# Preface to the Tenth Edition Including 2019

I've added another 12 or so chapters to this Ninth Edition. All but this chapter are reformatted essays from my writings during 2017 which were published on my active weblog, *Acts Of Being* at <http://loydfueston.com/>.

In 2019, I endured some visual problems which have been solved but which made it difficult for me to do any significant reading or writing from March to September. It has taken me more time to regain my mental energy. As a consequence, I wrote only those 12 or so chapters and also failed to do much with my next novel, *The Return of the Mastodons*. I plan to return to that novel and also to work on a nonfiction book, *Love and Stuff*; four very preliminary chapters from that book appear in this collection.

I'm turning to more focused efforts to deal with individual, 'large' problems. This will likely be the last general update I'll provide of my blog writings; future books will likely be novels or nonfiction works with particular topics.

Enjoy.

# Preface to the Ninth Edition Including 2018

I've added another 25 or so chapters to this Ninth Edition. All but this chapter are reformatted essays from my writings during 2017 which were published on my active weblog, *Acts Of Being* at <http://loydfueston.com/>.

In 2018, I continued to work—very fitfully—on the next novel in the series which started with *Gathering the Silence* [54], a story of a conversion to being an author on top of a conversion to Sacramental Christianity. This second novel, *Stranger in a Strange Land*, was put to the side for a different set of excuses than in 2016 and 2017: I was spending too much time trying to make sense of the gangsterish ruling elite of the United States but I was already starting to write about more fundamental matters in metaphysics and theology. As a result, a larger number of essays made it into Part VIII, *What Means It All?*. I hope to finish *Stranger in a Strange Land* by February or March at the latest. I've also begun to work on other mothballed novels and seem to have little or still have little interest in working on a nonfiction book though I continue to study mathematics and science, trying to draw concepts from those fields which experienced such explosive growth in various ways in recent centuries. I'll continue writing shorter nonfiction pieces for my blog.

Enjoy.

# Preface to the Eighth Edition Including 2017

I've added another 30 or so chapters to this Eighth Edition. All but this chapter are reformatted essays from my writings during 2017 which were published on my active weblog, *Acts Of Being* at <http://loydfueston.com/>.

In 2017, I continued to work—very fitfully—on the next novel in the series which started with *Gathering the Silence* [54], a story of a conversion to being an author on top of a conversion to Sacramental Christianity. This second novel, *Stranger in a Strange Land*, was put to the side due to various personal issues in the second half of 2016. I hope to finish *Stranger in a Strange Land* by July or so. I've also begun to work on other mothballed novels and seem to have little or no interest in working on a nonfiction book. I'll continue writing shorter nonfiction pieces for my blog.

Enjoy.

# Preface to the Seventh Edition Including 2016

I've added another 40 or so chapters to this Seventh Edition. All but this chapter are reformatted essays from my writings during 2016 which were published on my active weblog, *Acts Of Being* at <http://loydfueston.com/>.

In 2016, I continued to work on the next novel in the series which started with *Gathering the Silence* [54], a story of a conversion to being an author on top of a conversion to Sacramental Christianity. This second novel, *Stranger in a Strange Land*, was put to the side in the second half of 2016 as I concentrated on a nonfiction book nearly completed by the end of 2016, *The Shape of Reality*. I hope to finish *The Shape of Reality* by the end of February at the latest and *Stranger in a Strange Land* by July or so.

Enjoy.

# Preface to the Sixth Edition Including 2015

I've added nearly 40 chapters to this Sixth Edition. All but this chapter are reformatted essays from my writings during 2015 which were published on my active weblog, *Acts of Being* at <http://loydfueston.com/>.

In 2015, I continued on the course I'd set in 2014. I began work on the next novel in the series which started with *Gathering the Silence* [54], a story of a conversion to being an author on top of a conversion to Sacramental Christianity. I also moved on with studies of certain topics in mathematics and genetics and anthropology and other sciences and started work on a book about understanding human being by way of a more sophisticated use of modern empirical knowledge.

Enjoy.

# Preface to the Fifth Edition

## Including 2014

I've added nearly 50 chapters to this Fifth Edition. All but this chapter are reformatted essays from my writings during 2014 which were published on my active weblog, *Acts of Being* at <http://loydfueston.com/>.

In 2014, I shifted course slightly and began working on a more than half-completed novel which has sat in storage for nearly 10 years—how the time does fly. I continued my study of mathematics of a sort which might help to develop the qualitative tools, concepts and words, which can help generate proper descriptions of human being and its various relationships, including the issue so important in an age in which the 'positive' sciences (including empirical studies of history and literature and so forth) have been so successful: how much can be understood by way of quantity and what is left over to be understood by way of those non-quantitative modes of understanding which often seem to be as necessary as they are ghost-like in recent generations?

And it remains true that I hope your thinking is stimulated by what you find in this book.

# Preface to the Fourth Edition Including 2013

I've added about 70 chapters to this Fourth Edition. Nearly all of those chapters are reformatted essays from my writings during 2013 which were published on my active weblog, *Acts of Being* at <http://loydfueston.com/>.

In 2013, I shifted course slightly after publishing *A More Exact Understanding of Human Being* [53]; this book completed a major phase of my efforts to understand human relationships and the formation of the Body of Christ in this mortal realm, a formation not to be completed or perfected on this side of the grave. I began to move toward the closely related issues regarding proper descriptions of human being and its various relationships, including the issue so important in an age in which the 'positive' sciences (including empirical studies of history and literature and so forth) have been so successful: how much can be understood by way of quantity and what is left over to be understood by way of those non-quantitative modes of understanding which often seem to be as necessary as they are ghost-like in recent generations?

And it remains true that I hope your thinking is stimulated by what you find in this book.

# Preface to the Third Edition Including 2012

I've added about 80 chapters to this Third Edition. Nearly all of those chapters are reformatted essays from my writings during 2012 which were published on my active weblog, *Acts of Being* at <http://loydfueston.com/>.

In 2012, I remained on the course I set in 2011. I was strongly inclined to deal with the issues of relationships and of the formation of the Body of Christ in this mortal realm, a formation not to be completed or perfected on this side of the grave.

I still hope your thinking is stimulated by what you find in this book.

# Preface to the Second Edition Including 2011

I've added about 70 chapters to this Second Edition. Nearly all of those chapters are reformatted essays from my writings during 2011 which were published on my active weblog, *Acts of Being* at <http://loydfueston.com/>. I've also added a couple of older writings because of references in the essays from 2011.

In 2011, I turned more strongly to making sense of being so far as it's used by God in telling His story which is this universe seen in light of the Almighty's purposes. Specifically, I turned towards the issues of relationships and of the formation of the Body of Christ in this mortal realm, a formation not to be completed or perfected on this side of the grave. It should probably be noted that I considered the corruption of the modern political and economic systems, trying to determine what they tell us about the world and the mortal Body of Christ. Roughly speaking, I decided that these systems have been taken over by gangster conspiracies which play roles in human moral and community life roughly comparable to the roles of parasites and infectious agents and cancers in the biological world.

I hope your thinking is stimulated by what you find in this book.

# Preface to the Original Edition Through 2010

In July of 2006, I started publishing entries at the blog, *Acts of Being* found at <http://loydfueston.com>. I intended this to be a blog for further developing my view of God's Creation as first proposed in my first published book, *To See a World in a Grain of Sand* as described at [http://loydfueston.com/?page\\_id=17](http://loydfueston.com/?page_id=17). In November of 2006, I started publishing at a free blog, <http://loydf.wordpress.com/>, supplied through the generosity of those who develop the Wordpress blogging software. I made the probably bad decision to use the same title as my first published book, *To See a World in a Grain of Sand*. I intended to use that second blog to reach out to the more general public without an interest in more technical metaphysical matters.

Things never work out quite as planned, at least for me. I've more or less abandoned that blog at the wordpress.com site, though I keep it up as an archive of sorts. Readers do still come for a few modestly popular essays. And I have included in this ebook many essays from that site, *To See a World in a Grain of Sand*. Originally, I had planned to include only those to which I make reference in my other blog but I've decided to include a number dealing with the issues which are named as the titles of chapters in this book. I held back a few of no lasting interest and a number which are commentaries on parts of the Christian liturgical year. I hope to eventually fill out the entire liturgical year and then publish an entire set of commentaries in a separate book.

I'll be trying to publish an annually updated version of this book, though I haven't thought through my work schedule. As I update and maybe make some esthetic improvements, I might add some sort of an index though I know enough about the difficulties of constructing a useful, high-quality

index to be a bit intimidated by that prospect.

So far, though I've made not a penny from this work, I've been happy in a qualified way with my writings and I do feel guided by God in my work. He doesn't speak so clearly to me as He has supposedly spoken to some, but the results seem, at least to me, to be in better agreement with His Creation, with reality. I'll continue to move erratically and uncertainly in the ways I feel to be directed. I suspect that might lead me to divert more of my efforts to larger-scale works, books written as such. For now, I'll continue to publish these sorts of shorter weblog writings while trying to gear up my efforts on both nonfiction books and novels.

In any case, I hope that you, the reader, find something of interest and of help in this book. Even if you disagree with what you read, I would hope it will encourage you to make your own efforts to engage Creation as a whole, even if you don't see it as the Creation of the God of Jesus Christ as I do.

# Introduction

This book is the result of my floundering at writing a series of books which I hoped would give smoother and updated versions of my views on a wide variety of metaphysical and theological issues. As I see things, that includes also views on the nature of man and his activities in this mortal realm, even political and economic activities. I found I didn't really have that much to add to my weblog writings on many topics and have set the new goal of writing a book where I can provide some additional insight on the formation of the human brain as a re-creation of God's Creation. I might also finish a book on my efforts as a Christian to make peace with empirical reality. Other efforts will come as I see a need, including perhaps a book in which I show how to borrow concepts from abstractions based on modern empirical knowledge, to derive higher-level abstractions, and to apply those to our moral thought.

The parts, major sections, of this collection of weblog writings correspond to those topics:

- Part I Making Peace With Empirical Reality
- Part II The Human Mind as a Re-creation of God's Creation
- Part III Love and Stuff
- Part IV What is a Universe?
- Part V Human Being
- Part VI The Narrative We Know as a World
- Part VII What Means It All?

At times, I was not sure where to place an individual essay or article, but there is a certain amount of homogeneity of subject matter in the chapters. It would seem that my decision to include many of the essays or articles from my alternate weblog, *To See n a World in a Grain of Sand* at <http://loydf.wordpress.com/> had a good effect at times of lowering the intellectual tension though not, I hope, the intellectual quality.

I've not been very selective; I don't think I eliminated as much as 10%, deleting the occasional administrative announcement and only a few essays on topics which didn't seem to me so central to my purposes. This leaves much in the way of repetition and some clumsy wording, but I've tried to ease the worst of these defects.

The scholarly apparatus of this book isn't very impressive. I have set the goal of adding more writings each year from my active weblog, *Acts of Being* at <http://loydfueston.com>. I don't always note the original publication date for reprints or later editions or paperback editions of books published earlier with hardcovers. It's not unseemly, by scholarly standards, to make casual reference to, say, *Moby Dick* without noting the edition but I sometimes even commit the sin of providing nothing but a title for a more recent book. I don't think this should be a problem in this day and age when bookstores and libraries and publishers put information on the Internet for public use.

Part I  
Overview

# 1 Copyright Issues

*To See a World in a Grain of Sand* [41] and *The Peace of Christ* [44] are published by Wipf & Stock (see <http://www.wipfandstock.com>) under a traditional copyright. All of the other writings discussed in this catalog are released, as of January of 2015 or earlier as noted in the particular book. For copyrighting, I use Version 3.0 or later of the Attribution-Noncommercial-No Derivative Works license as written and published by Creative Commons Corporation. This license can be found at <http://creativecommons.org/licenses/by-nc-nd/3.0/>.

## 2 Writings by Loyd Fueston

### 2.1 Overview of Writings by Loyd Fueston

My work is of a whole though I've been told that my writing style, at least for fiction, changes a lot to fit the story I'm telling. I think I tend to write theological and metaphysical works, and the occasional political piece, in the style of a story-telling philosopher such as Plato or Nietzsche. I also write novels in the style of a philosophical novelist, such as Melville, or a theological novelist, such as Flannery O'Connor. Those novels are an integral part of the development of my worldview, my understanding of the Creator and His Creation, including that unique part of Creation—man.

### 2.2 Novels

#### Novels as Part of My Mission

Consistent with my view of the unity of human knowledge, at least true knowledge, I consider my fictions to be part of the same effort as my non-fictions. I've made six novels available for free download under a Creative Commons non-derivatives license.

#### The Open Independence of the Seas

*The Open Independence of the Seas* can be downloaded at <http://loydfueston.com/downloads/open.pdf>.

This novel is the second that I wrote but the oldest of my novels which still exists (substantially finished in 1999 or thereabouts). I trashed my first novel and have started to rewrite it. In any case, *The Open Independence of the Seas* [45] is an early and perhaps sometimes successful effort to unleash

my language to speak more truly of the world in terms of our modern knowledge of empirical bits and pieces of the world.

*The Open Independence of the Seas* [45] is the story of a young man who is trying to make sense of the stories of a grandfather who built churches and hospitals in Africa as well as missile-launching systems in America, a dead cousin who was more than half Nigerian and also more than half Welsh, a long-dead grandmother who had a reputation as being a nervy biologist, a 400-pound man who liked to sit on other people's faces, a 400-pound gorilla who was far gentler, a wise killer, a world devastated by nuclear war, and various other creatures. The protagonist, presenting himself as being borderline autistic, particularly struggles with the science-tinged poetry of that dead cousin who had made himself aware of the forwards and introductory chapters of many classics in science and mathematics.

## Safe Harbours and Open Seas

*Safe Harbours and Open Seas* can be downloaded at <http://loydfueston.com/downloads/safe.pdf>.

I wrote the first version of *Safe Harbours and Open Seas* [46] more than ten years ago. I believe the current version was finished about seven or eight years ago, though I did reformat it and also made some minor edits just before making it available for download in August of 2011. It's another novel about the conflicts in modern men because of our inability—so far—to deal with modern empirical knowledge and with the complexity of life in modern human communities. This novel is a comedy. Even a meta-comedy in a manner of speaking.

It's closely related to *The Open Independence of the Seas* [45] which I made available for download in September of 2010.

*Safe Harbours and Open Seas* [46] was written after the publishing industry showed no interest whatsoever in *The Open Independence of the Seas* [45]. Some chapters in *Safe Harbours and Open Seas* [46] are copied over from an early version of that other novel. *Safe Harbours and Open Seas* looks at a conflict between one author who is trying to make sense of God's Creation, both science and human history and another author who has a literalistic and superficial understanding of modern empirical knowledge. The first author, Parnell Lopez, is one of the main characters, and narrator, of *The Open Independence of the Seas* [45].

## Corporate Sex

*Corporate Sex* can be downloaded at <http://loydfueston.com/downloads/corpsex.pdf>.

*Corporate Sex* [39] was named *Unleashed Desires* when I submitted it to publishers and agents during the late 1990s going into the post-9/11 period. It is about the mating rituals and forms of reproduction that take place in the New York City financial districts. This is one of several novels where the main character(s) came to life before I began writing the book. Mary Pride was born more or less fully mature as I walked some quiet streets in the town where I grew up—Ludlow, MA—a year or more before I could get the plot straight.

## The Modern Critic

*The Modern Critic* [48] can be downloaded at <http://loydfueston.com/downloads/critic.pdf>

In 2012, I uploaded the novel, *The Modern Critic* [48]. This book was 99% complete ten years ago but I'd been procrastinating on the publication because I thought I might expand it substantially. That expansion now seems unnecessary and even esthetically unappealing. The book was complete after I added a few comments to fill in as little information as is necessary about some characters who chased or escaped each other out of the pages of the novel discussed above: *Corporate Sex* [39].

Anyone who reads this book could probably guess the truth: I wrote it in a good-natured phase of my state of despair at discovering that books requiring good reading skills and active minds don't appeal at all to the editors of the American publishing industry. In this, the denizens of that industry seem to be in front of the herd, not leading but going along in front.

*The Modern Critic* [48] is some non-essential middle to my novel *Corporate Sex* [39], a tale of courting behavior on Wall Street, though this book is about a literary world which is rarely visited these days by the sorts who are successful on Wall Street or Avenue of the Americas.

## A Man for Every Purpose

*A Man for Every Purpose* [37] can be downloaded at <http://loydfueston.com/downloads/aman.pdf>

*A Man For Every Purpose* [37] is a tale of a man who fragments when he is not able to deal with some of the problems in his life. It is told from the point of view of that character. One of my motivations in writing this tale is to show that true and moral fantasy has more to do with human perceptions than with magical events. Nothing impossible occurs in this novel but the telling of the possible events twists them and colors them in strange ways.

In any case, the fragmented protagonist is us as we go about our lives in this modern world. As was true of Mary Pride from *Corporate Sex* [39], Milt Jackson came to life well before I knew what he would do. In fact, I ran through several possible plots while Milt stayed pretty much the same.

## The Hermit of Turkey Hill

*The Hermit of Turkey Hill* [36] can be downloaded at <http://loydfueston.com/downloads/hermit.pdf>

*The Hermit of Turkey Hill* [36] is a story based upon a friendship, of sorts, that my grandfather, Charlie Milroy, had with a man who was the gentler sort of sociopath. The man lived in Ludlow for 35 years or so and spoke so few words that people weren't sure where he was from. I changed the name of the town, changed the name of the police chief—my grandfather, and made up a number of characters and little events to flesh out the few facts I knew about this story.

## Gathering the Silence

*Gathering the Silence* [54] can be downloaded at <http://loydfueston.com/downloads/silence.pdf>

*Gathering the Silence* [54] is the first volume of a modern conversion story, that of a young man who finds himself on the path to becoming a Christian thinker and author. The story runs parallel to mine but is much different at times, elaborated in a way to make things clear as they were to me after years of contemplation. I am currently planning on writing

another two volumes to complete the story, perhaps one to be published toward the end of 2015 and one toward the end of 2016.

## The Simple Life

*The Simple Life*[55] can be downloaded at <http://loydfueston.com/downloads/simple.pdf>

It's the story of some men and women and children gathering together in New England to form a community and take care of the vulnerable and the abandoned. After they start to form that community, the climate turned a little ice-age cold. Many have moved down to sunnier regions.

Adam Smith? The Invisible Hand? This is a concrete world which resists too consistent an application of abstractions...

Maybe we just need better abstractions or better ways of applying the ones we already have?

In any case, something invisible is working. Sometimes building and nurturing. Sometimes smashing.

## A Stranger in a Land of Strangers

*A Stranger in a Land of Strangers* [57] can be downloaded at <http://loydfueston.com/downloads/stranger.pdf>

*Gathering the Silence*, a novel described above, began a fictionalized, spiritual biography of someone much like me in some ways, very different in others. This novel, *A Stranger in a Land of Strangers*, continues that spiritual biography—if that be the proper term.

In the announcement of the availability of *A Stranger in a Land of Strangers* on my blog, I wrote:

This is what I wrote about that earlier novel in the announcement of the availability of the first edition:

In a sense this is both my latest and my first novel. It's about the fifth version of what started out as a straightforward fictional telling of my spiritual life, climaxing in my entry into the Catholic Church. Now, it's the first half of a story about the conversion of a man into a Christian author and its not nearly so straightforward.

The story continues with a certain success—though not of the financial sort—in the conversion of the protagonist to Christian author. There is serious regression in the more important religious conversion, though there are hints the two conversions are intertwined and, perhaps, ultimately one.

The Christian author might pull himself along on a spiritual recovery?

Who yet knows?

## 2.3 Nonfiction Books

### To See a World in a Grain of Sand

*To See a World in a Grain of Sand* [41] can be purchased at *Wipf & Stock* which has a website at <http://www.wipfandstock.com> or at many internet booksellers.

In 2006, my first published book appeared due to the kindly intervention of the theologian Stanley Hauerwas and the generosity of Jon Stock at *Wipf & Stock*, a republisher of Christian works of merit and a first publisher of works marketed in the academic community. That book was *To See a World in a Grain of Sand* [41] as described at [http://loydfueston.com/?page\\_id=17](http://loydfueston.com/?page_id=17). Only a paltry number of copies have been sold.

The synopsis for that book, printed on the back-cover, is:

With some modifications, certain insights of St. Thomas Aquinas can be used to make good sense of this dynamic universe of evolving things. These foundational insights cover the nature of human knowledge and the importance of acts-of-being.

The human mind is formed by interaction with God's effects in His Creation and this interaction takes place during three billion years of evolution and also during the lifetime of an individual human being. Creation is a manifestation of thoughts which God wishes to share with us.

God Himself is His own Act-of-being or the Supreme Act-of-being while all the underlying stuff of created things is ever and continuously brought into existence by God's acts-of-being. Complex things and living beings are brought into existence by

acts-of-being best described as parts of a story being told by God. Even metaphysical and mathematical truths are better described as being facts created by the same God who created things. God is the source of all being and all truths.

## The Peace of Christ

*The Peace of Christ* [44] can be purchased at *Wipf & Stock* which has a website at <http://www.wipfandstock.com> or at many internet booksellers.

My second published book about struggling through a difficult period, *The Peace of Christ* [44] as described at [http://loydfueston.com/?page\\_id=89](http://loydfueston.com/?page_id=89) did no better than *To See a World in a Grain of Sand* [41].

The synopsis for that second book, printed on the back-cover, is:

This universe is a battleground where forces of order and disorder struggle. We can eat or be eaten but even if we survive the struggle between predator and prey, we have to face floods and hurricanes, asteroids and volcanoes. True peace is possible even on this battleground because of Christ's victory on the Cross. This true peace can be understood when given its proper name: the Peace of Christ. We can understand better when we pray to God, when we read the Bible, and when we worship Him. We should pray, asking for God's help and praying the Psalms. We should sit quietly, letting ourselves become better aware of God's Presence and learning how to pray along with God, to listen along with God, to think along with God. We should read the Bible, the word of God as recorded by His prophets and evangelists. We should worship God at least once a week, preferably participating in the Eucharistic Rite, eating the Body of Christ and drinking His Blood as He commanded for the sake of our salvation (John 6:53). In various ways, we should allow God to fill us up with His Son that we might become Christ-like persons. Only in that Christ-like state can we obtain true peace.

