.

We've taken on, positively sought at times, a form of slavery in which most of us roam free and are allowed to engage freely in activities more appropriate to pigs than to men. It's a form of slavery in which the upper-classes are willing to give welfare alms to poor people through a political process and for political reasons. It's a form of slavery in which most human beings have been reduced to means, serving the ends of the unscrupulous and the ambitious. Now we move towards a more profound sort of moral degradation: men seeking fortunes and men with the good desires of easing or eliminating suffering or death have united to turn that which is human or that which might be human into a source of spare parts for others.

## 388 Celebrating Beauty

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=157>. It was finished and uploaded on 2008/06/02.]

Here is the beginning of a Vatican Information Service news-item:

### ROMANUS THE MELODIST: FAITH CREATES BEAUTY

VATICAN CITY, 21 MAY 2008 (VIS) - During this morning's general audience, Benedict XVI dedicated his catechesis to Romanus the Melodist, a Syrian "theologian, poet, composer and permanent deacon who resided in a monastery on the outskirts of Constantinople in the sixth century". Before delivering his catechesis in the Paul VI Hall, the Holy Father visited the Vatican Basilica to greet faithful gathered there.

Romanus, the Pope explained, belongs to "that sizeable group of theologians who transformed theology into poetry" and whose numbers include "St. Ephrem the Syrian, . . . St. Ambrose, . . . St. Thomas Aquinas, . . . and St. John of the Cross. Faith is love and so creates poetry and music. Faith is joy and so creates beauty".

Who better than Pope Benedict XVI to speak of the value of music and other arts in glorifying God and in drawing mortal men into proper worship? A highly cultured man who is said to be an accomplished pianist, he is also fluent in a multitude of languages perhaps including Old Syriac—the language of at least St. Ephrem. Certainly, I can't read any of the ancient poets or even the modern French or Italian poets in their own languages. I'm monolingual.

But I can speak one language fairly well and that's a language that is a combination of the words of the Creed and the descriptive words of modern empirical knowledge. And that leads me to sometimes listen in bewilderment as flesh-and-blood priests or ministers, or their televised brethren, speak another language which I can understand but consider obscurantist. I write theology and philosophy in my preferred language and also novels—some containing very amateurish poetry intended as a tease for real poets to speak of Creation as we now know it. I also speak, in my preferred language, of God in His role of the Creator who comes into view a bit more clearly with contemplation of a universe described well by general relativity theory and quantum theory. I even speak in that language of the areas of modern empirical knowledge that bother many Christians, evolutionary theory and history that doesn't always flatter our favorite nations or characters or ethnic groups. Yet, all this empirical knowledge points towards a Creator of a living, developing world which is a morally well-ordered narrative.

We won't be able to see that moral order until the artists and creative writers of our age speak in terms of the empirical knowledge which remains our age's greatest contribution to human civilization. After all, poetry, even about the greatest of Christian truths, is concrete and grounded in our understanding of what lies around us. We need to be grounded in the past and that includes a need to appreciate poetry based upon earlier understandings of God's Creation but we need good and creative and risky poetry which draws upon the understanding of God's Creation which is developing in its empirical aspects. Physics and mathematics, history and some fields of philosophy, literary studies and the practical fields of engineering and management are doing fine. At the same time, few are working on a way to restate the truths of Christian revelation so that they can be understood in the context of God's Creation as we now know it. We simply haven't produced much in the way of theology or even spiritual guidance for those many modern souls who are "lost in the Cosmos". And we've also not produced much poetry or narrative fiction that really deals with the modern realities.

Poetry, hymn-writing, musical composition both sacred and secular, need to be part of a living human culture. We need to keep alive that which we've inherited from the past but we need our own literature and music which is part of a greater culture along with our modern knowledge of mathematics, our deep and often disturbing knowledge of history, our knowledge of man's bodily nature, our knowledge of matter and energy and

fields at their most fundamental level. Our poets and our musicians, our philosophers and theologians, have not yet grappled with what might be called the universe of Einstein and, until they do, they won't be able to grapple with that more important matter of God's purposes for this universe, purposes which turn a universe into a world, a morally well-ordered narrative of sorts.

Until we have theologians and metaphysicians and poets and novelists who can speak of the realities of evolution and genes within the context of God's moral order, we'll have no chance of understanding Creation in Christian terms. Let's continue to read and study the poetry of Romanus and St. Ephrem, but let's pray for a modern Christian poet who can speak of man as we now know him, an evolved creature of genes and proteins who lives in a world where matter and energy are well-described by such fields of knowledge as quantum electrodynamics.

## 389 A Fraudulent Economy: Mixing Wealth and Illth and Mismeasuring the Mess

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=148>. It was finished and uploaded on 2008/06/06.]

There's an article on the *Harper's Magazine* website titled *Our Phony Economy*—see <http://www.harpers.org/archive/2008/06/0082042>. I'd originally read a summary of this article in another article I can no longer find. Both the original and summary articles talk about the odd fact that our economic statistics look better as our problems grow and we expend more scarce resources to deal with problems usually better handled in other ways. For example, our economy looks stronger as we get sicker and need more medical services. The original article also references a very good website which I'd been following for a while – *Shadow Government Statistics* at <http://www.shadowstats.com>. That website has a set of good primers on the political corruption of our government's unemployment and national income statistics, a corruption which has been ongoing since Lyndon Johnson's efforts to cover up the real costs of the Vietnam War and his Great Society programs. John Williams, the economist who runs that site, calculates unemployment statistics and other economic statistics the way they were calculated before the methodologies were corrupted by the various Presidential administrations since Johnson. Appropriately enough, you have to subscribe to his newsletter to get recent statistics, but the older numbers which are available to the general public are frightening enough. He does note in his background discussions that some changes to government statistics and analyses have been improvements but argues

strongly that the corruptions overwhelm the improvements.

One of the ways in which we defraud ourselves in our economy is through our accounting for our medical system. By pretending that a dollar given to a hospital is the same as a dollar given to a farmer or a manufacturer of durable goods, we Americans have been boosting our economy by living unwisely. Age-onset diabetes becomes an economically beneficial state because it causes us to buy more treatments from our doctors and hospitals. And there are also various therapists and maybe athletic clubs which benefit if we have good medical insurance. Money flows and obviously we're richer. Our standard of living has risen because we have more hospitals treating more diabetics. Over time, you have heart surgeries and various expensive drugs to contribute further to our wealth. Or is it illth? If half of us Americans or so were to obligingly get leukemia, the other half could go to work for the medical system, if only as van-drivers. Expensive testing and treatments would give us a hell of an economic year. Maybe even two years or so.

We wouldn't have to even worry if some lost their jobs because the patients were dying off at young ages. Some clever political operator would advise the President on how to eliminate those poor slobs from the unemployment statistics as President Clinton managed to eliminate the inner-city unemployed with the 1996 elections approaching. That was progress of a sort, at least to that exploitive class of politicians. President Nixon failed to even get the Bureau of Labor Statistics (BLS) to publish the more optimistic of the seasonally adjusted or the non-adjusted. The BLS insisted on at least announcing which set of statistics they were publishing.

And did you hear the one about keeping the calculation of inflation estimates down over the past 15 years or so? When we're less well off because of price increases, then obviously, a pound of hamburger gives us as much satisfaction as a pound of steak and so a substitution is made in the basket of goods used to calculate the consumer price index. Substitutions of that sort are one way that the published CPI over the past ten years or so has been about half of what it would have been by more consistent and more honest calculations.

## 390 Maybe We Should Fight the Disease and Not the Symptom?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=150>. It was finished and uploaded on 2008/06/09.]

I confess: I drank too often and too much in college. I went to college unprepared for the effort of serious learning and was shocked to discover that was the case. Lacking something in my moral character, I fell into evil ways. Yes, evil. And those were evil ways which can flourish in a society in which young men and young women are raised to be good, pliable targets for the exploiters of the marketplaces of the modern world. Once trained to long for the latest toy or the latest breakfast cereal, should we be surprised that they have little self-control when faced with the temptations of life on their own?

In a word, we fail to raise our children to be morally well-formed creatures possessing not only a knowledge of moral principles but also good habits. And then we send them off into the world, to college or into the corporate world. Even those who live near a good extended family might well play softball with guys who head right off to a bar after each game, not for a beer and some good debates about the pennant race but rather for six or seven beers and some increasingly irrational arguments.

You shouldn't even have to think about saying, "No," to a party you know is going to be a falling-down drunk-fest when you're in college to learn, supposedly something of a moral adult and ready to be turned into a cultured and perhaps productive moral adult. Well, a frighteningly high percentage of college students drink heavily and always will when they're not properly formed in their moral characters. See the article *Not All University Students Will 'Mature Out' Of Heavy*

*Drinking Habits* at <http://www.sciencedaily.com/releases/2008/05/080531185855.htm> for a study showing that some of them keep those heavy drinking habits when they leave college. Maybe we should be putting in the hours and efforts to develop moral character—habits first and then powers of reasoning—in our children? Maybe we should be more careful about the television shows and movies they see. Maybe we should be careful to teach them to admire their hardworking, if somewhat boring, grandparents instead of drug-using athletes or heavy-drinking singers.

# 391 Causality and Moral Freedom

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=169>. It was finished and uploaded on 2008/07/05.]

One of my goals is to find ways of speaking about causality, freedom, and related matters in terms that are consistent with what we know of this universe and with what we know of the nature of that unique animal called man. Tentatively, we can set this plan:

1. The human mind is formed as it responds to its environments. The conjecture that a rational universe exists will allow that mind to respond to the universe as a whole, potentially shaping itself as an encapsulation of that rational entirety. If that mind sees that cosmos or universe as part of a Creation of a rational God, that mind will be able to see that universe as a morally ordered narrative, what I call a world.

We have a duty to properly form our minds by way of appropriate responses to reality. This doesn't mean all human beings have to be physicists or meta-physicists. A farmer who truly inhabits his farm, nurturing the human beings in his household, the cattle and poultry in his barns, and the soil and plants in his fields is shaping his mind properly in response to God's Creation.

2. A truer moral freedom is largely dependent upon a solid body of knowledge and a mind capable of working with that knowledge. We have to understand our absolute constraints to best be able to build our moral natures and live our moral lives.

We have to understand lesser constraints so that we might be able to handle the cases of human brokenness which we can, so to speak, conquer. We have to understand the true options we have that we might realistically work towards a state which might even be moral nobility. Not all pious men need to do this work any more than all pious men need to be good farmers. Each part of the body plays its role. Physicists contribute empirical knowledge about the nature of being in this universe and speculative knowledge about the being from which this universe was shaped. Metaphysicians speculate beyond the range of physics, but subject to the discipline of the knowledge of physics. Theologians, poets, politicians, and many others play their part in bringing this understanding of being into concrete cultures: language and customs and institutional forms and so forth.

3. The above two items are opposite sides of the same coin. We need to understand our universe and from that understanding we can maybe attain a greater understanding of the entirety of Creation. We also need to understand the possibilities of human nature that we might become the creatures God wishes us to be and we do that by shaping our minds by responding properly to God's Creation. By way of a complex movement involving both of these tasks, we can begin to see the coin as an entirety and realize that a properly formed human mind, simple or intellectual, is one formed to think the thoughts which God manifested in this world.

The end result of this project will not be a bottom-up explanation of our situation in terms of basic physical forces but rather an understanding of created being in general. Though this greater understanding will be schematized in textbook form, it will actually be realized in properly formed human minds and in the structures and content of one or more human civilizations which I believe to be in embryonic forms. This effort isn't an academic exercise but rather part of a creative movement towards a new phase of Western Civilization or perhaps a radically new civilization or perhaps we can move towards multiple civilizations in this age of a technologically advanced and populous human race.

If we're successful in moving towards those new civilizations, we'll likely see new possibilities for dealing with our personal and social moral problems. We'll see new possibilities for building moral forms of human life,

new realizations of concrete human communities. For example, we might come to some understanding of the way that systems organize themselves. From this necessarily abstract understanding of systems, we might be able to gain some greater moral control over the various large-scale organizations of which we're part.

And then, I'm sure, we'll create new problems and history will continue.

## 392 Causality, Moral Freedom, and Genetic Glitches

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=170>. It was finished and uploaded on 2008/07/10.]

So what freedom do we have when we're strongly constrained by our genes and the rest of our body, by our upbringings and our social and political circumstances, by the very nature of space and time and causality? Whatever the result of the various debates about nature versus nurture, there are certainly some constraints upon us and, in a sense, it doesn't matter as much as some think that we might be shaped relatively more by our ancestor's environments or by our environments. That is, it doesn't matter for many modern theories of freedom, personal responsibility, and other diverse issues related to moral nature. In these theories, freedom is defined in terms of freedom from: nature, nurture, and current environment. I'll label all three of those as 'constraints'.

Constraints provide structure, you might say they're necessary for particular entities to exist. Without constraints, there's nothing to be free. I think that was the real point of Kate Chopin's *The Awakening* though it's often read as some sort of endorsement of the radical freedom which the protagonist sought. Having partly gained it by cutting her ties to first husband and then even her children, she completed her decay by swimming out into the ocean and entering a sort of formlessness.

Human nature is a set of constraints from which any particular human being draws his characteristics. Those constraints can be good or bad, and often that goodness or badness is a matter of context. We have breakable but somewhat strong instincts against killing other human beings. We feel various sorts of love for various sorts of other human beings or non-

human animals. Many of those forms of love might well be ‘re-targeting’ of the hormonal urges we have to protect little creatures that look like us but have eyes as big as plates and ways of cuddling up to us that break down barriers. Other loves may have developed by separate evolutionary pathways but might have been intensified by the strong urges that nearly all social mammals have to protect and play with their young.

Freedom isn’t bad for sure but it’s also not a good in itself, any more than constraints are. Our constraints offer the possibility of moral order or moral disorder but we often need to freely choose the specifics of our behavior, including the natural constraints we choose to nurture.

Freedom as such isn’t the point. A Christian wishes to be Christ-like, those of other traditions have their own ideal state. I’ll just say the goal is to be a good man, not to be free to be good or bad. How many would say a man who develops his freedom and uses it to become a mass-murderer (Hitler?) is a better man than a simple man constrained by genes and upbringing to be a good man? True it is that the simple man isn’t constrained so that there is 100% chance of becoming a good man. He can decide to be distrustful or hateful, he can fall in with the wrong crowd or become addicted to drugs, such as amphetamines, that nurture violent tendencies or other drugs that lead him to a deceitful and self-destructive state.

What about those who are constrained to be that which they don’t wish to be? I’ll not speak of the overall moral issues involved in homosexuality, but only of the dilemma of those who feel homosexual urges and don’t wish to be homosexuals. I’ve known a few such individuals, as well as some who varied between not wishing to be homosexual and then accepting it.

So what do we say when a scientific research project tells us that there is a strong correlation between homosexuality and the existence of a certain form of a gene? Most claims linking homosexuality to specific genes or brain-structures have failed to pan out when other researchers set out to verify them, but it’s far from impossible that one such claim will be verified. In a recent story, we learn of a discovery that certain genes which pass through the maternal line are correlated with an increase in the fertility of daughters at the same time they’re also correlated with increased odds that sons will be homosexual. See *Male Homosexuality Can Be Explained Through A Specific Model Of Darwinian Evolution, Study Shows* found at <http://www.sciencedaily.com/releases/2008/06/080617204459.htm> for a summary.

Excuse my anthropomorphism for the sake of economy, but it’s hard to

imagine a reason for nature to make homosexuals for the sake of that trait, but it's easier, given what we know of evolution, to think that homosexuality might be produced as a side-effect of a process leading to some reproductive benefit for siblings. A maternally transmitted gene that increases fertility of daughters while disposing some or all sons to homosexuality would be in line with a situation which seems, at first glance, to be at odds with evolutionary theory which is, in major part but not fully, a theory of selection by way of reproductive fitness. Though homosexual males can certainly father children, it would seem likely they wouldn't produce as many children on average as heterosexual males.

What can we say about evolutionary pathways which produce such seemingly strange results? First of all, we can simply say that evolution is a theme in a very complex story of which human beings are only part. Like all stories, it has rational underpinnings but it also has many factual aspects. In this way, it's no different than, say, *The Scarlett Letter*. If Nathaniel Hawthorne had written a prologue giving the entire history of the Bay Colony and every one of its members, we could still not have known in advance the flow of events in his classic story. If we were able to suspend our knowledge of history after 1776 and then read Douglas Southall Freeman's biography of Washington, we might well have been doubtful of the chances of the Washington's success as he took command of the colonial army at the siege of Boston.

The story of life on earth, biostory?, is a wondrous tale of great beauty and—at times—great horror and—very often—beauty marred by glitches. In fact, there has probably never been a creature not marred by glitches and human self-awareness has increased the problem by leaving many individuals aware that they're constrained, by nature or nurture or circumstances, to have traits or desires or limitations they desire not or to accept desires that leave them at least partly outside of their natural human communities.

## 393 Properly Empathic and Properly Moral

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=159>. It was finished and uploaded on 2008/07/18.]

See the article *Children are naturally prone to be empathic and moral* at [http://www.eurekalert.org/pub\\_releases/2008-07/uoc-can070808.php](http://www.eurekalert.org/pub_releases/2008-07/uoc-can070808.php) for an interesting finding about a complex moral differentiation which seems to be (at least partly) inborn rather than the result of upbringing or conscious thought.

One interesting point is:

<blockquote>

“Consistent with previous functional MRI studies of pain empathy with adults, the perception of other people in pain in children was associated with increased hemodynamic activity in the neural circuits involved in the processing of first-hand experience of pain, including the insula, somatosensory cortex, anterior midcingulate cortex, periaqueductal gray and supplementary motor area,” Decety wrote.

However, when the children saw animations of someone intentionally hurt, the regions of the brain engaged in social interaction and moral reasoning (the temporo-parietal junction, the paraculate, orbital medial frontal cortices and amygdala) also were activated.

</blockquote>

That is, children empathize with those suffering from ‘natural evil’ but have an additional response to cases of ‘moral evil’. They respond morally.

## 394 Destroying Minds One Show at a Time

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=161>. It was finished and uploaded on 2008/07/23.]

There is still another research effort that points to the dangers that television presents to developing minds, even when it's only on in the background. In *Parents should limit young children's exposure to background TV* at [http://www.eurekalert.org/pub\\_releases/2008-07/sfri-ps1070808.php](http://www.eurekalert.org/pub_releases/2008-07/sfri-ps1070808.php), we read:

Despite the fact that pediatricians recommend no screen media exposure for children under age 2, three-quarters of very young children in America live in homes where the television is on most of the time, according to research. A new study has found that leaving your TV set on disrupts young children while they are playing, even if the channel is tuned to adult shows. This means that simply having the TV on, even in the background, may be detrimental to children's development.

What is it about television that's so attractive that parents will watch it despite dangers to the minds of their children? It's bad enough that those parents are willing to destroy their own minds, but their children's minds?

## 395 How Should We Speak of Sin?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=172>. It was finished and uploaded on 2008/07/23.]

In an earlier entry, Chapter 25, *Broadening Horizons of Reason*, I quoted the entirety of a Vatican Information Service news article. I'll quote a stretch of that article about Pope Benedict's speech to a symposium of philosophers:

“Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.”

Benedict XVI indicated that since the beginning of his pontificate he had received various suggestions “from men and women of our time”, and that “in the light of these I have decided to offer a research proposal which I feel may arouse interest in a relaunch of philosophy and of its unique role within the modern academic and cultural world”.

Quoting his own book, *Introduction to Christianity*, he said: “The Christian faith has made a clear choice: against the gods of religion for the God of the philosophers, in other words against the myth of custom and for the truth of being”. And he went on: “This affirmation . . . is still fully relevant in the historical-cultural context in which we now live. Indeed, only on the basis of this premise - which is historical and theological at one and the same time - is it possible to respond to the new expectations of philosophy. The risk that religion, even the Christian religion, be surreptitiously manipulated, is very real even today”.

“The proposal to ‘Broaden the Horizons of Reason’ should,” he proceeded, “be understood as a request for a new openness towards the reality to which human beings in their uni-totally are called, overcoming old prejudices and reductive viewpoints in order to open the way to a new understanding of modernity”.

I’ve argued in various entries on this blog that physics and mathematics are the most important of the sciences when it comes to a revival, even rehabilitation, of Christian philosophy. This relates to the way that revival would unfold in time—we need to have some coherent and fundamental understanding of being before we have to deal with the particular entities which God shaped from more abstract forms of being. Once we have a fresh metaphysical perspective which considers what’s actually known about the possibilities of human thought (given largely by mathematics and logic) and the basic properties of physical being (given by mathematics and physics), we can engage in a fresh encounter with other forms of empirical knowledge and research, including disciplined contemplative knowledge based on understandings of empirical reality. In fact, we can’t really proceed in quite that way. Good historians (e.g. Jacques Barzun or John Lukacs) and good biologists (e.g. Walter J. Freeman and Gerald Edelman) will do their work using a metaphysics with plausible foundations even if those foundations are still being rebuilt.

Some say God is in the details. I think it better to say that the thoughts God chose to have in His role as Creator are in the details and also at the level of the entire universe. (See Chapter 193, *A Universe is More than it Contains*.) In Chapter 229, *Reality is Still Knocking: Human Uniqueness*, I discuss the losing strategy to grasp hold of tool-making or language use or moral nature as the explanation for human uniqueness. Our uniqueness, if we are truly unique in the animal kingdom, comes from the incarnation of the Son of God, when He became one of us; it comes from our relationship to our Maker.

If Christians are to engage in a fruitful encounter with modernity as Pope Benedict wisely advises, we’ll have to breath in the atmosphere of modernity without letting the rich gases burn away our beliefs. We need to learn the facts and speculations and stories of modern physics and biology and astronomy and then we must learn how to embed modern empirical knowledge into the Christian story. I’ll address a specific example, research results discussed in this story: *Sociological research shows com-*

*bined impact of genetics, social factors on delinquency* found at [http://www.eurekalert.org/pub\\_releases/2008-07/asa-srs071108.php](http://www.eurekalert.org/pub_releases/2008-07/asa-srs071108.php). The results are summarized in these words:

“While genetics appear to influence delinquency, social influences such as family, friends and school seem to impact the expression of certain genetic variants,” said Guang Guo, the study’s lead author and a professor of sociology and faculty fellow at the University of North Carolina-Chapel Hill’s Carolina Population Center and Carolina Center for Genomic Sciences. “Positive social influences appear to reduce the delinquency-increasing effect of a genetic variant, whereas the effect of these genetic variants is amplified in the absence of social controls.”

In other words, identifiable patterns in a child’s genes indicate their predilection for serious misbehavior if they’re not raised properly. These results are hardly surprising and are, in fact, consistent with Biblical views. The Old Testament, in particular, speaks often of traits passing from one generation to another and also of the bad results from a tree being bent wrong at a young age. It’s the New Testament that speaks of a freedom that comes through the Incarnate Son of God.

As St. Augustine of Hippo told us:

We do not sin, we are sin.

We are bodily creatures and we are sin, that is, we’re unformed and the possibilities for disorder are as great as those for order. We are sin but—remarkably—we can achieve a state of moral order. We can become at least virtuous pagans if we have some integrity and also the luck to receive a proper upbringing. To a Christian, a state of natural moral order is good in itself, but it’s far surpassed by a Christ-like state. With the grace offered to natural man by the Lord Jesus Christ, mortal man can achieve that still greater state, a share in the divine life, a resurrection into life without end as a companion of Jesus Christ.

Evolution can be seen as the prologue, but also an ongoing part, of the story of natural man, a creature which can rise to a state of natural moral goodness but in such a way that he’ll fall again. With even mild social breakdown, or an irresponsible or ineffective parent, a child with certain

genes might grow into a juvenile delinquent who endangers the welfare of many. A substantial social breakdown, such as we might now be suffering in the West, might well lead to the formation of a large body of barbarians born and bred in the heart of a decaying civilization.

By his own efforts, natural man can accomplish much but he needs good luck to achieve even a state of natural goodness and he needs the help of God to pass beyond that.

## 396 Are Americans Willing Victims or Merely Confused?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=163>. It was finished and uploaded on 2008/07/24.]

The *Wall Street Journal* published an opinion piece entitled: *Why No Outrage?*. Why indeed? It's beginning to seem as if a vast transfer of wealth has occurred over recent decades though becoming headline material only in 2008. This transfer moved wealth from the middle-class to a grasping minority. It's likely that many have dropped from a middle-class economic status and many more children of prosperous workers have lost their chance to reach the standard of living as adults which they enjoyed in their parents' houses. It's also likely that the upward path into greater physical prosperity has been largely blocked for those who are poor and those who made decent livings in jobs that break down the human body.

Our bankers, private and public, have continued the tradition set by Lyndon Johnson with his illegal and off balance-sheet financing of the war against the Vietnamese people, not that any presidents since Johnson have missed many opportunities to loot American assets to fund their favorite projects, many simply irrational and others intended to purchase the loyalty of specific groups of voters or deep-pocket contributors. I'm hardly surprised that generations of Americans who've formed their minds by watching television and modern movies haven't yet realized that the cash which comes from mortgaging assets isn't a true increase in wealth. It's cash you've received for an encumbrance upon your property (as an individual or as a citizen of a certain political entity). Sometimes it makes sense to borrow on some assets and sometimes it's just an inefficient and dangerous way to endanger your title to your own house or the assets which will provide for

your retirement or medical care.

This is a serious mess we're in. I'm relatively optimistic in thinking we can reorganize our economy and our governments, but we need to make a firm decision to deal with our problems and that means, first of all, that we have to deal with those who've robbed us while we were busy enjoying the fruits of our cash-flow. I'm sometimes pessimistic in fearing that we Americans will keep pumping air into the various bursting balloons of our financial markets until we've used up much of our resources. We need to understand our situation before we can begin to act to protect our families and to turn our country in a better direction.

We need to realize that credit is inflationary unless it generates a net increase in income, net after payment of principal and interest. Don't feel sorry just for those losing their houses or those who can't find a good mortgage. The inflationary damage of bad mortgages and bad credit-card debt and various forms of bad debt to stock-brokers and bankers and corporations has taken a hunk of flesh from nearly all citizens in this world though I think Americans have paid the biggest price to date. On the other hand, American politicians and a small number of now-wealthy businessmen and Wall Street sharks have been the biggest personal beneficiaries. We have a growing number of billionaire investment bankers and politicians who hold questionable fortunes of tens or hundreds of millions of dollars. We also have a shrinking number of families who could even afford to buy their own houses if they were starting over again. With the growing budget problems in local governments and the shrinking tax base, I think we may be looking at a future where we'll not be able to maintain our roads or bridges. Our sanitary systems maybe even be in danger, especially in some of the older cities on the East Coast or even the Midwest of the United States. I fear that even our school systems, as bad as they are, are in danger and we may soon see a year when many American children are sent to work in fields or factories in their early teens. Or earlier.

I repeat my question:

Are Americans Willing Victims or Merely Confused?

I'd say, "Confused." Politicians and corporate executives and various sorts of bankers have created a system so complicated that few have the knowledge or thinking skills to understand the debt-financed prosperity of recent decades was just borrowing on the future by way of selling off assets

that we'll soon need and that future generations will need before long. There may be some who don't want to understand so long as the party continues.

We should be outraged at politicians and businessmen alike. We Americans can start in the voting booth this fall. In the interests of non-partisanship, I'll suggest that you vote for Ralph Nader or Ron Paul depending upon your overall political stance, even if you have to write-in the name.

## 397 Why the Rush?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=177>. It was finished and uploaded on 2008/07/29.]

Nanotechnology which uses tiny, man-made particles which don't occur naturally is already being used heavily, especially in the electronics industry, but it would seem that many branches of industry, including medicine, are starting to deploy nanotechnologies. There's lots of information available on the Internet or in popular science magazines for those who wish to pursue the subject. I merely wish to raise the point that we've worked our collective selves into a mental state akin to an optimistic fatalism. If something is possible and bears the promise of some good results, we assume it will be done, it must be done. We sometimes consider the possible downside risks but mostly in a cursory manner. This remains true even as we deal with the fallout from the deployment of previous technologies. Those problems include a variety of problems: technological, political, social, and economic.

Now we're developing nanotechnology in which molecules and atoms are manipulated into forms they wouldn't be likely to take on in nature. This can be very good but there's also a likelihood that some anticipated and unanticipated dangers will be realized. The dangers might be small, but what is the reason to rush in implementing this technology that we risk the possibility of serious damage to the environment or to human health?

Some scientists are beginning to realize there might be problems. See *Nanoparticles In Sewage Could Escape Into Bodies Of Water* at <http://www.sciencedaily.com/releases/2008/07/080724221823.htm> for one example of concern about possible problems.

Why the rush to implement technologies when we're just starting to learn the problems which we need to avoid or at least mitigate?

## 398 The End of Illusions About Democracy?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=239>. It was finished and uploaded on 2008/09/16.]

There's no magic about democracy. Merely having formal democratic procedures gains you nothing but a more vulgarized class of political exploiters. Political machines will use those procedures, at least when they decay into populism, to gain control of the electoral processes that they might use governments to provide services for their clients. Honest, courageous politicians will be few and far between since the machines will have a strong incentive to weed out any possible candidates who have moral integrity. For what it's worth, this was and is one of my main reasons for a strong skepticism about Governor Palin—I have confidence the Republican Party bureaucracy wouldn't have allowed her to be chosen unless they already owned her soul or knew it was up for sale for a price they were willing to pay. (In addition, she seems to have little in the way of knowledge or developed intelligence or respect for politics as much more than a sport against that team using a different mascot, but that doesn't make her so much different from the vast majority of modern American politicians.)

When democracy, or any other system, works, it's because of men like George Washington who are willing to take a moral stand and worry about the consequences afterward and a Washington will succeed only if men of lesser stature but significant moral integrity are willing to follow him.

The moral integrity which can found a good polity, democracy or other, consists of a willingness to give life or fortune to do what's right. Americans, and nearly all those of the modern West, are far more likely to decide before hand how they wish to live and then to look at the possible moral stances

they can take. When we make our decisions in this way, most of us will naturally choose a prosperous and orderly life, unless we're in that small band who seek danger. This is why we need to take the first step with our moral foot rather than our calculating foot. If we're lucky, we can do what's right and also be blessed with a prosperous and orderly life, but we can't assume such.

Somewhere, Mark Twain pointed out that Americans, given a choice, don't really choose to engage in activities that might be a part of any Heaven conceivable under Christian beliefs. Those who know much about Mark Twain know his main moral allergies were set off by the middle-class who choose their moral rules according to the amount of support they give to a safe, comfortable life. Sins are allowed so long as they don't endanger safety, comfort, and middle-class respectability. In other words, Mark Twain was talking the sort of fellow who could be very upset about teenage promiscuity and abortion in the United States and would also support the use of criminal military technology such as napalm against other human beings, even civilian populations. Such a man is more interested in maintaining property values than he is in serving God and Man. Such a man is more interested in bourgeois respectability than he is in carrying his cross. Modern democracies seem to have produced masses of such creatures who are usually pleasant and neighborly while being morally deformed, at least by Christian standards. In Christian terms, they're men who prepare themselves for the outer circle of hell and not for Heaven.

Does democracy really nurture such men, encouraging them to become the sorts of cowards who place no value on any state that might be truly labeled 'freedom' because such a state carries risks of suffering or at least lack of luxuries? Does democracy merely allow such men to reveal themselves as such? Is the real problem the sort of populist democracy favored in the modern West, a democracy which sighed in relief when moral giants such as George Washington grew old and gave up power? "Now, we can choose the sorts of self-serving scoundrels who will flatter and bribe."

We have met the enemy and he is us.

Who engaged in the orgy of profiteering that led to the gutting of our banking industry, our construction and real-estate industries, perhaps our insurance industry, and even much of our manufacturing industry?

Us.

Who has taught many peoples about the globe to hate and fear the United States and its citizens when those peoples mostly admired us and mostly trusted us not so many years ago?

Us.

Who unleashed the corporations who did so much to corrupt our children and our own selves with truly mind-numbing and perverse entertainment?

Us.

We have met the enemy and he is us. And he looks like an ugly and cowardly beast in that mirror.

Let's stop talking about democracy as if it were a primary good and start talking about moral integrity. It might be an embarrassing and humbling conversation, but it might also be the beginning of a cleansing of American souls and also our public squares.

# 399 Our Troubles Have Just Begun

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=252>. It was finished and uploaded on 2008/09/22.]

It was a sad scene, all those mostly young men and women carrying their personal belongings in cardboard boxes as they exited the Lehman Brothers building. Did the better-established looters leave by way of limos that picked them up in a basement parking garage? Likely, but I don't know. I only know the scene was heart-rending. All those men and women who'd thought themselves so close to possessing their heart's desires and their tender hearts were torn from their chests, still beating, still bleeding.

What hurts, truly hurts some of us, is the realization that the vast majority of those Lehman refugees, and the vast majority of those who've kept their Wall Street or corporate widget slots, see nothing wrong with their behavior. Nor do their ex-roommates from Harvard who now work at the department of Treasury or State or Defense or even at some branch of the Fed. Maybe they're cognitively impaired so that they couldn't see they were systematically liquidating the productive assets of the United States to build a warfare empire overseas or a welfare empire inside the borders of the United Socialist States of America. Or maybe they were morally impaired so that they wished to be in the ranks of those skimming from that vast pool of cash as it flowed rapidly by. Empires offer good financial opportunities to their tax-farmers. In fact, I'm betting our tax-farmers on Wall St. and in the Fed are morally diseased human beings more than stupid human beings. To the extent they're stupid, it's a self-serving sort of stupidity that leaves them comfortably blind to the evil they participate in.

This is a frightening snapshot of some of America's best and brightest: highly skilled in certain financial and mathematical realms while being deformed and stunted in their moral characters. Meanwhile others of our best and brightest are in Washington spending money that doesn't exist to fight murderous wars that seem to produce no fruits other than more murderous wars. Still others of our best public servants spend their days conspiring to capture more welfare clients for the expanding welfare systems of our military socialist republic. And then there are those who are in laboratories figuring out how to harvest parts from lab-grown human beings so they can be sold for big bucks.

Productive assets can be built up again and sometimes will be far better than those lost for one reason or another. It's very, very hard—to the point of impossibility—to reform the moral character of so many who have so much promise in other ways, so many who could have done so much good by, for example, building tunnels that don't leak or systems that prevent simple human errors from killing many in train collisions.

To put it another way: the work a man is equipped to do is part of who he is as a moral being. A man who's been formed to skim from money that's moved around fast for the sake of generating fees is a certain type of moral being, one made to be such by his upbringing and his own decisions. A man who's instead been formed to live the disciplined life of a dairy-farmer or one who's been formed to live the orderly and sociable life of a small-town lawyer and local political leader is another type of moral being, one which seems to be dwindling in influence though there may yet be many of them.

I explored these issues in a novel looking at the prior stage of the decay of our commercial morality, a stage when corporate executives were still somewhat interested in actual business operations but in a strange way. They lusted after each other's corporate bodies, so to speak, in the way of a man and woman who truly love each other and have good, practical reasons to think a marriage might work. Yet, they are trapped in the superficial mating rituals of the modern pick-up bar, rituals marginally better than the flat-out irrational orgy of Wall Street in this year of our Lord 2008.

Anyway, the interested reader can download a copy of my novel, *Corporate Sex* at <http://loydfueston.com/downloads/corpsex.pdf>. It does bother me that the absurdities of the plot can't match the most recent facts, though the government's rescue plan doesn't yet involve help for an alcoholic and attractive Wall St. lawyer who falls in love with a rising star of the financial heavens.

It would all be a joke except for the massive destruction done to the American economy, for all the jobs lost as productive assets disappeared from the American landscape, for all the careers and business opportunities likely to be lost to the younger generation, for all the cynicism bred by the sight of our political and commercial leaders in action—as reprehensible as they are stupid.

# 400 Hard Times: Our Last Best Hope for Survival

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=263>. It was finished and uploaded on 2008/10/02.]

In this insightful essay, *The Big One is Nigh* at <http://www.chroniclesmagazine.org/?p=741>, Srdja Trifkovic provides some sobering analysis, including this statement:

If reasonable men agree that our civilization is spiritually diseased, morally rotten and demographically moribund, then a colossal, rapidly spreading global economic crisis should be neither feared nor wished away. It may yet be our last best hope for survival.

I would quibble about the fear, but I imagine he was advocating the conquest of normal fear of terrible likelihoods and not really the absence of fear. Fear is natural because many of us will at least go hungry and have to learn to live with cold houses or dangerous streets even in our nicest towns. We may face far worse than that, such as loss of many American soldiers during a bloody retreat from Asia or increased disease rates as our food runs short and our sanitation systems decay.

We have a need for prudence, properly understood—see the article on *prudence* at <http://en.wikipedia.org/wiki/Prudence>. Prudence is “the exercise of sound judgment in practical affairs” and not “the vice of cowardice.” Prudence can guide us to the virtuous way to proceed. Having done that, we proceed, step by step, avoiding unnecessary danger but not retreating or moving aside in a cowardly way. If necessary, we keep our eyes on the ground just in front of our feet and not on the vaguely seen

horrors which lie ahead or to the side. For many, this prudential analysis may simply mean that they choose their leaders as best as possible and then follow those leaders into the desert if necessary. After all, God called Abram and expected others to follow. He called the retainers and servants of Abram through their leader.

We modern Americans, and other citizens of the West, tend to decide what risks we're willing to take on and then to set the best and most moral course within the boundaries set by our desire to be as safe and comfortable as possible. We must learn to put what's right first. Considerations of safety and prosperity should be secondary.

# 401 Bankrupting the Soviet Union and then Our Own Country

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=267>. It was finished and uploaded on 2008/10/03.]

Antiwar conservatives and others have expressed great admiration over the years for a man who died in May of 2008, William Odom. See the article at [http://en.wikipedia.org/wiki/William\\_Odom](http://en.wikipedia.org/wiki/William_Odom) to learn of this retired general who stated in no uncertain terms that the 2003 invasion of Iraq was the greatest strategic blunder in American history. He deserves great credit for that, but he seems also to have been involved in the decision of President Carter and then President Reagan and President Bush (the father) to boost our weapons programs in the hopes that the economically incompetent USSR would be forced into bankruptcy by trying to keep up with us.

As the story is usually told, we spent the Soviets into bankruptcy. I don't really believe that to be the main reason for the collapse of the Soviet Union, but we certainly spent a lot on our military systems and have gone on to spend far more in the 15 years since then. Apparently, no one seems to have recognized there was some level of expenditure at which the United States would also go bankrupt.

And no one seems to have thought about the difficulty of putting the genie back in the bottle. Once we had given over so much of our economy to the production of missiles and cluster-bombs, once the armaments manufacturers had hordes of well-connected lobbyists, once workers in Los Angeles and Detroit had jobs manufacturing weapons, once scientific research had

been redirected to projects important to weapons development, how were we to return to normal ways of making our livings rather than ways deformed to the goal of “bankrupting the commies”? It’s perhaps fitting that we bankrupted them and went on to waste our so-called peace dividend and to bankrupt ourselves.

In his farewell speech, President Eisenhower warned us that the military-industrial complex, a term first used in that speech, was already dangerously large and that was nearly 20 years before the strategy of enlarging it further to bankrupt the Soviet Union. It turns out that General MacArthur warned his fellow Americans, in the early 1950s, of the dangers of an economy in which military production is so important. (See *A Dial Marked ‘War’: The last resort of our bankrupt elite* at <http://www.antiwar.com/justin/?articleid=13533>.)

By choosing to fight sadistic barbarians with their own weapons and their own strategies, we’ve made ourselves like unto the enemies who frightened us so. We’ve chosen to turn our country into the greatest producer in history of products intended to rip apart human beings, to burn through their skin and then slowly through their muscles, to destroy fresh-water and sewage systems. We’re weapons producers and merchants of death. After all, is not a man who kills women a murderer? Is not a man who heals children a physician? Is not a country devoted to weapons production and the support of huge armies and navies and air forces a militarized socialism, however much some profits might remain private?

Now we’re also broke, a state that seems more disturbing to us than our moral degradation. As a Christian, I’d have to suggest we should fear God more and bin Laden less.

## 402 Where the Political and the Moral Part Company

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=289>. It was finished and uploaded on 2008/10/28.]

We bring our moral order or moral disorder with us into the political sphere, a region in which a healthy people would spend only a small part of their lives. Our moral natures are shaped in our communities and not even in our town-halls let alone in that state capitol 75 miles down the turnpike from where I sit. God help us if we start believing that we should expect or want any moral guidance from that other capitol 500 miles away from where I sit, so accessible by way of the interstate highway built for military mobility and so useful for destroying local moral order, the only sort of moral order possible to flesh-and-blood human beings.

Many of those who are fighting for moral sanity in the modern world don't seem to recognize this truth that underlies the semi-truth, "You can't legislate morality." That statement is wrong in that sense that a morally well-ordered society will have moral legislation which will be binding upon morally disordered people and those who are moral as a matter of convention as well as those who are morally well-ordered in a deeper and more substantial sense. But we have to remember two constraints upon moral activity in the political sphere:

1. Political means can't build the consensus which can produce a morally well-ordered society.
2. As you ascend to higher levels of political abstraction, to greater centralization of power—however little or great, less and less agreement

is possible amongst the various communities and political associations of communities with their various ways of life.

In fact, it's unlikely that an overly complex society, actually a complex of communities, can build much of a consensus for more than the most basic issues. In saying this, I'm not even speaking of a society which has a substantial minority or majority of those whose moral ordering is less than complete or even outright deformed. A society which is really a collective of several morally well-ordered societies won't be able to arrive at a consensus of customs and laws because those would be different for an Orthodox Jewish society and for a Mennonite society and still different again for Ukrainian Catholics.

## 403 Differential Geometry and Moral Narratives

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=267>. It was finished and uploaded on 2008/11/01.]

Pilgrims travel paths, journeying from one location on earth to another, sometimes those places are fictional but usually quite concrete. To be sure, Dante's pilgrim found (as some of the more recent translations of *The Inferno* attest) that the path could wander away from him. It requires sharp vision and alertness to keep track of that path which seems to often test us in so many ways. That Christian poem, or other such Christian works as *Pilgrim's Progress*, follow in an ancient tradition scouted out by Homer in the *Odyssey* and likely many preceding verbal works that were not recorded in a more lasting form. C.S. Lewis followed a less popular variant of pilgrim literature when he wrote *Pilgrim's Regress* as a highly metaphorical work in which the pilgrim moved mostly, as I recall, from one site representing an inadequate or defective modernist philosophy to another.

Our moral and spiritual and intellectual journeys bear close comparison to physical journeys and there will always be room for concrete journeys in our various tales of our lives, individual or collective. But there's more to be said for modern man because there has been progress of an sort in complexity and richness of human life if not necessarily in quality of life. Moreover, there's at least one way in which the journey across roads or over oceans was always a distortion and oversimplification of the human experience:

There's not so strong a boundary between inside and outside for any creature in this universe though there was an illusion of such during the period that the human mind was evolving

through a stage where our individual existences were coming into somewhat sharper focus.

But there's more:

The number of human beings in our lives, the number of things, the level of abstract relationships in our lives (such as our relationships to far-away, centralized governments), the sheer richness of our relationships in total, demands better ways of examining and analyzing our moral and social lives.

We need metaphors as rich as our moral lives. Seemingly by accident, I've constructed the possibility of such metaphors by my efforts to view Creation from a Christian position while accounting for modern empirical knowledge, including the most theoretical of physics and mathematics. But it's no accident because my major concerns all along have been with the nature of created being and the nature of the human mind.

Modern empirical knowledge has increased by extraordinary amounts in recent centuries. In fact, much of it is really data that hasn't yet been digested enough to call it knowledge. Yet, we've greatly enriched our understanding of being, at least so far as atoms and stars are concerned. Still more importantly, we've come to have some understanding of the universe as an entity in its own right and not just a collection of all that we've observed so far.

We certainly can't claim to understand even the aspects of created reality covered by our most successful theories: general relativity and quantum physics. Yet, our understanding of certain aspects of being in this universe, and maybe a bit beyond, has been greatly enriched. It's been enriched far beyond the understandings of created being which are a part of our philosophical and theological traditions, including our moral traditions. The concepts of created being which underlying the study of black-holes is far richer than the corresponding concepts which underly the understanding that nearly all philosophers and theologians have for their study of human nature.

So, let's get to work.

Under a Thomistic existentialist philosophy, the human mind is seen as forming in active response to the environments of the human being or a multitude of environments or even the entire universe in some meaningful

sense. Our richer understanding of Creation is reflected in an increased richness and complexity of the human mind, at least a mind which is open to this new knowledge while also having a worldview, such as an intelligent Christianity, which allows that mind to make sense of those mountains of knowledge.

The path is not just beneath our feet, it's in our heads. Our minds partake of the slope and surface material of that path. Moreover, we're constantly being jostled about or just generally pushed left or right by the masses of our fellow-travelers—the traditional journeys don't respect the social nature of human beings and portray us as more or less pure individuals when it comes to our moral natures. To be sure, we often spend parts of our journeys in some sort of lonely desert, but we'll then return to more heavily populated regions.

But the journeys of a self-aware moral creature with a complex mind lie beyond our current ways of speaking, beyond metaphors drawn from simple paths across the surface of the earth. In this case, a need for complexity is also linked to a need for greater abstraction. I'm going to use differential geometry as one likely source for useful models for advancing our understanding of our increasingly complex and abstract selves, a change brought about by various factors including the increasing size of the human population but mostly the increasingly complex and abstract nature of our social and political relationships—although we should be careful to realize that this is a case where increasing quantity has caused significant qualitative changes. Differential geometric models are very abstract, but so is the world of a human being living in a complex society and developing a complex mind. Differential geometric models allow a much richer description of possible future paths at each point on a journey. Along with tensors, they also allow ways of speaking about the distortion in a space, say a moral space, caused by the presence or the movements of other creatures. Tensors are typically used along with these models (or separately for some purposes) partly because they allow a concise expression of complicated and complex physical actions, such as stretching or twisting or both at the same time.

The American physicist John Wheeler once summarized general relativity by telling us that matter tells space how to shape itself and space then tells matter how to move. Maybe we can play around with this metaphor:

Human beings tell moral space how to shape itself and moral space then tells human beings how to move through life—how

to act.

Now we're talking. I can relate to moral metaphors that speak not so much of a simple path beneath my feet as a path that merges into me, twisting and stretching me even to the depths of my being. This 'path' is all that I move through or communicate with and all of my own bodily substance.

I can relate to a human world in which, for good or bad, we shape our moral space, the space in which we live our moral lives, including both our lives in public spheres and private spheres. 'We' shape our moral space. Few there are strong enough, brave enough, to move onto a path far from those they've traveled to that point in their lives, far from the path they were raised to travel. But it would be easier for all of us to see the more abstract possibilities and demands of our increasingly complex moral lives if we had better ways to speak and think about those lives. An obvious example of human beings who were, so to speak, in over their heads is the bulk of 'nice' Germans from the 1930s and 1940s who continued to live local lives that were decent and morally well-ordered even as they failed to understand or to respond to the more abstract demands upon them as citizens of a nation which was acting in evil ways at higher and more 'abstract' levels. It's certainly true that some did see and understand their moral responsibilities, but even those had problems, so far as I know, bringing matters into focus.

I can relate to a human nature which is stretched and compressed and twisted as it travels along those paths, paths which can shoot away in unexpected directions without warning and sometimes without giving good indication of what's happening until we're well along a path we falsely thought to understand. Again, those nice, middle-class Germans were doing all they'd been raised to do, hold good jobs and pay their bills and take care of their own children, but the path leading to regions of moral order had veered well away from those simple paths they'd traveled, not because they'd been raised wrong in ways that could have been forecast but because the world had become complex in a way that modern middle-class thought doesn't even perceive. The world had gotten more complex than could be handled by modern middle-class ways of moral thought and behavior.

I can relate to a human life and to a human community life in which the path veers away from us as it did to Dante's pilgrim in which we can find out late in the game that the 'right' path we followed has led us or our children into a state of moral corruption.

Like it or not, human beings don't live in a world which is 'only' concrete—as I've tried to communicate in my various writings on this blog as well as in my first published book: *To See a World in a Grain of Sand* [41]. We live in a world in which the abstract is with us always. How else could mathematicians and other thinkers know of such strange entities as transfinite numbers? In my way of thinking and speaking, God shapes the concrete aspects of our world from a more abstract foundation which is the manifestation of the truths He chose for Creation. I call that abstract source of created being the 'Primordial Universe'. We can, so to speak, coax the abstract aspects of our universe, and perhaps those of Creation in general, out of what seems to be only concrete by way of proper tools of thought, such as differential geometry and tensor analysis and metaphors and analogies and so forth.

I say 'proper tools' because they are not merely useful fictions. Good metaphors draw upon more abstract levels of reality where, for example, the moral paths of a mind-ed creature can be more complex than any possibilities seen directly in his concrete world and the visible events of his life. Oddly enough, those complexities—at a proper level of abstraction—seem to bear similarities to the stretching and bending of space and time described in modern theories of gravity and in the sheer strangeness of being, time, and space in the levels of being described by quantum physics. Differential geometry and tensor analysis and other abstract tools developed by mathematicians and other scientists point towards certain aspects of being which I speculate to be thoughts God has manifested in the Primordial Universe, aspects which do greatly affect the lives of creatures which have true minds and which live in complex societies with other such creatures.

# 404 Not All is Fungible that has Value

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=299>. It was finished and uploaded on 2008/11/13.]

From The Collaborative International Dictionary of English v.0.48 [140], we have the definition:

**fungibles** Things which may be furnished or restored in kind, as distinguished from specific things;—called also fungible things. —Burrill. [1913 Webster]

A house is fungible, a home isn't. Goods can be moved in to build a subdivision but not a neighborhood. Even if the residents of an existing neighborhood were to move from New York to Montana and built houses near one another, it wouldn't be a neighborhood until the various relationships between individuals and households settled down into proper sorts of patterns. It would take some time and might not happen at all. In general, an existing neighborhood can be deserted but a new one can't be purchased.

Grandpa's tools are fungible in the sense that they can be sold out of his estate but the living attached to those tools, or his workshop, isn't fungible. It can die but can't be sold.

If we had economists and political scientists who could understand the above statements and develop them into a system of thought, we might have an understanding of truly free forms of capitalism and of describing some stable and tradition-based systems capable of dynamically responding to legitimate opportunities.

Instead, we are burdened with economists who teach us that freedom and prosperity are to be found by always being willing to sell that property

which grounds our ways of life. In opposition to that, I'll note that ways of life are built upon ways of making livings and to sell out those small family businesses on Main Street or to sell out the traditional family home to move to a subdivision is to sell out a way of life.

And we Americans have sold our ways of life in return for promises of soft and comfortable lives from cradle to grave. Now those promises are showing their worth with each bit of bad news about the economy and about our miscellaneous wars in countries we Americans can't even locate on a world map. But we and our parents and our grandparents should have been suspicious from the moment that our politicians at war (especially Lincoln and Wilson) so willingly and so easily took up the powers of a tyrant and, in fact, exercised those powers with greater ruthlessness than all but a few kings in European history. We certainly should have been suspicious of the *New Deal* which was not an effort to help troubled people but rather an effort to make the United States safe for large corporations which are in cahoots with politicians and government bureaucrats. We most certainly should have been suspicious when family businesses were burdened with all the regulation laid upon corporations. One particularly absurd example was the imposition upon local dairies of the sanitary codes necessary for those corporations which were trucking large amounts of milk from various sources and trucking that milk many miles to be sold days later.

It took many generations to build up the communities and habits and customs which we threw away for a chance at winter homes in Florida and for SUV's with heated leather seats. Should I mention our desire to buy lots of stuff at Walmart as cheaply as possible, stuff that we didn't really need? I just fried some bacon and came to wonder why I need floral printed paper towels to drain the grease. I'm old enough to remember that newspapers did the job fine. But now I live in a town where I can buy those pretty paper towels at a large supermarket and then return to a neighborhood where I don't know even the name of most of the families that live in a block or two of my residence. And we don't even really want most of the stuff we buy. It's the buying experience we seek and much of that stuff is disposable. Much ends up being stored in attics or given away after light use. Most Americans would have needed a warehouse to store all the stuff they bought over the past decade.

The party is drawing to an end, but we many have enough resources to keep it going in a low-key way for a decade or more. Will we have the guts and the moral integrity to admit we ruined much that we inherited? Will

we try to just live as well as possible and hope we escape this life before more is demanded of us? Will we instead have the guts and the moral integrity to sacrifice for the future? Will we continue to play the role of barbarians looting our own civilization or will we be willing to roll up our sleeves and become builders?

# 405 Ways of Thought in the Modern West

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=370>. It was finished and uploaded on 2008/12/29.]

I've just read *The Evolution of Civilizations* [119]. The author, *Carroll Quigley*—see [en.wikipedia.org/Carroll\\_Quigley](http://en.wikipedia.org/Carroll_Quigley) (1910-1977), was a distinguished historian who taught at Georgetown for 30+ years, Princeton and Harvard before that. Quigley was a bit controversial, a rather moderate conspiracy theorist with insider's information and a high opinion of the “Anglophile network” which was, and maybe still is, trying to bring about a one-world government. So far as I can tell, Professor Quigley differed from the mainstream of modern thinkers more because of his understanding of moderate realism (of which Thomistic existentialism was the most complete form before my efforts to update it) than because of his teaching that there is a group of bankers striving to reorganize the world.

In any case, *The Evolution of Civilizations* [119] covers the content of an introductory course he taught at the Edmund A. Walsh School of Foreign Service at Georgetown University where diplomats and other foreign affairs professionals were educated. Professor Quigley has many interesting comments upon the processes by which a full-blown civilization develops and then decays—there have only been about 24 verifiable civilizations in history. He speaks of Western Civilization as beginning about 750AD when Europe was pulling out of the Dark Age which followed the collapse of Rome. He goes on to speak of the West going through three stages of expansion (very unusual for a civilization which usually expands once and then moves towards its death by prolonged stages). He labels the three resulting phases of the West as feudalism, commercial capitalism, and industrial

capitalism—names carrying political as well as economic meaning. Each of those first two systems began to decay into a static state, foreboding stagnation but the West went on to new creative efforts as new ‘instruments’ (such as insurance brokerages to allow British fleet-owners to trade far and wide) developed to replace older instruments—such as the feudal system’s local production of nearly all goods. In Quigley’s analysis, creative ‘instruments’ decay eventually to self-serving institutions. He claimed our industrial capitalist instruments had become such self-serving institutions by 1930 or so. If true, this means our current task would be to develop new instruments, if we wish the West to recover once more and move forward, but we can’t really do that consciously though we can aid the process by being flexible and letting go of ways that no longer meet our general needs. The problem, of course, is that current ways provide prestige and wealth to the vested interests, those instruments which have survived past their period of useful service to become stagnant and self-serving institutions.

For now, I’m only going to pull from Professor Quigley’s book one idea, the fundamental idea of what he calls the outlook of Western Civilization—which he dates from about 750AD when Europe was pulling out of the Dark Age which followed the collapse of Rome. Its domination of the human mind was perhaps short-lived, he indicates perhaps the 50 years following the death of Aquinas, say 1275-1325 or so. And, yet, as I’ll explain later, moderate realism survived as what might be labeled the principle of modern science, in which category I’d place all disciplined ways of thought which accept reality. In the words of Professor Quigley, moderate realism is the outlook defined (loosely) by:

The truth unfolds in time through a communal process.

This worldview was, and is, diametrically opposed to various forms of idealism and dualism, views which can be illustrated by Platonism and Pythagorism and the early thoughts of Aristotle. There are various modern ‘isms’ that are idealistic and dualistic. In fact, nearly all organized systems of thought are idealistic and dualistic. Moderate realism is unique in its basic willingness to be shaped by responses to reality and thus to respond to the evolutionary and developmental forces to fundamentally part of this world. Thomism reached a highpoint of sorts by the teachings of Aquinas on the importance of the act-of-being, his existentialism, and by his teachings on the formation of the human mind and moral nature by

way of responses to environments. Under Thomism, or even less complete systems of moderate realism, philosophers and even theologians to some extent pay at least as much attention to sensory perception, to empirical data, as does a farmer or a road-builder. Under Thomism, there is no clear divide between theologians and philosophers and physicists, not because theologians or philosophers can dictate to physicists, but because they each have important ways of dealing with empirical data and penetrating more deeply into being and into the meaning of Creation and its various phases and parts. In this unified way of approaching God's unified Creation, we can see the truth of one of the teachings of St. Thomas Aquinas:

We know even God through His effects in Creation.

From this point on, I'll assume my updated understanding of Thomistic existentialism, which was itself a great expansion and 'updating' of the moderate realism developed by pre-Thomistic thinkers such as St. Augustine of Hippo. Unless I refer directly to Professor Quigley, the claims and analyses are my own. I'll also note that I've claimed in earlier entries that Jamesian pragmatism shares some important elements with Thomism or—more generally, moderate realism—in that knowledge is properly acquired from sensory data but the building up to greater structures can't proceed properly because no such structures, not even the world as a true world, can be assumed even tentatively in pragmatic philosophies as currently defined. See Chapter 84, *Pragmatism and Thomistic Existentialism*, and some of the following chapters for some more comments on this issue.

I'll illustrate the conflicts between moderate realism and other ways of thought by referring to a somewhat vague but important belief system—the American belief that our ways are inherently superior to all other ways, past or present. The two aspects of this belief are:

1. Dualism: There's American ways and there's inferior ways.
2. Idealism: American ways represent virtue and goodness and we can know that without the trouble of empirical investigation of reality.

In fact, reality has had a dream-like quality in the minds of Americans from at least the early 1800s. Tocqueville noted (circa 1838) that Americans had the odd trait of ignoring facts which were in conflict with

the American mainstream view of matters. This helps explain how Americans have always been willing to violate the traditional Christian concepts of just-war, including unlimited attacks upon upon civilian targets. After ignoring our actual behavior in wars against native Americans, in the Spanish-American War and all succeeding wars, we Americans will babble on about how morally pure we are and how much good we do for others in the world. From a different perspective than that of Tocqueville, Hermann Melville came to similar conclusions, claiming the so-called philosophy of Emerson and Thoreau to be a spiritualized materialism which was morally insane (a need to justify the self at the expense of charity and also of true piety is a major part of the thought of Emerson and Thoreau) and Melville feared that this moral insanity was a part of the American character. That moral insanity depends upon dualism and idealism to isolate the self from objective reality and its often inconvenient facts so that we Americans can see ourselves as pure no matter what we actually do.

This sort of self-justification in moral matters isn't allowed in moderate realism and neither is the myth-making that imposes our preferences upon physical reality, creating a world corresponding to American divisions of good vs. evil. What we like is good and was part of the creative work of the American-approved God. What bothers us is evil and is the result of the invasion of this world by evil forces independent of God. In particular, biological evolution is okay so long as it can be seen as having produced beautiful deer romping through the woods. Biological evolution is under the control of evil when it produces parasites which invade and eat the human eyes or retroviruses which destroy the human immune system. Similar comments can be made about the realms of this world which aren't part of life. In general, much is made independent of God so that He can join us, Americans and those good enough to want to be like us, in our purity. Such an important part of physical reality as biological evolution becomes something to be used by Satan as readily as by God. It's not a part of God's story but rather something existing independently of the Almighty.

Christian methodical realism is more accepting of God as Creator and tries to honestly deal with this world in all of its aspects even when humans find something to be repulsive. As Professor Quigley sees matters, correctly in my opinion, the scientific method is basically the way in which an adherent of moderate realism would explore empirical reality. St. Thomas Aquinas, a pupil of St. Albert the Great who was an important early European scientist, said pretty much the same though those fields we usually

label as ‘science’, such as physics and biology, weren’t so well-defined as specialties in those days.

Recent events would indicate that even bankers and business managers, certainly economists, in the United States pay little attention to reality. Some of President Bush’s advisors are said to have stated the belief that ‘power’ can overcome reality. Bush himself seems to have believed that noble intentions and a good opinion of oneself can somehow negate the objective evil one does. No wonder we’re decaying so rapidly, the good and bad parts of the West alike though I’d fear our war-machines will pull out of this decline better than our social or economic institutions. The United States maybe yet develop into a military socialist state with enough resources and firepower to continue dealing out death and destruction to many regions of the world for decades to come.

Quigley wrote that, quite plausibly, the instruments of our capitalist economy had become self-serving institutions by 1930 or so. His deep and prolonged efforts to understand the meaning of his vast historical knowledge led him to believe that such a problem can be overcome by either the destruction of existing institutions in such a way that fresher instruments can grow up or perhaps by the growth of instruments alongside difficult-to-erase institutions. So far there’s little sign that such growth of new instruments is occurring but the early stages might be hard to discern. What bothers me is that the commitment of the West to moderate realism is very weak, even in the ranks of Catholic theologians and philosophers and clergymen, and practically non-existent in the United States which is now the dominant political entity in Western Civilization. The United States seems to be leading the West on some death-march into Lalaland.

Philosophy and theology matter in our day-to-day affairs, but there’s a tricky point here. Plato knew that a philosophy dictated a way of life but, believing in an idealistic and dualistic way of truth, believing in a realm of the truly real which could be reached only by a great effort of a large-minded man, he preached a separation from concrete reality. And he preached a sort of idealism which would have no corresponding ‘outlook’ that would make sense to most men and would help them engage the real-world successfully. Let me repeat Professor Quigley’s words:

The truth unfolds in time through a communal process.

I’ll take Professor Quigley’s term ‘outlook’ as being the way in which our

community, however defined, views created reality and also transcendent reality. An outlook is then a more concrete version of what I call a worldview which is a more systematic, or 'philosophical', way of tying together our understanding of all realms of reality. Using this terminology, we can say that the average baker from Western Civilization should have a coherent outlook in which he has been formed over his years of schooling and working and playing and living in a family and church community and other communities. Theologians and philosophers, some historians and literary scholars, some scientists and politicians, should have a more sophisticated version of that outlook, a worldview. Over the history of the West, there's generally been a separation of outlook and worldview as one or the other develops faster or deforms faster, but they should be largely synchronized. In recent centuries, it would seem that the outlook of practical men advanced further and to more sophisticated understandings of reality than did the worldview of philosophers and theologians. To a certain extent, scientists began to take up that outlook and separate themselves from more disciplined forms of speculation, though we must always remember that much of the work of both Newton and Einstein began as philosophical speculation before the mathematical work began.

I'd argue that the West was unique in having a synchronized outlook and worldview just because the respect of the likes of St. Jerome and St. Augustine and especially St. Thomas Aquinas for the data of the senses, for the manifestation of divinely instituted truths in mere matter made it possible for men of the West to make sense of what goes on in a morally well-ordered marketplace and also what goes on inside the head of an Einstein and—perhaps surprisingly—to at least talk coherently about the Real Presence of Christ in the Eucharist. This, of course, assumes that there is truth manifest in the real world as opposed to idealisms that, in their pure form, teach of realms of truth separate from concrete reality. The historical truth is more complex. Christians, even during the age of moderate realism, often taught a form of idealism in which the world and the human body seemed to be totally depraved. Hegel created a system of idealist thought and Karl Marx's inversion of that system materialized the spiritual world of Hegel who had himself spiritualized all of created reality.

There have been important changes in adherence to moderate realism by various groups in the West, accounting in part for the strangeness of Western intellectual history and perhaps for our more recent practical problems. Catholic thinkers in particular seem to have separated themselves from

the mainstream of Western thought, which thought is still quite fertile in confronting reality and reaching to profound and abstract depths of understanding. With my light-weight knowledge of history, I placed the Catholic falling-away at the time of the Renaissance but that might have been more a falling-away of priests because Etienne Gilson places that falling-away at the time of the French Revolution when the inability of Catholic intellectuals to deal respectfully and intelligently with Enlightenment thought reached some sort of a crisis point. This is sad because the core of that Enlightenment thought seems to me to be, to a large extent, a weakened but true moderate realism.

Catholic thinkers may have been reluctant to deal with unfolding truth just because they were educated in and employed by instruments of the Church, and of Western Civilization, which had decayed into self-serving institutions. One possibly clear example comes early in the modern era with Galileo's feisty relationship with the Jesuits, some of whom were bitter opponents of Galileo and some of whom were respectful opponents and many of whom were supporters of one degree or another. Suddenly, Jesuits who had supported his ideas shut up as did those who had supported him personally as one who might be in error but should be allowed to work. Stillman Drake, the great biographer and translator of Galileo, says that it was likely the Superior General of the Jesuits sent out an order that Aristotle and his writings were to be defended at all costs, not the Church and the Bible but Aristotle and his writings.

Moderate realism shares with one of its children, physical science, an awareness that its specific forms are contingent and time-bound but specific truths can be discovered. St. Augustine's rejection of the idea that the human race had transmuted from another species was an inconsistent act and perhaps an act of intellectual cowardice, an act that led to a specific version of the doctrine of original sin which is still taught by the Catholic Church alongside Her more recent admission that evolution has occurred. There is a deep incoherence here that is detected even by young Christians with minds poorly formed by our modern educational systems, religious education as well as secular education in public schools. As strange as some might think this statement, Darwin's work was the necessary response to a thousand year-old wrongful conjecture which had rigidified into a caricature of an absolute truth. In simpler terms, Darwin corrected a major error in the thoughts of St. Augustine. This shows the power that a great thinker can have over the intellectual development of a civilization, in his inexcus-

able errors as well as his better thought. I'd also have to believe it was the incompetence of Catholic thinkers in dealing with this situation which brought on the anti-Christian attitudes and words of many evolutionary thinkers though they can't really be excused either for not understanding the situation more clearly when Catholic intellectuals don't have a good understanding of the historical background or the speculative content of Catholic teachings.

Still, there has been a general movement towards some greater body of truth, though often by way of conflicts which were quite avoidable. That movement can be summarized by:

The truth unfolds in time through a communal process.

As Christianity has turned away from moderate realism, the so-far successful project of the Christian West to understand what God is saying in the Bible and also in Creation is decaying into various superstitious forms, including the forms being generated by science acting without some overall guidance to be gained from an understanding of this world, a necessarily moral understanding. I think the loss of respect for the nature of the relationship between the human mind and God's Creation is already endangering the viability of the physical sciences and other fields of empirical research and analysis as self-sustaining projects, though the decay of optimism and openmindedness in empirical research is well behind the advanced state of decay in philosophy and theology. The decay seems still more advanced in politics and economics. We've already lost many of the practical goods realized during the years the West was truly Christian, including our political and economic forms and our self-understanding through historical analysis. We'll lose more before it's all over, whether it ends in a new recovery or an ongoing decay until Western Civilization is no more. Quigley documents the long periods of decay which almost always end civilizations.

Much is being lost and it's sad and it can, in principle, be avoided by a civilization founded upon the idea that we should openly accept and deal with empirical reality, a civilization founded upon a worldview of Thomistic existentialism or the sparser outlook of moderate realism. After all, truth is seen as unfolding rather than as being manifest in any particular forms of knowledge or any specific political practices or forms of production of food and artifacts. Formed to look at history as being an unfolding of truth, men of the West could move into the future confident that old truths can

be better understood, new truths discovered, better ways found to care for ourselves and our children.