## Four Kinds of Knowledge

*Four Kinds of Knowledge* [43] can be downloaded at <http://loydfueston/downloads/know.pdf>.

I set out on a different path and published my next book, *Four Kinds of Knowledge* [43], on the Internet intending to allow personal use though I reserved derivative rights. This book is a discussion of human knowledge and a denial of the ‘problem’ of human knowledge usually studied under the name of ‘epistemology’, a branch of philosophy forbidden to those who accept the claim of St. Thomas Aquinas that things are true. We know what we know by actively perceiving what lies around us and what is happening in our own bodies and we know truly when we know in such a way as to respond properly to the truth that is in the world. This way of putting it points to the similar views of the pragmatists who would be nearly Thomists in my updated sense, existentialist and relationalist as well as trusting reality, if only they were willing to admit our knowledge is local knowledge of a world, indeed, of a Creation.

In any case, I claim that human knowledge of all being is of two kinds though we can best see in terms of the four kinds in the full title of the book: revealed knowledge, speculative knowledge, scientific empirical knowledge, practical empirical knowledge. The two kinds of knowledge beneath this framework are knowledge of God in His necessary being and knowledge of God in His freely chosen role as Creator of a **specific** Creation.

## **Human Rights: An Evolutionary and Christian Perspective**

*Human Rights: An Evolutionary and Christian Perspective* [47], can be downloaded from <http://loydfueston/downloads/rights.pdf>.

This book is an expanded and radically revised version of an article I’d written to deny the metaphysical status of human rights. The book argues that rights have been unfolding in history as a result of human communities developing as part of the Body of Christ in this mortal realm. Rights have some sort of absolute sense only in this Christian context and I think some have suspected that something like this is true given the close relationship between Christian civilization in the West and the type of human rights found in the *Declaration of Independence* or the writings of John Locke.

## **Justice: The First Step Towards God**

*Justice: The First Step Towards God* [40] is a short article which can be downloaded from <http://loydfueston/downloads/rights.pdf>.

The article begins:

St. Thomas Aquinas taught that justice is the first step towards true religion. In Chapters 119 and 120 of *Summa Contra Gentiles, Book Three: Providence*, Aquinas speaks in terms of the service we owe and uses terminology appropriate to the well-ordered societies of the Medieval Age. The discussion is solid but somewhat distant to modern human beings with our poorly founded and abstract systems of political and moral thought.

In some way, anyone who will be able to enjoy sharing God's life has to at least render God the justice of acknowledging Him as our Maker. From that point, we need to develop a true sense of life, we need to learn how to live by actively engaging God through His Creation, a Creation which includes churches and synagogues, prayer groups and bible-study groups, but also includes many other thoughts of God manifested as forests and lakes, human technology and human arts and letters. Let us prepare for Heaven by responding actively to God's Creation so that we shape ourselves to encapsulate the thoughts He manifested in created being of all sorts.

### **A More Exact Understanding of Human Being**

*A More Exact Understanding of Human Being* [53] can be downloaded at <http://loydfueston.com/downloads/human-being.pdf>.

In this book, *A More Exact Understanding of Human Being* [53], I claim that: To the extent we human beings are truly images of God, we are encapsulations of the thoughts manifested in Creation by God in His freely chosen role as Creator.

There is more to a human being than mind and all that more contributes greatly to human understandings of Creation. Moreover, mind contributes to all that we place in the realms of heart and of hands. But heart contributes to mind and hands. Moreover, hands contribute to mind and heart. Man is a creature who thinks and feels and acts and needs to be understood in such terms. I first sought to understand the human mind as it tries to understand Creation and years ago wrote a sketch of this book which contained the following paragraph.

The human mind is an entity which is shaped in response to our environments, to the world at a higher level, or even to

Creation as a whole. In this way of thought, a human mind is an encapsulation of reality so far as we actively perceive it and actively respond to it. When we realize this is the nature of our minds, we can better develop them and we can begin to see that relationships, such as those which largely make up our minds, is primary over stuff. Relationships make stuff and shape stuff. God's love creates contingent being and His love continues to shape being right to the concrete realm of things. We can play our role in shaping that concrete realm of things with our active love and our other forms of relationships, some of which shape entities of God's Creation into evil forms.

What I said about thinking in that early version of the book can be said also about human feelings and acts. A more complete understanding of reality comes from considering human nature in light of those three aspects: mind, heart, and hands. We need thought both practical and abstract, feelings which are properly disciplined for the moral ordering of our lives, and actions toward an ordered life and an ordered relationship with the physical realms of Creation. Mind, heart, and hands.

## The Shape of Reality

*The Shape of Reality: Restoring Our Faith in the Unity, Coherence, and Completeness of Creation* [53] can be downloaded at <http://loydfueston.com/downloads/shape.pdf>.

## 2.4 Collections of Writings from Weblogs

I've released ten editions in book-form of lightly edited versions of the essays I've posted on my two blogs since 2006: primarily *Acts of Being* [38] at <http://loydfueston.com/> but there are a fair number of essays from my inactive blog *To See a World in a Grain of Sand* [42] at <http://loydf.wordpress.com/>. That book, *Acts of Being: Selected Weblog Writings From 2006 to 2014* [51], is available for free download at <http://loydfueston.com/downloads/acts.pdf>. It's large and contains about 560 chapters counting front matter.

I've added another 12 or so chapters to this Tenth Edition. All but this chapter are reformatted essays from my writings during 2019 which were

published on my active weblog, *Acts Of Being* at <http://loydfueston.com/>.

I thought to make it easier for others to dig into my writings by making them available in smaller groups, with themes which would sometimes correspond to the seven parts in *Acts of Being*:

1. *Making Peace With Empirical Reality*,
2. *The Human Mind as a Re-creation of God's Creation*,
3. *Love and Stuff*,
4. *What is a Universe?*,
5. *Freedom and Structure in Human Life*,
6. *The Narrative We Know as a World*, and
7. *What Means It All?*.

By the beginning of 2015, I had published two samplers:

1. *A Modern View of Creation: Making Peace with Empirical Reality* [49] downloadable at <http://loydfueston.com/downloads/acts-emp.pdf>, and
2. *A Modern View of Creation: The Human Mind* [50] downloadable at <http://loydfueston.com/downloads/acts-mind.pdf>.

These samplers don't seem to have drawn much interest and I probably won't release any more.

## 2.5 Other Writings to Come

My general plan is to return to writing novels in 2020 and to get back to reading serious materials in mathematics and physics to see what might result.

In my opinion, we can't move forward in developing better and richer understandings of God in His role as Creator, of His manifested thoughts (Creation), or of man in particular until we have a body of words and

concepts which are drawn from current understandings of Creation as we can perceive and explore it. In other words, we have to rely on the Creator's thoughts as we can discover them in Creation; our imaginations are simply not powerful enough to match what God has actually done.

Any understandings we can develop from our explorations of Creation would have to be in the form of a narrative which is an image of God's story, the story which is this world. Homer and the great lyric poets of ancient Greece are said to have blazed the paths followed by the ancient Greek scientists and philosophers. We also need poets and novelists to do this sort of work though I suspect they would nowadays have to follow Einstein and Darwin, if only to catch up.

### 3 Why Should We Care About These Sorts of Thoughts?

It's hard for a thinker to truly understand his own thoughts, if those thoughts are rich and complex. Mine are and I'm more self-aware than most prior thinkers just because I was born in the modern age when literate men are aware of their historical context and their own selves, sometimes to a painful degree. Even those modern men not highly literate have – until recently – had some awareness of history, if only that of their country of residence or of origin.

Something has gone wrong. The ongoing and intensifying problems being endured by the West and all parts of the world intertwined with our political and economic systems aren't just technical problems resulting from mistakes of political technicians or financial regulators. These problems were predicted decades ago, or even centuries ago, by the deeper thinkers of various beliefs. In these pages are references to some of those thinkers: Alexis de Tocqueville, Nathaniel Hawthorne, Hermann Melville, Albert Jay Nock, Gareth Garret, Hannah Arendt, Jacques Barzun, and Flannery O'Connor. All of those writers, and many others, saw moral weaknesses in the moral character of modern Americans and others of the West and also what might be classified as structural weaknesses in the political and economic systems of the West. Gareth Garret also saw (circa 1950) a certain irrationality which led Americans to invade and conquer various countries without even profiting from those imperialistic activities – though certainly some individuals and corporations have always profited from those invasions and general troublemaking by the American government. Jacques Barzun, in *From Dawn to Decadence: 1500 to the Present* [9], narrated these past five centuries in the West using the theme of decreasing standards of literacy – which certainly implies decreasing standards of abstract reasoning

and maybe other forms of reasoning. Partly for those intellectual reasons, we are in a state of total moral disorder.

Those who saw the loss of respect for the “permanent things” knew something had gone wrong generations ago, starting perhaps with Edmund Burke and with the Catholic Right circa 1800, all of them fearing that the French Revolution’s blood-letting might prove to be a sign of the true nature of modernity. In evaluating these claims and trying to understand from our position 200 years later, we should remember that blood-letting is also a part of the story God is telling, the blood-letting of biological evolution and that of human history and pre-history.

I’m a soft and overly gentle man of the modern West and I fear the suffering which might be coming down upon us in this period of great change which is opening up. It seems likely to me that Jacques Barzun’s highly qualified prediction of a century of stupidity and poverty and violence might well come true – see the aforementioned *From Dawn to Decadence: 1500 to the Present* [9]. Professor Barzun went on to predict that a new dawn would come when some poorly educated young man would find a store of the old books, old learning, and be fascinated. He would realize, in my words, there is something interesting in that old learning and worth the struggle to master.

I look at our current situation and our possible oncoming disaster this way:

Why not cut out the century and get right to an intellectual recovery?

We must be able to derive some good from our historical awareness and self-awareness and we might have a chance if a substantial number of young men and young women were to join in the effort to found a new Christian civilization or perhaps a new phase of Western Civilization. After all, we still have something of forward momentum though it seems at times we’re mostly sliding back down some hill into a more brutal and more impoverished form of barbarism. Yet, we still hold on tight to our computers and still put some tax moneys into the maintenance of dusty and ill-frequented library stacks of those old books as well as a healthy number of new books worth the effort to read. Still yet again, those libraries are purging books and putting up banks of computer monitors and racks of DVDs.

A recovery while we still have the keys to those libraries, even if we don't often enter the stacks of books, would be radically different from a recovery from a standstill. Mostly, it might eliminate some of those decades of ignorance and suffering. If we play our cards right, I suspect those who live a couple generations from now might realize that this period of suffering was actually a rebirth. Yes, I suspect that something wonderful will be born in a process as painful as so many births are. Can we minimize the period of pain and be holding the cleaned-up, screaming baby soon?

Maybe.

By the grace of God and by some of my own actions, I've been put in a situation where I have an eclectic store of knowledge along with the feisty and sometimes obnoxious attitude of a creative thinker who feels himself called into the breach, in a manner of speaking.

And so I'm putting together this strangest of books – a collection of writings from a blog or weblog, a form of publication used by most for works as ephemeral as those hardcopy books which appear on the best-seller lists of our dumbed-down, but still prestigious, newspapers and magazines. I'm confident that these writings speak of the truths God manifested in this world, and speak in such a manner as to help us shape our minds in preparation for sharing the life of God.

## Part II

# Making Peace With Empirical Reality

## 4 Introduction: Making Peace With Empirical Reality

In *Twilight of Authority*, Robert Nisbet quotes “the great bishop Butler”:

Things and actions are what they are, and the consequences of them will be what they will be; why, then, should we desire to be deceived. [102]

In this part, I’ve collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/>, in which I deal with the issue which is the title of the chapter. Usually, our responses to reality are at second-hand, that is, we respond to our own bodies or to our environments as perceived according to our “cultural assumptions”, taking this term in a vague sense to be explored by other thinkers if they think it necessary. For good or bad or indifferent, these “cultural assumptions” are mostly implicit. So far as I can tell, even seemingly well-educated men and women have no clue that their view of physical reality or human history or human moral nature is a speculative construction built up over a number of generations. My goal in the writings collected in this chapter is to argue in favor of a more active, courageous, and faith-filled response to God’s Creation, starting with those empirical realms which we can explore by our own senses or other empirical means.

# 5 The God of Jesus Christ: Transcendent God and Immanent Creator

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=25>. It was finished and uploaded on 2006/07/29.]

God is transcendent and immanent. That is, He lives as a necessary being, Father and Son and Holy Spirit, His own Act-of-being, but He also exists in each and every thing, each and every second of time, each and every cubic inch of space. Not even the emptiest space of our universe could continue to exist if God were not immanent in that bit of space, executing acts-of-being.

By creating, God chooses to become immanent in His Creation, else that Creation could not be. It is God's relationship to that Creation, His freely chosen decision to inhabit it as an act of love that brings that Creation into being.

Modern secularists remain willfully blind to God's presence in Creation, at least partly because they share the errors of most human beings throughout history—they think of substances as existing in and of themselves. When they think of God as Creator, they are likely to think in terms preferred by the neo-pagans of modern scientific thought. If God exists, then surely He is some sort of Mathematician or Physicist or Engineer raised to gigantic proportions. One might write humorously of those who see the limitations of traditional ways of viewing God as a human-style King and then go on to see God as an infinitely bloated version of themselves. I'll pass on and not do so in this short entry.

Instead, I'll point to the limited truth in seeing God in those terms

– as Mathematician or Physicist or Engineer. That is, there are aspects of reality which can be best understood by a serious mathematician or physicist or engineer. As I pointed out in my book *To See a World in a Grain of Sand* [41], God the Creator can also be seen as a King or Lawmaker through some of the aspects of His Creation. I would tend to believe this is less of a distortion than most other ways of seeing God since—at the least – it allows the Almighty His truly free will. I’ve also emphasized the way in which God is an author and I think that also is less of a distortion than thinking of God as a Mathematician or Physicist or Engineer since it emphasizes that He is a Creator Who has a purpose in His work. Creation is ordered in the way of a moral narrative, however brutal or amoral some of the action seems to be. But that is true of the greatest of human novels as well.

In any case, I’m going to shift to a restatement in more accessible terms of a critique a Jesuit scientist recently made of Intelligent Design. That critique was in the very dense, meaning-packed language of Catholic Scholasticism: Intelligent Design reduces God to being a secondary cause rather than being a primary cause, a true Creator. That is, it reduces God to a being who works in the way of a human mathematician or physicist or engineer, or lawmaker or author for that matter.

But we see God through His effects. We see God the Creator as a God who made specific decisions which are aligned with human skills and interests—necessarily so since we are part of this world. This world can be seen, and seen truly, by studying its mathematical and scientific aspects, by studying the ways in which nature is similar to human technology, by seeing the ways in which it is its orderly is quite contingent—personal decisions seem to be involved. We see God by telling stories, including our version of the story which is this world, the universe seen as ordered to God’s purposes.

We should be careful at this stage. That God, the Creator of this universe, is far too small. He is the true God but He is the true God acting freely to create a particular universe. Because He is acting freely in a specific way to create a particular universe, we see Him in a peculiar role. He is the true God but He is acting in a way analogous to human beings, the inhabitants of this world who have the unique property that their brains, and the minds rising from those brains, are an encapsulation of this developing world, this world which is much like a dynamic narrative.

Our minds themselves, in the way in which they work and in which they

encapsulate the world, are the truest source of information about Creation. Our minds are themselves ultimately an encapsulation of those truths which are labeled as ‘natural theology’. God’s world is a manifestation of those thoughts which God wished to share with us, wished us to have as our own. We form our minds properly when we respond freely and humbly to our immediate environments and then to the physical universe seen as a pagan cosmos or an Einsteinian universe and then to God’s moral ordering of that universe. It is in that moral ordering that the human being can see Pan as being a mask of the Creator of Christian revelation.

By forming our minds properly, we become truer images of God and begin to align our very beings with God, but there is a problem. First of all, those who form their minds in response to only their immediate environments or even to those environments and some plausible view of the universe are becoming better images not of God but of a finite number of actions of God. They are responding to God the Creator but are not to the revelations which tell us something of the God of Jesus Christ, the Triune God in His completeness. That God, the immanent Creator, is far too small. That God is the God of the higher pagans and not the God of Jesus Christ.

I admit to floundering a bit in trying to develop an intuition into a more complete idea. I am fighting my own words and the inflexibility of my own mind. I’ve done that before and truly believe that a proper fight will lead to a more relaxed state in which my mind begins to align itself with not only the Creator seen through His effects but also the God of Jesus Christ with whom we can all have a personal relationship.

It is mostly good to try to see the revelations of Jesus Christ in terms of the current culture, and there is a great value in seeing God the Creator through the eyes supplied by modern science—just so long as we realize that we are seeing God, thinking of God, in analogical terms. And now I’ll follow that thought. If we take seriously the Creator in terms of His actions as Creator, we can be ready to revise many of the speculations of Christian thinkers. I’ll be trying to explore those possible revisions over the remainder of my life, in nonfiction books and novels alike. For now, it is sufficient to point out two major directions in my thoughts, directions already discussed vaguely in *To See a World in a Grain of Sand* [41] and also in my blog entries and in computer files containing unpublished works in various stages.

1. We have perhaps reached the end of the usefulness of viewing God's offers of salvation in terms of human systems of justice; and
2. We have rich possibilities for re-envisioning our own selves and our unrealized possibilities and, equivalently, for re-envisioning our relationship to our Lord and Savior, Jesus Christ, as well as our relationship to His Father and Their Spirit.

If we suddenly return to paganism by seeing a far-too-small God, God seen only in His effects as Creator of a particular world, we risk losing contact with the true God who is far greater than that, far greater than even He who brought what-is into existence from nothing.

## 6 The Peace of Christ: A Short Book in Process

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=53>. It was finished and uploaded on 2006/12/23.]

In most of my posts, I've certainly seemed a pessimist, targeting the great problems of our age: moral decay and profound illiteracy in particular. As I've presented matters, modern men have the moral sensibilities of either self-righteous twelve year-olds or perverse twelve year-olds. Not options which are particularly attractive. Reading skills have decayed to the point where even those with large vocabularies and the ability to parse complex grammatical structures can't distinguish between given truths (of logic or of Biblical revelation) and the conclusions to complex speculative arguments. Few there are who understand even their own beliefs, or the history of their beliefs, well enough to put a complex text in context.

What are we to do? Are we to simply hunker down, admitting it's likely that Western Civilization will take another two generations or so to hit bottom and then might not even rise again? Hunkering down would be difficult at best for the disorder of this world would invade any conceivable refuges available for larger numbers of human beings. External order would be likely to corrupt any internal order which might develop by efforts of family and friends, local community or church community.

But a Christian has no right to be truly pessimistic just as he has no right to be triumphalistic. The world is not evil just as man is not inherently and inevitably depraved. But the world cannot save itself in the sense of coming to a moral conclusion. Nor can we men save ourselves by achieving the immortality that most great thinkers and spiritual leaders have considered so desirable, thought often teaching wrongly that man is born with an

immortal component, though perhaps not a component containing all that we value in ourselves.

We insist on interpreting our lives and God's story as a whole in terms of ideas and images which were once plausible but have decayed into superstitions. And we modern men not only produce strange images in place of the empirical realities of God's Creation, we also tend to follow the likes of C.S. Lewis in elevating magic over empirical investigation of God's Creation. Such ways will prevent us from finding even hints of the true peace of Jesus Christ, He who created this world along with His Father and Their Spirit. The same Triune God who continues to create this world, an empirical world subject to investigation and contemplative wonder. Not a world of occultist magic.

This world of galaxies and rattlesnakes is being born, a birth not to be completed in its own time and under its own terms. Men also are being born under similar limitations, but we can also abort this birth by our own actions and our own failure to act.

Birth is a painful and violent process, though some births are certainly less so than others. It's hard to see how peace can be secured in the midst of the conflicts caused by this birthing process. Some might be lucky enough to live during relatively calm periods, that is, periods when the earth has good climate conditions and few earthquakes, periods when the sons of men are at peace and are minding their local business.

Peace is hard to bring about, even hard to define. I speak not of the peace of a corpse—that is inertness. I speak not of the peace of human politics which often proves to be nothing but a truce while weapons are being developed and soldiers trained.

I speak of the dynamic peace of a true world or a true person. In my book, *To See a World in a Grain of Sand* [41], I defined both worlds and persons in terms of three attributes: unity, coherence, and completeness. This is a limited and tentative definition for sure, providing some necessary but maybe not sufficient conditions. My claim should also be qualified, of course, to account for our creaturely nature. The qualification is simply that we can have such attributes though they seem divine, by pagan standards, simply because it is still God who brings us into existence, each and every instant, and it is still God who also carries out those secondary acts-of-being which shape us.

And we must come to peace with the world as God created. To be sure, we can only know the world by way of limited facts and much in the way of

human speculations. We should be at peace with our descent from apes if that is the empirical truth. It is God who guided the evolutionary descent towards humanity, from amoeba to worms to toads to shrews to monkeys to human beings.

From here, I'll by-pass the theological and philosophical complexities and move on to speak of spiritual matters.

Peace is to be had. A tentative and imperfect peace to be sure. But a true peace for all that. A true peace that is but a hint of the perfect peace to be enjoyed by those blessed souls who will be resurrected to live with the Lord Jesus Christ for time without end.

How is this imperfect peace to be achieved? Well, the bad news from the human perspective is that we can't grab hold of it, only God can give it to us. The good news is that God seems to give a measure of this peace to all who seek it in good faith, though some of his greatest saints live in torment and spiritual dryness for long periods – Mother Teresa of Calcutta lived in such a state for nearly her entire adult life.

How do the rest of us go about seeking this imperfect peace? Easy enough—in principle. We prepare for a life with God.

We worship Him faithfully, at least once a week as was the true point of the so-called Creation stories of Genesis. And we try to reach a state of humility and gratitude during our worship service, whether Catholic or Orthodox or Protestant or Jewish. We are reverent, silent during the holy moments in whatever worship service we attend.

We pray daily. We should pray both by a regular routine, perhaps starting the day with a simple, “Good morning, God,” followed by the Shema or the Lord's Prayer. In the evening, a similar routine, with a short examination of conscience would be appropriate. We should also reserve some time, a few minutes a day and perhaps a longer session once a week, to simply sit quietly in the presence of God. There are various ways to achieve a quiet state though neither Christians nor Jews should be worrying about techniques to the extent of some of the followers of Oriental religions. This is not to deny the importance or utility of techniques. The Christian and—I believe—Jewish position is that techniques should be transparent. Techniques help us to quiet down but the point is to be open to God, to sit quietly and become aware of the God who is always present.

Most would say that we are trying to listen to God. I have more of a Thomistic viewpoint: we do not listen to God so much as we learn to both speak and listen with Him. Most of all, we learn to think with Him, to live

in His presence so that He has filled us up, ultimately to complete us but only at our resurrection.

For a sacramental Christian, Catholics and Orthodox and maybe some Protestants, there is more to say because the sacraments also play a role in bringing us into the Presence of God. When we eat the very Body of Christ and drink His Blood, we allow Him to infuse our very being with His Presence.

When we try to understand God's world, we are trying to move with Him as He shapes and sustains that world. If we try to understand the original act of Creation of this world, we even try to create along with Him. This is in the same sense that a three year-old girl moves behind her mother and imitates the actions of making a cake. Our acts have no effect, but they seem to enrich God's world in a way He desires. Such acts make us more aware of God's presence and teach us to have faith in God, the all-powerful God Who created this world, the all-powerful God who has promised to take care of His friends.

To the extent that we can see true peace in this world, we see it in the faithful way in which martyrs have accepted torture and death rather than betray their God. We can see it in a tormented woman like Mother Teresa as she devotes her entire life to caring for God's children, helping them to feel a measure of the love and peace she herself couldn't feel.

And this is what I speak about in the book I'm currently writing, actually re-writing from a draft completed nearly a year ago. That draft was as 'philosophical' and as dense as my one published book – *To See a World in a Grain of Sand* [41], but I intend to write *The Peace of Christ* [44] as a simpler book, a spiritual guide rather than an intellectual exploration.

## 7 God as The Creator of Truths

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=60>. It was finished and uploaded on 2007/01/13.]

It sounds strange to speak of God creating truths—even God, but I have two lines of reasoning that lead to this conclusion that God has created the truths of our universe, mathematical and metaphysical, as well as the things of our universe. I discuss this claim in my book, *To See a World in a Grain of Sand* [41] though I’m still working on a richer and deeper understanding of my own claim. I’m going to present a rough outline of the reasoning behind my claim rather than a complete argument, the initial form of which was the text of my book. It might not be clear even to me for a while if this presentation moves towards that richer and deeper understanding of my claim.

In this first installment about the creation of truths, I’ll address some aspects of the theological and metaphysical reasoning. Basically, the reasoning falls out naturally from Thomistic existentialism though that ‘naturally’ part depends upon an expansion of Thomistic existentialism in response to modern empirical knowledge. Our understanding of the universe, this phase of God’s Creation, has widened and deepened, leading to new possibilities regarding other phases of Creation, and new possibilities regarding the greater totality of Creation.

The first line, and more important line, of reasoning comes from my basic beliefs: an expanded and updated version of Thomistic Existentialism. God has no substance, not even something that could be labeled as ‘divine substance’. God is a pure act-of-being, His own Act-of-being. He is the supreme Act-of-being. As such He is the only being who truly exists. He is being itself. This is the line of reasoning I’ll be exploring in this entry. Soon, I’ll be posting an entry discussing the second line of reasoning which

involves the modern discovery as to the true nature of random numbers and the questions it raises about the nature of human mathematics and the truths which seem to be its foundations.

St. Thomas Aquinas upset a lot of thinkers over the past seven centuries with the claim: things are true. I would say that this claim makes him the most consistent empirical thinker in history amongst the more famous philosophers and theologians. This led me to a crazy line of thought culminating in the speculation that not only are things true, but truths are thing-like in a sense. This is not to say that all truths are thing-like but only those manifested in the underlying, abstract stuff of this universe—the Primordial Universe as I called it in my book. These manifested truths must include all those accessible to human thought, which is mediated through mostly the brain but through the entire human animal and its relationships with other physical entities. Even revelations of truths beyond Creation, those regarding God Himself, have to be expressed in terms of truths which are manifested in the Primordial Universe and then are included in the stuff which God shaped into this universe.

Things are true. They have to be true. How could something exist if it were not true? Well, that might be possible under pagan conceptions of physical reality where matter co-exists from eternity along with any possible Creator, more accurately—a shaper. There is — possibly—a realm different from the realm of concrete beings and there might even be a realm of untruths. So why is it different for a Christian? A simplified explanation is:

In a Christian worldview, God creates all that is not Him from nothing. Any creaturely entity—quark or rock or porpoise—is a manifestation of a thought of God. A thought of God is necessarily true.

God told us Creation is good. It's also beautiful and true. Since this phase of Creation, our universe, develops over time, the goodness and beauty and truth can sometimes be obscured or under development and appearing to be quite grotesque.

It's important to note that a Thomistic-existentialist viewpoint can handle a developing universe—still a great difficulty for philosophies, Christian or other, which accept the pagan claim that matter exists co-eternally with any Creator—who might Himself be the universe. More importantly, dis-

tortions come in the dualistic concept that there are separate realms of truths and concrete being.

Some might be surprised that I say there are Christians who accept that pagan claim that matter co-exists with God. This pagan, or paganistic-Christian, God is really a Shaper and not a Creator. Or else Himself the universe. Unfortunately, many of the philosophies of Christian history, including that of St. Augustine, took pagan philosophies based on that view and then patched them crudely with the valid but inconsistent claim that God created this universe from nothing. You can't patch up a metaphysics that undervalues the act-of-being, or slights it completely, by pasting on vague statements about the acts-of-being which are God's acts of creating from nothing.

Yet, there is a truth in this view of God as shaper, a truth easily absorbed into a Thomistic existentialist worldview. God is seen as both He who created the Primordial Universe from nothing and He who shaped this universe from that Primordial Universe.

Things are true. There is another way to argue to this claim and that is simply to note that any metaphysics which separates thing-ness and truth is inherently and dangerously dualistic. If truths are not in the things of this universe, where do we get them? Our very thinking organs are things. If we can have thoughts which are true, especially thoughts about very abstract mathematical objects, then we are all forced to be dualists or to fall into a state of mute stupidity before a universe which has no contact with truth.

The computational philosophies of intelligence have produced, as an accident, the realization in clear-headed observers that these sorts of pseudo-empirical philosophies merely replace a brain and mind duality with a brain and software duality. The mind and the software have to somehow live in an immaterial realm of truth while being able to show up in the brain or computer or sunspots as I vaguely recall from my days of reading science-fiction. The unanswerable question, one known to the supposedly muddle-headed Medieval Scholastics is:

How does the brain interact with mind or software if they are truly different sorts of stuff? Or non-stuff?

Computer software should be viewed as states of a certain type of organized matter—'circuits' which are electronic or optical or other sorts of

devices. The same is true of human thoughts being states of a certain type of organized matter—the human brain.

This is not to propose a reductionistic form of materialism. Quite the opposite. I'm saying that all the truths which humans can perceive or conceive are embodied in some deep sense in the very matter and organization of the human brain. As a Thomistic existentialist, I am willing to have the courage of my Christian convictions:

Matter is not 'mere' matter, it is sacramental stuff, manifestations of thoughts of God. As such, this universe in its totality somehow embodies all those truths which are accessible to human thought.

And that raises the question: What is human thought?

## 8 Staking Your Faith on Gaps in Empirical Knowledge

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=69>. It was finished and uploaded on 2007/02/16.]

*BrainWork* is a free newsletter distributed by *The Dana Foundation*, with a website at <http://www.dana.org>. This foundation is run by some of the most prominent neuroscientists, geneticists, and other biologists in the United States and—I believe—Canada. In the July-August, 2006 issue, there's an interesting article, *Out-of-body but in the Brain*.

The article tells us:

At every moment, the brain effortlessly integrates information from the body into a strong seamless sense of self. The proprioceptive system, for example, sends signals to the brain that allow you to know, without looking, where your hands, legs and feet are. The vestibular system in the inner ear relays information about your orientation to gravity. (Are you vertical, horizontal, or somewhere in between?)

The brain's synthesis of this and other information creates a sense of being inside your body. The out-of-body experience, in contrast, produces a sensation of consciousness floating upward, providing a view of the body from an elevated perspective. It results from a breakdown of the brain's ability to synthesize signals from the body.

It seems that near-death experience:

... involves a disruption of the sense of body integration, says Kevin Nelson, a neurologist at the University of Kentucky, but this disruption has a different cause. It involves rapid-eye movement (REM) sleep intruding into waking consciousness.

The final paragraph in the article reads:

Although recent research undercuts the notion that consciousness can exist apart from the body, it also demonstrates that consciousness is a tenuous creation of the brain. As Blake says, out-of-body experiences “show that the perception of our own body and self are prone to illusion.”

In my book *To See a World in a Grain of Sand* [41], I raised the claim that Christians should have enough confidence in the Creator to accept the results of empirical investigations, in history as well as biology or physics. If God created us as bodily creatures without a separable soul, what does that matter to us? Why would we settle such a matter independent of an investigation of man’s nature?

Too many people have staked their faith on beliefs which actually arose as speculative understandings of the best empirical knowledge of past centuries. Human speculation will often be seen as wrong, perhaps in the sense of incomplete or simplistic, in future ages. Much of the knowledge which fleshes out traditional Christian theologies is such speculation from past ages, based upon outmoded understandings of God’s Creation. Most Christians, and ex-Christians, seem incapable of recognizing the difference between the parts of their beliefs which are revealed truths and those parts which are speculative or even tied directly to empirical knowledge. As a result, many have lost their faith—especially in younger generations; surely, the Big Bang and all those bones in Africa prove the Bible is wrong. Not really, but they do prove that much of our inherited stock of speculative and empirical knowledge is wrong. Others have retained their faith by the bad strategy of either rejecting modern empirical knowledge or—more often—believing in both those bones in Africa and also in the literalistic interpretation of the story of Adam and Eve.

Given the great progress of empirical knowledge, in various fields of study and not just the physical and biological sciences, the opposition of many Christians to the best theories of the empirical world, including human nature, seems to put Christians in opposition to facts and plausible

theories. Those Christians seem to be in opposition to the truth. True it is that empirical investigation can only discover partial truths or even false truths about the physical universe. But, on the whole, empirical investigations point towards real truths about this physical universe and—in my terms—real truths about the world which is this physical universe understood in light of God's purposes in creating it. It even seems true that pure physical facts and theories might give us some clues to God's work as Creator, that is, His purposes in making this world.

There are not two truths and there is not your truth and my truth. Human beings either have souls separable from their bodies or they don't. Right now, there is growing evidence that the various events of the human mind and human soul, that is—soulish aspects of our physical natures, are tied directly to physical events in the brain. That shouldn't bother us Christians at all. We should move on, accepting the best empirical knowledge of our day and trying to understand it in light of the more important truths revealed to us in the Gospels of our Lord Jesus Christ.

## 9 Is the Concept of Original Sin Itself a Matter of Sinful Pride?

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=70>. It was finished and uploaded on 2007/02/17.]

So far as I can tell, the concept of *original sin* arose because St. Augustine of Hippo and some other important Fathers of the early Church were trained as lawyers. Moreover, the Hebrew Bible was the sacred works of a people who organized their lives by strict legal codes. Consequently, God was depicted as a Law-giver and Judge rather than as a Creator. This is an analogical depiction, as is true of all human efforts to depict God other than the existentialist view of St. Thomas Aquinas. That Dominican theologian would have been the last to deny the need for analogies once the existentialist insight is in place. The insight is: God is His own Act-of-being, the Supreme Act-of-being. All else that exists is the result of acts-of-being that only God can perform. Aquinas would have been the last to deny that analogies are necessary for human beings to try to understand God's self-revelations to us or to try to understand God in His freely chosen role as Creator. But we should be careful not to try to imprison the Almighty Himself in human analogies.

The concept of *original sin* builds on the pagan idea of a Golden Age in the past when all things, and the earth as a whole, were in a state of perfection. Moreover, they were at peace with each other.

So, why is the earth a place of struggle and decay? Why is the earth a place where things, or living creatures, come into being only to die after a short while?

The story of 'Original Sin' tries to answer those sorts of questions:

Clearly, there was a great fall. Since God is a generous and all-

merciful God, then the fall was not due due to His actions but rather to some great crime on the part of our ancestors, a rebellion against the Creator. Man's nature, once perfect in a creaturely sense—at peace with God and Creation, was injured beyond all possibilities of human repair. Most importantly, death came upon men.

All else being equal, this doesn't strike me as so implausible a viewpoint, except that it's in conflict with modern empirical knowledge. Man is not a fallen god-like creature but rather a hairless ape who shares a common ancestor with chimpanzees. Back beyond that ancestor, we share a common ancestor with rats.

Rather than being a fallen creature who needs a Judge Who will overlook the crime of his ancestor, a crime in which we all somehow shared, it seems man is inherently a rather modest creature whose natural fate is death. We're made to live for a few short decades and then to pass away.

There is a certain amount of pride some can feel in thinking of man as made for eternity but for a crime of his ancestor. Some enjoy thinking they are descended from Jesse James or Attila the Hun. The humble truth is that we are humble creatures and not much godlike or even perfect in a creaturely way—whatever that might mean. The possibility of resurrection, of life after death, of life for time without end as a companion of God, is the purest of gifts. Immortality isn't a lost property of man, it's something he never had and couldn't have had on his own.

Sometimes, talk about 'original sin' or 'depravity' reminds me of the Pharisee beating his chest in public. We would be gods, if only gods exiled to a penal colony. Forgiveness we'll accept but not the free gift that would raise a apish creature to a higher state of being, not the free gift that gives a peaceful life to a creature who is a battleground between order and disorder during his mortal life.

As a Catholic who aims to bare my soul in the Confessional once a month, I don't deny the reality of sins in the sense of acts or omissions for which I'm responsible, yet, if I were perfect, I would still not 'deserve' a resurrection from my grave. By God's commands, I feel bound to aim for perfection, for sinlessness, but that's simply my duty to my Creator. I would have the same duty even if He had not sent His Son to be the first of the resurrected.

We shouldn't think of our human selves in prideful terms as descendants of a god-like man and woman who fell by their own acts. In fact, I don't think a fresh reading of the book of Genesis would support such a view. We're apes and should be surprised and grateful that God would even consider giving us characteristics that will have to be super-added to our mortal selves.

## 10 An Ugly Retreat

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=84>. It was finished and uploaded on 2007/03/19.]

Even an armchair historian can tell you that a good general prepares for his retreat as soon as he sees the need for it. He tries to arrange an orderly retreat to minimize casualties and loss of equipment and other materiel. He knows not to try to hold ground which is indefensible, being well aware of examples from history of painful retreats such as that of Napoleon's retreat across the frozen plains of western Russia. Many young men from France and Austria and other countries were left on those frozen plains.

Christians, including Catholics, have been retreating in this way, but it's still worse than it was with Napoleon's retreat—it's not bodies being killed but rather minds and souls and moral characters. The thrusts of the enemy at the beliefs of Christians have often been horribly effective because servants of false gods have been more true to at least the physical aspects of this universe, this phase of God's Creation, more true than the servants of the Church of Christ. And if we Christians are not true to verifiable physical facts, who will listen to our talk of a resurrected Christ who was true God and true man?

Once it was plausible to see almost all movement as being due to living creatures, including movements in the direction of corruption and decay. Angels or gods moved the planets. Demons invaded human bodies and caused diseases of body and spirit. God wasn't properly viewed as the Creator who could energize the universe without these various spirits, whether labeled as 'angels' or 'nymphs' or 'gods'. In a word, God was seen as a bit less than all-powerful. He was a secondary cause who had to use tools rather than being a primary cause or Creator.

We've defeated small-pox—so long as remaining stocks of the virus don't

escape from a laboratory. We put a man on the moon and could do so again in five years or less if we were willing to commit the funds. We've seen the beginning of the expansion of this universe, before the birth of the stars themselves, and we've seen deep inside the atom. We've seen deep into the human brain as well and also traced hormonal flows—tying human mental and emotional phenomena to specific physical events in our bodies. And yet the drama of human salvation is still taught as if we have some sort of soul which is separable from our bodies. The skeptics can point to facts which show that it's unlikely we have souls made of stuff independent from our flesh and our blood.

Other facts indicate strongly that the common ancestors of all human beings were apish creatures who lived about 70,000 years ago. They were human but they weren't inherently capable of either abstract moral reasoning or abstract theological reasoning. We now know, partly from some horrible cases of child abuse, that we modern human beings develop even basic language skills only when they're nurtured by those who already have those skills. The development of more complex and abstract words and concepts must have taken tens of thousands of years.

When we Christians have tried to stick to stories proven wrong, how can we have any credibility with our children or others when we speak of the Son of God taking on human flesh to become our brother? Yes, most Christians have more recently and very reluctantly accepted the interesting and difficult facts about the evolution of *homo sapiens* and our close relatedness to chimpanzees and gorillas, our more distant relatedness to rats and toads. Even though we've formally accepted the truth of biological evolution, we insist on speaking of that all-important drama of salvation in terms given us by earlier thinkers who conjectured that human beings had been created in a state of creaturely perfection, a state of grace. Those wonderful beings, so god-like, had fallen from grace during the first generation.

Disciplined empirical investigation has greatly advanced our possibilities of understanding God's Creation. True faith leads to understanding and that implies that we don't have a true faith because we've not developed an understanding of God's world, a world which turns out to be different from what was assumed by those who set Christ's story in specific understandings of this world created by God. The Gospel is the Gospel but we men can't even understand why Christ died on the cross unless we understand our natures and what it is that He had to do to redeem us. From a simplistic viewpoint, this is all that needs to be changed: we need to see Christ

as offering a chance for true Life when we, and our ancestors, had never had any such chance. He wasn't offering to restore us to a life as God's companions. He was offering it for the first time. I don't think God would have waited so long to send His Son, wouldn't have endangered so many souls, if human beings would have been ready for Christ at an earlier time.

We Christians are moving too slowly in this matter. We need to make it a priority to update our telling of the story which is God's world, a story which exists for the sake of the one chapter which tells of Jesus Christ but that chapter must be set inside a human narrative which speaks of human history but also of other creatures, living and non-living. We've kept the old stories even as they decayed into superstitions and tales of magic. This was dangerous. We live in lands where impious skeptics dominate the entertainment industry and the schools. Those same sorts of skeptics are fairly prominent in science and literature. They're taking advantage of the situation. There's no reason to give them any such weapons to use against us and our children. The God of Jesus Christ created this world and still creates it each and every instant. We simply need to have faith that it all makes sense and makes sense together with the Gospel.

It's not sufficient to say the Bible is true and those bones dug out of the sands of Africa are also true. There is one truth and that truth lies beyond our perceptions and our capacity to understand, but we're to do the best we can—that's part of our efforts to imitate God. God tells the story which is this world in the strongest possible sense—His telling of the story is one with His acts of creating the world. We do our best to tell some version of that story in the way of children imitating their human father as he goes about his work.

We need to speak a story in imitation of the story which is God's actual work of creating this world. To do this, we need to be as true as possible to the story God is telling and not to some ancient versions of the story which are no longer true to what is known of the world. God has spoken the most important of His revelations to us in Holy Scripture but He's also spoken through those bones dug out of the sands of Africa. We need a story which speaks of both the incarnate Son of God and those bones. Let's be bluntly honest: we need to explain why the Son of God took on the flesh of an ape.

We're fighting a bloody retreat because we've been fighting the wrong battle for centuries. Thinking we were fighting to save souls, we were engaged in a battle against God's own Creation and our only allies were mythical creatures and magical incantations. Even C.S. Lewis, who was

a giant in moral thinking and in explaining the basic truths of the creeds of Christianity, was trying to rally the troops to fight alongside angels and elves. He imagined himself to be fighting Satan but he was fighting God's world and fighting also those human beings trying to understand the physical aspects of this universe. Even those scientists who were nasty sorts of skeptics were carrying out the divinely ordained task of understanding God's Creation—and many scientists have been, and still are, pious men and women, whether or not believers in Christian truths. Far too many Christians have been fighting against God Himself. Unfortunately, many saw, in empirical terms, the uselessness of this war and stopped being Christians—though sometimes still attending some sort of worship service and maybe even wearing clerical robes or collars.

It's God who shaped us from apish flesh and God who created a universe where there are hurricanes and volcanoes and small-pox. It's God who created a world where there are levels of reality which don't behave according to the brilliant, and still valuable, misconceptions which are our heritage from earlier generations of scientists and philosophers and theologians. Unfortunately, we'd rather accept ancient stories than deal with modern empirical knowledge. And it's not easy to deal with modern empirical knowledge. It takes the sort of discipline which comes only with years of effort to deal properly with modern science and mathematics and history and philosophy. Not every Christian should or could make this effort but it's bothersome that so many smart young men are steered towards the ancient stories if they show any talent or inclination for leadership in the Church. We need some to follow the path of Father Georges Lemaitre, the Belgian priest who was a co-discoverer of the so-called Big Bang model of the universe. Still more than that, we simply need some priests, and a multitude of teachers, who are literate in modern science and mathematics and in some branches of modern philosophy.

Modern scientists and historians and philosophers may sometimes bear despicable attitudes—but so do some believers, including some priests. The best of empirical thinkers are highly disciplined thinkers, better followers of Aquinas in a sense than the many theologians and priests who glorify him without having a clue about the depth of that great saint's commitment to honoring empirical knowledge.

We've made great progress against disease by recognizing that it's caused, typically, by microbes which are part of God's world as much as we are. We're starting to make great progress against natural disaster by

sending planes through developing hurricanes, by building super-computers which can model those hurricanes, sometimes accurately. We need to update the story of human salvation because that will force us to be honest about the most important role of human beings in God's story—we need to actively take moral responsibility for our own selves and for the nurturing of our children. But we're descended from creatures who had to struggle to survive and we have a tendency to relax when possible and we readily cede our moral responsibilities to our employers and our governments. Far too many will then blame Satan when those morally unguided human organizations begin to exploit and corrupt us or our children.