There's always hope, however quixotic it might seem. I don't recommend jousting with windmills to be sure, but I do recommend studying those windmills and the movements of air which drive them and I also recommend efforts to build better windmills. I recommend studying the millers and their customs, stories, and songs and I recommend creative efforts to form new customs, tell new stories, and sing new songs. I recommend efforts to restate Biblical and other truths in terms of new words and new concepts, that is, efforts to see God in His better understood effects in Creation. I recommend the rolling up of sleeves and the setting to work without any hope that good will result in our lifetimes or even in the next generation. I recommend that we start acting as if we have faith and hope and love, as if we possess an energetic courage. Maybe we can reshape ourselves to be true men of the West. Maybe our pretense could become reality.

# 406 St. Paul and Worldly Wisdom

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=456>. It was finished and uploaded on 2009/03/14.]

Christ did not send me to baptize but to preach the gospel, and not with eloquent wisdom, lest the cross of Christ be emptied of its power.

For the word of the cross is folly to those who are perishing, but to us who are being saved it is the power of God. For it is written,

“I will destroy the wisdom of the wise, and the cleverness of the clever I will thwart.”

Where is the wise man? Where is the scribe? Where is the debater of this age? Has not God made foolish the wisdom of the world? For since, in the wisdom of God, the world did not know God through wisdom, it pleased God through the folly of what we preach to save those who believe. [1 Corinthians 1:17–21 [141]]

St. Paul didn't have much trouble speaking bluntly but, like me, he was exploring new realms of thought outside the existing words and concepts. He often spoke in a confusing manner, a rather obvious fact that remains invisible to many who would draw revealed truths from the words of a man who was a preacher and founder of communities and not a systematic theologian nor was he any sort of philosopher. Commentators, including some famous theologians, have taken to the Pauline letters with tools reminiscent of those used to cut, shape, and sometimes deform sheet-metal. I'll try to

do better, neither missing the claims to revelation, nor the human insights, nor the mistakes due to the limitations of any particular human being, nor the inadequacies and mistakes due to imperfect ideas about God's Creation which are part and parcel of our condition as limited creatures of small regions of space-time.

I'll be making some background comments on my view of the Bible and how it should be read with an eye towards a number of Biblical commentaries I'll try to write, at a slow pace, if God grants me a good, long, active life. After those few comments, I'll be mostly concerned with this attack of St. Paul upon wisdom, an attack which is properly qualified in a commentary by St. Thomas Aquinas. I'll argue that we can gain a better understanding of what God is saying through His time-bound, finite, and error-prone servants by placing ourselves in the position of, for example, St. Paul and trying to hear what God was saying in words and concepts which we find more appropriate, often because we've learned much in these 20 centuries and have a better understanding of such matters as the nature and behavior of the entities of this world. And so:

What does St. Paul mean in condemning "worldly knowledge"?

It's hard to recover the meaning of St. Paul in some of his writings, because of the cultural distance and also because he was working as evangelist and founder of local church communities, not as a systematic theologian. And though important and useful, the recovery of what St. Paul truly thought might be less important than would at first seem. St. Thomas made two claims in his major writings which might shed light upon this issue:

1. Human moral nature is organic, not 'spiritual', and develops in active response to its environment. More generally, and adjusting for more recent discoveries about the human brain (and human being), I've made a strong claim that such is true for the intellectual aspects of a human being, including our so-called intuitions or 'sentiments' (the word used by Adam Smith and others in his school of moral philosophy) which were formed by the response of our human and pre-human ancestors over many millions of years and are still be formed and reformed as we respond to an ever-changing world. Our individual minds also develop by way of responses to our environments which may include some substantial understanding of all of Creation.

2. God does not generally speak to His prophets and apostles in the way that you and I would speak face-to-face. A man becomes a prophet by learning how to speak along with God, that is, by letting his mind and his tongue move with a human will aligned with that of God.

Aquinas, thinking of human ‘stuff’ as being too inert for certain responses, posited a ‘soul’ which is not human but is attached to a human being and carries out abstract reasoning functions. With this time-bound and plausible thought eliminated in favor of the modern knowledge of the dynamic nature of all matter and of the very particular dynamic nature of the human brain, we arrive at a radically different view of mind and of knowledge and of the world from that held by St. Paul. In particular, we can see that ‘mind’ doesn’t pre-exist human nature. There are some aspects of our minds which developed over the millenia as our ancestors evolved by responding to specific environments and there are some aspects which develop during our lifetimes as we respond to our own environments, even to the world as a whole. In this context, it’s important to realize that we don’t have pre-existing minds that can be filled with knowledge but rather minds that are shaped as we deal with the world in a way that can be seen as a knowledge-generating process. There’s not a clean separation between mind and knowledge, though we’ve been taught to think in terms of systematic knowledge that can be pushed into a more or less empty mind.

We have to learn how to avoid approaching primary sources of knowledge with too much in the way of a system. That is, we have to learn how to shape our minds to the truth as found in the Word of God and in the Creation of God rather than approaching in the manner of Fundamentalists with a small list of principles or dogmas which tell us what is true before we listen to God’s revelations in the Bible and in Creation. In other words, we have to give up our habits of filtering God’s words and our knowledge of God’s creative acts through our all-too human ideas of what can be true. I’ve discussed some of the underlying issues in *Four Kinds of Knowledge* [43], a book freely available for download.

In his commentary on 1 Corinthians, St. Thomas Aquinas tells us:

[J]ust as a disciple reaches an understanding of the teacher’s wisdom by the words he hears from him, so man can [r]each an understanding of God’s wisdom by examining the creatures

He made. . . [Page 17 of St. Thomas Aquinas' *Commentary on 1 Corinthians* [3].]

Later, Aquinas tells us [3]:

[T]he wisdom which attains to God through the things of this world is not the wisdom of this world but the wisdom of God. . . [page 51]

I suspect that St. Thomas didn't appreciate how radically insightful his theory of the development of the human mind was. He probably attributed to St. Paul too great an understanding of the importance of empirical reality as part of Creation. Though I'm sure Aquinas thought himself to be recovering St. Paul's meaning, he was bringing about a commentary as if he were putting himself in the place of St. Paul, responding to God and trying to move along with God.

In all likelihood, St. Paul did distrust the best human knowledge of his day, not quite seeing it was imperfect knowledge of God's Creation, that is, of God's acts of creating contingent being and sustaining it in existence. Aquinas did see this, at times very clearly, and he read into St. Paul's words his own better view of the nature of empirical reality and of human knowledge of that empirical reality. This is the correct way to read the Bible, but it should be more explicit than it was in the mind and writings of Aquinas. This is to say that the Bible remains the source of Christian revelation not because it's a collection of writings which somehow transcend the limitations of their all-too human authors. The Bible fills that role because it's the human recording of a particular conversation God was having with all of us by way of a particular group of poets, court historians, prophets, evangelists, and apostles. We can enter this conversation but not as a mere matter of the 'spirit', rather does it take some discipline in the way of 'worldly' thinking and a healthy bank account of 'worldly' knowledge. I can remember a high school history teacher of some wisdom telling us we have no 'right' to an opinion until we know some facts. I'm claiming that we should bring our knowledge, especially our modern empirical knowledge, to the process of encountering God by way of an intelligent and respectful reading of the Bible. We should use our facts organized as knowledge in our efforts to understand the Bible as a recorded conversation including some revealed truths sometimes unclearly stated, some time-bound insights, and some outright errors.

There are many valid reasons why we should be concerned about St. Paul's life and his education, about the historical circumstances of Isaiah, about the development of the Semitic peoples and their cultural state at the time of Moses. There are also good reasons to be concerned with the meaning that St. Paul and Isaiah put into their human utterances. But God's meaning that He was conveying through His prophets and Apostles is far more important than what those prophets and Apostles thought the Lord to be saying and far more important than the limitations of their individual selves or their cultures.

If Aquinas was right, then our understanding of the Bible will be greatly improved by admitting "the wisdom which attains to God through the things of this world." This doesn't mean we push aside the Bible or even its human authors in order to impose a better and more modern version of God's instructions to His children. It does mean that we need to struggle to put ourselves in the positions of those prophets and evangelists and Apostles to try and hear God's words fresh in order that we can have those words in terms that allow us to speak with God in our contexts as St. Paul spoke with God in his context.

## 407 If We Have to Use Mathematical Analogies. . .

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=478>. It was finished and uploaded on 2009/04/08.]

We have no choice but to use mathematical analogies in even our most subtle thoughts about moral and spiritual issues since mathematics, by definition, is the proper way in this universe to describe paths. We move over paths, we develop over paths. Our current moral talk and thought assumes a Euclidean space for our moral lives, including our innermost selves and our relationships to others. At the same time, mathematicians and scientists and engineers have moved on to far more sophisticated geometries for the description of not only exotic sorts of stars and black-holes but also spinning components in machines.

With all the self-justifying talk of moral theologians and philosophers and literary men about the differences between physical objects and moral natures, I find it hard to believe we live in a world where it's appropriate to describe the moral lives of men and beasts with simpler words and concepts than those which are necessary for physical objects. Surely, we can enrich our understandings and discussions of our own lives by using a richer set of words and concepts. Surely, the more abstract concepts corresponding to paths which can be found in more modern geometries can help us to speak more truly of our lives and our societies than the simpler concepts which correspond to simple paths and journeys over the surface of the earth.

Don't we spin and twist, often discovering that a simple event in our lives or a change in attitude leaves us in a state that might be labeled orthogonal to our societies or families? Don't we often feel ourselves relatively unchanged as our surroundings change around us, generating forces

on us which might well be analogous to the so-called ‘fictitious forces’ of physics which are, in one sense at least, generated by nonlinear changes in coordinates though no ‘true’ forces be involved?

Call me proud in my human nature, but I simply find it hard to believe that my insides can be described by analogies to simpler concepts than what is necessary to describe the forces on a spinning disc in my computer. I find it still harder to believe that my relationships to others, including those who are long dead, can be described by those simpler concepts.

My personal situation is making it difficult to put in as much time as I’d like in exploring the mathematics and physics which might give clues as to the true nature of the created being which is our human stuff and of which we are part. Yet, I’m plowing through, slowly, trying to learn as much as I can about concepts appropriate to more abstract sorts of paths, more abstract states of being, concepts which can be used to analyze seeming messes to determine what the true invariant relationships are. I know not what the end result might be, but I hope to at least inspire others to move on in this effort to expand the horizons of human reason, to borrow a phrase from Pope Benedict XVI.

In the end, a human being is far more than a star, far more than a spinning disc in a computer. My problem with those in literary and other human sciences is that they so strongly prefer inherited language and concepts which imply we’re triangles in Flatland rather than being—potentially—encapsulations of all of complex Creation described by such ideas as those of the general theory of relativity and quantum mechanics, transfinite set theory and abstract algebra. The moral nature of a creature struck with wonder by the glories of God’s Creation, the minds of creatures capable of exploring those wonders, are at least as complex as what they can appreciate, as least as complex as what they can understand—however incomplete that understanding might be.

To complete the title of this entry:

If we have to use mathematical analogies in describing our moral and spiritual and intellectual journeys, shouldn’t we use the best available mathematics rather than ancient stuff?

To be sure, that ancient stuff is still true, but it’s so small a part of the truths of modern empirical knowledge and it describes so small a part of Creation.

## 408 The Need for Abstractions in Moral Self-understanding

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=526>. It was finished and uploaded on 2009/06/19.]

In this article, I'm continuing my efforts to deepen and enrich my moral self-understanding as an American born in the middle of the 20th century. These efforts run parallel to my studies of modern empirical knowledge, including the seemingly arcane mathematics used in physics, and my assumption is that normal processes of mind-shaping will result in a more or less natural use of that knowledge in these moral analyses and also in my related literary efforts. This is to say that I hope to acquire a reasonable facility with the enriched understanding of fundamental aspects of created being which has been developed in modern mathematics and physics and to integrate that understanding into my understanding of created being in its other aspects.

As I've discussed before, a prominent historian, *Carroll Quigley* (see [http://en.wikipedia.com/wiki/Carroll\\_Quigley](http://en.wikipedia.com/wiki/Carroll_Quigley)) has claimed that the economic system of Western Civilization nearly collapsed twice before and new forms of economic organization were found so that West could return to a robust health—see Chapter 405, *Ways of Thought in the Modern West*. Those collapses don't seem to me to have been brought on by decay processes, though there was some moral and cultural decay which occurred as part of those processes. It seems to me that the very expansion and success of the West created conditions more complex and more abstract than the earlier forms of thought and feeling could handle. Those who accept the usual understanding of 'abstract' should be at least a little surprised by this prior statement but I intend it to be taken more or less literally. In my

way of thought, the abstract is a different level of being from the concrete but is also part of Creation and not some formality which doesn't really have an existence. I think the West reached a state of complexity centuries ago which indicates that abstract being is more directly a part of our technology, our politics, our art, our philosophy, and so on. During those two earlier periods of near-collapse, our ancestors needed to respond and to develop more powerful minds that could generalize from the concrete up to a more abstract level. The results were impressive, but the advancement of technology and of our understanding of fundamental aspects of created being has accelerated and we're in worse shape than ever. The remainder of this article is an effort to show how I clarified, somewhat, my own ideas upon this subject because of recent contemplations upon a nasty event in New England history – the war known as *King Phillip's War*, described at [http://http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://http://en.wikipedia.com/wiki/King_Phillips_War), a war waged by some of the Indian tribes against the European settlers and some Indian allies.

The details of the war aren't at issue here except for a general background understanding. My interest lies in an important stream of thoughts and attitudes of New England European colonists which showed itself during the period of King Phillip's War, a stream which I think to represent a failed intellectual maturing process on the part of highly educated and intelligent men in confrontation with alien cultures. Instead of moving towards a proper abstraction that would have allowed a defense of their own culture but also an understanding of the human good in a different way of life, the European settlers raised their particular way of life to a self-righteous ideal. A conflict of cultures was seen as a war between God's servants, the White settlers, and Satan's slaves, the Indians. This stream, which may have been nascent in Puritan thought from the time they first stepped into that wilderness region of the New World, developed fully during the lead-up to the war as the Puritan leaders dealt with the growing resistance of the Indians to the expansion of settled ways of life.

I'll mention one other relevant complication—the Puritan leaders were also blind to a problem that was affecting their relationships to the Indians who were baptized and living lives superficially similar to those of the European settlers. Those baptized Indians were strange creatures who had been shorn of the externalities of their native culture without truly becoming what the Puritan preachers wanted them to be—English Protestants. Rather than preaching the Gospel and letting it take, or not take, an In-

dian shape, the Puritans tried to make those Indians into inferior images of themselves.

This historical mess indicates we'd reached the point centuries ago where we needed to develop the language and concepts and mental tools to deal with the multiple levels of reality created by a world become far more complex than can be handled by the physical perceptions and simple models of reality held by an English mind of the early Enlightenment. As the human mind has encapsulated more and more of the richness and complexity of Creation, we've created not only powerful technologies but also forms of social and political relationships which make promises of wonderful possibilities even as they threaten our freedom and our flesh-and-blood relationships and much else. How are we to develop the possibility of richer and more profound moral thought and discourse? How are we to regain control of our individual lives and, by doing so, reshape the West into a morally well-ordered civilization?

I'd suggest that we start by familiarizing ourselves with the tools developed by Gauss and Einstein and Heisenberg and so many others, tools which deal with a reality in which time and space and matter are different from what Plato or Augustine or Aquinas or Kant thought them to be. From there, we can build up layers of understanding which correspond to complex things and even living creatures, especially those complex creatures called human beings. To be sure, some moral philosophers and theologians and novelists have made steps towards a recognition of the world as described by modern empirical knowledge, but we're far from a true integration of scientific 'facts' and 'theories' into our general ways of thought.

Let me return to the bloody mess known as King Phillip's War. I rely upon the narration and discussion of events which is found in the book *The Name of War: King Phillip's War and the Origins of American Identity* by the historian Jill Lepore, but I'll simplify matters by considering only two fairly well-defined groups of human beings:

1. American Indians who wished to continue a nomadic existence that was being disrupted by the spread of White settlements, and
2. white settlers who were spreading rapidly, especially through the river valleys, and were disrupting the nomadic patterns of life by clearing forest, letting domestic animals take the food of wild animals, filling in blueberry bogs, etc.

The first group was made up of tribes led by that man who was called King Phillip by the settlers, a man who saw that the Indian way of life was endangered by the very existence of the European settlements. King Phillip apparently wasn't prejudiced against Europeans as individuals. As was generally true with nomadic American Indians, he was biased against settled cultures and not the individuals from those cultures and was very generous from his standpoint in trying to integrate captured Europeans into the Indian way of life. Since the Indians had no written language and the transmission of their oral histories was disrupted, we don't know too much about how most of them viewed matters but there was fairly widespread support for King Phillip's war against the White settlers and many of the Indians fighting with the White men or standing on the sidelines did so because they considered King Phillip, his followers, and his allies to be more immediate enemies than the Europeans. The Europeans, with a few notable exceptions, saw the conflict as one between good and evil.

What's of interest to me in this situation is the apparent lack of intellectual detachment, the lack of abstraction from their particular situation, on the part of the European settlers. There is the appearance of abstraction in the highly literate writings of the Puritan intellectuals but that was really an idealization of a particular and concrete human culture. That is, they idealized a set of beliefs and ways of life not even held by all Englishmen, seeing those beliefs and ways of life as human norms for all times and places. True abstraction generalizes from the particular and specifically recognizes the possibilities of other particulars, in this case, of other ways to realize the moral good in human lives. The sort of pseudo-abstraction I call idealization seems to be common among modern thinkers, beginning at least with Kant's raising of the Newton's speculative and empirical view of time and space to the status of metaphysical truth. The Modern Age may well be an elementary school of sorts, a place for learning, or failing to learn, how to think in terms of proper abstractions that we might have a greater understanding of Creation, but we men of the West are not doing well outside of physics and mathematics and technology.

We've advanced in our technology very noticeably, allowing the development of, for example, ways of getting at natural resources deep underground and of fashioning them into useful artifacts or processing them for use as fuels. Our technology has allowed a tremendous growth of the population of the human race and a confusing complexity of political and social and moral relationships. We no longer understand ourselves or our societies and we

are, in that sense, “lost in the Cosmos.” It’s better to think of us as children in a situation where adults are needed. We need richer and more complex understandings of human morality at the level of our modern complexity of community and political life and also at the level of an individual navigating through this modern mess. And then we need to mature according to those understandings, but I’ll stick to the learning part of this process for now. After all, the implementation of what we learn, if we learn it, is done by way of lots of small-scale experiments in ways of life and ways of thought. It’s not possible to write an authoritative manual for good forms of human life in the 21st century, but it is possible to explore possibilities in the flesh or in fictional narratives.

Those who abstract only by idealizing their particular beliefs and ways of life will remain trapped by their prejudices, country yokels come to the big city and seeing no choices but to give up their ways of life fully or to react against the surrounding confusion by withdrawing into self-righteousness and maybe outright hatred. Only he who learns to abstract up to higher levels can truly see the viewpoint of others and see the goodness in multiple cultures which are in conflict even when he decides that he’s morally bound to side with one. For example, someone might see the goodness in the nomadic life of the New England Indians while deciding either that English Christian culture is far richer or simply that a larger, more settled population is morally preferable to a nomadic society of the few.

Some of the Puritan leaders of New England during the period of King Phillip’s War were very well-read in Newton and all were well-read in the Bible and classical literature and Calvinist theology, yet they proved unable or unwilling to ascend to a higher level of abstraction during the conflict with King Phillip and the tribes which followed him into war. Staying bound in their own concrete manifestation of Christianity and Western Civilization, they failed to see their position was not one of good and God-centered men fighting against a Satanic enemy but rather that of somewhat good and would-be God-centered men fighting to expand the domain of one manifestation of the Christian West. The enemy wasn’t Satanic but rather barbaric and nomadic. A suitable amount of competent abstract thought on the part of the European settlers of New England would have allowed them to see the true good they were defending but also the good the nomadic Indians were losing. A truer and more just peace might have been obtained even though I doubt the war could have been avoided.

Is it now possible for the West, as a civilization, to achieve greater

competence in the abstract thought necessary to understand our complex selves and our complex civilization? We seem about to needlessly destroy our own civilization because of the same sort of self-righteous blindness which led the New England settlers to misunderstand their conflict with King Phillip and his followers. The New England founders dug a rut of sorts and we Americans seem to have traveled that rut in the ensuing three and a half centuries. We've even managed to idealize that rut into the path of truth and righteousness and we claim to be trying to teach peoples around the world to travel those wonderful ruts with us.

## 409 Individuals and Herds

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=549>. It was finished and uploaded on 2009/06/30.]

This short article, *Conformists may kill civilizations* found at <http://www.nature.com/news/2009/090624/full/news.2009.593.html> is about an effort to find, in archaeological and evolutionary biological terms, a way of speaking of the odd fact that the residents of a once successful but collapsing civilization will go on acting the same way they, or their ancestors, did when that civilization was prosperous and growing. Having studied the mindlessly habitual behavior of Mayans as their civilization was being destroyed by environmental damage, these archaeologists in the article were able to see the likelihood that most human beings are conformists who don't even see the need to act differently from their habitual ways as things are falling apart around them. As we can see in the current financial and political disasters of the United States and some European countries, even those who are as aggressive as wolves are still sheep in the sense of conforming to once successful models of behavior even as the evidence grows that fundamental change is needed.

Banks are only one of many institutions which are failing and responding by continuing to do what hasn't worked lately but to maybe do it more intensely and more efficiently. There are schools, churches at various levels of organizations, government at all levels in the United States, publishers of newspapers and also publishers of books, who have acted no more sanely to their share of our current problems. Schools are particularly important since they're responsible for teaching the susceptible many to march along in a herd and for doing what they can to restrict the development of those inclined to think on their own. I remember learning in fifth grade that I had to watch *The Monkees* if I wished to be able to talk with my

classmates during recess. And, so, began a hobby of watching television which—quite fortunately—ended a few decades ago. Though I'll occasionally catch snatches of a show when I visit a dedicated television-watcher, I'm happy to say I'm mostly mystified by the blandly good-looking faces on those magazines at supermarket checkout aisles.

In the modern West, especially during the American dominated years following World War I, innovators haven't been particularly valued unless they produced new products and services for an increasingly passive citizenry, passive in an intellectual and spiritual sense. This, of course, has led to a frightening homogenization of speech patterns, entertainment habits, professed political beliefs, etc. across large swaths of the earth's surface. This wasn't a new phenomenon, but rather a maturation of a problem which Tocqueville saw when he came to the United States in the 1830s and observed a new sort of man being shaped by liberal democracy—a self-brainwashing herd animal.

But there are deeper matters than those which most label as 'politics' and 'economics'. A complex economy and a sophisticated political system are structures built upon a foundation of ideas about reality, ideas made manifest in the truly great literary works of a civilization—not the genteel ones produced by trained writers during periods of decadence but the works like *The Iliad* and *Don Quixote* and *Moby Dick*, the raw and powerful works exploring our relationships to some significant aspects of Creation. Those sorts of works, along with some more abstract works about Creation and its Creator, such as Plato's dialogs and Augustine's *The City of God* and Nietzsche's explorations of the mindlessness and soullessness of the post-Christian West, shape our ideas of time and space and matter and movement and human nature. We've not yet seen the Augustine of the modern world who can help us to make sense of the desires of that pretty young woman and also of the exotic physics which lies behind MRIs or even old-fashioned solid-state electronics, unless I'm that thinker or someone else who's being ignored by the mainstream.

Shakespeare was at least of comparable importance to William the Conqueror and Henry VIII in the creation of England as we know her. At a time when England was still a collection of local cultures, Shakespeare provided a call for the residents of those local cultures to join some hitherto non-existent herd of Englishmen. The jingoism of the drama *Henry V* made Cecil Rhodes and the other British empire-builders possible. Arguably, Shakespeare was himself riding a powerful wave and another might

have done that work if the Bard of Avon had never lived or had decided to preach something other than a self-righteous English nationalism. In the United States, we had Emerson's and Thoreau's glorification of a certain selfishness and self-centeredness which Melville labeled as a spiritualized materialism. Emerson's ideas suit us Americans fine while it is hard to read Melville's books, not because of his verbal and narrative experiments but because he deals with a reality we don't much like. We don't even want to be responsible for our children or our elderly parents and Emerson provided a pseudo-rational justification for the public school system and eventually the Social Security system. The counter-culture crowd seems to think of Thoreau as one of them, but he and his teacher were perfect philosophers for a nation of crooked bankers, brainless machine-politicians, and ordinary citizens who tolerated such because they hoped to win that odds-against lottery to join the ranks of the exploitive. On the whole, we Americans, and perhaps all citizens of the modern liberal democracies, revealed ourselves as having that trait Tocqueville feared he saw in us: we have never met a fact that we can't ignore if it's inconvenient to our purposes.

Melville created an Emersonian antihero in Captain Ahab who had the guts to attack Creation and to try to get past what wouldn't respond to his desires. Captain Ahab strived to attack the Creator rather than sitting in a Cambridge study and whining. Americans over the years since Emerson have been a mix of the two, brutal but squeamishly looking away from their own actions and the actions of the harpooners they send out against God's creatures. I should note that there are some serious Southern thinkers, alive and dead, who have seen this moral disease as located in the New England soul. They're more right than wrong, but the disease seems to have spread throughout the West because it's the perfect mind-set for conformists, self-justification presented as philosophy. The American attitude was showing clearly during King Phillip's War as I discussed in Chapter 408, *The Need for Abstractions in Moral Self-understanding*. Puritan thinkers failed to properly abstract from their own morality with the result that they associated their ways of thought and of life with absolute truth. This is to say that their concrete ways provided a false abstraction of human nature and human possibilities, but a very convenient abstraction. Men of the modern West can be willfully ignorant and culpably stupid while speaking in grandiose moral terms.

We need new ways of thought, respecting the past for what it is, doing our best to understand it but not remaining trapped in it that we might

respond to a ever-changing world. We need to start at a fundamental level where physics and mathematics have enriched our understanding of time and space and matter and movement and the nature of thought. Those new ways of thought won't save the West in the short-term. If the West continues its collapse into barbarism, those new ways of thought won't lead to any obvious signs of a new civilization before the next election of an American President. Between the end of the High Middle Ages and the beginning of the Renaissance, Europeans suffered through a century of stupidity and disease and famine and brutal violence. That period of suffering was short by other such periods between the collapse of a great civilization and the rise of another. We can hope to make the current period still shorter, but that new civilization or new phase of Western Civilization won't appear anytime soon unless men alive now are willing to sacrifice for and work for a great good not to be seen in our lifetimes.

The spiritualized materialism which Melville diagnosed in the thoughts of Emerson and Thoreau is founded upon a poisonous but powerful way of thought that can be described with equal strangeness as an idealized particularism. United with the conformist tendencies of the majority of human beings and financed, so to speak, by the spectacular prosperity of economic and political forms which encourage conformism of a sort which can be labeled a decentralized totalitarianism, we end with a mass of humanity in the modern West which is remarkably resistant to reality. They are frightened by change, but that's a normal human response which I also feel. More importantly to those of us who are puzzled by the ongoing repetition of what's not working, conformist men are blind to the need or even possibility of true change. They try to deal with their fears of things that roar in the dark by denying that there are such creatures as man-eating bears or knife-wielding men. When those denials seem to endanger them, conformist men lift their wrists to bear the shackles of those who promise to protect them.

## 410 As the Ruins Crumble...

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=565>. It was finished and uploaded on 2009/07/28.]

The policy analysts, Right and Left, are working hard to assign blame for the problems of modern economies and polities. In the United States, they examine taxation and regulation policies of governments from Washington's administration right up to that of Obama. They also examine the strong dislike Americans have for taxes along with the longing they have for the promises of security which can be fulfilled – in the short-run—only by a government with strong powers of taxation. We argue about social security but few get to the real point—social bonds are formed by our dependencies upon each other and our willingness, even the desire of many, to be dependent upon a central government rather than upon relatives and neighbors speaks of matters deeper than the technical details of financing our elderly years. Social security could have been pretty much the same if it had been designed specifically to implement in a gentle way the goals of Lenin and Hitler and Mao—the destruction of the ties which bind human beings into families and other local communities. FDR and LBJ succeeded where those great tyrants failed.

Americans, modern men of the West in general, are willfully stupid and ignorant creatures. I've spoken of this often, as have the likes of Tocqueville, Hawthorne, Melville, Ray Bradbury, Solzhenitsyn, and Gore Vidal. Seemingly a strange group, especially with Bradbury, an interesting writer and thinker but hardly one at the level of the others in the list. He joins them in his intelligent sensitivity to moral issues and his willingness to ask tough questions. Way back in the 1950s, as one example, he was one of a handful greatly worried about the power of television to suck out our minds and souls to complete, in a manner of speaking, the true American Revolution,

the revolution desired by the decent and cowardly members of the herd rather than the revolution desired by the true noble amongst the Founding Fathers and rather than the revolution desired by the bravely greedy amongst the Founding Fathers.

Melville wrote about his fears of a basic defect in the moral character of Americans, one which may now be found around the world. More exactly, Melville first saw a deep flaw in the expressed thoughts of Emerson and Thoreau and then began to fear it was a true sign of a basic American trait. What was this trait? He wrote in his diaries at one time of hearing Emerson speak for the first time and being impressed in some regards but feeling that the sage of Cambridge, if he'd been present at the moment of Creation, would have had some good advice for the Almighty. In the margins of a copy of Emerson's writings, he was said to have written a plea for God to help the poor man who organized his soul according to these teachings. In the strange and interesting novel, *The Confidence Man*, he portrayed Emerson as the philosopher who spoke gobbledy-gook, who advocated a genteel sort of self-centeredness that denied true love for the other. Thoreau was portrayed as his practical pupil who put this perverse morality into words that appealed to the many who couldn't read Emerson. Melville once described Emerson's teachings as a sort of spiritualized materialism. And he wrote *Moby Dick* as his awareness of this moral defect in the American mind and soul was growing. That novel, which breaks all the rules taught by advocates of mediocrity, had some interesting scenes such as the brutal behavior of the American whalers who stumbled upon a birthing ground and bloodied the waters killing the mothers and their calves, not only showing an opportunistically murderous streak but also a lack of concern for the future of their own way of making a living. And, of course, there was Captain Ahab. Was he Ralph Waldo Emerson with the courage of his convictions? Was he the 'mainstream' American who had the strength to attack a Creation which didn't meet his standards and the honesty to refuse to willingly accept his status as a creature?

Were all the American war-crimes from the time of the early wars against American Indians acts which ring true to some evil deep inside of us rather than being just temporary aberrations? I wrote of King Phillip's War in Chapter 408, *The Need for Abstractions in Moral Self-understanding* and my belief that the crimes committed by the colonists from Europe (the American Indians were far from a state of innocence), and perhaps their prosecution of the war as a whole, came as the colonists—for all the high

education of their leaders and scholars—proved incapable of generalizing from their own ways of life to wider human possibilities. They thought the Indians were evil because they resisted becoming a certain type of middle-class, dissenting Englishman.

The Puritans leaders and thinkers feared signs of something I would have considered good—some of the European settlers were adopting some Indian ways. Two peoples (speaking very simplistically) were living in the same region and might have been able to form a new way of life, but the Puritan leaders thought any compromise of their ways of life to be a surrender to Satan and some of the Indian leaders, including King Phillip, saw that a compromise would force the Indians to adopt a more settled way of life. They preferred to die and to lead their followers to death rather than give up that nomadic life.

Modern Americans are much like those Puritan leaders—precocious adolescents. They and we have advanced to a high level of concrete and moralistic ways of thought, but we've refused to even see the need and desirability to move on towards adulthood. This is almost certainly the explanation for the phenomena noticed many years ago by some European observer: The United States is the first country to go directly from barbarism to decadence without passing through the state of civilization. Mom and Dad have gone away and the kids have control over the house and the checkbook. Those kids were well-raised and go off to school and work each day, even with Mom and Dad gone, but they don't know how to spend their leisure hours in activities which will enrich their human beings. It's hardly surprising that the thugs down the street have taken over the neighborhood and are grabbing up what hasn't yet been destroyed or used up in the name of a good time.

This claim isn't in conflict with the great success of Americans in many realms, nor is it in conflict with the reality of promising American cultures, even hints of a civilization, which showed themselves regularly in the 1800s and less frequently since then. An immature people might be precocious and high-achieving barbarians so long as they are able to inhabit a civilization built and maintained by others. We Americans were, in a deep sense though not a political sense, colonists of Western Civilization as incarnated in the British Isles in recent years. Then, the highly honored idiot-leaders of Europe decided, beginning in the early 1900s, to destroy each other's countries over differences that could have barely justified an old-fashioned, pre-modern duel between warlords and a few thousand of their mercenaries.

Since then, the Europeans and Americans have become parasites of a sort, drawing down the bank-accounts left us by centuries of thinkers and doers.

In any case, our problems are deeper than even the inability of the bankers and corporate executives and politicians of the West to make money any way other than selling productive assets overseas. Our basic problems reach down into our very souls and minds, into our most fundamental relationships to God and Creation and man. Those basic problems are the cause of the lack of intelligence and the lack of moral integrity that lies behind the American belief that we can make our livings by selling to each other goods made overseas and serving each other steaks and micro-brews while purchasing the plate-ware and mugs from countries of cheap labor. Those basic problems help to explain the American belief we bankrupt citizens can somehow get together to pay each other's mortgages—with Washington and Wall Street taking a cut in the process.

Many are the classical liberals and libertarians who seem to think that we can solve our problems by getting the government off our back and getting back to work, unlikely as it is that Washington or Boston/Albany/Sacramento/. . . will shrink to more appropriate sizes. The problem is that, as I've discussed in a few entries, the human mind which is so important to our ability to function in a complex civilization has developed along with that civilization. If that civilization has decayed, or has never taken root in the case of the United States, that tells us that few are those who have minds well-formed enough to really understand themselves as individuals living in complex societies embedded in complex political structures. Few can even understand such abstract concepts as property rights or even rights over their own persons. It takes many generations to build a civilization but once destroyed, in perhaps a single century, the foundations are gone. Those foundations are found in the minds and souls of civilized people and they are not to be restored or replaced by simply educating barbarian children. It takes many generations to go from barbarism to civilization when the foundations need rebuilding.

I've written of the contingent nature of the human mind, that is the aspects of a human being that work with abstractions—see Chapter 250, *Preliminary Thoughts on the Evolution of the Human Mind*. Simplistically, the human mind has evolved over eons at the species level though it doesn't seem to have shown itself clearly until circa 600BC when Homer and the succeeding lyric poets had made philosophy and mathematics possible, when some unknown Israelites put together the complex mosaic known as the

Books of Moses, when some unknown Vedic geniuses created Hinduism. No matter how poor or rich the social environment, the individual mind must develop over a lifetime. Clearly, there are going to be complications as a result of intermediary relationships and entities such as large-scale civilizations and smaller-scale societies, including towns and church communities and extended families. It takes centuries, and a lot of hard work on the part of butchers and bakers and poetry-makers, to build a civilization which can then be a home to those smaller-scale societies. In the case of the most recent cycle of Western Civilization, it has taken about five centuries of growth and then decay in literacy and reasoning skills to bring us to a sad point—see Jacques Barzun’s *From Dawn to Decadence* [9] for a powerful narration of this most recent major period in the West.

We aren’t the proudly independent and hardworking retailers and manufacturers that Adam Smith observed. Those Glasgow Scots of the mid-1700s were self-seeking but highly constrained by damaged but largely intact moral and social structures. We should be careful in applying Adam Smith’s thought to modern Americans who possess little of the humanly defective but certainly strong moral characters of an eighteenth century Scotsman. And those Scotsmen lived in a society that demanded certain types of behavior from its merchants and professionals. Whatever one thinks of the specifics of that morality, it provided a good framework for freedom in the marketplace, that is, one merchant could trust another if only because he knew the price the other would pay for behavior seen as wrongful.

I’ll go no further into those sorts of issues, preferring to make the more fundamental, and Thomistic, claim that we are intentional animals. Our moral natures and our minds develop in an organic manner producing physical changes including changes in external relationships. For now, I’ll ignore the complication that our relationship to our Creator isn’t quite external and deal with the other aspects of our lives.

Man is a particular creature, each of us developing by our responses to our environments—which sometimes include some representation of the entire universe or even some additional parts of Creation. But our environments and our readily available responses, our habits and customs, are the results of historical processes themselves made possible by billions of years of evolution. I believe man has become the sort of creature who can, in principle, encapsulate all of Creation within his mind, thus imitating by way of understanding what God did in creating this world and all else that is part of Creation. That implies there are some proper directions for

our development. To transcend our immediate environments and even to understand the depths of our own human nature, we have to develop our abstract reasoning abilities. To move towards a state where we are truly images of God, we have to be like Jesus Christ, true persons who move with freedom yet do the will of the Father.

Western man was moving in the right direction, not that we can ever reach our most highly desired destination by our own efforts, nor can we even truly see that destination this side of the grave. Then, Western man was diverted by a struggle for forms of material prosperity not fit for human beings—we sought prosperity for its own sake and not for the sake of what it makes possible for us and our children. Having lost his bearings, Western man, in his political collectives, has become a murderous and treacherous beast indeed.

In any case, we are in the presence of that famous cliché, a two-sided coin. On one side, we find my claim that our main problem is more profound than the problems discussed on so many websites and on all the cable news channels. In future generations, those lesser problems will likely be seen as symptoms of the more profound breakdown of Western Civilization. One way of seeing the nature of this breakdown is to simply ask: What understanding do men of the West now have of Creation? Any answer would be an incoherent mixture of contradictory elements. We don't exist to advance towards heaven, at least not as the West as a whole. We move as a herd of anthropoid creatures, but we don't really move with a common purpose beyond the satisfaction of needs and desires which are unnecessary and sometimes dehumanizing.

On the other side of the coin is the open possibilities of building a new phase of Western Civilization. If the people of the West prove not to be interested, or if they prove to be not up to the task, those who can produce a greater understanding of Creation and of man's place in it can teach the men of the recovering civilizations of the East, and also teach men in regions where new civilizations might arise. In any case, this work of understanding Creation can be quite demanding but also great fun much of the time. Always demanding and sometimes fun. Even when I struggle, doing odd jobs sometimes, to get a pittance to pay my small bills, I'd rather be doing what I'm doing than what the great predators of the decaying West are doing. And what I'm doing right now is contemplating what I've written and wondering how much of the analysis can be enriched but also made more rigorous by applying the understandings of time and

space and matter which come from modern physics and mathematics. For example, is there a better way, in terms drawn from modern geometry or tensor calculus, to speak of the multiple levels of development of the human mind: species and civilizational and individual?

# 411 Defining Landscapes and Possible Paths, Not Determining Paths

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=583>. It was finished and uploaded on 2009/08/12.]

I'm stumbling along with my project to enlarge and enrich our moral discourse by drawing upon the modern mountains of partially processed empirical knowledge, including some disturbing information about our inability to anticipate or prevent the development of evil in our own societies. I'm learning or relearning—at an elementary level – some of the most important tools of modern mathematics and physics, in particular those necessary to understand the revised, and still evolving, understandings of time and space and matter. I'm also reading history and novels again and have retrieved a few unread books by serious brain-scientists or evolutionary theorists. At some point, the pot will begin to boil, and I hope to find I'm cooking up something interesting.

In all of this, I would hope any readers would realize that I'm not making any sort of assault upon human freedom though I think standard doctrines of so-called free-will are in serious conflict with those inconvenient things called facts and—even more importantly—with any coherent stories to be derived from the various facts of modern neuroscience, evolutionary theory, history, literary explorations of human nature, and the actual working methods and recorded thoughts of the likes of Einstein and Feynman, Gilson and MacIntyre. See Chapter 385 *Is this Evidence Against Free-will?* for a discussion on experimental evidence that our free-will isn't what we think it to be. Perhaps part of our moral problems are due to our misunderstand-

ing of how we make decisions and of the sort of freedom appropriate to a human being.

I'm charting out our world, our more complex world which has emerged as a living story. I'm also trying to speak, especially in my novels, about our relationships to others and to our world. I might state my preferences on how to best traverse this world but I'll try to make those clear as I try to provide ways of describing human possibilities, immense territories with a huge number of possible paths. It will be up to individuals and communities to begin cutting paths through the woods or to begin exploring other sorts of wilderness regions, to try different ways of organizing their moral movements through this world. I'd be happy just to provide some of the concepts and words which might help make possible those efforts.

One need is words to speak of the different shapes of our moral spaces at different levels of our hugely scaled and immensely complex world, family vs nation as one example. I think we'll see a great problem because we, or at least our community and religious and professional leaders on our behalf, have given a great deal of control over our lives to organizations which work top-down, killing all natural development just when mathematicians and other scientists are discovering the apparent dominance of self-organizing systems in this world. Our entire universe seems to be such a system and each living creature from bacterium to blue whale is such a system. Wolves interact in such ways as to set in motion self-organizing processes that form packs and even somewhat larger scale social structures when multiple packs interact on boundaries of their territories or when they move alongside each other to follow migrating caribou herds. Human beings form a dangerously rich set of interactive structures from the so-called nuclear family and individual friendships through extended families and local communities all the way up through nations to supra-national groups formal and informal.

The best that can be done right now is for historians or sociologists to tackle pieces of this big mess, without having a coherent way to view or discuss human moral, social, and political life in a more complete way, without having ways for an individual to have a coherent view of his relationships to family and friends, to local community and national government, to church and larger-scale religious communities.

Think for a moment of a social, moral, and political problem which is tied to purely physical foundations: How do we move ourselves and our goods from one location to another, within our local communities, to other nearby communities, across the continent, and to regions on the other side of

the earth? First of all, we Americans, and most others, of this age will think of this problem in false terms of the cold-war bureaucrats and cold-warrior politicians who reshaped the United States into a form more useful to them by way of building the highway system and otherwise stealing resources to create a car-centered life. When we fall into this bureaucratic view, we'll see the United States, or any other country, as just a piece of real estate upon which we can impose a grid of interstate highways connecting to state roads connecting to roads which go to malls or through neighborhoods in suburbs or inner cities. You don't have to study the works of *Jane Jacobs* (see [http://en.wikipedia.com/wiki/Jane\\_Jacobs](http://en.wikipedia.com/wiki/Jane_Jacobs) or other critics of these highway systems to realize that such road systems designed top-down will not just provide for transportation routes. They'll destroy or destabilize neighborhoods. They'll put a town which will benefit from a bridge in conflict with the town on the other side of the river which might well disappear or change to a different sort of community if that bridge is built.

In other words, a simple road system, when designed in a simplistically rational way, begins to distort various sorts of social and political spaces, moving 'social mass' from one point to another or creating black-holes or intergalactic voids. I'm writing as I think and won't try to elaborate this sort of idea for now, but the point is that sometimes we might need *Salvador Dali* (see [http://en.wikipedia.com/wiki/Salvador\\_Dali](http://en.wikipedia.com/wiki/Salvador_Dali)) if we wish to have a realistic map of a road system scaled to its local effects on human beings and their flesh-and-blood communities.

What interests me now isn't so much a static view of our current state so much as ways of speaking of our movements upon the various social, moral, and political paths of our lives and of the lives of our communities. First of all, we need to recognize that that the paths we travel in our social and political and moral lives are themselves dynamic, being reshaped by our own movement, the movements of other human beings including the gathering into communities, and various changes in our physical environments. The paths we travel, the possible paths ahead of us, can be twisted by the actions of others and by the very existence of large-scale groupings of human beings which can distort moral space in the manner that a black-hole can distort spacetime.

We need to be able to qualitatively discuss our movements through moral, social, and political spaces. We need to be able to define and use invariant relationships that allow us to discuss relative distances as well as

forces and so-called pseudo-forces which push us aside or spin us around or even suck us down into some pit. Even a great truth can be distorted by changes in the path or in other external conditions. It's good to become a self-supporting and family-supporting worker but blindly doing so can make a human being into a widget of an evil bureaucracy. Your father minded his own business, went to the machine-shop each workday and brought home a paycheck to pay the mortgage and the taxes. A good man, good father and good citizen. If you do the same thing, you might be supporting a country turned towards evil ways. I hate to pick on the Germans of the 1930s all the time, but they provide a benchmark of sorts for a change in the moral spaces of the West. A man who was a hardworking factory supervisor in 1910 and lived the standard middle-class life was a morally responsible human being. His son who did the same in 1935 was a servant of evil. We should appreciate the problem of the common man in 1930s Germany who was not equipped to even recognize what had happened to him or to discuss it in coherent problems.

I'm still taking baby-steps, but I'm beginning to intuit a qualitative but disciplined way of speaking in which Germans traveled a path which remained upon a regularly shaped surface, corresponding to a reasonable manifestation of Western civilization and its traditional morality, but began skirting near a cusp of sorts by at least the 1920s and then moved over that cusp onto, perhaps, a funnel-shaped surface where a single misstep led to a slide down into a spout which empties into a moral pit of sorts. Such a slide can be seen as due to a moral 'pseudo-force' similar to gravity. Movements transverse to the general movement of a man's community could also cause a pseudo-force which would induce a spinning and a curvature of that man's movements, a moral Coriolis force.

## 412 Narrative Plausibility as Approximation to Truth

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=601>. It was finished and uploaded on 2009/09/28.]

It seems to be hard to say in what sense a truth can exist apart from a context, even one so seemingly clear as  $1 + 1 = 2$  or “Two contradictory statements cannot both be true.” Think of it in terms of works such as Whitehead and Russell’s *Principia Mathematica* which attempted to ground our ‘intuitions’ about arithmetic upon an elaborate formal apparatus. In order to build that apparatus a large amount of sophisticated mathematical thought is already assumed. This doesn’t mean that such works are useless—they can be at least consistency checks—but it does mean such works don’t provide a foundation for our belief that  $1 + 1 = 2$ . I believe it was Wittgenstein who pointed out that the apparatus of Whitehead and Russell used a system of indexing which assumed the very truths which were to be justified.

It seems more likely that our mathematical systems are the result of bootstrapping operations which have sometimes moved slowly and have sometimes involved jumps to new plateaus especially during the explosion of mathematical thought which began with Leibniz and Newton and, maybe, hasn’t yet ended. After some digestion of these these major jumps, and perhaps at times when smaller jumps have accumulated, mathematicians have reformulated human understanding of what mathematics is and what formal truths are. This is not to deny the large amount of exploration which can be done on each plateau once a formal understanding has been accepted, but I’m not setting out to produce a serious work of the history of mathematical thought. I’m raising a very large claim:

Individual truths, as creatures can know them, are true only in context of the entirety of Creation, though our view of that entirety is necessarily time-bound and contingent.

Or at least: those individual truths need a context, but the context has to be larger in scale the more encompassing or more abstract the individual truth at issue. Absolute truths have to be a plausible part of a narrative understanding of Creation. Plato and Aristotle produced a narrative of sorts for higher pagan thought but they didn't do it in a self-conscious manner as did Augustine when he produced, in *The Confessions* and *The City of God*, a well-organized narrative for a system combining Christian theological beliefs and Neoplatonic metaphysics. St. Thomas Aquinas also produced such a narrative oriented strongly towards an empiricism nearly buried at times beneath a Medieval style of rational argumentation and also elaborate Neoplatonic decoration which played no essential role in his thought and in which he doesn't seem to have really believed.

If we follow these great pre-modern thinkers, updating to what we now know of Creation and cleaning up some of their errors of substance and presentation, we find that there is still the need for intellectual developmental processes which involve bootstrapping. We have to rebuild even those parts of the foundation which are in good shape to recover a truer understanding and to integrate it into the parts we'll be adding.

I'm trying to produce a very explicit, but very sketchy, narrative of Creation. I'm a child of an age of some substantial historical awareness, an awareness that cuts across true (human) history, our understandings of the evolution of life, our understandings of the development of this expansionary phase of our universe, etc.

As our understanding of all these narratives has become more sophisticated, we've found ourselves facing a conundrum of sorts. Under my claim that truths are contextual, we can say the ancient Greeks could understand the elementary truths of arithmetic in light of arithmetic itself along with their understanding of geometry, physics, and some sort of Platonic-Aristotelian understanding of the human mind. Now arithmetic can only be truly understood as part of a whole that includes transfinite set theory, modern logic, quantum physics and all that, more modern understandings of the human mind, etc. We can now see the world as a far more complex story, more complex in its plot but also in its material stuff and its characters. Even simple truths are part of a not so simple whole.

I believe that Wittgenstein said something of this sort: the search for the foundations of our universe may well reveal that the foundations are supported by the superstructure. This is in the same spirit as my claim.

## 413 Freedom and Structure in Human Life

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=621>. It was finished and uploaded on 2009/12/29.]

Over the past twenty years or so—beginning with some novels, I’ve been creating a worldview on a somewhat disorganized basis, that is, I was writing as ideas came to me, sometimes addressing a few moral issues, than a theological belief, then a modern understanding of a basic mathematical or physical entity—such as ‘random number’ or ‘universe’. My store of ideas is now large enough to move on to an effort to write a more systematic work which will start with a summary volume and then will move on to a more detailed discussion of created being in its various levels along the spectrum from abstractness to concreteness. Along that path, I’ll deal with some theological issues since divine being, God who is His own Act-of-being, is the source of created being in both its abstract phases or levels and its concrete phases or levels. As Aquinas pointed out, we learn God’s wisdom by studying His creatures. (I understand ‘wisdom’ in this context as something like perfect knowledge, but that’s another issue.)

For now, I’m playing around with some ideas about created reality at the narrative level, the level where created being is shaped to fulfill some purposes—need I write “moral purposes”? —of the Creator. Within that narrative, men form political communities. Remembering that human nature evolved at the species level over billions of years and that a particular human nature (human being) develops of the course of his life, we have to ask how human relationships could be any different. Human relationships must also evolve at some ‘species’ level and develop in their individual instances, including those often complex and multi-layered relationships

which are ‘political’.

How is it that Plato or Aristotle or Hobbes or Rousseau or Marx could tell us how we should organize our political relationships when those are actions and aspects of human beings who are creatures of a developing world of empirical processes? I don’t wish to attack pre-modern thinkers nor even those who did their work when the modern enterprises of gathering empirical knowledge were well under way. I do wish to encourage a different attitude towards our efforts to understand political or other aspects of human nature. Likely it is that the evolutionary tree of political species is highly complex if less so than the evolutionary tree of life on earth. Likely it is that there are more such political species than there are recognized nations. Likely it is that new species will come into existence as we move forward. Likely it is that species of political systems are parts of complex environments and can’t even be understood apart from those environments. Likely it is that the work has hardly begun on understanding the branches and nodes on that tree of political species.

Let me be true to character. I’ll digress. . .

The human mind as we know it seems to have come into being in relatively recent times. In the creation of Judaism as a coherent monotheism, the creation of Hinduism as a coherent philosophical polytheism, and the creation of Greek philosophical/scientific thought – all in the sixth century BC or so, we see the first clear signs of human abstract reasoning. As the human mind developed, human civilization became more complex. Prior to the development of higher-level abstract reasoning, the technologies of earlier civilizations, such as the development of building techniques in Egypt, seem to have developed by trial and error and not by design. Apparently, the pyramids were built to proportions corresponding to ‘mystical’ numbers because earlier pyramids were built to greater heights relative to the lengths of the bases and those pyramids collapsed, killing workers and supervisors alike. As biological evolution is said to operate by blind experimentation of a sort, so early human technology operated by half-blind experimentation. Now, we can see more clearly, but I’ll note that truly new technology – such as quantum computing devices—still must be developed in part by clear-sighted analysis of half-blind experimentation. The world is not a tinker toy device and we must acquire empirical knowledge by experience of some sort.

We’re told by some great thinkers of earlier centuries that governments are monarchies or oligarchies or aristocracies or democracies. Those

thinkers lived early in the development of the human mind and also early in the exploration of possible forms of political organization. Why would we think that men barely in the childhood of human abstract thought, such as Aristotle, could provide us with a complete catalog of political possibilities? Why would we think such a catalog could exist since many human social and economic possibilities had not yet appeared. Why would we think that our belief in such an existing catalog would do aught but trap us in ruts? It seems to me that any effort to discuss the current political mess of the United States in those terms of monarchies and oligarchies and aristocracies and democracies is akin to discussing the nature of elephants in terms of tree-trunks and snakes and ropes.

But preliminary and simplistic ideas were necessary in physics and in political thought as well. Physicists moved on to shape their theories to understandings of created being which were themselves shaped by established theories or known holes in established theories or perhaps rawer forms of empirical knowledge. Political scientists and philosophers, those who deal with human nature in any of its aspects, need to pull off a more difficult project since human political organizations aren't mathematical objects but rather real-world entities which come into being by the actions of the same creatures who study them.

Most political thinkers of past centuries wrote as if they had some sort of mystical access to a realm of absolute truth. On the other hand, some political thinkers of recent centuries, have seen the dangers of systematizing done badly or too early and seem to have rejected—perhaps implicitly—the possibility that theory can be properly shaped to the empirical reality of even a narrative of morally ordered or disordered events. I say this acknowledging that a proper political theory or historical theory may not look to be such if one thinks in terms of the rules set down by political philosophers. A more proper theory might have a narrative structure abstracted from the particular narratives of human history. Is that a theory as we currently understand it? Was the story of Adam and Eve perhaps an early version of this sort of narrative theory? In my opinion, that story speaks of an awakening of moral self-awareness, but in a highly abstract way that is sometimes classified as mythical, perhaps because we can only classify early attempts to produce abstract narratives as standard myths. In other words, the story of Adam and Eve might well have been a very conscious literary construction similar to the narratives found in the writings of Plato and Hobbes and Rousseau and Nietzsche.

In my way of looking at things, traditional thinkers were struggling to develop more powerful conceptual tools but their thought wasn't rich enough to handle the real world for a simple reason I'll be mentioning often as I move on to various writings: God, our Creator and Lord, has a richer imagination than men, certainly a richer imagination than the apish men who were our ancestors. We have to learn God's thought by studying His Creation. Even when the implications of Einstein's general theory of relativity were played out by both mathematical development and empirical discoveries, the human mind had to stretch greatly to encapsulate those aspects of this universe. When quantum theory was being first developed, the most open-minded and creative of physicists could hardly believe what they were discovering. Could the greatest of ancient historians or poets have believed that mankind would one day number in the billions, that a man would step on the moon, that old age would be pushed back to the eighth or ninth decade of life?

Let me repeat a speculation I've developed over the past few years and stated in Chapter 590, *Theology, Physics, Philosophy, and Politics* as follows:

1. The components of thing-like being arise by local processes which allow the possibility of some substantial freedom.
2. In this world, certain patterns exist at a global level, including the fundamental structure of space-time. Local entities will respond to those global aspects of this world as they—so to speak—grow up into the world. The local entities will change themselves to somewhat encapsulate what they respond to. Over time, some entities will achieve some sort of success by a combination of proper responses and luck. Other entities will fail. Over time, complex environments will also develop.

It seems to me that all forms of thing-like being in its various and sundry aspects should follow this abstraction. We should be able to develop in political thought (social and moral thought in general) conceptual tools which follow this model as do some of the conceptual tools of physics. We should be able to develop a set of theories and discover a body of empirical knowledge (or reorganize existing knowledge) so to make use of this model of thing-like being in this universe. As quantum mechanics deals with the domain of things arising from processes with substantial freedom and general

relativity deals with the domain of larger-scale structures, so we need to be clearer about theories of human nature, including theories dealing with man's political activities (the realm of freedom) and his political organizations (the realm of constraints imposed by large-scale structures). The unity of this world comes from those larger-scale structures, the shape given to space and time by gravity, just as unity of the human race comes from the larger-scale structure of the Body of Christ shaped to conform to its Head, the Lord Jesus Christ.

Political science and political philosophy should follow physics not in specific calculations but in engaging in both exploration of empirical reality at the emerging thing-like level and at the structure level to which the things must form themselves by response. That formation by response will take place over generations in a way analogous to biological evolution. We should not assume that we have a catalog of either individual human actions or human political organizations (or more generally—any human community). We must act and we must study and contemplate our own actions if we are to understand human nature. We must have hope in the future and faith in God while still realizing that we can't achieve a perfect polity, or any other sort of perfect human community, because new forms of community do arise in history and these give rise to new possibilities which might well be proper parts of the Body of Christ which is the perfect human community.

## 414 Civilization for Dummies

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=628>. It was finished and uploaded on 2010/02/02.]

So far as I know, there is no such book as *Civilization for Dummies* though it's what a modern man might hope to find if, that is, he were aware of the nature or even existence of such a complex entity as a 'civilization'. In fact, modern man has decayed into that barbarian child foreseen by Jose Ortega Y Gasset, a barbarian child living in the midst of a great city from which his parents and other adults have disappeared. The city is simply his natural environment rather than a great work of past generations. Until recently, it has seemed as if there were plenty of material goods for having a good time and generally living well, but we can fear what the rapidly approaching future might hold for us. I wouldn't predict an apocalypse but I might predict a century of darkness, ignorance, and poverty such as that which followed the High Middle Ages, fooling Renaissance and Enlightenment thinkers into believing that the entire Middle Ages had been so dark.

I believe it likely that Western Civilization will eventually revive for it has been quite resilient, surviving not only internal economic and political crises but also barbarian invasions and near-conquest by the Turkish and Berber empires. Moreover, major changes in human views of their world were adopted and integrated into an enlarged and enriched Western intellectual structure. This resiliency and adaptability was largely provided by a balanced respect for the abstract and the concrete, for speculative and empirical knowledge, which was grounded upon the the Christian philosophy of moderate realism summarized by the American historian Carrol Quigley in these words: "The truth unfolds in time through a communal process." (See Chapter 405 , *Ways of Thought in the Modern West*.)

I'll cut through a lot of complicated historical analysis and simply make the claim that books have played an essential role in Western Civilization because they allow us to take empirical data which is beyond the reach of any one mind and to abstract it into knowledge which can then be used in speculative efforts to attain greater understanding. Books allow the construction of complex networks of understanding of Creation which can then be disciplined to God's revelations of His purposes as Creator. Books allow us to better explore and understand and properly use our world.

Nowadays, we of the West are increasingly illiterate. Even many of those in the shrinking pool of highly skilled readers don't always have the attitudes of the literate. All things considered, many of our most highly educated citizens would no more choose to read a difficult book than would our citizens with only rudimentary reading skills. To be truly literate, you must have a great deal of respect for books and for bookish forms of knowledge. You must desire to entertain yourself and teach yourself in bookish ways. You must be as willing to exercise your visual and mental literary skills as a swimmer is to work his lungs and skeletal muscles. It's not sufficient to have good reading skills to be deployed when necessary for immediate purposes. Those reading skills will have been lost just as a swimmer who doesn't work out daily will soon lose his speed and endurance.

Real books, not books written for self-proclaimed dummies, are an ideal form for human beings to engage in a conversation over the centuries. That sort of sustained conversation is a running commentary upon human events, a commentary which forms a narrative too complex for any individual human mind to actually understand, though it's understandable in principle to a human with a well-formed mind. Empirical knowledge from various sources can be bound together by speculation and the entire mess can be abstracted to a higher level which may well cut across cultures or even across phases of Creation.

It was the *City of God* by St. Augustine of Hippo and not *The Idiot's Guide to Christianity in the Roman Empire* which helped found Western Civilization. It was Shakespeare's *Henry V* which gave voice to the English nation as truly such. A Cliff Notes version might be a useful study aid but it's hard to imagine such stuff giving a strong sense of nationhood to a mob of Anglo-Normans and Saxons and Welshmen and Gaels and various and sundry other tribesmen.

The more complex a nation, and certainly a civilization enfolding multiple nations, the more complex the stories which bind the parts and the

whole together. Inhabitants of a complex, well-ordered civilization need a correspondingly complex literacy that a correspondingly complex and well-ordered story, or set of stories, may be told and heard. We have particular problems in our age because our newer and richer understanding of the stuff of this world and how it acts and relates to other stuff is not going to be so easy to integrate into our thoughts as it was to integrate Euclidean geometry and Aristotelian physics nor is our current understanding of the origins and nature of the Bible going to be so easy to integrate as it was to integrate simpler views about Moses being literally the author of the Pentateuch which was seen as speaking literalistic truth about a variety of issues. It will also not be so easy to integrate our modern understanding of man as it was to integrate a simple view that man was created as a creature somehow endowed with something called a ‘mind’.

I’m oversimplifying, but, my point is that so many human beings, including many proclaimed as great thinkers, are convinced that man was given access to absolute truths about Creation and intellectual history was to be no more than filling in some details. We are instead confronted with a world which must be understood by shaping our own ways of thought to match with that reality often upsetting to the genteel souls in our midst, a reality which can’t be described by books which fit on the shelves of any one library.

The narrative of Creation I’m working on—though no one man or even generation could finish it—would consider our inherited knowledge from Jerusalem and Athens, our immense mountains of empirical knowledge, and plausible speculations which tie it all together so that it makes sense as descriptions of stuff created by God and a story being told by God using that stuff. As I said above, this would be a very complex narrative, one certainly not reducible to any sort of *Civilization for Dummies*.

We had a vibrant civilization in the West when we had a substantial number of human beings in the West who had faith in the Biblical stories and some faith in the appropriate and tentative narratives told by their poets and philosophers and—more recently—their physicists and biologists and mathematicians. We have no such faith in the Bible, no narratives worthy of the vast accumulations of knowledge in our libraries and computers. Not surprisingly, we also have a decaying civilization. Despite the belief of some that science and other empirical fields of knowledge have somehow come to dominance over revealed knowledge and faith, I don’t even see evidence there are many scientists or historians who have a coherent view of

science beyond the horizons of their own highly specialized fields. Not only has the center not held, the pieces have themselves fragmented.

# 415 Why We Can't Build or Rebuild the Countries of Other Peoples

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=631>. It was finished and uploaded on 2010/02/06.]

I'm proposing this principle:

A Creation meeting the plausible criteria of unity, coherence, and completeness, would most likely behave in a manner consistent with the manner in which it was created.

In other words, if the evidence strongly tells us that the world and the entities within it develop at the level of individuals and evolve (a different sort of 'develop' in this context) at the level of classes of individuals (stars or *homo sapiens*) is likely the work of a Creator who can be plausibly regarded in this context as a story-teller and not an engineer with bureaucratic inclinations. Modern empirical knowledge indicates strongly we live in a world in which developmental processes dominate and few, if any entities, come to existence in their final state. The specific conversations and acts of God recorded in the Bible also show that He is a story-teller, even a coach for His characters.

I've addressed some of the underlying issues in my writings on this blog and in my first book *To See a World in a Grain of Sand* [41] as well as a book on the nature of knowledge, *Four Kinds of Knowledge*, which can be downloaded from my website, <http://loydfueston.com/downloads/know.pdf>. For now, I'll avoid further discussion and simply note that, in this world, types of entities, such as species of living creatures, evolve and

individual entities develop by way of internally developed responses to their environments. Even stars develop by processes more closely analogous to character development in a human novel than to the design of a bridge. In the Bible, the Israelites were shaped and molded by God over a period of centuries and the pilgrim Church on earth, however defined, is also being shaped and molded in similar ways.

The erector-set paradigm of engineering design is breaking down even when applied to technology, but that paradigm was never fully accepted by the best of engineers nor by talented tinkerers such as Ford who was aware in his eccentric way of the social effects of not only automobiles and roads but also of the factory system. Electronic circuitry, and certainly such facilities as particle accelerators, have been so complex that no one human being could have much more than a superficial understanding of the totality of the structure. We've come far. In ancient times, trial-and-error construction techniques resulted in unstable pyramids that killed workers and supervisors. A king or one of his officials could more or less organize an entire kingdom, as Joseph the Hebrew did for Pharaoh, but that was also a trial-and-error process that didn't produce results that allowed for both freedom and a well-ordered society.

A movement towards design techniques solved some of those problems, on relatively 'small' or 'simple' projects but then failed when applied to complex technology and certainly failed spectacularly when applied to any complex society, which any human society is, even a society of two. In fact, it really doesn't work very well to plan your own life out and to act as if those plans can be fulfilled exactly. Plans should always be ways of allowing reasonable responses to an ultimately unpredictable world.

Recently, we've heard of 'design' processes, such as those for the Boeing 787, so complex that no one could even know if the darned thing could even be assembled properly until the major sections were flown in from the factories in various parts of the world. Apparently, the engineers at Boeing headquarters demanded that they be allowed to assemble one plane by hand before moving on to regular production. It's perhaps more interesting to consider the social aspects of the construction of a bridge. The best bridge in the world can destroy nearby communities, perhaps because of a conscious concern on the part of designers with larger communities or perhaps because engineers haven't always been aware of the consequences of building ramps and entrances in established residential neighborhoods or in commercial neighborhoods frequented by those who would find repugnant

even occasional visits to regions dominated by masses of concrete and steel. In general, those sorts of depopulated areas tend to also be crime-ridden or at least frequented by drug-addicts, alcoholics, and others who give at least some sign of being dangerous. If bridge construction projects can be so destructive of human communities, then imagine what havoc can be wreaked when such limited engineering design techniques are applied directly to human communities.

We should act in ways consistent with the underlying processes of our world. This world is one of developmental processes where each entity has to respond properly to what its environment offers it, or throws at it. Moreover, as biochemical stews became cells of some sort which then absorbed self-replicating chemicals (DNA, etc.) to become cells as we know them and as cells combined into mold slimes and then into more advanced and specialized colonies such as jellyfishes and . . .

The responses which an entity makes, shaping itself in the process, must come from inside that entity, animal or family-line of animals or religious community or nation. This isn't a pessimistic claim that "The world is too complex to anticipate all possibilities," though there are such concerns allied to my main point which is simply:

The world operates in the way of a developing story and nearly all entities in this world also develop or evolve as if characters in a narrative rather than being raw stuff to be machined.

I'm making a positive claim we should operate according to reality as best described by our historians and physicists and many others.

We don't know where the world is heading. We don't even know what will happen to our families or countries, though we who are Christians are bound to believe that the end result will be the incorporation of those who belong to Christ into the Body of Christ without loss of particularity. In fact, that particularity will be enhanced so that we can be truly Christ-like. Before I can further explore this idea of the Body of Christ—not to be done in this article, I have to say what should be obvious from the Bible, especially the letters of St. Paul. Particular human beings are unique and don't even all fit in the same general categories. The same is true of nations and other natural groupings of human beings. We won't fill the same role in the Body of Christ and we don't fill the same role in this mortal realm. Not every human being is suited for life as a rocket engineer at NASA and

not every human community is suited to be a part of a high-tech society that sends rockets to the moon. Moreover, some human beings capable of living such a life, some communities capable of so forming themselves, have no desire to do so.

Why can't we just help the Haitians after their natural disaster without trying to rebuild Haiti so that it has an American-style or European-style infrastructure? Why don't we let them find their own way by responding to their own environment? Why don't we let them develop according to what they can find inside themselves and in their relationships to each other and to those who go to help them without the agenda of turning them into Americans or Spaniards? We like to burden others with American or European technology which leaves them confused at best and certainly unable to respond to their environments in their own ways. We like to burden other countries by educating some of the natives to be Western-style bureaucrats and academics of a sort who are no longer 'natives' and, because of that, aren't capable of developing native responses to the new possibilities they learned of at MIT or Oxford or Heidelberg. We in the West have also erred against the particular human being, trying to channel our children into paths of development suited for forming more bureaucrats. Nor have we respected local cultures.

I'll pass on to make one last point, though it's not something I can yet write about with any clarity. Development of an organism, or the evolution of a family-line of organisms, isn't really something that works bottom-up. The development of complex organisms is ongoing at multiple levels and perhaps at all levels of development currently available to that organism. One of the best examples involves only two levels—individual organisms develop over their lifetimes even as species evolve over longer periods of time. But individual development and special evolution overlap. As we develop as individuals reflecting one temporal stage of evolution of the human species, we remain part of the greater evolutionary flow, though there is reason to believe evolution might itself have evolved to a new level with the appearance of a rational and self-aware race.

Moreover, we have other forms of evolution or development which overlap with biological evolution and the development of an organism. Life on earth engages in complex and recursive relationships with the atmosphere of the earth. There is also interaction at the level of DNA and soma between different species—such as that between viruses and their hosts. Viruses can implant their genetic coding inside the genetic code of other species.

Viruses can also transport pieces of genetic coding from one species to another. Bacteria form a super-organism of sorts, being able to shed some genes and pick up others from a pool of bacterial genes flowing through the earth's biosphere and including genes for resistance to various antibiotics. An interested reader can download my dark comedy, *A Man for Every Purpose*, at <http://loydfueston.com/downloads/aman.pdf>, which plays off some of these confusions caused by our willful misunderstandings of our human selves and our situation in this world.

A human community is one very complex entity. We should fear those who try to guide this development because they will deform the organism, just as if a child were to be fitted at birth with a brace to straighten the natural and necessary curve in his spine or to force his skull into the shape found in a different ethnic group.

We should help those who are in need of food, shelter, medical care, and clothing but we should think long and hard before imposing Western style infrastructure upon the peoples of Africa or Haiti or other regions. Centuries ago, the Japanese and Chinese had already developed their social organisms to a level where they could adapt Western technology and even some social forms to their own needs and desires. The Chinese needed only to get back on their feet after a period of weakness which was the result of Western dominance established during the later stages of political decay of a particular imperial government. The Haitians aren't in that sort of a position. They're descendants of Africans torn out of their tribal environments and thrown into a brutal system of slavery where they didn't really have even the limited opportunities to learn the skills and forms of self-discipline which were necessary to slaves on a Virginia tobacco plantation. The Haitians have no part in the West other than as victims of brutal exploitation and then as welfare dependents of various Western states and charitable organizations. They don't need the Marines building roads and modern housing for them. They probably need help in increasing the output of their many small farms and crafts shops and they need that help in the form of simple technology they can sustain while moving into the future their own way, even if their way turns out to be a recreation of African tribal life in the middle of the western hemisphere.

Of all human beings, those who call themselves Christians should realize that not all parts of the Body of Christ are the same. The heart should not be trying to force the liver to pump blood. The power-plant engineer should not be trying to help the Amish blacksmith who'd suffered a fire

by installing a modern, factory-built natural-gas forge and erecting a steel-framed building around it.

I write not so much to criticize Haitian aid efforts as to make the general point that we modern human beings haven't yet come close to integrating modern understandings of our world into our ways of thinking. Now that we're learning, or should be learning, about the complexities of evolution and development in this world, we have some who expand a critique against centralized, or top-down, control into an argument that we're just so many social atoms and will never be anything different but at the loss of our personal selves and we have others who plow forward to stimulate economies or to rebuild foreign countries as if they were constructing a 1880 textile-mill according to a blueprint which can be drawn on a single, large sheet of paper.

## 416 How Grotesque the Good when It's Developing

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=660>. It was finished and uploaded on 2010/06/03.]

While thinking of the suffering endured by patients in the modern medical quest for miracles, I grew depressed and sought to cheer myself up by thoughts of hospices which allow human beings a bit of dignity as they approach death. And so it was that I turned to Flannery O'Connor's insightful and Thomistically funny introduction to *A Memoir of Mary Ann*, a book which told the story of a young girl with a face-deforming cancer who went to live in a hospice run by sisters from the Dominican sub-order founded by Rose Hawthorne Lathrop, Mother Alphonsa after she had donned the habit. She was the daughter of Nathaniel Hawthorne. Near the end of this short essay, Miss O'Connor tells us:

After an afternoon with [the sisters], I decided that they had had about everything [in their hospice work with cancer victims] and flinched before nothing, even though one of them asked me during the course of the visit why I wrote about such grotesque characters, why the grotesque (of all things) was my vocation. They had in the meantime inspected some of my writing. I was struggling to get off the hook she had me on when another of our guests supplied the one answer that would make it immediately plain to all of them. "It's your vocation too," he said to her.

This opened up for me also a new perspective on the grotesque. Most of us have learned to be dispassionate about evil, to look it in the face and find, as often as not, our own grinning reflections with which we do not argue, but good is another

matter. Few have stared at that long enough to accept the fact that its face too is grotesque, that in us the good is something under construction. The modes of evil usually receive worthy expression. The modes of good have to be satisfied with a cliché or a smoothing down that will soften their real look. When we look into the face of good, we are liable to see a face like Mary Ann's, full of promise.

Full of promise? How can a face distorted by disease be full of promise? How can the founder of the Church of Christ without Christ be funny, especially after blinding himself and then killing himself by prolonged, horrible penances? How about a self-named Misfit who went to prison for a crime he no longer remembers, certain though that the punishment was out of proportion to the crime, be full of promise? Was it his promise that was realized when he killed a family, mother and father, two children, and a grandmother, after finding them stuck on a dirt road? How about a smart 12 year-old girl who loses her nasty attitude only when she's immersed in prayer? Full of promise to be a nun but that's a pretty limited sort of promise in this modern world where God-centered people do good by finding careers with social service corporations (nonprofit, of course). As for the 14 year-old cousins of that 12 year-old nun-to-be, in a convent school but itching to be loose women. . .

Strange promises she created in her fictions though she herself lived amidst those we who have decided our best goal isn't the pursuit of what is truly good but rather the avoidance of pain and suffering. We wish to inhabit a world in which pain and suffering can be eliminated, a world in which the Creator brings us to prosperity and an easy death so long as we obey our understanding of His commandments. And, so, we Americans—but probably many modern peoples—do inhabit such a world, if only in our own minds. And we've been able to pretend this is the world since our spiritual ancestors, epitomized by Emerson and Thoreau, first discovered that God had botched His Creation and seems deaf to our advice on how to fix matters. If God won't listen to us, we'll create our own world. . .

For a remarkably long time, good luck in geography and natural resources and the self-destructive tendencies of our enemies allowed us Americans to pull off this rebellion against God and to even present ourselves, even to ourselves, as a Christian, God-centered people. This is a complicated subject and I've written about it in various contexts, including

that of the war of the European peoples of New England against the native peoples. See Chapter 408, *The Need for Abstractions in Moral Self-understanding* for a discussion of my understanding of the basic weakness in the moral characters and moral reasoning of the Puritan leaders of New England, weaknesses I believe to have been magnified into virtues, partly through the work of Emerson and Thoreau but also through the idealistic deformations of American politics by Abraham Lincoln, deformations upon a system already deeply corrupted by Aaron Burr's founding of Tammany Hall and Thomas Jefferson's willingness to ally himself with this early political machine when he thought he could use Burr and his followers to his own purposes. This combination of idealism and fundamental corruption has created a political system that's quite beyond any true reform.

We need to keep our political and social situation in mind, but I'm mostly concerned in this situation about the clear fact that people classify any grotesque creature, man or beast, and any grotesque situation as evil. Why do we not see the possibilities of good arising through the sorts of evolutionary and developmental processes which have produced the human race and also the Christian Church? Cowardice has much to do with it but there's something still deeper involved, a revulsion to human nature as we see it when we look at a human being eaten by a cancer that grew from his own bodily stuff or a human being entering a dementia that leaves him there in body but strips him of memory and then reason and then other human characteristics or behaviors. There can be little left of our grandfather or friend, little left but a shell that even seems a mockery of human nature as the eyes grow vacant and the skeletal muscles lose their tone.

I confess to being a coward myself, not so much about death but a lot when it comes to pain and suffering, I try to be honest with myself and with the fact that this too is a part of the world as God created it. But I struggle to toughen up my backbone. I look in the mirror and see not an actively evil man but one who has to paint himself into a corner to be somewhat certain he'll do what is right when the real trouble begins (maybe before many months pass). I feel strongly that we live in a world where there are undesirable moral implications to our dedication to avoiding pain and suffering. And we court various moral ambiguities, and even moral degradation, when we raise the avoidance of pain and suffering to such a high priority. When we also make it a priority to avoid death as long as medically possible, we begin to turn away from Creation and from our Maker. Yet, even more than death do we avoid pain and suffering though

we do our best to avoid any and all unpleasant aspects of human life in this world. We don't seek the good but merely seek to avoid that which fits in our pitifully inadequate understanding of evil.

Pain and suffering, and death, are often enough by-products of the historical or developmental or evolutionary processes which can produce not the good directly but the stuff from which God will make the good, mostly on the other side of death in the world of the resurrected, but this world can be quite good in its own way. In any case, when we try too hard to avoid the unpleasant aspects of the story God is telling, we risk placing ourselves outside of the story, we risk placing ourselves outside the sometimes horrifying processes by which we move forward towards the good. Then we babble on about carrying our crosses when we develop cancer or have to endure economic hardship, after devoting our lives to imposing our standards upon God's world rather than working within God's world, this story He's still telling. It's been 20 centuries since our spiritual fathers murdered the Son of God, 20 centuries since we were shown the purpose of Creation: to allow the Son of God to learn obedience as a creature and to sacrifice Himself to His Father in an act of pure, self-giving love. And still we insist that God is supposed to give us a pleasant comfortable life so long as we follow a set of rules acceptable to us. And still we insist that the purpose of this all is to save us human beings. You see, this all-powerful God created a world in which human beings were to have been god-like creatures who led peaceful and prosperous lives. . .

Somehow, events escaped the control of God and here we are, but we'll do our best to be those god-like creatures and to demand the peace and prosperity which is rightfully ours.

The underlying problem we have is with developmental and evolutionary processes that stretch beyond very short periods of time. When we look at days or years or even the lifespan of mortal man, the easiest way of understanding is to assume entities of a permanent nature which act in events that don't change the entities in a fundamental way. And we fail to make the transition to thinking in terms of the eons over which God shaped us and continues to shape His Creation. Even Einstein thought in this way during his famous attacks upon any understandings of quantum physics which allowed the reality of the strange processes when very small transitions in energy or small regions of space or time are involved. See Chapter 156, *A Christian's View of Einstein's and Bohr's Debate on the Meaning of Reality* for my short summary of a position stated in *Critique*

of *Scientific Reason* [75] by the German philosopher Kurt Hubner.

We can't accept the idea that human nature is the result of a freely moving narrative process, a process factual to the extent it is free. We would be free to behave according to our desires and to be already fully-formed persons. Not necessarily do we desire to be God or even gods, but we have our own opinions about matters and will pretend that we can have opinions in clear conflict with reality so long as we have the power and wealth and circumstances to ignore that reality. We would rather live in DisneyWorld than DarwinWorld or EinsteinWorld.

I can understand why we modern men wish to be "persons frozen into some sort of immutable being." If particular human natures are shaped by responses to environments—as I've claimed—then we modern Americans would be the sorts of creatures who've been shaped as mostly passive participants in a rather despicable sort of life, watching violent sports and mindless situation comedies or reality shows. We would be the sorts of creatures who are passive victims of amusement park personnel. But we would like to believe that we are truly men and women who value freedom and have strong moral characters that we exercise when called for. We like to believe that we are the types of creatures who value intelligence rather than the stupidity and bestial passions which dominate our favorite entertainment. But we go on watching and listening to that which teaches values and attitudes which disgust us when embodied in a teenager who actually kills with the abandon of our heroes and anti-heroes or a young woman who aborts her baby so she can enjoy the free life of those modern women in the movies.

And, yet, the Body of Christ continues to form even if many of its organs turn into predatory parasites and many of the individuals, cells in a manner of speaking, will not likely be part of that Body when it is fully formed in the world of the resurrected. But who can tell? Didn't Christ forgive the sins of passionate sinners with surprising ease? Who can be more morally grotesque than those deformed by greed or sexual lust? There are other vices which also damage us badly but greed and sexual lust are pretty bad in their effects on us. While Christ seemed to often forgive the sins of those who were passionate, He offered up little or no hope for the lukewarm, those with smooth skin and regular features. The lukewarm are never grotesque in appearance. Often quite attractive the lukewarm. In a bland sort of way.

God is shaping the entirety of created being, especially the stuff of human nature and He seems willing to pound us to a bloody pulp at times,

to bury us under streams of molten rock, to pour moral-carcinogens down our throats with the drugs and alcohol which our bodies can come to so crave, to trick us into eating dangerous foods—at least dangerous in high amounts—by the desires for high-calorie substances which kept our apish ancestors alive during hard times, to twist the facial features of a young girl into sheer ugliness—at least by the standards of the lukewarm with their smooth faces and their regular features.

It would seem that Darwin, despite losing his poorly founded and Biblically literalistic faith, at least faced up to God's acts as Creator better than the vast majority of those who claim to be Christians, better than the vast majority of Christian clergymen. Yet, in the end, Darwin's honesty about the workings of Creation led him away from his Christian faith just because he couldn't accept a Creator who would work His wonders by such grotesque and distorted paths, paths through realms of ugliness and pain and sorrow. Any God acceptable to Charles Darwin had to be distant and uninvolved with such a world. He had to be a God who retreated after Creating. If He existed at all. Or maybe the pagans were right and matter co-exists with God. Most modern Christians seem to keep their pain at a distance by denying God would have created such a world and so they adopt a sort of semi-paganism which allows them to think that evil, from Satan or multiple sources, has somehow invaded the work of an – otherwise—all-powerful Creator. Christians who can't deal with the grotesque aspects of God's Creation have to act and talk as if the world doesn't quite belong to God. And so it is that these bad things happen against the will of this all-powerful and all-knowing God, who is then reduced to vengeful acts such as aiming a hurricane at New Orleans or unleashing a volcano on the gentle inhabitants of Montserrat. And then there's AIDS which killed even the gentlemanly and morally well-ordered Arthur Ashe who got his HIV from a blood transfusion. I guess God sometimes has poor aim. Or else maybe these terrible aspects of Creation are a basic part of the story He's telling, a story in which good in formation looks as grotesque as evil in its maturity?

I would suggest that Christians should grow up and accept the fact that God, while interested in our ultimate good, is clearly not interested in guaranteeing an easy and comfortable life to even His most faithful followers. In fact, He seems to sometimes hit those faithful followers all the harder and to twist them and their paths through life with all the greater force. If you eliminate all that is grotesque in your life, and your children's lives, be aware that you might be trying to eliminate all that brings about the

ultimate good that our Maker intends for those of His children who accept His will.

What could be more grotesque than a tortured Christ, a source of the true light of goodness overwhelmed by a rather sadistic darkness which is part of His Father's Creation? What could be more grotesque than the Son of God humiliated and whipped? What could be more grotesque than Jesus Christ, His body bloody and battered and His features distorted by pain and wounds? What could be more grotesque than a God who taught us to conquer evil by watching His own true Son submitting to such horrors? What could be more grotesque than a saved world, a world after the resurrection of Christ, where children can be more often healed—for a while—of face-deforming cancers of the sort endured by Mary Ann, but increasingly our miraculous medical cures depend upon techniques and methods and extend-life-at-all-cost attitudes which are sometimes morally bothersome even when not directly immoral, at least bothersome to those of us who value the good over the elimination of what is considered evil or grotesque by men of the modern West, as dainty in their sensitivity to nearby pain as they are brutal in inflicting death and destruction upon children and others in far-away regions of the globe.

# 417 Americans Govern in Order to Engage in Politics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=670>. It was finished and uploaded on 2010/08/06.]

In one of his novels about the American Empire, Gore Vidal quotes the American-English novelist Henry James as claiming, circa 1900, that it was the United States which was corrupting political systems around the world. The Irish political scientist, William E.H. Lecky, wrote in the 1890s of the great divide in American morality, the citizens being so generally well-ordered in their private lives and the (caucus- or machine-controlled) politicians being so corrupt at least in their political activities. The French political scientist Bertrand de Jouvenel wrote in the middle of the 20th century of American politics being dominated by machines which select politicians of weak moral character because their job is to help the machine-bosses to deliver the goods to clients. Those bosses can't afford politicians in their systems who have enough moral character to vote the interests of their constituents or of the entire country, let alone traditional understandings of moral truths, because that might not serve the clients of the political machines.

So far as I can tell, the American political system is corrupted beyond repair and that raises serious questions in my way of looking at this world as being a physical world ordered to some purpose or purposes of God. As a Catholic Christian trying to make sense of the totality of Christian revelation and empirical knowledge, I see the world as having been created for the purpose of allowing the Son to make of Himself a willing and trusting sacrificial lamb for the purpose of learning obedience and showing His love for the Father. Given this particular world in which this drama of self-

sacrifice took place and especially given the incarnation of the Son as a man, the world is also ordered to the related purpose of allowing the birth and development of the Body of Christ. This world is a womb for the Body of Christ which will come to healthy and perfect adulthood in the world of the resurrected. In this world, developments seemingly analogous to diseases and cancers and parasitic invasions can occur. Is the American machine-controlled government a parasite which should have never have been allowed to attach itself to the body republic? Is it once a legitimate organ which has gone cancerous? Is there another analogy more appropriate?

But what of the individual human beings in whatever regions or organs within the Body of Christ as it develops on Earth?

Regions or organs?

Let me speak in general terms first before hinting of some great complications, and greatly interesting complications.

Individual human beings aren't simply absorbed into the Body of Christ as in a science fiction movie where they, or alien beings, become entirely enslaved to some sort of collective. Those who are saved will remain their own particular selves and yet will be one Body of Christ as Father, Son, and Holy Spirit remain individual divine Persons and yet are one God.

One real-world implication of my worldview is that it's likely, certainly more than possible, that there are a multitude of organs in this developing Body of Christ. I doubt the Church is the entirety of this Body though She is the organ which is the linked to God in specific ways and thus the most important of the organs. Yet, I believe there will be organs in the Body, even in the world of the resurrected, which will correspond to a variety of needs and talents, many of which the Church has nurtured in various ways over the centuries and yet are mostly independent of the Church. Complex human relationships will continue to exist in the Body of Christ. In this way, we will apparently differ from the relationships of the Persons of the Holy Trinity. Then again, three divine Persons might engage in a multitude of complex relationships within the divine nature.

Let's follow the organic metaphor implied by the Body of Christ and especially by the nature of the Body of Christ as a union of the Head, Jesus Christ, with those who belong to Him. Organs which work against the health or even the formation of the Body of Christ would be the equivalent of tape-worms or cancerous masses or infectious bacteria or viruses. Yet, as I've said before: there are various needs of human beings living in communities and governments of some sort seem to fit the bill. Just because

there will be no enemy countries in Heaven doesn't mean there won't be any need for human beings to engage in some purer and more abstract form of politics.

I'm sure the language of organisms will be part of my final results but I'm vaguely imagining organisms, including 'abstract' organisms formed of concrete organisms, which will have aspects needing more powerful descriptive language than that drawn from our knowledge of human beings and human societies at the purely concrete level. The traditional languages used in the modern West to describe human political and social and moral activities are themselves expansions upon the languages inherited from thinkers who had not, for example, seen anything analogous to modern industrial economies or the complex of modern research universities.

I'm planning to develop a language partially drawn from modern physics. To tighten this summary a little bit: I envision that the Body of Christ, and maybe many lesser groupings of individual organisms, exist partly—maybe even largely—in regions of Creation more abstract than the granite structures of Washington, DC. They would also have relationships which exist in regions of more abstract forms of being. Describing the Body of Christ in terms which are enriched by what we now know of Creation will require the application of abstraction best explored so far by mathematicians and physicists.

I'll return to my perhaps eccentric discussions of particular political and social and moral issues, though I've reformatted a fairly long and complex novel—my first (finished around 1998) but in storage since it was ignored (even SASE didn't guarantee a response to us lesser folk) or rejected by publishers in the mid-1990s. If you wish, you can download the novel *The Open Independence of the Seas* at <http://loydfueston.com/downloads/open.pdf> for free. This novel is, in part, an experiment in integrating some of the insights of modern science into our language and our thoughts. I also mention it because writing such works should be a sign that I'm not developing a politics solely for the afterlife but rather an understanding of human political needs and possibilities that might help us to solve some of our current problems.

I'll never tire of reminding people that the great thinkers of the past, Plato and Augustine and others, responded to new knowledge of the world rather than just shuffling about well-established ways of looking at, say, possible forms of human politics. As one example, there seem to be no political forms of organization in our tradition catalog of possibilities in

which power and responsibility are in proper balance for a technologically advanced human race with a population in the billions. Yet, our political reformers and political philosophers, even those who claim to possess moral imaginations or something of the sort, can do no more than return always to that catalog and try to solve serious problems by degreasing a cog or by painting a dial. Similar but more complex statements could be made about our forms of social organization and our ways of structuring our moral lives. The complexities are of a sort analogous to those of modern physics, leading to the need for speculation and disciplined theorizing but making it pretty much impossible that there is any way of replacing what might be called the 'Aristotelian catalog of political possibilities', as one example, with a similar set of political schemas. I'm not suggesting we build a new catalog but rather that we respond to reality but respond to it by serious, hard thought which will lead to good abstractions from particular empirical situations.

# 418 As Go the Immune and Neurological Systems

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=700>. It was finished and uploaded on 2010/09/21.]

Analogies can be taken too far and too literally, yet I wonder if we can apply to the human social organism, ultimately the Body of Christ, the example of a long-ago and primitive immune system ‘spinning off’ a neurological system. As I understand this particular line of speculation in evolutionary biology, and it was years ago that I read about it, that primitive immune system was largely a set of cells which tried to distinguish between ‘self’ and ‘non-self’, between what was supposed to be inside that particular organism and what was an invader. Somehow, that effort to distinguish between ‘self’ and ‘non-self’ led to a central nervous system, ultimately thought, as well as to defenses against diseases.

So this would be a line of questioning:

Government as we know it has grown out of systems to identify unfriendly or alien human beings (or sometimes to subjugate the other) or to protect against non-human dangers to the physical and moral aspects of our communities. As we mature towards the Body of Christ, is our government going to split into a policing (immunological) system which operates with some independence but under conditions where it has only as many resources as it needs for the task at hand and a planning and thinking (neurological) system which plays a role in the ongoing functions of the parts of the Body but also plays a central role in understanding the environment of that Body and planning for the future?

Once again, I'm throwing out a half-baked idea to point towards the possible fruitfulness of a true engagement with the organic aspects, and perhaps fundamentally organic nature, of human communities. By "half-baked idea", I mean not a dumb idea but a speculation in the early stage of development. Many speculations will be still-born to be sure, but you have to have lots of ideas to have much chance of even a few good ideas. (I'm pretty sure Einstein made a comment to this effect somewhere.)

For all the silliness of conjecturing a speculative but hidden relationship between government and thinking, there might be something to this idea if only because we, at least we Christians, need to pursue the organic analogy for human communities, ultimately for the Body of Christ—else that Body becomes a mere illusion separated from reality. We should take seriously our knowledge of cellular organisms, abstract from it, and apply the abstractions to our efforts to understand human communities, political and social.

For the benefit of those coming into an ongoing line of speculative thought:

Human beings won't lose their freedom when they become members of the Body of Christ. The best way to understand is by an analogy to the Christian belief in the Trinitarian God. As Father, Son, and Holy Spirit are free Persons while being one God, so many men can become free persons while being one Body of Christ. Rather than being enslaved, human beings who become members of the Body of Christ will share in the absolute freedom of God.

## 419 The Invisible Hand, Good and Evil

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=739>. It was finished and uploaded on 2010/11/19.]

I'm in the midst of revived efforts to explore modern knowledge of time, space, and matter to create an enriched and enlarged Christian understanding of Creation. My patterns of learning, contemplating, and writing are often interrupted by the horrifying spectacle of the United States decaying at a rapid rate and dragging with it a world which had allowed itself to grow dependent in many ways upon this immature giant of a country, this country peopled by adolescent people who somehow got hold of the keys to the liquor cabinet and the bulldozer from Daddy's company.

I've maintained and continue to maintain that we aren't just facing some technical currency problems. Even the more substantial loss of productive capital from the United States is only a proximate and local problem in a world which seems to be heading towards a chaos of sort. We Americans, indeed all those of the modern West, have fundamental problems which are showing as specific problems, such as ethical breakdowns in banking and politics. Addressing bank regulatory breakdowns won't help much if there are so many coming out of colleges and universities who have so little moral sense or perhaps so little in the way of moral courage—see Chapter 257, *Developing Virtues the Thomistic Way* found at <http://loydfueston.com/?p=736>, for a discussion of how to develop such a virtue.

As a civilization, we have somehow shed our moral sense, our sense of who we are, what our world is, and what a proper human life is. We have no reason to be here beyond getting a house with a living-room suited to a

high-definition, wall-mounted, 60-inch television set. It's really not so clear that Americans ever had a true understanding of the civilization in which they exist, the West. Albert Jay Nock recorded in the early 1900s a comment made by a European friend finishing up a tour of the United States: "The United States is the first country in history to go from barbarism to decadence without passing through a state of civilization in between." [Quoted from memory.] As barbarians, we lived off the cultural heritage of still reasonably healthy Europe. As decadent hordes, we live off the cultural heritage of Hollywood and the National Football League.

This situation forms a background of sorts as I go about my work and provides a rather strong motivation for my efforts to make sense of the world in Christian terms, thus providing a foundation for a revived or reborn Christian civilization.

With this short apologia for my recent and anticipated efforts, I'll move on to talk about the other side of Adam Smith's golden coin. First, I'll certainly admit that Smith was right, along with many others before and after him, that:

Markets and other complex assemblages of human beings can produce desirable results in the aggregate though the individual participants act as individuals, aiming for their personal good and not any aggregate good.

Nor do they aim for any aggregate evil which can, and does, arise along with or sometimes instead of the aggregate good. And so, I would expand the claim:

Markets and other complex assemblages of human beings can produce either desirable or undesirable results in the aggregate though the individual participants act as individuals, aiming for their personal good and not any aggregate good or evil.

Almost all the time, desirable and undesirable results will occur in the same human communities. I'll also add that evil is sometimes a deliberate result brought on by brutal or exploitive men, criminals though they might enter the history books as great industrialists or statesmen. There have always been wolves in the sheep-pens.

There are also issues with human understandings of good and evil, but I'll only note for now that the good under development can appear

grotesque, even in an evil way—see Chapter 416, *How Grotesque the Good when It's Developing*. This opens up a number of possibilities, including the possibility that the structures built by exploiters and despots might well be primitive versions of important structures which will appear in a completed, perfected form in the Body of Christ. Or they might simply be corruptions of structures or organs which can play good roles.

I'm an optimist in the long-term, believing that evolutionary selection processes work in human communities to favor socially desirable behaviors, but we mortal men live in the short-term and have to face the prospect that our human communities can be organized by free activities in a way that's exploitive or even downright evil but stable in the short-term. To be stable in even the short-term, an exploitive system has to generate enough prosperity to pay the soldiers and policemen and bureaucrats. In the long-term, the effects of God's grace, His mercy or love, can be seen in the generally upward movement of a race of great apes with some talent for violence.

Grace doesn't destroy or replace nature. Grace completes and perfects nature. Even in this mortal realm, God's grace is at work. It moves and changes individual men and also communities of men, not just the Christian Church, in the general direction of states of completeness and perfection. But God's grace usually moves human communities forward at a glacial pace, relentlessly but slowly even when the humans in those communities are frenetically running around in circles. And glaciers often crush and pulverize towns and farmlands and beautiful stretches of forestland. Those crushing and pulverizing movements of glaciers are sometimes advances towards God's goal of shaping us into the Body of Christ, but we see not the greater good when that glacier is crushing our friends and destroying our homes and means of living. Yet, Creation includes explosive volcanoes and fast-moving streams of lava as well as glaciers. When the Creator wants to make something fresh, He is good at destroying what lies in the way of His efforts.

When individual men and human communities are the agents of destruction and creation, we can speak of the invisible hand because of lack of better ways of speaking. As I wrote at the beginning of this article, I'm aiming to develop better understandings based upon modern empirical knowledge disciplined to the very small stock of truths God has revealed through the incarnate Son of God, Jesus Christ. Until then, we can use the obscurities of terms such as 'invisible hand' as early modern scientists

had to use meaningful but fuzzy terms, such as ‘impulse’ (a clumsy and inaccurate concept roughly corresponding to momentum), before developing better terms and enriched and enlarged understandings of the physical aspects of this world.

The invisible hand is neither all good nor all bad. It’s a part of the movement of God’s narrative towards and through the ongoing Apocalypse, the ongoing formation of the Body of Christ. Though I sometimes speak pessimistically of destructive forces working on the West and perhaps other realms of humanity, I try to always speak of the great possibilities for building something still better than Western Civilization, something that will still be imperfect and full of sinful men but might have some unanticipated traits or organs of the Body of Christ.

Some of the forms of organization resulting from the invisible hand will be misused in the short-term, as Hitler and his followers used the techniques of modern management to round-up and murder millions of human beings. We can’t afford to be too pessimistic about the troubles of the past century or so, which seem to be intensifying in some ways even as I write. We should start looking at the potential good of proper use of modern knowledge and start trying to figure out how we and our parents and grandparents went so far off-track. Yet, we should remember again that we sometimes assume too much. We were warned by Jesus of Nazareth about the straight and narrow path. It might well be that the path God wishes us to travel curves in certain ways. See Chapter 403, *Differential Geometry and Moral Narratives*, for a short discussion of this issue, a discussion I hope to enlarge greatly, God willing.

Those who live in an age with cities having more than 10 million citizens and the total world population in the vicinity of 7 billion should appreciate the need for rational use of resources and for better and more creative use of modern empirical knowledge. We should also appreciate the need for proper moral guidance in the application of those rational techniques, but God will continue to shape humanity into the Body of Christ whether we work in the short-term for good or evil or for morally unguided short-term goals of prosperity or safety. This doesn’t mean that all human beings or all human communities will be part of that Body when fully-formed. It seems unlikely that all men or all societies will enter the World of the Resurrected to live for time without end.

It does mean we should try to discern the shape God would have us take for our human natures, as particular individuals and as specific com-

munities, and to cooperate with His shaping processes even when it means we, as particular individuals and as specific communities, will suffer in this mortal realm. It does mean that we will be pushed forward onto a path suited for this shaping process but we individuals can enter brier patches or tar-pits, the probability of such disasters increasing if we fight against God. It does mean we can move off the path and go over a cliff while looking back at a time and region which we define as having been better. It does mean we can gripe and turn ourselves against the path we travel not seeming to understand we travel as part of a story being told by the Almighty, thinking that we can come to a Heaven of our own definition though we refuse to bow to God by properly responding to His own acts as Creator of this messy and sometimes nasty world.

## 420 What is a Conspiracy?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=743>. It was finished and uploaded on 2010/12/02.]

Relationships of a more abstract sort, such as those in politics and economics, are not so much different from concrete relationships as we might think. Not so much different as we've led ourselves to believe. Those concrete entities which are more complex, such as a man or a rhinoceros, are made of substances which have a variety of internal and external physical relationships with well-defined biological and mathematical aspects. For example, there are the various ways in which carbon, hydrogen, and nitrogen molecules combine to form a seemingly endless array of organic chemicals.

How does the magical jump occur when a complex biological organism, a man or a wolf, takes on the role of a moral and social being? Can we isolate this magic by proper use of our powerful mathematical tools? We sometimes optimistically assume such a role for mathematics in our efforts to understand concrete being and its relationships. Then at some point we confront some very complex entities or events and, as if facing a brick-wall, we retreat to either waving our hand in a spasmodic way and claiming that the magic occurs and man isn't 'just' a physical animal or we say that man is 'just' an animal and morality is only what hides from us our condition of enslavement to our own genes.

We do our best to skirt around the modern confirmation of the suspicions of a minority of pre-modern thinkers (including **almost** St. Thomas Aquinas)—man is a physical creature living in a physical universe but we should also take seriously our own feelings of limited but real freedom and our own moral feelings of guilt and longing. This is not to say that everything reduces to the physical but rather that the physical, concrete, and particular world we inhabit is the manifestation of an entire spectrum of

forms of being which range from the purely abstract manifestations of the truths God chose for Creation to the flesh and blood of human creatures. I've used something of a sound-bite phrase to convey the idea:

Matter is frozen soul.

The physical is more than a reductionist or dualist might imagine. Man isn't a soul attached to a flesh-and-blood animal. Rather is man a flesh-and-blood animal with attributes which imply strongly that flesh-and-blood, carbon and oxygen and hydrogen, can't be dismissed as no more than objects to the perceptions of immaterial entities.

Concrete, particular things and living beings are shaped from more abstract forms of being. We need to ask: what are the possibilities of describing this world, in both mathematical and narrative ways, once we expand our understanding of created being? (I include the biological as a special sort of narrative.) I can say that a great range of possibilities have opened up in front of us because of the vast expansion in recent centuries in empirical data and in the knowledge sometimes generated when good abstractions are drawn from that data. I've said that created being is created being is created being. Specifically:

- Abstractions accessible to the human being are also part of created being.
- Concrete manifestations of being are shaped from more abstract forms of created being.

We have no need for souls, not because physical reductionists are right but rather because our flesh and blood has already soul-like characteristics as does the flesh and blood of rattlesnakes and baboons. We human beings are unique because of our complex brains. We can respond to our environments or even the entire Universe or even the entirety of Creation in such a way that we shape our minds to what God has created, encapsulating various realms of created being in the very shape of our minds where I consider the 'shape of a mind' to include not only the underlying shape of the human brain but also the relationships of the entire human being to what lies outside of him. For those who like to have a hint of the end of the argument—the strongest and most important of those relationships is the

one we Christians call charity, love of a self-giving sort. Plato wrote of this relationship as did St. Paul and St. John and others in the *New Testament*.

So it is that I say we draw abstractions from empirical data—those abstractions are part of the being shaped into the empirical entities connected to that data and we can explore empirical reality to discover the abstract forms of being from which concrete things are shaped and which are yet present in concrete things.

For the remainder of this article, I'll write as if our only way of accessing abstract being is mathematics. It's a major way for sure especially when we consider general forms of mathematical reasoning, call it 'qualitative mathematics'. In any case, there are even some mathematical aspects to narrative. The easiest example is the great variety of metaphors drawn from traditional Euclidean geometry for describing our paths through life. Those paths are getting more complicated as human life grows more complex and as we learn more about Creation. We now seem to be traveling through regions of abstract relationships which mostly confuse us. Our moral and social analyses can benefit from modern geometries, even the differential geometry used by Einstein to describe curved spacetime.

For now, I'll assume that the mathematical aspects of concrete being are shaped from abstractions mostly but not entirely different from those used to shape the narrative aspects of created being. This is partly a matter of levels. Go to a very, very, very abstract form of being and it might be what all forms of reason, narrative and mathematical, are shaped from. Go far enough down the evolutionary tree or bush or whatever and you find a some multi-cellular creature that lived hundreds of millions of years ago and is the common ancestor of tarantulas and men. This is a weak and ultimately misleading analogy, but it can help us to purge ourselves of some dangerous delusions about the nature of being and mind.

I'm thinking that we can gain some perspective of the evolutionary and developmental pathways of human communities by trying to deal with those complex and sometimes terrifying events which give some sign of having been shaped by groups of conspirators. We can learn much from analyses of conspiracies or, more generally, events which have the air of a conspiracy, such as the murder of a powerful leader or a build-up to a war that later proves to have been not only unwinnable but also unjustifiable except for the benefit of a few who might well be conspirators.

Physical scientists, mathematicians and physicists as well as biologists, have learned a lot about empirical reality by studying pathological cases,

though it may be easier in those fields to identify a true pathology. Some conspiracies, pathologies of a moral or social or political or economic sort, are undoubtedly real and not just the nightmares of feverish and fearful minds. Has there ever been a lack of sophisticated criminal activities in history when vast amounts of wealth and power were at stake? This doesn't mean that all the theories about the murder of John Kennedy are true, but it does mean that we should consider the powerful interests endangered by some of the policy changes President Kennedy was said to be considering – ending the Cold War with Russia and disarming Europe (possibly with the aid of Pope John XXIII), dropping sanctions against Cuba and stopping plots to overthrow Castro, ending the oil-depletion allowance, withdrawing from Vietnam. We should realize there were investment bankers who lost fortunes in Cuba and maybe were threatened with further losses in the Texas oil-fields. There were also large losses coming with the possible cancellation of the contracts to build harbors in Vietnam (companies later folded into the ubiquitous Halliburton). There were careers and fame to be lost to intelligence operatives and generals and admirals who were, in any case, dogs well-trained to fight the Cold War whether it made sense or not. And, of course, there were various fanatics who wanted to wage war upon all of not-American humanity. Would they have hesitated to kill one man who endangered them?

I'm proposing we approach the study of the evolution and development of human communities by studying the socio-pathological acts of many a politician and general and investment banker. I'm proposing we start thinking of these creatures and their conspiratorial groups as being parasites and cancers and various sorts of infections in the bodies public, the entities which currently exist in the general movement towards the Body of Christ—a movement we Christians have to believe to be real however much we may realize that Body won't form in this mortal realm. Far too many think that these conspiracies, if they exist, must be mystical and supernatural, run by mighty wizards or demons or Jesuits or Freemasons. And so it is that many who think in more mundane terms consider it a sign of mental instability to ask if the CIA, the Secret Service, various investment bankers, and their politician allies might have killed John Kennedy. Or to speculate they might have destroyed Richard Nixon after he ordered Richard Helms, director of the CIA, to bring the files on the Kennedy murder and the Bay of Pigs invasion of Cuba. Helms refused to follow the direct orders of the President in this incident which appeared in the White House tapes

just before the CIA-trained criminals, such as E. Howard Hunt, began to appear on the White House payroll. And why was it that Ronald Reagan spoke out so strongly during his 1980 campaign for the Presidency against the Trilateral Commission and other banker-funded initiatives to influence public policy and then, after one meeting with David Rockefeller, loaded up his cabinet with members of the Trilateral Commission and the Council on Foreign Relations?

The fact is that we know some criminal conspiracies have worked – such as the bankers’ conspiracies run by Cecil Rhodes or J.P. Morgan. Sometimes, they’ve destroyed their own members or the country of their members. We can think of the conspiracies to gain control of most of southwest and central Asia which were first suggested by one of the most brilliant and unstable descendants of John Adams—Brooks Adams who was active in the latter decades of the 1800s and a little while into the 1900s. There is no guarantee that conspirators will be successful or even rational in their efforts.

So let’s put this issue in terms I’ve used in discussing being:

Are conspiracies a matter of being at abstract levels (such as those described by mathematics and theoretical physics and metaphysics) or rather a matter of being at the concrete level of particular entities and the narratives formed as those entities evolve and develop?

Are conspiracies a result of a brokenness at a deep level of Creation, an abstract level from which concrete being is shaped? Are conspiracies the result of a radical defect in Creation caused, perhaps, by a fall from grace of the ancestors of human beings? Or perhaps a radical defect caused by God withdrawing from His own work?

Are conspiracies rather a matter of concrete structures and entities sometimes forming wrongly, a matter of those wrongfully formed structures and entities doing damage to other entities in the context of a particular world of evolution and development? Even better formed structures and entities could sometimes engage in such destructive behavior. Conscious entities could even act in such destructive ways believing themselves to be serving a greater good. In the context of such a radically social animal as man, socio-pathological acts would be Darwinistically bad, to speak simply. In this way of thinking, conspirators could even destroy a host

organism of great promise, as the bankers and politicians might be doing to the United States.

I've already given my answer above. I'm going with the second option, choosing to regard conspiracies, in the context of the Body of Christ under formation, as being invasive acts by parasitical organisms or by cancerous bodies which grew from inside the (relatively) healthy communities developing, oh so slowly, into the Body of Christ.

If we take the path of thought I'm suggesting, we would consider conspiracies, by implication—sin in general, as being wrongful shapings or movements of a sort similar to the misshapings which result in biological entities such as parasites and infectious organisms and cancers. I've chosen conspiracies as a focus of my discussion partly because of their importance in the modern world since at least the formation of Tammany Hall by Aaron Burr and partly because they are a fairly well-defined phenomenon, so long as we take the rational view that they're simply the result of powerful men acting in small and organized groups for their own presumed good and against the common good. (I've noted that a conspiracy can aim at the common good, but I'll ignore that possibility to avoid unfruitful complications in this discussion.) So a small group of men developing a silver-mine in an uninhabited region wouldn't be a conspiracy but it was a conspiracy when businessmen and public officials acted to 'help' the Apache tribes by providing welfare programs of a sort which allowed them to steal the silver-mines discovered after the Apaches had been forced onto land originally considered to be bare of resources.

The Bible is sometimes ridiculed because it contains a number of stories in which disease is presented as a result of sin or of a spiritual invasion of the human being. Maybe we should have stepped back and considered the not so implausible suggestion that sin, and spiritual disease in general, is the same phenomenon as biological disease. I would deny they are the same phenomenon at the concrete level but would suggest they are similar wrongful developments shaped from the same abstract being.

One of my guiding rules is:

Grace doesn't destroy or replace nature. Grace completes and perfects nature.

This is certainly consistent with my proposal that evolutionary processes bring into existence new forms of social and political community

as well as the related proposal that development processes shape specific communities. The presence of evolutionary and developmental processes in human history implies we should learn from general thinking processes which have produced spectacular results in biology. And it implies we'll see many defective or inadequate or unlucky social groupings, some of them being promising social organisms which weren't able to defend themselves against parasites and cancers and infectious agents, such as conspiratorial groupings.

At the same time, I remain committed to the idea that we can better understand many of these issues by proper use of the mathematics developed to explore and describe matter and time and space. In fact, I'll now backtrack a little on my above discussion of human communities as being formed by forces analogical to those of biology. Internally, groupings of human beings will be like organisms but those organisms, and the greater communities or even long-lasting civilizations we form, will be like the stuff of this universe. The classic statement of general relativity due to John Wheeler is:

Matter tells space how to shape itself and space tells matter how to move.

I think there to be an analogous but much more complex statement to be made of the 'matter' of human moral and social and economic and political groupings. Matter of both sorts evolve (family lines of galaxies or groupings of animals) and develop during the lifetime of an individual (the Milky Way or Japan) but those evolutionary and developmental processes take place as that matter moves within complexly shaped spaces. (I also think that even the understanding of our moral development as individuals would benefit from concepts borrowed from the modern theories of spacetime and matter.)

## 420.1 Criminal and Not Satanic

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=843>. It was finished and uploaded on 2011/05/02.]

This section is just a short addendum to the essay which forms the main part of the chapter.

At the time I wrote that earlier essay, I was looking unsuccessfully on the Internet for some overview articles I'd read, articles written by Murray Rothbard, a good, thorough, and reliable scholar so far as I can tell. This is the specific article which had impressed me most: *Wall Street, Banks, and American Foreign Policy* found at <http://www.lewrockwell.com/rothbard/rothbard66.html>. Professor Rothbard also wrote a short update: *The Conspiracy Theory of History Revisited* found at <http://www.lewrockwell.com/rothbard/rothbard170.html>.

This is my summary of the lesson to be learned by a clear-eyed view of matters:

The powerful and the wealthy form a 'class' of sorts which simply excludes the rest of us from their struggles for power, one criminal family or gang in this class fighting against another criminal operation, gathering into a united force only to protect their general realm from any possibility of reform or of 'invasion' by the common folk.

For a very compatible treatment of this issue by another reliable historian, you can read Gore Vidal's series of novels going from *Burr* to *The Golden Age*. These novels deal with various issues but give a good overview of the growth of the American elite of bankers and politicians—true industrialists, producers of wealth, such as Andrew Carnegie and Henry Ford were despised for their biases against imperialism and foreign adventures in general. In particular, Vidal's novel *Empire* gives an interesting account of the partially successful effort to convert McKinley from a hard-headed locally-biased politician into a proto-emperor and the coming to power of the uninhibited Emperor Teddy. The House of Morgan and the House of Rockefeller were on the rise along with the more ephemerally occupied House of White. Even the feisty Teddy took banker money while still talking the talk of a reformer. In any case, he was as much of an imperialist as Morgan and Rockefeller though with slightly different goals.

I repeat that the great conspiracy of the modern world isn't really a conspiracy. It's not secret if you read serious histories of the library-bound or journalistic sort. It's not unified in the way of an super- or sub-human conspiracy run by Satan or the Jesuits or the Freemasons or the Communist Party or Hitler-cloning Nazis in South America or selfish genes. This conspiracy is really just an indirect way of separating the citizens of the

modern world into haves and have-nots. We don't have an official aristocracy, at least not in the United States. As a consequence, there has been no conservative and publicly recognized class to man the bulwarks against the barbarians named Morgan or Rockefeller or Walker or Soros. The barbarians often bring fresh blood, but they should be taught some sense of public honor until the time arrives when we know how to form polities without some sort of aristocracy forming, by one process or another.

The great non-conspiracy of the modern world has been the conversion of the prosperous countries of the West into ganglands where the House of Morgan once waged war against the House of Rockefeller and now . . .

Now, the situation is more complex and probably more unstable. The West as we know it is falling. Maybe China and India will replace the countries of the West as the dominant powers. Maybe the West will recover in some way. In any case, the up-and-coming leaders of the human race, whoever they will prove to be, should take note of the way in which a self-seeking and self-defined aristocracy formed in the United States as a cancer or a parasite rather than forming as an organ of that public body.

Cancers. Parasites. Criminal gangs. Take your pick, but don't romanticize the disgusting mass as a superhuman conspiracy. And don't dismiss it because of the nervous laughter of establishment thinkers.

# 421 The Dynamic and Communal Nature of Marketplace Information

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=746>. It was finished and uploaded on 2010/12/09.]

See *this article by David Henderson* found at <http://original.antiwar.com/henderson/2010/11/28/adm-mullens-spinning-vs-prof-hayeks-insight/> for a short and clear discussion of Hayek's understanding of knowledge in light of the real-world problem of American incompetence, most especially when our governments move in to solve our problems or those of Afghan tribesmen.

Professor Henderson puts the situation simply by saying: "Who has the relevant information about your current circumstances? You do."

The article started me thinking about how I'd speak of these truths in terms of my worldview, a Thomistic existentialism updated to consider modern empirical knowledge. This article is a small step towards the goal of using the powerful conceptual tools of modern mathematics and physics to speak of the complexities of community life in the modern world. For example, differential geometry would allow us to speak of more complex paths than are possible in the 'Euclidean assumptions' of traditional thought. I've written on this general topic before in various chapters, including Chapter 252, *Mathematical Physics and Moral Philosophy* and Chapter 411, *Defining Landscapes and Possible Paths, Not Determining Paths*.

True freedom of Creation and creature, even if limited, implies strongly that all of the information 'needed' to control a situation doesn't even exist when a would-be controller would need it, but the information is

coming into existence as the situation develops—as always, I deny any true split between the abstract, such as the models of how markets operate, and the concrete, actions of buyers and sellers. The actions and the knowledge are one since concrete being is shaped from abstract being and is realized as a narrative plays out. The abstract remains in the concrete. So the knowledge of the price I can get by bringing my tomatoes into the farmers' market this afternoon comes to exist as I offer to sell them and others offer to buy them, perhaps at a lower price than I expect. Or perhaps I profit from a bidding war caused by a shortage of fresh tomatoes that day. And maybe I learn to my sorrow that a big-box grocery store has opened down the road and is selling cheap tomatoes from California or Chile or some other foreign land.

My knowledge comes into existence as I respond to my environments, to the Universe as I understand it, to all of God's Creation as I understand it. My environment is always being changed by my actions and the actions of others, perhaps the actions of corporate executives in Cincinnati and their bankers in New York City. I can write in similar ways about my knowledge of the world or of all Creation, but those are far more complex forms of knowledge and are affected by a variety of bodies of knowledge of longfar away acts and of distant structures and relationships. Of particular relevance would be the complications of modern societies where some have the power to effect the lives of human beings they've never seen and one man, Henry Ford with his mass-produced automobiles, or a small group of men, the leaders of Europe in 1914 with their mass-produced death, can reshape human lives for centuries.

Locally, there is a community at the farmers' market even if it's ephemeral, at least as a community of buyers and sellers. And we must remember what the American historian, Carroll Quigley told us:

The truth emerges in time through a communal response.

Notice the qualifications which deny truth can be held by an individual at a point of spacetime—"emerges in time" and "through a communal response."

The truth, that is—the perfect knowledge, of the current situation for tomato-sellers in the farmers' market exists in the community of buyers and sellers, in a manner of speaking. But markets are dynamic, partly because of external factors but also because of the interactions between human beings

in those markets. This sort of knowledge is only ‘truth’ by analogy because it probably never quite comes into firm existence. If it does, it will be for just a short while before changing conditions bring about a new equilibrium which itself will prove to be ephemeral. This isn’t to say that markets, or any other human environments, are so unstable as to be chaotic. It is to say that they are dynamic in a way analogous to a living creature although they might rapidly pass through more stages in a few days than a human being will pass through in 80 years. And it is to say that we need to enlarge our understanding of truth to include knowledge of narratives.

The implication is that we can’t know a dynamic creature because it will be significantly different in months or years and maybe even in hours. That’s not quite true. As I’ve noted before, Plato and the Bible agree that ‘to know’ a living creature is to be intimate with that creature. When a man knows his wife, he is intimate with her in a sexual way, but not only in that way. We can hope. If he is intimate with his wife in other ways, then he participates in meaningful ways in her journey through life, in her story which is part of the story God is telling. A man then knows not only his wife’s body but also her story. He lives her story with her and she lives his with him and they live a story as a couple.

We know reality by being actively engaged in reality, though my idea of such an active engagement is different in some ways from that of many human beings, certainly of many of my fellow Americans. Intellectual engagement, spiritual engagement by way of prayer and worship, is not only active but also more active, more true, than physical activity on the part of sleepwalking members of modern herds. Contemplating the meaning of Jacques Barzun’s history of the past 500 years in the West, *From Dawn to Decadence* [9], is active while turning on the television generally is part of a stretch of time experienced in a passive way.

Why are we losing our freedoms? Is it because we’re under attack by fanatics who hate our freedoms? Or is it because we Americans have destroyed our various sorts of human communities, forgetting that even individual freedom is exercised in local communities?

I would suggest that we have forgotten that families and church communities are composed of individuals, some of them morally mature, who come together to do things and grow things and make things. We have forgotten because we accepted the invitation of our political and economic masters to become self-centered individuals and to enjoy the supposed pleasures of life as lemmings in mass marketplaces. We have become consumers rather than

producers. We no longer even produce our own local and communal understanding of reality, choosing instead to consume one or another canned version that suits the purpose of one of our masters.

We chose not to become individuals who are citizens of flesh-and-blood communities organized to some moral purpose, raising children or worshipping God or making our livings in a way that allows us to mature and to participate in all these communities. If we accepted these roles as members of multiple local communities, if we matured to fulfill these roles, we would be able to perceive our local environments so that we could respond, as individuals but mostly as members of these local communities.

The truth emerges in time through a communal response.

We have to remember that the communal response is itself the result of acts of individual members of the same or interacting communities. In order for proper responses to be made, rather than invitations to a conflict, even a local farmers' market has to have a substantial measure of moral structure built from the moral characters and particular habits and beliefs of those who participate in that market. See Chapter 218, *Networks of Public Spaces Rather Than One Square*, for a short discussion of the research of a mainstream liberal professor at Harvard which supports this idea that communities with a particular moral structure are necessary for social peace and proper interaction. (The professor, Robert Putnam, was very upset by his discovery that you can't just throw together a variety of human beings with different beliefs and moral habits and have them spontaneously form a thriving and peaceful community. Most liberals, right-wing as well as left-wing, seem to be ignoring this work which is very disturbing to modern political and social beliefs.)

In this context, the lesson to be learned is that the sort of marketplace knowledge discussed by Professor Hayek and his follower, Professor Henderson, is not basic knowledge about reality. It is information gathered from our environments by active exploration and response of a sort conditioned by basic beliefs and habits and then organized by way of basic beliefs and habits.

# 422 A Proper Coordinate System for Visualizing Human Knowledge

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=775>. It was finished and uploaded on 2011/02/21.]

As I read books on mathematics and science, I'm always thinking of issues in theology and metaphysics and politics and history. My inclination, whatever works I produce as byproducts, is to absorb knowledge as if it were background knowledge for a novelist. This doesn't mean 'research' that will produce reliable historical novels but rather the reshaping of my mind that I might tell a particular story which describes some true aspect or aspects of this world.

As I review discussions of coordinate systems in the science and mathematics books on my current reading list, I'm thinking about ways to speak of human knowledge in a unified sense as being made of knowledge-units, so to badly speak for now, which can be seen as states of being situated at specific points defined by a very complex system of coordinates which are defined by the various aspects of the issue under discussion. I'll give a specific example later. (See the freely downloadable book, *Four Kinds of Knowledge* [43] for my general views on the nature of knowledge.)

This much seems to be clear: modern forms of rationalism assume the world, Creation if admitted as such, consists of different realms describable by different forms of knowledge. Let's simplistically but usefully think of these forms of rationalism as being both Spinozean and Cartesian. From Spinoza, we learned to think of the world in terms of realms of being, each with its own realm of knowledge. From Descartes, we learned to think of

those realms of knowledge as being orthogonal to each other—in a manner of speaking. Moral philosophy and physics deal with the same reality but x-morality and y-physics meet at point (x,y) without really affecting each other. Changes to our understanding of man's moral nature don't affect our view of our physical world and vice versa.

Despite the potential, or even likely, complexity of this Spinozean-Cartesian way of thought, simplicity was the order of the day. Then again, as much simplicity as possible, but no more, is the rule for most thinkers exploring new ideas, else, they would soon be lost in many-dimensional mazes. Simplicity demanded that, at all points of contact between reality and a way of thinking about realms of knowledge, we should try to see simple geometrical objects – points or lines or planes. To make the system manageable, and to advance to a better system, thinkers had to—mostly—implicitly assume that those orthogonal knowledge-objects have flat surfaces and follow the rules laid down by Euclid. The entities and path-events we see in our world seem fantastically shaped to us, quite mysterious they be, partly because we expect to see the structures and movements suitable to an erector-set world. To be fair to Spinoza, a powerful and brutally honest thinker, and Descartes, a similar thinker with the added skills of a great mathematical thinker, they couldn't have gone directly to ways of thinking about knowledge that are as sophisticated as what are now possible because of the explosion of geometric knowledge in the 19th century which resulted in, amongst other advances, Einstein's view of spacetime.

The structures and movements, and the relationships between structures, are what they are and our efforts to understand their world—which is also our world—produce some sort of approximation to reality. Gradually, we can move towards a better approximation so that I can even say our minds can be shaped to encapsulate this world. Once it was necessary to see the physical stuff of the world in terms of Euclidean geometry. This fed into the philosophical systems of the Classical Greeks and related thinkers. Then we had the much richer world of the Newtonian-Libnizean calculus in (sometimes unfriendly) alliance with Cartesian analytic geometry. This fed into Kant and the British empiricists. The thoughts of all these schools of philosophy and science were greatly shaped by Spinoza's fragmenting of the world into realms of being, realms of knowledge, but modern science developed in a certain way partly because of Cartesian schematics and Spinozean fragmentation. Could the advance have happened so rapidly otherwise? I don't know.

In any case, the thinkers of the Age of Discovery were not only astronomers and mathematicians but also geographical explorers and even proto-anthropologists and proto-zoologists who enriched human thought by bringing samples or at least word and drawings of the exotic creatures and human cultures outside of Europe, but that didn't seem to have led to any questioning of the fundamental nature of the stuff of this world. But why should all specialized levels and fields of human knowledge advance together?

To complete this whirlwind summary of human intellectual history, we have more recently had such oddities of thought as positivism which seemed to have taken Descartes' skeptical methods and made those means into ends as well. These latter developments seem to have been also distortions and misuses of the tremendous advances in mathematical rigor in the 19th century or so. One line of advance was the explorations by Riemann, Klein, and others of more abstract systems of geometries in research papers, which papers were used by Einstein and his friend Grossman to develop systematic techniques of differential geometry and tensor calculus for use in Einstein's description of a world with a curved geometry of spacetime.

Our world is what it is and it's a bit twisted and curved to our perceptions and cognitions. We can think of it in analogy to Einsteinian spacetime where the three dimensions of space and the one dimension of time can be best described in terms of coordinate axes which are generally skewed, not at right angles. This provides mathematical ways of describing, say, the bending of both time and space at the horizon of a black hole, ways which can be labeled as 'natural'. Coordinates are handled, that is, in ways that are natural for the aspects of physical reality which are being explored, such as the problem of measuring a 12 inch ruler on a spaceship passing you at 10,000 miles per hour and another passing at 10,000 miles per second. The second spaceship is traveling, relative to you, at a small but significant percentage of the speed of light—189,000 miles per second—and the ruler will be relatively shorter by your measurement than the ruler on the slower spaceship.

At the same time, we should note that these measurements of reality, in fact—reality itself, are governed by certain invariants. The most important for this example is the speed of light which is the maximum speed of communication between entities in this universe — after all, light or electromagnetic energy in general is the medium which carries communications in this universe.

Let me take a very simple commandment as an invariant for human communities:

You should honor your mother and your father.

The problem is: how are we to care for our parents, including all those of the earlier generation in our community? For communities reasonably stable over a small number of generations and also in the concrete relationships between individuals, there is usually a traditional solution to the problem and it can be accepted, even accepted as an ‘absolute’ solution by those rigidly bound to one set of attitudes and thoughts. For example, the Puritans of Colonial Massachusetts took care of most of their elderly and others needing help within families or local congregations. At the same time, the Colonial government, and the Massachusetts government for several decades after the War of Independence, mandated that all local **political** communities provide shelter and clothing and food for all human beings in those local communities without means and without someone to care for them.

More directly in line with the problem of caring for the elderly: those who had built up farms or trade businesses, or had maintained or expanded inherited productive property, would turn those over to one or more children in return for care over their remaining years. There was no highly liquid economy to provide even an illusion of independence for the elderly from their children. The productivity of those children and their willingness to honor their commitments to their parents founded or ill-founded the security for those parents in their elder years. The parents prospered or suffered, all else being equal as economists say, from the competence or incompetence, luck or ill-luck, of their children.

Right away, we can see a more complete description of this problem would involve a complex set of coordinates dealing with the economic structure of a particular community and the larger communities of which it’s a part and also a complex set of coordinates describing the relationships between generations. The aspects of economic structure to be considered would include the ownership of productive operations (corporation or family), the level of liquidity (cash-transactions or barter), the ways of setting up offspring in life (“communities setting up other communities in the ‘Amish’ way” or “send the kid off to the mills at 12 or to college at 18 in the liberal/individualist way”), and so forth. This isn’t an inclusive list and the possibilities in the parentheses are merely examples. Already we can

see a complication and complexification—the list of aspects of economic structure includes “the ways of setting up offspring in life” which is also an important aspect of the coordinate system describing relationships between generations.

What can I conclude at this point? First of all, I’ve failed at a very basic level—that of setting up a way of dealing with the complex moral surfaces we form in our community lives. This is a well-known failure—some moral-social conservatives were in opposition to Social Security from the beginning because of this particular issue of the interaction between economic structure and the relationship between generations, but those conservatives had no way of speaking that was compelling. In my terms, they feared that an effort to deal with the care of the elderly using a tax-based, cash-based pension system would itself tear American families and communities apart by altering the relationships between generations, but they came across as being simply Scrooges uncaring about the starving elderly. Action, especially that as dramatic as altering the care of the elderly and disabled, changes the shape of the surfaces we move on as moral and social creatures. That action is also very difficult to describe and, for now, beyond being describable to any but sophisticated thinkers—which doesn’t necessarily mean those with doctorates or even those with college degrees. In any case, even those philosophers and social-scientists who are sophisticated thinkers haven’t any convincing ways to describe these problems to each other.

In general, competent historians and economists have been dealing with these issues for a couple of centuries or so, some of them in very competent and articulate ways, some of them in prose much easier to understand than that I’m producing as I suggest new ways to look at our individual and community lives. The problem remains that their prose is that of traditional thinkers, embedded in ‘Euclidean’ worlds or perhaps ‘Spinozean-Cartesian’ worlds. They don’t think or write in words and concepts more natural to the sophisticated problems of abstracting from concrete and particular human societies and of describing societies much more complex than those of pre-modern times.

## 423 Which Master Does the Modern Christian Serve?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=836>. It was finished and uploaded on 2011/04/22.]

In *The Liberal Mind* [95], Kenneth Minogue speaks of misguided political and social reformers in the line of modern liberal thought:

How many visionaries have unwittingly prepared a hell on earth because their gaze was stubbornly fixed on heaven? And when hell comes—well, there is always some *ad hoc* theory of sinister interests or Judas-like betrayal to extricate the theorist from his disaster. What his illusions have prevented him from understanding are the forces he in fact served; and good intentions are quite beside the point. Stupidity is a moral as well as an intellectual defect.

Something similar could be said about Christians, not just when they are in the roles of reformers or missionaries but most of all when they think to be worshiping the God of Jesus Christ. They might claim to be worshiping the God of Jesus Christ, but they have their eyes on a different god, one who would never do what is done in Creation, would never pour down lava upon the innocent, would never send tsunamis to destroy entire towns of decent human beings, would never send upon us—his best and most morally pure servants—sufferings. It could only be Satan behind our sufferings because they think their God is a god who made a good and peaceful world for us and fallen angels and sinful men caused that good and peaceful world to become something different from what God had intended for us.

I can remember watching a documentary on earthquakes on television years ago and a geophysicist from—I believe—the University of California at Berkeley made an excellent point. He referred to the beauty and usefulness of the geographic structures of the area around San Francisco Bay and noted that all of this was created by processes which were, and are, violent beyond human imagination.

This is how God works in this world. The violence isn't something that fallen angels or sinful man introduced into a world in which San Francisco Bay and the Sacramento River and the Sierra Mountains would have come to be by gentle and peaceful processes. Even the rich soils of our best farmlands are formed partly of eroded volcanic rocks. Iowa corn and Hawaiian macadamia nuts are possible because of volcanic eruptions bringing minerals from deep inside the earth.

The universe expanded out of an extremely dense state in an explosion of sorts which stretched out space and time from a small region indeed and also created matter as we know it from some abstract stuff.

Stars and galaxies are the result of gravitational forces which are weak but become strong and violent when enough matter is involved.

Planets likely formed by some sort of crashes and smashes on a meteorite scale, though understandings of such processes are not very solid.

Life on earth likely formed from gunk-like stuff and, over the eons, became unattractive critters eating and being eaten.

Dinosaurs. Gigantic crocodiles. Saber-toothed cats. These and other monsters came to be in the evolutionary stream of events which led to human beings. And the rise of our species has brought about the newness of self-conscious moral monsters.

Continents smash into each other and into plates underlying the oceans. Glaciers sometimes sweep away huge masses of dirt and rock, Cape Cod and the eastern half or more of Long Island are the result of glaciers retreating and leaving that stuff they scraped from large regions of North America. Someday, storms will scatter the sandy stuff of Cape Cod and Long Island over the floor of the Atlantic Ocean. Volcanoes explode. Meteorites hit with enough force to leave huge craters which can be seen millions of years later.

Each of the Hawaiian islands in turn has partially collapsed as it was formed by passage over the volcanic hotspot which sends up the stuff of beautiful islands. The big island, Hawaii, is next. Scientists tell us it will collapse sometime in the next few hundred thousand years and the resulting

waves will kill all life on on the entire Hawaiian Island chain, likely sending waves that will leave mudflats in place of Los Angeles. This death and destruction is a part of the process of forming those beautiful islands, not some Satanic add-on to a gentle process of formation.

God sends life-giving showers upon the good and the bad, the malicious and the innocent. He also buries alive in lava the good and the bad, the malicious and the innocent. He sends viruses which don't just target the criminals and the sadistic brutes.

But modern middle-class men and women would inhabit a different universe, one good enough for us. We serve the bland and the soft and the gentle at the expense of the noble which often comes only by way of suffering. We ignore the evidence that God shapes what pleases Him by processes often violent. When we try to see the world in gentler terms and try to live our lives in those other terms, we serve another master than God. We prepare ourselves for another fate than life without end as companions of the Son of God, our Lord Jesus Christ.

God is telling the story He chose to tell. It is a story where beautiful mountains and bays and islands come into being through violent processes which leave innocent creatures buried underneath millions of tons of rock or even underneath molten rock. When we judge some of the Creator's chosen ways of acting as being evil, we are judging God as being evil, if only in part.

We worship and serve an Almighty who's responsible for all in Creation that we approve of and we have Satan to blame for all the rest. How convenient. How blasphemous.

Surely, this is no more than an intellectual mistake, an error in theology and not one with practical implications.

Not so. We worship a God who encourages a cowardly sort of prudence. We implement the dogmas of such a worship in the form of cradle-to-grave care for all. We entrap ourselves and would entrap all in our countries in webs of mandatory public-education and mandatory health insurance. We mandate the safety and security which we think God intends for us when Satan, or the Commies, or the radical Muslims, don't interfere. We don't bother to develop the tougher virtues which would help us to struggle and suffer for what is good and noble, our political freedom as well as our Christian faith.

We've messed up badly because we don't serve the God of Jesus Christ, don't even see Him or His Creation, don't read His Holy Scriptures, with the

clear eyes of a prophet and the accepting heart of a believer who accepts God and His works with an unconditional faith rather than judging the Almighty and His Creation by our cowardly standards. We want to serve a God who will take better care of us. We have served such a God and we are about to pay a high price for our cowardice and our lack of faith, for our fundamental and self-serving dishonesty. We gave up any noble virtues in the interests of a cowardly quest for safety and material prosperity and soon we'll have neither the fruits of virtue nor those of a materialistic prudence.

Meanwhile, God goes on creating not only beautiful islands in the Pacific but also that still more beautiful Body of Christ. I intend to stick with that God and to pray He carries me through to the end of this story He's telling. I'm as cowardly as other modern men but I'm willing to walk out on that limb, giving me no choice but to pretend to be brave and faithful to the Lord.

## 424 What is Politics?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=859>. It was finished and uploaded on 2011/05/20.]

I've recently reread Kenneth Minogue's *The Liberal Mind* and this has raised a number of questions in my mind. For now, I've got to address the question in the title, "What is politics?" from the viewpoint of my effort to enrich and expand our understanding of the Body of Christ as it forms in this mortal realm.

In *The Liberal Mind*, Professor Minogue says:

Now what makes liberal individualism so plausible is that the individual is the only self-conscious entity whose limits appear to correspond to a physiological creature; and also that the thoughts and feelings which constitute institutions such as states or churches must be physically located in the minds of human beings.

...

Yet if we wish to learn about the military behavior of soldiers, we must study military activities, not psychology. And similarly, if we wish to understand politicians, we must attempt to understand the activity of politics, not discover whether politicians are nice or nasty men. [page 50]

For this chapter, the first part of the quote is most relevant. I put in the second part, which points more to the next question of the reality of communities, because I wanted some balance and some hints of where I'm headed. In fact, any who've been reading my writings over the previous few years would realize that the question of the reality of entities defined

by relationships has been partly addressed in my past efforts—relationships are primary over concrete entities. In a sense, human communities exist first and shape the individuals. Which comes first, chicken or egg? How about the flock? And the environments in which the flock lives?