If we wish to understand disease, we should listen to doctors and evolutionary theorists. If we wish to understand natural disasters, we should listen to the geophysicists and oceanographers. If we wish to understand the moral problems of our days, our social decay and our political disasters, we should listen to the reliable historians and also scientists such as neurobiologists. Neither Satan nor St. Michael make sense in terms of modern empirical knowledge, nor would they play much of a role if they did exist. All that's necessary to understand Auschwitz is what the Jewish philosopher Hannah Arendt told us: the Nazi programs worked because nice, middle-class Germans were willing to man the bureaucracies and the chemical plants, to build the railroad lines into Poland, so long as they didn't have to actually kill anyone. They were willing to cede their moral responsibility to Hitler and his henchmen in order to keep their paychecks and their benefits. More recently, Robert McNamara has spoken in similar terms of the bureaucrats who ran the war in Vietnam even after the facts were accumulating that it had become a criminal war waged against the people we were supposedly there to defend. These sad situations are illustrations of the evil possibilities in what Adam Smith labeled *the Invisible Hand*.

We need to nurture a new generation of philosophers and theologians who are broadly educated in modern empirical knowledge, including modern mathematics which has proven to be far richer than the mathematics which has been a basic part of the foundation of human thought since at least Pythagoras. Maybe some of them could be specialists as was Fr. Lemaitre, but that's not necessary. Aquinas didn't have the specialized scientific knowledge of his master, St. Albert the Great, but he learned enough that there is even a leading neurobiologist who thinks Aquinas to be the best philosopher for understanding modern science. Aquinas simply paid

attention to God's world rather than trying to impose angels and demons upon it, nor did he try to impose *a priori* criteria in the manner of Kant. We need to understand the world which God created, we need to understand the new possibilities and dangers of huge human organizations, if we are to understand Auschwitz and Vietnam and our various ecological crises. We also need to understand them to learn how we can create new forms of communities in which flesh-and-blood human beings can lead good lives. We even need to learn what a good life is in the context of a human race so powerful, wealthy, and populous by any earlier standards.

The belief in Satan and St. Michael is quite useful to the human forces of evil in our age. We'll happily cede our moral responsibilities to our corporate employers and our governments, sure that any evil which occurs is due to that fallen angel, sure that St. Michael will protect us in the end.

To properly disengage from this useless war against God's own world, we need to have priests and teachers who know enough to have an appreciation for God's world. We need to inspire Christian youth to become neurobiologists and oceanographers while retaining their faith. That will happen only if those better-educated priests and teachers appear. Until then, we Christians will be little more than sheep wandering around in company with our shepherds who don't understand God's world any better than we do.

The truth, so sad under the circumstances, is that no war should have been fought. There should have been no retreat in which souls were lost even more than bodies. We were not holding indefensible land. We were standing on holy ground, land given to all creatures of earth, but given in a special way to those who belong to the Lord Jesus Christ. The enemy has been retreating from that holy ground along with us because the enemy is us.

# 11 Engaging the Thought of Pope Benedict XVI

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=122>. It was finished and uploaded on 2007/12/18.]

In his first encyclical and in his book *Jesus of Nazareth*, Benedict has invited criticism of those parts of his thought which deal with speculative thoughts, including the nature of the human being. What is a speculative thought? Roughly speaking, it's the result of an act of the imagination, a faculty stunted and deformed in modern men, scholars and authors and musicians and politicians, butchers and bakers and candlestick-makers.

I should make a few preliminary statements about this entry and some upcoming entries on the thought of Pope Benedict. First, I don't feel qualified to criticize his theological thought as such. For what it's worth, I greatly admire his theological work. He has a rare ability to appreciate tradition without being rigidly bound to the speculative aspects of tradition. I do feel qualified and willing to criticize the foundations of his theological thought and any speculative (philosophical) thought which appears in his work from the viewpoint of empirical knowledge. And there is much speculation and empirical knowledge to be found in any system of human thought, even a system dealing with aspects of God in His transcendence. Speculative knowledge of the form called 'metaphysics' is a lesser sort of knowledge than revealed truths and less necessary in its truth content than those revealed truths but it's the glue that holds together that system.

Moreover, as I've argued in Chapter 69, Hellenistic metaphysics grew up in parallel to Hellenistic mathematics. Our understanding of mathematics has expanded greatly in recent centuries, including our understanding of such metaphysical concepts as infinity and randomness—which now seems

to be a sort of very raw fact rather than some number or event coming out of a process mysterious to even God. The truths we've inherited from Pythagoras and Plato and Aristotle are still truths, but they now seem to be possibilities in far greater realms of truth, just as Euclidean geometry is one set of 'realized' truths in a far greater realm of possible geometries.

Pope Benedict XVI seems to be ill-served by his advisers and conversation partners in the areas of empirical knowledge (at least in mathematics and biology and physics) and speculative knowledge. I'll speak of this in a later entry where I'll deal with some issues of randomness and chaos.

At this time, I'll note that Etienne Gilson once claimed of St. Augustine of Hippo, arguably the greatest of all Christian theologians: he was a great theologian despite having an inadequate metaphysics. Because of his inadequate understanding of modern empirical knowledge and of modern mathematics—empirical and speculative, because of the consequent inadequacy of some parts of his metaphysics, Pope Benedict is in danger of earning a similar epitaph: an important and very good theologian despite having an inadequate metaphysics and an inadequate understanding of the empirical knowledge of his day.

In any case, we can notice that Pope Benedict's first encyclical began with a section dealing with speculative matters, including the human soul. The Holy Father is quite aware that we have a problem in the confusion of revealed truth and other sorts of knowledge and seems open-minded about seeking a solution. He wants to actively tell his admirers and others that speculations, even from popes in the context of an encyclical or from a saint in the context of his greatest writings, are still human thoughts and open to criticism.

Pope Benedict has done a lot to clean up Christian theology, to restate traditional Catholic theology in particular so that his books illuminate rather than clouding and obscuring as do so many older books when read through modern eyes. Along this line, I've noticed in conversations with intelligent Catholics who've read the works of St. Augustine, say *The City of God*, that they read books of substantial human thought as if through a dark glass. Able to recognize words and to scan many pages of text, they seem to have little background knowledge of the history of human thought and other fields, only rudimentary skills of understanding thought which stretches much beyond a single sentence, and little ability to distinguish between revealed truths, empirical knowledge, and speculative knowledge. Those readers will scan a number of pages on which a high level of specula-

tive human genius and the best of the empirical knowledge (of circa 400AD) is applied to the task of understanding, for example, the story of Adam and Eve. And those readers will miss the contingent elements on those pages, taking the conclusion as if a revealed truth, or—more accurately—the clear and only intelligible understanding of that story. That particular story, read with a fresh mind, seems to be dealing with an awakening from animal lack of self-awareness rather than a fall from grace as a modern Christian would understand such an event.

Modern theologians and philosophers are not so easy to deal with. They are as bereft of imagination and as institutionalized to the needs of bureaucracies as much as any insurance claims-processing clerk or corporate marketing executive. And, yet, every moral theologian feels he must be creative, whatever he might mean by ‘creative’. This has led to the apparent production of one heresy after another in some circles, even when those circles are made up of men who are Catholic or Protestant clerics formed in respectable seminaries. I say “apparent production” only because the body of modern heretics is composed of two groups:

1. Those like Fr. Hans Kung of whom we can apply a statement that the physicist Wolfgang Pauli once made after a presentation by a fellow scientist: “He’s not right but he’s not even wrong.” [As is often the case, I quote from memory.] I read one of Kung’s tomes once and didn’t have a clue what he was talking about. His expressed thoughts have not enough coherence to be considered right or wrong.
2. There are also those like the modernists condemned by Pius X and others. There was a certain coherence to much of the proclaimed thought of the true modernists but they did nothing more than discover ideas raised by the heresiarchs of the early centuries of the Church and convincingly denied by the likes of St. Irenaeus, St. Athanasius, and St. John Chrysostom—within the context of the Christian community. [But we should remember that Jaroslav Pelikan, the great historian of Christian thought, once said that St. Augustine was the father of both orthodox and heretical Christian theology in the West. We should also remember that the heretics were sometimes important and creative thinkers who raised the important questions and forced more orthodox thinkers to a deeper understand-

ing of the Bible and the creeds and the liturgy and prayers of the Church.]

We don't yet understand God's Creation and thus don't fully understand our relationship to our Creator or even the relationship of God in His role as Creator to God in His fullness and transcendence. We were given the task of exploring this world, in its physical aspects and in its aspects that can only be seen when we try to apply revelation to understand the goals to which God is moving the world. It takes some creativity to do such work. In past centuries, men such as St. Augustine of Hippo and St. Thomas Aquinas showed us how to go about those tasks and gave us plausible systems of thought which worked well within the context of the speculative and empirical knowledge of their times. Unfortunately, the vast expansion of modern knowledge has forced us to return to drawing board and modern thinkers have shown little sign of the creativity to redo this important task.

One problem in an age of excessive specialization is the loss of the big picture. By saying this, I'm not recommending that everyone become a creative, big-picture theologian or philosopher. I am saying that we should attend to the larger scope of any theological or philosophical or exegetical task. Let's take a couple of points raised by Pope Benedict XVI in his book, *Jesus of Nazareth*:

1. We shouldn't read any part of the Bible out of the context of the entirety of that book. Without Moses and Elijah, without the Davidic Kingdom and Temple worship, the words and life of Jesus can't be understood. The interested reader can find good reasons for this in *Jesus of Nazareth* but the major one is that Jesus Christ is the Word of God, the Torah and also the rest of Holy Scripture.
2. We should remember that the Son of God incarnated Himself in a specific place at a specific time and as a member of a specific people. Jesus of Nazareth was a devout Jew who was a descendant of Abraham and Elijah, David and Jeremiah, even if He was also their Creator. His words were spoken in the context of such a concrete-minded people of very specific beliefs and practices.

There is another aspect to Pope Benedict's thought which appeals greatly to me, partly because I hold a similar view but I came to it by

a dramatically different path. He realizes that even with Christ Himself, what's most important is His relationship to the Father. In my work which has concentrated on Creation, I've conjectured that relationships create substance, relationships shape things and living creatures. There is obviously a great truth underlying this sort of a view. The real question is whether it's the best and most fruitful way to speak. (See Chapter 156, for a short and early discussion of this speculation.)

I'll now confess to something: I learned my Catholic theology from reading books by Pope Benedict or thinkers tied closely to him. This is odd in a way since my faith in God's Creation and my common-sense acceptance of empirical knowledge were influenced strongly by his thoughts and yet I seem to be more accepting than those thinkers of that knowledge which comes from human exploration of Creation.

## 12 The Metaphysics of Position, Momentum, and Missed Field-goals

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=125>. It was finished and uploaded on 2008/01/01.]

After discussing a use of Heisenberg's Uncertainty Principle to understand the results of experiments in the fairly straightforward case of the polarization of light-waves and of individual photons, Alastair Rae speculates:

[If] we understood properly what the concepts of position and momentum mean on an atomic scale we might find it... illogical to possess definite values of these quantities simultaneously. [120]

The point to be made is more general and can be more understandable in light of one of the biggest errors that history records on the part of a brilliant thinker: Kant tried to turn his understanding of Newtonian dynamics into a metaphysically necessary system. In fact, Kant died thinking he'd succeeded in presenting physical reality as necessarily existing in a Euclidean three-space with an absolute and uniformly moving time dimension.

Einstein knew better not because of metaphysical reasoning but rather because he knew the literature of important experiments and he had a deep understanding of Maxwell's work on electromagnetism. To cut to the chase, Einstein speculated that our physical environment seems to be a four-space with three dimensions of space and one of time and found he could develop a new dynamics (special relativity) which was consistent

with Maxwell's equations. (Time retains its own properties as do the spatial dimensions, but they can bend each other in various sorts of interactions that can't be explained so much as accepted as raw facts of how things are.) Over a period of years, by way of hard work and with the help of a mathematician friend who helped him learn differential geometry and tensor calculus from research papers, Einstein also restated gravitational theory to include his understanding of spacetime and his belief that a gravitational field is impossible to distinguish by way of experiment from an accelerated frame of reference. This means that, if you're in a sealed box, you can determine if it's accelerating but you can't tell if you are in an elevator in free-fall or a box being accelerated through space by a smoothly operating rocket.

Einstein's gravitational theory would eventually lead to an understanding that matter shapes the four-dimensional spacetime, even creating spacetime in a sense by stretching it out. The American physicist John Wheeler told us that matter shapes space which then tells matter how to move.

We probably don't have the best possible understanding of these matters but we have more understanding than in those centuries without radio telescopes, those centuries during the slow maturing process of mathematics.

Philosophers, theologians, and other thinkers don't make the best possible use of our modern empirical knowledge because they refuse to remember what Aquinas told us: metaphysics uses the specific sciences. This isn't a purely instrumental 'uses' but rather a fundamental interaction. Metaphysics truly is what its name implies: an abstraction from our empirical knowledge of physical reality, including the mathematics we develop as we explore that reality. Metaphysics isn't just an ivory-tower activity which is done independently of empirical reality and then applied to judge that reality. It's our way of creating a language, including the words for complex concepts, that we might talk about reality.

God is multi-lingual. When He works to shape this universe and to tell the story I call a world, he speaks the languages of quantum physics and chemistry and chaos theory and biological evolution – including moral evolution. When God creates from nothing, creating the basic stuff of this world and the world of the resurrected, He speaks the languages of transfinite set-theory and algorithmic complexity theory and metaphysics. Don't take these analogies too seriously—they won't bear up under much weight, but I do intend to point the reader towards a new view of the

relationships between this universe and the more abstract foundation of Creation which I call the Primordial Universe. I intend to point towards a new view of the relationships between different fields of knowledge as well.

But not entirely new. Alastair Rae seems to have some substantial understanding of the possibilities. In my way of thinking, thing-like reality is shaped from more basic levels of reality. Speaking very vaguely: the various elements of this universe must be derived in some sense from the elements of the Primordial Universe, but that doesn't tell us immediately what those elements are or even what sorts of entities they might be. The underlying stuff of our thing-like universe are abstract and the difficulties in quantum mechanics come from our inability to understand how this abstract and well-determined stuff collapses to the concrete stuff of this universe, concrete stuff which seems to have some freedom not found in the underlying stuff. If we are to understand that underlying stuff, the truths God manifested as the foundations of Creation, we must study those levels and aspects of Creation which we can and explore and analyze. We must understand the more contingent levels of created being to be able to generalize to the more abstract levels.

Position and momentum aren't metaphysically necessary parameters and aren't even necessary—so far as we know—at the level at which quantum effects occur. At the same time, there is something corresponding to position which shows up when we try to measure position but in such a way as to destroy the possibility of measuring something corresponding to momentum at the same time. A crude analogy: when we look at copper ore, we shouldn't expect to find all the attributes of finished copper piping and valves. When we look at the more raw components of created being, we shouldn't expect to find all the aspects or attributes which exist at the level of this concrete realm of rocks and rats and robots.

We live in exciting times and the open possibilities for human thought and action have unsettled us a little more in these turbulent times, these times when much is being destroyed in one way or another and the new societies and political structures are but dream-like and nightmarish possibilities.

Modern man has piled up mountains of as-yet undigested empirical facts and theories. Many of these facts and theories are very disturbing, casting in doubt our post-Kantian intuitions that the sort of time and space that we experience are necessary foundations of any sort of reality, casting in doubt our traditional understandings of what numbers are and what logic

is, casting in doubt our belief that there is an infinite chasm of sorts between us and other sorts of animals, casting in doubt much that gave us the illusion that we understood God's Creation in certain important ways.

We need to show the courage and creativity appropriate to our opportunities to gain richer understandings of our human selves and our world. As it is, many Christian leaders and scholars seem determined to see these opportunities only as problems, refusing to do their duty to lead their flocks towards good pastures because of the rocky trails that lie between us and those green meadows.

# 13 Einstein and Bohr: Don't tell God what to do!

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=126>. It was finished and uploaded on 2008/01/01.]

Alastair Rae adds a wrinkle to a famous comment by Einstein:

When Einstein said that “God does not play dice”, Bohr is said to have replied, “Don't tell God what to do!” [120]

He notes that there's some doubt as to the 'historical accuracy' of this exchange, but there's an important point to be raised about Bohr's response. I don't know that Bohr was much more disciplined in his metaphysical thought than Einstein was, but Bohr seems more clearheaded than Einstein in metaphysical matters, at least from a Thomistic viewpoint. St. Thomas told us that metaphysics uses the specific sciences, and that would certainly include the most fundamental of physical sciences—physics.

Metaphysics uses the specific sciences, not slavishly as Kant did with Newtonian dynamics. It was Kant, and not Newton, who derived a metaphysical system founded upon the parameters and operational principles of Newtonian dynamics and the absolute time and space in which that dynamics was set.

Metaphysics uses the specific sciences to discipline itself to reality. When a philosopher or anyone else tries to understand reality using too many *a priori* principles, he's essentially trying to impose his speculations upon reality. The proper use of knowledge from the specific sciences will supply the dose of reality which fights against this wrongful human tendency.

“Don’t tell God what to do!” Wise words though there might be some doubt whether Bohr actually said them and much doubt as to whether he would have understood the full significance of that advice.

Listen to God. Listen to His direct words in the Bible and pay close attention to the Story and the stories He tells in that Holy Work. Listen to God in the traditional worship and prayer practices of His Church. Listen to God in your experiences of His world and in the results of hard thought and contemplation and empirical research as recorded in the best works of men.

Don’t tell God what to do, listen to Him when He speaks in the Bible and when He speaks in the experiments and theories of the quantum physics. Listen to Him even in that story which is your own life.

## 14 Theory of Knowledge

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=128>. It was finished and uploaded on 2008/01/11.]

Pope Benedict has an appropriate respect for the human mind and its products, cultural and intellectual and spiritual. Yet, there's a big gap in his thought that could be filled only by a proper appreciation for modern empirical knowledge, including in a very explicit way the problem areas of mathematics, physics, and evolutionary biology. I also question if he's being given good information about some of these areas, such as evolutionary theory and chaos theory—both of which he seemed to dismiss as sources of any sort of truth in *Jesus of Nazareth*, his first book of a series on the Lord Jesus Christ. But the real problem is the fundamental gap in his thought about human knowledge: he speaks openly and carefully of speculative knowledge and revealed knowledge (or truths) but doesn't seem to have an explicit view of how empirical knowledge fits in to the total picture.

In many of my writings, I'm primarily interested in creatively viewing God's Creation, viewing it as clearly as possible given our stock of knowledge, revealed knowledge and speculative knowledge (such as metaphysics) and empirical knowledge (separated in one of my books [43] into scientific and practical). Pope Benedict doesn't seem to take seriously enough the work of empirical thinkers who work in the domain of physics and mathematics and evolutionary biology and other such-like sciences, but this might simply be a problem of not having a way of relating the results of those fields of study to revealed and speculative knowledge.

Aquinas told us that metaphysics uses the specific sciences. I've gone beyond that, noting that Hellenistic metaphysics was a Siamese twin of Hellenistic mathematics. Our idea of what mathematics is has expanded greatly, implying that we should expand our ideas of what metaphysics is

in a parallel way. (See Chapter 69 for a discussion I posted after Pope Benedict's well-publicized speech at Regensburg.) In an argument that a couple thinkers found fascinating (one well-known mathematician and one theologian), I used modern understandings of randomness as being a high level of algorithmic complexity—factuality—to argue that only God could make a random number, only God could act in a random way, a truly personal way. I leave it to the reader to draw the meanings of this way of thought, perhaps by exploring my posts at my major website, *Acts of Being* [38], or in my first published book *To See a World in a Grain of Sand* [41].

There's more too it than that, such as the realization that modern physics points to the likelihood, at least as I see matters, that physical matter and energy and fields are shaped from a strange stuff that is almost abstract, almost a ghostly manifestation of mathematical truths and metaphysical truths and 'arbitrary' facts. Speaking somewhat poetically, matter is frozen soul-stuff.

For the current discussion, the point is simple and clear: modern mathematics and physics point to richer possibilities for metaphysical understandings of created being. In addition, the shaping processes which turn that abstract stuff into thing-like matter are more a narrative than a tinker-toy construction using pre-formed components. In terms of Hellenistic metaphysics, this implies that the *Timaeus*, the only dialog Plato wrote to deal directly with the God and His creative acts, needs to be used as a strong corrective to the more prosaic, and pantheistic, views of Aristotle as well as Plato's more 'philosophical' dialogs in which matter and human souls seemed more god-like than the gods and the God seemed much in the background. Aquinas, of course, had the Bible as a corrective to his use of Aristotle, a use which Etienne Gilson thought to be a complete reshaping of Aristotle's thought. It's also interesting to note that Plato the religious believer denied that any creature, human soul or god, could be immortal but only the God, the Father and Creator of all.<sup>1</sup>

Though many Christians who fret over empirical knowledge are mostly worried about evolutionary biology, it's actually a trivial intellectual maneuver to talk even about the evolution of moral nature once the basic story

---

<sup>1</sup>I have subsequently learned that some scholars think that Plato, when speaking of the immortal human soul, was referring to an entity which existed at the level of Man, the entire human race and had no connection to an individual human being.

of the physical universe is in place, a universe shaped from some strange stuff, manifested truths, into thing-like being.

We Christians need to pay close attention and give proper respect to all sorts of human knowledge. In a book I've published on the Internet for free download, *Four Kinds of Knowledge* [43], I classified (true) human knowledge into four categories: revealed truths, speculative knowledge, 'scientific' empirical knowledge, and practical empirical knowledge. I went on to claim that this is a division made necessary by our creaturely perspective. Ultimately, there are only two sorts of knowledge: that of God in His necessary and transcendent Being and that of God in His chosen role of Creator making contingent decisions about the stuff and events of created reality. And that leads to an understanding of the importance of physics which is not the study of some sort of neutral stuff upon which the drama of salvation will take place. The basic stuff of our universe, including energy and fields as well as matter, is an active part of that drama. Again, I recommend the interested reader explore the posts at one of my websites, *Acts of Being* found at <http://loydfueston.com/>, or read my first published book *To See a World in a Grain of Sand* [41].