In any case, I want to quote Professor Minogue again before moving on:

A social institution is a self-conscious grouping of interests. But we are not always self-conscious, and the study of institutions is far from exhausting political and social life. For in philosophizing we are confronted with another kind of evidence which in liberal individualism must be explained away, but which for other philosophers is itself a starting point. As examples of this evidence we may take a philosopher absorbed in a problem, an artist in a picture, or a soldier engaged in an attack. None of these people is self-conscious, and the behavior of each can only be explained if one understands the relevant activity. . . . But what is false in liberalism is the doctrine that these moments, times of concern with self-preservation and comparative status, rather than the times of self-forgetful absorption in activity, are the yardstick of reality. [page 51]

It might be that part of our difficulties in understanding the relationships of individuals to communities, institutions, etc. is that most people feel most alive when most self-conscious, not when losing themselves in a difficult and interesting task. They feel most alive when they are experiencing the pleasures of good food or music at a rock concert rather than while they're growing food in an intensive garden or playing a recorder. It would be in those two latter activities that we would most resemble those we pretend to admire, da Vinci and the DiMaggio brothers and other high achievers.

The ability to put all of yourself into a worthwhile task outside of yourself, building a clock from scratch or solving an important problem in astrophysics or worshiping God, is a necessary part of becoming God-like, even a necessary part of sharing life with God. To drive the point home, without being judgmental towards individuals, I sometimes get the impression in my own praying and in observing others praying that even the best of us will sometimes soak in our own holy and self-righteous juices and call it prayer. Prayer is getting lost in our conversation in which we learn to talk

along with God. Along with. Not to and not even with in the face-to-face sense.

The previous paragraph points towards one or more major problems we have to solve to become—so to speak—better than ourselves. What does that have to do with formation of communities or our entry into an existing community, at which time—if we truly become part of it – we become one of those forming that community.

Let me diverge to note a recent article about the loss of memories when one partner in a relationship, such as a husband or wife, falls into dementia. The article, and the underlying research and analysis, actually deals with the wider issue of the loss of memories in more general sorts of human groups. The article, *Psychologists Ask How Well—Or Badly—We Remember Together* found at <http://www.sciencedaily.com/releases/2011/04/110427171642.htm> tells us:

Several years ago, Suparna Rajaram noticed a strange sort of contagion in a couple she was close to. One partner acquired dementia—and the other lost the nourishing pleasures of joint reminiscence. “When the other person cannot validate shared memories,” said Rajaram, “they are both robbed of the past.”

...

Some findings in the field of collaborative memory research have been counter intuitive. For one, collaboration can hurt memory. Some studies have compared the recall of items on lists by “collaborative groups,” or those who study together, and “nominal groups,” in which individuals work alone and the results are collated. The collaborative groups remembered more items than any single person would have done alone. But they also remembered fewer than the nominal groups did by totaling the efforts of its solitary workers. In other words, the collaborators’ whole was less than the sum of its parts.

This so-called “collaborative inhibition” affects recall for all sorts of things, from word pairs to emotionally laden events; it affects strangers or spouses, children or adults. It is, in scientific lingo, “robust.”

...

“If a small group can reshape memories, we see how individuals come to hold certain viewpoints or perspectives,” she says. “That can serve as a model for how collective identities and histories are shaped.”

This “collaborative inhibition” might be a large part of what’s happening when human beings form into mindless or amoral herds. Alexis Tocqueville noted back in the 1830s that Americans have an odd inclination to ignore the most blunt and most obvious of facts when it conflicts with the mainstream view of things. Yet, we can be feisty as individuals. Maybe we need to be by ourselves to be able to fairly evaluate the moral implications of our actions as communities?

It’s the memories shared, and then lost, that interests me, for now. The ‘lost’ part interests me only as a pointer to the existence of shared memories, even group memories or community memories shared by large numbers of human beings—some of whom we’ve likely not even met.

Let me turn to another quote from Minogue’s *The Liberal Mind* before I try to determine some direction for my future efforts in dealing with this important aspect of the formation of the Body of Christ:

A tradition in this [second and better] sense is a knowledge of how to go about tasks, one which can only be transmitted by imitation, and which cannot be written down and summarized. In this sense of tradition, it is development rather than repetition which is the central idea. And what leads such traditions into decadence is precisely the conscious operations of reason. For reason fragments a tradition into a set of policies, ends and means, and works in terms of principles, which are to traditions just what dogmas are to ideologies—distorting fixed points outside the range of criticism. [page 55]

Development, rather than planning, is crucial and so are operations which might not even be conscious, but I’m going to tie matters together by saying that politics is the art of human community-building. A true politician, even if he’s a local dentist organizing a club for admirers of the Corvette, involves both the skills needed for a community to survive and prosper and also the stories which give meaning to the past and the dreams which give a true purpose to the future of that community.

It seems likely to me that we come together to form human communities partly because of the gaps in our memories. If we formed one-man, or one nuclear-family, societies merely interacting with other such societies as being external to our 'real' societies, we would never have the sorts of rich community lives that led to even the Bohemian neighborhoods of London and New York in healthier days, let alone the entirety of Western Civilization. In *Robinson Crusoe*, Daniel Defoe, an important thinker in the development of modern thought about the individual, did all he could to present in positive terms an impoverished community of one man living in isolation with another one-man community which was a man of different culture and language. A community as an assemblage of black-boxes. It's hard to even describe the brilliant strangeness, and perverseness, of such thought to one who believes in the Body of Christ and in that ultimate of communities—the Holy Trinity of Father, Son, and Holy Spirit.

I'll note without further discussion that it's very odd to me that Christian thinkers, theologians and political philosophers and others, seem to expend little effort thinking about the nature of that ultimate community and what it would mean for human communities.

In any case, a community of truly free-standing individuals hasn't existed in the real world and exists in fiction only in impoverished imaginations, in books of impoverished narrative. I say this as an admirer of Defoe at his best, as a journalistic novelist who did wonders with the story of the Plague in London. I should also qualify myself. Some science-fiction writers with good imaginations, if not always the highest literary talents, have written of perverse societies of isolated individuals. The most relevant of such books is certainly the book in which Ray Bradbury got it right, as opposed to Orwell and Huxley. In *Fahrenheit 451*, Bradbury told us of a totalitarian society built from the ground up by isolated television-watchers. Sound familiar? Bradbury, in fact, thought television was the final piece in the puzzle, allowing Americans to retreat from reality, entering a state where they wouldn't be bothered by God's Creation. Tocqueville feared something like this would happen in the United States in his *Democracy in America* published in the 1830s. Hannah Arendt expressed a similar view regarding the entirety of the middle-class and countries dominated by that class.

So, let's think about three men from a reasonably rich culture:

Tom remembers some things, perhaps consciously or perhaps

just in his customs or habits or the skilled movements of his hat-making hands. Dick remembers some other things but is dependent upon Tom, not just because of Tom's hat-making skills but also because it's Tom who remembers a large number of songs from their Irish ancestors. It's Harry on the other hand who has taken up the odd habit of reading histories about these United States to which their Irish ancestors came and it's Harry who can tell them about some of the great accomplishments and some of the great failings of the land those hungry Irishmen came to, perhaps even telling of the way those Irishmen were despised and treated as animals useful only for their strong backs.

The art of politics, building a church community or a local political community or a men's club, is meshing together those memories, leveraging off the gaps in any one man's memories, in order to nurture and coordinate the requisite skills and also to construct something like a narrative which gives meaning to that community. When I speak of leveraging off the gaps in memories, I'm largely pointing towards a humbling process similar to what St. Paul spoke about in Romans:

For by the grace given to me I bid every one among you not to think of himself more highly than he ought to think, but to think with sober judgment, each according to the measure of faith which God has assigned him. For as in one body we have many members, and all the members do not have the same function, so we, though many, are one body in Christ, and individually members one of another.

As some sociologists and historians, such as Robert Nisbet, have claimed:

We are bound together in communities by ties of dependencies.

We need each other's skills and we need each other's memories. As I've noted before, echoing others such as Nisbet, we've chosen to walk away from our smaller-scale communities and to become dependent upon the centralized powers of this modern age. We've left behind our community roles to become workers in giant corporations, citizen/soldiers in giant states,

and consumers in giant marketplaces. The problem is the nature of these top-down, exploitive communities of always self-conscious and always self-concerned individuals rather than their size since the Body of Christ, even with salvation restricted to a relative few, will be more gigantic than any conceivable human state.

Continuing to remember but to bracket away the question as to whether a community is a real entity or a mere collection of individuals, we can ask a similarly important and difficult question:

Do we also need a genius to organize us into a richer and more complex community?

I'll say no and will even claim a domineering or would-be domineering 'genius' of this sort will destroy or deform a community. We need to be patient and we need to do our work in our locality, which might actually be a region where various localities meet and form a more complex community. One way to see what I'm saying is to think of a federation which grows organically.

The governing councils for the various towns and cities in an urban area would come together to form a county. The governing councils of counties would come together to form a state. And so on. These processes once occurred naturally in our long-gone (relatively) free markets. One fairly straightforward example comes from the insurance industry where companies combined from the primary companies up through layers of the companies taking higher levels of risk to 'smooth' out those risks over time and over larger geographical areas. A very limited model of community building, but one which worked well even though it always had some levels of top-down design.

And we have to be careful about our thoughts. We think about a certain realm of human life in terms of engineering or bureaucratic system building when we should be participants in a narrative process which can't be guided if it's to remain healthy and strong. That is, we'd have to be careful not to 'guide' the process too much and certainly not to try to impose our favorite solutions upon an evolving system.

Healthy human communities evolve over longer scales of time and develop over shorter scales of time. As the historian Carroll Quigley claimed:

The truth unfolds in time through communal processes.

In my way of thought, this is an recursively entangled line of thought. You see, “Things are true,” and “Truths are thing-like.” This means that communities are true and not just ad-hoc arrangements. Moreover, communities are thing-like. The communities and the communal processes themselves unfold in time.

But entities like the United States and the so-called global economy are hierarchical structures imposed on masses of human beings and various human communities which would otherwise develop truer and more fruitful communities.

Perhaps we can say that the community evolves in time as true relationships emerge?

We haven’t gotten it right yet and we aren’t capable of fixing everything because we don’t even know what we’re fixing let alone what it’s really supposed to be like. More than that, we’re organisms, ourselves growing and developing towards futures we can help shape but can’t plan in the way that modern bureaucrats once imagined they could plan for a safer and more prosperous and more aesthetically pleasing Harlem.

Rather than trying to design our various communities, we need somehow to regard them as being more like evolving and developing organisms than designed and manufactured machines. When we so regard them, we can research them and analyze them, not for the purpose of controlling what shouldn’t be controlled but rather for the purpose of understanding them that we might move along with their development in our own lives and with their evolution to the extent we can consciously live as members of one generation in that democracy of the dead, the living, and the yet unborn.

In conclusion, I think it relatively easy to define politics as the art, drawing upon some science, of bringing together different skills and other forms of memory for the purpose of forming a community, perhaps to serve God and perhaps to get in a good game of bridge once a week. It’s harder to define even a vague range of legitimate actions on the part of the those who take on leadership roles with a ‘political’ aspect, but I strongly believe they should limit themselves to being actors who are part of more or less spontaneous processes, perhaps guiding them when a community begins to stray from all possible moral paths, but, even then, not trying to guide them down a specific path.

## 425 Moral Free-fall

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=872>. It was finished and uploaded on 2011/05/27.]

You have weight when you're not in free-fall, that is, you have weight when you're kept from traveling the shortest path from your current location to the center of gravity of whatever system you're in. This shortest path, known as a 'geodesic', is described at <http://en.wikipedia.com/wiki/Geodesic>.

When you're weighed down, by your own bodily mass or that of other entities you are helping to support, you are experiencing forces exerted to keep you from traveling towards the local center of attraction, the local gravitational center which is found near the center of the earth.

Free-fall in physics is the state where an entity is moving along a geodesic towards the local center of attraction, itself moving towards a more regional center of attraction, right on up to the global center of attraction, the universal center of mass in a manner of speaking. Weight is the result of fighting gravity—on our part or on the part of the crust of the earth which supports us this far from the local gravitational center.

Viewed this way, gravity isn't a force. There's no force pulling that moving entity towards the center. A so-called 'fictitious force', describable in terms of a coordinate change, causes that entity to move in the way that a ball-bearing spinning around the rim of a bowl will gradually move downwards towards the bottom of the bowl. It's an interesting analogy but only if you can imagine away the force of gravity and picture the bowl stretching itself in front of the ball-bearing in such a way as to direct its movement without exerting a 'true' force. Then the ball is guided towards that bottom of the bowl because of the stretching of the very structure of spacetime. You can maybe make the imaginative leap a little easier by

thinking of the ball-bearing moving on a rubber membrane stretched over a bowl. You can see the rubber stretching and depressing itself to bring a sufficiently heavy ball-bearing towards the center and you can imagine you're seeing spacetime stretching and bending underneath, for example, the earth as it revolves around the sun.

Some say we should stay out of God's way, but they don't mean we should be passive or uninvolved but rather that we should give ourselves up to the will of God. Augustine of Hippo said that the man who truly loves God can do as he wishes. Clearly, that great saint meant to claim that the true lover of God would then be doing what is right as much as he can humanly understand the right and reach its standards. But we can get still closer to the truth by saying we should stop fighting against God and do His will as He draws us towards His Son at the center of Creation.

The path of moral right, the path of what is good and true and even beautiful, is a moral geodesic where we follow the path where we exert **no** force and, we can pray, no other entity exerts sufficient force to keep us from the Lord at the center of Creation. When we give ourselves up to Christ, we exert no force to prevent ourselves from being captured by this fictitious force and that force will then move us in a relatively painless and effortless way to the center where we meet Christ.

God, Father and Son and Holy Spirit, do all the work, creating space-time, creating the matter of which we are made and which we need to survive, moving created being and stretching the very shape of Creation to bring us to the center where Christ awaits us.

I simplify as you could guess from the discussion about movement towards a local center of attraction and then to a regional center of attraction and on up to a movement towards a universal center of attraction. We cluster first into communities of various sorts, forming perhaps complex systems of multiple sorts of communities which then move towards a center of attraction shared with other similar communities. The larger communities then move towards greater centers of attraction. By way of a self-ordering process directed by the shape and nature of Creation, we move towards that center which is Christ, the Head of the Body of Christ.

And now I feel a little more confident I can use the richness of abstractions drawn from modern physics to speak of the non-physical aspects of Creation. Much needs to be done for us to gain a newer, a richer and more complex understanding of Creation and of our relationship to the Creator, but I feel to have taken a small step in the right direction.

## 426 Who Do You Choose to Be Dependent Upon?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=875>. It was finished and uploaded on 2011/05/28.]

A very important line of thought and research underlies this short article: *The Ties That Bind: Grandparents and Their Grandchildren* found at <http://www.sciencedaily.com/releases/2011/05/110513204417.htm>. Knowing that research in traditional societies in the undeveloped world had shown that children's health and longevity were improved greatly when they were under the care or supplemental care of grandparents—typically, as I recall from reading about some of this research years ago, the improvement occurred only with blood relationships—some researchers looked for and found similar advantages to grandparent involvement in caring for the children in industrialized communities as well.

Health and longevity are easier to test than the somewhat related moral traits which can be nurtured in children by constant contact with grandparents who can tell them stories of their own grandparents back in Hungary or Denmark and can give those youngsters a sense of connectedness to concrete human traditions. Those concrete, blood-based traditions are necessary as a foundation even to Christians who are called to love, in some way, human beings they've never even met. Without a firm connection to concrete traditions, even the most openhearted of evangelists or the most dedicated of medical missionaries, even the most curious of scholars or the most adventurous of businessmen, will find their minds opening so that their brains fall out. Their hearts will also melt down to puddles containing emotions more self-righteously destructive and self-destructive than truly charitable.

Grandparents are older, yes, and that means that some of the fire inside

CHAPTER 426. WHO DO YOU CHOOSE TO BE DEPENDENT  
UPON?  
1960

their bodies has burned out. Yet, that doesn't necessarily bring wisdom. There are certainly many 60 year-olds who have failed to live 60 years, instead choosing to live their favorite five or so years a multiple of times up to their 60 years on Earth. Yet, many have matured in a true way and can pass on much wisdom to their grandchildren. This is wisdom the parents might not yet have unless they took in their grandparents' stories and lessons in a way that is beyond most of us—a certain amount of experience is needed before we truly take to heart even the most obvious of moral truths, including those which seem to deal with quite mundane aspects of a well-ordered life. There is a time and a rhythm in the life of a grandmother or grandfather of proper priorities, a time and a rhythm which allows them to pass on the wisdom they might possess in some measure. Even if they aren't wise, or knowing in a more exact sense, they can pass on stories, memories, feelings, many of the bricks in the foundations of a well-ordered way of life.

Not all ways of life are worth continuing but I can recall with warmth the way of life in a small-town in Western Massachusetts when I was young. Some of my fondest memories concern relationships, some in which I took a part and some I merely observed in the way of a young boy, and many of those relationships were those of extended families. The extended families were dissipating because of the loss of the dependencies which hold all human communities together. The parents sent their children off to be formed in public schools and then to see the world as marines and soldiers and sailors. Those parents breathed a sigh of relief as Grandma and Grandpa were able to move into government-subsidized housing when they had to give up their own house. More sighs of relief came as the old folks were able to "maintain their independence" with the help of Social Security and Medicare.

It's difficult to believe our politicians and bankers and corporate executives could have planned all they carried out, yet they've acted in a consistent manner as if planning to replace local dependencies with dependencies of individuals and local political communities upon the Federal government which was seemingly thought to be independent of all the rest of Creation. In a similar way, we're dependent for food and clothing and other goods upon giant corporations rather than upon a more rational mix of mom-and-pop stores and regional or national department stores, local manufacturers and transnational car companies, local farms and giant agribusinesses in Iowa or Southern California, local hospitals with good nursing

care and big-city hospitals with fancy technology. Rather than that sort of a balance, we inhabitants of the modern West, not citizens of the West in a true sense, allowed ourselves to be convinced by the politicians and bureaucrats, the bankers and corporate executives, that they had the universe under good control. They stood upon the true bedrock of existence and could guarantee our safety and security so long as we were willing to do no more than accept their gifts, no more than to become dependent upon them.

While scientists were looking in the wrong places, Americans had discovered that all created being rested solidly upon the landfill of Washington, DC or maybe the granite bedrock of Wall St. or whatever the hell the City of London rests upon. It hardly matters at this point where these various criminal conspiracies and conspiracies of sheer stupidity were truly controlled from. What matters is that we've accepted those offers of the politicians and bureaucrats, the bankers and corporate executives. Certain they were that they were now Masters of Reality, they themselves were overwhelmed by hubris and the gods laughed at these morally and cognitively insane play-things and all the many foolish human beings who had turned their property and their food production systems and industrial productions systems and their governments—even their children and grandchildren—over to these lunatics. Starting with pioneer lunatics such as Teddy Roosevelt, we eventually reached George W. Bush and his thugs who thought they could create reality with enough firepower and then we've managed to descend further to Barack Obama who seems to think he creates a better reality by merely giving a feel-good speech. But the firepower is still deployed to kill many and destroy much, even if there is increasing doubt as to whether anyone has a clue what might be the goals of our lunatic masters.

Yes, we're dependent upon the various departments and agencies of the Federal government and have freed ourselves of dependencies upon parents and children and grandchildren and cousins and neighbors and fellow-worshippers. By allowing ourselves to become dependent upon the largess of central governments and their allied banks, largess actually funded by wealth taken from us, we've forged our own chains. Yet, there is hope in our bodies. We've corrupted ourselves, adopting thoughts and many behaviors of slaves dependent upon the central powers of our nation-states. Our minds, our souls, are corrupted to the needs of those who care for us only when we're useful to them but our bodies, though softened and stripped of many vertebrae, retain some of the instincts that lead many parents and

CHAPTER 426. WHO DO YOU CHOOSE TO BE DEPENDENT  
1962 UPON?

grandparents to sacrifice themselves for their children, for the current benefit of those children and so that those children might have good futures. If only we can remember that our own futures would be more secure if we could integrate those children and grandchildren into viable human communities which we're part of, communities which we're willing to be dependent upon.

# 427 Killing Communities, Killing Innocent Human Beings, Killing Our Souls

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=878>. It was finished and uploaded on 2011/06/01.]

In this article, *Steady Relationships Reduce Amphetamine's Rewarding Effects, Animal Study Suggests* found at <http://www.sciencedaily.com/releases/2011/05/110531180946.htm>, we learn:

Long-term relationships make the commonly abused drug amphetamine less appealing, according to a new animal study in the June 1 [2011] issue of *The Journal of Neuroscience*. The findings suggest that social bonds formed during adulthood lead to changes in the brain that may protect against drug abuse.

Prairie voles are rodents that form lifelong bonds with mating partners. In the new study, researchers directed by Zuoxin Wang, PhD, of Florida State University, found that male voles in established relationships displayed less interest in amphetamine compared with their single counterparts. Amphetamine exposure led to changes in the nucleus accumbens—a part of the brain's reward system—that differed depending on the relationship status of the voles.

Better living through our body's own chemistry. Let's form good human communities, including lifelong marriages, and get that dopamine flowing. We'll be much better people for it.

I recently reread *Fahrenheit 451*, a novel nominally in the sci-fi genre but actually a more substantial work of moral and social and political commentary. Ray Bradbury was writing about a country malformed at all levels of human communities and even in the souls and moral characters of nearly all citizens. That is, he was writing about the United States at a time when too many imagine there was moral order and even goodness. At best, Americans in 1950 were conformists in a country where there was a decaying but still substantial moral order inherited from past centuries of Christian civilization—in Europe. Our seeming goodness was no more than skin-deep niceness. Bradbury saw that this conformity, lawns were well-kept and violent crime was rare, was itself a sign of a horrible type of totalitarianism in a nearly mature form — a totalitarianism which had formed bottom-up. Our true enemy wasn't Hitler or Stalin but rather that moral coward in the mirror. And, so, our communities had become no more than ways of comforting ourselves as we built forms of human relationships which are strange and shallow and good only to shape and unite into gangs the sorts of human moral trash my Grannie from Montrose would have dismissed without so much as a word and barely a raising of the eyes.

We Americans hadn't yet reduced ourselves to moral trash but, by at least 1950 when Bradbury wrote *Fahrenheit 451*, we had become a people very good at brainwashing ourselves in the interests of the mainstream views of the world. We needed only a full schedule of television programs—and the scientists' brilliantly conceived communications network converted into the pornographed and facebooked Web—to finish the job of isolating us from healthy communities, the job of turning us into so many globs of moral trash.

I'll note quickly that Alexis Tocqueville had seen this tendency to brainwash ourselves in the interests of the herd view back in the 1830s and had written of it, though he speaks indirectly at times because he had stumbled on the modern concepts of 'totalitarianism' and 'brainwashing' without having the words to speak clearly.

There is a bit of blackish good-news that comes out of *Fahrenheit 451* and it ties in to this news of the resistance to at least amphetamines of creatures with good social lives, that is, creatures who produce good flows of the brain chemical dopamine—to usefully simplify. In Bradbury's novel, those who had seemed to be deadening themselves in pursuit of safety and comfort found that this life wasn't so good as they might have thought. The main character couldn't even remember much of his life, not even how

he'd met his wife or where she came from. And his wife was a drug-abusing mess – prone to overdoses which might have been accidents and might have been attempts of suicide. In fact, there is a strong implication that citizens of this nightmare world so similar to ours were killing themselves at a pretty good rate. Then the book ends with the effort to kill a lot of other men—a nuclear war.

Bradbury is a little clumsy as a writer but he's a man of profound insight and seems to have nailed the case. The main point of the book seems to be: Americans prefer to be dumb, perhaps because they're lazy and perhaps because they really don't see the need for all those books and all that knowledge about ancient history, like the history of the American Revolutionary War. Of course, Americans also despise the oral histories of their own families. This is a matter of great importance to me but I'm more interested, in this context, in Bradbury's portrayal of a society where social bonds have become so tenuous that an intelligent man doesn't remember meeting his wife, doesn't have a clue why they got married, and really doesn't know more about her than her name. That society is also awash in violence. Bored people of all ages jump into cars and head out to the main streets, hoping to find a nut, that is—a pedestrian, to run down. Men sometimes head off to fight in wars without their wives being concerned enough to ask where the war is being fought. People jump from buildings without their widows or widowers bothering to mourn. They simply remarry because. . . Well, actually, they don't really know why they ever marry because spouses get in the way of their friends on those interactive television programs. Drug overdoses are so common that technicians of a sort respond by going to the bedside with a device that sends a mechanical snake down the throat to clean everything out. No one is concerned. It's a routine matter, a world where drains clog up regularly with poisonous stuff and a serviceman comes to roto-root the stomach and intestines.

You see: we Americans not only prefer to be dumb, we also prefer human relationships which make no moral demands, perhaps because of a slightly different sort of laziness and perhaps because we would be gods of our own dreamworlds. True human communities disturb us as much as honest politicians do.

Not knowing much history and not being inclined to look for any answers in the past, not even the barely remembered tales of long-dead Grandpa, we Americans have weakened our social bonds to a point where they are barely such. We can no longer see that even the neighborhood bar was a

healthier community than those which form on Internet social sites. Weak social bonds leave us vulnerable to a host of problems, drug addiction being one of them. Addiction to violence, at least as a spectator and possibly as a participant, is another.

Let me switch gears a little by noting that amphetamines are sometimes used by bikers, skinheads, neo-Nazis, and others to prepare themselves for violence. It can magnify rage and eliminate healthy fear or prudence. My father was a Navy Hospital Corpsman sent to Korea with the Marines and served in a battlefield hospital unit. He said that corrupt doctors sold amphetamines to corrupt Marine officers who wanted to juice their men up for action—good way to win medals and promotions I would guess.

The study discussed in the first paragraphs of this essay indicates: “Long-term relationships make the commonly abused drug amphetamine less appealing. . .” With that reminder, I’m going to ask a highly speculative question:

Is it possible that American support of murderous wars against civilian populations, punctuated by **shock and awe** displays against poorly armed and poorly trained armies of a sort, is made possible—not caused but made possible—by our deteriorating social relationships, by our loss of community life, by our lack of desire for healthy and morally demanding communities?

Is it even possible that our weak social relationships convince American young men that it’s easy to kill? Is it possible that they find out it isn’t so easy to kill or even watch killing? Is it possible that this latter speculation would help us to understand the extremely high rates of suicides and of serious psychiatric disorders amongst veterans of combat in Iraq and Afghanistan? In a very powerful book, *On Killing*, Lt. Colonel Dave Grossman tells us that there is a small percentage of men who are morally well-ordered and yet capable of killing in a detached manner if they think the killing to be morally justified. Most men will pay a big price for killing, even under circumstances where they think the killing is morally justified. Colonel Grossman did his studies for an advanced degree in psychology by studying men not made for killing, men who had killed in World War II and succeeding ‘police actions’ and those men were suffering nightmares, seeing the faces of the men they had killed, for decades afterward.

Maybe, just maybe, if Americans were a people with morally well-ordered communities, maybe, just maybe, we wouldn't be cheering as our troops nailed more gooks or rag-heads? Maybe, we would mourn our war-dead and those enemies we killed even if we felt forced to wage war to truly defend ourselves?

Maybe.

After reading Colonel Grossman's book a good ten years ago, I stopped going out to watch the Memorial Day Parade pass by. He said those true war-heroes, those men who had killed face-to-face with an enemy soldier aiming a weapon in their direction, refused to march in or even watch Memorial Day Parades. They considered them to be celebrations of killing enemies and didn't think that was something they could be part of. So far as I can tell, we even celebrate the deaths of our own soldiers rather than mourning them. "Let's party in the cemetery. We can rest our beer-cans on the tombstones of all those brave men who died so we can be free and good and all those things we Americans are. What a country!!"

As for me, I mourn, not just for the American war-dead, and not just for the dead of all nationalities in these needless and stupid wars our leaders start and we support. I mourn also for the human communities which have died of neglect while we Americans were pursuing a life not so much different from that depicted in *Fahrenheit 451*. Certainly, Bradbury got it right when he thought we'd desert the front-porches and the parks to dive into what is now called virtual life, on the television screen and on the Internet. He was right we'd throw books away, if we're not quite ready to turn fire departments into book-burning operations. Books are one way to enter that ultimate community—of the living, the dead, and those not yet born. Books are a racial memory of sorts. Do it right and you can begin to tap into the memory of the pilgrim Body of Christ. You can begin to see the world as God sees it. You can begin to see what an ugly and evil mess we Americans have made of our country and of all parts of the world we invade.

For all our American pretenses to being Christians, we've become not just sinners who murder large numbers of Iraqis and Afghans and others without justification, we've also become a nation of the Anti-Christ, a nation which wages war against not only ancient Christian churches in other lands but also against our own human communities. Like Captain Ahab in *Moby Dick*, we hate all that constrains us, including our families and the traditions of Christianity. We hate our own not quite dead desires to enter

the Body of Christ. Not so brave as our brother Ahab, We would purge our memories of God Himself that we could be free... Free to join virtual communities and to take drugs to make up for our stunted minds and deformed moral characters, free to engage more fully in killing and partying afterward. What a country!!

# 428 Be Obnoxious and Be Our Leader

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=888>. It was finished and uploaded on 2011/06/09.]

I shudder a bit at the results of the study discussed in the article, *Breaking Rules Makes You Seem Powerful*, found at <http://www.sciencedaily.com/releases/2011/05/110520092735.htm>. We learn:

What happens when people interact with a rule breaker? Van Kleef and colleagues had people come to the lab, and interact with a rule follower and a rule breaker. The rule follower was polite and acted normally, while the rule breaker arrived late, threw down his bag on a table and put up his feet. After the interaction, people thought the rule breaker had more power and was more likely to “get others to do what he wants.”

“Norm violators are perceived as having the capacity to act as they please” write the researchers. Power may be corrupting, but showing the outward signs of corruption makes people think you’re powerful.

The ever insightful Tocqueville was shocked when he came to the United States in 1830 or so. Having heard stories from his father’s good friend, the Marquis de Lafayette, about the high caliber of American leaders, he found the Americans holding leadership positions in 1830 were no better than self-serving scoundrels. Why do we prefer self-serving scoundrels and “norm violators”? Why do we think sociopaths make good leaders? Is it a simple matter of thinking bad behavior to be a sign that a man or woman already has power? If that were true shouldn’t morally responsible human

beings refuse to submit to that sort of power? Don't we have the moral responsibility to recognize our tendency to follow sociopaths and to do something about it? If we can't recognize such morally disabling conditions and do something about them, we can't be morally responsible voters, we can't be self-governing in a morally allowable manner.

In any case, we are particular sorts of physical animals. We become true persons, human persons of higher moral standards, by shaping ourselves to be such, by proper responses to our own given natures and to what lies outside of us. This requires some effort. In slacking off, heading for the television rather than—for example—reading Jacques Barzun's *From Dawn to Decadence* [9] or similar sorts of intelligent narrative histories, we've chosen to be self-governing creatures of a willfully ignorant sort. We certainly aren't taking on the roles of morally responsible human persons. At the risk of seeming an elitist, I'll state without qualification that anyone who can't intelligently and critically read historical narratives or biographies (of Abigail Adams and not some movie star) shouldn't be voting in this complex world. Anyone who knows we're waging a variety of wars, large and small, in Asia and North Africa, and threatening more wars in Latin America and sub-Saharan Africa, and doesn't even take the time to browse some geographical works at their local library or to browse various Internet sites (such as that of *National Geographic*), shouldn't be voting and shouldn't be opening their mouths in support of the rule-breakers in Washington or London or Paris.

If such efforts are beyond the capabilities or time-constraints of most American citizens, we should consider whether we, as a nation or nation-state, have any business interacting with, let alone devastating regions of the world when we haven't a clue where Iraq or Afghanistan are, what ethnic groups inhabit those countries, what the histories of those countries are, or how they make their livings. We, the American citizenry, are generally incapable of stating even the simplest of coherent understandings of what Clinton or Gore or Bush or Cheney or Obama or Biden were trying to accomplish by killing so many innocent human beings in other countries. But, so far as I can tell, these leaders also have not a clue what's really going on in those foreign lands and they fight those wars partly to provide jobs in the war-industry and partly as a result of Washington politics. Many Vietnamese children were maimed or killed so LBJ could show he was tough enough to be a manly President and, apparently, many were maimed or killed in Iraq so George W. Bush could push his legislation through

Congress. Rather expensive political games from the viewpoints of those on the ground.

Even the low American government estimates of “collateral damage” in Iraq and Afghanistan indicate we’ve now killed more than 100 innocent human beings for every innocent human being who died on 9/11, a rather horrible and damning—literally damning—situation for American Christians who line up behind Pilate and Caesar as they try to make peace by creating deserts about the world. It’s not just the proportion of 100 to 1, but the very fact that we Americans were willing to unleash murderous firepower upon innocent men, women, and children because of crimes committed by Saddam Hussein even if we should have known those crimes existed only in the lying imaginations of Bush and Cheney.

We kill a lot of innocent human beings and destroy a lot of infrastructure when we invade and occupy. We leave behind poisoned ground and very high birth-defect rates when we depart. Robert McNamara has confessed we were systematically killing or seriously injuring thousands of Vietnamese civilians a month—each month we created multiple 9/11 piles of civilian casualties. Vietnam and some regions of Iraq, such as Fallujah, have extremely high rates of birth defects because of the poisons we shot into their land. And how big a cost have American soldiers paid in the power-games played, from comfy Washington offices, by these thugs and mass-murderers we elect to the White House, the Senate, and the House of Representatives? Rather than terms like “rule-breakers” and “norm-violators,” we should just go right to “war-criminals” and “mass-murderers.”

We certainly prefer “rule-breakers.” Heck, we even seem to adore a serious amount of ignorance and stupidity and incompetence on the part of these gangsters and mass-murderers who are threatening the health and even the very existence of Western Civilization.

But who put those rule-breakers into power? The American voters. Are there some who bear a greater share of responsibility? Paraphrasing St. John Chrysostom, the road to Hell is lined with the skulls of those priests and ministers and rabbis and teachers and scholars and publishers and others who had the responsibility of applying serious moral critiques to society and government and the responsibility of guiding the development and education of the mass of citizens of the West. Those non-political leaders bear a great share of the guilt if not quite so great a share as the political leaders, but there’s enough damnation to go around and a goodly amount remains with the willfully ignorant creatures who proudly vote for their favorite well-

groomed thug after spending months watching the occasional debate with no content and not even coherently expressed sentiments, but mostly those proud voters are busy channel-surfing that they might catch some good rock-and-roll videos and exciting parts of that show about efforts to survive on an exotic island at the expense of other human beings.

Maybe we American adults think the disordered children of *Lord of the Flies* are to be admired and emulated rather than to be feared and steered into better paths?

# 429 Moral Narratives and Differing Scales of Time and Space

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=895>. It was finished and uploaded on 2011/06/14.]

As matters currently stand in theories about physical reality and in philosophical analyses of those theories, there are no signs of homogeneity over the vast differences of scales in spacetime studied by scientists.<sup>1</sup> In general, created being at the quantum level (think of ‘subatomic’ levels of energy changes rather than small as such) seems sewed together with created being at the macroscopic level and there’s at least hints the universe might have its own nature apart from what it ‘contains’. See Chapter 193 , *A Universe is More than it Contains* for a discussion of a well-founded theoretical claim that the conservation of energy might not hold in our universe as a whole even if it holds at the macroscopic level as a true physical law.

Symmetry-breaking is a useful metaphor and seemingly a literal truth in some cases. Symmetries have been broken so that one elegant entity becomes two or more entities of greater concreteness or particularity. Modern cosmological physics and particle physics have produced strong evidence that the electroweak force shattered into the electromagnetic force and the weak nuclear force. Symmetry-breaking might have been involved in many of the events which led to our universe being in its current state. Created

---

<sup>1</sup>Of course, we do have the unity from our common-sense: the stars and human beings and subatomic particles are parts of the same universe and do interact and even contribute to the being of each other.

being was probably strongly unified, at least in many of its aspects, when the universe was so dense that it took up less space than an atom takes in this current stage of expansion – being has frozen and has shattered in various ways that can be compared to a large body of water freezing and cracking or shattering in various places. See Section 184.1, *More on Symmetry-breaking as of 2011/06/13*, which is an update included as a separate section under Chapter 184, *Symmetry-breaking, From Physics and Mathematics to Metaphysics*, for a discussion of this issue. In this way of thinking, the beginning of the current expansionary phase of the universe was largely a phase change, from an extremely hot state to a relatively cool state.

But I'm conjecturing that something stranger has occurred. This shattering of symmetry has split being along lines that we can't perceive directly, only with our minds. Space and time don't add up to form larger scales of spacetime, though, as I noted above, many assume or hope that the universe is just a gathering of macroscopic chunks of spacetime which are themselves somehow built up directly from the strange entities explored by subatomic physics. That is, the macroscopic realm of concrete being in this universe seems to be something more than, or different from, a mere assembly of large amounts of subatomic being. In Chapter 193, *A Universe is More than it Contains*, I point out that the universe is its self, it has properties that don't seem to correspond to a mere building-up of large amounts of macroscopic stuff.

At least as a speculative adventure, I'll take seriously the lack of evidence of homogeneity of spacetime, perhaps the very nature of matter and energy, across different scales. I'll claim:

There are cracks in created being, in a manner of speaking, and the very small, the medium-sized scale where we live, and the very large are somehow sewed together. (A bad way of speaking, but mathematicians do sometimes talk in such ways when putting together strange geometric structures or spaces.)

What does this mean? I don't know and I'll admit it might not prove to be literally true. Someone might come up with a brilliant theory which can tie together the 'quantum' realm, the macroscopic realm, and the cosmological realm as one homogeneous physical structure. Based upon the current state of our understanding of the physical world, I doubt this can happen.

At the same time I do remain convinced that the universe is a coherent entity, in itself and as an assembly of other entities, just as a human being is a coherent entity while being composed of a variety of organs and materials, each of which can be understood separately in coherent terms though 'coming to life' only when part of the entire human organism. My claim that the universe seen in light of God's purposes forms a world, unified and coherent and complete, isn't dependent upon a strong form of homogeneity or isotropism.

The problem of tying together quantum theory and the general theory of relativity has drawn the efforts of many bright physicists and mathematicians and has resulted in exotic and insightful, but far from fully successful, theories such as various string theories which often hypothesize this universe as being a 4-dimensional 'surface' of a realm of being with more dimensions than that.

On the whole, the results of these sorts of theories don't pass the 'smell' test for future success, seeming more like the ingenious theories being developed prior to Einstein to deal with the problems he dealt with in a surprisingly direct way—he accepted reality as being what it seems to be in terms of the best descriptions based upon solid investigations. Einstein inherited a lot of the pieces from Newton and Maxwell and Poincare and Lorentz, the latter two having been among that group of Einstein's older contemporaries who had worked themselves into dead-ends.

Accept reality.

Now I'll seemingly switch course by suggesting a symmetry break is involved when the concrete stuff of this universe emerged from a more abstract stuff, but the symmetry is different from any that would give a set of laws which would 'shatter' directly to Schrodinger's equation in quantum mechanics and Einstein's field equation in the general theory of relativity. More accurately, the symmetry-breaks which resulted in the quantum and cosmological realms are examples of a more general event, the particularization of abstract forms of being. I don't see any reason to believe that this particularization had to occur in such a way that 'dimensionality', the nature or even number of spacetime, would have to be the same at all scales of this universe.

If we consider all that we know and all the open questions, we're probably farther from developing a theory of created being in its wholeness than Aristotle was from developing a valid theory of gravity. The best news in this field is the fact that we understand what is at issue, we have a vari-

ety of interesting and difficult questions, and we can make some intelligent statements about various aspects of this realm of created being—this realm which can be explored by empirical means or by various sorts of analyses allied with empirical investigation.

I'll suggest here that we know not much more about the realms of being we can directly perceive than we do about the small and the large, as incomplete as our knowledge also is of those realms. What we do know is that the macroscopic realm is, in a manner of speaking, more intensely narrative. The universe is itself a narrative and, as it is seen as a world in light of God's purposes, has a life-story, but it's at the level of macroscopically observable entities, stars and galaxies as well as frogs and humans, that we see the emergence of some actual entities, and some plausible but as yet undiscovered entities, which are fully moral characters and not just things in a story.

How does this level of thing-like being, complete with living things, come into existence and maintain its existence? We readily admit the miraculous nature of life, but we err by not realizing how remarkable it is that this macroscopic level of narrative exists. If some disembodied intelligent creature from another universe were to be told about quantum levels of reality and about what we might call the Einsteinian universe, would he be able to posit the existence of our macroscopic realm? Would he be able to hypothesize that such a macroscopic realm would give rise to self-aware creatures, evolving in family lines and developing during individual lifetimes and sometimes even being self-aware and morally purposeful?

This macroscopic realm might result largely from matter and energy surging up from the quantum realm into the spacetime structure of this universe, but—I remind the reader—something else seems to come in from more abstract realms of being, something which differentiates this scale of being in this universe. Moral stories don't come about by adding up quantum events nor do they take on only shapes dictated by gravity.

Again: how does the macroscopic level of thing-like being come into existence and maintain its existence? Let me start by conjecturing that the raw stuff of things pours into this universe from some vast sea of more abstract stuff. This is at least somewhat in line with the re-interpretations of quantum theory proposed by Louis de Broglie and David Bohm. In their systems, quantum events are seen as having somewhat more traditional casual relationships though my understanding is that it's not necessarily true that determinism is re-established as even a possibility, not even at

the most basic level of physical events. In a manner of speaking, this sea of raw stuff could be icy so that we could skate on it. That would give us a gliding motion and an ability to turn with little effort that would be a limited freedom, a freedom easy to over-estimate but real nonetheless. More generally, I actually think we'll need to generalize our concepts of causation but I currently have no speculations in this area. Some sort of hyper-cause and hyper-effect relationships will hold in Creation, but that's hardly more than a restatement of the problem.

For now I'll limit myself to claiming that the macroscopic realm, the narrative realm in which human moral narratives occur, isn't just some meeting point of the quantum level of reality and the cosmological level of reality, though it is in large part exactly that. It isn't just made of what bubbles up from the great quantum sea of Bohm and de Broglie nor is it shaped only by the structures of Einstein. This isn't to imply occult forces operate at any scale or level of this concrete realm of God's Creation. It is to say that those three realms of created being which form the foundations of our human beings all draw separately—if that is the right word—upon more abstract realms of being. They come together to form a universe, which itself becomes a world, unified and coherent and complete, when seen in light of God's purposes. None of this forces us to believe the universe is homogeneous over those three realms so far as the properties of spacetime is concerned. Nor are we forced to believe in homogeneity with regards to a variety of other aspects of concrete reality.

## 430 Are Conspiracies Self-organizing?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=901>. It was finished and uploaded on 2011/06/21.]

Are conspiracies self-organizing, at least in part?

In general: yes. There is no centrally-controlled conspiracy run by Satanic servants or omnipotent bureaucrats. There are networks of those who inherited wealth and power and those networks are sometimes refreshed by new blood of the ambitious and talented. There are also tightly organized operations with a specific result in mind, such as the murder of President Kennedy seems to have been. In countries with a more publicly respectable class system, we can even see open domination of governments by networks of blood-relatives, marital-relatives, and school-chums. What some Americans see as a all-encompassing conspiracy, and many see in occult terms, seems to be no more than the operations of an American class system which we prefer to remain invisible. Even those who do see this situation in more realistic terms have to speak crudely in terms of insiders and outsiders because there is no socially acceptable way to speak of the classes of American society, not even in New England so shaped by the blue-blood families whose ancestors allegedly came over on the Mayflower.

In chapter 2 of *The Anglo-American Establishment*, Carroll Quigley gives far too much detail for most of us of Lord Salisbury's dominance of the British government and of Oxford through that network which Quigley calls the *Cecil Bloc*. This Bloc, which was very strong from about 1885 through 1930 or so included only a small fraction of the aristocratic class of England, but it's the sort of development to be expected in a nation where it is, or at least was, accepted that some are more equal than others,

especially when it comes to access to sources of power and wealth. The situation is similar even in the New World, but far less rigid.

*The Anglo-American Establishment* and other books by Quigley are available for free download at a website devoted to Carroll Quigley, <http://carrollquigley.net/>. Quigley, who was a rational and sometimes admiring historian of these power elites, was a professor at Georgetown University and, amongst other activities, taught a course in “how to think historically” which was apparently required for State Department and CIA employees studying at the School of Foreign Service.

I’ll remind my longer-term readers and inform my newer readers that my interest in exploring conspiratorial theories is centered around their nature as pathologies of human moral systems, including social and political and economic systems. I study pathological developments that I might understand the healthy forms of the entities. I’m following a path like that blazed by Louis Pasteur who came to richer understandings of biology partly by the study of disease. In this case, I’m studying a rather spectacular disease which has helped to destroy the possibilities of peace and prosperity which seemed within our grasp in 1910 or so, then miraculously reappeared around 1990. It would take one heck of a miracle for those possibilities to reappear in the next few decades. We may even be entering a century of war and stupidity as civilization bottoms out (we can hope), a situation brought about because of the morally irresponsible actions of Western leaders and the morally irresponsible ignorance of other Western men. The power-elites of the modern world seem to be addicted to brinkmanship and to the wars and other disasters which result and we the common folk applaud them, at least if they’re leaders of our good political party rather than those bad men who lead that other evil party.

I perhaps have written too often about so-called conspiracies without yet being able to propose a good way to think and talk about them in terms acceptable to my worldview, something of a Thomistic existentialism updated to account for modern empirical knowledge. Yet, I was inspired to travel this circuit once more by an article, *Information flow can reveal dirty deeds* at [http://sciencenews.org/view/generic/id/330731/description/Information\\_flow\\_can\\_reveal\\_dirty\\_deeds](http://sciencenews.org/view/generic/id/330731/description/Information_flow_can_reveal_dirty_deeds), which tells us “The flow of the famously corrupt corporation’s (Enron’s) electronic missives suggests that dirty dealings tend to transpire through a sparse, hub-and-spoke network rather than a highly connected web.”

We’re also told that:

And the work suggests that networks aren't just static conduits for information.

"It's intriguing," said Aven. "We've treated social networks as contained plumbing systems directing the flow of information, but we should think about them as water that carves river beds of social relations."

In other words, sophisticated criminal operations are self-forming, dynamic networks rather than rigidly structured bureaucratic regimes of the sort that we lesser folk are supposed to inhabit with smiles on our faces. The far more complex 'conspiracies' which are actually the operations of our hidden class system are still more dynamic than the specific criminal conspiracy in which the owners and top employees at Enron tricked themselves into forming.

This idea of self-organizing networks is implied by Adam Smith's speculations on the *Invisible Hand* and also by modern work on self-organizing systems. I've written about Smith's *Invisible Hand* doctrine as being morally neutral, it can work towards evil or good—see Chapter 419, *The Invisible Hand, Good and Evil*.

When human communities form, whether a social club intending to support little league and other local charities or a criminal gang or a corporation turning to illegal exploitation or a political machine masquerading as an open political party, networks of various sorts will form. How do the members of a lodge of Elks or the local VFW decide to support a new athletic group or a community pantry? Well, they'll vote eventually, but it's likely that the more energetic and more involved members would have already discussed matters, exchanged information and opinions, in various informal ways, when they crossed paths at the local supermarket or when they met at the bar during a wedding reception or a political fund-raiser. Criminals? Did Boss Tweed or Lucky Lucchese communicate action-plans by way of office memos? Did they gather information from reports produced on schedule by the research department? It's likely that Boss Tweed's desires were expressed to the boys gathered in his office and also likely that Lucky Lucchese's research department consisted of barbers and bartenders and bookies and the cops on the beat.

The situation isn't so much different with more exotic conspiracies or the general conspiratorial air of American political and economic life caused by our refusal to see that the Emperor indeed has clothes, the purple toga

of a man behaving as the superior of the vast majority of us. We don't yet have a Caesar but we have a society separated into Patrician clans and plebeians who are being reduced to a proletariat state. The modern-day Patricians aren't so tough and virtuous as those ancient Romans, but they can be just as ruthless, just as nasty, though most can't handle weapons themselves. There are plenty of plebeians willing to sign on as mercenaries for the opportunity to loot their fellow plebeians or to stomp on their faces. Or at least to grope their genitals and breasts.

Ruthless and brutal but usually genteel even when speaking to the common folk. And they know which fork to use at state banquets. They even know the rules about which neighbor to converse with and for how long. They might not have much to say of interest, but they know how long to dwell upon it before turning to the Senator's wife across the table. And many even know how to switch to the small-talk appropriate at the corn-cob booth at a state fair.

The idea that the good, as defined by some, might be served by the murder of a national leader, American or Congolese, might be discussed on the deck of a sailboat or the green of the 1st hole at a golf-course. The destruction of a local banking system in the interests of central banks and big-city banks might be planned during dinner at an elegant restaurant in Midtown Manhattan or even at a backyard celebration of a baptism or a bar mitzvah. The lower level workers, the servants of the powers-that-be, have their own networks of information and their own ways of planning the tasks which fall to them by various formal or informal paths. Undoubtedly, much of this discussion and planning takes place at second-tier country clubs or tennis clubs, at backyard barbecues in neighborhoods of houses awfully nice but less than mansions. They don't just talk about the Red Sox and Yankees during their cocktail parties, waiting for a formal request for proposals on how to deal with a difficult country. Each banklord who has an opinion or a stake in the results will contact Congressmen or friends in the State Department to push for another war or against a war or for construction of a dam in Africa. Kill an African leader or build a dam to supposedly raise living-standards in some region of Africa. The entire globe and not just the West, is but an exploitable realm for the Western elites. This doesn't mean that they march in lock-step though they seem to develop fixations in a way indicating some factor of mob psychology is at work.

And I repeat, the elite is an underground aristocratic class which some-

times engages in criminal behaviors or sometimes just behaves in secretive ways as they try to protect and enlarge their own wealth and power. What always remains true is that the rest of us are excluded.

Unfortunately, the vast majority of Americans collude in maintaining their own status as exploitable sheep so long as they are allowed some basic luxuries and a life where they don't have to exercise initiative or use their minds. Even historical facts are ignored if they conflict with that oh-so-comforting view of American history dished out in public schools. What will they do when the luxuries disappear? Will they grumble and continue to fill their roles as an underclass so long as the new television season looks promising?

In fact, I don't think the model of *network* is quite rich and complex enough to describe the structure of the 'secret' American class system, though it works for systems of communication. I think the proper model would be one similar to that of curved spacetime in modern theories of the universe. And yet there is a major difference in that the curvature of spacetime in this universe is caused by gravity, a force which—so far as we currently know—is only attractive while the forces of what might be called social-spacetime also involve repulsion of a certain type. Those in the power-elite don't want to drive all others far away only the proper distance; they're useful if only as oil-rig workers, farmhands, or compliant politicians or government bureaucrats.

Yet, I'll invite readers to contemplate the words of the American physicist, John Wheeler:

Space acts on matter, telling it how to move. In turn, matter reacts back on space, telling it how to curve.

In social or moral terms:

Social-space acts on human beings, telling them how to act. In turn, human beings react back on social-space, telling it how to curve.

Class systems set up different regions of social-space so that some are excluded. At the same time, the regions of power-elites exert a strong force on many other regions, forcing members of lesser classes to orbit the upper-class system, even though not allowing them to come too close. No,

Ernest, the difference between us and the rich, at least the established rich, is greater than having money or not. They have money, more importantly power, but they inhabit a different world than the world of the poor and the powerless.

Only the smallest of baby-steps and I'm far from happy with it, but it's worth thinking about in order that we know how to move forward in describing our current situation in our moral, social, political, and economic structures. Such a description is important not for pure 'academic' reasons but so that we know how to create better structures, perhaps resembling the moral, social, political, and economic structures so many Americans imagine to already exist.

# 431 Your World is a Narrative—Don't Let it Be Written for You

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=914>. It was finished and uploaded on 2011/07/02.]

You travel a path through a story, your life, which is intertwined with a variety of other stories at different levels, all of them coming together in that story which is this world, the growth and development of the Body of Christ in this mortal realm.

The path you might prefer to follow will often threaten to curve away from you. Maintain a high state of awareness. There is evidence from a variety of scientific studies which warn of the dangers which arise when you don't explicitly take care of your movement through Creation, the growth process of your own self and your children, a growth process of an organism with moral and intellectual and spiritual aspects.

False memories can be implanted in your minds so that you can't even remember truly where you've been, even so mundane a false memory as that of holding a glass bottle of Coca-cola in a stadium which bans glass containers: see the article *Ads Implant False Memories* at <http://www.wired.com/wiredscience/2011/05/ads-implant-false-memories/>. This is a frightening possibility in a world where governments and corporations and other powerful entities have plenty of reasons for you to accept their false histories of important historical events and of the very ways in which wealth is distributed and power is structured. They have reasons for you to live a life profitable to them.

There are a variety of studies in which the scientists 'read' minds in

one way or another, for example, to predict which songs will be popular with teenagers by scanning the brains of test subjects as they hear new, unreleased music. There are others which are showing an ability to predict our actions in the near-term future by scanning brains. The scanning of brains is a powerful technology and a dangerous technology. It can help us a lot and lead to medical miracles, but it can most certainly be misused. In general, the more powerful a technology is, the greater the harm it can cause. And we should remember that prediction can lead to causal or correlative models that can then lead to control mechanisms. As it is, sophisticated marketers, such as those at Coca-cola, have found weak but effective steering mechanisms.

The philosopher Ian Hacking wrote an important book, *Rewriting the Soul* in which he concludes that the multiple personality syndrome was the result of the creation of barriers between different blocks of memories, some of which were false memories and some of those may have been implanted by therapists who were trying to help troubled human beings. Some of the so-called “recovered memories” which tore apart families and tortured human beings who needed help were implanted by incompetent therapists. Some of the spectacular claims of child-abuse in institutional settings turned out to be the result of memories implanted by incompetent investigators. I remember reading of a case of alleged large-scale child-abuse where competent investigators came in later and said they thought something bad had occurred but they couldn’t get at the truth because of the false memories in the minds of some of the children. By that time, they were group memories. The children were remembering together what had never happened.

If you can control someone’s memory, you can control, or at least influence, many of the thoughts and actions of that human being. Stalin knew that but wasn’t so good at rewriting memories as the American politicians, marketers, and entertainers.

Are we the targets of campaigns to shape our memories of important events, murders of national leaders or entire wars? Are we the targets of campaigns to shape our memories towards someone else’s desired understandings of the economy, of actual and possible ways to make livings?

We Americans, and some other peoples as well, have remained remarkably complacent during a period when vast amounts of wealth were destroyed by needless, criminal wars and by a profitable sort of incompetence on the part of Wall St. So far as I can tell, a large percentage of the remaining wealth was transferred from productive members of society to politicians

and bankers. Was our complacency partly a result of these campaigns in which false memories were implanted, memories intended to lead us to see the scoundrels of our power-elites as serving our interest and as being good men and women? At least we consider as good the ones on our side of the football spectacular being played between the Donkeys and the Elephants. If we're Elephants, the Donkeys are evil though they all seem to have trunks instead of snouts. If we're Donkeys, the Elephants are evil though they seem to have long floppy ears sticking up from the tops of their heads.

How many Americans could think straight enough to realize that our wars to "defend ourselves" after 9/11 have killed at least 100 innocent civilians for every one innocent victim in those towers? How many Americans remember we were—quite systematically—killing or seriously injuring thousands of Vietnamese civilians each month? Yet, when someone carries out a nasty large-scale crime against us, we declare them to be agents of evil and we wage wars across the globe.

I'm going to end with a link to an article about a study showing researchers can predict some future actions by scanning our brains: *Researchers Can Predict Future Actions from Human Brain Activity* at <http://www.sciencedaily.com/releases/2011/06/110629171228.htm>. There is much potential good in this technology, as they note at the end of the article, but it's dangerous technology in a morally disordered society in which nearly all human beings, including many in the power-elites, take on the passive role of clay to be shaped by external forces.

A true human person is a human animal who tries to shape himself by intelligent responses over time to external reality. Those intelligent responses begin when we're young with firm guidance from parents and other adults with a concrete relationship to us. As we mature, those intelligent responses should increasingly be the result of our own understandings and voluntary actions towards a state of human being we'd like to occupy.

A human animal which allows itself to be shaped by whatever external forces grab hold of him is nothing like a moral person.

# 432 Liberalism and the Struggle Between Will and Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=923>. It was finished and uploaded on 2011/07/08.]

Let me propose a new definition of a liberal:

A liberal is one who values will greatly and thus is inclined to exaggerate his power over the thing-like world, over his own nature and the nature of other human beings, over a merely factual world, and—maybe—over truths.

This seems strange in light of the teachings of the very early liberals. Most, such as Locke, taught moderation in any efforts to impose your will upon the world because you would then be limiting the freedom of others, at least in many cases. Hobbes even seemed to teach that men are powerless as individuals; good men can't even protect themselves or their loved ones against the violent amongst us – without the help of Leviathan. Yet, we have to remember that other liberals, Adam Smith and John Stuart Mill, have been very optimistic about the power of the individual to take care of his needs and proper desires—however 'proper' is defined—in a world which can descend into chaos and mindless violence.

I think there is some sense to be made of this Modern Age, this Liberal Age, if we think in terms of this optimistic doctrine about the power of the human will. Hobbes willed to escape the turmoil of religious wars. Rousseau willed to escape certain sorts of moral responsibility which seemed to him to be better handled by a polity. Adam Smith willed to seek a proper gentleman's prosperity and life within the context of what might be called a 'bourgeois moral order'. John Stuart Mill was interesting in that he willed

an individualistic freedom seemingly compatible with Smith's marketplace and he also willed radical, and not necessarily empirically sensible, political reforms seemingly compatible with Rousseau's polity.

I noted recently that I've finished reading Norman Cantor's *Medieval History: The Life and Death of a Civilization* and he ended with the story of the Oxford Franciscans, most prominently Duns Scotus and William Occam, waging war upon the Thomistic concept of the mind and its importance to mankind in our relationship to Creation and Creator. Even the most brilliant of liberal thinkers, even Hobbes and Rousseau and Smith and Mill, seem to me to drive their thoughts forward not by any process similar to the Thomistic process in which a human being develops organically—mind develops as the human being responds to external reality and begins to properly re-shape himself in that response.

I might be speaking in a clumsy way as I try to summarize a lot of thought into a few words but the idea is that will, in the conception of Duns Scotus and his liberal descendants, is a pre-existing faculty which can be directed towards. . .

Towards what?

In a complex world, such a faculty would be guaranteed to get most human beings in trouble and would also be guaranteed to destroy a liberal society. If will exists, it's not capable of engaging the world in such a way as to understand our circumstances or to project possibilities. Will, unless it's a human aspect controlled by a disciplined mind, is capable only of attempting to dominate and control.

I'll stick to my views that we're born as human animals and shape ourselves, in ways appropriate for organisms, to develop aspects which can be labeled 'moral' and 'mind-like' and 'soul-like' and so forth. With this sort of an understanding, will isn't an independent faculty and neither is a mind. Yet, mind is the relationships a human being has with some plausible and honest understanding of a reality which is itself objective, in fact, a manifestation of some thoughts of God. Mind is a human being who develops a plausible understanding of objective reality and responds accordingly. Some who aren't called to lives of intellectual work or mystical contemplation still give a sense of some sort of deeper understanding of what it's all about.

The point I'd like to make is that a cognitively and imaginatively sane understanding of reality, especially but not only the part we directly interact with, is what directs morally purposeful action and the plans we might have for better and further shaping ourselves and those under our influence.

We don't live in a world where sane choices present themselves clearly. A great deal of planning and purposeful activity of a general sort is needed to become the sort of moral creature who can begin to make moral sense of this world, including our small regions. We develop habits and attitudes. We acquire the skills to understand better and to act better.

If we are morally well-ordered creatures, will is likely an illusion of sorts, a result of some with simple views of their own selves trying to justify their organic selves as being ruled by their self-conscious aspects. Organisms act as organisms, not as mere residences for agencies and faculties which exist independently of liver and toes and so forth and act accordingly.

It is the mind which can help us to move through life in ways which are morally sane. Will is mostly an illusion, the light reflecting off our wakes as we look behind and try to understand our lives. To see our moral natures in those optical displays of what lies behind us is to have already sunk into a form of insanity.

The punchline, perhaps already anticipated by my regular readers, is that I consider nearly all modern political thinkers and doers to be liberals. The anti-mind crowd has swept the modern fields in nearly all endeavors. Now begins the counterrevolution, or so I can pray.

## 433 The Final Frontier of Our Modern Moral Journey

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=933>. It was finished and uploaded on 2011/07/16.]

The so-called World War I, was actually the beginning of a war not yet over in this year of 2011, though now consisting of the hugely expensive American military bumbling about in a number of countries as our political leaders dance and speak their chosen roles of blood-soaked buffoons. That first phase of the ongoing War of the Modern Age, the phase called “World War I” was perhaps the worst if only because the European leaders who blundered and blustered into war and many of those in the masses who charged forward to the horrors were seemingly civilized human beings, a cut above those more obviously barbaric creatures who followed them. We can even claim to be their victims to some extent, that is, we became more deeply barbaric because of their stupidity and credulity and cupidity. After that first phase of our ongoing war, Winston Churchill, saw the horrors though he did little to return Europe to a civilized state in the remainder of his career. But he did speak darkly and wisely in these words quoted in Martin Gilbert’s biography of the English bulldog and requoted on page 3 of *The Present Age* by Robert Nisbet:

All the horrors of all the ages were brought together, and not only armies but whole populations were thrust into the midst of them. . . Neither peoples nor rulers drew the line at any deed which they thought would help them to win. Germany, having let Hell loose, kept well in the van of terror; but she was followed step by step by the desperate and ultimately avenging nations she had assailed. Every outrage against humanity or interna-

tional law was repaid by reprisals—often of a greater scale and of longer duration. No truce or parley mitigated the strife of the armies. The wounded died between the lines: the dead mouldered in the soil. Merchant ships and neutral ships and hospital ships were sunk on the seas and all on board left to their fate or killed as they swam. Every effort was made to starve whole nations into submission without regard to age or sex. Cities and monuments were smashed by artillery. Bombs from the air were cast down indiscriminately. Poison gas in many forms stifled or seared their bodies. Liquid fire was projected upon their bodies. Men fell from the air in flames, or were smothered, often slowly, in the dark recesses of the sea. The fighting strength of armies was limited only by the manhood of their countries. Europe and large parts of Asia and Africa became one vast battlefield on which after years of struggle not armies but nations broke and ran. When all was over, Torture and Cannibalism were the only two expedients that the civilized, scientific, Christian States had been able to deny themselves, and they were of doubtful utility.

We modern, civilized, scientific, Christian men—especially Americans—have overcome another inhibition, no longer denying ourselves the expedient of Torture, though American leaders have instituted procedures to keep it better hidden. I guess we have only to stop denying ourselves the expedient of Cannibalism and we will have completed our transition into what we wish to be. We will have fulfilled our heart's deepest desire—to be the Lords and Judges of Creation, to make ourselves into what we wish to be and not let ourselves be limited by God or Nature.

## 434 Am I an Eggregationist?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=946>. It was finished and uploaded on 2011/07/22.]

While reading an abridged version of the cosmological sections of Pierre Duhem's massive study of Medieval science, *Medieval Cosmology*—published by the University of Chicago, I paid closer attention to some mathematical discussions by later Scholastics. As Duhem noted, those discussions were very sophisticated anticipations of the concept of limit which matured in the 1800s though it was probably somewhat implicit in the writings of mathematicians of the 1700s who were developing Newton's ideas. Those discussions by the Scholastics were sophisticated but unconvincing in some unsettling way...

And I realized they were verbose and clumsy because of a lack of proper terminology, perhaps a lack of concern for the seas of words they were generating. To be fair, it's not clear they were in the position to develop the fundamental concept of 'set', but I'll put aside that major difficulty for the sake of making a point. Some of the discussions would have hit the bulls-eye if they'd had concepts and words corresponding to 'open set', 'closed set', 'least upper bound', and 'greatest lower bound'. Someone who's been through an advanced undergraduate course in analysis, or better, could easily understand the difficulties that would cause in discussing limits. Add to that the problems caused by lack of modern algebraic symbols and you've got the sort of prose that was ridiculed by Renaissance thinkers who were intellectual children compared to those late-Medieval Scholastics. Yet, the children had a point that the language was simply too much in several ways.

That led me to think about an apparent language problem in my occasional discussions about decentralizing political and economic systems. I've read some discussions, especially on libertarian sites, where some read 'dis-

tributivist' and think it means top-down distribution of power. I doubt if Hilaire Belloc, author of *The Servile State* would have defined his political and economic self-description that way. If there are some who call themselves distributivists while believing a central authority 'distributes' power, so be it.

Yet, maybe the term raises suspicions for good reasons? Or maybe it's at least inadequate? Maybe those suspicions could be alleviated, those inadequacies addressed, only by floods of words of the sort the late-Medieval thinkers generated in their efforts to discuss certain problems within their explorations of the concepts of 'infinitely small' and 'infinitely large'.

Let me assume there is a problem that can be solved, opening the possibility of more sophisticated ways of discussing and analyzing human communities.

The 1913 Webster uses phrases such as "To divide among several or many" and "To dispense; to administer" and "To divide or separate" to define 'distribute'. There is a hint of top-down organization, that is, a hint we start with some sort of given whole and then divide it, perhaps for the sake of administrative efficiency.

Can the word 'aggregate' better fulfill my goal of speaking of a complex bottom-up process, local and concrete communities forming dispersed and abstract communities—without drawing in each and every member of the community to life in a "greater" community? That greater community might be—in fact, often should be—no more, and no less, than a set of relationships between business and political and religious leaders from the smaller and more concrete communities.

The 1913 Webster defines 'aggregate' by way of phrases such as "To bring together" and "To add or unite, as, a person, to an association." So far, so good, but I'm still not happy with aggregate.

I need a word that takes in the sense of aggregate and allows for some degree of conscious, bottom-up planning but mostly evolution in a largely Darwinist sense. Evolutionary developments can be recognized pretty quickly, sometimes as they are occurring. I would bet that one mark of a society giving birth to a successful nation or even civilization is that it has knowledgeable and insightful leaders who recognize the nature of emerging structures and attributes, nurturing some and trying to head off or just delay others. The need for such leaders would increase as the human race advances. A relatively primitive and small-scale farming community might develop into a more complex community, manufacturing tools and furniture,

trading food and tools for cottons, financing that trade in goods, without a lot of prior awareness of what's emerging. So long as the community leaders nurture what is emerging, it might matter little that they can't really anticipate what might come from these new ways of living and making a living.

I'm not good at coining words but it's an interesting puzzle. How about: *eggregate*. To *eggregate* is for entities to come together in a larger-scale association of entities by natural developments, including evolution, not by centralized planning or other top-down means. So, a group of local bankers getting together to plan for a multi-community industrial complex might well be within my definition of natural association but not if a far-away government comes in to participate in any substantial way.

A group of communities developing by natural means into some association of communities would be a type of *eggregation*.

The 'e' in evolution comes from 'out' and 'volve' brings a sense of unrolling. Evolution is an unrolling or unfolding, which is somewhat false in Darwinist terms, but these sorts of coinages rarely have pure pedigrees. The 'gregate' in aggregate comes, roughly speaking, from a term meaning to gather a flock.

**Eggregate** we 'gather a flock'. Out of what already exists, a greater community is gathered by natural means including bottom-up human planning.

The collection of letters, 'eggregate', doesn't seem to be in use as a word, so I'll continue.

*Egregation* would typically be a type of evolution but there are certainly some forms of evolution which would fall outside of 'eggregation' as there would be *eggregations* which are not evolutions. For example, the formation of colonies and then multi-cell organisms from single-cell organisms would be an evolutionary development and an *eggregation*. The arising of modern human animals from hominids would be an evolutionary development but not a *eggregation*. Certain human organizations, such as a chartered bank or a chartered social services club, might be formed by *eggregations* which aren't evolutions, though they might be part of a more general evolutionary process.

I don't know if I like 'eggregate' but we need new words to navigate between those who see only those forms of natural evolution without pur-

posefulness and those who see only those forms of political organization which are planned by a team of bureaucrats and engineers working under the direction of a committee of politicians.

I'll think about it as I go about my work of developing new ways to understand this world, including the human realm.

# 435 Maybe Low-Information Voters Shouldn't Vote?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=962>. It was finished and uploaded on 2011/08/02.]

Here's an article about a mildly interesting finding that low-information voters are more likely than others to vote for the best-looking candidate: *Face Value: Looks of Political Candidates Are Key Factor Influencing Low-Information Voters* found at <http://www.sciencedaily.com/releases/2011/07/110718121726.htm>.

In more blunt terms, these low-information voters can be described as willfully ignorant and morally irresponsible. I'll make an impolite request to these voters (not that any such creatures would be reading my works): please stay home on election day and then maybe, just maybe, the votes of more responsible citizens would be worth something. By "responsible citizens," I don't mean those who read the pamphlets from the major national parties or the unions or the AARP or the national business groups. I don't even mean those who listen to speeches by one of the small number of politicians who don't stink of corruption. I mean those who might take the time to go on the Internet or—still better—go down to the public library to find out something about the latest country invaded by our evil bozos in Washington. Is it even a real country or just a paste-up job by a retreating British Empire? Is there any verifiable reason to believe that country is any real and imminent danger to the United States or any of our allies or does this seem—at least possibly—to be another discretionary war to the benefit of the military-industrial complex, including the war-mongering foundations and the 'charitable' foundations set-up and run by the power-elite? There are lots of such questions that will start to pop up in the heads

CHAPTER 435. *MAYBE LOW-INFORMATION VOTERS  
SHOULDN'T VOTE?*

2000

of those who learn something about the world and then try to make sense of what they've learned.

I tend to fear that many Americans who are proud of having voted in recent national elections probably don't know what continent Afghanistan is on and probably have an image of a country populated by evil wretches created by Satan for the specific purpose of killing us morally pure Americans. But we can-do Americans can rescue them. We can-do Americans can turn those Afghans into good people, if only they'd stop shooting at heavily armed American soldiers who suddenly show up in their villages with weapons pointed in the general direction of the villagers' children.

# 436 Fictitious Forces in the Moral World

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=980>. It was finished and uploaded on 2011/08/09.]

Slowly do I move forward in my efforts to develop words and grammatical structures and concepts adequate to describing the social and moral setting of man as he learns to shape himself, his societies, his technologies, to better reflect and take advantage of the richness and complexity of God's Creation. This richness and complexity can even be described—to an extent—as being itself a result of the human mind's development as men explore more deeply and more widely into Creation, sometimes managing to respond in ways that seem to be appropriate in practical or moral terms, terms not to be ultimately separated and not to be fully separated even in the short-term by those who wish to be wise, that is, to act and think in ways anticipating a greater and more accurate knowledge than we currently have.

The knowledge we have of Creation, and the wisdom we need to exercise even as we no more than aspire to the true and complete knowledge of which that wisdom is but a pale reflection, can be seen as having developed in our past and to be developing now as man explores and otherwise responds to that Creation, a manifestation of thoughts our Maker wishes us to share with Him. As I've said before, "God is smart." When it comes to the thoughts of God which resulted in spacetime and stuff, God knows more than freshman mathematics and freshman physics. He knows at least as much as the physics faculty at Harvard and so we should expect it to be hard work to understand what God did as Creator.

And so I turn, for a short while, to more prosaic matters of the sorts un-

derstood by those professors at Harvard and many other physicists around the world.

The so-called fictitious forces in physics are the result of forces which don't exist in all frames, coordinate systems, to the perception of all observers. (I'm being loose and colloquial in my language.)

In *The Nature of Science: An A-Z Guide to the Laws & Principles Governing our Universe* [134], the physicist James Trefil provides some technical background for this discussion and does so in clear and understandable prose:

An observer watching from the outside [as the car you're riding in takes a sharp turn, would say] you were simply continuing to move in a straight line, as any object would if not acted upon by an external force, and the car curved away from you. To this observer, in other words, it's not that you are being pushed against the door—it is that the door is being pushed against you.

There is nothing inherently contradictory between these two views. They lead to exactly the same description of events and exactly the same equations describing those events.

...

Because not all observers see a force acting, physicists often refer to the centrifugal force as a *fictitious force* or *pseudoforce*, but I find these terms somewhat misleading. There is, after all, nothing fictitious about the force you can feel pushing you against the side of the car. The reality of the situation, though, is that you are still trying to move in a straight line and the car is turning away from that straight line and so pushing against you. [page 67]

Centrifugal force can be fictitious in that various descriptions can be given of you being thrown against that car door but it's not imaginary, as Professor Trefil tells us. A broken arm or wrenched shoulder is real by any of the various descriptions.

Arguably, the force most often labeled 'fictitious' is the Coriolis force. Professor Trefil has this to say:

It is the Coriolis force that produces the swirling cloud patterns we associate with satellite pictures of storms. Air starts

to flow in a straight line from areas of high pressure to areas of low pressure, but the Coriolis force deflects it and causes it to move in a spiral path. (Alternately, we could say that the Earth rotates underneath it so that it appears to move in a spiral to someone on the planet's surface.)

Again, we can label this force 'fictitious', but anyone who's experienced the damage done by the swirling winds of a hurricane, or even seen it on television, will wonder at the use of this term.

Just to nail down the reality and importance of fictitious forces, gravity is also a fictitious force in general relativity and—so far as I know—all other mainstream theories of gravity. It is 'fictitious' because gravity, in Einsteinian theories, is a result of bending of spacetime, which is itself what is being described by frames of reference. You aren't pulled by the earth but rather do you slide down where the earth has bent spacetime by its relatively large mass. This is why you feel weightless on certain carnival rides or on an elevator which starts its descent rapidly. In that frame of the ride or elevator, you are weightless, you are moving freely in the earth's gravitational field. To "move freely" in this sense is to be standing still in the common-sense understanding.

In the same way, if you were standing on a train flatbed as it curved sharply, you'd be moving freely and feel no forces for a few seconds as you went flying off in a straight-line. You wouldn't feel any force until you slammed into a tree or scraped along the ground. Very suddenly, you would have entered a different frame of reference in which you will feel a great deal of force as you collide with something or the other.

I'll move to my main topic by quoting myself from Chapter 403, *Differential Geometry and Moral Narratives*:

The American physicist John Wheeler once summarized general relativity by telling us that matter tells space how to shape itself and space then tells matter how to move. Maybe we can play around with this metaphor:

"Human beings tell moral space how to shape itself and moral space then tells human beings how to move through life—how to act."

Following Hannah Arendt and others, I've spoken of the modern middle-class which went about its various works, engineering and administra-

tion and chemical manufacturing, oblivious to—or perhaps struggling to suppress—any perceptions that they were helping to commit large-scale crimes against a variety of innocent human beings: the Jews of Central and Eastern Europe in the 1930s and 1940s, the Ukrainian peasants in the same general period, the North Koreans and the Vietnamese and the Iraqis in the period of American self-destruction. We Americans, perhaps the junior-league imperialistic countries of Europe as well, are likely to suffer soon, at least within a generation, from the same emotional humiliations and physical hardships which a harsh reality inflicted upon the Nazi-era Germans and Soviet-era Russians when their imperial carnival rides ended.

I've noted before that Adam Smith retreated from his cheerleading for British-style capitalism long enough to ponder the frightening possibility that the sort of commercial society described in *The Wealth of Nations* might well produce citizens quite genial but lacking moral integrity not because they're willfully immoral but because they have no innards to speak of, just a pleasant smile and gentle habits.

Let me take a look at this situation from a slightly different angle to see if we can learn something or at least start developing a new way of speaking about such matters, a new way that might help us to understand how and why we get into our modern moral messes—such nice men and women sending their armed forces overseas to kill children directly and by way of destroying sanitation systems and hospitals and so forth. Maybe we could even find some possible ways out of these modern moral messes. It's unlikely we can avoid our imminent disaster because we're too cowardly, most of us, to have been riding loosely on the equivalent of a railroad flatbed, but being inside won't protect us because our train isn't just going around a sharp curve; it's being thrown off the rails and heading for a nearby field littered with boulders.

Let's switch from physical spacetime to a different sort of space, the space of social relationships. In these short pieces, I sometimes feel a need to be repetitive and I'll remind the reader again that I consider created being to lie on a spectrum of abstract being to concrete being, of the most abstract truths which are those God manifested as the raw stuff of Creation through the likes of mathematical truths to those more particular mathematical truths we can see in quantum mechanics and particle physics and on to the thing-like being of this world. I speculate that social spaces belong to a more abstract group of spaces which includes spacetime—let's call it spaces

of relationships for now, including relationships of an entity to its context.<sup>1</sup>

It's not just that our paths through life start curving beneath our feet as Dante the pilgrim recorded at the start of *The Inferno*. Those paths and the ground around them are twisting as we enter a phase of human history where some complex possibilities of Creation are now appearing, often without our conscious participation in their emergence. The very space in which our trunks and heads move are being twisted in ways often different from the twisting of the ground beneath our feet. And, yet, we're bringing on these changes ourselves by exploring Creation and responding to it, rightly or wrongly. We're bringing on many of these changes by the acts of creating civilization and exploring greater moral possibilities as well as powerful technologies.

I'm still thinking matters through and will probably outline an entire book on this subject of expanding our language and concepts for describing and analyzing our moral natures and moral lives, but I'm working on general concepts now and trying to set up my explorations of this topic. Let me go wandering about a little, as is my habit.

Assume something like an orthogonal coordinate system, a retreat from the goal of setting up coordinate-free systems as is done in general relativity and also in certain complex but non-relativistic and non-quantum branches of science and engineering. Let's assume that the y-axis is some sort of a measure of the acts of a human being which result from individualistic desires, urges, etc. The x-axis is the measure of the acts which result from communal ties, duties, etc. Be careful about literalizing these natural ways of talking as if desires belong to us as individuals and duties to us as community members. Also be aware that I'm consciously writing in a way not fully in conformity with my claims above about the nature of the individual (stuff or matter) and human communities (the 'spacetime' of our moral and spiritual lives). I'll say no more about these complexities and complications for now. In fact, I may not ever reach the point where I have a set of concepts and words and grammatical structures adequate to the task. There will be plenty of work for future generations of thinkers. And, so, I'll return to the main line of discussion.

---

<sup>1</sup>Lest there be confusion, I'll note that I don't claim that abstract truths are all mathematical, but I'll not go into details here. The main claim of this book is that being lies on a spectrum from the fully abstract—not being just mathematical abstractions, to the fully concrete—not being just physical stuff.

Imagine a circle which defines regions of individual-community mixes which are proper for a man who is the member of a certain community, say a village of pre-Celtic natives in southern England a few thousand years before the birth of Jesus Christ. There is no easy way, so far as I know, to say that the possibilities in that region are “more individualistic” or “more communal” than what I experience in the region of Ludlow, MA, USA in 2011. The ways in which they were individualistic and the ways in which they were communal were different from the ways I experience. The ways of those longfar agoway human beings combined to form a total human situation, so to speak, which was undoubtedly much different—again—from what I experience in my various communities. One obvious difference is that modern men are probably members of a variety and number of smaller communities within larger communities to an extent which would bewilder a man of 5,000 years ago.

I’m about to place a big burden on your visual imagination even though mine isn’t really so strong—it’s one of my weaker cognitive talents.

So, take on the burden as you imagine this graph of individual vs. community moving into a new direction perpendicular to the axes, individual and communal. That region defining an appropriate mixture of individualistic and communal characteristics for southern England moves through the centuries as if it were reflections in a fun-house. Worse. Unlike most assumed spaces for discussions of the physical universe, this space isn’t likely to be well-behaved. Drawing analogies to the analyses of physical space to be found in books about general relativity, post-Newtonian gravity theory in general, there are likely to be rips and tears and other distortions in the shape of that region so that singularities, and maybe other serious problems, will arise. I suspect the definition of causal regions will be far more complex where I consider causal regions for now in terms of timelike regions and spacelike regions and null-lines of special relativity. In any case, there will be great stresses which twist and turn any entity in these moral-social spaces.

I’d like to stay with that image of that region of “appropriate mixtures of individualistic and communal characteristics” as it moves forward in time, twisting and turning, tearing and—in some localities—disappearing into black-holes of a sort. In addition, new regions will appear on that graph. To the extent this analogy works, vague and poorly-defined as it is, our lives are paths through those graphs. And some, including those of us alive in 2011, suffer and enjoy rapid change, that is, great deformations to that

region within short periods of time. As we move forward, we might find ourselves moving from a 'mainstream' spot deep in the heart of that region of individualistic-communal characteristics to a marginal spot or even one outside what is considered appropriate in a world which suddenly seems so brave and so new.

As we move into strange regions, we'll feel forces upon our innermost selves even if we're moving in the straight lines we might have learned from morally well-ordered parents, teachers, clergymen, Boy Scout leaders, and others. Our moral-social space is twisting about as we try to move through it. And it's twisting about in a way undecipherable in any but very abstract terms which I believe to be above the level of abstraction of the mathematics used by modern theoretical physicists to describe the various shapes, contorted and otherwise, of possible spacetimes. From that level of abstraction, there are various lines of descent toward concreteness, one line leading to the relationships of spacetime and matter-energy, another line leading to the relationships of human communities.

One point I'd like to emphasize is that abstract being is for real. Abstractions aren't just descriptions of concrete created being. They are what concrete created being is shaped from and they continue to inhere in that concrete created being. Those moral-social spaces aren't just a bookish description. They are a reality inherent in our nature and realized by our development as a race, by the development in particular of the human mind and all that comes from the mind: technology and culture and whatever other categories of human civilized life you might like to use.

## 437 Should We Now Fear Good and Noble Scientific Research?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=997>. It was finished and uploaded on 2011/08/30.]

This article, *Hunting for a Mass Killer in Medieval Graveyards* found at [http://www.nytimes.com/2011/08/30/science/30plague.html?\\_r=1](http://www.nytimes.com/2011/08/30/science/30plague.html?_r=1), informs us that:

Modern [bubonic] plague is carried by fleas and spreads no faster than the rats that carry them can travel. [And this modern plague can be defeated by eliminating fleas and/or rats.] The Black Death seems to have spread directly from one person to another.

and

Victims sometimes emitted a deathly stench, which is not true of plague victims today. And the Black Death felled at least 30 percent of those it inflicted, whereas a modern plague in India that struck Bombay in 1904, before the advent of antibiotics, killed only 3 percent of its victims.

It's easy to understand why scientists think it might be important to recover the DNA for that earlier plague from graveyards in London. They are motivated largely by a desire to protect us from a re-emergence of this other form of the bacterium—the only part of the DNA sequenced so far is identical to that of the modern bacterium, *Yersinia pestis* for those who wish to know the name of the little beast. Scientists might find it to be

very likely that the horrible version of that bacterium would emerge by mutations in the wild or they might find it would be likely to happen under certain conditions or they might find it wouldn't be likely.

So, let's say the DNA for that horrible bacterium is sequenced. A vaccine and maybe other helpful medicines are developed. That could save many lives, even entire peoples, if a mutation in the wild brought back that earlier form of *Yersinia pestis*.

That's the good side of the coin. Unfortunately, we live in an age where the citizenry—I speak of the United States—are gentle and submissive barbarians and they're ruled by political machines which choose for them candidates for leadership positions who are a much worse sort of barbarian. With very few exceptions, the political leaders of the United States and several European countries, act as if under no significant moral constraints when it comes to unleashing death and destruction upon foreign countries.

If the full DNA for *Yersinia pestis* of the more dangerous sort is sequenced, we'd have the possibility of a truly dangerous biological weapon being developed by forcing a mutation of the modern and less dangerous form of the bacterium. It would then be available for use by these moral monsters who are the political leaders of the United States and many other countries. At this point, I have horrible visions in my head. I won't try to so much as sketch out the scenes—check out Daniel Defoe's *A Journal of the Plague Year* or any history book covering the 14th century.

What's really bad is the simple fact that a scientific research project with good goals raises fears of this sort. How far the West has fallen from even the pretense of being either Christian or a civilization. We, through our increasingly evil leaders, can misuse even knowledge gained to understand God's world and to protect human beings against a possibly great danger. We've proven capable of corrupting the most noble of ventures and then we return to the regularly scheduled program. And so much of what we do is irrational and unprofitable and seemingly done for no purpose other than the domestic political points to be gained by the politicians who can murder the greater number of innocent human beings in distant countries.

## 438 The Essence of Liberalism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1003>. It was finished and uploaded on 2011/09/02.]

In *The Liberal Mind* [95], I think Professor Minogue dismisses the query “What is the essence of Liberalism?” for reasons which are proper, but I’ll discuss it anyway because I think it to be one of those ultimately futile lines of inquiry which can lead us to better ways of understanding human nature, especially in its communal aspects, because of what we’ve learned—or should have learned—from modern empirical knowledge-gathering enterprises, especially physics and mathematics. We can start with Minogue’s warning about some approaches to understanding the modern views of human politics (nearly all of those being ‘liberal’ or other choices which are mostly far worse):

If we seek, rather pointlessly, for some essential liberal position, then we might find it in the belief that happiness and individual freedom are always in harmony. Just as liberals believe that the good of the people may always be identified with what the people want, so they also believe that we can have variety without suffering. [page 78]

Perhaps some who don’t consider themselves to be liberals also share this “belief that happiness and individual freedom are always in harmony.” And perhaps we can guess at one of the reasons many human beings speak well of freedom and do nothing to gain it or maintain it – they prefer to be happy. Happiness to most physical creatures is tied more closely to safety and comfort, to protection against suffering or early death and to a full stomach and a chance to relax and not have to work hard with brain or back. For example, nearly all the American Christians I know seem to think

that God owes them a safe and prosperous life in return for not committing the worst sorts of sins and for praying and worshiping. I'll speak no more of this difficult situation here, though I'd like to see my fellow Americans and others wake up and become aware of the terrible situation we're in, not just created by failures of regulation or some glitches in banking or manufacturing. We've let much of the foundations of Western Civilization decay underneath us and we show little sign now of being capable of dealing with this mess.

The unwillingness of Americans, perhaps most modern human beings of the West, to face reality and to respond to it was a much discussed problem and historians and other analysts, from Tocqueville and Hawthorne through Nock and Ortega Y Gasset through Barzun and Kennedy, have seen the signs and tried to warn us. In recent years, we were too busy watching television and prior generations had excuses just as strong.

We must move on, understanding what we currently are—formless puddings rather than evil brews—and then moving on to better things. If you wish, you can think in terms of C.S. Lewis' image of hollow-chested men. One sign of our decay is that we have absorbed some ideas from liberalism, mostly from the optimistic wing of liberalism and mostly ones which release us from the responsibility of taking care of our own selves and those in our families or other local communities. We believe we can have it all, freedom and happiness and we just assume one of the central powers, political or business or charitable, will be there to make sure we have it all.

But...

I'm going to head in a radically different direction, questioning whether we even understand the components of human nature and human community life well enough to have meaningful discussions based upon such aspects of human life as 'freedom' or 'happiness'. My goal is not to produce another critique of political thought and behavior in the modern world, though I have to engage in those sorts of critiques at times. My goal is to provide a framework and language for discussing human moral communities of all sorts, including political communities. That might not be a goal to be achieved in a single lifetime nor by one man. In fact, this new understanding of Adam in what is truly a new phase of God's story, our world or even the entirety of Creation, is a substantial part of what needs to be attained to build a foundation for a new civilization.

I'm in the process of writing my first list of assumptions for a run at providing for richer and more complex discussions of human social, moral, po-

litical, and economic structures and our paths of development as we respond to these structures and to other realms of being. For now, I'll make public some of my ponderings about the nature of human moral development—key to the entire human organism in so far as he is a potential person, that is, an entity which is unified, coherent, and complete in the way of the Father or the Son or the Holy Spirit.

I consider created being as, in one sense, a spectrum running from abstract truths to concrete things. That is: “Things are true,” as St. Thomas Aquinas claimed, and “Truths are thing-like,” as I've claimed. It's also necessary to bear in mind that concrete being is shaped from more abstract forms of being grounded ultimately in truths God chose to manifest for this particular Creation. It's unclear how we can talk about the different layers of created being, that is forms of being with different degrees of abstraction and concreteness.

In line with both Aquinas and modern brain-scientists, I consider mind to be not an entity but rather a set of relationships between the human organism and its environments, including itself in some recursive ways. This mind is shaped, at least in a healthy and robust form, by active responses to its environments, maybe the entire universe which I call this world when seen in light of God's purposes, or even—miraculously, the entirety of Creation.

With that in the background, the idea behind my slowly ongoing efforts to develop these new ways of understanding human nature, in its individual and social aspects, is to borrow from the sophisticated analysis physicists and mathematicians have made of spacetime, matter-energy, fields, and so forth, abstract to an appropriate level where we meet up with the abstract forms of being which we draw upon in forming our minds, abstractions still present in the most mundane of physical things.

I think a good qualitative understanding of our human moral natures has to be built first on the recognition of the true developmental nature of an organism, goal-oriented development, intentional development. This is true not only of the human brain and our skills in moving through the world but also of our social and moral relationships. Obviously, there is a great, almost recursive, mess here with mind and human moral development and social relationships not so separable. Some extreme individualists, especially modern liberals of the left-wing or centrist or right-wing variety, will have problems with my way of speaking now that it's becoming clear that I'm claiming human individuals aren't some sort of free-standing

metaphysically-defined entities but rather complex entities intertwined with their societies and physical environments and formed by active response to specific environments. As I've claimed before: Einstein didn't have a paleolithic mind stuffed with the schematic knowledge of the 19th century but rather did he have a mind shaped to a more complexly considered knowledge of that 19th century. He was more of a German and a European than he himself might have admitted.

I'm writing about qualitative understandings at various levels of abstraction and concreteness. Here's a very crude diagram to make my goals a little more explicit, especially to those who haven't been following my work for the past few years or more:

Something like that.

Physicists and mathematicians have given us an understanding of the abstractions at Node Y1. I think their work includes at least an implicit understanding of what might be at Node X. If we can clarify that understanding of Node X a bit, we can move to Node Z1 and then to Node Z2. The abstractions at Node Z1 won't be mathematical in terms of quantification, so far as I can anticipate matters. But I suspect that mathematics, even including its quantitative fields, is grounded upon abstract forms of being which are more qualitative than quantitative. Relationships are primary and entities, even mathematical truths, come into existence because of a relationship. (Pending relationships cause the fuzziness of quantum mechanics rather than any absolute uncertainty.)

The language is fuzzy and necessarily so. I'm trying to develop language for talking about more abstract realms of being and am forced to twist and re-use existing language to do so. I think I can do better as this project moves forward but I know there are others out there who will be able to do better, perhaps some reading this essay soon after I post it. In any case, I have a very preliminary list of assumptions about the properties of that realm of being in Node Z1 and will try to move all the way up to Node X.

I'll end with a simple warning not to take the diagram itself literally. I don't think there is anything wrong with it so far as such charts of knowledge go, but my own view of knowledge would imply the situation is much more complex, recursive, interactive, iterative. . .

Chose your own favorite buzzword from those which populate serious and popular works telling us about modern empirical knowledge. This essay itself could be considered to be somewhat recursive—I'll now point back to the starting-point. I think liberalism, at least in its more classical form, is

composed of efforts to answer questions raised by new empirical knowledge of human nature (Node Z1). However poorly formed some of the questions of liberal thinkers might be, as bad as some of their answers have proven to be, they were intelligent efforts fairly early in this era of great expansion in empirical knowledge. Most of the answers proposed by the other schools of modern thought were worse, for example, various schools of socialism and fascism. Conservative and traditional forms of thought couldn't, on their own resources, provide direct answers, being so inclined toward protection of what was perceived as good in inherited knowledge and attitudes and ways of life as to be largely closed to new opportunities and inclined to retreat into various sorts of ghettos when facing those opportunities in the form of problems or outright threats.

What we need, in terms set by this essay, are thinkers who can move up to higher levels of abstraction to figure out how our human natures and communities become more complex and richer in possibilities (even the most passive of individual human beings have natures which are more complex just because of our more complex communities). I'm suggesting that we can learn many tricks from modern physicists and mathematicians and might very well be able to borrow directly from what has been learned from the exploration of spacetime, matter and energy and fields, and even the most abstract regions of mathematics.

Slowly, so slowly as to be quite frustrating, I'm moving forward and have already written out a very tentative list of assumptions as to the structure of Node Z1 in the diagram above. It will likely take months, perhaps a year or more, to settle on a good list of assumptions and to do much with them. Don't worry—I'll be pestering my readers with preliminary versions.

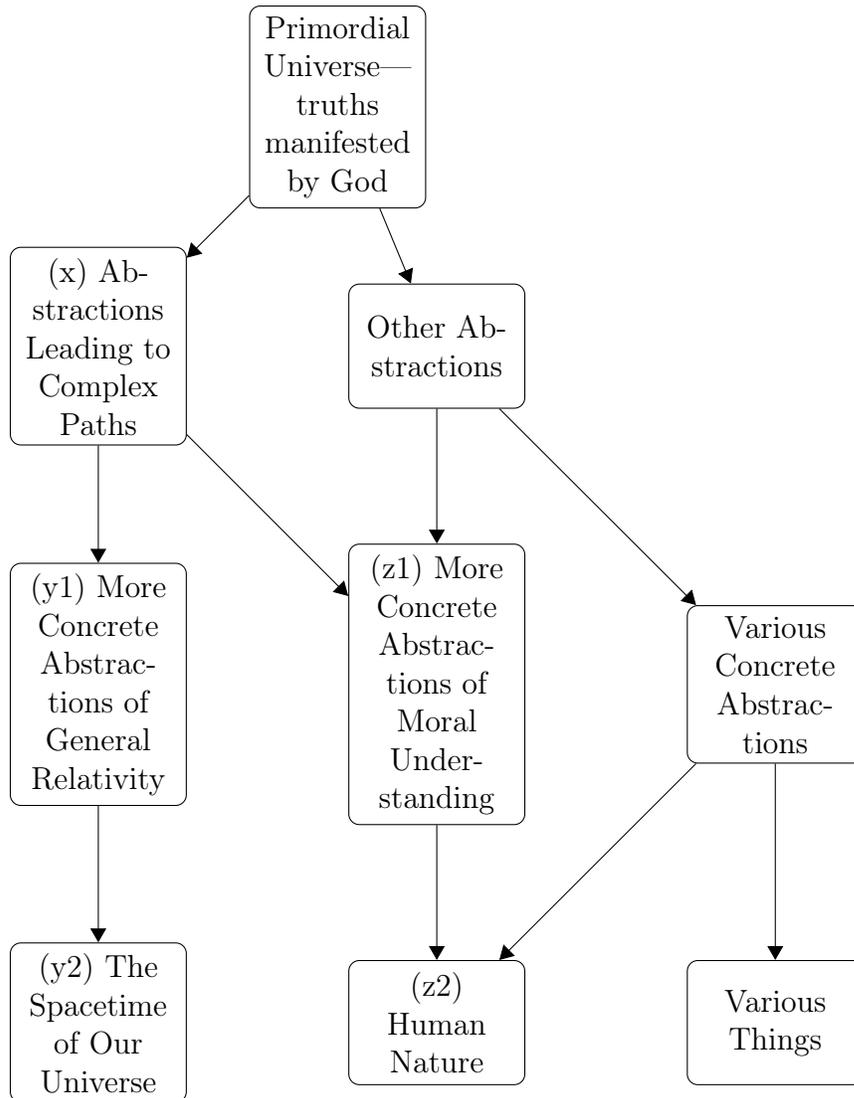

Figure 438.1: Simple Relationships of Abstract and Concrete Levels of Being

# 439 Economics and Politics: We're Retreating into Barbarism But We'll Advance Anew

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1007>. It was finished and uploaded on 2011/09/03.]

I've been reading Albert J. Nock's biography of Thomas Jefferson which is available for free download at <http://mises.org/books/jefferson.pdf> through the generosity of *Ludwig von Mises Institute*.

In that book, Nock deals with lines of thought in Jefferson and his colleague, friend of his younger and older years, John Adams. Jefferson (almost) saw the American Constitution as having been engineered to make possible a grab for power by the non-producer class, the exploiters as we might label them. The qualification is because of Jefferson's refusal to quite conclude in a clear manner that the political activism of most of the Founding Fathers was tied strongly to their economic interests. He kept separating the issues and writing, acting as if the Federalist leaders wanted a country suited to financiers but their Federalist politics was driven by separate political beliefs.

Whatever incompleteness there was in Jefferson's overview of matters, he saw that the financiers, speculators, stock-jobbers, etc. were the dangerous interests in a country sitting on the edge of a vast continent of unclaimed wealth. For a good century and a half, the American greedy elite were able to satisfy their desires while leaving enough for the American producer classes. We may be seeing the end-game of this grab for power as bankers, politicians, certain types of industrialists, academics who support the power elites, and various others may well be in the process of destroying the disci-

plined and skilled laborers, the farmers, the entrepreneurs, the small-town bankers who toiled honestly—for short hours sometimes to be sure – to turn local savings into local mortgages and loans for local businesses. These producer classes, though they have been remarkably and frustratingly passive in the face of abuses of power, are perhaps the last remaining components of a true republic.

I'm going to try to step back and to look at matters I've written about before with a fresh view, though it's hard to do this when I'm living through an ongoing crisis which might lead into a total collapse of the West. My emotions are at a high level, though that is perhaps not bad according to some modern brain research which indicates emotions can help drive and focus rational thought.

Let me start a short journey which will zig and then zag...

In some of my writings, I've proposed that our modern governments, as corrupt and exploitive as they've become, are mortal versions of organs which will be part of the Body of Christ in the world of the resurrected. I've also proposed that truer forms of governments, corresponding more closely to those organs of the Body of Christ, will arise by natural processes. There will be evolutionary processes of a sort, Darwinian selection processes which will destroy those political forms, economic as well, which aren't developing towards that Body of Christ. We and our descendants may not see more than a hint of the organs of the Body of Christ and, even if we do see hints of the form of those organs, they're not likely to develop properly in this mortal realm. So why is it worth the effort to develop this sort of view of human politics?

Let me try to summarize some of my claims which underly my efforts to understand man's role in God's Creation:

1. Man is born a human animal, a bit on the unique side but part of the animal kingdom in all important ways, including in his mortal nature.
2. Man has a brain which he can shape by responding actively to his environments, to environments he can learn about, to the entire earth, to the universe, to all of Creation. By properly responding in this way, a man is forming a mind which can, in principle, encapsulate God's manifested thoughts.
3. Human communities evolve through long expanses of history and develop within their own lifetimes.

It is a matter of Christian faith that some of us are being formed into members of the Body of Christ but we know little about what that really means. I take this to a radical conclusion: all human beings, including any who will not be saved, are members of a number of communities which are part of a selection process not so much different from that of the earth-bound biological realm, and I include those nasty aspects which can be described as “red of tooth and claw.” The selection process is at least somewhat like that of early single-cell creatures coming together in colonies and learning to live as one organism.

Yet the selection process must be much different from the formation of multi-cell organisms. Those who become members of that Body of Christ won't be fully merged to become no more than a heart-cell to be used for the good of the entire organism. We will each be used for the entire organism, for sure, but we'll also remain morally well-ordered individuals.

There are exploiters and producers, according to Jefferson and many others—including me. The exploiters are largely morally ill-ordered people filling legitimate, or plausibly legitimate, leadership positions. I think many libertarians and anarchists would agree that the exploiters are morally ill-ordered but would balk, to say the least, at any claim that the roles filled by those exploiters are legitimate, though we may not yet know exactly what those roles are. To be clear, I'm claiming something for which there is no strict analogy I know of, but imagine the space where your heart should be but it's filled with a cancerous mass of cells which does some pumping of blood but will eventually destroy the entire organism.

This is how the situation might have been summarized by two well-informed men of high intelligence: Isaiah and Jeremiah.

God's story will move on. Our modern efforts to form something which might be called the political organ of the earthly Body of Christ have failed. It's not hard to see why and it's quite hard to see how humanity will move in the right direction to make another good try.

I can make a few more plausible comments, at least plausible to those of us who accept the Biblical (mostly Pauline) view of the Body of Christ as referring to a real entity which will arise: a creaturely equivalent to the Holy Trinity, but much more highly populated. There will be many human persons in the Body of Christ but only one Body in a manner analogous

to the Trinity where there are three Persons in one God. Now for the comments:

1. The Body of Christ and its individual organs will evolve from the bottom-up in a process at least somewhat similar to biological evolution, natural selection intertwined with the processes of chemical evolution of genes and regulatory processes that can set existing genes to different levels of activity. The detailed processes will be different but the complications and complexity will be similar.
2. A promising organ of politics in the evolving Body of Christ still has to develop properly and that requires morally well-ordered human agents who make at least adequate responses to the problems and opportunities they face.
3. We of the modern West (say 1800-2011) failed to form a stable and morally well-ordered political organ in our efforts to build a democratic, bottom-up, approximation to this organ. The predatory activities of the gangsters who flowed into the top levels of the hierarchies of our centralized governments and centralized banks and centralized corporations and so forth was an important factor in this failure but the most important reasons were the inability of the common citizens to fulfill the duties they claimed to take on even as they sought to take advantage of the rewards of being citizens of countries which were formally republics.
4. It's not likely in my opinion that the proper political organ of the Body of Christ will be structured according to our current catalog of political forms. In any case, we Americans perhaps made our effort a bit absurd by trying to build what was alleged to be a bottom-up system by top-down planning carried out by an elite gathered in Philadelphia behind locked doors and with the agreement that no private notes would be kept and no information given to non-participants.
5. There is the additional complication that any gathering of political activists will serve particular purposes, as the Constitutional Convention of the United States served the centralizers of power and—eventually—those who would gain power and wealth by the ways and

means of centralized banking, such as financing debt for governments, allowing them to spend more money than they truly have. To be sure, I do believe there were a few moral giants amongst the Founding Fathers and the regular guys amongst them, even most of the scoundrels, were more constrained in their self-serving ways by moral habits and custom. It remains true that they had feet of clay and a few had feet right up to their necks.

6. Over time even in morally well-ordered countries with centralized governments, we can see the impact of the fact noted by Lord Acton: Centralized and powerful governments attract men with the moral character of gangsters.

As is true of all the organs of the Body of Christ, the political organs in their earthly form will evolve and develop by the processes which are part of God's Creation. We can see those processes at work in biological evolution though we must go through the hard work of abstracting from our concrete being towards that domain of truths manifested by God, the domain I've called the Primordial Universe in prior writings. Once we have some of those abstractions in mind, we can move back down towards understandings of our moral natures and of our communities.

In Chapter 438, *The Essence of Liberalism*, I talked of one proposal for dealing with the increased complexity and richness of modern human communities and of the modern understanding of man as an empirical creature. We must develop new concepts and words and wrote, as I have before, of borrowing from modern physics and mathematics. After all, I imagine a creature such as man is at least as complex as the stuff of which he's made and the spacetime he moves through. The interested reader might wish to check out the diagram I put in that chapter to show what I mean by abstracting from the concrete and to show why I advocate doing this.

This is the work of those who are the abstract-thinking members of the Body of Christ. And this work of achieving an understanding adequate to our modern situation has to be done before the general citizenry can understand their own communities well enough to find ways to select better leaders and to force straying leaders back on track.

I often speak in harsh terms towards all of us in the modern world and it certainly is true that the simplest of men should detect something is deeply wrong with modern human communities, yet it's the intellectual and spiri-

tual explorers of Creation and those who make sense of those explorations in the form of philosophical texts and novels who have failed just because they have to do their work first.

And I think the work is being done, a bit late and a bit slowly. In some future age, perhaps it's even opening now, that work will be done and the citizenry can do its work. God's story will advance as we move forward towards a better, but still incomplete and defective, earthly version of the Body of Christ.

# 440 I Have a Problem with Many Conspiracy Theorists

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1016>. It was finished and uploaded on 2011/09/12.]

I'm speaking of rational 'conspiracy theorists' which means those who claim, rightly, that power-elites develop and are quite capable of engaging ruthlessly in focused criminal conspiracies when their interests are threatened. I don't even know how to make a pitch to those who think there is a tight-knit conspiracy run by Satan or Jesuits or Freemasons or the like. To carry out such a conspiracy would require that the central managers would be able to fully understand and control this world. It would require they be as smart as the Creator.

Something of a rational and more limited conspiracy is not only plausible but likely in a world where some might be able to control many for their own purposes. In terms used by Thomas Jefferson: exploiters divide themselves out and try to form a class that dominates the producers. Jefferson seemed too willing to assume that some Providence or providence would protect American producers and keep the exploiters under control. His friend, then non-friend, then friend again, John Adams, agreed about the division between exploiters and producers but didn't think there was much chance the exploiters could be controlled unless the United States recognized an aristocratic class of some sort and put specific constraints upon them, even if only the constraints of honor which have sometimes done a fair amount of good in channeling the exploiters in somewhat better directions. Of course, when Vikings are attacking there is an obvious role of honor for warlords. It's not clear what legitimate role there could be for our modern-day central banks and big-city banks. They seem to exist only

for their own purposes.

Our modern bankers and other financiers who sit heavily in the centers of our modern day spider-webs have no skills, at least none they exercise, but those of wrapping governments, companies, and individuals in fibers of debt. Let the victims sit in those fibers until they soften up, rot a little. That works better for a hungry, liquid-sucking spider than it does for an entire banking industry. Predatory bankers tend to destroy the societies they would use for their own enrichment.

I, of course, am not speaking of honest banks that still, even in this age of corruption, try to turn local savings into local mortgages or business loans. I'm not speaking of banking operations which finance ongoing or new companies by loaning on inventory or by offering even risky loans. I'm speaking of banks, and other investing operations, which seek control of wealth created by others. Kodak and Apple aren't likely as start-up operations nowadays. If some corporation doesn't back-engineer and steal their product, an investment banker will steal the company as soon as it needs a loan to meet payroll. Local savings banks aren't set up for that sort of work. Maybe they can help the local grocer through cash-flow problems but not a start-up manufacturer.

There have been other periods when bankers, and their allies amongst high-spending politicians, were dominant. There were still other periods dominated by warlords or by tribal or nationalist politicians more interested in expansion of various sorts than they were in looting their own people. There were even periods dominated by the producers, such as the Colonial Age of North America and the succeeding century or so. That even led into a mixed period when we had, in a manner of speaking, Henry Ford and Andrew Carnegie mixing with J.P. Morgan and John D. Rockefeller.

Bankers have not always been dominant, not even in sophisticated societies. There are times when the men with guns, or the barbarians with spears, will rule. Still, it's true that rich societies eventually get soft and corrupt so that bankers of a certain type can obtain vast sums of money and gain great power over productive assets and also governments. We're children of our age and even rational observers tend to think the ways of our age are the ways of every age. We live in a corrupt age, an age of moral decay, when bankers and corporate cams and political cogs rule.

So, I'm going to firm up a recommendation I've made in a loose manner before. I'll break it down into a few points.

1. Humanity tends to separate into at least two classes: exploiters and producers to use the terms of Thomas Jefferson.
2. The exploiters fight against other exploiters for power and wealth, mostly being united in their belief that the common folk are there only for the skinning.
3. The failure to recognize and properly constrain powerful families has resulted in an illusion of secret conspiracies though a little knowledge of history would tell us that members of the exploiter class regularly have committed crimes out of passion or to achieve their private goals. They are what they are partly because of the belief that they own the earth and the rest of us are tolerated to the extent we can serve them.
4. There is no occult, superhuman, supernatural core to these social processes. The exploiters are human beings from families founded by aggressive men of some high levels of talents. They are human beings. Often the talent of the founder isn't transmitted to sons or grandsons.
5. I repeat: the men from exploiter classes commit crimes. In some periods, they have no reason to pretend otherwise. Warlords can freely murder peasants or have their way with the daughters of the tradesmen in villages. In such periods of history, there is no recourse that doesn't involve death to those in the lower classes. Nowadays, the exploiters have good reasons to commit their crimes, say the murder of President Kennedy, as mafioso-style criminal conspiracies.

So what does this mean? A lot of the conspiracy theorists are intelligent and well-read men and women who know a bit of history. Yet, they concentrate fully on the present danger at a time when the present danger might be disappearing to make room for the next danger. In terms from military strategy: We should be careful about putting our greatest efforts into preparing to fight the last war. While I would like to believe we will be heading into a period dominated by producers, it seems likely to me we'll be entering a period dominated by local warlords who can provide police and military protection. The would-be bankers might have to return to honest work as merchants and traders, even having to bear risk themselves without having politicians on the payroll who can cover losses with taxpayers' money. I make no claims to be reliable in my predictions, but the main

point is that we should try to anticipate the future well enough to see the dangers we'll be facing there rather than concentrating on the dangers in the rear-view mirror.

# 441 The Exploiters Are Setting Policy

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1032>. It was finished and uploaded on 2011/09/20.]

On a regular basis, commentators of various viewpoints will re-evaluate what we Americans have done in Afghanistan and other occupied countries, wondering whether we could have acted more effectively. Some even express a bit of concern for the impact of our actions on the innocent civilians who have been killed or injured or impoverished in what seems now to have been a useless war against an enemy which was likely never that dependent upon an Afghan base, an enemy whose leader—one leader anyway—had stated a desire to bankrupt the U.S. by drawing our country into wars expensive in financial and moral terms and maybe expensive in lives.

The thousands of Americans killed, the greater number maimed or otherwise injured seriously, is—in ‘realistic’ terms pretty cheap compared to the losses of in the Pacific Theater of World War II and trivial compared to the price paid by the Russian peoples in the European Theater of that same war. Yet, each of those dead or maimed was a son or daughter, husband or wife; in a word—human beings. The same can be said of the far larger numbers of Afghan and Iraqi civilians and soldiers killed, maimed, or injured.

We Americans, and the allegedly ex-colonizing peoples of Europe, have entangled ourselves in various countries of Asia. Perhaps it is only coincidence that we particularly concern ourselves with countries rich with oil or natural gas or with those countries which can provide routes for getting oil or gas out of a landlocked country in such a way that Russia, China, and probably India can be cut out of the action or forced to pay our price. I

doubt it's much of a coincidence.

Let me leave moral issues in a state of suspense to ask a question which most, not all, commentators ignore:

If the issue is access to oil and natural gas and perhaps some other natural resources, why don't we deal with this important economic issue by way of economic means? We claim to believe in economic freedom. Why don't we enter good-faith negotiations to buy the oil and natural gas and whatever else?

When a brutal dictator or an elected leader makes a plausible attempt to defend his country's interests, we invade and conquer, typically making the situation much worse for the common folk of that country. We spend lives and wealth to get what was often provided to us in the oil markets. Maybe we drive the price down but I'd be hard-pressed to believe that our savings in that way come close to paying for the bases and soldiers and weapons systems which help us save pennies at the gas-pump. And those savings might be imaginary.

Of course, we can say that Saddam Hussein was a bad man who needed overthrown because he supported al-Qaida. . . Well, he didn't really but he had weapons of mass destruction and factories for making more. . . Well, he didn't but he used some of those weapons of mass destruction, the ones he couldn't make, in the war against Iran. . . Well, if he used what he couldn't make himself, that raises the potentially embarrassing question: where'd he get that poison gas? And that might lead to just enough research to tell us that Hussein had avoided assassination attempts over the years because he knew all the tricks of the jackals, professional murderers in the employment of the Western governments and banks—he had been trained as a jackal himself by the CIA in the early 1960s. (See the books of the economic hit-man John Perkins for a frighteningly plausible, and historically consistent, tale of the brutal though cheaper ways in which the West got its way in less powerful countries. It was in a quick browse of Perkins' *Confessions of an Economic Hit Man* where I read that the term 'jackal' is used for the professional murderers, employed by the CIA or other agencies in the West or sometimes contracted from outside gangster organization.)

Let me cut through a lot of trash-talk and sloppy thought, even by those who see the basic truth of the situation. I'll diverge a little, of course, by referring to the two previous chapters in which I spoke of the claims of

Thomas Jefferson that human beings can be roughly sorted into the two classes of exploiters and producers – Chapter 439, *Economics and Politics: We're Retreating into Barbarism But We'll Advance Anew*, and Chapter 440, *I Have a Problem with Many Conspiracy Theorists*.

The Western powers, most certainly the U.S., are ruled by politicians and bankers and corporate executives whose skills, and probably basic inclinations, lie entirely in the sphere of exploitation.

Somewhere in the American Empire series of novels, I believe in *Empire*, Gore Vidal tells us that John D. Rockefeller and J.P. Morgan, bankster equivalents of Attila the Hun and Louis XIV and N. Lenin, despised the likes of Henry Ford and Andrew Carnegie. Those poor, deluded fools were interested in becoming rich, and leading rich lives, by creating wealth. What idiots. It's far better to steal control over the wealth created by others, particularly since it can lead to control over the very minds and souls of other human beings. If an exploiter works things right, he'll even be able to stomp on the faces of other human beings or to do the equivalent in the psychological or political realms.

As I've discussed before in various ways, this is a situation where legitimate roles in the developing Body of Christ, bankers and political leaders, can be filled by parasitical organs. Alternatively, we can say that invaders turn legitimate organs into cancerous masses inside that Body.

Henry Ford and Andrew Carnegie might well have negotiated with Hussein or with more decent and more legitimate rulers who were destroyed by the Western powers. The give-and-take of free-markets were home to such men, though they certainly were capable of lesser abuses than those of Rockefeller and Morgan. A free-market can be corrupted by lesser sinners but it can still retain at least some of its moral order so long as the participants are morally well-enough formed. This means the greater and lesser entrepreneurs have to be dedicated to making wealth by way of legitimate means and the citizens have to be strong enough and insightful enough to resist the lure of bribes offered by the exploiters—bribes to be paid back at high rates of interest by future generations.

The West is at war with much of humanity because the West is ruled by those who like to rule rather than those who lead, which class includes those businessmen and bankers and lawyers who are part of wealth-producing enterprises. Moreover, the common folk of the West – for various reasons including truly lousy school systems—are incapable of understanding these issues of human morality, of human politics and economics. So far as I

can tell, the ‘non-ruling’ leaders of the West, religious and intellectual and others, haven’t a clue about these major realms of human reality.

For now, I’m only interested in the understanding and not in the ways in which we can use a better understanding of human community life, in good and bad forms, to do better in the future. As I’ve said before, this is a long-term effort. Rome wasn’t built in a day and Western Civilization wasn’t either. The very speed with which the United States was built might well explain the instability and the rapidity of corruption. Various commentators were speaking of deep moral defects in the American citizenry and the American republic very early on. As I noted in Chapter 408, *The Need for Abstractions in Moral Self-understanding*, serious defects in moral reasoning and the consequent behavior were to be found in the New England mind by at least the time of King Phillip’s War, in the 1670s—see [http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://en.wikipedia.com/wiki/King_Phillips_War) for some background information. Though thinkers from the American South are often spot-on in discussing the moral defects of Northerners, they had their own blind spots, effectively ignoring not only the moral but also the practical problems of slavery. The difficulties of assimilating, at any level, a radically different people is the most important of the practical problems. There were even Southerners who saw that problem arising and kept on buying slaves.

The United States was the most likely center for a rebirth of Western Civilization, being both marginal in geographical and cultural terms and also substantial in wealth and population. Early on, we Americans refused to take on that responsibility. Our general refusal to take on serious responsibilities showed in the leaders we chose, men who like to exercise centralized control over that which they don’t understand and can’t build. We chose to be ruled by exploiters rather than producers and it would seem that much of the world is paying for our moral irresponsibility as a people.

I’ll write here as if I were a Biblical prophet. After all, we learn from Isaiah and Jeremiah about how to speak about a Creator who remains active not only as the God of His individual creatures but also as the God of human communities and human history. At least we Christians should learn how to so speak from two prophets who were intelligent and knowledgeable about not only the earlier books of the Hebrew people but also about the politics and history of their times.

The Creator isn’t through with the peoples of North America. We are being humbled, though we are just beginning to realize something is going

wrong. We are in the early stages of what seems to be a pulverization, a crushing, a smashing of a sort which would frighten those who saw the riches of Babylon, the power of Rome, the glories of Beijing destroyed. Rome and Beijing have been destroyed more than once, but historical forces were focused on those locations and the peoples who lived there. They could suffer for their stupidity or moral irresponsibility, sometimes for their plain bad-luck, but they couldn't escape the fate of being fathers to greater civilizations. We North Americans will also suffer to keep alive the possibility that our children or grandchildren will exercise moral responsibility though we had chosen to remain perverse and self-centered adolescents.

The prior paragraph is a prophecy and not an attempted prediction. I think it is quite plausible, and it might prove to be a true picture of the future but I'm merely stating a morally well-ordered goal toward which my work is targeted. As a Christian, my morally well-ordered goal is centered upon the Creator and my understanding of the story He's telling.

I'll quote Thomas Szasz as quoted in a recent weblog entry by Jim Bovard at his blog-site, <http://jimbovard.com/blog/>:

People dream of making the virtuous powerful, so they can depend on them. Since they cannot do that, people choose to make the powerful virtuous, glorifying in becoming victimized by them.

Producers, though they might be morally sleazy in their own characters, are engaged in an inherently moral enterprise. Exploiters, though some might well be admirable in their personal characteristics, are engaged in an inherently immoral enterprise.

Make of the above stew what you will. I'm still exploring and testing lines of thoughts as well as ways of speaking which will allow me to make a greater sense of human communities, past and present and future.

# 442 Is Power for the Sake of Power the Same as Power Earned by Productive Achievements?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1036>. It was finished and uploaded on 2011/09/21.]

The article, *Power Corrupts, Especially When It Lacks Status* found at <http://www.sciencedaily.com/releases/2011/09/110920121608.htm>, explores a very important subject and extends a line of research which is decades old or centuries old if you wish to consider the work of Jeremiah and Plato, Tacitus and Augustine, Dante and Goethe, and so on. That older understanding is substantial but poorly focused in many ways. This might be an area where disciplined science can add to the works of those philosophers and theologians and poets.

The research discussed in this article, which the scientists wisely recognize to be preliminary, tells us much and points to further questions and possible lines of analysis. In the article, we read:

In a new study, researchers at USC, Stanford and the Kellogg School of Management have found that individuals in roles that possess power but lack status have a tendency to engage in activities that demean others. According to the study, “The Destructive Nature of Power without Status,” the combination of some authority and little perceived status can be a toxic combination.

...

According to the study, possessing power in the absence of status may have contributed to the acts committed by U.S. sol-

diers in the Abu Ghraib prison in Iraq in 2004. That incident was reminiscent of behaviors exhibited during the famous Stanford Prison Experiment with undergraduate students that went awry in the early 1970s. In both cases the guards had power, but they lacked respect and admiration in the eyes of others and in both cases prisoners were treated in extremely demeaning ways.

...

Social hierarchy, the study says, does not on its own generate demeaning tendencies. In other words, the idea that power always corrupts may not be entirely true. Just because someone has power or, alternatively, is in a “low status” role does not mean they will mistreat others. Rather, “power and status interact to produce effects that cannot be fully explained by studying only one or the other basis of hierarchy.”

I’ll suggest a new idea to be explored as scientists go forward in exploring the uses and abuses of power by one or more human beings over others: power tends strongly to corrupt when it is gained by the struggle to gain power and may not tend so strongly to corrupt when it comes as a result of productive achievements.

## 443 If You Seek Power for the Sake of Power, You Should Keep Fear and Stress At High Levels

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1054>. It was finished and uploaded on 2011/10/01.]

Soon after writing the weblog entry upon which the previous chapter, Chapter 442 was taken, I responded to an article published on the Web, *Who's the Best Leader: The Saint or the Scrooge?* found at <http://www.sciencedaily.com/releases/2011/09/110928105720.htm>. This article deals with a different but similar question: When nastiness threatens, do human beings prefer to be led by men of moral integrity or ruthless and unscrupulous competitors? As usual, I'm addressing a study under the assumption it's set in the framework of what I consider an inadequate view of our world, a world which is showing itself to be greatly more complex, very much richer, than that inadequate view can allow for. I'm heading toward a richer and more complex way of speaking about our world, especially our human communities, but that way is itself built upon a foundation of a richer and more complex and more complete understanding of created being.

In fact, the title of this essay reveals I'm making no unique claims so far as a basic understanding of the facts goes. Novels such as *1984* and *Fahrenheit 451*, serious history books about Stalinist Russia, or journalistic history works about the United States from at least World War I can tell us a lot about the manipulation of fear levels by leaders wishing to guide a human herd into wars or into persecution of some alleged internal enemy. A serious reading of some good general history books will start to reveal some

fuzzy patterns in history. I'd recommend Jacques Barzun's *From Dawn to Decadence* or the works of John Dahlberg, Lord Acton. Start with books by or about such serious thinkers and follow the trail of references as suits your tastes and interests. We shape our minds by such active responses rather than becoming "invincibly ignorant" by adopting a "perverse literacy" in which we accept mainstream accounts of reality and never strive for a different or deeper understanding. (The quoted terms are those used by Thomas Jefferson to describe a problem he already saw developing in the American mind during his lifetime.)

Let me make a claim which will allow me to pull some of these ideas into a greater coherence. The common traits of systems labeled as 'fascist' by knowledgeable commentators are the schematic and artificial nature of the authority structures and the way in which authority is imposed from above, imposed by those who wish to hold power. If we live in a dynamic world, a world in which family-lines of organisms and family-lines of systems evolve, a world in which individual organisms and individual systems develop over their lifetimes, then we should be patient, holding mostly to behaviors and attitudes which overlap those of libertarianism and even anarchism. We should be unwilling to hand family authority to any governments, reluctant to hand local authority to centralized governments, inclined strongly to local agricultural and manufacturing enterprises while engaging selectively in larger-scale and wider-scale enterprises when appropriate. We should always be ready to trade with other local regions and to engage in fairly open cross-financing with other local regions, biasing such activities to nearby regions.

To start, we should invest in and participate in activities which we can understand and which are likely to serve the purposes of our local citizenry in living good lives, morally and socially well-ordered lives. We shouldn't be oblivious to the needs of those farther from us but we should be humble about any assumptions we can help them to live better lives because such thoughts usually have led us to forcing others to live like us. We should refuse to become human materiel for the great plans or simply the grasping ambitions of those men who seek power for its own sake and wealth for its own sake rather than accepting them when they come and using them to serve moral human purposes.

Speaking more directly to the referenced article, we should place our faith in God or at least in some system of virtue and we should refuse to fear that which our masters or would-be masters would have us fear. In

this refusal and in our positive behaviors and attitudes which serve nobler human purposes, we gain our liberty and cast off our chains. Even if we are conquered and have chains put on us by forcible means, we can remain true men while our acceptance of the fears nurtured by central powers make us the most despicable of creatures: man-like but spineless critters seeking the safety allegedly found when we accept the rule of men whose only right to rule comes from their ambition and their greed.

In any case, God is moving His story forward. No one can stop the formation of the Body of Christ but we can find ourselves being crushed and pulverized by the forces of history when we refuse to try to understand them and to move with them. Sometimes we can find ourselves being crushed and pulverized even if we understand and try to cooperate with God's story. We should learn how to think about history, about human communities and their relationships to Creation and its Creator, from the prophets Isaiah and Jeremiah.

## 444 What is Politics? (Another Take)

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1063>. It was finished and uploaded on 2011/10/08.]

In Chapter 424, I addressed the obvious question, “What is Politics?”. I covered a lot of ground to start off a line of reasoning tightly tied to my current goal of enriching our store of words and concepts for discussing our moral and social lives. While it’s true that man hasn’t changed in some basic ways, that’s pretty much irrelevant because man is—within some vaguely defined but strong constraints—a self-shaping creature, that is, he shapes himself by responding to his environments, to the universe or even the world which is the universe seen in light of God’s purposes. Man can even shape himself by responding to the entirety of Creation, including realms of abstract being.

We know more about realms of being beyond the simple concrete realms accessible to our Neolithic ancestors and even more than was accessible to our early modern ancestors with their growing stock of scientific knowledge, of historical knowledge, of technology for exploring and exploiting the realm of concrete reality. We are shaping ourselves, however slowly and reluctantly, to a richer and more complex Creation than our ancestors knew about.

We have raised the level and increased the depth and breadth of our conversation with Creation and its Creator. We have a chance to shape ourselves to be richer and more complex creatures than were our ancestors. To a certain extent, we’ve been forced to take that chance.

So, I’ll continue dancing around the question, “What is Politics?” until I’m ready to provide some sort of a broader understanding of this aspect

of human communities. In fact, a complete answer would have to first deal with the question, “What is a human community?” I’ll simply assume a naive understanding of community though I’ll be speaking of communities of the sort which are relatively large and complex, communities which have a need to care and nurture for their members **and** to protect against dangers within and without, say, from internal criminals and from external enemies. This is to point to talk of communities as entities which have need of something akin to an immune system. That means communities which have some awareness, probably a mix of conscious and unconscious, of themselves as communities. For now, I’ll put that line of thought aside but it should be kept in mind.

Does such a community necessarily have something which could be labeled a ‘common good’? Does it even have a unity of perhaps multiple goods which form a single common good? We can perhaps view this as a basket of individual goods which are compatible at least in the sense that different sorts of independent communities can at least share a public square.

Professor Minogue tells us, in *The Liberal Mind*[95]:

[A]nything genuinely recognizable as the common good so seldom occurs in political activity that politicians have to be calculators. [page 86]

I also won’t be speaking of turf battles in the attaining of goods by individuals, families, voluntary organizations, local governments, central governments, or other entities. I’ll not speak of either moral responsibility or moral right or efficiency involved in a particular entity or level of government claiming it can best deal with a particular common good or bundle of common goods. I will instead stick to the issue: Is there something that can be considered the common good, or even a common good, for larger-scale communities, those with political structures?

In a world of evolving and developing entities, we should expect that there will be no such thing as a “common good” speaking in the sense of a basket of common goods which cover a substantial amount of what might be called a rich and worthwhile human life. When a common good can be seen, it will likely be a readily perceivable good, such as the need to defend ourselves against invading enemy forces, or it will have disappeared before we know it exists or it might disappear more slowly but the instruments we

had created to nurture the common good will have turned into self-serving institutions which simply won't go away.

The communities of the human race are evolving. Individual communities develop or fail to develop, perhaps simply fail to survive. As a Christian, I believe this to be all directed to the formation of the Body of Christ, where all who belong to Christ will fully belong to that Body while remaining individuals in a manner similar to the nature of the Holy Trinity: Father, Son, and Holy Spirit are one God while remaining individual Persons. We have a desired state of being ahead of us and, even if all men were Christians, that doesn't really define for us much in the way of an overarching common good. After all, the point of this paragraph is that we must develop into individual persons and retain that individuality for the Body of Christ to be what it's promised to be. Moreover, I'm struggling to speak rationally about the Body of Christ in terms of our modern knowledge of Creation. How could I possibly speak of a basket of common goods which are good for all those individuals and also good for that Body?

It would be hard to believe that many of the things which seemed to be common goods in Elizabethan England would be common goods in 21st century England unless we speak in terms of meaningless generality. Even those which have remained common goods, mostly having to do with physical security and with justice systems, have changed drastically in many ways.

I'll repeat the quote from Professor Minogue's *The Liberal Mind*[95]:

[A]nything genuinely recognizable as the common good so seldom occurs in political activity that politicians have to be calculators. [page 86]

Politicians, said Minogue in the early 1960s, have to be "calculators" to try to handle issues with any alleged "common good." He has admitted in a forward to the reprint by Liberty Fund that he would not be so optimistic if he were to write *The Liberal Mind* in more recent years. He was speaking about his general view of liberalism which is that of a political philosopher and, under this rational way of thought, Ronald Reagan was as much a liberal as Ted Kennedy. I'd think it'd be likely he would now say that politicians nowadays, since at least President Johnson in the United States, imagine common goods into some sort of false existence by taking similar or analogous goods which exist in particular forms for, say,

Italian-American small businessmen or Norwegian-American dairy-farmers or Mexican-American ranchers or even Anglo-Saxon lawyers and investment bankers. I doubt that Johnson set out to destroy American social order and the American economy and I also doubt his desire to provide benefits for poor citizens was more than the shallow feel-good sort of sentiment. Mostly, he was out to win a game of politics, to grab more power.

Setting up a common good is good politics, so long as you consider politics to be a game of power rather than a means of serving the community. Defining a common good for any rapidly developing human community isn't easy, if it be possible at all. Certainly, it doesn't seem doable for a community complex enough to have political systems which wield any true power, even so much as controlling the finances for a small police force and the contributions into a regional school system.

Let me take the example of education, including vocational training. Certainly, this is something of a common good, even a necessity in a complex human community. There is no one educational system, no path of intellectual or vocational development, which is appropriate for all children in all ages of man. Some need to acquire some basic skills and knowledge in various topics, including mathematics, and also some basic skills in self-learning so they can become scientists or engineers capable of dealing with change rather than just having a fixed store of knowledge and skills from their college years. Some students need to learn how to read business contracts and how to write a clear, straightforward business letter. Some need to learn some basic mathematics well enough to read blueprints and specs for a custom designed mold or machine part. And so forth.

We're looking at a rather diverse system of needs which imply a great variety of educational goods. The situation gets worse when we admit, as educational bureaucrats refuse to, that some children need to be released from school for a year or more just to let them get the physical movement their bodies crave.

There is no common good beyond the raw need for some sort of a basic education for life in a complex society. That implies governments, as local as possible, might have a role in providing infrastructure which can then be used by, say, parents contracting with individual teachers or groups of teachers which are not public employees. The parents would be providing for the educational needs of their diverse children with diverse environments and diverse opportunities and diverse desires.

There is so much diversity so long as human beings remain true individ-

uals that I'm not even sure if the Body of Christ will have any well-defined basket of common goods. Or perhaps I should say it will be a pretty large and diverse basket of goods.

# 445 Are Serious Historians Conspiracy Nuts?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1072>. It was finished and uploaded on 2011/10/13.]

I've started reading some of the works of John Dahlberg, Lord Acton, sometimes given honorary titles such as "the historian of liberty." Being largely cash-free, I downloaded pdf files of some of his works from Liberty Fund which has made available for free a good number of classic books on history, political theory, philosophy, science, and other topics—see *The Online Library of Liberty* at <http://oll.libertyfund.org/index.php>. This foundation has done remarkable work since its founder, Pierre Goodrich, set out to make available works of liberty which had gone out of print, including some of the writings of the Founding Fathers of the United States or writings from that period, such as John Marshall's biography of George Washington and the history of the American Revolution written by Mercy Otis Warren, a woman who was said to be a formidable intellect and was opposed to the development of a commercial republic and was hostile to the Constitution from an Anti-Federalist perspective.

For a couple of decades, I've been working to develop richer and more complex ways to speak of our moral, social, and political natures in this age when our human communities—not by coincidence—have grown richer and more complex as we've learned more about the richness and complexity of Creation. I've been led to a serious effort to learn some of the physics and mathematics I should have learned more than 30 years ago in college and also an effort to read good literature and solid works of history. I'll speak of one of my discoveries while reading serious histories which probe into the relationships between, say, kings of different countries or a king and a pope

or an American president and the American citizenry. There are other sorts of histories, such as some of Michael Grant's histories of the ancient world which give broad-brush overviews, but I'll speak of those with what might be called a political edge, not an agenda, but an edge.

Acton's writings certainly have an edge of this sort as do the writings of Jacques Barzun or those of John Lukacs or—though I've not yet read them—those of Mercy Otis Warren. I would imagine that Churchill's historical writings have both an edge and an agenda. There are many good history books out there and not enough time to read them, especially with the competition in literature and science and philosophy.

Acton's knowledge was most certainly not thin, nor is that of Barzun or Lukacs or Warren or a number of other good historians. History is a subject where references and bibliographies in one good book provide a good way to find other good, reliable works by the same or different authors. Physics and mathematics are in a similar position as is modern neurosciences.

With all of the above as background, I'll state my main point: Acton most especially in my recent experience but good historians in general take viewpoints on political and diplomatic and military activities which are far closer to those of moderate conspiracy theorists than to those of public school textbook writers and writers of most popular history books. In my admittedly limited experience, even most of the seemingly more serious books on topics such as American wars and American presidents are naive and shallow in their attitudes towards the types of events considered by those moderate conspiracy theorists. I'll say at this point that the ones I'm calling 'moderate' tend strongly to rely on verified facts, sometimes refusing—for reasons on credibility—to mention plausible but unverified facts in their more formal writings.

Lord Acton had said, "Power tends to corrupt and absolute power corrupts absolutely," and also had noted that powerful and centralized governments tend to attract men with the moral characters of gangsters. Gangsters would, of course, be willing to murder political leaders and others who endanger their wealth and power and some would even be willing to commit false-flag acts, even murdering a number of their fellow-citizens, to start a potentially profitable war. Selling weapons or weapons-manufacturing equipment to soon-to-be enemy countries is another activity of the stupider sort of gangster – see Barzun's *From Dawn to Decadence* [9] for the verification that the United States did sell Nazi Germany, circa 1936, the machinery to build modern weaponry. Years ago, I'd read a collection of es-

says by the French philosopher Jacques Maritain years earlier, one of those essays written in the late 1930s and translated into English for publication in the United States in the early 1940s had mentioned the badly-kept secret that Americans were committing this act as notable for its stupidity as for its criminality. American history is actually loaded with large-scale war-crimes, large-scale crimes against innocent civilians, treacherous abuse of American military personnel, and murders of politicians at various levels of government. That is, our history is loaded with crimes of the sorts committed by power-seekers for the past 5,000 years or more.

In one of his essays, Lord Acton notes that an honest study of history will lead to a depressing view of mankind and he believed that a more optimistic view can be derived only from a faith in God, a God who knows what He's doing and whose purposes are served even by the plentiful crimes of the greedy and ambitious, abetted by the cowardly compliance of the self-blinded common folk. Both Acton and Barzun, and many another historian, speak of the need for students of history to develop a proper detachment—Acton had trouble with this. I'm not one of those who believe there is no progress showing in human history but any progress in our understanding of moral order, certainly any progress in our institutional and legal implementation of order, will always be subject to attack by the ambitious and greedy amongst us, those labeled 'the exploiter class' by Thomas Jefferson and labeled in similar terms by many since then and before then for that matter. We seem to be in a period when those attacks have resulted in great damage to a moral order already in bad shape because of the moral irresponsibility of those with a duty to maintain and enrich Western Civilization.