My philosophical and theological writings aren't always easy to read but this is because I eschew the textbook style and also the modern rules about separation of different 'realms' of knowledge. Believing that many of our wrongful views of even mathematics and physics are due to our moral problems, I'll intertwine discussions of moral issues and the birth and development of stars.

Our empirical knowledge tells us how it is that we receive and understand even revealed truths. We have no truth-organs in our bodies upon which God stamps those truths. We have brains which, ideally, shape themselves to encapsulate our environments (which we can pray to include a morally well-ordered human society), the universe as a whole if things go well, and God's world (the universe seen in light of God's purposes) if things go very well. From there, we can even move on, by way of mathematics and metaphysics and revealed truths, to an understanding of Creation as a whole – including the world where the resurrected live for time without end with the Lord Jesus Christ. Not only is our speculative knowledge and our stock of revealed truths mediated in the human body through mundane things such as brain-cells and hormones, but our understanding of speculative possibilities and our understanding of revealed truths can be enriched by a better understanding of empirical knowledge, knowledge of God's uni-

verse, knowledge of some of the decisions God made in shaping the raw stuff of Creation into the thing-like stuff of this world.

To complete his system of thought, Pope Benedict, perhaps along with a co-worker, needs to consider empirical knowledge in addition to revealed truths and speculative knowledge.

# 15 Priests, Ministers, Monkeys, and Truth

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=121>. It was finished and uploaded on 2008/01/12.]

Here's another statement of my goals in my writing:

I'm trying to build a vocabulary and stock of concepts that would allow Christians to speak truthfully to the greatest extent allowed by our current stock of knowledge (early in the 21st century).

Recently, I heard a homily by a new priest. While wishing to remain respectful of a man with some very good qualities, I have to say I was horrified at the way he dealt with a situation. He was speaking of a young girl who came to him and announced sadly, "Somebody told me we're descended from monkeys and that means we're no good," words to that effect. His response, as far as I understood his incoherence at that point, was to tell her she wasn't descended from monkeys.

I could have been listening to a fundamentalist preacher who'd stepped out of the pages of a Flannery O'Connor novel. That's not all bad. One of the points she was making in her novels was: those fundamentalist preachers had remembered some truths (such as the all-encompassing demands of faith) which had been forgotten by more liberal clergymen as well as by the skeptics of our age. Admitting that, I'd say that a Catholic priest should be educated well enough to realize that we are descended from monkeys (and also to know that St. Augustine admitted the possibility of a descent from some non-human species back in *The City of God*, 1400 years before the birth of Darwin). It's the duty of a faithful clergyman, Protestant

or Catholic, to deal truthfully and openly with the world as God made and then to give a reason why that doesn't affect our faith or our moral principles, not to deny the world as it presents itself to us.

If the best a clergyman can do in defending human morality is to sneer unintelligently at the idea that we're descended from monkeys, then he shouldn't be in the pulpit. Over the course of her life, that girl will realize she does share a common ancestor with monkeys and, assuming that she does no better in finding an intelligent Christian understanding of the human condition, she'll see a straightforward scientific fact as being in conflict with her worth as a human being and perhaps in conflict with her faith. She might even realize that our modern medical technology was developed by research that assumes we're members of the animal kingdom, descended from 'monkeys' and metabolically very similar to pigs in important ways. She'll see Christian clergymen who have no intelligent way to speak about human nature go into the hospital to take advantage of all that technology which assumes we're—yes—descended from monkeys.

At the same time that I see a deep problem here, I can understand why the typical clergyman has neither the time nor the talent for the particular task of engaging in large and eclectic readings and then interpreting a vast body of human knowledge from the viewpoint of a Christian. What I can't understand is why so few of those clergymen have good enough instincts to realize there's a problem. The skeptics and atheists are winning the battle of the minds to a greater extent than some realize and they're winning partly because of the intellectual incompetence of Christian clergymen who haven't clue how to deal with modern science from the viewpoint of Christianity. So, they sneer at the idea that we're descended from monkeys and they continue to talk as if Adam and Eve literally existed. Those who then admit to the truth of biological evolution make the weakness of their positions all the more obvious.

If it's really necessary for either Catholic Church or the various other Christian churches to ordain men who have poorly developed minds, for whatever reason, those men should at least have better scripts to read from. More importantly, neither the ordinary church-goer nor the children in formation should have to live in two domains of truth, one which he or she leaves behind when walking out of church at 11:00 on Sunday morning, that same one which is left behind even by those priests and ministers when they walk into a hospital.

# 16 Walling Off Our Christian Beliefs

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=129>. It was finished and uploaded on 2008/01/18.]

I'm puzzled by those who think we can be Christians without having a way to think of God's Creation on its own terms but from a Christian viewpoint. They worship and then move back into a society more skeptical than pagan. The big problem is that we modern men have piled up huge mountains of empirical facts, some of those mountains being put in the context of greater maps, but not from the viewpoint of Christian believers.

Many have retreated, perhaps from personal preference, to magical views of reality. Despite the recent claim by a Cardinal of the Catholic Church that C.S. Lewis and J.R.R. Tolkien taught that magic leads to evil, their books were filled with good wizards and evil wizards. Magic, in their view, is like anything else in that it can lead to evil, but—far more importantly—they taught that magic is a fundamental part of the world in which we live. Magic is a way of – supposedly—making things behave according to our desires or needs, good or evil. Unfortunately for those who hold to that viewpoint, magic is false to what we now know of the workings of this world. When there's a conflict between verifiable knowledge of God's world and the preferences of C.S. Lewis and J.R.R. Tolkien, I'll go with that verifiable knowledge.

Before all else, a Christian has to be honest. Certainly, he has to be honest in perceiving the world God did create rather than some world we might prefer. He also has to be honest in trying to make sense of that world, first on its own empirical terms and then in the light of revealed truths.

When we allow non-Christians or even Christians in their secular roles

to have a monopoly on interpreting modern empirical knowledge, we let them shape our minds and the minds of our children for most of our hours and in most of our activities. Our Christian beliefs retreat into a ghetto of sorts inside our own minds. (See my novel *A Man for Every Purpose* [37] for a tongue-in-cheek treatment of our modern ability to build walls between different ‘parts’ of our own selves.)

We modern Christians live in two realms of truth, a realm of Christian truths for a few hours a week and a realm of knowledge interpreted in non-Christian or anti-Christian ways for the remainder of our hours. This situation will erode our faith and that of the children we drag along behind us. Most adults and children will decide, “Why bother?”

Why bother? Indeed. As matters stand, my qualified sympathies go with those who’ve decided it isn’t worth getting out of bed to attend Mass or Protestant services. They’re willing to make a break with an unjustified habit when they’ve got other, more important things to do.

In our modern situation, for which we and our parents are largely to blame, we need strong and positive reasons to remain Christians and a listing of doctrine isn’t going to do it when we see reality in non-Christian or anti-Christian terms. We need to be able to perceive this physical realm as being truly and fully part of the Creation of the God of Jesus Christ. We need well-formed minds and sane imaginations. We need to consider modern empirical knowledge, the history of the Holocaust and of modern warfare as well as quantum mechanics and genetics, and revealed truths. We need to use our minds and imaginations to see this as all one body of truth, most plausibly by extending the story of salvation in the Bible outwards to the entire world, backwards to the so-called Big Bang, and forwards to the end of this universe which is more likely to be a whimpering heat death than a fiery confrontation between angels and demons.

Some are searching for the reasons that so many are leaving Christianity and are getting no help from Christian leaders and teachers, intellectuals and novelists. Christianity is a faith in which witnesses go out and catch the attention of God’s lost children so that their attention might be directed to the lamb. And there are still some being brought to Christ though the evangelists and preachers, the teachers and writers, no longer have a coherent account of this world and no strong argument that it belongs to the God of Jesus Christ.

# 17 The Poetics of Quantum Mechanics

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=130>. It was finished and uploaded on 2008/01/25.]

I'm currently reading *The Principles of Quantum Mechanics* by P.A.M. Dirac, though I'm missing more than I'm getting. With a weak educational background and a lack of toughness to dig in, I'd abandoned my physics major in college more than 30 years ago. I made up a lot of ground since then, but I can't really recover those lost 'windows of opportunity' in my intellectual development. Literate in science in a general way, I'm not really so competent in abstract mathematics that I can easily follow Dirac's style of thought and presentation. Needing to beef up in quantum mechanics, and a few other areas of specialized knowledge, I'd be better off with some other books on my desk, such as the Dover reprint of *Quantum Theory* [12] by David Bohm. I will get to that book soon enough.

Why am I continuing to read Dirac's book when I'm missing so much that I could catch a little better if I read a more concrete book first?

Reading Dirac on quantum mechanics is an esthetic experience, but also an experience that helps to reshape the mind even when the content seems a little vague and beyond direct grasp. He writes a strangely abstract poetry rather than something to be found in a typical modern textbook. I suspect that much is slipping into the back of my mind while I'm wondering at the flow of symbols. That happens with certain poets: Herbert or Wordsworth or certainly Wallace Stevens. In fact, Stevens might be a good colleague for Dirac as would be the novelist Melville. Arguably, my style as a philosopher and theologian and novelist also involves heavy use of abstract symbolization of concrete reality. None of these writers, including me, is at

all attracted to the sort of magic glorified by C.S. Lewis, J.R.R. Tolkien, and a host of other modern paganistic Christians or neo-pagans. There's enough 'magic' in reality as God gave it to us, enough that fascinates and irritates a healthy imagination.

It was nearly ten years ago that I bought Dirac's book. I read the early chapters at that time and wrote two novels not yet published, the first having as one of its characters a poet fascinated by the symbolism of Dirac's formulation of quantum mechanics. I wrote several poems in the name of the Poet, whose ordinary name happened to be Dylan Shagari since he was half Welsh and half Nigerian. A book like *The Principles of Quantum Mechanics* can induce contemplative states in a sensitive reader. It can induce streams of imaginative thought rather than just filling the mind with material organized in the bureaucratic way of a textbook.

Dirac, by all testimonies, was a unique thinker, exploring physical reality by way of mathematical abstractions, as if he wanted to insulate himself from more concrete reality until he found something interesting which would lead him back by way of an insight—such as the possibility of anti-electrons or positrons which was said to arise in a session of what might be called 'mathematical flow of consciousness'. Einstein, Heisenberg, and probably Newton constrained their thoughts to some understanding of physical reality and then looked for the mathematics necessary to communicate and further develop their insights. Einstein and Heisenberg were said to dislike mathematics in and of itself. They were conventional novelists, Tolstoy or Eliot, looking at concrete reality to find characters and narrative streams. Dirac was Wordsworth, character and narrative were abstracted away to symbols, or maybe Melville using novelistic styles to do what Wordsworth did with poetic styles.

Dirac's book isn't easy to read and I imagine I could have learned more, by most measurements, if I'd chosen to read Bohm's book first, but I'm learning some deep truths from Dirac's book, deep truths about the workings of the human mind and the odd ways in which our minds can be so well shaped to our world that some unusual thinkers can abstract away some aspects of that world, producing symbols that can be used to explore possibilities before returning to more explicit consideration of concrete reality.

# 18 The Need for Respectful Criticism

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=131>. It was finished and uploaded on 2008/01/28.]

As I noted in a previous entry, I believe that Pope Benedict is open to respectful and meaningful criticism of the sort which might be given by one competent scholar to the work of another or by one devout Christian thinker to the thoughts of another—else why would he go out of his way to point out that some of his writings, even as pope, are speculative? He seems an honest truth-seeker who has a preference for *a prioristic* forms of speculative reasoning and has not yet properly responded to modern empirical knowledge.

I would like to begin a Catholic debate about the meaning of modern empirical knowledge and the need for honest efforts to update Catholic speculative thought to better accord with what is now known about God's Creation. Pope Benedict seems reluctant to move forward into what seems so brave a new world and that's certainly understandable since he's protecting some important truths and some important institutions. Realistically, there's no one who's yet provided him with a way of treating modern empirical knowledge on its own terms while respecting our stock of theological and metaphysical truths.

In recent centuries, there's been a split of human knowledge into multiple realms in a way generally intended to allow proper freedom to specialists, but that way has led to at least an implicit belief in multiple realms of truth. In my way of thinking, there are ultimately only two 'realms' of knowledge: knowledge of God in His transcendent and necessary Being and knowledge of God as Creator in His contingent and free-will decisions. All

of empirical knowledge and speculative knowledge ultimately collapse into knowledge of God as a Creator. There are practical reasons to speak of a more detailed breakup of knowledge into realms of revealed knowledge, speculative knowledge, and empirical knowledge of various sorts, but such a scheme is no more than a concession to the weakness of our perceptive and cognitive abilities. We're limited in capacity and prone to error.

Pope Benedict is clearly a Christian thinker of great importance. That is, many are looking to him for guidance as we try to retain our grasp upon Christian truths, but he does need to be more open to modern empirical knowledge. He needs to encourage Christian thinkers to discipline themselves to learn more of this empirical knowledge and, by way of a contemplative (speculative) effort, to start building systems of thoughts which reflect both Christian truths and our best understanding of God's world. The Christian worldview which properly considers revealed truths and modern knowledge may or may not resemble the worldview I've worked to build.

Many Christian thinkers react against this modern build-up of empirical knowledge because we modern men all have mental indigestion of a sort caused by our samplings at this table covered with huge trays of facts and somewhat smaller bowls of truer knowledge. One of the symptoms of this indigestion has been a general conflict between Christian belief and empirical knowledge. We should do our best to ignore our discomfort and to courageously and confidently deal with that empirical knowledge and to make sense of it in terms of Christian revelations.

The spirits of the modern era have tried to increase prosperity and security by pushing all considerations of grounded truth away from us if they might lead to conflict in society. This has had the odd result of bloated nations growing up which have engaged in wars far more bloody than the 'religious' wars that Hobbes and the other founders of liberalism wished to end. These spirits have often used a strategy of glorifying empirical knowledge to soften or even destroy the absoluteness of any sort of truth. Such a strategy wasn't linked to any valid line of speculative thought but some defenders of Christian beliefs have reacted to this strategy of liberal political philosophers by building systems of thought in which even 'natural law' is strangely *a prioristic* which usually means that much of modern natural law thinking is based upon empirical knowledge of man and his world at the time of Aristotle or maybe St. Augustine. This is to say in Thomistic terms, that metaphysics uses the specific sciences. To remain

the foundation of speculative knowledge in general, metaphysics has to be updated to consider the specific scientific knowledge of the present.

This is an important time in history and we need to think clearly about the restatement of revealed, absolute truths. We also need to think through the nature of contingent truths and to reconsider which of our contingent truths have held up under the critiques of modern thinkers.

It would be nice if we could avoid making too many errors as we try to correct the errors we've already made or inherited. It would be even nicer if we could simply move to a position that recognizes the empirical knowledge which tells us so much about God's acts as Creator rather than continuing the somewhat embarrassing retreat before the forces of empirical knowledge-gathering. St. Augustine was himself a thinker who acknowledged the importance of empirical knowledge and St. Thomas Aquinas was perhaps the best empirical thinker of all theologians or philosophers. But their speculative thought had some errors introduced by the empirical knowledge of their day, as does the thought of any man at any time in history.

We should always be using the best understanding of God's world and not simply reacting to the use of modern empirical and speculative knowledge by those who may be our enemies or maybe be indifferent to Christians or may even be friendly to us but not willing to soften the effect of, for example, knowledge which makes a mockery of every homily or sermon or book that speaks as if the story of Adam and Eve was literally true. (Even allegories and metaphors become lies in an age when reading and thinking skills have decayed so badly as to make most of us literal-minded in the worst sense.)

We aren't enemies of those who are, in Christian terms, trying to understand what God did as Creator, in His primary acts of creation and in His acts of shaping a particular world and particular creatures. God has presented us with a great opportunity and too many Christians over the centuries have turned it into a problem and have, arguably at least, helped to generate a situation that's difficult to understand:

Modern men have decayed in many ways relative to their Medieval or early modern ancestors (see *From Dawn to Decadence* by Jacques Barzun for the definitive treatment, to date, of the decline in Western Civilization), but they've also excelled in certain areas, most especially in the empirical realms including not only physics and biology but also history and biblical exegesis

and many other fields. Yet, in those fields, decay will set in, and probably is already advanced because of the general decay in levels of literacy described by Professor Barzun.

We should see the struggle to make sense of modern empirical knowledge as an opportunity for understanding certain of God's decisions and actions as a Creator. The so-called Big Bang and the evolution of life on earth are backdrops, but very important backdrops, for the incarnation, life, crucifixion, and resurrection of the Lord Jesus Christ. For some reason, Pope Benedict, and many other defenders of Christian truth, don't seem to be fully open to the possibilities raised by the greatest accomplishments of modern man. For example, seeing the truth to be found in Hellenistic metaphysics, many shy away from the implications of modern empirical knowledge that the truth of Hellenistic metaphysics might be just a small region of the metaphysical truths God manifested in the raw stuff of Creation, the stuff from which He shaped concrete being. The very possibility of this expansion of speculative thought often doesn't seem visible to many of those who are defending traditional truths.

Most of the expansions of metaphysics which are implied by my work to date would actually involve an elevation of factual knowledge and historical development relative to knowledge based on a prioristic reasoning—a goal which I think to be justified by a simple respect for God as Creator.

# 19 Dealing with the Physical Universe

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=134>. It was finished and uploaded on 2008/02/09.]

Where do I go from here? I probably should go more slowly than I did in Chapter 92, *The Ascent of the Human Mind*. In that posting, I was unleashing my mind and imagination, trying to map the entire path from here to there in one image.<sup>1</sup> In terms of the conventional descriptions of creative writing, I didn't just cut open a vein, I ripped open an artery and let it gush out onto my keyboard. Let's travel a bit more slowly for the next few postings.

As I noted in a prior entry, Bohr was said by some reports to have had a good response to Einstein's famous, "God doesn't play with dice." Bohr may have responded, "Don't tell God what to do."

Let me impose my own understanding upon this statement:

Listen to Creation to try to understand what God did. If your theories of physics or your supposed metaphysical truths are in conflict with the evidence of God's Creation, then do more research, thinking, contemplation, and praying. Try to understand what God did as Creator rather than imposing your presumptions upon Creation.

---

<sup>1</sup>The reader should bear in mind that this book presents many of my blog postings with minimal changes. The book presenting a smoother and perhaps more coherent version of all this work is in progress, as many things are in this world. In any case, if this were that other book, I would rewrite that chapter rather than noting I perhaps went too fast in developing my ideas.

So far as I can see, empirical knowledge gives us our only possible picture of God in His freely chosen role as Creator just as revealed truths give us the only possible picture of God in His necessary and transcendent being but even revelations are uncertain precisely because they come through experiences. Revelations must also be treated as empirical knowledge to some extent, as the Catholic Church does in encouraging historical and literary studies of the Bible. In any case, speculative thought, especially metaphysics, typically functions as the glue to hold it all together, from our creaturely viewpoint, though speculation is the inferior of revealed knowledge (revealed truths mediated by human ways of thought).

But we need to go further, at least to the point of St. Thomas Aquinas that our interactions with our physical environments shape our minds. No, we must go further than that. We need to supplement the Thomistic claim with the findings of modern psychologists. For further development of my thoughts on this subject, see Chapter 78, Chapter 79, Chapter 80, Chapter 81, and Chapter 82. Gigerenzer points out in discussions of his various studies of the human mind in operation that much of our knowledge is found in our environments and remains there. In a sense, much of our conscious thinking is done by way of interacting with our environments in non-conscious ways. One reason that the term ‘mind’ is useful is this realization, explicit in our understanding of libraries, that our minds overlap into our societies and our physical environments. Our minds expand beyond our brains and the other parts of our bodies.

Before I’d even read Professor Gigerenzer’s *Adaptive Minds* [61], I’d made the claim in my first published book, (*To See a World in a Grain of Sand* [41]), that the uniqueness of human beings lies in the ability of the human mind to expand out beyond its immediate environment to see the universe and beyond to see the universe as morally ordered to God’s purposes. It is when this moral order is perceived, however vaguely, that the universe becomes what I call a world, having the attributes of unity, coherence, and completeness. [The human mind shapes itself first to its environments but any intelligent animal forms something like a mind in response to its environments. There has to be more to define the human mind, or at least the potential for more.]

Notice that this process culminates in a human being which is a better image of God, having a mind which can encapsulate some of what God creates. It’s a playful image, much like the child who picks up sticks and rocks to use them in imitation of his father who’s building a shed with

saws and hammers. This is perhaps the major reason for the importance of empirical knowledge:

Empirical knowledge helps us to shape our minds in imitation of God in His freely chosen role as Creator.

By empirical knowledge, I mean not only knowledge of stars and galaxies, of long-ago ape-men and dinosaurs. I mean also knowledge of the events leading up to World War I and the American War Between the States, the proposed explanations for the development of science in Christian Europe and the plethora of high-quality novels written in Europe during the 1800s. For Americans, it would be of particular importance to understand the failure to produce a true American culture outside of some music genres. For European Christians, it would be of particular importance to understand why 2,000 years wasn't sufficient for Christianity to conquer the hearts and minds of their fellow-citizens.

We need a way of understanding the Gospel in so far as it is a human narrative <sup>2</sup> and our other empirical knowledge as being part of one story. We need a way of understanding and I can see no other way to understand all of this than as a story, a morally ordered narrative. God, as Creator, is more a story-teller than an engineer. In His story, which is this world, He is also the absolutely dominant character, but we are failing to see this story, acting as if the universe were somehow a region alien to moral truths or other truths. We are refusing to pay proper attention and proper respect to the empirical knowledge which is our perception of this story. We often think and speak as if we believe this world to be not good enough for us when this world is our birthplace, the womb in which the resurrected are growing now even if we can't be sure who is in that group. Rather than womb, we often think and speak as if it were a stage and we're pre-formed characters passing from stage left to stage right.