I've not discussed a large number of historians or of serious political actors who recorded their thoughts, but the point is clear and will bear up when you read much in the history-books aisles at your public library or your favorite bookstore: those who seek power and wealth are far too often willing to commit various sorts of crimes, small or large, to get what they want. The American government has been remarkably confident about releasing information about some of its crimes, usually many years afterward. It's likely the politicians and bureaucrats know that Americans have short attention spans and are always willing to accept today's propaganda and to ignore evidence of past criminal activity. For example, see the article on *Zapata Corporation* at [http://en.wikipedia.org/wiki/Zapata\\_Corporation](http://en.wikipedia.org/wiki/Zapata_Corporation) for a discussion of

a company involved in CIA conspiracies against Cuba. Zapata was, shall we say, closely connected to the powerful and wealthy Walker family and their relative, George Herbert Walker Bush, named after his grandfather, a powerful investor in the so-called House of Rockefeller. For a more extensive overview of this powerful family group and their suspicious activities, see the book *Family of Secrets* by Russ Baker or see Russ Baker's website at <http://russbaker.com/>. It must be said that these activities, even including possible involvement of a future President of the United States with the murder of President Kennedy, are little different from many acts committed in history by men who are honored by at least some.

At the risk of beating a dead horse, I'll also give a couple of other links about criminal activities of the United States government.

In the article on Operation Northwoods found at [http://en.wikipedia.org/wiki/Operation\\_Northwoods](http://en.wikipedia.org/wiki/Operation_Northwoods), we learn it "was a series of false-flag proposals that originated within the United States government in 1962. The proposals called for the Central Intelligence Agency (CIA), or other operatives, to commit acts of terrorism in U.S. cities and elsewhere. These acts of terrorism were to be blamed on Cuba in order to create public support for a war against that nation, which had recently become communist under Fidel Castro." In essence, these proposals amounted to small-scale events of the same sort which occurred on 2001/09/11. So much for claims of some that the United States government would never be willing to murder their own citizens in order to start a war.

In the article, *Repatriation àÀ The Dark Side of World War II, Part 3* found at <http://www.fff.org/freedom/0495a.asp>, we can read of the despicable treatment of some Russian soldiers who can be said to have betrayed the Soviet Union but also fought against the Nazis to help liberate Czechoslovakia. (The entire series of articles is worth reading.) The Wikipedia article on Operation Keelhaul, [http://en.wikipedia.org/wiki/Operation\\_Keelhaul](http://en.wikipedia.org/wiki/Operation_Keelhaul), makes reference to the more general set of crimes against millions of refugees who were repatriated by way of deception or force to the Soviet Union with full knowledge on the part of the Western leaders that Stalin intended to either murder these refugees or use them as slave labor, mostly in Siberia. Roosevelt promised Stalin at Yalta to do this and Truman kept the promise perhaps because Stalin held American and British POWs from German POW-camps and wouldn't release them until the refugees were given to him. As it turned out, he never released those POWs – they also died in Siberia. Julius Epstein, an

investigative journalist-historian, published an authoritative book on this topic in 1973 to mostly resounding silence on the part of the self-censoring and self-brainwashing residents of the modern West.

Russ Baker is one of a number of investigative journalists who set high enough standards that they can be labeled as ‘historians’ though it will be decades before we see the writing of authoritative histories on the events, criminal or otherwise, of our times. But, though time will give us better explanations and more facts, we have enough in the way of solid facts to be sure that our age is no different from other ages—we have not only criminals of the ordinary ‘mugger’ sort but also criminals of the ‘higher type’, presidents and prime ministers and generals and bankers and so forth. They have engaged in criminal conspiracies on a more or less continual basis, more frequently in recent years with the breakdown in moral order and the closely related breakdown in historical knowledge and literacy skills and thinking ability on the part of citizens, butchers and bakers and professors and priests and engineers.

I don’t think historians who study this age in future generations will be any more optimistic about the crimes of human beings than was Lord Acton in the second half of the 19th century. They will still be studying not only the noble acts and legitimate progress of the human race but also the crimes, high and low, of human beings including those in political or financial positions of power. Yet, our Western governments, our banks, our corporations, are greatly out of control by the standards of any but the dark ages of history.

## 446 What is Political Discussion?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1125>. It was finished and uploaded on 2011/12/17.]

In *The Liberal Mind* Kenneth Minogue, the British political theorist, tells us:

“Need” belongs to a particular language of political and moral thought arising from the conception of generic men. Once we have entered into that language, we can only say individualist things. It is a language which has grown out of the liberal movement (and some associated movements) and it has, like all languages, its particular blind spots, the things which it cannot say. Once inside, no matter how much we thresh about, we shall be hard put to it to escape. A great mistake has been to imagine that an ideology consists of a set of answers to neutral questions; whereas in fact, it consists in the questions.

In a strong biological sense, I do need food, clothing, a warm place to work, a comfortable bed in a warm room. Some of this could be partially given up at the cost of health, physical and emotional and mental, but I’m not volunteering to lead an ascetic life.

I’m left with that confession that I need food and shelter and clothing, in common with those who are driven to eat out multiple times a week and those who desire houses with a thousand square feet per inhabitant. I need some entertainment and some stimulation, in common with those who think the Beatles were the equal of Mozart and those who act as if the availability of new audio or video technology will inevitably lead to some sort of worthy esthetic feats. I need a sense of belonging, of membership in a substantial body of my fellow human beings, in common with those who imagine recent

American presidents to be more than political gangsters of the sort drawn to powerful, centralized governments. I need a way to worship my Creator, in common with those who honor Christian leaders who pander to power rather than speaking truth to power. I need some peace and order in the streets, in common with those who support the destruction of civil and political rights in the interest of promises of safety and security.

We have an ideologically formed language of needs which is only partially determined by our biological needs and which helps shape both the modern nation-state—the welfare-warfare state, and its citizens.

Which questions do we ask so that we think the answers offered by the modern nation-state seems normal and inherently desirable?

The questions being asked in the United States since World War II seem also to lead to answers involving movies about cannibalistic psychiatrists and to concerts starring 70 year-old men still singing about adolescent angst. They seem to lead to answers involving gigantic sports stadiums and a surprising number of young men who are well over six feet tall and weigh more than 250 pounds while being as agile as 180 pound athletes of an earlier age. The questions being asked seem to lead to answers involving a huge number of American military bases throughout Asia and Africa and Latin America and the replacement of American citizen-soldiers by Rambo. The questions seem to lead to answers involving the strip-searching of elderly ladies in American airports and the acceptance of the mass-murder of men and women and children in Waco because their leader was said to be a nut.

When I find a good insight or a great way of expressing an insight I'd already imbibed, I tend to repeat it for a while. I apologize if it's annoying to any of my regular readers, but. . . In *The Quiet American*, Graham Greene said that we Americans feel the world exists to give us opportunities to feel good about ourselves. And so I claim:

The main question Americans, and far too many other modern human beings, propose to the world is: What can you offer to make me feel good about myself?

We Americans have become hollow-chested human beings in the terms of C.S. Lewis or genial creatures lacking any true moral character in the terms of Adam Smith. We seek to feel good about ourselves rather than to be good men by objective standards, whether those of virtuous paganism or of Christianity.

We have deformed our own minds or souls, our moral characters, by the strategy, workable for only a short while, of forcing the world to seem to be something it isn't, something which gives back feel-good answers to that question: What can you offer to make me feel good about myself? We are paying a big price, Americans and others in the West, as the world is revealing itself to something different from what we assume it to be. The world isn't something to be shaped to our desires but rather something to which we should respond, thus shaping ourselves to that world, that is, shaping ourselves in response to those manifested thoughts of our Creator. In a simplistic phrase: we should seek to be good rather than to feel good about ourselves. There is a world of difference.

# 447 Overwhelming Our Moral Characters

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1138>. It was finished and uploaded on 2011/12/24.]

I've just listened to the former CIA analyst, Ray McGovern, as he spoke about his moment of cowardice—when he learned of a memo from General Creighton Abrams which revealed the Army commanders in Saigon were deliberately lying about enemy strength. Mr. McGovern was a young CIA analyst and thought about revealing it to the press, which was willing to speak inconvenient truths at that time. McGovern admits he retreated from his moral duty because of concerns about his family and about his own career. Like Daniel Ellsberg who could have blown the whistle earlier, he reasoned he be able to do more good if he followed his career and gained enough prestige so that he could one day even tell the truth face-to-face to the President—the audio of the interview can be found at <http://antiwar.com/radio/2011/12/23/ray-mcgovern-34>. Mr. McGovern went on to an honorable career in the upper regions of the CIA and is now engaged in various battles to combat abusive use of government power especially by the American and Israeli governments.

I wish to propose:

If certain forms and levels of power are such as to overwhelm the moral courage and strength of a typical human being, then we should be cautious about allowing those forms and levels of power to develop.

At the same time, I think that we shouldn't adopt a view that all forms of authority and power are wrong. As a Christian, I believe in the Body

of Christ and believe those who will live with Christ in the world of the resurrected will be a part of that Body while remaining individuals.

We, as individuals, are pilgrims in the mortal realm, pilgrims traveling through our own world towards a world which is a perfected and completed version of this world. The Body of Christ is, in an analogous way, developing in this mortal realm and grows, intends – in Thomistic language—towards its perfected and completed state which it can reach only in the world of the resurrected. The Body of Christ is currently riddled with entities which are cancers or parasites. Some of those malformed entities are classified in modern thought as criminal or terrorist and some are classified as political. I have little respect for the American government in Washington and I have a low opinion of it in nearly all of its manifestations since the passing of the Founding Fathers—and they weren't perfect for sure. Even at that, my belief in the developmental nature of the Body of Christ forces me to acknowledge some legitimacy on the part of governments of even the worst sort—as Christ did though I don't think He gave the all-out endorsement to the authority of mortal political entities which some have read out of His few words on that subject. As Lord Acton once pointed out, those who believe in the Christian Creator have to believe that these evil men who are so powerful and so prominent in history serve some purpose of the Creator. As I recall from my readings of Tolkien, he made a very similar point, at least in one of the 'background' histories.

How can Nebuchadnezzar or Genghis Khan or Stalin or President Bush-clinbushbama serve God's purposes?

I certainly don't have a good answer in the usual terms, as was true with Lord Acton, a historian and—I'd say—philosopher of history with deep and wide knowledge and the intelligence and skill to put that knowledge into the form of true histories.

I can say a little on the topic from my viewpoint which combines short-term pessimistic with long-term optimism.

We should be careful that we not allow power to concentrate in a form or to an extent that it can be handled safely and morally only by creatures with greater ability and stronger moral character than we mortal men have. If I'm right that the Body of Christ is forming to some extent in this mortal realm, as is true of individual saints, then there will be some forms of concentrated power in our future as a race. Those forms of power will evolve and develop by natural means, in ways beyond our capacity to plan or even to anticipate. It is my very optimism about this aspect of human

communal life that leads me to advocate modesty and humility and to deny that I, or any of my fellow human beings, can see much beyond the next step.

Let us learn to take that next step in all modesty and humility, moving slowly along the path of development of the Body of Christ or at least toward some reasonable idea of better human communities after recognizing the evolutionary and developmental nature of this world. Evolutionary and development processes do include the possibility of catastrophes or positive events of a dramatic sort, but they're mostly unpredictable. Even when we can reasonably predict some great change is coming, as is true in this year of 2011, we can't be sure when it will hit or what form it will really take. For example, we don't know if it will immediately cleanse human communities of the worst of these cancerous and parasitic men and gangs of men or whether we'll collapse into some dark age when they'll rule.

# 448 Predators, Producers, Sheep, and the Love of Liberty

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1141>. It was finished and uploaded on 2011/12/27.]

I'm trying to deal with a problem I feel to be at the foundation of a body of thought which I generally admire—libertarianism of the Old Right and Rothbardian sort. On the whole, my attitude is similar to my attitude towards Jamesian pragmatism. For a discussion of that attitude, see my responses to Walter J. Freeman's *How Brains Make Up Their Minds* [35] as contained in: Chapter 83, *Is Christian Morality a Natural Morality*, and Chapter 84, *Pragmatism and Thomistic Existentialism*. In the second of those chapters, I state:

I consider myself a Thomistic existentialist and most certainly not a pragmatist, though I think that pragmatist methods are the same as the 'first-stage' methods of Thomistic existentialism. I've criticized pragmatists, even those that I admire—such as William James or the brain-scientist Gerald Edelman because of the inadequacy of a pure pragmatist approach to understanding the universe. Their bottom-up approach is the proper 'first-stage' to understanding Creation but they refuse to admit it works only if there is a world to meet them, a world in all its unity, coherence, and completeness.

Libertarians are not really homogeneous in their doctrines, though it would seem to me that they have a shared belief in something called 'liberty' which is alleged to be a metaphysical right of man. Liberty is more than just a sum of particular freedoms; it's a general freedom from past

repressions which are assumed representative of the ways in which human beings can be enslaved if only partially. Libertarian versions of liberty seem, by a naive analysis of historical timing, to be founded upon what I'd call a semi-metaphysical principle sufficient to ground their pessimistic attitude towards government, which attitude seems to be a reaction against the strange monsters which arose in early efforts of predators and idealists and realists and simple folk to develop governments suited to the needs of modern complex societies.

Obviously, I'm closer to the views of Michael Oakeshott than to those of Ludwig von Mises. Oakeshott was one of the very few true conservative intellectuals in the 20th century. Amongst his other peculiarities, he considered the claims of the *Declaration of Independence* to be mere silliness, the stuff of delusions. It wasn't the case that Oakeshott had no principles and no respect for rights of some substantial sort. It was the case that he grounded his beloved Englishman's freedoms in flesh-and-blood, dirt, and history.

History is an interesting part of the puzzle. I believe that human history is a part of the story God is telling which we know as the world which I define as the universe viewed in light of God's purposes.

I can't take seriously many claims about human needs or rights unless they can be seen in concrete men and in human history. This is a problem to be sure since history, as Lord Acton noted sadly, seems to be greatly influenced by evil men. Some of my recent efforts are directed towards writing a human version of God's story in which those gangsters also play a role. I'm learning, as a child-like author, to imitate my Maker as He goes about His tasks in Creation. The actions of those evil men, some of them prominent in recent American history, are mildly described as despicable, but this is God's world, God's story. The Almighty did what He did and we should try to understand what He did and not what we imagine He should have done.

For now, it's most important that I claim man is an empirical being in an empirical world. Again I don't 'reduce' man and his world to a simple empiricist chaos, but there is much work needed to be done before we can have a modern Christian view with the contextual explanatory power of the view St. Augustine developed 1500 years ago, a view which largely held until the early modern period and a view I'll partly—and only partly—revive as part of my effort to contribute to a modern Christian understanding of Creation.

We can make all the claims we wish about the desirability of liberty for men but those claims will be plausible only if the human race is composed predominately of those who wish liberty and can handle it. In fact, a metaphysical grounding of liberty, such as that read into Jefferson's claims, would require any true human being to be—at least in potential—as much a lover of liberty as that redheaded Virginian himself.

In fact, I think what I have to say wouldn't have surprised Murray Rothbard of libertarian fame or Albert Jay Nock of the Old Right at all, though they might have differed to some extent or other with my conclusion: the typical human being doesn't seem made for life in a libertarian society. In effect, most human beings are more concerned with safety and comfort rather than liberty for themselves or their children. There is also a small group of human beings who aren't suited for that life of 'radical' liberty because they have no respect for the liberty of others. They like to accumulate wealth and power.

Perhaps we human beings aren't made of just a producer class and a predator class as Thomas Jefferson taught. Maybe there is another vaguer class of truly sheep-like creatures who might be predatory in a cowardly way or productive in a submissive way but aren't about to show any initiative in pursuing good or evil goals. And maybe we're all partly made of predator and partly of producer and partly of sheep-like creatures. Maybe many of the producers and even many of the predators wish to live in political communities which provide them with certain sorts of structures for their good or bad activities.

In any case, producers are only a part of the human race or—more plausibly—part of each of us. I'll assume the simple case for now, that each of us is predominately of one type: producer or predator or sheep and there is likely a good amount of truth in that assumption at least with respect to our particular concrete beings as they develop in specific contexts. I'll assume for this chapter the ultimately inadequate but interesting suggestion of Jefferson that we are producers or predators. (I'm sure he knew he was oversimplifying and knew well that was often a mistake to usefully make on the way to a greater truth.)

We have to realize it likely that only a part of the producer class is made of those who wish liberty. Much productive work can be done, if less efficiently, under conditions of political authoritarianism of some sort and that's good enough for some tradesmen and doctors and even ambitious entrepreneurs. In any case, there are highly productive individuals, those

who can take some initiative, who seem comfortable compromising their liberty and that of their fellow-citizens so long as they can do their work in a well-ordered society.

There's much uncertainty in all of this. We don't know if those who act the roles of predators are truly different from us or whether they might be strictly us responding to different opportunities, to different environmental conditions in general. This is to say, I don't know if we can better understand men by thinking in terms of well-differentiated classes or in terms of a line drawn through the soul of each of us. Let's slide by that problem for now. After all, this is a preliminary work directed towards the long-term goal of understanding men in the context of politics.

What about the sheep? Recent research have shown, at least for mice, lack of proper nurturing by the mother will leave her youngsters as anxiety-ridden. Likely it would be that we are similar—lack of proper nurturing by a mother would leave her children to grow into cowardly, anxiety-ridden adults who would consequently be passive, sheep to some lesser or greater degree. There are undoubtedly other ways a fearful human being could be produced even if his genetic code allowed for better character traits.

Speculations upon speculations upon. . .

In any case, I don't present this argument as one who believes in liberty as a plausible goal for human beings. I'm not complaining that men don't value liberty however much they might claim such when they wish to gain a particular freedom, such as that of watching trashy movies. I present this argument as one who believes human beings are what they are and that can only be determined by empirical evidence, not all of it of the sort to be tested in the laboratory. In fact, much of what I'm discussing has to be evaluated on the historical record as well as by observations of behavior in town government, at the church picnic, in the malls and the stands of professional sports stadiums, on the battlefield, in the various workplaces, and on the playground.

What I can say for sure is that there is plenty of strong but not absolutely convincing evidence that only a minority of human beings have the character attributes suited to the dangerous life of liberty, if such a life were possible as more than an idiosyncratic existence on the edge of structured human communities, including one or more political communities. More frighteningly, most men seem to have little concern for any of the specific freedoms necessary for any sort of republican form of government. This is almost a commonplace observation, as we could learn from

two serious observers of Americans during the same period early in the life of the American Republic.

Nathaniel Hawthorne wrote an introduction for the first edition of *The Scarlet Letter* in which he confessed to feeling unmanned when working as a government employee in the customs house in Salem, circa 1850. Hawthorne also stated a belief that Americans, in those days when we imagine such creatures as rugged individualists, wished to sell back their liberty in return for promises of financial security—a government job was often sufficient in those days before modern welfare systems. Hawthorne was forced to believe the United States had become a republic advocating personal liberty only because of a small group of brave and dedicated men.

(According to Gore Vidal, see his historical novel *Burr*, Aaron Burr admitted that the Founding Fathers, some at least, were lawyers trying to create a country in which lawyers would prosper. I believe the best interpretation of history usually lies between idealistic and cynical understandings. In the period 1770-1800, there might well have been a period when the idealists were closer to the truth—the plutocratic families which had dominated colonial times had been at least partially pushed aside and men who were at least courageous and energetic came into power and held it for a generation against the growing numbers of opportunistic scoundrels.)

Tocqueville, circa 1838, published *Democracy in America* in which he tried hard to be optimistic about what might be called the ‘American experiment’ but was forced to admit Americans held their mainstream opinions to an extent that they could ignore facts in conflict with those opinions, not even seeming to realize their views were contradicted by the real world around them. He predicted Americans would eventually create a new type of country for which he had no words but we might call it a benevolent totalitarian country, one formed by the herd itself and not by those “great men on horseback” who are so influential in history when the circumstances are right. In 1950, Ray Bradbury published *Fahrenheit 451* which explored the possibility that television would provide the technology for completing this process, allowing the herd and maybe most leaders to make a still greater effort to ignore reality, an effort which would lead to a true disaster—the large-scale destruction of much of Western Civilization capped by a nuclear war in his particular tale.

There is much truth in libertarian criticisms of the modern state, particularly in the words of those such as Nock and Rothbard who honestly describe the events and structures of our modern states in terms that at

least implicitly admit that many men, probably most, seek security and companionship of the sort not much consistent with radical principles of individualism or even of more modest forms of political freedoms based upon intermediary institutions. In fact, there will always be those who are willing to betray family or church, perhaps for reasons we should sympathize with, and cooperate with the central powers who offer short-term relief in return for our allegiance.

Is this lack of respect for our own liberty a matter of bad formation? That would raise the question as to the better formation of masses of men and such a question would then lead to the sorts of political solutions denied by many, probably most, libertarians. That is, they might be tempted—against their better natures—to argue, essentially, for the formation of a new people to replace the inadequate people formed by nature. In my opinion, we should be heading towards an understanding of political institutions in which power is properly distributed. In fact, power should be jealously held at the highest level at which it can be morally and safely exercised, and no higher. And that level is determined by human nature and by the level of development of their political understanding and skills in at that time.

I often quote the historian Carroll Quigley: “Truth unfolds in time through a communal processes.” What’s important is to see the communal nature of even our better understandings of Creation, including we human beings who are part of it. In fact, this emerging truth isn’t merely abstract knowledge to be recorded in the works of philosophers and historians and chemists. It’s a truth in the fullest sense. Things are true and truth is thing-like. That is, truth is manifested in things and their relationships, including our political and economic and social and spiritual relationships with other human beings.

We can coherently describe human beings only as organisms, biological entities—living things, whose higher attributes and desires are potential rather than in their DNA or their abstract principles. In Thomistic terms, we should intend to a better state of being. It’s hard to imagine how this process could even proceed in a true individual given the vast amount of formation necessary. Again: “The truth unfolds in time through communal processes.” We are, in truth, members of communities and all of those communities have political aspects. Our own human beings are true but reach a level of higher truth when we cooperate with that unfolding of truth which is a communal process, one form of which is a political process.

There are most certainly political aspects to the processes by which

all human beings form themselves. We see these political aspects even as early as those playground days when one energetic or charismatic fellow decides if it'll be baseball or soccer today. This might give us a hint about the nature of the political process—politically inclined men might have a calling of sorts to draw us out of our tendencies to retreat to too small a life or too passive a life. In Thomistic terms, some of us need leaders to help us respond actively and properly to God's world. Having written that, I'll point to the problem Lord Acton saw so clearly—when political power becomes too great and too concentrated, it draws men with the moral character of gangsters.

Acton had a vast and deep knowledge of history and seemingly of human nature and, like me, considered governments to be something greater, perhaps far greater, than necessary evils. He was right and so am I. The goal shouldn't be to eliminate government but rather to realize the political life as a natural part of human life. We have to be modest in the short-run, not letting the ambitions of even the better sort of men, certainly not the ambitions of men with the moral character of gangsters, to impose upon us political systems which are inherently bad or even systems for which we aren't yet prepared. From one angle, we can say we shouldn't let political systems or the underlying political communities grow too large or too complex until we're prepared for that greater system and the greater community. Eventually, says some muse of history, we'll learn how to govern something as large and complex and powerful as the United States. But we won't learn it in the positivistic way of the Enlightenment intellectuals, including the Founding Fathers of the United States. We'll learn it when several relatively large and complex human political communities come together to share many of their political duties and responsibilities, come together to form a greater political community. This greater political community will be associated with a body of knowledge, including speculations in the tradition of Plato's *Republic* and Voegelin's *Order and History* but also including the most concrete of practices and the entirety of that body of knowledge won't really be known even to the best political thinkers at the time it develops. In fact, it's probable a greater understanding of the nature of this political beast will mature only by the time the human race has moved on to a different, richer, and more complex state of being.

Yet, we should be capable of recognizing a truly bad situation. The United States is a failed experiment and it's likely the case that the best and most peaceful solution is a voluntary breakup into a number of more

coherent entities which can then start learning how to form a better version of a greater republic. As a Christian, I also believe, and have stated in the past, that God might well pulverize the United States and then rebuild this country to be what it should have been. This would be a painful and degrading process and I believe it's likely to happen because the United States remains the most plausible realm for the revival of Western Civilization, a civilization which might yet have a lot of ruin left in it, maybe even some good in it.

Do I believe all I'm claiming in this essay which has grown beyond my original plans? Mostly, though there is much uncertainty due to both an inadequate understanding of human beings and an inadequate understanding of this world, indeed an inadequate understanding of all of Creation. When we look at our race and speak of 'predators' and 'producers', we engage in a simplification which is useful but only so far as we don't take it as literal truth. The same is true when we speak of nearly any aspect or attribute of a human being, even the most sharply defined of virtues. I could make similar comments about our understanding of this universe seen as a coherent narrative. Much of the problems in this area come from our Spinozean tendency to fragment our knowledge into sorts of knowledge to be handled by specialists. Those realms of knowledge have become representative of realms of being in the thoughts of modern men. Humpty-Dumpty has fallen off his wall and we look on as various specialists examine the remains. What chance have we of also making sense of the world in a single coherent narrative, even with the help of Plato and Augustine and Wordsworth?

A man is an organism which develops within certain inherited constraints and he develops properly when he actively responds to his environment and more. A man's environment includes his human communities, starting with his mother but certainly he doesn't emerge from his childhood as a freestanding individual but rather a dependent rational animal, in the words of Alasdair MacIntyre. Dependent. Dependent creatures forming complex communities need political structures, even government.

Man is a creature of flesh-and-blood, a creature of a particular type. Man is intertwined with his environment, most especially human communities. Man is an empirical creature and he is not to be truly understood by way of metaphysical principles as thought many in the past few centuries including Jefferson and perhaps some other prominent Founding Fathers. Nor is man to be understood by theological principles as too many of my fellow-Christians believe, explicitly or implicitly. Man is also not best understood

as an individual who is ideally free from all forms of government. We can't even say man is best served by a minimal government. We can only say that we need to pay attention to the best research of anthropologists and historians as to man's behavior and apparent nature in past years as well as to the best research of neuroscientists and others with something to add to the understanding of our racial nature. Then we Christians, in particular, should engage in intense study of the books of the prophets Isaiah and Jeremiah knowing they were well-educated men who were knowledgeable about the political situation of the rulers of Israel and also the situations of the rulers of the surrounding pagan empires. We would benefit greatly from such a reading of the political world of creatures shaped at the racial level by Darwinian processes and at the individual and community level by processes described by modern brain-scientists and historians and evolutionary biologists. In the context of this essay, there will be little support for theories of minimal government, let alone anarchy and much support for the ideal of a humble and modest cooperation with God's story as it develops. Rather than setting the goal of tearing down, we should aim to build slowly and with modest aims, working along with natural processes of development.

The world itself develops and often in unexpected ways. Our understanding of the world develops in a still more unexpected way since we're always catching up to what we didn't understand in the past as well as struggling with the emerging aspects of God's story.

That God is a clever Fellow. Awfully creative as well. And always surprising. And it is God's thoughts which we should be trying to understand rather than making assumptions drawn from our preferences. This is true when we try to understand human nature or human history or spacetime or matter. It's God's thoughts, manifested as created being which are the proper study of mankind.

## 449 Another Take on the Human Being as Individual and as Community Member

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1151>. It was finished and uploaded on 2012/01/06.]

I've used a chunk of the following quote from *The Liberal Mind* [95] by Kenneth Minogue in Chapter 424, *What is politics?*:

Now what makes liberal individualism so plausible is that the individual is the only self-conscious entity whose limits appear to correspond to a physiological creature; and also that the thoughts and feelings which constitute institutions such as states or churches must be physically located in the minds of human beings. A prime minister is undoubtedly at various times an individual self standing in competitive relation to other selves; especially, indeed, when he is struggling with political rivals. But there are other occasions when his thoughts and acts must be taken as State-thoughts and State-acts, and when they cannot be reduced to the psychological operations of an individual. In its extremer forms, liberal individualism is a fallacy which since Mill has been called Psychologism: the doctrine that each individual may be psychologically explained, and all social institutions must be explained in terms of individuals. This mistake is endemic in liberalism, though its presence has in recent decades been camouflaged by adding to the basic model of generic-man various sociological components—class membership, social norms and so on. Yet if we wish to learn about the

military behavior of soldiers, we must study military activities, not psychology. And similarly, if we wish to understand politicians, we must attempt to understand the activity of politics, not discover whether politicians are nice or nasty men. It is not that psychological (or sociological) knowledge is in these cases of no account; it is simply that the distinction here between psychology and military art or psychology and politics is a false one, and that the starting point for explanation must not be the rationalist essence of the individual, but the complex situation we are trying to explain. [page 50]

The simplest of us is a most complex beast, though some saints, Buddhist as well as Christian, are said to be simplified towards a state of unity. We take on roles in life and may even have not only different ways of thought but also slightly different blocks of memory which are activated or de-activated when we move from one room where we are a son of an aging and mildly demented parent to another room where we have to deal with an overloaded schedule at a local community of worship to another room where we have to answer to a boss and clients. I've generalized freely from findings discussed briefly in a podcast from the *Scientific American* website: see Chapter 121, *Rooms of Memory*, for my take on these findings as well as a link to the podcast.

Let's say there's no true 'ego', no true center of 'self-consciousness', no center of an inborn 'person'. Where is the true 'I' to be found? Or is there no 'I' if there is no inborn substance, however metaphysical, to be described as 'self-conscious', no inborn substance which simply existed from some magical moment forward for time without end. Perhaps that magical moment is the instant of conception or perhaps an instant of ensoulment—if we wish to return to a Medieval idea which had the virtue of being rational and part of a coherent and consistent understanding of human nature in the context of a world also subject to a coherent and consistent understanding.

Where is the somewhat free individual to be found that he might be me? I'd claim strongly he's not to be found in some metaphysical incantation which speaks of the undetectable to explain that which is detectable and subject to exploration and maybe even testing. I'd also claim he's not to be found as a citizen of a realm filled with entities which can act upon an empirical world without being empirically detected. He's not even to be found in a listing of some encoding of the human mind.

I'd suggest the individual, free-thinking and free-willing and free-acting in a highly qualified but concrete manner, is to be found where human beings are found—in human communities. This introduces problems to be sure. We're learning from scientists and historians what we should have already known from the Bible and from our various human traditions—we are shaped in communities. I guess this is a painful thought for those who seem to have forsaken their traditions or to have been forsaken by those traditions—a situation found in all periods of radical, and often rapid, transition in the structures and maybe contents of human cultures or even of an overarching civilization.

We're in trouble but our goals should be relative to our situation. We should seek to understand what our situation truly is which means understanding our own selves in the best available terms and that points to what the true problem is. Our situation is horribly complex and immensely complicated relative to what was properly anticipated by those who gave us our current understandings of our individual human natures, our communal human natures, and the basic structures of Creation. While retaining a respect for what is absolutely true and complete in its truth, we should realize that reality has to be defined as the best understanding of some partially viewed Creation, best being defined by our current capabilities for exploring that Creation and for making sense of it. Due to a variety of factors but mostly the great success of the exploration of this empirical realm of Creation in recent centuries, we are capable of a far better understandings of all of Creation than the understanding we've inherited.

Such an understanding has to be faith-based, not because dogmas need to be imposed upon what-is but rather because what-is has to be taken on its own terms and a greater reality has to be extrapolated from the relatively small human stock of knowledge and skills, small at all spacetime intervals however immense our knowledge and thinking skills might be relative to those available even in classical Greece let alone in the growing community of Jericho 10,000 years ago or more.

At this stage of this imaginative journey into the largely unknown, it makes some sense to retreat to the more limited, less truth-seeking, effort to understand the freedom of man viewed as an individual creature. In Chapter 219, *What is Freedom*, I wrote:

In the modern world, we tend to think of freedom in terms of satisfying desires. To be sure, even many who live for that

false sort of freedom seem to realize that we then become no more than our desires or, more horribly, the thwarting of those desires—a terrible and humiliating state in either case. Hannibal the Cannibal is the most free of all modern men because he has become his desires and he has gained the power to satisfy them. Hannibal the Cannibal is the role-model for our politicians and our lawyers, our investment bankers and our corporate executives, our athletes and our entertainers. He may even be a role-model for many clergymen.

Let me move in a different direction with a quote from a modern philosopher [11]:

“[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work.” [page 172]

Let me provide another quote, this one from a prominent brain-scientist [35]:

“An intent is the directing of an action toward some future goal that is defined and chosen by the actor.” [page 8]

As Freeman discusses, intention is the movement of an organism into the future. If we intend to be free, we will take one tiny step after another towards the goal of having a “whole personality,” which can only occur in a human organism which has taken on the properties of a true person: unity, coherence, and wholeness <sup>1</sup>.

Here’s what it comes down to: though forced in many of his actions by the needs of his land and his animals, a true farmer in his role as farmer is free in a way radically beyond the false freedom of a passive television viewer who can choose from 20 movies, seven football games and three soccer games, five so-called reality shows, and so on. Horowitz playing Beethoven’s *Moonlight* sonata is playing notes written a century before and yet he exercises freedom beyond my imagination as I try to choose from a bookcase filled with CDs with a variety of musical styles and performers.

They are part of a community and work as members of a community. In the case of American farmers, they have typically had clearly visible but informal cooperative arrangements with neighboring farmers as well as

---

<sup>1</sup>Usually, I’ll use the term ‘completeness’.

invisible but more binding arrangements with those who farmed that land in the past and the ones who will follow. Horowitz is in a community stretching over the centuries and it includes composers and arrangers, accompanists and conductors, as well as pianists. Farmers are bound by the needs of the crops and animals bred by past generations, pianists by the very design of their instrument and the way that composers sought to use its potential.

But again: that farmer and Horowitz the pianist are free when they truly intend to be what they only pretend to be at the start of their careers, what they become step by sometimes painful step.

There is a problem here that I've only partly solved, a problem caused by our inability to shed older ways of thinking and speaking—not always a bad thing since it can prevent changes for the worse or maybe useless changes for the no better. So it is that we can be easily led astray by a language and a set of concepts which grew to explain and justify an ending era of feverish and unbalanced prosperity, that is a prosperity of things and the activities which gain those things which was accompanied by a paucity of well-formed human beings, farmers or pianists, writers or politicians, home-builders or clergymen.

A rich community life is necessary for the development of men of substance and high achievements. Men of substance and high achievements are necessary for a rich community. There is a reciprocal relationship which can be excluded by our modern language and our modern conceptions of man and his communities for that language and all of those concepts were formed by the battle between liberal individualists and various sorts of collectivists. In analogical terms from physics, the liberal individualists would evaporate the streams of human history, liberating drops of water to be particles of gas which would be free from the other particles. The collectivists would freeze those streams into crystalline structures while claiming to be moving bravely into the future.

Water isn't a compromise between ice and vapor but rather a remarkable substance with properties unpredictable to those who know only ice or vapor. Even in this physical substance, we see peculiar properties arise because of the characteristics of the entire universe, such as its thermodynamic path—from a indescribably specific state, it is expanding into a more general state, one with higher entropy though allowing for the development of highly specific states, such as life, at the expense of throwing still greater entropy into the surrounding environment.

This world is specific in a way that can't be simply defined by the

starting conditions of a physical system as we can currently understand it. It's specific in a way that can only be described as 'narrative'. It's a highly specific story in which water arises because of some peculiarities in the union of two hydrogen atoms with one oxygen atom. Water is a very useful stuff and has a different relationship to ice than most liquids have to their corresponding solids. This isn't the place to discuss matters in which I'm barely conversant but the point is: Water has to exist for us to know water. My own thoughts would indicate the likelihood that there are general principles which could allow us to predict the existence of water and its strange relationship to ice at the transition points between states of matter, but if we learn those principles in this mortal realm, it will only be because we first knew water. In this analogy, which might prove dangerous, we are water molecules but we have the full properties associated with such an entity only when we are part of a large stream of other entities like ourselves.

We are born as human organisms with the potential to become some true sort of individuals but we can only become human persons, rich and complex in the way of a small world, in the context of human communities. And a human community reaches a high level of complexity and richness, a level necessary for serious accomplishments, only when there is at least a significant minority of well-formed human persons, human individuals who are worlds in themselves but not separate from those communities.

# 450 A Poet Lends a Helping Hand

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1154>. It was finished and uploaded on 2012/01/09.]

In the poem *The Sycamore*, Wendell Berry straddles some no man's land between metaphysics and theology and poetry to give an interestingly aslant and insightful definition of narrative:

It [the sycamore] has gathered all accidents into its purpose.

As characters in the narratives which are our individual lives, we should gather all accidents into our purpose. We should respect and try to understand as others are gathering in accidents into the various purposes in the many stories inside this world. If others seem to be merely befuddled, if there is no such gathering and seems to be no intention to a purpose, we can only be sad for those others. If some are gathering the accidents of others toward an exploitive purpose, we should be angry but also should wonder how God might be gathering even the accidents of His evil creatures into His purposes.

We who are Christians, believers in an all-powerful and all-knowing Creator, should realize this narrative understanding of reality allows a harmonization between Moses and Darwin. Darwin describes the processes by which the accidents are generated to be gathered into the purposes prophesied by Moses.

God is even now gathering all accidents into the overarching purpose for which this story, our world, is being told: the birth and development of the Body of Christ, born in the cave in which the crucified Jesus Christ was buried and from which He emerged. This Body is growing yet through time

as its various parts evolve and develop. The Almighty gathers all of our accidents and our purposes into that greater purpose. Even our purposes are but accidents within that greater narrative.

From the same poem, on a related topic, the very next line reads:

It has become the intention and radiance of its dark fate.

This seems to beg for a Thomistic understanding of ‘intention’ as a growth process of an organism rather than a subjective thing which overlaps with desire and motivation.

Because of centuries of neglect of Western Civilization—no, the ‘pagans’ didn’t take it away from us, we just abandoned it—we have a paucity of ways of speaking the Christian truth. I’ve claimed before that poets and novelists and artists and musicians have to give us a new vocabulary to speak of the new concepts which are just on the other side of our cognitive reach. Perhaps there is at least a part of such a vocabulary already existing in the works of some of our modern poets, such as Wendell Berry.

## 451 The Busybody Chicken and the Naughty Egg

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1159>. It was finished and uploaded on 2012/01/11.]

Here's a link, <http://www.testosteronepit.com/home/2012/1/9/the-systemic-nature-of-medicare-fraud.html>, to a good article, *The Systemic Nature of Medicare Fraud*, about some specific problems which have developed in the Medicare system, resulting in fraud.

Some of us are crooks for sure. Why do those crooks all of a sudden have the power to bankrupt our society and destroy our middle-class prosperity?

Years ago, I had a conversation with a former Assistant Director of the FBI. He told me, nearly 25 years ago, that the United States had once been a country of citizens with good moral habits and behaviors. Little in the way of policing was needed for the average citizen but only for those truly inclined to crime and that police work was done after crimes were committed.

Police generally didn't snoop though they perhaps didn't have to snoop about the most important matters since a good part of the American population, and many others around the world, lived in stable small communities where people knew each other and—as I recall even from the 1960s and early 1970s—kept watch on each other's children and houses. The policemen in town knew which young men were inclined to draw a knife or throw a punch in anger, which women didn't respect the property rights of others, which children and parents needed a talk every so often to remind them of the future of someone who goes bad. And, of course, everyone knew where and how the town's bankers lived and could be suspicious about sudden displays of wealth which might indicate embezzlement. They knew if the

town's grocer with a liking for games of chance was suddenly desperate for money. Money wasn't just siphoned away by the mechanisms of an abstracted banking system and the town's potential exploiters didn't live mysterious lives in rich men's towns several stops up the railroad line.

Our country worked not because we had amazingly efficient police forces and technologically advanced regulators but rather because most citizens—including policemen and bank regulators—were doing their modestly defined jobs and had good reason to go about their business mostly trusting their neighbors and bankers and lawyers and co-workers and so forth. And they had good reason to believe they would know if someone went bad or ran into problems which might lead them to desperate acts.

Things got away from us. We were so successful in many ways that we developed rich and complex banking systems and manufacturing systems that we didn't understand well and didn't know how to control. Most Americans were oblivious until recently that problems were developing though historians and others have been warning for several generations that our societies and our technological capabilities were growing and developing faster than our abilities to understand and control them.

I'll throw out a suggestion which comes from my grandfather who was a small town police chief from about 1936 to about 1954. He died when I was young so I never really knew him but I've been told that, back in the 1930s, he predicted that the rate of violent crimes would rise greatly in the United States in the ensuing generation. I doubt it was his only reason for such a fear but my grandfather did believe the rise of the FBI and other police agencies in the centralized governments would take away the freedom of regional leaders to make arrangements with criminals such as the establishment of combat-zones where rational criminals were allowed to control gambling and sex-trade activities in return for policing those zones themselves and in return for protecting visitors to those zones from undue harm.

I've been trying to deal with this general issue of a world grown too rich and complex for us. I deal with some of the issues in Chapter 447, *Overwhelming Our Moral Characters*.

There has been a general decay of human nature, in its individual and its communal aspects, into a disordered state in the modern world. This doesn't mean that we're evil as isolated creatures though some of us are. It does mean that, under current conditions, we don't know how to live individual lives of moral integrity and we don't know how to form proper

communities, including political communities.

What can we say about the political community which runs Social Security and Medicare, a few relatively large and criminal wars, a greater number of small criminal actions in any given year, a dysfunctional space-exploration program, a number of troubled transportation systems, vast networks of schools which aren't, and assorted other disasters? It isn't a community. It's an incoherent gathering of disparate regions seeking to gain advantage at the others' expense and of unassimilable groups seeking to gain still more advantage at the expense of other groups, many of them sharing a number of individual members. Such a political disaster can't run any complex system in a manner hinting of either moral integrity or practical efficiency and effectiveness.

As I've said before, it's time to let the United States break up into smaller countries which may or may not become republics and may or may not come together to form a more rational and more sustainable confederation. Some of those countries might well have the desire and the capabilities to organize various sorts of welfare systems for its citizens. Let God's story work the way it will and we must learn how to move with the story rather than trying to impose our dreams upon reality.

In the meantime, any human crooks stealing from the public till should be prosecuted and jailed as individuals, any crooked corporations should be broken up, but that won't fix much and won't fix it for long. In a land of moral disorder and political incoherence, the crooks will find their way into that public till again. We could empty the till or leave only a few pennies in it, that is, go to an anarcho-capitalist system or something of the sort. I've vote to devolve into the sorts of communities which can meet human needs rather than to stop trying to meet those needs.

## 452 How Much Health-care Do We Need?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1163>. It was finished and uploaded on 2012/01/12.]

I haven't had any health-care for ten years or more. Haven't seen a doctor. Have only had special blood-tests when donating blood a few times. I've been lucky for sure but it's also likely that I've gotten good advice from non-interventionist doctors who told me to avoid the medical system as much as possible. To be sure, they did tell me to find another non-interventionist doctor wherever I happen to live and to go for a check-up every couple years, but I made a decision to do the work I felt God called me to do and I've made not a penny from my writing. Trying to be consistent with my beliefs, I've accepted help from relatives and friends but haven't applied for any sort of government aid.

Why haven't I made any money? I can only repeat what I was told by independent literary agents as well as ex-employees of the mainstream publishers: the American mind has deteriorated so badly that even the employees of the publishing industry can't handle demanding books. There is no market for what I'd call real books—not that I deny the goodness of a certain amount of mind-candy in the intellectual diet.

In any case, there is apparently no need or at least no felt need in the United States for books or other products which might develop the mind. This would imply that Americans, probably most in the modern West, feel no need for a well-developed mind just because they have fulfilled Adam Smith's fear that the citizens of the prosperous West he foresaw would feel no need for moral integrity. Yes, in general though not in all cases, I do tie together moral integrity with a proper cultural level for your historical

circumstances.

Let me move back to the question in the title by considering a quote from Kenneth Minogue's *The Liberal Mind* [95]:

[W]hile the welfarist is concerned with vague general ends, it is in fact the means which are crucial in society—for the simple reason that the ends are never reached. [page 106]

This implies our true 'needs' are for means to reach ends rather than being 'needs' for the ends themselves. As they say, "Teach a man how to fish rather than giving him fish." As our means expand, so will the ends we might personally define as 'needs' and so will our luxurious desires. All of this should be, must be, defined within an understanding of a good human life and that will involve means more than ends.

There's an interesting and more specific line of thought I'd like to quickly explore. If we were to develop greater means, I think it's likely we find ourselves in a different place than we would have planned. Going forward from that place, we would start desiring still different ends, perhaps ends we couldn't even imagine. In the meantime, we, or our descendants, would have started developing means we certainly couldn't imagine.

To make "vague general ends" our focus is also wrong because such mis-thought and misbehavior will lock us and perhaps our descendants into pursuing, with ever greater desperation, goals which have revealed themselves as strange.

Let me now switch to a practical issue of great immediate importance.

We are at a transition point. The Modern West is decaying a bit prematurely but it would have happened at some point. This decay into decrepitude and senility is happening early because of our lack of courageous and creative response to the very successes of the Industrial Revolution and various sorts of reformations including those in religious and political communities.

We are looking at the need for very basic changes which are likely to lead to a variety of changes in our political communities. There are likely to be many hurt as we respond to this decay of the West and its various communities, but far more would be hurt and hurt for generations to come if we don't respond in some plausible and proper manner. One of the most dangerous of temptations in the early phases of our responses is that of reforming various parts or aspects of communities which are fundamentally

flawed and need to be dissolved or radically restructured. Only time will tell us exactly where to head as God's story moves on, but we shouldn't be looking backward and using too many resources to solve ongoing or new problems by way of defective institutions.

So far as Social Security and Medicare are concerned—they appear almost as if they were designed to maximize conflicts between generations and between various ethnic and religious groups which have very different ways of approaching financial matters, caring for the elderly and those who fell through various safety nets, and so forth. The Euro-zone is currently being destroyed by conflicts between the Northern and Southern Europeans. The American population almost certainly has similar conflicts because of different ethnic traits – on top of the generational conflicts already showing. For example, members of some ethnic groups tend to seek high cash income while the members of other groups will seek business ownership with lower cash income in the short-term along with the build-up of business assets. All else being equal, the first will be better off with retirement annuities, cash benefits, whether purchased from a private institution or supplied by a government program funded by some sort of taxes. They might even be better off with a sub-optimal government program with a bad tax strategy. The second might be best off if they can leave their business assets to the next generation under favorable circumstances in return for being supported in their retirement years. Meanwhile, tax and regulatory policies in the United States have destroyed the viability or at least attractiveness of traditional family businesses.

In other words, despite what big-mouth and invincibly ignorant politicians and 'expert analysts' say, there is no one solution which is perfect for all of us. At least, we haven't discovered it and we aren't likely to do so or even to find a variety of better solutions for the different groups in our larger communities so long as we remain committed to our current ways of doing things, spending time and energy and other resources to reform institutions we should allow to die.

We've trapped a lot of human beings into dependence upon these government programs which worked well at least for some but only so long as we met the solvency requirements of these not-quite but sort-of Ponzi schemes. It's probably a bit more complex for Medicare but Social Security was in good shape so long as we had annual net (after inflation) growth of 3% in the national economy and a ratio of about 3 active workers for each retired worker. We passed to the bad side of any such point of solvency by

the early 1990s or so.

I suspect our good-looking, pre-2000 economic statistics were fraudulent since at least the 1970s, but a little thought would indicate that even a well-designed pay-as-you-go system can have serious problems with even a relatively short stretch of economic problems and the consequent inadequate premiums/taxes. So far as the workers go: I believe we currently have 1.8-1.9 active workers for each retired worker on Social Security. It's likely that we would have run into the demographic problems even if our economy had grown non-stop and were projected to continue to grow. At the very least we would have had to up the 3% net growth as the birth-rate fell. I'll leave it to the reader to contemplate my claim in light of history or to explore the issue in an historical context—not the hot-house context of current politics and growing generational conflicts.

So how much health-care do we need?

I'll claim that we have no right to demand of this world any level of health-care or retirement benefits or the like. What we have is a duty to build the sorts of communities which have the means to care for their members according to the traditions and overall purposes of those communities. If we succeed in building the means, including the music and other arts which bind communities, we'll be able to help care for ourselves and others in the appropriate ways, which may or may not involve high levels of the sort of industrialized health-care which is the standard in the decaying West.

## 453 Can the State be Limited?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1171>. It was finished and uploaded on 2012/01/24.]

The state as we think of it in this year of 2011 can't be limited without destroying that state. This is because—in Jeffersonian terms—the state as it currently exists in most countries is an instrument of a vague group of human beings which we could call the exploitive class; these morally disordered creatures have taken control of the governments of these modern states. This current generation of predators are certainly good at destroying, even at the level of entire countries, but not so good at even profiting from that destruction, let alone being good at building something worthwhile.

How did this happen?

C.S. Lewis once claimed that Hitler and Stalin had not lost. In the way the West chose to fight them, the peoples of the West became the disciples of those brutal men who were much better at destroying than at building much that was useful let alone good or beautiful. The leaders of the modern West are very much in this mold. However much they like to soak in their own morally-advanced juices, they know only destruction, the reduction of enemies to submissive, quivering creatures and the reduction of sewage systems and hospitals to piles of rubble.

To save these states, the United States and Germany and so forth, legitimate governments would have to be formed by some morally well-ordered human beings from the producer class, preferably having formed smaller-scale groups with interests and legal rights tied to the future. Then they would have to take over and powerful, greedy men are rarely thrown out of power without the type of violence which simply places a different group of powerful, greedy men into power, but that's not a set of issues that I can

discuss in this short essay.

More importantly and relevant to the themes of this essay: I see no signs that the ordinary citizens or even the most capable of producers have learned much. If the United States is rescued as a prosperous republic by some miracle, the American citizenry would allow another predatory takeover of the United States so long as the new predators were careful to appeal to the fears and desires dominant in the public marketplaces of our sad, sad days. I imagine the situation is little different in other parts of the West.

I'll sidetrack a small bit to give a warning to the wary: membership in the class of expoliter/predator or that of producer isn't pre-determined but is, at least partly, taken on. Nor are most of us pure producer or pure predator. To use some oversimplified historical examples from a crucial period of American history: Henry Ford – despite some rough characteristics—was almost a pure producer of wealth, Andrew Carnegie probably had a bit more predator in him, John D. Rockefeller proved he could be a producer but opted to become largely pure predator, and J.P. Morgan was a predatory financier from the start to end.

The modern movement towards democracies and republics which has led to the state as we know was largely enabled by the freeing of community members to be individuals under kings and some early advocates of democratic or republican forms of governments. This process was partly driven by offers on the part of power-seekers to relieve the troubled of some of their suffering. It was also partly driven by the mobility of opportunity and the overlapping mobility caused by the chance to escape various forms of persecution. The first cause is more important to my current thought and I'll ignore the ways in which communities dissolved or weakened simply because their members left for better opportunities or at least the dream of such.

The modern state has continued to secure its power by offering help to those suffering from abuses of power in smaller-scale communities. How many fathers are abusive? It doesn't matter to the leaders of modern states and their employed do-gooders any more than it mattered to King Louis XIV and his do-gooders in the 17th century or to any other would-be tyrants in history who have sought power by shattering natural human communities. So long as the modern state can elicit complaints from some allegedly abused children, you can interfere in all families. This is a game American politicians are good at, so good they've taken their show on the road man-

aging, for example, to show the world some of the bad and some imaginary bad done by Saddam Hussein before moving in to wipe out all the good he'd done without more than a show of healing the damage he'd done to his country. (Iraq had good infrastructure before the American military destroyed it, that is, destroyed sewage systems and fresh-water systems and schools and hospitals.)

In all likelihood, as I said above, the American citizenry and the citizenry of other countries of the West would fall for this sort of a routine once again and the related routine offering of government jobs to more than can be supported by the rest of the population. I'm not saying that all government jobs are useless or dangerous. In fact, in alliance with politicians, such non-governmental workers as doctors and ditch-diggers have grabbed a large enough share of the economy to cause damage. And then there are bankers. . . Nuff said

In any case, politicians have the power and ambitious, stupid politicians have the motive, to make governments excessively large. Nathaniel Hawthorne pointed out in the 1850s, in the introduction to *The Scarlett Letter* that Americans will seek promises of financial security of this sort and are quite willing to sell their liberty in return for government jobs or other government income or government-enforced monopolies. Our moral characters haven't gotten any tougher since then.

This would indicate that a general regime of individual freedom isn't going to work the next time either, though I think other possibilities exist which don't lie on that simplistic spectrum of possibilities from individual freedom of the modern libertarian (or 19th century liberal) variety over to modern style tyrannies, but let me zag a bit now that I've zigged—as is my custom.

I've been very critical in the past toward my fellow Americans—that is, ordinary citizens and not power-seekers—and toward others in the West and I probably shouldn't have been. The Bible tells me, the Catholic Church and nearly all Christian churches tell me, that most of the brethren of Jesus Christ are sheep, not shepherds and not even brave by the limited standards of sheep. This helps us to understand what's at stake with some of the important questions I've tried to raise when I address political and moral issues.

Why do we let legitimate governments mutate into cancerous masses? Are we so taken in by the big show of federal money to put fancy swimming pools into schools not able to teach basic skills of reading and writing? Sure

it is that the pools were intended to improve the physical fitness or make up for past prejudices against some racial or ethnic or religious groups. Or at least the politicians lead us to believe they are truly compassionate and devoted to the public good. At the same time those state-centered leaders do what they can to destroy the authority of those communities which have retained enough coherence to remain true communities in the face of the state and its allies in Hollywood and on Wall St.

As I've been doing for several months, I'll turn to *The Liberal Mind* [95] by Kenneth Minogue, seeking to cast some light upon our modern mess:

[I]t is characteristic of liberalism to make politicians of us all; and in this case we find liberalism promoting alertness to trends among the population at large. Indeed, to be liberal *is* to accept an obligation to be concerned with matters beyond our direct responsibilities. [page 109]

In these words, I find a strong pointer to another reason for seeking to be a member of a concrete, local community which is represented in centralized governments rather than being an individual member of an abstract, fluid herd voting for a morally compromised product of political machining. Those whose primary energies are devoted to family and local communities, those who devote more of their remaining energies to following professional football than to the most casual readings about the countries recently invaded by the armies of the West, troop off to elect the scoundrels who will decide which countries we'll invade over the next few years. By making government the work of all, at least for one day every year or two, our political masters have made sure government isn't the special work of those who know enough and have the qualities to protect those who belong to their communities. We have also, borrowing from Thomas Jefferson, developed a "perverse literacy" in ourselves and this has led to an "invincible ignorance" which leads most to pay no attention to the thoughts of those few who've bothered to learn something about the modern world. The invincibly ignorant feel it good enough to learn a few convenient talking points and to maybe learn something about the issues as defined by policy wonks who live in a world where the nomads of Afghanistan are no more than pawns in political games played in Washington and London and Rome.

There are a lot of things going on in the modern world. There are a number of long-ignored problems which are developing into festering sores

the size of Mt. Etna. Meanwhile, we allow ourselves to be taught that any Vietnamese or Iraqi peasant who shoots a heavily armed American in his backyard is an evil creature and we concern ourselves with so-called issues which have little to do with reality and a lot to do with the egos and squabbles of those who thrive in political snake-pits.

So: What is going on in our day and age? What should we be doing, for example, to return the West to some path of moral and intellectual sanity?

I don't think we can understand our world by laying matters out in a schematic form. There's a story going on, a story being told by God, and it's not a matter of intuiting *a priori* or any other metaphysical truths, but rather a matter of paying attention to the actual past, on evolutionary and historical and annual scales, and trying to figure out the nature of the physical surroundings and the nature of the characters and the types of events which move the story along smoothly and the types which disrupt the story in various ways. Let me zig again to quote Professor Minogue on his use of 'state' to refer to a legitimate form of society and associated government:

The State is not an aspect of society; it is the only unity that society can lay claim to. [page 131]

This is as good an excuse I can find for a somewhat delayed retreat from my recent tendency to take the libertarian understanding of 'state' as something always bad, always imposed upon a population who should be free of central authority. Let me take a definition of state, from an older and more solid dictionary (Webster's 1913 dictionary [140]):

**state** A political body, or body politic; the whole body of people who are united under one government, whatever may be the form of the government; a nation.

The definition says nothing about where power originates and that would seem to be the entire problem; certainly, the origin and nature of power, as well as the need to protect it from the inordinately greedy and ambitious, was the major political problem of their day for some prominent Founding Fathers of the United States and most especially John Adams and Thomas Jefferson, in their work as Founders and also in their correspondence during their years of retirement. It is also clearly a major problem

in to some highly-regarded advocates of liberty such as William Lecky and John Dahlberg (Lord Acton), and others who occupied islands of sanity and intelligence in this modern desert. For an intimidating list of books by serious students of these issues—including Lecky and Dahlberg, see *The Online Library of Liberty* at <http://oll.libertyfund.org/index.php>. Many of these books are out of copyright and available for free download as pdf files.

I admit to still having some reluctance to use ‘state’ in that sort of good sense, however tentative and qualified that goodness, perhaps because I started coming to some dim awareness of my political environment during the years of the American war against the Vietnamese people was followed by Watergate and then by the disasters we know as the Ford and Carter administrations—Monday morning quarterbacks can see these disasters were largely, though not entirely, caused by Johnson and the criminal way he financed a criminal war. Then, things seemed to get much better and, like many of my generation, I was lulled to sleep by the future-eating prosperity of the mid-1980s through 2000 or so. (Actually, I was a little ahead of the game, waking up to our dangerous situation around 1990 but that was forced by some crises in my personal life.)

As a young and very confused advocate of conservative thought and behavior, I had hopes that Reagan would re-establish something like the decent and fairly well-ordered small-town world I’d known as I grew up in the 1960s and early 1970s. I was under the illusion for a few years that this had truly happened and then, for another ten years, under the illusion the Reagan Revolution had been for real and betrayed after the fact by Bush and other Republicans. Oddly enough – in retrospect—I can see the world I longed for was a somewhat mindless world which wasn’t so good for me but that’s another story I’ve at least hinted at in other writings. There’s now historical evidence, including testimony from Paul Craig Roberts and Angelo Codevilla, that Reagan had honestly planned to do what he promised in his first election and his administration had been somehow bullied (don’t know what the threat was) into accepting George H.W. Bush and other pro-statist insiders who proved to be saboteurs of the most treacherous sort. I knew there were traitors to Reagan and to the American nation as a whole but didn’t know how early they’d done their work. Murray Rothbard has also written of Reagan’s campaign promises to cut back on the power of the bankers and their creatures in the Council for Foreign Relations, Trilateral Council, etc. David Rockefeller obtained a one-on-one meeting with Reagan after he’d won the election and Reagan appointed a cabinet dominated by

charter members of the Trilateral Council, such as Schultz and Weinberger.

In retrospect, things look very bad for any who would speak of the American state as being a morally ordered community, one caring for all its members and—at the very least—maintaining a level playing field. But we should remember that failures in a dynamic world of evolution and development don't mean that the effort was wrongly directed. It might be that multiple tries are needed for one reason or another. In other words, our failures are likely the failures of creatures living in the early stages of an evolutionary process, a process in which a variety of social relationships are forming and a variety of ways of stabilizing those relationships are coming and going. The American State as we know it is falling apart, probably pretty fast. Such is true of most of the states in the West as well as those around the world, even in the Orient, which have modeled themselves upon some orthodox or heretical view of political systems advocated in the academic and journalistic communities in New York City or Paris and sometimes actually tried in the American State or the Soviet State or the Italian Fascist State.

If the nets of salvation are to gather in many, communities of various sorts are needed to care for the many who don't have the initiative or the talents to explore Creation and to think through what they discover. Communities of various sorts are needed for the blind and the timid—if they are to be saved. That is to say—human communities must care for the weak and cowardly in the flock. After all, God could have created a world which would have terrified and broken the strongest and most hardheaded of men. By God's highest standards, all human beings are lacking in intelligence and initiative and courage and faith, but, in His mercy, He has set lower standards for us.

I'm now ready to claim that we need some form of the state to compensate for weaknesses and to satisfy positive desires of the members of the Body of Christ. I'm also claiming that God will give us what is needed for that Body.

What then has gone wrong with the state in recent centuries? Let me just hint at an answer by addressing one specific problem I see in our efforts to form communities and to govern those communities.

The problem with the United States is not that we're currently paying no respect to the Constitution written in 1789 but rather that we think it possible to so structure a growing and developing community, political or otherwise. The Catholic Church has a similar problem as do many other

communities of Christian or other nature. The Pope is less the father of a growing and developing community—as most recent Popes would prefer to be—and more the king of a community assumed to be frozen into a structure that it will take on in heaven. We maximize the dangers and damages of rapid change, and lose all control over our most immediate future, when we treat the United States and the Catholic Church and so many other human communities as frozen structures. It would be dangerous, and an intellectual error, to assume a community is the same as an individual organism but it's a simple observational truth that they are similar in many ways, including the fact that they are developing entities rather than entities which can be designed at one time for all time. No wise parent determines details of their child's life when that child is but an infant. Even in the most traditional of societies, the farmer's son might become an apprentice to a blacksmith, the farmer's daughter might have to learn how to arrange the more complicated, if more luxurious, life of the household of a major merchant. We don't know what God's world will offer us or throw at us, as individuals and as communities. To predetermine our responses is to live yesterday's life in tomorrow's world, it is to be planning to drive a horse-and-buggy in a world which suddenly is building interstate highways. In the realm of politics, it also to put your children's life under the control of men who have learned the tricks of gaining and using, or abusing, power in such a mindless society.

Political structures—indeed, all communities—evolve in the way of stories rather than being entities from a short list given to us, once and for all time, by Aristotle. To a Christian, the proper form of a state is that which serves the Body of Christ, as a whole and as a collection of individuals. The proper form of a state isn't that which enables efficient economic development, though competent and wise statesmen wouldn't interfere in matters not directly the business of the state. The proper form of a state isn't one which allows ambitious men to stride as glorious conquerors across the stages of history, though such men play a role in that history perhaps similar to the role of various brutal predators in the story of biological evolution. The proper form of a state isn't one which either interferes with religious matters nor one which serves human religious institutions. I have even come to believe the Christian Church herself is but one organ in the Body of Christ though a particularly important organ. In this mortal realm, it may well be proper that the Church and state are wary of each other as their overlapping roles develop.

In any case, we need some sort of centralized political authority, something which corresponds vaguely to our current idea of a state, but we don't really know what form that state should take on and we certainly don't know how to build one. But that's part of our problem. We think to build such a complex entity when it needs to evolve and develop. We need to learn how to be energetic and intelligent characters in a story rather than strange engineers designing the future of our communities as if designing a road-system.

# 454 Why Do We So Readily Accept or Even Welcome War?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1174>. It was finished and uploaded on 2012/01/30.]

In *The Liberal Mind* [95], Kenneth Minogue tells us:

War is habit-forming, and peace is confusing to many people who cannot deal with conflicting standards and feelings of guilt.  
[page 111]

I'm aware of others who made comments about the eerie and morally disedifying attractiveness of war to many men who are seeking to avoid not just moral confusion but also seeking to escape what seem to be boring lives. And I myself still sometimes dream of waging violence against some Other threatening those and that which I value. Sinners we are and the major danger to those who would wish to do better is our tendency to justify our favorite sins and, being habituated to war, we modern human beings of the West, especially Americans, have tended since 1914 or so to invent justifications for any and all military actions against those who are different from us.

Perhaps the basic problem is what I've noted recently—most human beings are sheep and not well-formed for independent and self-directed lives. We don't know how to amuse ourselves and this makes us victims of exploiters who provide despicable and mind-numbing entertainment. More than was ever true of the Soviet Union of Stalin's days or China of Mao's days, in the modern West, minds and moral characters are shaped by scoundrels of various sorts, politicians and political commentators who get our juices flowing and help to further shut down our brains, educationists

who prefer teachers and students who shut up and get on with the mindless routine. We are primed to jump at opportunities—such as wars against enemies well-defined at least in the propaganda—to prove to ourselves we are energetic and morally-directed creatures who can accomplish something more than applying bureaucratic rules to the applications passing over our desks, something more than drinking some good wine or a fine micro-brewed beer as we catch a few hours of television.

Maybe Thomas Jefferson was right when he wondered if Americans would have been better off illiterate rather than having what he called a ‘perverse literacy’. Illiterate human beings have a hardheaded common sense, of a parochial and otherwise limited variety to be sure, which allows them to deal with reality without the aid of television or rap music. Like those with a higher literacy and access to books or music or other substantial stuff, preliterate people don’t get bored. The first group are more likely to complain there are too many (serious and good) books and not enough time. The second will loosen up as some tune up fiddles and pipes. The first will go looking for a library or will sit quietly with “Volume Mi-No” of the encyclopedia which seems so archaic and so comforting. The second will sit without feeling boredom or may go looking for some woodwork or painting to do. Those who are semi-literate will read Stephan King or Thomas Harris novels or will surf the Web or the cable television looking for something to satisfy a stimulated but poorly focused brain.

As Jefferson realized, our illiterate ancestors were more properly skeptical about any government officials or big-city merchants who made promises of a better life. A knowledgeable historian may well say that Jefferson was wrong in some ways, but the point remains that there is such a state as ‘perverse literacy’ where the human being has traded in a fully concrete view of the world for one where concrete reality is partially and—usually—incompetently organized to one or another abstract scheme. And I will add, perhaps redundantly, that those whose skills of literacy lead them to writings by or about Jefferson, or the writings of Lord Acton or Forrest McDonald, Charles Beard or Hannah Arendt, will be capable of amusing themselves and of engaging in intelligent conversations about our current mess. They will also be capable of evaluating the mindlessness of our politicians and political commentators for what it is and also capable of evaluating the claims of historians and philosophers and moral theologians.

The semi-literate or ‘perversely literate’ human being, smart or not so smart, college-educated or 8th-grade dropout, doesn’t know how to evaluate

the world in that way. They absorb one or another schemes advertised to represent reality, having little talent for or developed skills for evaluating those evaluation schemes, so to speak. And few there are who can build new understandings of reality, whether that understanding is in the wrongful form of a scheme or in the form of a narrative which uses specific schemes in limited and well-defined ways.

Modern men have absorbed morally disordered schemes which give false descriptions of reality and provide horribly misleading guidance for action in the world we inhabit.

We're easily bored and our heads have been filled with romantic images of that most horrible of human activities—war. We think glory when the reality is scared men peeing or shitting in their pants as soon as the guy next to them is beheaded by a piece of sheet-metal shrapnel. We think of armies advancing when the reality is that tanks are rolling over the rubble of schools and hospitals covering the corpses of innocent human beings of all ages. We think of precision bombing when the reality is one alleged enemy in the midst of a village of innocent human beings or even no more than a wedding party celebrating the Afghan way by shooting rifles into the sky. This is a reason our equally confused American leaders start too many wars and probably a reason the United States can't win wars nowadays. It's not that we need to be more realistic in a nasty way or more realistic in a morally compassionate way. We need to be more realistic. Period. We need to pay attention to the stuff and characters in our universe and we need to pay attention to the story in which they play roles in a story which is unrolling. And we, however 'we' is defined, are among those characters.

This is an added complication, a richer additional meaning, to the words of the historian Carroll Quigley which I quote so often:

The truth unfolds in time through a communal process.

It's not just that the truth already manifested in Creation has to be understood by a timefull process. The fullness of truth can only be known at the completion of the story we call the 'world', our universe seen as morally ordered to the purposes of God. The story goes on and the truth—from our creaturely viewpoint—is still evolving and developing.

To me, this stuff is more exciting than war could ever be if only because human wars, just or unjust, are only a part of this story itself unfolding as part of Creation in its entirety. Others clearly feel different, most especially

all those adolescent leaders in Washington and their supporting casts in uniform and in the do-gooder organizations who just love war at a time when we can help those we miss to get back on their feet and become better human beings, that is – more like Americans or Englishmen, and we can also help to rebuild some fraction of the schools and hospitals and roads and agricultural infrastructure we've destroyed. And make a profit at that. What a world!

And all the guys at home get to cheer as they watch those precision bombs go down the chimney of a Baghdad building just like Santa Claus. And we Americans can take credit for being almost like St. Francis – the buildings we show blowing up on the television screens are never hospitals. Maybe it's an Iraqi military office being hit at a time when the only occupants are janitors and cleaning-ladies. But it's not a hospital like that pile of rubble down the street which the Pentagon PR guys didn't mention in their briefing, providing a potent signal of sorts to let the television news-shapers know what be their duty.

What a way to escape boredom and satisfy our patriotic longings. What a noble way to satisfy our desires to sacrifice for our country. "Hey, Joe, grab me a beer while you're in there. They just machine-gunned some more bums moving around the streets. Probably some America-hating creeps'll claim they were a bunch of children. Wanna order a pizza? This could go on a while."

There are guys who've been there or who served in the military in supporting roles and could have ended up in combat roles. And there are guys who've suffered a lot in various ways. I knew some who went to Vietnam and they were forced to kill some civilians, even young ones, to stay alive. There were some who figured out that Johnson and the other scoundrels in Washington had betrayed the boys in uniform and they weren't happy about it. There were a lot back home who were suspicious but didn't want to do anything to damage their respectability. Like the nice men in the bureaucracy described by McNamara in his memoir of the Vietnam era, the leaders of our churches and towns and universities mostly went quietly about their duty, acting as if there were no stench of moral decay coming from the White House, the Pentagon, Foggy Bottom, Langley, and so many other places. It was a moral mess. Even legitimate wars of defense can be messes of accidental killings of innocents or even your comrades-in-arm. Even legitimate wars can corrupt the leaders and ordinary folk back home. We should treat war as the very dangerous activity that good historians

describe. And some of those good historians were warriors themselves. You could help your understanding of war as a brutal activity by reading *On Killing* by Lt. Col. Dave Grossman or *War as I Knew It* by Gen. George Patton or *A Rumor of War* by Philip Caputo.

I agree with Professor Minogue's comment: "War is habit-forming, and peace is confusing to many people who cannot deal with conflicting standards and feelings of guilt." I also think it quite strange because the guys who are in the real fighting see lots of conflicting standards. A fire-fight is going on and there's suddenly movement in the high grass off to the side. Fire or not? I talked to a guy who was a U.S. Army Ranger in Vietnam and he said he fired and later found the corpses of an elderly lady and three small children. Did he do wrong? Should he have taken a little bit more risk to his own life and the life of his comrades? I don't know. I wasn't there – basically the title of a too-young-to-go novel about Vietnam I play with in my minuscule time which is spare while I have functional eyes. Oh, for young eyes. There's too much to do while so many who parade as God's chosen ones, called to work as clergymen or Christian intellectuals, seem to find time to watch an American's allotment of television and movies—and what sort of Christian would subject himself to that mind-numbing, soul-destroying experience which is so large a part of the problem I'm writing about here.

We've made ourselves and our children into invincibly ignorant and willfully stupid people, living in a morally perverse dreamworld. I speak not of the worst among us but the mainstream among us and, over time, the alleged elite—teachers and clergymen and political leaders—have refused to do their duty and have instead charged to the head of the herd as it heads toward barbarian and morally disordered regions. We who are now the members of the responsible generation were ourselves once the children under the misguidance of an earlier generation of adolescents masquerading as adults but now the West has been thoroughly looted, in cultural resources still more than in financial resources. The end-time, in a manner of speaking, approaches fast as the likes of Alexis Tocqueville, Hermann Melville, Jose Ortega y Gasset, Garet Garret, Hannah Arendt, Paul Kennedy, and Jacques Barzun have been prophesying. I could even add some of the Founding Fathers who were pessimistic about the moral maturity and moral character of Americans. And, no, I'm not saying the world is ending, only that an age of prosperity and promise is ending in a horrifying and destructive manner.

This may seem a funny way to summarize a large-scale cultural and moral critique, but:

We don't know how to entertain ourselves properly.

Incapable of finding enjoyment in the care of animals or woodworking or reading serious history books or reading even serious mind-candy, we sit in front of the television and imagine ourselves to be the sorts of human beings with more initiative and greater moral character. We imagine ourselves as explorers and great warriors or – increasingly—as celebrities to be admired because of our fame. Masses of defenseless human beings and the infrastructure of a major city are but props for our imaginations shaped by *Rambo* and *Star Wars*. An adolescent mind struggling through regions of violence toward some sort of good moral order would be better served by dreams of a good number of American politicians and a few generals standing on the scaffold, about to pay the price for what they did to young American men and to the Vietnamese, to more American men and the Iraqis.

I've found myself that dreams of vengeance against our own treacherous leaders can help move me along the path toward a better Christian moral order, however strange to the likes of St. Francis it would be to reach moral order by way of dreams of vengeance of the sort God has denied to us.

Vengeance? No, that is forbidden us. Calling to account? Yes, if we Americans were capable of being a moral self-governing citizenry.

It's easier to seek entertainment in dreams of fighting the Other, the Other which is evil and which is devoted to destroying us. It's hard to work with a pile of planks to turn them into a table-top and just as hard to read serious science and serious theology to establish a meaningful opinion about any possible conflicts.

Let me repeat a quote from *Time and Free Will* [11] by Henri Bergson:

[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work. [page 172]

Before going on, I'll remind the reader that Farmer Wendell Berry is as much an artist as is Poet Wendell Berry.

We are potentially free and also potentially morally well-ordered because we're born as social creatures and a human sort of freedom and also good moral order are to be found in our social relationships, some of which we can 'sublimate' even to love of God. When we are truly free, we aren't Hannibal the Cannibal satisfying despicable desires. We aren't flaccid and passive creatures enjoying stupid and evil movies about Hannibal the Cannibal or Rambo. But that is what too many of us are—flaccid and passive creatures who enjoy not only evil movies but also news of evil and unjustified violence inflicted on many innocent human beings and perhaps a few who are alleged to be evil in the way of American political leaders—that is, they kill or order others to kill innocent human beings.

To the extent that these Americans, political leaders or applauding followers, are free, then we can say: "[Their] acts spring from [their] whole personality." This is not a good thing—to have a personality which is devoted to moral disorder.

On the other hand, anyone who reads *On Killing* by Lt. Col. Dave Grossman, an airborne Ranger and then a psychologist, will learn that ordinary Americans of previous generations, moral and decent men, who killed face-to-face in battle because they thought it morally justified were still suffering occasional nightmares decades later. I think those men discovered that war isn't much in the way of pleasurable entertainment, at least not for men of moral character. Lt. Colonel Grossman even tells us those men refused to put on their uniforms to march in such events as Memorial Day parades. They were willing to put on their uniforms to fight again if their country needed them, but thought parades and the like were too much like celebrations of killing others—some more of that entertainment of a morally despicable sort.

A morally well-ordered warrior has to be a little detached from the destruction and death he inflicts on enemies and on some innocents who might be in the wrong place at the wrong time. A morally well-ordered citizen-soldier struggles unsuccessfully for that detachment, aware if only after the fact, that he has inflicted horror and brought it into his own self. I would hope that we will someday reach the point where citizen-soldiers who don't have to kill or even see in person as others suffer as a result of armed force won't try to derive vicarious pleasure because of the heroics of those who did have to fight and kill and maybe wade through muck containing human remains. I would certainly hope those at home will gain a true respect for what some endure not because they suffered but because of the

suffering they inflicted or helped to inflict on others.

Read Lt. Col. Grossman's book if you have any doubts: except for a small percentage, some—and perhaps most—good men will pass through their own suffering and move on but will carry the suffering they inflict on others for the rest of their lives, though there is some merciful attenuation over time. This is a good thing. Painful but good.

## 455 Let's Hear It for Amateurs, That Is, for Lovers

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1180>. It was finished and uploaded on 2012/02/09.]

Not one to accept the mishmash of ideas which is the modern worldview, Professor Minogue reminds us in *The Liberal Mind* [95]:

A free State is one in which there is a strong resistance to professionalization; it is marked by that “versatility” which Pericles claimed for Athens. [page 150]

This is not to argue that professionalization is bad. Minogue was himself a quite highly-regarded professional in the field of political history and theory. This is to argue that we should resist professionalization as we should resist any good thing that might outgrow its own domain, in a sense—might outgrow its own good.

The modern age is one of monstrous growths of that sort and we are learning, some probably already knew of this from studies of history, that one problem with excessive professionalization is that it quickly decays into an amateurism of the bad sort, a rigorism tied to yesterday's thoughts and embedded in a general sloppiness of thought. This is a still greater danger in this excessive professionalization which I'll be emphasizing.

One obvious example of professionalization gone bad, in this year 2012 of an ongoing worldwide crisis, is banking and finance in general. The professionals, in the commercial banks and the central banks and the government bureaucracies, carry about heavy degrees from prestigious universities as well as a long list of attendances at equally prestigious conferences which were gatherings of Nobel laureates, government ministers, and other highly

professional experts who all belong to the right societies and the right country clubs. Unfortunately, it seems they mostly know how to enlarge the financial sectors of economies to a bloated and unsustainable size, largely by encouraging the solution of problems and non-problems as well by way of products and services which provide large flows of fees and other incomes to financial professionals. Which creates a new round of problems to be solved by financial professionals.

Of all modern professionals, scientists and engineers have maintained the highest levels of what could truly be labeled professionalism, the attainment and disciplined deployment of high levels of knowledge and skills in a field. They have done so precisely because they're forced to respond to reality rather than being fully free to build their own little ghettos in which they can serve their own interests and the interests of some of the human institutions to which they belong. Having said that, there are those even from the scientific community who have worried about the effects of the corporatization of science – some articles summarizing the results of complex experiments in fields such as particle physics might have lists of dozens or even hundreds of 'authors'. This large-scale corporatism will probably drive out the sorts of true individuals who can take on the role of prophets to their fellow-scientists and will also make it difficult for any remaining members of the herd to feel even the need to exercise personal moral responsibility. Anyone who has read a history of the Manhattan Project or a biography of a major participant will know these moral problems were already showing up in that project, relatively small by current standards, and showing up despite and because of the fact that those scientists of an earlier time tended to be more individualistic and had been raised in societies which didn't pay undue respect to political or military or professional authority.

There are others who have given personal testimony about the decay of fundamental honesty in the practice of science. Back in the 1960s, Michael Polanyi, chemist and surgeon and philosopher, was so testifying. More recently, David Ruelle, a French physicist who was one of the rediscoverers of what's misleadingly called 'chaos theory', testified that copies of his articles had actually been cut out of journal copies in the libraries at universities where his academic rivals were resident—see *Chance and Chaos* [125]. Put this together with the ease of assembling scientific research teams to build weapons which could be fairly labeled as evil and the ease by which scientists carry out research which their parents and grandparents would have con-

sidered the stuff of science fiction nightmares not so long ago, and we have warnings that the professionalism of even scientists might well be decaying into what might be called amoral service of one's self and one's institutions. After all, there's nothing morally special about those who have minds capable of fluently working in the formal systems of quantum mechanics. The moral goodness often found in scientific research is arguably a carryover from the early modern traditions of the amateurs who founded these fields of research and often remained amateurs, that is—lovers, even when invited into universities or given grants to set up laboratories. See Chapter 236, *Are All Scientists Evil?* for a slightly more extensive discussion of this issue.

The point is that we're all human beings and the focusing of the mind and spirit which can occur with any intense professionalization, including that of clergymen and moral philosophers, can lead us to enter a ghetto with walls which are no more than a self-serving blindness. When this happens, professionalization turns from a training/education and practice which serves higher ends, including especially the needs of human communities, and becomes a source of fragmentation and conflict of the sort which can quickly break down moral order. True human communities, including those of political natures, are formed and held together by bonds of dependencies which are of a moral nature, that is, both the shepherds and the sheep are dependent upon each other and both willingly take on the task of forming the appropriate bonds of moral order. And—again – professionalism can develop into a form which dissolves these bonds of moral order rather than building new bonds or supporting old bonds.

## 456 We Should Be Willing to Pass Moral Judgment On Professionals

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1185>. It was finished and uploaded on 2012/02/18.]

In Chapter 455, *Let's Hear It for Amateurs, That Is, for Lovers*, I used a quote from *The Liberal Mind* [95] by Kenneth Minogue, to argue along a slightly different line than Professor Minogue had intended:

A free State is one in which there is a strong resistance to professionalization; it is marked by that “versatility” which Pericles claimed for Athens. [page 150]

Rather than follow the thrust of Professor Minogue’s statement, I argued that excessive professionalism was likely to lead to amoral self-service by professionals, even those in science and engineers who are held in line somewhat by their need to stick closely to reality. In speaking this way, I was dealing mostly with the tendency of human instruments to decay into institutions. This terminology is due to the American historian, Carroll Quigley—a short introduction to this controversial and—in my opinion—important thinker can be found at [http://en.wikipedia.com/wiki/Carroll\\_Quigley](http://en.wikipedia.com/wiki/Carroll_Quigley).

As Quigley used these terms, and I follow him, an instrument is set up to serve a greater community such as the Christian Church or an entire civilization or the vaguely defined community of those who wish to understand our universe or world, said instrument almost certainly decaying eventually into a stagnant and self-serving institution.

Here, I'm going to deal with the dangers to free men of trusting entirely in professionals, even those who maintain their moral integrity and maintain the instruments they founded as such rather than letting them decay into self-serving institutions.

In addition to the institutional corruption I discussed in that previous chapter, Chapter 455—*Let's Hear It for Amateurs, That Is, for Lovers*, there are also the more vulgar forms of corruption—self-serving acts by those who don't even believe in their cause and also simple padding of the pockets by believers and non-believers alike. These vulgar forms of corruption, however dangerous in the short-term—and the biggest danger is perhaps their effect on those still in early stages of shaping their moral characters, are of little interest in the long-term. Let us go then, you and I, and enter realms where generations are spread out against the sky.

As St. Paul told us: we each have our role to play in the Body of Christ, in the various human communities of this mortal realm and some will be given the opportunity to play roles in the various human communities of the world of the resurrected. Yet, I'll conjecture we'll not be and not expected to ever be extreme specialists who leave the other job to the other fellow. In fact, in line with the analogy I've drawn between the Body of Christ and the Holy Trinity, our individual thoughts and skills and behaviors will be those of all other members of the Body of Christ.

This puts me at odds with many of the streams of political and social thought in this dusky period of the modern age. There have been some powerful and influential thinkers who thought of one or more communities of men in such a way as to at least imply the individual human being is little more than a passing inconvenience. There have been more, perhaps the best of modern thinkers in these fields, who have turned the individual human being into a strange creature whose social relationships are voluntary and, if volunteered for, accidental.

Ultimately, my beliefs about even pragmatic politics are founded upon my understanding of the human being and his potential relationship to the Body of Christ and to other human beings in that Body as well as to God. This doesn't imply a pietistic attitude. In fact, I'm increasingly inclined to the view that there is some validity to the concept of 'scourge of God', a term once applied to the likes of Attila and Genghis Khan but equally applicable to modern leaders including some of the most prominent of American presidents. This isn't to say that we should be fatalistic or submissive to men who might serve God in the long-run, quite unconsciously, but most

certainly do serve their own ambitious and greedy desires and those of their associates.

Put these long-range views aside for a moment and think in terms of the middle-range, the range of our lifetimes and those of a few generations before and after our own generation. At this range, a polity with well-informed and clearheaded decision-makers can aim to act in a morally well-ordered manner. The shorter end of the long-range is the domain perhaps of the Pope, according to historical rules of thumb, but mostly the long-range belongs directly to God: the Almighty gives us hints of the life we might one day share with Him but most of the long-range is incomprehensible if we think in terms of suffering or prosperity, both of which are showered upon the good and the bad alike. In addition, as I noted above, God's ways of working will occasionally unleash scourges even upon peaceful and well-ordered societies. Sometimes we can come to realize, along with Isaiah and Jeremiah that this is the price we pay for living our own lives without considering the greater part of God's story, of this world. The ancient Israelites didn't respond properly to a new age in which barbarian conquerors had gained control of the wealth and technology of advanced pagan societies. We modern men of the West haven't responded properly to a new age in which great prosperity is punctuated by horrible wars. This historical mess has allowed the great growth of population and the spread of advanced technology even in the third-world at the same time that we see large-scale piles of human bodies as well as the brutal destruction of the infrastructure of entire countries which stand in the way, intentionally or not, of power-elites in one or more powerful countries.

We have failed to study reality and to think hard about proper ways of responding, of reshaping ourselves and our various communities. We have failed to create a proper moral order even in our families because we have—at best—tried to hold on to a way of ordering our thoughts and behaviors which is no longer coherent in this new world of immensely complex and complicated human communities, communities which we've failed to even try to understand. We have an understanding of the Bible and of human history in general which leads us to a state of psychosis, a separation from reality.

We need to respond in more appropriate ways to our opportunities and problems and this isn't a task for specialists but rather for those who have a wide-ranging understanding of at least one major human tradition as well as a similar understanding of modern empirical knowledge. From such a

foundation of knowledge, we can begin to understand our individual selves, our communities, our universe. We can respond to God's Creation so that we can see a world: the universe in light of the moral purposes of God in His freely-chosen and freely-constrained role as Creator. A world is unified, coherent, and complete, though only in the very long-range since this universe is boiling over with the products of evolutionary and developmental processes. But, if we do our best in the middle-range, we can see – however tentatively—how we particular individuals and our specific communities should be ordered to fulfill our roles in this world, this true narrative—that is, morally purposeful tale.

This isn't a job for a specialist. Nor should it be considered a job for some recognizable elite, though it's clear that serious writers and thinkers from various fields will play important roles if they have the courage and faith to respond. But creative writers and thinkers are rarely specialists. Nor are those increasingly rare leaders we could label as 'statesmen', political leaders seeking peace and order and prosperity. Nor are most prominent specialists to be labeled as 'only', not if they are truly educated and truly alive in their mental and spiritual lives, not spiritual leaders seeking new ways to order the developing relationships between men and God, not entrepreneurial businessmen seeking to realize prosperity for their own selves and others, not lawyers and judges seeking new legal forms to consider rapidly developing and evolving individual and communal relationships, not architects and builders responding to new technology and new ways of living, not craftsmen seeking to give us the appliances and furnishings and decorations for our changing lives, and so forth.

We need some generalists to give us some overviews of the process of understanding this world, this story of which we are part. These generalists will work as poets and novelists, musicians and visual artists, architects and engineers, politicians and economists, house-builders and road-builders, etc. We need some generalists, some dreamers and visionaries, from the entire range of human efforts, but these generalists will be only a small percentage of all the workers in these fields. They must be communicators of not only their own efforts to respond to this dynamic world of evolutionary and developmental responses but also communicators of their professional communities. Generalists, whether specialists themselves or not, are dependent upon the efforts of specialists but they must go beyond and outside specialist efforts.

Moral order is sustained, enriched, even changed in fundamental ways

when appropriate, by generalists and not by specialists nor even by some consensus of groups of specialists. Those groups of specialists can contribute to the overall understanding which will be manifested in some attempt at establishing moral order. Some members of those groups might even move into the more open regions of generalists, as some physicists did in advocating for controls on the nuclear weapons they had helped to design, but they do so as generalists who have a particularly good understanding of the underlying technical issues. Their moral judgments as such are no better because they might be brilliant scientists.

And what has this to do with the ‘freedom’ of which Professor Minogue speaks?

Our ultimate freedom is a sharing of the life—and freedom—of God by way of entry into the Body of Christ, the most inclusive human community in the world of the resurrected. In the meantime, we can realize some reasonable approximation to freedom, in our political and economic and cultural and familial aspects of our lives by understanding our world and responding to that understanding so that we ourselves can become images of God, encapsulating and understanding – however incompletely and defectively—God’s acts of bringing Creation into existence and shaping it in various ways. This understanding, and the proper ordering of thoughts and behaviors which it enables, gives us only a limited freedom in this mortal realm. We have to limit our actions or those of our communities in response to the acts of worldly powers—as Isaiah and Jeremiah tried to convince their fellow-Israelites. We have to limit our actions to consider our frailties and defects of person and communities. We have to limit our actions to those allowed by a physical universe we only partially and imperfectly understand. We have to limit our actions by a sense of modesty and humility, recognizing in some overall way that we don’t understand well enough to act in ways that put undue burdens upon our descendants or upon those who live in our age.

This is freedom: to realize the moral possibilities of our individual selves and our communities, to so realize by both a deep understanding and a well-ordered behavior. Such a project requires that wide-ranging knowledge and generalist attitude which I have been speaking of.

# 457 Moral Order vs. National Welfare Systems

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1189>. It was finished and uploaded on 2012/02/19.]

The bishops of the American Catholic Church are upset with President Obama's mandate that all participants in regulated health-care programs should have coverage for contraceptives, abortions, and perhaps some other services and products considered immoral by Catholics and many others. But this Catholic layman has a question:

What right have the bishops to object in quite this way to a mess they helped to make by strongly supporting national health-care in a country in which there is so much divergence in moral beliefs affecting medical decisions?

In fact, we can generalize as I did in the title. Any national program which affects matters of moral order will eventually create these sorts of conflicts if there is no consensus on important moral issues in the underlying population of individuals and communities. The interested reader can sample letters and reports from the American bishops and their advisors at <http://www.usccb.org/issues-and-action/human-life-and-dignity/health-care/> to see how enthusiastically the American bishops and their staffs helped to create this mess which bothers them now. It's quite appropriate they should be bothered but, over the past six years, I've posted several essays about the difficulties of acting as if we're a morally coherent nation when we're not. Others have been arguing about the dangers of national social welfare programs from various standpoints,

including the highly regarded Catholic historian Thomas Woods who argues from a libertarian standpoint. Did any of the bishops or their advisers pay attention to any sounds outside of their echo-chamber?

Take this as a general rule:

Social systems which have a major moral component should be designed for and implemented within morally coherent communities.

This doesn't exclude charitable give-and-take between communities not in full moral agreement, but it does exclude dependency relationships between such communities except in the most dire of circumstances – such as the large-scale destruction of a region's infrastructure by a natural disaster.

In other words, the American Catholic Church and its leaders, Christian leaders in general, had no business in recent decades pushing for any sort of national health-care in a country where there is no consensus on moral issues affecting medical care, such as abortion, contraception, hospice care, or the care for children lacking some of the capabilities of most children. If anything, they should have been questioning many existing programs such as Social Security and Medicare. After all, the opponents of Social Security beginning in the 1930s have criticized more than the financial dangers of Social Security. Some have also claimed that such a program would weaken the bonds of families and would even cause an inter-generational war. And, as it turns out, weak families and inter-generational war over Social Security and Medicare are among our greatest existing or impending problems.

As we become more dependent upon medical systems which are certainly not under the control of individuals nor local communities nor even the larger religious communities, we'll be offered such poisonous fruits as drugs and techniques developed by experimentation on lab-grown embryos 'engineered' to have specific medical problems, growth of embryos who will never be born but will provide transplantable tissue or organs, engineering of babies to be brought to birth to provide transplantable organs—some of this is already happening quietly in major research centers. For example, this relatively old article from 2006, *Harvard to Create Human Embryonic Stem Cell Lines* at [http://www.rxpgnews.com/stem-cell-research/Harvard\\_to\\_Create\\_Human\\_Embryonic\\_Stem\\_Cell\\_Lines\\_4400\\_4400.shtml](http://www.rxpgnews.com/stem-cell-research/Harvard_to_Create_Human_Embryonic_Stem_Cell_Lines_4400_4400.shtml), tells us:

After more than two years of intensive ethical and scientific review, Harvard Stem Cell Institute (HSCI) researchers at Harvard and Children's Hospital Boston have been cleared to begin experiments using Somatic Cell Nuclear Transfer (SCNT) to create disease-specific stem cell lines in an effort to develop treatments for a wide range of now-incurable conditions afflicting tens of millions of people.

In an article from the *Harvard Gazette*, we read about a meeting of some theologians who discuss some varying views on the allowability of using these embryos for research—the Catholic Church and more conservative Protestant churches seem not to have been represented: *Stem cells, through a religious lens* at <http://news.harvard.edu/gazette/story/2007/03/stem-cells-through-a-religious-lens/>. Read the article and note the difference in moral teachings regarding the use of embryos grown from stem-cells even amongst theologians of monotheistic religions. How can Catholics participate fully in a health-care system with Muslims who allow the therapeutic use of stem-cells derived from 'surplus embryos' produced in fertility treatments? I don't feel the right or the urge to go on a nationwide crusade to stop all acts I consider immoral but I also can't benefit from such acts without endangering my relationship to God, not even surreptitiously by way of medicines or techniques derived from research on those embryos. Nor do I even wish to be in a hospital which carries out what I consider to be immoral research or treatment. If we can't be sure the service or product isn't free of the taint of moral disorder, then we'll have to refuse it. The bishops have helped to create a situation where any morally well-ordered Catholic Christians might soon have to refuse all services and products of the American medical industry. The entire industry is on its way to being morally contaminated in a very deep way.

We should learn to think in terms of the general rule suggested above:

Social systems which have a major moral component should be designed for and implemented within morally coherent communities.

Human beings with diverse moral beliefs aren't going to be able to agree on a wide variety of health-care issues or social welfare issues in general. A morally diverse group of human beings or a morally diverse gathering of

human communities aren't going to be able to form a coherent community at a small or large scale. A falsely-justified attempt at implementing social programs with those who don't agree with your moral positions will result first in the moral corruption or confusion of human beings in the various communities, not just the community with the toughest moral standards. In addition, such confused efforts will produce serious disagreements threatening any existing social coherence, however slight, and will endanger any chances of meaningful dialog on matters of fundamental moral importance. And they might even endanger the very existence of some of these communities reduced to dependence upon a government which pursues its own interests, probably more free to do so because of the lack of moral coherence along with the pretense that we are a morally coherent nation.

Anyone who wishes to read a well-documented scholarly analysis of this lack of moral consensus in the modern West can check into the writings of Alasdair MacIntyre, such as *After Virtue* [88]; *Whose Justice, Which Rationality* [89]; *Three Rival Versions of Moral Inquiry* [90]; and *Dependent Rational Animals* [91]. For a good historical work narrating the past five centuries as a period of decay in the West, see *From Dawn to Decadence* [9] by Jacques Barzun.

## 458 Freedom as an Interest in How Things Are

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1192>. It was finished and uploaded on 2012/02/23.]

I'm coming to the end of this scattered series of essays inspired by Kenneth Minogue's profound book on modern politics, *The Liberal Mind* [95]. My thoughts have developed so that my understanding of liberalism has taken on a surprising form, but no form of liberalism seems to me plausible or rational.

I've taken a position that relationships are primary rather than concrete stuff. Even the flesh-and-blood of our bodies are secondary, or greater, forms of created being. God created this concrete world, this world of thing-like being, from some sort of abstract stuff hinted at in the work of physicists and then He shaped this concrete stuff into what He needed to tell His story, the story centered around the Son of God.

When God brought Creation into existence, He was acting with the full power of God.

When He began to shape the primary stuff, the Primordial Universe – which I claim to be manifested truths, He was working within the constraints of His own decision to create a specific Creation. We could say, analogically, that the Almighty was acting as a metaphysician in knowing the primary truths He'd manifested and a mathematician and physicist when He began to shape those truths in levels of increasingly particular being.

When He began to tell a story using this particular universe, the Almighty was acting as an author telling a tale of evolution and development of nonliving and living entities interacting, forming relationships.

Our freedom, and our rights such as they are in reality, are at the level of that story and not at the level of the thing-like stuff, our own bodies, which participate in that story. Our freedom and our rights involve relationships formed by human beings who are the result of a long and complex evolutionary process not yet over and are also the result of the evolution and development of human communities and also—of course—the result of development of that individual which is ideally dominated by complex, morally guided responses to the opportunities and problems of God’s Creation.

Once again, I quote Henri Bergson from *Time and Free Will* [11]:

[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work. [page 172]

Here’s an interesting statement made by Kenneth Minogue in *The Liberal Mind* [95]:

[I]n considering the circumstances in which free independence is possible, we must observe that it depends to a very large extent on an intellectual interest in how things are, in contrast to the desire to make things conform to a pre-established plan. [page 151]

In making peace with reality and responding to it in such a way that we develop that artistic personality alluded to by Bergson, we achieve freedom. If we are in a community of like-minded human beings, we might well establish strong relationships of the sort which mandate that we acknowledge strong rights on the part of others and others will acknowledge strong rights on our part.

In an essay on the German school of history, John Emerich Edward Dalberg, Lord Acton referred to liberals as “promoters of secondary liberties” and I think he would have at least accepted for discussion my claim that freedom and an artistic personality are deeply connected, that is, my claim that this deep relationship between true art and a free life tells us where lies the primary liberties, those which conduce to a well-ordered human life, one in which the human being has become a person, forming relationships with

the world which allow him to become a world of sorts, a morally purposeful narrative. Both world and person are unified, coherent, and complete in meaningful senses, being open to that which is still greater, that which encompasses them on a larger scale without compromising their existences as world or person.

Think of this as a fractal, if you wish. Human beings are a smaller version of a human community, similar to that community in a sense much like that used by mathematicians, that is, the smaller entity is ‘shaped’ the same as the larger. And that community is similar to the world, itself similar to the entirety of Creation. For those who’ve never read about fractals, I use it in the sense of having a complex structure where there are some smaller, similar entities within the largest. ‘Within’ is as important as ‘same shape’.

In this way of thinking, a civilization is something like a work of art just as a human person is. A large community, even if prosperous in some ways isn’t a true civilization without having true unity, true coherence, and true completeness. A human being, in the same way, isn’t a human person if he has not those traits.

Having those traits, that human person is free even if he lives a life constricted in many ways by either his fellowmen or by the environmental or economic or political conditions during his lifetime. That human person is aware of his accomplishments, his talents and limitations, knows of the difficulties of his life in a way that affirms his traits of personhood—unity and coherence and completeness. If political or economic or technological conditions are adverse, he might have only a very constrained freedom, maybe hardly any at all outside of his own thoughts, but his freedom is truly that unlike the false freedom of those exploited consumers who think themselves free because they can watch dirty movies.

I’m going to close my latest effort to plumb the depths of Professor Minogue’s book [95] with a couple of quotes and a quick conclusion:

One cannot organize a work of art; nor write poetry to rule. The man who sets out quite deliberately to maximize his own happiness is likely to fail. Whilst one may, perhaps, be able to create vast pools of technicians at will, one cannot create political stability or a nation of mystics. There are many things in the world which we cannot attain simply because we want

them; and some are beyond our grasp precisely because we want them too much. [page 157]

There are no means which serve the precise end of freedom, for freedom, like happiness, is not an end that can be pursued. [page 158]

Happiness of the mundane sort is most certainly not a bad thing in its proper place, nor is freedom of the obvious sort allowing us to move around and do those morally proper acts we should wish to do nor is it a bad thing to live in a human community in which we all behave towards each other in a way that corresponds to what traditional liberals labeled as rights of one sort or another. I can't imagine a human life in this mortal realm where happiness is continuous nor one where we each and all move with morally well-ordered freedom. In fact, it's often the case that one man's happiness might conflict with that of a wife who wants the family to take common vacations but doesn't enjoy fishing or hunting. We certainly haven't worked things out so that there are no conflicts between the rights of a landowner who wants to divert much of the flow of a waterway to irrigate his crops and someone downstream who wants to keep a good flow of clean water moving through his swimming hole. The best we can do is perhaps take up the position I came to after reading some of the works of Frederick Hayek and some of the works of Thomas Sowell a number of years ago (I supplement and reword to my own slightly different overall viewpoint):

Some sort of well-ordered system of property rights might always create conflicts because of real and imagined injustices but that system will allow for a peaceful human community.

We can go beyond that, but the issue of property rights are clearly fundamental since they deal with food and mineral resources and other materials and transportation routes allowing us to feed and clothe ourselves.

I believe it to be a commonplace amongst lawyers and legal commentators that tough cases make for bad precedents and, hence, bad law. It's also true that tough, outlying situations can make for bad understandings of human history or of Creation in general. Our Maker has clearly given us a world and a nature which lead to conflicts which must be worked out in non-optimal ways. The story which is our world, the physical universe seen

in light of God's purposes, goes on but it's sometimes rough on the good and bad alike, sometimes especially rough on those who are trying to be friends of God, sometimes just as rough on those who are trying to lead virtuous lives for other reasons. Yet, it is possible to live our lives in a way that brings out "that indefinable resemblance [between our personality and our free acts] which one sometimes finds between the artist and his work." By doing so, we have attained some measure of freedom, perhaps hard-earned freedom, in the strong sense that we have chosen our own moral path, one which embeds us in our own lives. For that is perhaps the real issue underlying this sort of discussion: there are far too many human beings who give little sign of being truly alive, of being active and free participants in their own travels through this mortal realm. This was pretty much the reason for Albert Jay Nock losing his faith in the doctrine of the immortal soul and then his Christian faith—since he falsely considered that doctrine a necessary belief for the Christian view of the resurrection.

While I don't imagine I can dictate or even predict God's acts, I speculate that those who will be saved will be those who have enough life, who can live with the dangers and blessings of freedom, so that they can share God's own life. Those who can't live freely in this true sense and those who've not developed their lives in this way, have remained human animals and may enter the eternal grave along with non-human animals, but the next paragraph raises a different possibility.

As I've speculated before: true freedom is beyond the capacities of created natures and can be obtained only if God blesses us with the gift of sharing in His own life. I've also speculated that we are saved as members of the Body of Christ and that raises more complicated possibilities of the freedom-lovers, or at least freedom-toleraters, amongst us being capable of providing to their more timid or more closed-minded fellowmen what is needed for being part of that Body. This would mean that something of the sort could occur in this world but only by way of strong communities containing some significant percentage of freedom-lovers.

The liberal arguments for some sort of rights, both those of 18th century lovers of freedom and those of 20th century lovers of centralized and intrusive governments, break down for those arguments assume some sort of uniform human nature which has a desire for freedom and for human rights which demand much of all. The percentage of those who love freedom so they won't compromise even to save their own lives might be far too small to directly support any stable free society and might make for a relatively

small Body of Christ, but maybe that small number can provide something needed by others and can, in turn, accept from others what they lack.

## 459 Progressives Kill Progress in Future Generations

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1198>. It was finished and uploaded on 2012/03/03.]

One of the worst things one generation can do is trap future generations in one specific way of life or one way of solving problems. There is perhaps more than some think to the witticism by someone whose name I can't recall: "I refused to be a radical when I was young because I didn't wish to be a reactionary when I grew old." There is perhaps more, though perhaps not much more, to the simple observation that modern rock-and-roll music is little more than a set of ruts worn-down by one generation drawing upon deeper traditions such as African-American blues and Celtic music. That is, rock-and-roll was a genre with limited artistic possibilities and most of those seem to have been explored by men born in the period 1930-1950 or so. In a strange but interesting way, rock-and-roll music can be used as an analogical case to the problems I'll be discussing in this essay.

This is a strong version of my claim: Progressives, with their tightly organized programs embodying strong views on how to solve certain problems lock future generations into specific ways of organizing their political and social and economic activities.

Whatever you might think about the solutions of the New Deal, whatever true urgency you might attribute to the construction of the national security complex after World War II, we're stuck with the particular programs and institutions, we're stuck with the costs and the large number of federal bureaucrats and even engineers and scientists who are making good livings doing what might not need to be done any longer. If those things ever needed to be done.

I have to admit that I sometimes think of progressive-talk as being no more than self-interested rhetoric by which one group of intellectuals and businessmen and educators and others justify programs which suit their fancy or provide them or their students or followers with good livings. This is unfair because there is a fairly high percentage of consistent progressives, that is—not ‘progressive’ on a selective basis—who seem truly motivated to make a better society, to care for the poor and elderly who’ve fallen through all available safety nets, and so forth. While the motivations are noble, progressives should think a bit more in terms of long-lasting programs which can solve one problem today and trap the next generation. They should realize that they are tying individual human beings and human communities together with artificial bonds of dependencies which might create serious conflicts in the long-run. Progressives, and anyone solving problems including businessmen, should realize that we human beings have a tendency not only to fight the previous war but also to burden future generations with the weaponry and strategies we’re developing for our current wars.

We should try to leave behind weaponry as light as possible and strategies as flexible as possible. It would be nice if we could even leave easily disposable weaponry and strategies.

Leaving behind the metaphors of warfare, I’ll also suggest we should be more humble and also more respectful toward our ancestors, troglodytes that they might have been by the standards of our enlightened age. We should consider that maybe even the feudal systems of Medieval and early Modern Europe were developed as serious solutions to problems when the solutions advertised by the moral giants of the Modern Age weren’t yet available. The feudal system might well have been an imperfect solution to the problems of a world with low levels of literacy, little non-animal power generation – though far more than many realize, few roads, regular invasions by Vikings in Western Europe, by horsemen from the central steppes of Asia in Eastern Europe, by other Europeans including your angry brother with his band of knights and knaves. The feudal system became bad at least by staying around too long but that’s the way of all human institutions and will be true of the welfare systems, the educational systems, the legal systems being set up by the modern progressives over the past few generations.

I happen to believe these modern progressivist programs were poorly conceived to start with, that they create dependencies upon centralized powers in order to help those who fell through safety nets and those who have had bad experiences, even severe abuse, in communities which develop

as part of natural human relationships, such as the family, or those which develop by bottom-up processes which we can handle pretty well, such as local political communities and ethnic clubs. In effect, if reform were needed, it was at the level of naturally developed human institutions, but it doesn't matter to the point I'm making—modern progressives are no different from those in the past who solved the problems of their age and left the solutions to burden succeeding generations.

As I've said recently in various ways—we try too hard to build what must develop over time, bottom-up by way of a communal process in line with the unfolding of truth through a closely related communal process. We modern folk don't seem to be all that good at either sort of communal process, that of nurturing communal life or that of seeking truth. Human beings will need to become good at those sorts of processes if our race is to ever to mature into a peaceful and well-ordered community on that largest of scales, the scale of the Body of Christ. (No, I'm not arguing for or against universal salvation, only that the Body of Christ will contain all those who will share God's life for time without end and the pilgrim Body of Christ should be seen as including all living human beings as well as a good number of deceased human beings.)

I'm not claiming we should stop trying to help the poor and the down-trodden, I'm not claiming we should stop trying to solve all sorts of problems. I'm only claiming we should be humble enough and prudent enough to be modest in our efforts to develop programs which might – in principle—solve serious problems but prove to be burdens for future generations, burdens of the sort which make it difficult for our descendants to solve their problems or even to fine-tune any successful programs we leave behind us.

# 460 Paying for Perverts at the Airport but Drawing the Line at Birth-control

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1218>. It was finished and uploaded on 2012/03/23.]

I want to ask a simple question of the bishops of the American Catholic Church:

Why is it acceptable for Federal agents to fondle the breasts of American women, probe the genital regions of American children, and publicly remove the diapers of incontinent elderly Americans but beyond the moral pale to force those violated Americans to pay for birth-control and sterilizations? (At least, it's beyond the moral pale if those violated Americans happen to be Catholics.)

I don't ask this with a bias toward one or the other abuses of government power since I consider both to be just that—abuses of government power. I do think it particularly despicable to be violating the bodily privacy of human beings, especially women and children, but I seem to be somewhat alone on that issue amongst American Catholics. And I do suspect the agents of a growing police-state are a greater threat to this country and its religious freedoms than an additional tax, however disguised, imposed by a bloated government which already collects lots of money to pay for activities which are criminal or simply dumb.

Maybe religious freedom remains standing when a little boy's penis is manipulated by a federal agent or a little girl's rectum is penetrated by a

gloved finger, but—if so—what would it matter? At best, that would be a religious freedom compromised by a tight connection to evil. In fact, while this airport security regime would be bad if imposed upon us, it's a true moral horror, a shame to us in the deepest sense, just because we've so readily accepted it.

Bluntly speaking, the bishops, and their Protestant and Jewish colleagues, long ago showed they were willing to give up a large measure of freedom in return for Federal money or the satisfaction of endorsing programs which will surely end all those problems which the Bible tells us will always be with us. We have a bloated and non-workable welfare-warfare state partly because the leaders of the American Catholic Church, not just bishops, thought they'd found an easy way to feel good about themselves and to pretend to bring Heaven on Earth. Thus, there was no time and energy to spare to figure out if these feel-good programs were good for the American people, as individuals or as members of communities. Time was a 'wastin'. A New Deal was needed so that everyone could have 2 Potted Chickens in the Nude World Order. Or something equally as intelligent as that.

American politicians have already measured the level of moral integrity and moral courage of the American Christian leaders and now they're just negotiating the price of their cooperation and a few contractual details before inflicting the next humiliation upon the citizens of the United States, or inflicting far bloodier humiliations on the inhabitants of Southwestern Asia. Or maybe it'll be Mexico or India or Angola next—there are growing rumors of the evil resident in those countries and our leaders are devoted to rooting out evil throughout the world. And the bishops will interrupt their battle for religious freedom long enough to pray for the success of another invasion or two. Your Excellencies, as an American Catholic, I plead with you to learn the meaning of the term 'just-cause' and to learn how to evaluate the flimsy excuses offered by warmongering and war-profiteering politicians. Those excuses have proven to be lies in all the recent wars and police actions of the American government.

While we're at it, I might ask the Catholic bishops if they'd noticed that American invasions have recently been very effective at destroying ancient Christian communities? Is the strangely constrained religious freedom beloved by the American Catholic bishops of infinite value and the very existence of ancient Christian communities in Asia of no value at all? I fear that Americans, including Obama and the Catholic bishops, are the re-

sult of a people having more money than brains, more power than moral character.

We Americans wish to spread our freedoms and our goodness around the world and there's nothing like a demolished fresh-water system or a city reduced to rubble and collateral corpses to teach the world how to live like us good Americans. Just so long as the American government doesn't impose a health insurance plan on the Iranians that forces Iranian Catholics, if any survive, to pay for birth-control. Just promise us you won't do that, President Obama, and we American Catholics are ready to go to Tehran with you. Or at least to sit in our living-rooms and watch young American soldiers kill and be killed for our viewing pleasure.

American politicians will tolerate an ill-tempered spasm on the part of American bishops because the politicians hold all the cards those bishops and their predecessors passed to them during the decades when works of charity and of social care, including the care of retired workers, came to be considered the responsibility of central governments primarily and the responsibility of subservient contracting agencies only secondarily. The American Catholic bishops, helped train the members of their flocks to become dependent upon the Federal government and to assume the leaders of that government are speaking truly when they say we need to invade another country that allegedly threatens us or to expand the not-yet implemented health-care plan to include needs or rights claimed by some substantial minority. Of course, the wrong sort of expansion leads to screams of moral outrage on the part of our Pandoras. "I didn't mean to release that particular critter."

I'm not claiming the American Catholic bishops are more cowardly or more hypocritical than the rest of us. Along with the other American Christian leaders, these bishops are little different from other American men. In general, we fail to protect our women and children and elderly against our governments, though we'll support the murder of hundreds of thousands in other countries because of some ghostly criminals in the mountains of Afghanistan. Manly, aren't we? We remind ourselves of John Wayne playing Davey Crockett. I'll bet we're impressing the other peoples of this small planet with our sheer, bare-chested manliness. I'll bet we're really impressing the God of Jesus Christ who told us to kill ragheads and gooks by the thousands, let government perverts violate women and children and elderly, and – above all—refuse to pay for birth-control and sterilizations.

# 461 Through the Looking-glass: Religious Liberty and Religious Toleration

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1227>. It was finished and uploaded on 2012/04/06.]

I'm trying to tighten the focus of some of my own ideas in the area of religion and society, religion and government, religion and any other form of human community. There are probably many things to be said about the conflict between religion and various sorts of religious societies, and some also cover conflicts involving some who hold no firm religious beliefs but do have strong moral beliefs about human life. I'll not make most of those statements, at least not here.

I will speak generally about the various conflicts associated with so-called Obamacare, including the religious freedom problems. They seem to be partly, maybe largely, caused by confused actions and lack of actions on the part of Catholic bishops and other Christian leaders over the past century or so as the American state has drawn its citizens into a variety of dependency-relationships. We shouldn't become dependent upon power-centers which might one day call upon us to act against our principles. In fact, I'll claim that religious neutrality on the part of governments is possible only if religious conflicts deal with issues not really important, at least not in our public life. In that case, religious freedom has no particular value and religion itself becomes the purely private affair advocated by extreme liberals of the modern era.

If religious beliefs have any substance, if religious beliefs have any bearing on the behaviors and the other aspects of concrete lives of human beings,

if they are—in the strongest example—sacramental or even Sacramental as some Christians believe, then any behaviors affected by those beliefs couldn't be subject to compromise in the interests of 'religious neutrality' and then the public square becomes at best a gathering of mobs representing different beliefs as they shout at each other—or worse.

In fact, we think of public squares in terms not compatible with true religious faith, but I'll put off a discussion of that issue to a future essay. I'll give only hints about the possibilities of sharing some substantial amount of a public square with those who advocate beliefs which Catholics and some other Christians think to be morally disordered.

Let me propose a rule:

If a program involves substantial issues over which there is much principled disagreement on the part of significant groups, then we should be very modest indeed in the implementation of that program or competing programs.

This doesn't exclude the possibility of relatively small 'safety-net' programs for something like medical care but even there we should realize there is a chasm between 'us' and 'them', however those are defined. For example, important research hospitals in the United States are trying to find cures for horrible medical conditions by experimenting upon embryos who have those conditions, at least in potential, and who are grown in the laboratory. I'm not interested here in arguing this topic, only interested in noting that many Christians, some Jews, some skeptics and atheists, believe that any being which is at least arguably human should be treated as human. How can we—I'm one of them—share a medical system with those who are developing medical technology by experimenting upon lab-grown embryos and will maybe be harvesting tissue or specific biochemicals from lab-grown human beings? How can those who think abortion is a right share a medical system with those who think it murder?

Maybe we should be so tolerant as to act as if we had no moral principles?

Our leaders would have us move forward assuming that those with greatly divergent moral beliefs can cooperate on medical systems and we can create a crazy-quilt pattern of exceptions on the basis of conscience. We negotiate treaties with men who have gone over to behavior we consider evil and then somehow that protects our noble and pure selves. And,

of course, we can trust men who do what we consider evil to honor their agreements. Our Christian leaders don't seem to have any clear ideas how this can happen, probably because it's a psychotic view in a strong sense, a view at odds with reality as understood through honest human perceptions and reason. Our leaders have merely asserted, without explanation, that we can have one uniform, nationwide healthcare system though it can't be quite uniform when our beliefs are threatened. Don't worry, as problems arise in this morally incoherent plan of action, we'll jury-rig solutions. They even tell us that we can share everything so long as we have gimmicky accounting to make it seem we Christians don't pay for anything God would not allow.

Again, I think we Christians can cooperate on basic safety-net services with those who would allow abortion services and even experimentation on human embryos. Somehow. If we had leaders, if they had advisers, who were morally responsible enough to learn about these issues and think about them rather than just reacting in ways that make certain sorts of shallow Christians feel good about themselves. We should worry that we've become a people better at organizing feel-good rallies in Washington and state capitals than at thinking hard about the world and anticipating problems.

And, if our objections to the economics and politics and morals of our neighbors involve truly fundamental principles, we should be thinking seriously about forming communities of those who share our principles. Done properly, this sort of separation would bring some peace and order to a world growing increasingly chaotic as we pass through another period in which established ways of thought and behavior are breaking down and there are mass movements of individuals and groups into regions inhabited by those with greatly differing cultures and religious beliefs and so forth.

Let me put this in terms of God's purposes for us.

We are in a narrative which is the formation of the Body of Christ in its mortal form. We have not the knowledge, not the power, not the legitimate authority, to force this Body into some sort of preconceived shape or to have some sort of preconceived functions. We are intending—in the Thomistic sense of growth—properly as individual human beings when we respond as best we can to our opportunities and problems, including discretionary opportunities for pure pleasure. We grow into the future. We develop toward a goal we can only dimly perceive—if we can see it at all. We have a duty to cooperate with God, to remain firm in our intentions, so long as we intend to obey our Maker. We explore possible paths of development.

We don't create the territory in front of us, the abstract spaces of possible developmental paths.

When we act as if we were aiming at some knowable point down the path of development, when we think there is some sort of larger entity already formed and under our control, we become rebels against the Creator who is telling this story. We try to take over the role of our Maker.

As one who has accepted the questionable task of trying to see a little further than is usually wise into the future, that is—into the unfolding narrative which is our world, I can assure those who think it easy to see some allegedly desirable goal, “universal healthcare” or “democracy in every nation”, that it is a task that will give the morally responsible thinker more than a few eerie dreams and even the occasional nightmare. To the extent that prophecy allows even the slightest bit of foresight, it can frighten those with stronger hearts than mine. The future, the world as it will be in a few generations, is no longer ours. It's not a matter of just fun gadgets and all sorts of high-tech conveniences as if it were an episode of the cartoon show *The Jetsons*. Only those insensitive to the conventions and customs in our behaviors and thoughts, our very ways of seeing and hearing the world, will think they could go back to, say, the Philadelphia of Ben Franklin's days and feel as comfortable as if they'd gone to a nearby city for a day of shopping and entertainment. It's a indication of the reasons the United States is the most bumbling and incompetent empire in history: we are so insensitive to cultural issues, to moral and other habits, so inclined to bend the world to our will, that we feel comfortable in any and all cities of the world—so long as we can find our favorite American restaurants. We ignore all the surrounding mobs of smelly human animals speaking some sort of gibberish. We've even made ourselves insensitive to our own cultures, to our own moral habits and customs. We can't smell and see the differences between the streets of Boston and those of New York City.

Let me wrap around to draw some sort of a conclusion about the topic in the title. Religious toleration in some sort of large-scale public square would be possible only if all the human beings of the surrounding communities were in agreement about the nature of their world, the moral purpose—if any—of the events of their individual and communal lives. As I've noted before—perhaps in weaker language, only a deluded fool could believe that communities differing on such important issues as abortion and experimentation upon lab-grown embryos can possibly share—fully—either a medical insurance system or the medical system itself.

I fear the worst is yet to come and it might involve a quiet and cowardly surrender by Christian leaders.

## 462 We Americans Love to Stay in Our Comfort Zones

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1249>. It was finished and uploaded on 2012/04/27.]

Math is hard, Barbie, and that goes for you too, Ken. It's hard like tennis or basketball or baseball, requiring hours of hard work on basic skills when you really have little clue how those skills will really be used. When you have the basic skills of arithmetic or of fielding and throwing the ball, then you learn how to handle symbols in a manner analogous to numbers or you learn how to turn the corner at second-base or how to position yourself for the rebound.

There are many in these United States of American who put in many an hour of practice duffing away before approaching a round of golf at par. There are many who teach their children of the need to work at those skills of skating and slapping away at pucks. There are even some, slightly old-fashioned, who see that Junior practices his latest chord before heading to his next guitar lesson and see that Missie hammers away at the animal-friendly plastic keys on her electronic musical device each every day.

We leave mathematics to the professionals and the best of parents will rarely do more than make sure Junior is getting good grades on his exams and Missie is doing her homework. We leave it to those professionals to set the standards, to decide what Junior should be learning as a freshman and Missie as a junior. My own experience, even during a slightly better period in American education, taught me – eventually—that we're leaving some important issues to the care of some who themselves never aspired beyond the duffer stage, beyond the stage of banging out *Chopsticks*. This article tells us my experience might be typical

for American students. There are countries which do better. For some specifics, see the article, *Countries That Best Prepare Math Teachers Share Similarities: Several Key Conditions Generally Lacking in US* found at <http://www.sciencedaily.com/releases/2012/04/120416101026.htm>.

The article tells us:

Countries that best prepare math teachers meet several key conditions generally lacking in the United States, according to the first international study of what teacher preparation programs are able to accomplish.

The IEA study, led by Michigan State University, suggests that in countries such as Taiwan and Singapore, future math teachers are better prepared because the students get rigorous math instruction in high school; university teacher-preparation programs are highly selective and demanding; and the teaching profession is attractive, with excellent pay, benefits and job security.

The key word is ‘rigorous’. Math is hard, but—as I’ve noted before—so are any subjects when approached properly. Rigorous is painful for a people trained to be the passive victims of canned entertainment or to consider work to be something which can be done according to a short checklist developed by some bureaucracy.

Our English departments in the American school systems aren’t in much better shape than our mathematics departments, perhaps a little better just because we’re generally born with more language skills than mathematics skills and a highly motivated man or woman will find it easier to acquire higher level skills in the nature of composition and textual analysis just by frequenting their local library or the college library even if their formal education was weak. However, just as a talented teenaged furniture maker needs to learn higher levels of skills and discipline from a master, a lover of language also needs to learn from a master to be a truly skilled and self-aware practitioner, at least at a level adequate to serious teaching—we will, of course, always need a lot of teachers who concentrate on rudimentary skills but that sort of teaching can work only if teachers of all levels of skill have a good respect for rigor and are in a system and a culture which also has that good respect.

It's easier to motivate ourselves in fields where we generally start out with some decent level of talent. We can almost all throw a rock at a target or a ball in the direction of our father as he teaches us some athletic skills. Some of us, certainly not me, have enough coordination of limbs and of eye-hand movements to be able to advance so quickly that learning to play ball can be fun for years of development rather than a chore. Any serious athlete will tell you that even the great ones reach the point where they have to participate in special strength and skill exercises to continue to advance or to maintain very high levels of skill.

In a similar vein, many of us can more or less naturally acquire enough visual skills and enough oral language skills to become at least somewhat literate. Some have great facility with various aspects of language so that learning to recite poetry or write simple poetry or learning how to read serious narrative works is fun for many years of development. Then comes the day when you have to struggle to wrap your mind around the book of Genesis or a poem by Shakespeare or the writings of Thomas Jefferson. Back to the practice field.

One of the problems with mathematics is that there aren't that many who naturally develop any serious skills and I learned, by experience and years of contemplation upon experience, that most educational systems—certainly the one in my hometown—have not the slightest clue how to nurture even a raw talent such as I had, high-level but not at the level of a truly creative research mathematician. I would have probably become a physicist or engineer but for learning how to hate college after going there poorly prepared in habits and attitude – I'd been able to stay even more securely in my comfort zone than most and went to college as a couch potato of sorts. When I, as a boy, had needed to learn how to work, how to learn and think rigorously, I had been encouraged by the educational system, as well as American culture in general, to stay within my comfort zone, to sit and get good grades by sleeping through class and then browsing the material in study-hall.

# 463 Prosperity that Never Ends. . . Oops

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1283>. It was finished and uploaded on 2012/05/29.]

Historians have noted that approaching crises typically take longer to arrive than the more prescient of the victims-to-be would expect. And then they are typically far worse than the more pessimistic of the victims-to-be would expect.

I fear the truth that might lie in the above claims because we of the West, and many in other parts of the earth, live with governments and allied business communities which have gone to the limits to push back what might have been a manageable crisis in order to save as much as they could of the system. As it became obvious that salvage job was Mission Impossible, they continued their ineffective programs which – whether they had anticipated this or not—had the side-effect of turning honest people’s money into politician’s money and crooked banker’s money. That certainly provided a motive to continue with actions which did so much damage to the United States and most of its citizens. I oversimplify a bit but not so much as I would have thought even ten years ago.

Why did our masters-of-reality decide to move in for the kill? Had matters reached the point where the parasites were better off feasting off the flesh of the suffering beast rather than returning to the long-term strategy of taking a few quarts blood on a regular basis? We can assume something of this sort, but the question then becomes: Why? What had changed? The United States, as a particular and interesting example of Western countries, was and arguably is an immensely wealthy and powerful country. Many are now inclined to speak of the inevitable decline of a great power, though

it would have done a bit more good to have spoken that way and acted to deal with the problem 20 years ago when Paul Kennedy enraged many by suggesting the United States was showing signs of premature decline. Premature? I'll get to that after noting that Hannah Arendt had forecast 20 years before that the United States would face a decision in the early years of the 21st century: accept a collapse back into poverty or become a more forthright empire and steal what Americans were no longer able to produce on their own. Why can't we produce now what we seemed to be producing well in those early years of the 1970s? I'll also get to that after noting that one prominent American commentator and man of the Old Right, Garet Garret, had noted around 1950 that the United States was the strangest empire in history. To put his insight into my somewhat more expansionist claim: we paid the price, morally and financially and in blood of Americans and foreigners, to conquer other countries and didn't manage to profit, at least not at the level of our country as a whole, though clearly those heavily invested in the national security complex, in terms of careers or finances, have done well though not good.

All the while, right up to the seemingly minor recession of 2001, the American piles of wealth seemed to be increasing. Junior insurance company executives were building houses in my hometown at least double the size of the houses the doctors and lawyers and prominent business-owners had lived in when I was a boy in the 1960s. BMWs and Accuras and Lexus's were suddenly common, along with such exotica as Cadillac SUVs and pickup trucks. Simple, Mom-and-Pop restaurants were struggling unless they specialized in breakfast, though the fast-food restaurants were doing fine. At the same time, the larger surface streets and even the blue-collar shopping centers in the general area were sporting a host of what might be called mid-scale chain restaurants allegedly bringing us some part of culture from Texas cow-country or from Australia or from some part of Florida, that peat-desert hell in the making. The upscale restaurants were also doing fine though some were so crowded as to weaken the pleasures of a revamped dining experience.

I've written of distorting an economy by confusing the transactions related to unhealthy living and the resulting ill-health: see Chapter 389, *A Fraudulent Economy: Mixing Wealth and Illth and Mismeasuring the Mess*. The problem is still larger and more general than that.

As we've grown richer, we've sought more services, especially luxury services as well as the illth services which keep our overfed, sedentary selves

alive. We're eating out more and convinced that each of us deserves the medical care and other benefits of the richest in society. While it's certainly true that we have developed some technology beyond the dreams of our grandparents by enlarging the markets, that can only go so far. Rich people can afford rich people's medical care, and that care might become middle-class medical care in another ten or twenty years. It's the same with houses. Rich people can afford rich people's houses and some of the enhancements to those houses might show up in the houses built for the middle-class and worker-class in another generation or so. As it was, over the previous 20 years, middle-class people allowed themselves to be suckered into buying these 5,000 square foot energy hogs and are now in trouble, as is the banking industry which made sheer silliness possible.

The moneys controlled by politicians and also the moneys paid as insurance premiums (how many pay cash for medical services nowadays?) are still flowing though I'd guess the accountants at the average over-mortgaged, over-built, over-equipped medical center are worried. The next crisis will be manageable from the viewpoint of those seeking to keep the system alive only if the Federal Reserve Bank and Treasury Department can keep alive banks which are still gambling—in a casino dominated by bad bets. Private and public pension funds are in deep deficits. Medicare and Medicaid are in deficit by about the value of everything on the face of the earth. An increasingly shaky insurance industry is making generous payouts for natural disasters and self-inflicted medical problems and dents to ridiculously expensive cars and so on. There there is the medical industry which is spending like that drunken sailor though there are clearly disruptions to cash-flows coming at them soon, bigger problems behind those.

In general, you could probably find more problems by looking at any industry linked too closely to the Federal government or regulated by any level of government. Even well-run private companies are buying from and selling to these critters which are frozen and staring into the approaching headlights. It's time to go into the road-kill meat business.

The Apocalypse isn't coming but it's time for those who would help their fellow-citizens to at least get some perspective by looking at other periods of economic and political collapse. Some of those periods are only a little tough and some are downright nasty and are linked with major drops in population and decades of hardship. Think wars, famine, disease. Think barbarian hordes on the move. Think slavery.

Let's pray we don't reach that point and the United States might suffer

least of all even if we deserve worse—we're behind the deepest and widest moats on the planet and we have a lot of resources which can keep us fed, clothed, and sheltered. But, at the least, we'll be losing our nice cars and our summer visits to the Caribbean. And our diets will be simpler, perhaps a good thing since Americans don't seem to be able to eat healthily so long as that ice cream is in the freezer and the steak restaurant is offering a special on a huge slab of beef with a two-pound baked potato topped with a quarter-pound of butter and a crumbled pound of bacon.

We thought we could afford to live above our means, and outside the constraints of wisdom, by pretending to increase our means and by pretending the doctors and drug-companies could cleanse our bodies as fast as we poisoned ourselves. We've committed ourselves to paying ever higher salaries and benefits for various workers, bankers and musicians and nurses and teachers and so forth, whose productivity has been—at best—stagnant in recent decades. We've done this at a time when it seems likely that some of those workers, bankers and teachers for sure, aren't performing so well as similar workers in prior generations. Perhaps, they were forced to work against the grain by the changes I'm talking about, which have led to not only unrealistic expectations on the part of nearly all of us but also to severe damage to our moral character. Bankers, even from the most solid of local institutions, have to satisfy the needs and desires of those who want it all and want it now. The children of such human creatures have internalized this sort of moral disorder and have not the habits and attitudes to allow much in the way of real learning. This puts a burden on the best of teachers, to be sure, but the proper – if seemingly nasty way—to handle the problems is to send the children ill-prepared or ill-equipped to learn standard material to classes teaching more appropriate material or operating under more restrictive discipline. Maybe some should simply be sent back home. A more flexible system might accomplish this without unduly prejudiced bureaucrats making judgments on particular students. Perhaps the local communities could supply basic infrastructure and the teachers and classes for basic courses in reading, writing, and arithmetic. Then parents could contract with private classroom teachers or even tutors for individual instruction with perhaps some public subsidy to ensure talented youth with important talents don't miss out.

I don't really feel the need or the right to propose an entire system of reform because—and this links back to much of my recent work – we've messed up badly in many of these areas and we need to retreat and to start

fresh development and experimentation. We needn't and shouldn't begin any reformation with strong expectations of what we should do. Once we've reached better ground, we can begin to respond to God's Creation, cooperating with the processes of evolution and development which the Good Lord ordained for this world.

So, why do I say that the decline of the United States is premature? Is it something which could have been delayed, even for an indefinitely long time? There's a graph found often on the Internet in recent months. This graph shows the length of time for which one country or another has had the reserve currency for the past six centuries or so. Nearly all those periods have been 75-100 years before the reserve-currency country began an economic and political and military decline. The graph itself is very simple and shows the U.S. dollar has been the reserve currency for about the same amount of time as the currency of Portugal in the 15th century. Portugal had great leadership but it was a very small country with little in the way of natural resources and her time of glory came before there was much capability to buy or steal needed resources from third-world countries.

Speaking very generally, the United States, which is remaining the dominant military power for now even as our economic might dwindles, surely should have lasted longer than Portugal as the reserve-currency country, which is essentially possible only for the dominant world-power. We were even reasonably well-liked before we made it clear we'd kill innocents all over the world to make ourselves feel good about ourselves. We had no real competition until we simultaneously outsourced our production and some of our skilled technical services to Japan, Taiwan, China, and other countries while also wasting our energies, morale, and money on wars that didn't seem to have a real point other than convincing American leadership they were some sort of second-coming of the political and military geniuses of the Macedonians, Romans, and Mongols. We gave away the sources of our wealth and then spent it anyway. The evidence indicates our recent leaders in the U.S. learned strategy by watching Three Stooges movies, except our stooges had all those planes and bombs and tanks and high-tech guns. Moe and Larry and Curly poked eyes. They didn't bomb the hell out of cities filled with civilians and the infrastructure they needed to live decent lives.

In any case, it's likely that Nixon prevented the loss of reserve currency status, which loss would have been a good thing if we wanted to be a modest and peaceful people rather than the enslaved residents of a global power, by taking the U.S. dollar off the gold standard. He sold the American people

down the river but protected the power of the American government and military-industrial complex. Nixon, acting not as an individual but as a cog in a machine which he had entered by his own choice, doomed us and put up government barriers to any efforts to revive American industry, which was a bit tired—as a real estate agent might say—in the early 1970s. We needed innovation and the nurturing of endangered skills, not luxury goods and exotic vacations along with Vietnam and then Grenada and Panama and Iraq-Kuwait and... The United States has become a obese predatory beast with poor muscle tone but still driven to invade and occupy and fight until it weakens of exhaustion and meets some sort of end.

Over the next week or so, I'll be writing about some specific aspects of the ongoing decline in American prosperity and the inevitable decline in military and political power which will follow. I may or may not write about the related problem of the sheer lack of interest Americans have had, and still have, in taking on the role of leading a revival of Western Civilization.

## 464 Why Are the Parasites Killing the Host?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1286>. It was finished and uploaded on 2012/05/30.]

This is a short follow-up to the previous Chapter 463, *Prosperity that Never Ends... Oops*. Besides a few unexplored aspects of this situation, I also left hanging the question which is the title of this post: Why Are the Parasites Killing the Host?

Indeed, why? Wouldn't they be better in the long run to keep the source of blood and flesh alive while feeding off of it? I really can't say for sure and I don't believe it worth spending too much time thinking about the matter. It's a bit like trying to figure out what went wrong in the political system of Germany while planning for your battalion to meet its goals, including survival, on the beaches of Normandy. There will be time for such historical analyses, by professional historians, when we move past the oncoming disasters. For now, I just wish to make a few suggestions to make it possible to have a more or less complete narrative understanding of the situation of the human race in 2012.

1. The thrill of the hunt has gotten hold of some of the bankers and politicians and a feeding frenzy has begun.
2. The population of the exploitive or predatory class has grown so large as to unleash, again, shark-like feeding behaviors in the face of a limited food supply.
3. The beast is dying anyway, so why not rip out a big hunk of as-yet healthy flesh.

4. The looting has been set in motion and no one can or will stop it.

In my next essay, I'll move on to a more useful attempt to understand: why have so many of us been oblivious to the increasing signs that something had gone wrong in our age? In fact, some seem to still be oblivious. In my hometown, everyone is excited about the possibility of redeveloping the mills which once were so productive of jute-stuff and then a variety of metal and paper products. What sorts of companies are going to go in there? The major occupant will be a large health-care facility at a time when Medicare is approaching a cliff, Medicaid is probably dead on the scene but not certified, all sorts of insurance companies are likely to tank because they're one of the industries being stripped to the bone by the low interest rate strategies of the central banks (and they have other problems), and everyone has noticed the U.S. pays twice as much as Germany, as a percent of GDP, for our relatively crappy health-care.

Let me add an item to my list: The parasites are killing the host at this time because the host is loving it as its flesh is ripped away from its bones; it cries for more of the same stuff.

# 465 Dumber Every Day, With Beer in Hand and War on TV

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1289>. It was finished and uploaded on 2012/06/02.]

In Chapter 127, *Intelligence vs. Intellect*, I quoted Jacques Barzun from *The House of Intellect* [7]:

We [in the United States] have in fact intelligence in plenty and we use it perhaps more widely than other nations, for we apply it with praiseworthy innocence to parts of life elsewhere ruled by custom or routine.

...