This world is the womb for those who will be re-born into life without end. We have little serious reason to believe that God provides us substance or nourishment from outside of this womb. He even sent His Son to also

---

<sup>2</sup>I would argue the revelation in the Bibles is contained in the responses of the listener or reader rather than in the literal text. This isn't an endorsement of subjectivism but rather a part of my claim that, as organisms, we form ourselves only by way of active responses. Scriptural revelation from God becomes such only when it finds a willing listener or a loving reader.

develop His human nature in this womb. We have to remember that, in my terms, each human being—but also each rock and rattlesnake—is an object of God’s love. It’s that divine love which provides us with what we need and we should assume the Lord has provided a world adequate in itself to shape us to His purposes.

In his defense of the ultimate truths, Pope Benedict is sticking with traditional metaphysics, including its ways of interpreting experience, the basis of empirical knowledge and also that which shapes our minds. He’s sticking with a metaphysics that was, in fact, shaped by empirical knowledge including mathematics. It was shaped by the empirical knowledge of the ancient Greeks and has been enhanced in subsequent centuries but not nearly enough. Certainly, that knowledge was good enough to allow Plato and Augustine to see much in the way of truth and to allow Aquinas to achieve some insights which couldn’t really be appreciated before the development of modern neuroscience, mathematics, and cosmology.

We can do better now because we have better tools but the tools are themselves among the objects of study—they are also things and relationships in God’s world. The main purpose of the research is to shape the mind of the researcher and to shape it to encapsulate the world, the story being told by God. This and not utilitarian goals is the true motive for one who strives to understand the world as a duty he owes to his Maker. This is the understanding that can best make sense of this universe as more than just a collection of things that sometimes work in a way that implies some hidden order. The order is not fully hidden though it can be seen, however vaguely, only by those who have the faith that God is the Creator of this universe. Atheists and agnostics and Deists can see strong hints of the order, but not hints that allow them to even conjecture a world, unified and coherent and complete.

But there are problems also with Christians who see this world as not quite enough for God’s purposes, not really a manifestation of truths but only a setting for creatures who process knowledge as if they were some sort of data independent of the mind in which that knowledge resides. The human mind is the knowledge. The mind is the encapsulation of the world if it reaches that lofty shape. By being such an encapsulation, the mind has been shaped to an image of the thoughts that God manifests in His acts-of-being by which He created from nothing the foundational stuff of Creation and then shaped it into this world and also the world of the resurrected. When we learn to encapsulate this world in our minds, we learn to think

the thoughts God manifested in Creation. Each age has done something of this sort, but no one until Aquinas realized that our minds are shaped by our responses to our environment and no one was able to prove how it happens until the development of modern neurosciences. The thinkers of each age have the duty to their Maker to form the best possible story of God's world.

In this age, the major task for thinkers, especially Christian thinkers, is to understand the moral ordering by which the universe is a world. To fulfill this task properly, we must make modern empirical knowledge part of our thought even at the expense of a painful expansion of our understanding of what this world is and a corresponding contraction in our illusions about human minds being able to directly access truths, metaphysical and mathematical, which lie beyond this world. The truths God manifested in the basic stuff of Creation are part of this universe and empirical knowledge gives us the path to move towards better understandings of those truths, but – again—the better understanding is not separable from the mind in which it is contained in only a manner of speaking. It's this insight and not any particular views about biological evolution or randomness or the nature of matter which is important in my efforts to develop a worldview which gives us a new view of the unity and coherence and completeness of this world. We've not had such a view in recent centuries. The Cosmos which the early Christian Fathers adopted from the great pagan thinkers has been dismantled and Christian thinkers, including the leaders of the Church, have failed to respond properly.

## 20 Speaking the Language of Your Age

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=137>. It was finished and uploaded on 2008/03/01.]

The [dogmatic] declarations [of the early Church] were uttered in the language of Greek philosophy because the false statements were uttered in that language. [*The Power and the Wisdom* [94], page 129]

The opponents of the Church, both the ones with good intentions and the hateful ones, have moved on. They no longer critique the claims of Christianity in terms of Hellenistic philosophy. More than that, the faithful speak the languages of their age and culture—as they generally should. It's not the fault of the sheep that the shepherds teach and preach the faith in a strange language, embedded with alien concepts, a language in which—for example—matter is assumed to be dead and inert and some sorts of spirits are needed to bring life to mere flesh and blood.

To be sure, the shepherds speak the more modern language when seeking medical treatments developed under the assumption we're evolutionary cousins of pigs as well as monkeys. The shepherds also use the mainstream language when they fight those fundamentalist Creation Scientists who are consistent enough that they wish the same language to be taught in schools that priests and ministers use when giving homilies or sermons on the moral condition of mankind. That is, they wish biology teachers to speak as if the human condition were explained by a literalistic understanding of the story of Adam and Eve as filtered through two doctrines of the early Fathers of the Church: the special creation of man and original sin. Those doctrines

made (some) sense in a world that didn't know much about brain-cells or DNA, but we know of such things. We know how mere matter can maintain itself in a living state. The transition from non-living matter to the first organic forms of organization remains a mystery but one solvable in principle.

The modern opponents of Christianity critique the claims of the Church based upon more or less coherent understandings of modern empirical knowledge, history and exegesis as well as physics and biology. I think we should listen to them. They may know something about this universe, this phase of God's Creation, something that was not known to those who built the traditional metaphysics and the systems of theology by which Christians interpret the revelations of Moses and Isaiah as well as that Revelation Who is the Lord Jesus Christ.

After all, Plato and Aristotle helped Christian theologians, and artists, to speak of the triune God and the Incarnate Son—by way of a forced response to those who used Hellenistic metaphysics against the Gospel. It's time for us to realize a similar process of critique has been under way for five centuries or more and the leaders, thinkers, and teachers of Christianity haven't produced much in the way of impressive responses. We've not yet seen the modern Basils and Cyrils and Augustines who can take on the critics of Christianity on the grounds of modern knowledge.

Skeptics, including some open to good Christian responses, can point to the tight correlations between brain-events and the thoughts and feelings which define human life. Defenders of the tradition immediately shoot back with some argument from Plato or Augustine which assumes mere physical matter isn't capable of doing what scientists are showing it does all the time. There's a lot of evidence that actions of physical matter can be the most sublime of thoughts and feelings. This is somewhat mysterious but no more so than explanations by way of some sort of soul-stuff which can't be seen or detected but somehow can interact with matter. (See my first published book, *To See a World in a Grain of Sand* [41], for an early take on my worldview. In that worldview, it's possible to speak of matter as being frozen soul-stuff if that way of approaching the issue is more acceptable to many. The core relationships would remain the same.)

We can speak clearly and coherently of human nature if we simply speak as if modern empirical knowledge can be trusted. After all, we trust it when our lives are danger and we check into the hospital for tests or surgery or medication. Why do we speak as if the allegory of Adam and Eve were

literally true while we and our children are learning the words of evolutionary biology even in the movies we watch? Why do we speak of angels and demons when our children learn how the words which can tell the depressing stories of human cowardice and deliberate evil and also learn the words which speak of invisible hands and self-organizing systems and the ‘chaos’ which might give a direction to time <sup>1</sup>.

No wonder we Christians are losing our battles for souls, even those of our children. There are no souls to win, only human beings with soul-like attributes. Why would this bother us? The deceased human being who is my mother is true and I know she loved me in a special way when I was an infant and continued to love me all her life and I pray she’s with our Lord Jesus Christ, loving me still. What does it matter if the evidence gathered by modern science is providing ever more details of the neurological and hormonal foundation of my mother’s love for me? The love is real. Why would anyone think it a lesser feeling if it has no so-called spiritual component? Maybe I’m strange but it’s that love that matters to me not how God chose to manifest it in that particular woman who was my mother. It doesn’t bother me at all if that love could have been described as certain activities in a body of flesh-and-blood.

If we learn to speak and think of the universe as we modern men best understand it, then we can speak and think of our true relationship to Creation and to our fellow-creatures, even to God. We could perhaps even come to better appreciate the miracle of salvation given to inherently mortal creatures. Somehow, God allows us to see much when we base our understanding of Creation on the best available human knowledge. Refusals to do so will totally darken that glass we see through, even if our preferred form of knowledge is that which led St. Augustine or St. Basil to many good insights. Many Christians today try to think like Augustine and Basil (or saints of far lesser intellectual quality), but those ways of thinking, however fruitful and worthy of study, are irrational when a living man tries to use them to understand God’s Creation in an age when the underlying empirical knowledge is much different.

But the situation is worse than I’ve stated above. It’s not just that we speak a language ill-suited for the empirical knowledge of our age. Modern

---

<sup>1</sup>What is usually called chaos theory is actually the theory of certain types of well-determined non-linear systems which lie beyond the predictive powers of human mathematics at least in its current state.

human beings in nearly all age groups and educational achievement levels speak a gibberish made up of words and fragmentary concepts drawn from scientific and historical discourse, added to words and fragmentary concepts drawn from Church teachings and Western traditions. Such a stew isn't conducive to rational discourse that can lead to understanding.

## 21 Can Hellenistic Metaphysics be Baptized—Part 1?

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=143>. It was finished and uploaded on 2008/04/15.]

In reading, Ernst Cassirer's *The Individual and the Cosmos in Renaissance Philosophy* [18], I realized I've been guilty of a major oversight in any discussions of 'Hellenistic metaphysics'. Cassirer doesn't speak much of Christianity or the Church in that book, but he does speak of swings between various forms of Hellenistic metaphysics. And there are indeed different beasts in that menagerie. Using Christianity as a reference:

1. The Hellenistic thinkers in the Apostolic era and for two centuries following were generally followers of Plato and Aristotle, Zeno, Pythagoras, Epicurus, and other thinkers who lived before Jesus Christ. While those Greeks (all were largely Greek by culture but not all were ethnically Greek) were wrong about the nature of being—some more than others, they were pretty much all rational and clearheaded at least in the formulation of their questions.
2. Two centuries after Christ, Plotinus completed the development of a bastard offspring of Platonism which was called Neoplatonism. Soon enough, intellectual life was a picnic for those who prefer a confused view of being so they can select from a cafeteria of inconsistent entrees. It was also a meal eaten in desperation by Christians trying to protect their faith in God the Creator when they had no coherent understanding of Creation or even of being.

None of the Hellenistic systems of philosophical thought are adequate for grounding Christian belief in Creation nor for providing the best possible language for speaking of God. Still, the followers of Plato and Aristotle and the other earlier Greeks hold to rational thought which allows at least the possibility of seeing the primary Christian revelations in their blazing glory without obscuring those truths with inconsistent speculations. A careful reading of *Being and Some Philosophers* [62] by Etienne Gilson would be well worth the time for anyone seriously concerned about these issues.

Somewhere, Etienne Gilson said he could imagine St. Thomas Aquinas throwing up his hands in frustration as he tried to make sense of the paganistic babblings of Pseudo-Dionysius. And a great cry came forth, “What does all this have to do with Christianity?” In fact, Aquinas’ respect for the data of our senses and his strong tendency to use common sense to order that data would have rendered Neoplatonism repugnant to him, however much he felt forced to put angels and demons into his system of thought as decorative elements.

Plotinus and his followers had introduced great confusion into their concept of being and beings and that confusion was appealing to some Christian Fathers, some of whom should have known better. The sorts of confusion which allow wishful thinking and the avoidance of discipline and hard-work has remained popular. For the more abstract-minded out there, the first error of Plotinus was to derive the nature of being from first principles and not from what can be seen in what lay around him. Plato also was somewhat committed to this error but was also committed to the principle he gave to the astronomers/astrologers of his day: Save the phenomena. To give a flavor of Plato’s situation by way of an unfair characterization: He was committed to both wishful thinking and scientific observation. Plotinus wasn’t much worried about the real world or its phenomena.

The Neoplatonic errors in being led Plotinus to the belief that an impersonal and impassive God—having nothing to do with the God of Jesus Christ—couldn’t even know that this imperfect world existed. Mediators, such as angels and demons or a demiurge weren’t just an option. At least one god-like creature was necessary for any communication between God and His Creation.

Clearly this was a philosophy not conducive to Christianity and, so it was, that members of a contrary race—even St. Augustine of Hippo – chose to build their Christian theologies upon such unpromisingly swampland. To be sure, as intelligent readers have noticed (see Jacques Barzun’s dis-

cussion of Augustine's thought in *From Dawn to Decadence* [9]), Augustine moved from a paganistic and Neoplatonic philosophy in his youth towards a shockingly blunt physicalism in his later years and later works such as the later chapters of *The City of God* [104] where he ponders the fate of our nail-clippings when we're resurrected in the body and also jokes about those who can control their bodily functions so well as to make music with their farts.

But the early Augustine influenced later Christians greatly with his Neoplatonic errors, errors to which many are attracted in any case. Christian thought was soon turned away from efforts to understand the world created as an act of love by God and turned towards grotesque imagery of hierarchies of angels ascending to a God sitting majestically on a throne in Heaven. The Neoplatonic Christians did believe in the Biblical revelations and this business of the throne in Heaven was about the best they could do to see the God of Jesus Christ as the creator of a Neoplatonic world, but they'd signed a deal with the devil, so to speak, and we're now paying what's due.

In any case, though considered a major thinker, Plotinus and even his 'sort-of' follower St. Augustine in his earlier years, seemed to share the belief of occultists and magicians that mediating beings (angels and demons) somehow create breaks in logical laws and cause-and-effect relationships. This gives a philosopher or theologian or ordinary believer an immense amount of freedom to exercise his imagination in an undisciplined manner. This unleashing of human thought about being from the empirical world has continued to be a blessing for those who are befuddled enough to draw part of their worldview from modern science and part from ancient superstitions about gods, our angels and demons, who were seen as movers of planets and agents of disease. Now their major task is to take the responsibility for our failure to pass on Christian beliefs or even civilized moral behavior to our children.

It's not that creatures of the sort of angels and demons are inherently impossible. It is true that they don't make sense to us as creatures of this universe unless they make sense in terms of what we know and believe about this universe, this phase of God's Creation. And no one has made sense of them in such a way. If anyone wishes to tell us how angels fit into a universe in which creaturely substance is so well-described by Einstein and Heisenberg, they're free to do so. And this universe as it is so powerfully and deeply understood isn't porous to different sorts of creaturely being.

This points to another reason to have a clear Christian philosophy: God Himself seems impossible in this universe if He's seen as having substantial being or at least He'd be excluded from this universe. I'll talk about this in later entries.

Let me put it bluntly:

We Christians have, quite literally, no coherent and rational way to talk about our most important beliefs.

We sound like lunatics both when we speak of our belief in a resurrection of the body and when we babble on about angels and Satan and even when we speak of God the Creator of this universe. Why do we sound like lunatics? Because 99% of our lives are spent talking the talk and walking the walk of a modern empirical viewpoint in which known creatures, including human beings, communicate by means of energy transfers mediated by particles. I happen to believe that modern empirical knowledge is the best way to understand this universe, this phase of God's Creation, but the immediate problem isn't even ultimate truths so much as incoherence, sheer irrationality.

Let me put the issue into slogans:

1. You can't have both Satan and MRIs.
2. You can't have both St. Michael and the National Hurricane Center.
3. You can't have the entire complex of angels and demons and also a rational understanding of modern history.
4. You can't have the God of Jesus Christ and also Neoplatonic wish-thinking.

There are certainly signs that many are beginning to see that modern-day Christians preach an irrational way of thought. As I noted above, we're paying the price for the deal our ancestors made with the devil, a deal we're struggling desperately to maintain. I see signs that many believers are unsettled and uncertain in their beliefs because they can see the validity of the criticisms of Christianity as it is preached and taught and written about in the modern world. Sure, the ordinary citizen doesn't understand these matters explicitly but that's never mattered. It's certainly doubtful that many

believers or scholars or artists understood the Augustinian underpinnings of their culture in the Middle Ages though post-Roman European culture was founded upon Augustinian foundations.

The ordinary believer knows something is wrong but he can't say what other than to wonder aloud why his children and grandchildren aren't sitting next to him in the pew. What's far more disturbing for now is that very few priests and ministers show any explicit awareness of what's gone wrong. Many of those clergymen are floundering about, aware that something has gone wrong but they can only vaguely blame Satan or a corrupt media for their sins of omission and our sins as well. Those well-intentioned men do much and accomplish many things but fail utterly at one of the most important things: nurturing the faith of the children and bringing to Christ those who left Christianity or were never baptized. Look out into the emptying pews. That's one of the signs that Christian faithful, clergymen and laymen alike, can't convince their children or friends that the God of Jesus Christ is the Creator of Einstein's universe.

Undoubtedly, most priests and ministers have a strong respect for modern empirical knowledge and at least some doubts about some speculations in the Christian traditions, but they go on babbling about Adam and Eve and original sin as if it were a revealed truth. Each time they do that, some bright 13 year-old who visits the *National Geographic* website each week will sneer to himself, "Right, two apes ate an apple and put me on the road to Hell and the only way I can save myself is to listen to this guy talk about a wise and loving God." That's a more explicit rejection than will usually occur. The more typical cases will be like my own situation. After being given membership in the Congregationalist church in which I was raised, I would have stopped going to church because there really didn't seem much point to it. I continued as a companion to my grandmother out of respect for her but stopped attending church for 15 years after I left for college.

Human beings have never gone to church or synagogue or temple just to sing to some Ethereal Fluff in the sky. They go when they have a reason to fear or love a God or gods who play a role in their world. In other words, they want a God or gods which give evidence of being real, a God or gods which are more than decorations for their inner-lives. Human beings want divinity with some oomph to it.

I hate having to write in such negative terms because the real point is that God is the Creator of the world in which we live, a world open to empirical investigation. What if it's a world bereft of the foo-foo stuff of

paganism or sloppy wish-thought philosophy? That doesn't matter. In fact, it seems a better world for being what it is instead of being Neoplatonic.

The real work, and the fun work, is the hard study and thought which will allow Christian thinkers to make sense of the world on its own terms. If talented, hard-working young thinkers can be turned to this work, then Christians might even start playing a role in forming the cultures in which we live. We might be able to walk out of the intellectual ghettos in which far too many devout Christians live. We might be able to speak in terms that make sense given what we now know about this universe, this phase of God's Creation. We might even give our children and our neighbors reason to wonder if the God of Jesus Christ might be the Creator of all those stars and gas clouds, rattlesnakes and rabbits.

## 22 Can Hellenistic Metaphysics be Baptized—Part 2?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=145>. It was finished and uploaded on 2008/04/23.]

In this chapter, I continue with an analysis started in Chapter 21, *Can Hellenistic Metaphysics be Baptized—Part 1?*

Recent centuries have seen a mysterious retreat from the mainstream of modern thought on the part of Catholic clergymen and also Catholic laymen whose intellectual work is oriented directly to the needs of Christianity. I'm far from being a well-read historian but I've read enough survey works to see the retreat of Catholic thinkers into ghettos which seems to have taken place by at least the time of the Renaissance. Catholic thinkers, some very competent in their sadly limited expertise, often emerge from the walls of those ghettos to snipe at those who work in the mainstream. The main complaint of those snipers seems to be: those non-Catholics have developed worldviews which don't give proper respect to Catholic beliefs.

Let me state a general principle:

If you think you have some important information of any sort, information perhaps dependent upon a particular viewpoint for its complete understanding, then you are the one who has the responsibility of giving that information to other human beings in a plausible form.

Kant and Descartes and Darwin were under no obligation to teach a Catholic view of human moral nature if they didn't hold Catholic beliefs. Rather than just sniping at them, some Catholic should have come forward

to make better sense of physical reality than Descartes and Kant and Darwin. Instead, the best of them sniped and then proposed a view of this phase of God's Creation which makes little sense and shows great confusion. Some seem to think that Einstein is right in his description of the nature of space, time, and matter, but Pseudo-Dionysius is also right in his blabber about angelic beings. In fact, many are the Catholic thinkers who show the shallowness of their knowledge and the weakness of their minds by their lack of understanding that it was Einstein and not Darwin nor Kant who shot down the world in which demons and angels teem. I've written in Chapter 186 and Chapter 187 of the great gift Einstein gave us in his concept of this universe—though he himself saw this universe only gradually and with some reluctance.

A Christian thinker doesn't fulfill his responsibilities by playing to the pious practices of those of simple faith nor does he show much rationality when he uses elaborate theological structures to justify peasant superstitions while ignoring empirical knowledge. Whether priest or layman, he needs to be nurturing a faith that can accept those aspects of God's world which are in conflict with those pious practices and simple faith. That task can be carried out only by those who have a strong faith that even the nastiest discoveries of modern evolutionary biologists work towards God's good purposes. It takes commitment and personal discipline to keep up with modern empirical knowledge so that problems can be anticipated. As matters stand, Christian leaders aren't even responding to existing problems, preferring to place the blame upon anti-Christian scientists and philosophers for the disconnects between their favorite theological systems and knowledge of the real world. It's the younger Christians who grow up with that knowledge of the real world who have suffered by losing their faith. And the reaction is to pray for them a little and continue on with business as usual. "Surely, it can't be our fault because we're wonderful and we're comfortable with all this talk of St. Michael and Satan and Adam and Eve who sinned and pushed all of us in the direction of Hell." Those young men and women and many others are leaving because they have no reason to believe that Christianity has much to do with reality.

It began with that retreat by priests and other Catholic intellectual leaders, that is, the retreat from the responsibility to make sense of the real world as being part of the Creation of the God of Jesus Christ. It was a funny sort of retreat because Catholics and Protestants alike maintained very high standards of scholarship in, for example, Bible and language stud-

ies where discoveries in modern times have done a lot of damage to pious views of the Bible. Why have moral theologians not followed by developing a system of natural law theory which properly uses the discoveries of modern evolutionary biologists and brain-scientists? It's clear to me that God isn't going to let us live peacefully in our piously constructed views of this world.