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

The dumbing down of Western man isn't a dumbing down of the individual's intelligence but rather a loss of willingness and ability to draw upon deeper and wider sources of thought, mostly thought of great worth since it has survived some sort of selection process, similar to the selection processes of biological evolution. This is to say it has survived in such a way as to reproduce itself in various related bodies of thought, as Greek thought

proved its 'evolutionary worth' by contributing in various ways to the substance and form of other civilizations, Roman and Arabic and Persian and eventually Christian thought of East and West, and so on to our day and beyond. We modern men of the West have adopted some strange understanding of ourselves as individual creatures somehow freestanding and able to benefit from our cultural heritage on a purely voluntary basis, choosing to take our political beliefs from, say, the Roman Republic and our metaphysical beliefs from the Aristotelians of Athens and our cultural beliefs from Lutheran Germany of the Renaissance and so forth. Mostly, though we worry about pleasing ourselves by selecting from a menu of surrogate experiences in front of the television, shopping and dining experiences at the local not-yet-dead mall, vacation experiences in artificial Edens—some of which were legitimate centers of human cultures before being discovered and exploited by Americans and Europeans, experiences, experiences, experiences. If you have to purchase experiences, plan the details from menus provided by corporations, live them for a while as if they were the real thing and not as meaningless as your lives back home, treasure them until you can repeat the next year. . . They ain't for real and you're being trained to give up what's real for some imaginary circle of Hell which is quite profitable for someone.

Whew. . . A mouthful and no more than an expansion of what Professor Barzun claimed and what has been claimed by a variety of insightful thinkers. Let's move on and see what can be made of this mess.

In recent decades, the measured IQs of modern human beings have risen. The trends of various public test scores even for the United States as a whole have been surprisingly good if adjusted for the different populations taking these tests. When I go out and have casual conversations with my fellow Americans, or occasionally try to have a more serious conversation, I'm struck by the apparent liveliness of their thinking processes and also struck by the way that that liveliness is directed down a small number of well-worn paths which have proven themselves to be fruitless and dangerous. Though we might think that a loss of awareness of tradition might free us for creative movements, the opposite seems to happen to most human beings. Freed of some sort of structure, and maybe some tools, from one tradition or another, human beings take to a cattle-like movement, paying attention mostly to the cow in front of them and the bull to the right and the calf to the left.

Without attachment to some rich tradition, without that intellect which

is “the capitalized and communal form of live intelligence,” we lose our awareness of the greater world rather than becoming free to move away from the herd. We are those herd-beasts and few are those who can so much as look wistfully away from the direction in which moves their herd. We can be members of herds moving through good pastures, moving in a morally well-ordered manner, and moving towards appropriate goals. Or. . . We can be members of disordered herds moving in ways and directions to no good purposes or to the purposes of exploitive men. Any disordered herd will likely come to be exploited in large or small ways.

We Americans were always vulnerable to exploitation because we are relatively bereft of intellect, but there was a day when we, including the politicians and businessmen and generals, had some serious respect for the likes of George Kennan, Arthur Schlesinger, Adlai Stevenson, Robert Taft, Garet Garrett, Jacques Barzun, and Lionel Trilling. That age of respect for men worthy of respect for their connection to intellect was just dying in my youth though it was years later before I knew about it or about any of those men. Notice the variety of men on my list. I deliberately chose a smattering of left and old-right (true conservative and not much like modern Republicans), politicians and diplomats and academics and more-or-less independent men of letters. There’s even some overlap for those with more complex vocations. Even someone so erudite, so sophisticated in her expressed thoughts, as Hannah Arendt, the Austrian-American philosopher and historian, could publish in magazines of wide circulation and get some serious distribution for serious works of history or philosophy.

What’s going on that we Americans, and apparently Europeans as well, seem to be barbarian children trying to run a complex civilization? I use the language of Jose Ortega Y Gasset in *The Revolt of the Masses* [60]?

I think in slightly different terms than Ortega Y Gasset and nearly all modern thinkers because I’m willing to be consistent to my Christian beliefs in all my thinking, even in realms of politics and economics and—even, even—physics and other sciences.

This world, the universe ordered to God’s purposes, is a story in which the Body of Christ is forming. This Body will not fully form in this mortal realm, but rather in the world of the resurrected. Yet, we are called and driven to intend to move into our proper roles in this Body, where I use ‘intend’ in the Thomistic or biological sense of being a movement in a growth or development process.

The Body of Christ itself will be the ultimate human community, like

unto the Holy Trinity in that the members will retain their individuality while becoming fully members of that community which will be one. All will be shared and yet each thought and each action will come from a member or at least an organ of that Body, yet, it will be the thought or the action of all. Each of us has to play our own assigned role. Each of us has to contribute from our own talents. Yet, what we give will come from all and will be received by all in the Body of Christ, even as we are giving it and also receiving it.

Intelligence is an attribute of individual members of the Body of Christ and intellect belongs to the Body as a whole or at least to organs of that Body. Some members have intelligence directed towards matters which are properly concerns of individuals first and others have intelligences which can operate in that individual way but they are particularly sensitive to the intellect, the communal form of live intelligence. Likely it is that there are also some with limited intelligence but a talent for taking up matters settled by the intellect.

We human beings of the 21st century are still early in the process of the development of those organs of the Body of Christ which have strong relationships to the intellectual organ, but we can see some remarkable developments if we pay attention to where we are, what we have in communal relationships, relative to the human race in earlier periods. A creature who seemingly evolved to live in kinship groups of maybe 50 at most is now living in cities with tens of millions of human beings organized into a bewildering network of smaller, but still often large, communities. We can organize the building and operation of continent-wide power grids and communication networks. We have built civilizations—early forms of the Body of Christ itself as primitive fish were early forms of more sophisticated animals including social mammals, as apish creatures five million years ago were early forms of human beings. These cities have grown increasingly large over time. The Rome of Pompey is nothing compared to the city which now sits on that site. Nineveh is a village compared to Beijing. What is to come? Will we be seeing a global civilization arise over the next few centuries or will we see a group of large and small civilizations interlinked in various ways and to various degrees of tightness? Of course, given how terrible all men are at predicting the future, especially those who try, something completely different is likely to develop.

Yet, as certain sorts of participants in a very complex story, we need to have possible futures in mind that we might be better and faster able to

react when opportunities and problems arise. And there are certain members of the Body of Christ who have the goal of understanding longer-range, larger-scale, more abstract matters that we might understand ourselves and our world and also anticipate those possible futures. This is the role of those who have the sorts of wider knowledge in science and history and technology and literature and the other arts and at least some knowledge of the work of the various workers which feed a large and complex human community and put up its buildings and collect trash and so forth. (To be sure, some men of high intellect and high culture are often limited in their ability to deal with some fields of human knowledge or human activity. For example, literary men often, though not always, find simple algebra to be difficult. Many well-educated men have great difficulty understanding simple laborers or even skilled craftsmen.)

Intellect, “the capitalized and communal form of live intelligence,” is the knowledge and the allied thinking processes I refer to in the above paragraph. Development of a dynamic form of intellect, the process of taking in tradition and trying to adjust it to new circumstances, is not to the liking, perhaps not within the capabilities, of even most of those with some serious connection to intellect. Professor Barzun discusses in *The House of Intellect* [7] the odd fact that the 20th century up to that point, 1959, and since then in my opinion, has been a period of exploiting the creativity of scientists and visual artists and creative writers and philosophers whose prime working years had mostly ended by 1900 or so. Much good has come from the hard work of expanding and developing in detail the work of Einstein and Planck, Riemann and Gauss, Tolstoy and Melville, Picasso and van Gogh, Mahler and Mendelssohn, Ford and Carnegie, and so forth. But there is a certain flatness in the creative efforts of succeeding generations, with the possible exception of the quantum physicists such as Bohr and Heisenberg and Schrodinger and especially Dirac.

Why did this explosive activity come to an end?

There are a number of histories of human thought not yet written which will deal with this question. I don't pretend to have the skills or the access to materials which would allow me to participate in the writing of such histories. Nor, to be honest, do I have enough interest in the question to make such an effort and turn away from other work. I can only claim that this loss of creative intellect, and the lost of awareness of the need of such, is the problem we face, it is the way in which men of the modern West have dumbed themselves down even as they've retained high levels of individual

intelligence. Individual men have retained their intelligences but devoted them to analyses of upcoming drafts in the sports leagues and to politicking rather than to knowledge of human history and to efforts to understand how to move forward into new moral and social and political relationships better suited to our situation, our problems and opportunities, than are the relationships we inherited. Even the cultured men of non-creative but high levels of intellect such as Trilling and Nock are not to be often found and are not influential in forming even the higher culture for there is no such state of mind.

We lost our intellects while retaining our individual intelligences but it would have been hard for any but dedicated students of the past to have retained their intellects since the world has shown us new forms and we can keep our intellects, communal forms of living intelligence, only by moving into the future and developing new forms of intellect to correspond to the new forms of our world.

# 466 Misallocating the Gains of a Productive Economy

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1295>. It was finished and uploaded on 2012/06/04.]

The economist William Baumol, see [http://en.wikipedia.com/wiki/William\\_Baumol](http://en.wikipedia.com/wiki/William_Baumol) warned us about one of the problems which human beings create under conditions of prosperity, see [https://en.wikipedia.org/wiki/Baumol's\\_cost\\_disease](https://en.wikipedia.org/wiki/Baumol's_cost_disease):

Baumol's cost disease (also known as the Baumol Effect) is a phenomenon described by William J. Baumol and William G. Bowen in the 1960s. It involves a rise of salaries in jobs that have experienced no increase of labor productivity in response to rising salaries in other jobs which did experience such labor productivity growth. This goes against the theory in classical economics that wages are always closely tied to labor productivity changes.

The rise of wages in jobs without productivity gains is caused by the requirement to compete for employees with jobs that did experience gains and hence can naturally pay higher salaries, just as classical economics predicts. For instance, if the banking industry pays its bankers 19th century style salaries, the bankers may decide to quit and get a job at an automobile factory where salaries are commensurate to high labor productivity. Hence, bankers' salaries are increased not due to labor productivity increases in the banking industry, but rather due to productivity and wage increases in other industries.

The original study was conducted for the performing arts sector. Baumol and Bowen pointed out that the same number of musicians are needed to play a Beethoven string quartet today as were needed in the 19th century; that is, the productivity of classical music performance has not increased. On the other hand, real wages of musicians (as well as in all other professions) have increased greatly since the 19th century.

In a range of businesses, such as the car manufacturing sector and the retail sector, workers are continually getting more productive due to technological innovations to their tools and equipment. In contrast, in some labor-intensive sectors that rely heavily on human interaction or activities, such as nursing, education, or the performing arts there is little or no growth in productivity over time. As with the string quartet example, it takes nurses the same amount of time to change a bandage, or college professors the same amount of time to mark an essay, in 2006 as it did in 1966.

Baumol's cost disease is often used to describe the lack of growth in productivity in public services such as public hospitals and state colleges. Since many public administration activities are heavily labor-intensive there is little growth in productivity over time because productivity gains come essentially from a better capital technology. As a result growth in the GDP will generate little more resources to be spent in the public sector. Thus public sector production is more dependent on taxation level than growth in the GDP.

As it turns out, many of those jobs without productivity gains occur in government activities and in industries, such as medical-care, which are particularly susceptible to an excessive degree of government meddling, though it might start out as low-level regulation. As a consequence, such jobs have increased in number as well as in salary and benefit levels. The industries so friendly to government meddling, especially health-care and weapons manufacturing and military services, have grown so huge as to distort the very political process, black holes distorting political and economic spacetime so that more stuff is sucked inside.

We've allowed ourselves, and our more local and more natural communities, to become passive in our economic roles, workers and consumers,

and many of those centralized institutions upon which we are dependent are generators of the unproductive jobs I wrote about above. Politicians and allied businessmen have poured borrowed money into the medical-care or military industries. We've created an economy in which our health-care industry, as a percentage of GDP, is twice the size of the same industry in Germany. Our military-industry complex is about as large as the military industries of all other countries combined. How much do we have to spend to think our precious American selves are properly cared for by our hospitals and properly protected by our armies?

The economic costs of our self-indulgence and the indulgent behavior we've allowed in our politicians are starting to hit when so many Americans, especially those no longer young, have a belief they have a right to new joints, new veins, expensive drugs at low-cost, long stays in hospitals and rehab centers. We accept it as natural that we will invade or at least surround any country which behaves badly, for real or as presented by our scheming politicians and think-tank sharks. I knew some young drivers when I was young who bragged of their fathers' power to protect them from the police but some of those daredevils learned the laws of physics hold even in a politically corrupt town. We will also learn that some basic rules of economic and political relationships will hold despite our perceptions of unlimited American power and wealth. We the citizens of the United States are trapped like rats conditioned not to escape. We'll be squashed or driven out of the cages we've constructed for ourselves.

# 467 Hints of Unity, Coherence, and Completeness

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1298>. It was finished and uploaded on 2012/06/08.]

Since 2006, I've been writing books and essays, nearly all of which are available for free downloading on the Internet. My main theme is simply the need to see our world as being the universe in light of God's purposes for this concrete realm of Creation, which includes the need to see the entirety of Creation by properly disciplined speculation. The world in itself is unified and coherent and complete. Creation can be described in similar terms and so can any entity properly labeled a human person. I'll also claim that a civilization can be described in similar terms and will deal with that a little more later in this essay.

We can think of these three defining characteristic, unity and coherence and completeness, as signs of a moral narrative and we then see hints of ways to produce a Christian understanding of being in light of both revelation and also modern empirical knowledge. As part of that, we see hints of new Christian forms of politics and economics, new Christian ways to achieve moral order and to tell the stories of these morally ordered communities. We can see hints of new ways to integrate our individual selves into new forms of communities and new ways of forming relationships to other communities. We can see new ways of forming communities in which Christians and non-Christians can fully participate.

The point I wish to drive home is the need to re-establish the foundations of our civilization or to build new foundations for a new civilization. A civilization is essentially the human minds of its members and its entirety, the minds of the individuals and also the communal mind which Jacques

Barzun calls the 'intellect'. (Here and for the rest of this essay, I'll ignore the physical infrastructure such as precision manufacturing machinery which, if lost, would take several stages of engineering and manufacturing to recover.) A well-developed human mind is essentially the civilization in which it is found. The decay of our civilization, our moral disorder and other forms of disorder, are the same as our minds, our individuals minds and our communal mind. Our inability to engage in proper politics, our inability to control our habits, our inability to hold together our families and church communities and social clubs, are the external signs of the chaos which is us and our ways of understanding reality and of forming relationships.

A civilization is like unto a world or a moral person: unified and coherent and complete in itself. Can we simply will to instill a better order in our governments and our businesses, in our houses of worship and our family homes? No, we have no viable order to shape ourselves and our communities. The world accessible to man's exploration and exploitation has expanded greatly. It grew far larger than the prior understandings of that world. Satan hasn't invaded. We've simply failed to recognize the evidence of how large and complex the world is. We try to deal with this world now known to be immensely large and extraordinarily complex in terms of intellectual systems better suited to a world of villages, low levels of technology and scientific knowledge, slow transportation, and slow, low-capacity communication.

We can't move forward before we develop a new view of our empirical world and all that we might speculate or believe to lie beyond that world. The stuff of stars and of human bodies and of spacetime is what God uses to tell the story which is the world. The relationships involving all that stuff and the entities made from it are the relationships of that story and tell us much about our relationships to God. We need to have a greater understanding to guide us as we develop more focused understandings, as we try to work out the problems of our political and religious communities, as we try to figure out how to safely feed and entertain ourselves and our children. But it's necessarily an iterative process in which we, some of us in any case, concentrate on those more specialized viewpoints. What the specialists learn feeds into the greater understanding of human history, of the world, of all Creation.

We should take 'understand' in the widest sense, the sense which takes in all of human knowledge and plausible speculation. We need to have a narrative that includes a very fundamental understanding of this universe's

explosive expansion 15 billion years ago. That narrative should also consider dinosaurs and mastodons and apish men. It should consider abstract algebra and biochemistry and bridge design. It should consider the various ways of making music in Vienna and Bogota and the jungles of Brazil and Nigeria as well as the hills of Arkansas and the steppes of Mongolia. It should be willing and able to make judgments about the relative worth of those various ways of making music. It should make some sense of the human liking for symmetry and for certain color combinations. It should make sense of nuclear families and extended families and tribes and New England towns and Asian cities and Nigerian medical societies. Again, it's an iterative process because the greater understanding has to develop from more specific understandings of concrete being and particular entities and specific stories. That greater narrative will be the shape of our minds and much of the contents of those minds as well as our communal minds.

The poet and farmer Wendell Berry has told us that if we find a moral way to make our livings, we'd know how to solve our ecological problems. I'm expanding this idea greatly to claim that if we find a way to make sense of all that we know or believe to exist, we'll also know how to restore moral order to our various communities and how to make our livings and how to set priorities on technological and scientific research as well as better defining what serves human needs in the development of mines and the construction of factories and transportation systems. We'll know how to feed ourselves and our children, how to entertain ourselves, and how to properly care for our property. We'll know how to re-form our civilization or how to develop a new one and we'd know in the process of doing so.

Arguably, our largest political communities, nation-states, are currently the most morally chaotic of our institutions and are causing a variety of other forms of decay and chaos. I'd claim, and have claimed, that we Americans desired, in a unformed and childish way, to become the citizens of a large nation-state with high moral standards and have failed to follow the proper path of growth and development. We certainly learned the art of nurturing self-esteem, a trait we elders criticize so freely in the youth. Rather than being a virtuous people capable of examining our actions and evaluating their practical and moral effects, we patted ourselves on the back whether we were sending money to tsunami victims or devastating Baghdad—such an attack on a city is fully and undeniably a war-crime in terms of Christian just-war teachings. We let our politicians and bankers and industrialists get out of control, after all we got a share of the borrowed

money, and then accepted what they did as part of our efforts to, above all, feel good about ourselves.

We never matured, not as individual citizens and not as a country. We have formed ourselves into a mob marching to the primitive beat of modern pop music. Our American mob is collectively at the moral level of a self-righteous 13 year-old. Such a mob can produce some ugly and bloody scenes when it controls, or its leaders control, as much fire-power as the U.S. armed forces can deliver. A different set of ugly scenes of poverty can be produced when those leaders control the world's reserve currency. Those leaders are more ruthless than the rest of us, less inhibited in criminal behavior, but they too are part of the herd. They too are us.

Clearly we don't yet know how to develop into a community on the scale of the United States and seem to have forgotten how to develop into smaller scale communities. We will eventually develop into a community far larger than even the U.S. or China—the Body of Christ. If we don't yet know how to develop a coherent political entity on a scale seemingly indicated in the modern world, we have to realize that we'll have to pay the price of retreating and letting ourselves be guided by our developing minds and especially that communal mind which doesn't yet exist. The processes of such developments will not be, could not be, centrally planned and controlled but they need to be conscious unlike the workings of a pure Darwinian process, more conscious than the workings of Adam Smith's Invisible Hand. What does that mean? First of all, we need to intend what is most important, where I use 'intend' in the Thomistic and biological sense of being a step forward in a growth process. More than that? I don't know but I'll learn by participating in the development of a new civilization or the re-formation of Western Civilization, a development which includes the development of our individual and communal minds.

Having said all that, I'm going to point to an interesting discussion which doesn't go far enough, though that's a weak criticism when we're exploring a world which seems different than we and our ancestors assumed in recent centuries. Ralph Hancock has posted the essay *Prospects for the Democratic Nation-State: What State Are We In?* at <http://libertylawsite.org/liberty-forum/prospects-for-the-democratic-nation-state-what-state-are-we-in/>. There are also two responses. Aurelian Craiutu has posted the essay: *Loving the Democratic State Moderately* at <http://libertylawsite.org/liberty-forum/loving-the-democratic-state-moderately/>.

Daniel McCarthy has posted the essay: *From the Nation State to the New Church* at <http://libertylawsite.org/liberty-forum/from-the-nation-state-to-the-new-church/>.

I have one major criticism of Mr. Hancock's essay and this is what my essay has led up to. He is concerned with the fundamental problems in the political institutions of a civilization melting down (to re-form or to be replaced?) in terms of that civilization's own understanding of its mind: something that is labeled 'reason' has to struggle to gain control over something that is labeled 'passion'. Modern neuroscientists have shot down such a model of human nature. In any case, Mr. Hancock suggests—quite properly—that we need a more humane, less technocratic or rationalistic, understanding of 'reason', but such a suggestion is reasonable as stated only if we stay within the general limits of the Western tradition—a behavior not found in the founders or re-founders of civilizations. Instead, and at the very least, we need to develop a radical re-understanding of the human mind as I've suggested starting with an early weblog entry which can be found in this book as Chapter 69, *Hellenistic Metaphysics is Too Small*.

Another way of stating my criticism of nearly all current efforts to understand our problems and move forward: they assume a way of thinking and try to impose it upon a recalcitrant reality when they should be learning how to think from that reality which, after all, was created by God. At least we Christians believe so and I would move on to explicitly claim that all of Creation is the manifestation of thoughts of God, thoughts He wished us to share with Him, thoughts which we should use to shape our minds and become better images of the Almighty. God's mind and imagination are beyond human understanding, but He gave us a world where we can share His thoughts and also His creative freedom, learning how to be like God, how to share His life one day. But we learn no such thing if we continue to bring our human systems of thought to our exploration of reality. Gauss and Riemann and Einstein found that the greatest of thinkers hadn't provided what they needed to understand space and time and they responded properly to a world a bit more complex than could be assembled from Euclidean instructions. We are learning, very reluctantly, a similar lesson about human nature and human history, about the nature and history of human communities.

Maybe I've done a good job. Maybe I've made a good first effort in a major move forward into a new understanding of Creation and the Creator. Maybe not. At the very least, I've shown the large scale of any plausible

effort to make that move towards an understanding of a well-ordered human race in a Creation which is well-ordered. It's not nearly enough to criticize our failed and failing institutions in terms of the ways of thought of a civilization which has itself failed to produce an adequate understanding of Creation in light of vast piles of undigested and partially digested empirical knowledge and in light of all the possibilities and dangers which have risen with modern technology and the sheer size of human communities. Framing the criticism in slightly modified terms maybe helps a little to understand what's going on as the building falls down upon you but it doesn't help you to rebuild before it falls or to move elsewhere and build anew.

# 468 Christian Traditionalism: Moving With God's Story

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1304>. It was finished and uploaded on 2012/06/14.]

Call it traditionalism or conservatism if you wish—though I refer to an attitude and a body of thought far from the comic-book views of the mass-media commentators and the ideologues they serve. What is it?

One of my favorite, perhaps overused, quotations is from the historian Carroll Quigley (see [http://en.wikipedia.com/wiki/Carroll\\_Quigley](http://en.wikipedia.com/wiki/Carroll_Quigley) for a short article and pointer to his major works):

The truth unfolds in time through a communal process.

In this idea, we have a better definition of a true Christian traditionalism or conservatism. Does it serve to define other forms of traditionalism and conservatism? Put that question aside for a short while. I'll provide my own understanding of what it is that we Christians are to learn from tradition and from the current state of the world, my own understanding of what it is that we are to conserve.

A Christian conservative, unlike perhaps most others, isn't interested – at least, shouldn't be interested—in preserving a particular social or economic or political structure in this passing and mortal world. In general, the Bible itself presents no such structures, nor even an ecclesiastical structure, which we modern Christians would think to be worth reviving or conserving. Jesus Himself denied the absolute value of the family and of the Sabbath.

If the Christian Bible is unsettling in denying the primacy of much that conservatives would declare among the Permanent Things, what does it give us? It gives us a variety of books of prophecy, wisdom writings, histories

of ancient Semites, four strangely limited biographies of Jesus of Nazareth, and various sorts of writings of followers of that same Jesus. Overall, the Christian Bible gives us a story, a narrative directed to the moral purposes of the Creator. And it gives us stories of attempts to respond to God's world, some attempts being successes and others being failures and others having ambiguous results. It doesn't tell us where the story is heading nor does it tell us exactly how to play our parts in that story, but it does give us much in the way of advice on how to find our way in that story.

A Christian traditionalist or conservative, as paradoxical as this might first seem, is concerned with the forward movement of God's story and only concerned about the things of tradition to the extent they are playing a valid part of this ongoing story or are helping us to understand this story in which they no longer play a part. We aren't called to preserve the structures or ways of David's kingdom nor the ways of simple Hebrews at the time of Jesus nor those of on-the-move evangelists over the next century or so. Why would we think our calling is to preserve the ways, political or social or economic or cultural, of Italy during the Middle Ages or England during the Age of Reason or Germany during the glory years of the ruthlessly rational and remarkably competent Bismarck or Europe during the exciting decades before the guns let loose in August of 1914 or even working-class Waukegan during the boyhood of the recently deceased Ray Bradbury? We certainly aren't called upon to conserve the American way of life in its current morally disordered state.

In this world, we are characters in God's story, participants in the Body of Christ as that Body develops in its mortal form as a community of mortal creatures. It's the story, the Body in its entirety, not the organs of that Body which are important; those organs might come and go during mortal development. It's the story, not the structures in which those organs are set, structures not necessarily less mortal than many of the organs. As the kingdoms of Israel and Judah came and went, so will the United States. As the Aristotelian summation of all that was worth knowing came and went, so will modern forms of knowledge, including the forms I'm developing. Certainly the Christian Church will persevere for She is the organ of worship and of moral and spiritual order, but She will change. She has to change for She is currently so ineffective at even properly shaping Her priests and bishops and other ministers, so cowardly in the face of criminal wars and abuses by the powerful, so falsely charitable when accepting checks to do works from centralized welfare-warfare powers, so falsely courageous when

the battle is lost or when those powers threaten something of direct interest to the bishops.

The story continues. To uphold tradition properly, we must study and explore in God's Creation. We must learn to see even slight hints of His acts of creation, His acts of shaping what He has created, and to see the slighter hints of His purposes which might tell us where the story is headed. What is the Good Lord up to? We now know the Creator's story is set in a spacetime which seems strange to us. We know also that matter and movement and relationships between entities aren't what we would think from our ordinary lives. We have learned, by shedding of much blood and destruction of much important infrastructure and art, that human nature—especially when united in certain types of political movements—is capable of great evil: masses of nice men can reluctantly but faithfully serve a Hitler or Stalin rather than join the persecuted.

The good we have learned to do in living our parts in this story can have a dark side—the technology which has raised living standards and increased expected life-spans can destroy human relationships and can also destroy or badly damage some parts of our physical environments and can also stimulate selection processes on infectious organisms which might produce truly horrible epidemics.

The bad we have learned to do can at least hint at the side of light and goodness—some sadistic barbarians, such as the Assyrian emperors or William the Conqueror, have formed political entities which proved to be good settings for the development of better forms of organization such as countries republican in government and capitalist in economy. Should we celebrate that some of the good in our modern world came from the sufferings of those raped and murdered, enslaved or left with no way of making a living, by one conqueror or sometimes a parade of such brutes? No, but, as I implied in the paragraph above, we should be careful in celebrating even the good we do—it might not be so fully good as we think. We should be joyful for the gifts of God and should ponder how to properly use those gifts and should wonder at the complex nature of those gifts which so often bite us and bite hard.

Even when those inclined to morally well-ordered motivations fall into evil, the ensuing repentance can lead to deeper understandings of moral and spiritual order and to a proper sort of liberalism, generosity of spirit and openness of mind. Such periods can also lead to that old problem of tossing the baby out with the bathwater, beliefs are shed along with the

desire to torture or kill those who disagree with us. During the 1950s and 1960s, Europe showed some promise of having truly renounced her efforts to commit continental suicide. Then, prosperity brought back the hubristic traditions and Europeans have seemingly discovered a way both old and new to destroy their continent and their cultures.

I don't pretend to produce a full catalog of the possibilities we have of learning from the past in God's story, of learning and of changing our very selves in proper response. Call me Janus as I look to what has happened and what is now happening and only partially perceived and likely not at all understood. The past and transitions are what we can know and even the past is not well-known in a true sense until understood in light of a worldview, an understanding of God's story in light of His purposes. In such a light, the story which is our world can be seen as unified and coherent and complete within itself. That is, it has those qualities until we learn by exploration or the world teaches us by perhaps cruel suffering something important and not yet part of the story as we understand it based upon the memories and customs found in our traditions. We explore, in some ages with faith and courage, yet even in such ages we don't much understand those ongoing transitions which are so disruptive and more so promising. Columbus didn't just sail the ocean blue, he blasted apart a logjam in the minds and spirits of the Europeans. The ensuing onrush of water did a lot of harm as well as still more good.

As we sail into our own oceans blue, lacking the faith and courage of Columbus, we leave the deck and settle into our cabins stocked with all the man-made items which make us feel comfortable and safe even as the boat rocks and rolls and even as we, if we are honest, admit we fear success in our journey as much as we fear failure. Perhaps more. And so those who think to be conservatives, pull out the books on the shelves of those cabins, dusting and fanning the pages to check for worms and other vermin. They gain much true wisdom and some distorted wisdom by pondering the criticisms Tacitus made of the corruptions of the Roman Empire and the highly intelligent debates between the Founders of a once promising American Republic. They stare with admiration at the paintings and statues of past centuries. Too many of them remain in those cabins, thinking them to be preserving something they label the Permanent Things.

It's the world outside that cabin which provides the stuff and the experiences which can generate new ideas to fill new books as wonderful as those of Sophocles and Virgil and Shakespeare. But we can rise to those heights

because we've moved on to hitherto unknown regions of God's world. We don't stand on their shoulders. We move some miles ahead of their graves.

We should conserve what is worth saving in light of our understanding of our past and what is happening now. We should honor, if possible, that which is no longer worth saving if it had helped to advance God's story. We should even ponder respectfully such horrors as the French Revolution, so bloody and also so destructive of decrepit political and economic and social structures being preserved by those who were profiting from the wrong sort of conservation. Perhaps a defective moral order, one which was moreover structured to meet the needs of a prior age, could be a barrier to the development of a better order, perhaps it could be an obstruction to the forward movement of God's story.

The story, when seen as such, is dynamic. It's not simply some sort of game in which the pieces move themselves, sometimes with the assistance or even the insistence of God. The pieces change, even change themselves by how they move. The board changes and also shows itself to have always been different as it is explored. Many of the rules change or at least show themselves to be different as the pieces interact with each other and with the board and with the Creator. We need to move up to a higher level of abstraction so we can see what is truly permanent, invariant in terms of modern mathematics and physics. I don't claim to have any such vision and might not reach that vision in my allotted time on Earth.

In ancient times, it was plausible to see a proper order in a crystalline form. More recently, men began to think in terms of a society which moved in a way corresponding to Newtonian dynamics. Smaller communities of men might be bound to a larger center of power and culture and that entity which was seen to reside at the center of power was unaffected by the movements of those smaller and more distant entities. Then, as was the case in Newtonian dynamics, thinkers began to adjust for the effects of smaller communities on the greater center, coming to realize 'binding forces' worked on the entire system and all the entities in that system—even the greatest and most central of entities. Over time, various thinkers have done much to account for such complications and nonlinearities. These analogies from earlier understandings of physics to moral systems or political systems didn't live only in the human mind. They were part of the nature of created being.

And, now, we need to move on to understand a world which seems to sometimes move well outside the boundaries of any system of reason we

have yet developed. As one example, I think we need some abstraction of the geometric concept of geodesic (see <http://en.wikipedia.com/wiki/Geodesic>) which has certainly proven its worth in physics and other sciences including the engineering sciences. In that article, we read a limited definition, but one that covers our needs and more:

[A] geodesic is a generalization of the notion of a “straight line” to “curved spaces”. In the presence of a Riemannian metric, geodesics are defined to be (locally) the shortest path between points in the space. In the presence of an affine connection, geodesics are defined to be curves whose tangent vectors remain parallel if they are transported along it.

The concept of geodesic practically invited itself into theories of gravity, which—roughly speaking—have become theories of spacetime since Einstein gave us his theories of relativity. I think some corresponding concept, abstracted properly, can play a role in restoring some serious understanding of this world and of God’s way of moving it towards His purposes. How do we get to a proper abstraction and a better understanding of our world? Let me retreat a little to talk in very general terms about the ways in which our understanding of the nature of being, including the being of moral creatures, are truly meta-physics, dependent upon ideas drawn from physics.

Plato and others did much good in the early years of philosophical and scientific thought by working with models which saw some sort of ideal forms which were static. A man, a tree, certainly a triangle, are imperfect images of some perfect entity, some Real entity. Paths, including paths of a moral creature through its life, were seen in Euclidean terms. Moral paths were usually seen as the geodesic of a Euclidean plane: a straight line. To be sure, some such as Dante intuited a more complex reality—in the opening lines of the *Inferno*, the path curves away from the non-observant pilgrim.

Static understandings of the world as a whole, of God’s story which is a morally purposeful narrative, are no longer possible though such understandings of classes of entities and of individual entities which are static for substantial periods of time will continue to carry much truth. We can consider first-order changes to static entities and – even more importantly— to their relationships. That brings us to an idea of an orderly but steady movement through time, corresponding to the concept of velocity in physics

but leaving us in a pre-Newtonian state. Even Galileo didn't fully appreciate the importance of second-order changes, acceleration, but that was expected since the calculus was needed for a true appreciation.

Second-order changes correspond to acceleration or to a geodesic through a curved spacetime—the curvature of spacetime might be flat and the geodesic is then a straight line. I imagine that any realistic understanding of the more general structure of our world, the structure in which we moral creatures live and move and form our relationships, will be very complex. That structure will be a manifestation of an high-level abstraction which will perhaps be a straightforward generalization of the spacetime of General Relativity and other theories of gravity. Perhaps.

I'll refer to the following graph I've used before:

We can start at *Node y2*, which represents our current understanding of *The Spacetime of Our Universe*. This node is found on the bottom row. From that node, we work our way up through higher levels of abstraction until we reach a level which shows some promise for helping to understand, for example, human nature. So, by abstracting somewhat, we can reach *Node x* which is *Abstractions Leading to Complex Paths* and then travel down to *Node z2* which is *Human Nature* including our understanding of our moral pathways through this world. This understanding is also supplemented by other abstractions as shown by the arrow from the unlabeled node titled *Various Concrete Abstractions*. By *concrete abstractions*, I intend to convey the idea of a level of abstract being which is close to that of our concrete world.

Whew!

I'll pull things together by generalizing the old rule: just stay out of God's way and He'll do what needs doing. No one who's ever said that to me has been passive. They had something in mind which kept them actively doing their duty but in a way that kept them from obstructing God's story. So, the rule is wrong if we try to take it literally. It becomes more plausible if we try to state it in terms of a geodesic: We should become sensitive to the movements of God's story so that we move along the main plot-line with minimum effort. We wouldn't have to try at all to journey towards the Sun if we were in space and were captured by its gravitational field. We certainly aren't making any effort to move along with our galaxy towards a faraway gravitation center called the Great Attractor. We also wouldn't have to try at all to move along with God's story if we let ourselves be captured by that story and let ourselves be pulled along toward His goals

for this world.

And, yet, there are all sorts of things going on locally as we all stream, willingly or not, towards God's purposed end for this world. As we can properly cooperate with physical forces or can defy gravity, perhaps for the thrill of some so-called extreme sport or perhaps because we like to drink and then drive recklessly along a cliff, so we can also cooperate with the forces of God's story or can try to defy them. By responding to the more local matters in a morally responsible way, we can still find ourselves struggling against the divine narrative forces which draw us on. Sometimes, taking some sort of risk that defies the forces of God's world, as did the early aviators, is the morally responsible thing to do. God didn't give us a simple path to navigate and the nature of the Body of Christ as it develops is quite complex, complicated, self-conflicting in the Body's mortal form, vulnerable to invasion and to parasitic infestations, etc.

I'll be trying to deal with some of those complications and complexities in writings to come soon, God willing, but I'll quickly deal with the question I raised at the beginning of this digressive essay that was, to be quite honest, hard to bring to a coherent end: Does my understanding and expansion of Quigley's claim serve to define other forms of traditionalism and conservatism? I don't think so, though Jews and Muslims might be able to produce a somewhat similar claim which allows for their different views on the relationship of God to His Creation. Those who don't see this world as a Creation, or a part of a greater Creation, won't be able to think along these lines. At least I don't think so.

And even Jews and Muslims see God as a King who rules over a world separate from Him. We Christians see God, at least I do, as a Creator who brings moral order to the concrete realms of His Creation by the way He shapes rawer or more abstract stuff. By His very acts of manifesting truths as the raw stuff of created being and then shaping that raw stuff by various stages from the human viewpoint, and then telling a story at an appropriately concrete level, God brings about moral order. He brings it about because He is in those acts of creation and shaping since all created things are thoughts God chose to manifest in Creation. He is a Creator and a King only by analogy.

There is much to be done in understanding a world unfolding itself in human perception and—more reluctantly—in human thoughts. All of Creation, including the concrete realm which is this world, is proving to be richer and more complex than can be understood in terms of Hellenistic

thought or early Christian thought or Medieval Jewish thought or any other thought which has yet taken firm shape.

My effort to understand the world in the best available terms isn't an academic exercise. It's part of an effort to bring a new phase of Christian civilization into being. Understanding, truly knowing, is also doing. To truly understand is be part of God's story, moving with the Almighty and doing your own work in your little piece of the world. And in this way, I propose, a Christian truly conserves, truly saves what should be saved in tradition. He conserves by helping God to change this world and all the entities which are part of it to the goal of bringing the Body of Christ to unity and coherence and completeness.

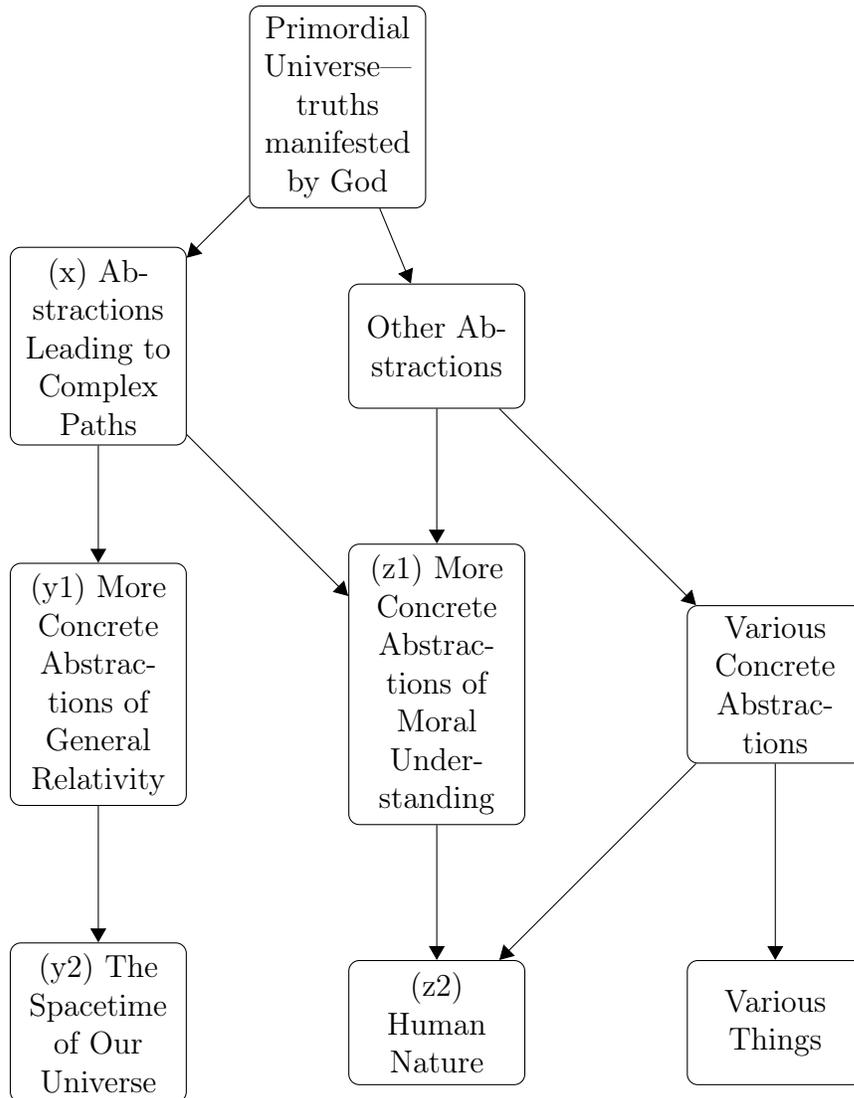

Figure 468.1: Simple Relationships of Abstract and Concrete Levels of Being

# 469 Can We Retain or Restore American Prosperity?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1311>. It was finished and uploaded on 2012/06/20.]

A few weeks back, Michael S. Greve published a discussion of one of our fundamental problems in these troubled times, as opposed to the secondary problems discussed by the better technical experts in financing, investment, etc. Greve's essay, in three parts, can be found at:

1. *The Constitution of Affluence, Part I* at <http://libertylawsite.org/2012/05/17/the-constitution-of-affluence-part-i/>,
2. *The Constitution of Affluence, Part II* at <http://libertylawsite.org/2012/05/21/the-constitution-of-affluence-part-ii/>,
3. *The Constitution of Affluence, Part III* at <http://libertylawsite.org/2012/05/23/the-constitution-of-affluence-part-iii/>,

The first essay begins with Greve's statement of the problem he is addressing:

We live under a Constitution of Affluence. Obviously, I don't mean a constitution that produces affluence. (Prosperity may be right around the corner, but it's the corner behind us.) I mean a Constitution whose basic institutions presuppose and depend on high levels of affluence and, equally important, public expectations that life will get better and richer.

The United States Constitution—the formal Constitution and its nineteenth-century arrangements—is (or was) not a Constitution of Affluence in the sense just explained. It sought to create conditions that would be conducive to rising prosperity—principally, by way of ensuring political stability, meaning institutional arrangements that would let citizens go about their business without constant fear that somebody, someplace might confiscate the proceeds. But it was supposed to work, and it did work, even in times of prolonged economic stress—in one of those “varying crises of human affairs,” as John Marshall might have said and in fact did say.

We don’t want the conditions of prosperity. We don’t want to work to understand and to do. We just want prosperity and now we assume prosperity is ever coming our way. Americans remain an assembly of mostly hardworking peoples but we think prosperity, a recent-model car and an annual vacation to some tropical paradise, are our right and not the result of luck in ancestors and in date of birth as much as a result of our hard work as individuals. In many ages, men and women have worked still harder than we just to avoid too many weeks of empty stomachs and too many children buried at a young age. We learned what the world is really like during our years of prosperity and so did our leaders who seem to be dull of wit and empty of knowledge as much as they are overly ambitious and excessively respectful of their own less than modest talents. We willingly hand over power to those leaders who make promises corresponding to our false beliefs about the nature of reality—which are theirs as well. We turn away from any politician or other leaders or thinkers who might remind us, as did Rudyard Kipling in his poem, *Gods of the Copybook Headings* – see [http://www.kipling.org.uk/poems\\_copybook.htm](http://www.kipling.org.uk/poems_copybook.htm), that payment will be made when those gods, the moral rules which govern human life, catch up to us. Peter cannot ever be robbed to pay Paul. I would add that Peter shouldn’t even assume he’ll ever be able to make enough to support just himself and his family. He should take steps to ensure his prosperity rather than just knowing he can always count on his corporate employer and his insurance company and his mutual fund and the Social Security system.

We can address a multitude of secondary problems in the American citizenry but the primary problems remain as Greve states above. The primary problem, that is, if we assume we inhabit yet a Western Civilization

which is intact, that is, if we assume we're standing upon some foundation which supports us as we go about living and making our livings, raising our children and worshipping as we see fit. Under this assumption, the primary problem might not be solvable until some disaster brings down the rickety superstructures built upon the foundation, but the foundation remains as do the building materials.

If we stay with that assumption, that there is a good slab of concrete beneath our feet, we could deal with a variety of serious and true problems which are secondary. Many intelligent and insightful analysts, including a number of amateurs blogging on the Internet, are addressing such problems as inadequate or wrongly-targeted regulation, malfunctioning educational systems, and so on. Greve says there are no solutions because we've built a political system that operates as if the money will continue to flow even if the politicians and general citizenry begin to realize the flow is diminishing in real terms. That is, we are strongly encouraged by the system we've built and by our own inclinations to continue acting as if the fiscal problems are a mere aberration that will disappear at any second. Moreover, we'll soon be at each other's throats.

As general prosperity dwindles for at least a while, those who know school budgets can't be cut will be at war with those who know police department and fire department budgets can't be cut. There are pensions and health benefits for the elderly and the disabled and the impoverished. There are wars which some think need fighting and, in any case, expensive but often ineffective military systems to buy. There is a huge and growing national security bureaucracy and industry. There are roads to be maintained. We know, in our heart of hearts, that there is money to do all of this for all of this is necessary to help us maintain the living standard which is our right. Mostly, we just know the world is truly what it seemed to be for the sixty years or so of never-ending American prosperity and power. Surely, such an important aspect of reality can't change.

I wrote about this human weakness a few years back in an essay responding to an article which "is about an effort to find, in archaeological and evolutionary biological terms, a way of speaking of the odd fact that the residents of a once successful but collapsing civilization will go on acting the same way they, or their ancestors, did when that civilization was prosperous and growing." Chapter 409, *Individuals and Herds*, provides more discussion as well as a link to that article which started from the discovery that the leaders and citizenry of a phase or local manifestation of Mayan

civilization destroyed by ecological problems were aware of those problems as they developed and did nothing in response.

We may be in worse shape than those Mayans and others studied by anthropologists and historians trying to deal with this lack of response by peoples aware their civilization was being destroyed. If there was a loss of faith in the Mayan understanding of reality because of their problems, that understanding would have, in some strong sense, remained intact if a bit battered. We don't have an corresponding understanding of reality. We've lost it as modern empirical evidence has piled up telling us the specific understandings of Western civilization, understandings of space and time and matter and human nature, are wrong. I would say those understandings aren't rich enough or complex enough to cover reality as we now know it, but nearly all modern human beings, including most scholars and rabbis and learned poets, won't be able to dig in and see the situation for what it is. They will see strong hints of utter wrongness. As Walker Percy told us: we're lost in the cosmos. But we're lost just because we developed the knowledge and skills to launch ourselves out into that cosmos, leaving behind a world falsely understood. And we haven't developed a proper understanding of that cosmos even though we're penetrating it in a high-speed rocket. We no longer see a true world, the universe seen in light of God's moral purposes. But we see the universe with greater clarity and in greater detail than even Einstein could have thought possible a century ago. We simply need to develop a moral understanding, that is, we need to find a moral narrative that provides an understanding of human individual and communal lives, of stars and rattlesnakes, of modern theories of gravity and quantum mechanics, of a man who was the incarnate Son of God—true creature and true Creator.

I deal with our problems at that bedrock level in Chapter 467, *Hints of Unity, Coherence, and Completeness*. In that chapter, I somewhat developed the idea that we need to rebuild our civilization, and—equivalently, our minds—at a fundamental level. Efforts to fix our banking or political or industrial systems, efforts to set priorities in a world of large but finite resources, will fail if we don't first develop an understanding of our world, if we don't find a meaning for our individual and communal lives.

So: Can We Retain or Restore American Prosperity? My answer is: Only if we first understand the world in which we would be prosperous, which means we'd have to also come to understand what sort of prosperity we wish to have.

# 470 The Greatest Achievement of Medieval Civilization

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1318>. It was finished and uploaded on 2012/06/25.]

In June of 2012, I read *Western Europe in the Middle Ages, 300-1475, Third Edition* [131] by Brian Tierney and Sidney Painter. The book ended with these wise words:

In the last century of the medieval era, the peoples of Europe had to cope with an unprecedented combination of plague, war, schism, and economic decline, all occurring simultaneously and all interacting with one another. In the face of these disasters, medieval men did not lose their nerve. They did not succumb to a “death wish.” Instead, they kept working at their problems, solved them as best they could, and in doing so, brought into existence the institutions of the early modern world. Thus the “time of troubles” of the late Middle Ages did not lead to a disintegration of Western civilization but to a new era of expansion and achievement. Unlike the population of ancient Rome, the peoples of medieval Europe conducted themselves with enough sense and courage to avert the threat of a new Dark Age. That was the greatest achievement of medieval civilization. [page 575]

It’s clear we’re going through troubled times so far as our political and economic systems go. Our financial systems have become bloated looting operations, in league with the politicians and bureaucrats of the powerful nation-states. The dominant power in the world, the U.S., was never so pure as naive Americans believe and has now lost all sense of moral decency in

its behavior overseas. As bad as it is to conduct criminal wars as a national policy and to use taxpayer money to rescue financial crooks when they lose their custom-tailored shirts, I think we have still deeper problems. See Chapter 467, *Hints of Unity, Coherence, and Completeness* for a recent overview of my claims about our fundamental problems and what we can do to move forward.

The obvious question is: will we conduct ourselves “with enough sense and courage to avert the threat of a new Dark Age”? There are good signs, some of which can be seen just by Googling for phrases such as “sustainable communities” or “resilient communities”. ‘Communities’ is the key word. We don’t need to populate the hills and deserts with heavily-armed sociopaths preaching an incoherent and immoral sort of radical individualism. We need local communities to start restoring some balance to our dependency relationships. We also need larger-scale communities, religious and political, because we’re finding ourselves in a complex world with a huge human population. We face problems which need to be dealt with inside of very large communities, though those giant communities themselves will provide only a setting and not any viable solutions.

We need to work hard to develop our “sense and courage.” And we should also approach our tasks of building with humility and with a respect for the real world. We should allow new communities to develop as they will though we should direct them to moral and humane purposes. As individuals and as communities, we will do our duties by responding to opportunities and problems courageously and with good sense, not by seeking to impose our will upon the recalcitrant stuff and the powerful forces of this world, this story being told by God.

# 471 As Bodies are Frozen Soul, Politics and Economics are Frozen Morality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1330>. It was finished and uploaded on 2012/07/02.]

I've written in the past that we can think, with proper qualifications and definitions, of physical matter including our bodies as being frozen soul: see Chapter 172, *Frozen Soul and Other Delicacies* for a recent essay discussing that claim. This language of "frozen soul" is another way of thinking about the spectrum of created being:

1. God manifested the truths He chose as the raw stuff of Creation.
2. The Almighty shaped more particular forms of abstract being from those pure truths.
3. After some unknown number of steps of increasing particularity (maybe just one but I suspect more), God shaped the concrete stuff of this universe and began to use it to tell a story which I call our world.

I was motivated to change the rules of the metaphysical game a little bit by changes inside of me which came as I recovered a strong form of Christian faith and then began to read substantial books, including books and other works in the fields of mathematics, physics, and brain-sciences. Those led to other fields such as evolutionary biology but, at least at first, I was quite affected by some accessible but serious works in cosmology and relativity

and quantum physics. Specifically, I learned of the discovery of modern physicists that some of the concrete forces and particles of our universe are particular entities which come from the breaking of more elegant or more symmetric entities. See the article at <http://en.wikipedia.com/wiki/Electroweak> for a brief description of the electroweak force which breaks down or freezes into, in relatively low-energy environments, to the electromagnetic force and the weak nuclear force. The electroweak force, so far as I understand matters, couldn't be observed, it couldn't exist as such, under the conditions we would consider normal, including even such extreme environments as the plasma atmosphere of the sun—millions of degrees hot.

As go forces, so go the associated particles, leptons (such as electrons and neutrinos) with W-bosons and photons as particles which exchange the forces. As the best current theories have it, the particles of our universe are the results of more symmetric entities breaking. The current celebrity particle, the Higgs boson is also incorporated into the Glashow-Weinberg-Salam model. For short articles on the three theorists awarded the Nobel Prize in Physics in 1979 for developing this model, see [http://en.wikipedia.com/wiki/Steven\\_Weinberg](http://en.wikipedia.com/wiki/Steven_Weinberg) (Steven Weinberg), [http://en.wikipedia.com/wiki/Sheldon\\_Glashow](http://en.wikipedia.com/wiki/Sheldon_Glashow) (Sheldon Glashow), and [http://en.wikipedia.com/wiki/Abdus\\_Salam](http://en.wikipedia.com/wiki/Abdus_Salam) (Abdus Salam).

In other terms, the electroweak force doesn't exist as such in this concrete realm of Creation, but I could say it does exist in those pieces from its shattered self. It's pretty general knowledge what electromagnetic force does. The weak nuclear force brings about the transitions between a neutron and two particles—a proton and an electron. The electromagnetic force and the electroweak force are, in a manner of thinking, shards of the same force and yet they operate in completely different ways. Forces, interactions, relationships are part of created being and also lie on a spectrum from the more abstract to the more concrete.

Moral relationships are the ties between social beings and also the ties between individuals or communities and lesser or greater realms of Creation. They are also the relationships between creatures, including communities of creatures, and their Creator.

Particular sorts of relationships correspond to particular sorts of entities or to particular aspects of complex entities. They are particularized forms of more symmetric and more elegant relationships. Moral relationships, speaking in general terms, are those which connect us to other complex en-

tities, most especially to other morally aware entities. In this case, I include such totalities as the Universe or all of Creation and such communities as the body of physicists or the body of Orthodox Jews and also complex environments such as the local watershed including its plants and animals and fungi.

The political communities exist to establish and maintain public order, internally in the case of all levels of politics and externally in the case of national governments—in terms of human political organizations in 2012. The economic communities exist to produce the goods we need to survive or to enjoy life beyond simple survival. Political communities seek a certain sort of public order in which citizens feel safe from street-criminals and fraudulent businessmen at the same time that economic communities seek a sort of order which involves such local turbulence as the destruction of entire industries when no longer needed or the downgrading of the reward to certain lines of work. The morality appropriate to economic activities would include such matters, some coming under the Ten Commandments, as honesty to customers and to employees and to employers and to governments. It includes a desire to obey the legitimate criminal statues and, at times, a pragmatic willingness to obey the abusive or over-expanded criminal statues as well. It doesn't include a desire for justice nor even a pragmatic willingness to see justice done as part of the economic system. The better man, the man of high virtue, might have the lesser skills as an entrepreneur or salesman or machinist. Obeying the basic rules of economic behavior should, with very few exceptions, allow that virtuous man to make an honest and decent living as defined by his place and times, but the scoundrel might every well be the one living in the mansion on the hill. Moreover, his ruthlessness might have played a role in his successful rescue of a struggling company, perhaps cutting the employment in half but keeping at least those jobs and that wealth-producing capacity. Living in a city of crumbling factories shouldn't deny a man a fair day in court but they might deny him a good living without the businessmen and business communities being at all guilty of immoral behavior. Harm can come as a result of morally condemnable criminal acts or as a result of bad luck in the economy. A man can lose all he has but such losses occur in the economic realm with no moral guilt involved.

None of this is new, only put in terms of a new metaphysics, a new view of Creation and the entities it contains. This is to say I've tried to view the issues and to write about them in a way consistent with my proposed ways

of viewing all of Creation in its different realms. As the title of this essay goes: As bodies are frozen soul, politics and economics are frozen morality. As electromagnetic force and weak nuclear force are results of a shattering of electroweak force as this universe began to expand to a cooler and more particular form, a more concrete form, so political morality and economic morality are the results of a similar shattering of more abstract forms of relationship as particular entities came into existence. They involve overlapping communities and mostly the same individuals but largely separate relationships.

I'm gaining confidence that my way of viewing Creation is quite plausible given what my Christian faith teaches me and given modern empirical knowledge. So it is that I'm pretty confident in the plausibility of what I'm proposing as a general framework for reworking our moral systems into related entities/communities and relationships which are entities in a world of particularity which is the result of the shattering of higher-level symmetries.

I think there has been a modern recognition that something like this is the proper way to view moral systems but there is mostly an inherited tendency to think that there is one sort of moral man formed according to one moral system. So it is that we have politicians, even the honest ones, who tend to believe that the economic system should obey some rule of uniform justice—the good man who has committed no crime shouldn't be prosecuted or persecuted because he lives in a disordered region and he should also not suffer hardship because he is a skilled machinist in a region where such work is disappearing. In a similar way, those who believe in a specific form of justice of the sort administered by political systems think to impose, for example, a sex-equal form of justice inside the family and inside religious organizations. The political ideologues of this modern sort are not willing to accept that women might be willing to give up such a form of equality because they think and feel the way which is plausible for a sex specialized to bear and raise children. Nor do those ideologues, with their sense of justice appropriate for criminal court systems, accept some might believe God ordained or commanded sex-specific roles inside families and at the altar. To criticize in the other direction, we see those who believe in a specific form of charity wishing to impose the moral beliefs and behaviors of charitable activities upon the political and economic realms—perhaps most especially because the zealots in the political and economic realms have already invaded the realm of charity and set up a free-for-all. (This isn't to say that a businessman can't be active in Christian or Jewish or secular

charitable organizations or in political movements, only that he shouldn't be supporting particular charities or particular political causes through his businesses.)

The unity of moral relationships can come into synchronization—in theory—but only in the individual who honors the different sorts of moral relationships proper to the various realms of human activity. The businessman can obey the limited moral rules of the economic realm, oblivious to justice and charity, but he can go home and give proper support to his favorite political organizations and can write checks to send to the synagogue or a struggling monastery or the local animal shelter.

## 472 Why Does Time Move Only Forward?: Some Preliminaries

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1352>. It was finished and uploaded on 2012/07/21.]

I've just started to read Hans Reichenbach's *The Direction of Time* [122] and lines of thought came to life before I'd even finished Hilary Putnam's foreword for the 1991 reprinting of an English translation by the University of California Press.

I'll probably write multiple essays on this subject of the direction of time, though it doesn't seem to be a major problem in my worldview. But it does provide some interesting openings for various explorations of that worldview. I'll start off by explaining in this essay why the direction of time isn't a major problem in my worldview, though I've noted in past essays that there is no inherent reason known to mathematicians or physicists why time in a universe like ours moves in any one particular direction. See Chapter 198, *As the Universe Ages, It Forgets What It Once Was* for a recent discussion of some general issues regarding time and the universe.

We live in a concrete, highly particularized, universe in which a variety of decisions have, in a manner of speaking, been made—I qualify matters only to leave room for the truth that God is a Creator whose ways of deciding and implementing His decisions in Creation aren't fully describable in terms of creaturely deciding or creaturely acting. There are a number of physical constants which appear in equations of gravitational force or electromagnetic force, classical or quantum, or nuclear physics or... Though we know not what the exact shape of spacetime is, it seems clear that it has a set of highly particular properties though there are vast numbers of possibilities just in the geometries, topologies, and differential structures currently

being considered as the most plausible, or even the barely plausible, for our universe as we currently know it.

From a practical standpoint, the answer to the question, “Why does time move only in the direction we label as ‘forward’?” is simply: That’s the way the world is. We are creatures of such a world and our minds work as the world works.

Let me unbundle that a little.

In my worldview, as I’ve often explained, I’ve restated the symmetry speculations of physicists and mathematicians in a somewhat sharpened but more meta-physical way:

1. Created being lies on a spectrum from the more abstract to the more concrete, where the more concrete is shaped from the more abstract.
2. Abstract forms of created being remain in the concrete forms which are shaped from them—this can be considered the soul-like aspects of things, especially living things.
3. The directly perceivable aspects of our universe are the aspects of very particular, concrete, thing-like, being.
4. We see the universe as a story being told by the Creator when we come to some understanding, however incomplete and imperfect, of the specific moral purposes of the Almighty.

Let me move a bit beyond my first answer: Time moves as it does because of the need for moral intention in the Thomistic sense, that is, moral growth and development processes. As individuals and as communities and as the Body of Christ as a whole, we intend toward a certain state which has proven to be quite a moving target, which is hardly unexpected since we can’t see even possibilities too far into the future and rarely can be sure about what will happen an hour from now. The basic idea remains the same: We are to first of all accept reality as it is and not just to accept the behavior of atoms before denying the equal but more perceptible reality of moral behavior, in men and wolves, and the immaterial aspects of relations in general.

The universe isn’t forced into the mold of a world, a morally well-ordered story. The universe naturally moves in such a way that certain types of evolution and development occur. Lines of creatures arise which evolve into

lines of social creatures. Stable societies, at least at the level of mammals and birds, involve behaviors which can be properly labeled as ‘moral’, however defective or incomplete the behavior of social birds or rodents. Moral natures and minds and other immaterial entities arise naturally in this world and those immaterial entities are ‘made up’ of relations as the heart is made of flesh and blood. The language is clumsy for now, though I can hope we’ll learn to speak more clearly as we recognize more explicitly that the immaterial aspects of physical creatures are fully as real as the mathematically describable abstract entities which freeze into the stuff of this world. See Chapter 172, *Frozen Soul and Other Delicacies* for a discussion of the symmetry-breaking process by which a force unobservable—as yet—in this universe, the electroweak force, breaks down into the electromagnetic force and the weak nuclear force. For that matter, a little knowledge of the problems that Faraday and others had in establishing the existence of magnetic fields should hint strongly at the truth that we really can’t observe electromagnetism in the same way we can observe a tomato plant or a hunk of asphalt. Fields of all sorts can be directly explored by physical means but they have much of the nature of entities more abstract than the more concrete forms of thing-like being.

Even from a physical standpoint, we’re seeing a universe which makes no sense unless we see it as somehow moving toward certain local goals of order. The universe as a whole has to be seen as at least providing the large-scale setting for the regions of order, even if that order often has immaterial aspects of the sort not to be explored in the way of an experimental physicist—economics and other social sciences remain historical arts more than sciences as we understand the term nowadays. In terms of an anthropomorphic argument, you could move on to draw various sorts of weak or strong conclusions about us not existing to observe the universe unless it were a certain sort of entity or even that the universe in some sense is made for us. This smells too much of subjectivism though the arguments aren’t entirely wrong. If we are to find objective truth of a grander sort, we have to retain an objective attitude when we study the universe—most specifically in terms of its current phase of expansion. We must assume the universe is an entity which exists and see what that means before we start discussing a creature which came to exist 13 billion years or so after the start of that expansion.

The very violent beginning to the current expansion of the universe, the so-called Big Bang, was from a state so highly specific as to dictate

the direction of entropy—that initial state of this expansionary phase was so particular that it had very little entropy. Entropy tends strongly to increase because that state of the universe was so particular, that is, so low in probability. The universe is moving over a path which is taking it toward a state higher in probability. The story God is telling is that path. And far more. But at least that path.

The universe follows that path as it—so to speak—seeks a more probable and more stable state and that path is headed toward that state, headed in a direction we label ‘into the future’. It would seem the universe is yet at a state of relatively low entropy, but we don’t know what the comparison is. We know only the facts—the universe moves in one direction in time as-if consciously seeking some different state. That movement has allowed the development of complex structures which develop by decreasing their own entropy and, as a consequence, increasing the rate of the overall increase of entropy of their environments. It isn’t possible to use energy with perfect efficiency, hence there are no perpetual motion machines, and, hence, any local movements toward lower entropy, such as the development of a living organism or the growth of a civilization, will cost some entropy overall.

The story moves on. How do we come to learn this?

The human brain can be seen as evolving at the species level and developing at the individual level. When we expand our perspective to the mind, the immaterial aspects of human intelligence, then we have to make more complex statements involving human communities. I think much confusion about human thought-systems, with their insights and defects, comes from some sort of tendency to think of the human mind as being something independent from the evolving human brain. Let me suggest, quite speculatively, that a child learns about the direction of time by being constrained to see certain streams of events as the development of an entity with constant existence. The constraints come from the strong built-in belief that things have continuous and permanent existence.

The child sees a kitten and then sees it grow and develop into a somewhat different animal but, the instinct remains to think it’s the same it was when it was a tiny helpless kitten. The child sees seeds placed in the ground or perhaps a piece of potato suspended in a clear drinking-glass. Where the seed was buried, a plant rises. The piece of potato begins to grow stalks and then leaves. That child is shaping his mind as he actively responds, including those responses which are tied to seemingly passive but attentional perception. He sees things which continue to exist but they change. At

some point, not too many months after gaining some toddling fluency in language, he's ready to be integrated into the surrounding stories. At first, he listens as an adult reads to him of, perhaps, an Easter bunny which grows and prospers under the care of a child and his mother. He hears stories of exotic animals and perhaps of children going on simple adventures at a farm or even in a jungle across the ocean.

I don't know what sorts of socializing stories a child might hear in our brave, new world, but we once heard stories about the farmer and the milkman and the policemen. We heard, however implicitly, of the formation of communities and the formation of human bonds, concrete and even those somewhat abstract bonds to those who worked in far distant lands to provide us with bananas. Looking back, I still have good memories from my pre-teen years of reading a series of properly whitewashed biographies of great men and women. I think I learned a lot about moral order and even a bit of history from those books however distorted those books were in some ways, but properly distorted in ways better clarified in later years.

Children generally acquire a naive but plausible and basic understanding of the nature of long-lasting entities, and learn of the error of some of their assumptions when Grandpa disappears one day. The little boys and girls, siblings and cousins, might hear of a place called Heaven or they might hear some vaguer words meant to comfort by obscurity. Often, I fear, they hear a form of obscurity which is a verbalization of their parents' confusion and lack of well-defined faith.

This is where two of my concerns meet. There is substantial evidence gathered by brain-scientists that human beings are born with certain important instincts about their environments of things and living things and relationships. Those instincts are part of the foundation of sophisticated views of moral causation—found in more human beings than sophisticated views of physical causation. Given my beliefs in the nature of the human mind, its capability of shaping itself to reality, given the overall shape of pathways through time which are traveled by stars and living creatures alike, those forms of cause-and-effect which relate to the moral order would seem more fundamental than more physical forms of cause-and-effect. We're creatures who strive to see order in our complex perceptions of static environments and in dynamic streams of events and moral causation is generally even more important to us than physical causation. Often enough, we delude ourselves, a well-researched problem since it can even distort the work of trained observers. We tend to see creaturely forms of purpose in our

environments and that is nowadays labeled as ‘anthropomorphic’. In our modern efforts to deal with this error, there are many, including some serious philosophers and theologians and scientists, who throw the baby out with the bathwater, forgetting that it remains at least an open question as to the nature of causation at more abstract levels of being, let alone at the level – however speculative—of the Creator.

## 473 Religious Liberty for Those Who Really Count

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1362>. It was finished and uploaded on 2012/08/09.]

Those who have been following the Obamacare mandate mess will know of the prayers of American-Catholics, led by their bishops, for religious liberty. Apparently, the religious liberty, even the very lives, of Syrian Christians is of little interest, nor were the liberties and lives of the Christians living in other ancient communities which have been systematically destroyed in Asia as the Clintons, Bushes, Obama, and other political gangsters have pursued criminal wars **unexamined** by the American-Catholic community or most of the other Christian communities in the United States. See *Christ Almighty! US Foreign Policy vs. Middle Eastern Christianity* at <http://original.antiwar.com/justin/2012/08/07/christ-almighty-us-foreign-policy-vs-middle-eastern-christianity/> for a discussion of a matter of shame for the United States, at least for the citizens who are Christians—and, no, there is no doubt that American intelligence officers and perhaps military personnel are at least in the safe-haven camps of the Syrian rebels (Turkey and maybe Jordan). It might turn out that, as was the case in Lybia, there are Western military and intelligence personnel disguised as native rebels. The American government is quietly supportive, in public, and strongly supportive, behind the scenes, as Saudi Arabia and Qatar, those two American allies which are such wonderful bastions of liberties—religious and political, arm and otherwise support the rebels in some insane effort to reshape southwestern Asia by first reducing entire countries to violent chaos. We have yet to see one of those countries returned to a state of social and

political order, but the centuries stretch ahead of us.

In any case, you shouldn't hold your breath waiting for a Catholic magazine or news-site to talk openly about this issue and the pattern of American invasion of a country followed by destruction of the ancient Christian communities. Nor should you hold your breath waiting for the American-Catholic bishops to bring up the topic in a national conversation. Who gives a damn about those strange Christians who look a lot like the guys in Al-Qaeda?