In truth, the Church has never expected most priests to become high-level intellectuals. There have been some places and times when priests were barely literate. Nowadays. . . I wonder how many Catholic priests and seminarians have the skills to critically read a difficult book, such as St. Augustine's *City of God*. I wonder how many seminarians could fulfill an assignment to identify some key points where the arguments of Augustine or Aquinas break down because those arguments depend upon empirical knowledge now known to be incomplete or defective. My personal experience is that, as amazing as it seems, Catholics who read *The City of God* do so without realizing it to be one of the most complex books of sophisticated speculation ever written. In terms and style that made sense in light of the empirical knowledge of his age, St. Augustine did very much what I did in my book *To See a World in a Grain of Sand* [41].

If those seminarians and priests can't read the great books of the past in the context of the periods of those books, if they can't read a book in light of the author's assumptions—having first the skills to identify those assumptions, they aren't going to be able to speak intelligibly to those who have grown up in an age where it takes a struggle and even a bit of creativity to think and speak of the real world in Catholic terms or even in weaker Christian terms.

So many Catholic and Protestant clergymen, as well as lay intellectuals, are able to function competently in their liturgical or spiritual lives while also functioning competently in a world which presents itself to modern eyes as being incompatible with Christian ways of thought developed in past centuries. The very fact that they can function so well with one foot in two different realms of truth is itself a sign they hold, if only implicitly, a very strange idea of what truth is and of what reality is.

## 23 Pseudo-Dionysius

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=151>. It was finished and uploaded on 2008/05/16.]

In a news item from the 2008-05-14 newsletter of the Vatican Information Service, we can read:

### PSEUDO-DIONYSIUS THE AREOPAGITE: MEDIATION AND DIALOGUE

VATICAN CITY, 14 MAY 2008 (VIS) - In today's general audience, held in St. Peter's Square, the Holy Father resumed his series of catecheses on the Fathers of the Church, concentrating his remarks on the figure of Pseudo-Dionysius the Areopagite whose aim, said the Pope, was "to place Greek wisdom at the service of the Gospel".

Benedict XVI explained how, during a period marked by "harsh disputes following the Council of Chalcedon", this sixth-century author affirmed the fact that "the light of truth . . . eradicates error and brings the good to shine forth. With this principle he purified Greek thought, bringing it into relation with the Gospel".

The Pseudo-Dionysius used Greek polytheism "to show the truth of Christ and transform the polytheistic world into a cosmos created by God" in which "all creatures together reflect the truth of God."

"Because the creature is a glorification of God, the Pseudo-Dionysius' theology becomes a theological liturgy. God is found, above all, by praising Him and not just through reflection".

This Father of the Church created the first "great mystical theology. . . . With him the word 'mystical' took on a more

personal and intimate meaning: it expresses the soul's journey towards God. . . . The Pseudo-Dionysius shows that at the end of the road to God is God Himself, Who comes close to us in Jesus Christ".

"Today Pseudo-Dionysius the Areopagite assumes fresh relevance", said the Holy Father. "He appears as a greater mediator in the modern dialogue between Christianity and the mystical theologies of Asia, the well-known characteristic of which lies in their conviction that it cannot be said who God is, that He can be spoken of only in negative terms, . . . and that only by entering this experience of 'no' can He be reached".

Dialogue, said Benedict XVI "does not accept superficiality. It is when we enter deeply into the encounter with Christ that a vast area for dialogue opens before us. When one meets the light of truth, one realises that it is a light for everyone: disputes disappear and it becomes possible to understand one another, or at least to speak to and approach one another". AG/ PSEUDO-DIONYSIUS AREOPAGITE/. . . VIS 080514 (370)

Maybe Pseudo-Dionysius can be a mediator in a dialogue with mystics of Asia, though I find Pseudo-Dionysius's writings strange almost to the point of repulsiveness. To be sure, those writings are rational in a sense, but it's entirely what I call a 'top-down' rationality, a worldview imagined without a lot of contact with the nitty-gritty details of this world God inconveniently made. There are undoubtedly some Christian missionaries who can serve God by reaching out to those mystics of Asia, but it's dangerous right now for the Church, or her separated sisters, to be reaching out publicly in this way when our main ways of expressing the faith have already become implausible to so many in the West, including most young adults who'd been raised as Christians but educated in secular settings in which the knowledge presented is not so much biased as de-contextualized.

I would propose we Western Christians examine our thoughts and feelings to try to understand why Christianity is suddenly implausible even in a Christian culture before courting Asian mystics. My take on the situation is very simple: Christian thinkers fell into the trap set by Spinoza and his theories of separate realms of knowledge, theories which not only consigned theologians to various ghettos but also turned theology and philosophy into studies of fairy-tales. We need to reestablish Christian connections to God's

Creation before we go chasing after polytheistically grounded conversations with Asian mystics.

An honest, and non-hostile, confrontation with modern empirical knowledge should lead to a regrounding of Christian thinking so that it could deal with God's Creation from the standpoint of Christian revealed truths. Stated more positively:

1. The Einsteinian view (speaking loosely) gives us a universe which plausibly can have the properties of a world as I define it: unity, coherence, and completeness. Just as importantly, modern physics and mathematics give us the possibility of defining this universe explicitly as a phase of something greater, all of Creation, which might have another phase which we could call Heaven.
2. Cosmological physics, evolutionary biology, history, literary and linguistic exegesis, and other fields give us the possibility of seeing this universe as a world which is a well-ordered moral narrative, where the highest level of order is determined by God's purposes which we know only through revelation. As I see matters, a world, unified and coherent and complete, without being this sort of a living story.

We need to understand the historical importance of Spinoza, a distinctly non-liberal thinker, who taught liberals how to divide reality into realms of knowledge which weren't even contiguous let alone overlapping or even, the Deity forbid, parts of one unified realm of truths. We have an opportunity to undo this particularly damaging aspect of modern thought while keeping those many truer aspects of modern thought and also keeping all those piles of partially digested modern knowledge which can become true knowledge. We can do this by adhering to a consistent Thomistic existentialism, updated in its view of Creation to consider modern empirical knowledge.

Against Pseudo-Dionysius's books, I'd propose the intellectual biography of St. Augustine, a man whose early writings, even as a Christian, were in the same vein as Pseudo-Dionysius. By the end of *The City of God* [104], he'd become so strong a physicalist that he wasn't so much concerned with angelic hierarchies as he was with such questions as: what happens to all our nail parings and hair clippings from our mortal existence when we participate in the bodily resurrection? He was also so concerned with bodily control, not control of an evil body but control of our very selves, that he

made a rather vulgar joke about a man who could fart out a musical tune. Most readers seem not to notice such disturbing trends in the thought of the great bishop of Hippo. St. Augustine of Hippo led us away from the types of thought we read in the books of Pseudo-Dionysius. Strange it was that Pseudo-Dionysius didn't learn the lesson since he followed Augustine by a century or so.

Etienne Gilson didn't think highly of Augustine as a philosopher though admitting freely that great bishop was likely the greatest of all Christian theologians, but I think Gilson didn't give enough credit to Augustine for a very difficult journey not by way of ascension but rather by coming to a better understanding of empirical reality including his own human nature and also his immediate environment and even his historical context. Gilson does note that Augustine was a brilliant psychologist as well as a genius at theology. In that vein, a little meditation on Augustine's main insight into the psyche of man will bear fruit: God is more deeply inside of us than we can ourselves reach. As the Creator and sustainer of the stuff and entities of His story, the Almighty is also so deeply inside those genes and the nasty events of evolution, that we can't see Him without a serious effort to understand the empirical levels of that story.

We don't approach God so much as we become more aware of His immediate presence. We develop that awareness by listening with God as He speaks so that we can speak and talk along with Him as well. We don't ascend to Him by ladders built of human dream-stuff. When Einstein tried to impose his own preconceptions upon Creation: "God doesn't play dice with the universe," Bohr responded (perhaps): "Don't you tell God what to do." See Chapter 13, *Einstein and Bohr: Don't tell God what to do!* for a very short discussion.

We are soaked no longer in Christ in the conventional way but we are soaked in poorly digested knowledge of Christ's Creation. This tells us what we need to do to preach the Good News of Christ to our neighbors and our children and to most modern Asians. Anyone who wants more details or further arguments can explore the writings in my weblog, *Acts of Being* [38] or join the few, the silent, the readers of my first published book: *To See a World in a Grain of Sand* [41].

## 24 Extraterrestrial Life

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=154>. It was finished and uploaded on 2008/05/20.]

An astronomer at the Vatican Observatory has said, in a very confused way so far as I can tell, that the question of extraterrestrial life is an empirical question. (See *Could ET be Our Brother?* found at the website <http://fatherroderick.sqpn.com/>).

This is old news. In 1277, in what seems to have been a confused encyclopedia of condemnations, Etienne Tempier—Archbishop of Paris, did seem to make the point that we can't override God's freedom as a Creator by human dogmas, even if those are derived from the works of the greatest and most authoritative of philosophers.

Some historians think that some, or many, of Tempier's condemnations were aimed at Aquinas. (There is apparently some evidence that Tempier had prepared a specific set of condemnations of the work of Aquinas and was told to bury it by the Curia.) I would support the major thrust of Tempier's condemnations while also arguing that Aquinas, with some inconsistencies that greatly upset Pierre Duhem and others, was one of the best empirical thinkers we know of. For a Christian to be an empirical thinker is the same as for a Christian to recognize God's freedom as a Creator.

The problem is: when we try to understand natural revelations, those found in God's Creation, we can see not the transcendental God but rather a 'Zeus', a Demiurge, a mask, implied by the specific, free-will acts of that true God who lies beyond our perception and even beyond all possible human thought in some sense. (See Chapter 574.) To see the transcendental God, even dimly, we must see Him in Jesus Christ and by way of rising above the immediately empirical to see this world, the story God is telling, in the context of the Son's incarnation, crucifixion, and resurrection. What

I've seen is humbling. Creation isn't about us but rather about an act of self-sacrificing love made by the Son in submission to His Father.

And that leads to the real problem in the discussions about this interview with that Vatican astronomer. Some commentators seem to think the issue comes down to: if there are intelligent forms of life out there, will they share our redemption? There's an assumption here that a creature advanced to a certain stage 'deserves' to be redeemed and resurrected into life without end.

A little clear thought based on the Gospels should tell us we were offered redemption because the Son of God chose to take up a human nature to His divine Person. We don't deserve to be redeemed nor do we, as finite and mortal creatures, 'need' to be redeemed. Redemption came to us as a totally free gift as a result of a drama, involving mostly the Father and the Son, in which we played a supporting role. At the same time, Christ loved us because He had chosen to become one of us and had first loved His holy mother and then others around Him as He lived His 35 or so years as a mortal man.

Redemption isn't a prize given at some rung on the ladder of evolution. It's a matter of Christ taking us up to His Father along with His own human nature. Modern empirical knowledge seen in light of the Good News of Jesus Christ leaves open the possibility that we might one day meet a race more advanced than us in many ways and yet not redeemed by Christ. We might meet a race of god-like beings whose existence ends absolutely at the death of their mortal beings.

## 25 Broadening the Horizons of Reason

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=159>. It was finished and uploaded on 2008/06/09.]

I've included the entirety of an article from the Vatican Information Service. Pope Benedict XVI has spoken publicly about an important issue he addressed in some of his earlier books: Christian philosophy must respond to modernity and theology must also respond, though he apparently believes—plausibly enough—that theology will respond first to an updated philosophy.

Pope Benedict tells us, “Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.” This is a good start though I would say that an understanding of man, a creature of this universe whatever our fate might be beyond the grave, requires some substantial understanding of the universe. Christian philosophers need first to deal with the work of Einstein, Gödel, and their successors. Then they need to deal with Darwin and his successors, especially the current generation of brain-scientists. General relativity and quantum mechanics and, likely, string theory, and many fields of mathematics, tell us much about the nature of the being that God shaped into this universe and also some speculatively much about the underlying being which was the raw material God created from nothing. History and other fields of empirical knowledge also have much to say but we have to start with the basics of the pesky stuff we're made from before we can more fully understand the story God is telling with this stuff.

Like it or not, geometries of space-time and the facts of electrons and electromagnetic fields provide the most certain knowledge we have of created

being. A whole variety of empirical fields, from history to transfinite set theory, provide us with a more complete view of this universe, one which could then be disciplined to a Christian understanding of this universe as a world—which I define as a universe seen in light of God’s purposes. A world is much like a morally ordered narrative. But it will require a lot of work to build a philosophy founded upon being rather than “myth” or the “gods of religion”. And we have to realize it will be not only a great effort but also a disorienting effort. See Chapter 69 for a discussion of this issue. Note I say Hellenistic metaphysics is too small, not that it’s wrong.

If anyone wishes to see a first shot at just such a system of thought as Pope Benedict would desire, they can check into my first published book, *To See a World in a Grain of Sand* [41]. I’ve also completed a book on the nature of human knowledge which can be downloaded for free, *Four Kinds of Knowledge* [43]. And I’ve gone beyond the thoughts in those books in the short essays posted on my weblog, *Acts of Being*, found at <http://loydfueston.com/>.

#### POPE HIGHLIGHTS THE VITAL ROLE OF PHILOSOPHY

VATICAN CITY, 7 JUN 2008 (VIS) - This morning in the Vatican, the Holy Father received participants in the sixth European Symposium of University Professors, which is being held in Rome from 4 to 7 June on the theme: “Broadening the Horizons of Reason. Prospects for Philosophy”.

The symposium has been promoted by university professors in Rome and organised by the Office for Pastoral Care in Universities of the Vicariate of Rome, in collaboration with regional and provincial institutions and the local city authorities.

In opening his address to them the Pope mentioned the fact that this year marks the tenth anniversary of John Paul II’s Encyclical *Fides et ratio*, and he recalled how when that document was published “fifty professors of philosophy in Roman universities expressed their gratitude to the Pope with a declaration underlining the importance of re-launching the study of philosophy in universities and schools”.

“The events of the years that have passed since the publication of the Encyclical have”, said the Holy Father, “delineated more clearly the historical and cultural stage onto which

philosophical research is called to enter. Indeed, the crisis of modernity is not a symptom of the decline of philosophy; on the contrary, philosophy must embark upon new lines of research in order to understand the true nature of that crisis”.

“Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man”.

Benedict XVI indicated that since the beginning of his pontificate he had received various suggestions “from men and women of our time”, and that “in the light of these I have decided to offer a research proposal which I feel may arouse interest in a relaunch of philosophy and of its unique role within the modern academic and cultural world”.

Quoting his own book, *Introduction to Christianity*, he said: “The Christian faith has made a clear choice: against the gods of religion for the God of the philosophers, in other words against the myth of custom and for the truth of being”. And he went on: “This affirmation . . . is still fully relevant in the historical-cultural context in which we now live. Indeed, only on the basis of this premise - which is historical and theological at one and the same time - is it possible to respond to the new expectations of philosophy. The risk that religion, even the Christian religion, be surreptitiously manipulated, is very real even today.”

“The proposal to ‘Broaden the Horizons of Reason’ should” he proceeded, “be understood as a request for a new openness towards the reality to which human beings in their uni-totality are called, overcoming old prejudices and reductive viewpoints in order to open the way to a new understanding of modernity”.

“The new dialogue between faith and reason which is needed today cannot come about in the terms and the ways it did in the past”, said the Pope. “If it does not want to see itself reduced to the status of sterile intellectual exercise, it must start from the current real situation of mankind, and upon that build a reflection that embraces man’s ontological and metaphysical truth”.

In closing, Benedict XVI referred to the need to “promote high-profile academic centres in which philosophy can enter into dialogue with other disciplines, in particular with theol-

ogy, to favour new cultural syntheses capable of guiding society". In this context, he expressed the hope that "Catholic academic institutions may be ready to create true cultural laboratories" and he invited the professors to encourage young people "to commit themselves to philosophical studies by facilitating appropriate initiatives" to guide them in that direction. ## 26 Let's Engage the World, Not Attack Errors

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=177>. It was finished and uploaded on 2008/08/21.]

Today, August 21, is the feast-day of St. Pius X who was Pope from 1903-1914. A saintly man for sure, he was born into poverty and lived an ascetic and morally disciplined life, being greatly concerned about pastoral issues. He gave high priority to the needs of ordinary Catholics and was also greatly concerned with the poor and the confused of all faiths.

Yet, as was true of most Catholic leaders and Catholic thinkers over the previous four centuries, and remains true of most today, he failed to deal in a positive, open-minded, and open-hearted way to modern knowledge even when it was straightforward knowledge about the physical things of God's world. He attacked errors and did it in such a way that outsiders couldn't see the positive content of traditional Catholic thought. Then again, part of the problem was the inability of Catholic thinkers to even see they'd locked themselves in a ghetto of sorts.

There were various reasons for the estrangement of Catholic thought from the mainstream of human thought since at least the 1600s and it wasn't just the truly or falsely perceived errors in that mainstream. Catholic thinkers failed to notice a truth discussed by John Henry Newman, an older contemporary of Pius X: even the most absolute of truths must be restated in each age of man as human language inevitably changes. Truths stated in the words and concepts of an earlier age can become errors. Sometimes, Catholics have participated in those language changes unconscious of the effects upon statements of Christian belief. For example, Catholic pro-lifers join other pro-lifers in claiming that we're human persons at conception,

confusing the traditional distinction between 'person' and 'nature'. Was Jesus Christ a human person at conception? If not, He was different from us, not a true man. If He was a human person at birth, then He couldn't have been a divine Person, the Son of God, unless we use a confused understanding of 'person'. In fact, we're particular manifestations of human nature at birth and become human persons to the extent we become Christ-like and take on attributes analogous to those of the only three true Persons: Father, Son, and Holy Spirit. And this points to a major problem: it isn't those outside Christianity who are distorting the meaning of a word, 'person', necessary to express Christian beliefs. In this case, Christians who try to achieve one good, helping to protect the defenseless, are damaging their own capacity to clearly express their beliefs or teach those beliefs to others. The more general problem is the one noted by Cardinal Newman. Words and concepts change over time as we move forward in God's story. If we're unwise in either trying to continue speaking old truths in old words, or in adjusting our words without paying attention to their effect on old truths, we'll turn those old truths into lies.

The underlying problem, which even Newman seemed not to understand clearly, has to do with empirical knowledge, knowledge of this phase of God's Creation—our universe. This is knowledge which I claim to have expanded to include increasingly plausible speculations about other phases of Creation, even plausible speculations about some very fundamental aspects of Creation. We have huge piles of empirical knowledge, much of which has not been properly organized from any perspective and very little has been organized from any Christian perspective, a strange situation since St. Thomas Aquinas seems to be exactly the hardheaded empirical thinker who can give us ways of dealing with modern knowledge of history and biology and physical matter at a fundamental level, even our disquieting knowledge of the history of Christianity and Judaism, including the sometimes strange history of the Bible. To his credit, St. Pius X had an instinct that Aquinas is that sort of important thinker but seemed to have a poor understanding of the Thomistic method which would lead a modern follower of Thomas to a respectful encounter with modern empirical knowledge as one way of enriching our understanding of Christian beliefs.

As one example of the refusal of Catholic thinkers to deal with modern empirical knowledge: they'll claim to accept some version of evolutionary biology and then speak to their children and others as if there were a special creation of Adam and Eve. Many of the individuals who do that may

not believe in that special creation and some may even realize there is a contradiction that makes their teachings sound like gibberish to children and adults who live in a world where television regularly broadcasts specials about all those bones dug out of the sands in Africa. There are still deeper problems in understanding the nature of being in Creation but those are more complex and require more explanation. The interested reader can explore this blog, starting with the category *Christian in the Universe of Einstein* found at <http://loydfueston.com/?cat=29>.

Pius X was aware that something was seriously wrong, aware that the world was not truly hearing what the Catholic Church had to say—not that I’m claiming that a fair hearing would necessarily lead to mass conversions. While Pius X was still a young man, John Henry Cardinal Newman was finishing up a productive life in which he’d helped to make possible a respectful self-critique of Catholic teachings and Catholic ways of speaking.

We’re in far better shape now. Pope John Paul II was open to modern empirical knowledge though I really don’t know if he had any serious knowledge of the specialized fields. Pope Benedict XVI is also open to modern empirical knowledge and has serious knowledge of at least medical biology. He’s also aware of the problems in a Catholic understanding of being that is not ‘broad’ enough given what we now know of the observable aspects of being in this universe—see Chapter 25, *Broadening the Scope of Human Reason*. I’ve also made a respectful criticism of his speech at Regensburg—see Chapter 69, *Hellenistic Metaphysics is Too Small*. In retrospect, I may have been a little unfair because he might have been simply noting the truth of Hellenistic metaphysics and not claiming that truth to be nearly rich enough to describe being as implied by modern empirical knowledge, gravitational theory and particle physics and quantum mechanics and transfinite set theory and random number theory and so forth.

Pius X saw some of the errors which had taken root outside of the Catholic ghetto, errors which were naturally enough seeding themselves inside the ghetto as well. The Fathers of Vatican II threw open many of the gates and doors of the ghetto, knowing that God doesn’t want us to protect our faith by isolating ourselves from the greater part of the human world. Catholics responded with the joy of children being released from a dreary school but remained inside, taking advantage of their freedom more often than not by developing unattractive forms of worship and by destroying many of their valuable institutions. Others left the ghettos as a first step in leaving the Catholic Church or even Christianity of any sort. Pope

John Paul II told Catholics, and others who listened: “Do not be afraid.” Engage the world with open hearts and open minds. Pope Benedict XVI has developed a reputation as a reactionary in some circles, partly because he wants to stop some of the silly celebrations of those who’ve not yet found the faith or courage to leave the ghetto, but he’s also trying to nurture that faith and courage in at least Catholic intellectuals that they might leave the ghetto to engage the outside world in a respectful give-and-take.

Better times are on the way for Catholic thinkers but I don’t expect to see them arrive during my mortal years.

## 27 Preliminary Thoughts on Causation

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=182>. It was finished and uploaded on 2008/09/23.]

I've defended the legitimacy of philosophy in this age of empirical thought and will continue to do so but I admit to being less than impressed with the state of philosophical thought about causation. It strikes me as being localized in the way of pre-modern physics and pre-modern geometry. Localized physics (such as special relativity) and localized geometry (such as Euclidean geometry) has its valid applications in human thought, including analysis of our universe, but most events and states of being in the universe can't be understood by billiard ball physics. And that's the comparison which is appropriate for the first stages of my efforts to understand causation from a more 'modern' viewpoint.

We are ourselves organisms and are not some sort of immaterial point-like entity, mind or soul or free-will or whatever, which is imprisoned in a body. Nor are we even controlled in any direct way by a highly focused region of the human brain. Many philosophical thoughts and literary images of human nature seem to fall under the illusion that our true selves are autonomous agents which exist in extension-free points, perhaps in our brains. In fact, our selves are distributed over our entire body and over our immediate environments through our relationships with other human beings, non-human beings, things, weather, and so forth. Certainly, the prefrontal lobes are more 'us' in some real sense than our little toe is but I'm advocating a model similar to a field in physics in which that little toe has a certain 'intensity of us-ness' but the prefrontal lobe has a greater intensity. Neuroscientists often speak this way but typically as if this 'us-ness' is

purely a mental construction rather than being reflective of relationships to an objective external world.

Since I'm currently trying to take on causation, I'm viewing the human being in his role as a moral agent but one that is an organism extended through space. Admittedly, the space occupied by even an NFL defensive tackle is pretty small in the greater scheme of things, but the point is that neither that tackle nor I are concentrated at one point of 'moral agency', call it soul or mind if you will. The non-locality of an organ, the spread of being through flesh and bone, liver and brain, is different from the non-local aspects of modern physics, but physics describes the stuff of our physical beings and our properties as complex beings depend upon the possibilities of our basic stuff. We become aliens when we inhabit a world of electromagnetic fields, quantum waves, and gravity which is a shaping of spacetime and then pretend ourselves to be describable in terms drawn from much simpler physics and mathematics than that used for classical fields or quantum mechanics or modern gravitational theory. As I've discussed in earlier writings, it might even be that the ethereal feel of our minds might tell us that those minds reside in electromagnetic fields generated by our brains. (Other more exotic possibilities are far more speculative.) Yet, mostly would I propose that our minds are the relationships our physical organisms form with other part of our own organisms or with external entities including our environments or greater realms of Creation. For now, various speculative models of the mind are possible but the evidence would indicate that only non-local models are plausible.

If a human mind can encapsulate the world—as I've claimed in my writings, then that man with a mind will begin to see causation in the context of that more complex world. Those relationships and strange entities found by modern physics in the realm of the very small and the very large are far richer than pre-modern empirical knowledge would indicate. Modern empirical knowledge hints of possibilities which seem the stuff of dreams to some and of nightmares to others.

Are these larger-scale and smaller-scale realms of being relevant to a man qua man? Do strange forms of physical interaction and strange relationships between strange entities mean anything to us in making sense of our lives? Do they mean anything in our moral lives? Or should we stick to forms of reasoning which correspond roughly to physics and mathematics as understood at the time of Aristotle? And that's the problem. Metaphysical reasoning, including the analysis of causation, concerns understanding

of being in its totality. The aspects of being described by physics and mathematics are but part of that totality but there must be a coherence. Modern physics and modern mathematics don't fit well inside a totality which was originally constructed with thoughts which included pre-modern physics and pre-modern mathematics.

The strangeness of quantum mechanics isn't just grist for our mental mills, it's the foundation of stability in physical being. The modern gravitational theories and the cosmological theories they spawned are also not just grist for our mental mills, they indicate a surprising sort of unity of physical being in this universe. The modern expansion of the very concept of what mathematics is also isn't just grist for our mental mills, but rather hints of the ever broader horizons of reason which are found in Creation when human thinkers allow themselves to respond wholeheartedly to such hints.

We need new languages and new concepts for our understanding of causation in Creation and for the moral discourse which can flow from an enriched understanding of causation. We need words and phrases and images which speak of man as a being spread out over time and space, a morally coherent agent but not one tightly focused and able to make free-will decisions independent of his environment, including the causative factors which work upon his being or even the effects which will come from his acts.

We need to see ourselves, as causative agents and objects, in terms analogical to interfaces over manifolds. We need to think in terms of many to one or many to many or even one to many. This doesn't mean we should replace a failed moral calculus with a moral tensor calculus. It does mean that we should recognize that as creatures born into this universe, creatures who develop in this universe, creatures with minds which can—at least in principle—encapsulate this world, our properties and our relationships with other creatures will be amongst the richer and more complex possibilities of this universe. So it is that we can learn much from the expansion from Newtonian calculus to the tensor calculus used by Einstein to develop the general theory of relativity. A similar abstraction is necessary for us to gain an understanding of the more complex human being who lives in the context of a densely populated world of complex and abstract relationships, economic and political and social.

Creative thinkers, novelists as well as philosophers and scientists, need to soak themselves in the new views of physical reality that new words and concepts might emerge in strange images and metaphors which will be

stumbling blocks to all those with rigid ways of thought. I'm trying to do this myself, though my middle-aged brain is responding somewhat slowly to relearning the knowledge I'd learned poorly as an unmotivated math major in college and to learning from scratch what was not covered before I'd dropped out of the 'higher' track in math and out of physics entirely. Yet, it's having some effect upon my thoughts.

Understanding the world comes not when we use some sort of preformed entity, material or immaterial, to process data gathered from the sands of Africa or the realms of deep-space. Understanding the world comes when we shape our minds in response to that data, making it ours in the deepest sense. That is, we begin to encapsulate those parts of our world which we perceive or can speculatively perceive.

## 28 The Practical Consequences of Inattention to God's World

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=519>. It was finished and uploaded on 2009/06/09.]

Americans, perhaps most human beings of the Modern Age, don't perceive what's inconvenient to their desired worldview. This is hardly a new observation—Tocqueville was puzzled by this trait back in the 1830s and others since, including Hawthorne and Melville and Solzhenitsyn and Ray Bradbury have at least spoken of this problem. Perhaps Tocqueville in *Democracy in America*, a book mostly complimentary to Americans, and Solzhenitsyn in his critiques of the West including the forward to the abridged edition of *The Gulag Archipelago*, were the most direct in their observations. Solzhenitsyn was forced into a renunciation of his almost unqualified high opinion of Americans by one specific spree of systematic criminal behavior committed by the U.S. Army according to agreements involving Roosevelt, Churchill, Truman, and Stalin—see *Operation Keelhaul* found at [http://en.wikipedia.com/wiki/Operation\\_Keelhaul](http://en.wikipedia.com/wiki/Operation_Keelhaul) for a summary discussion of the brutal betrayal of many Soviet refugees and even some descendants of refugees from prior generations. All the betrayed human beings were tricked or forced back to the Soviet Union where they were sometimes sent into slave labor camps and sometimes executed right in front of the Allied soldiers. Solzhenitsyn was forced to realize that Americans had been able to walk away from their crimes and to even wash their own memories of the horrors they'd participated in. We walked away with an unchanged view of our moral purity as a people—strangely enough, this is true even of those who have a good sense of their own nature as personal sinners.

Maybe, we should be careful in condemning the young soldiers who were probably confused about what was going on, but we have to place full responsibility upon the older and more experienced American and British participants in this crime, including chaplains and medical personnel and senior officers and State Department officials, who would have known pretty well what was happening. They kept their mouths shut in the same cowardly manner as the nice middle-class Germans who served Hitler rather than risking punishment or loss of respectability. Yet, we still have to ask even of those young soldiers: how many of them were paying enough attention to be suspicious at least when they saw the brutal executions of ex-POWs whose crime had been to be captured when Stalin had ordered them to fight to the death? Did they remember what they'd helped to do or had at least witnessed?

What frightens me about talking to those just older than me, Vietnam veterans, is the small percentage who were observant enough to notice, for example, the almost total lack of Viet Cong or North Vietnamese soldiers in the villages invaded by American troops. Some were deeply disturbed to find themselves fighting teenagers and old men who were fighting in front of their family homes and others either didn't notice the suspicious demographics, if that's a proper word for the age and sex distribution of corpses. Still others just echoed the government line that these people defending their villages were commies who didn't place any value on human life. They deserved to be shot down because they were trying to kill Americans who were only there to help the Vietnamese. Those who wish to read an account from a Washington perspective of an awakening awareness of the criminal nature of the war against the Vietnamese people can get hold of a copy of *In Retrospect: The Tragedy and Lessons of Vietnam* by Robert S. McNamara and Brian VanDeMark. This book speaks about some of the policies set in Washington which led to American soldiers waging war upon Vietnamese civilians and also speaks of the willful ignorance of those managing the war when McNamara was able to confirm by his early access to the libraries of Kennedy and Johnson that the facts of a criminal war were sitting right in front of them during their many meetings where government officials crossed items off their to-do lists and worked towards their career goals before heading home in their nice cars to their nice homes with their nice families.

The sheep can't be deemed totally innocent but the primary blame belongs to the shepherds. Our moral and spiritual leaders, our so-called

thinkers, clergymen and philosophers, theologians and poets, political and business and civil-servant leaders have refused to pay attention to the world around us. Empirical reality has created problems to our established moral views to be sure and it's just when empirical knowledge threatens to be inconvenient that we human beings are strongly tempted to misperceive or ignore even the most obvious of facts. We need to pay attention most intensely just when empirical reality is most bothersome or most painful.

In fact, empirical knowledge seems to always come into conflict eventually with any set of ideas, political or economic, scientific or philosophical, technological or domestic. The Creator's thoughts lie always above and beyond us and those thoughts are best seen by way of human thoughts and human behaviors which are active responses to Creation and which prove to be appropriate responses. Even those few doctrines which we Christians claim to be revealed truths have had to be re-understood under the pressure of changing knowledge of empirical reality. For example, we believe God has promised a resurrection into life without end for those who belong to His Son, Jesus Christ. He didn't give us detailed instructions and we should pay more attention to modern biology, including evolutionary theories, as part of the process of understanding those promises of resurrection. After all, our inherited understandings of those promises were partly drawn from (often misunderstood) doctrines of pagan philosophers attempting to understand man's nature and his situation in the Cosmos. For example, the idea of the immortal soul held by the Christian Fathers came largely from Plato though there's no reason to believe that Plato's 'immortal soul' had anything to do with individual human beings.

To see truth, we first must pay attention to the things around us, to reliable histories of the West and of our own particular parts of it, to the best knowledge gathered by physicists and chemists and engineers, to the needs and desires of those around us, and to other aspects of empirical reality. In these early years of the 21st century, our environments include the abstract domains of modern mathematics as well as our best views of the space-time regions when the universe first expanded out from an extremely dense state. The environments of anyone who reads regularly or even watches decent documentaries on television also extend to ancient Egypt and to the highlands of Kenya.

Pay attention and think if you would ascend towards some plausible view of the nature and meaning of Creation and all the individual creatures it includes.

Right now, we Americans are paying a price for not paying attention because our economy has been gutted by the various criminal activities, domestic and foreign, of our government and big-business leaders. This isn't the place to discuss those details and there are others far better informed about the details than I am. I'm merely pointing out that we could have stopped this disaster years ago as it was developing but we didn't pay attention. As for me...I haven't voted for a major party candidate for President of the U.S. since 1988 and few other major party candidates for any political office in these past two decades. I even turned in a blank ballot once when there were no acceptable alternative candidates. For what it's worth, I also gave up any hope of ever receiving significant Social Security or Medicare benefits back in the late 1980s. These problems with our political and economic systems were not so hidden except to those who were willfully blind.

In any case, a morally well-ordered society, and all the attendant practical advantages, comes into being by actions that can only be proper if they are in response to a properly perceived world, a world to which we pay attention.

## 29 “Values Can’t be Drawn from Facts” and Other Old Philosophers’ Tales

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=676>. It was finished and uploaded on 2010/08/13.]

We’re told that David Hume proved that values can’t be drawn from facts. Most recently, I read of this alleged proof in an interesting and mostly unobjectionable book about the relationship between Protestant ways of reading texts and the origins of science, Peter Harrison’s *The Bible, Protestantism, and the Rise of Natural Science* [69]. I’ll pass over the issues of defining ‘facts’ or ‘values’ or ‘proof’ and go directly to an rough explanation of how it is that we do, in fact, draw values from a factual world. In Chapter 110 , *Intentionality as the Guide to Philosophical Thinking*, I discuss a quote of Sir Isaac Newton, perhaps reading into it too much, but I think not. He said:

I keep the subject of my inquiry constantly before me, and wait till the first dawning opens gradually, by little and little, into a full and clear light. [Sir Isaac Newton]

I understood him to say that truth is found, and a ‘true’ mind is formed, as an honestly and constantly lived response to reality as we can best know it. Such an intensely lived response will reshape our thoughts and minds. It will form our moral characters.

In my writings, I’ve been developing an understanding of created being, a subject to which I’ve recently returned as I’m trying to develop an understanding of moral and social and political aspects of human life. For now,

I'll just refer the reader to Chapter 596, *The Never-ending Project* where I summarized some aspects of my current understanding of created being. My understanding of created being can perhaps be more readily understood by some readers if they approach through my parallel understanding of the human mind and how it works. Part III, *The Human Mind as a Re-creation of God's Creation* Contains a number of chapters which develop my view of the human mind.

The process of shaping the mind in response to Creation ensures that we gain values which are found in Creation in its entirety, including the world of the resurrected as well as this world. Creation is the totality of created being and includes not only created being but also various levels of abstract being going right back to the thoughts God manifested as the basic, or raw, stuff of this Creation. The concrete values proper for men, flesh-and-blood creatures that we are, can be drawn from the narrative which is this concrete world in its movement towards an unknown future, but we can rise to higher moral levels by proper formation and use of our minds. This doesn't mean we transcend Creation but rather that we can begin to understand the purposes, let us even say the values God intends for His created works.

Movement. Evolution of species or classes. Development of individual entities.

Our moral instincts aren't a direct vision of some transcendental realm of truths. They come first from behaviors and attitudes which evolved in the human genetic line over millions of years. In fact, that process of evolution of moral nature started in pre-human lines of social mammals and, to some extent, in still earlier lines of living creatures.

At some time, the moral characters of our ancestors seemed to come into a tighter and more conscious state, partly because of a useful error in human thought. Once our ancestors had ascended, or descended as Darwin would have said, to a greater self-awareness, they concluded that our moral behavior is under direct, immediate control of those aware selves. In fact, we are creatures of moral action and it's been shown that, at least for certain easily measured actions, we start to act before the more conscious, higher regions of our brain show any sign of activity. I've written of this issue before and written a little about its practical effects, though arguably R.L. Stevenson spoke more graphically in *Dr. Jekyll and Mr. Hyde* about the dangers of the illusion that we can directly control our 'inner selves'. In fact, true values are useful as guides to human animals in strengthening

their moral characters but, for the most part, self-aware thinking plays a role by shaping our selves so that we act properly in the future, not by turning us into some sort of creature which can transcend by a heroic exercise of the will, for example, the powerful urges caused by a genetic problem. Values, moral abstractions in general, are necessary for the conscious shaping of our selves or our children, but our moral character is in that behavior, it is realized in our embodied selves and our actions. It's not just our 'good' feelings.

In my effort to communicate a view at odds with most views of human moral nature. I've spoken in past years of two sets of processes which have formed the human mind, including its moral aspects. In 2011, I realized that the communal aspects of our moral natures have to be considered separately, and so the list becomes:

1. We are born with certain tendencies toward behaviors and attitudes which are our 'moral instincts'. These are the results of selection processes working over many thousands of years upon particular genetic lines of highly social creatures with other characteristics such as an opportunistic attitude.
2. We are shaped as individuals as we respond actively to our environments. If there's a harsh side to my views on human nature, it's the implication that passive human animals never develop towards the state of human personhood.
3. We live in communities which teach us moral behaviors and values and those communities go through processes which I think to be similar to those of the evolution of biological species and also some processes similar to those of the development of the individual.<sup>1</sup>

These three processes exist at the concrete level of created being and the events which occur in the narrative which is this world. The second process, formation of the human mind, also exists at more abstract levels of created being. The third process involves communities of various types and sizes and abstract relationships are certainly involved. The entire process of understanding our own moral natures starts from awareness of the factual

---

<sup>1</sup>There is some insight to be gained by contemplating the claim of the historian Carroll Quigley: Truth emerges in time through a communal process.

aspects of our own physical nature and continues when we begin to deal with those factual aspects through our intellectual faculties, that is, when we begin to draw abstractions from our concrete moral natures.

We place a high value on human life because we evolved as human beings in human societies, even though those societies might have been often no more than families. We have instincts against killing other human beings and most men even have great trouble killing another man, face-to-face, when it seems morally allowable. A humbling fact, which emphasizes the animal foundations of human moral nature, is that wolves seem to have stronger instincts than human beings against killing other members of their own species. A wolf will place higher value upon the life of another wolf than a man will place upon the life of another man. Human beings have developed higher moral principles, absolute principles, despite starting from a lower moral level of concrete behavior than wolves, in some respects.

In this brief survey, I'll also mention a problem which arises in the Gospels of Christianity. Jesus of Nazareth imposed some very difficult demands upon us, particularly His demands in the *Sermon on the Mount*. It's not clear why creatures in a world of Darwinian processes should love their enemies and not clear how to actually shape ourselves or our children to the higher demands of Christ, but we could—in principle—understand these matters. Some would say we should simply obey Christ but He called us to imitate Him, even to be perfect as God is, and didn't call us to simple, mindless obedience.

As St. Thomas Aquinas told us:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures He made. . . (Page 17 of St. Thomas Aquinas' commentary on *1 Corinthians* [3].)

By understanding how the Creator worked, we come to understand the thoughts He manifested in Creation. Within those divine thoughts, are what we call values, and we can make those thoughts our own by proper exploration of empirical reality and proper active response to it. Values can come from facts because the Creator chose the facts which surround us, like the abstractions, manifestations of God's thoughts. Even those

sometimes nasty facts which deal with the evolution of moral species and the development of moral individuals are part of the story God is telling.

## 30 A More Open Metaphysics and Political Philosophy

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=679>. It was finished and uploaded on 2010/08/25.]

We have to learn to move forward in our thought by trying to honestly perceive reality and to openheartedly respond to it while becoming aware of the distortions of the preconceptions we always bring to such tasks. This is a logical development of the insight we have inherited from Aquinas and a few of his truer disciples, an insight discovered independently by modern brain-scientists, that the human mind is formed by active responses to its environments. It can even be formed in response to some serious knowledge of a vast array of environments, of the universe, or of Creation in its entirety.

I've said this often but I wish to emphasize an aspect of this claim I'm just starting to explore as I wander through the streets of my town and also through the pages of biographies of George Washington and Thomas Jefferson, tales of the American Constitutional Convention of 1789, political discussions by W.E.H. Lecky and Albert Jay Nock, and various works on particle physics and the history of thought in geometry. I should be, and soon will be, concentrating on matters of physical science, mathematics, and ontology as I prepare to get back to work on an enhanced summary of the worldview I've developed over the past 20 years or so. I hope that my thoughts on these political and social and moral aspects of created being will start maturing in the back of my mind so that I'll be able to move smoothly into these aspects after writing the summary of my views on the nature of the fundamental aspects of created being, largely concentrating on what we label as 'physics' and 'mathematics'.

So it is that I'll not provide for now even so much as a serious sketch

of how we can move forward in understanding our own political and social and moral natures—as they evolve under the environments we are ourselves changing rapidly though not in ways we can anticipate with any great accuracy. That is, we can understand what has happened and somewhat what is happening but we can't understand what the opportunities and problems will be for our grandchildren because we can't understand how they'll be living as individuals and as members of families, what technologies will be available to them, how they will understand their relationship to Creation and Creator, and so forth. True it is that we have to act in ways that will respond properly to our own circumstances without unduly constraining future generations, but I'm not yet ready to even speculate on real-world actions until I can better understand where we stand.

When trying to understand the vast changes in human life and human possibilities over the past few centuries, I find it hard to believe that so many think that our political possibilities are limited to a small catalog of political systems which can be readily controlled by perhaps a king or a small body of wealthy men, by a group of intellectuals gathered to write a constitution for the ages or by cigar-smoking big-cogs in political machines. I can well believe that men gather to conspire to some goal in their selfish interests but I can't believe they can do so effectively—though I agree with the conspiracy theorists to the extent of recognizing immense damage done by bankers who would control governments and or intelligence agencies murdering leaders in their own countries or around the world.

The CIA, or a cabal within it acting with perhaps the support of Texas oilmen and weapons manufacturers as well as key senators, might well have murdered President John Kennedy.

The Council for Foreign Relations and similar gatherings of bankers and intellectuals and politicians might well have played a major role in shaping American policy. In general, they've exercised some large degree of influence over the past 50 years, a period in which a country, the United States, blessed with every bit of historical luck and natural resources a patriot could dream of, has been driven through a very short age of immense power and wealth to near collapse. In the end, the United States might well have been the most powerful country in the world for not much longer than tiny, low-population and low-resource, Portugal back in the 15th and 16th centuries. Yet, on its own, the American government seems not more competent than these bloody-handed professors with their theories about controlling the world by controlling central Asia—an idea actually tracing

back to the brilliant lunatic Brooks Adams, brother of Henry Adams and great-grandson of John Adams.

Without going into details, without being able to go into details, I'll say for now only that I think we have to move towards a political system analogous to a self-organizing society, more weakly analogous to a free-marketplace. More accurately if less specifically, we should think in terms of organisms, of the evolution of family-lines and the development of specific organisms.

The errors of traditional political thought, from Plato to Madison and beyond, come at their most fundamental level from their wrongful understanding of metaphysics or—equivalently—their wrongful understanding of how the human mind forms. The political philosopher isn't born with a knowledge of absolute truths of human political and social natures any more than a physicist is born with a knowledge of absolute truths of time and space and matter. We are born with certain brain responses that assume adults will help us when we whimper in need or distress and we are born with certain brain responses which assume objects continue in existence. Neither set of brain responses correspond to more than highly qualified truths, though there are usually ways in which such qualified truths can be understood in terms of more abstract forms of being which are reflective of less qualified truths, but that's not my main line of argument for now.

What are the basic forms of political organization? Are those forms truly limited to republic, monarchy, oligarchy, and democracy? Is democracy little more than disorder waiting to happen? Are we forced to go with hierarchical systems which are designed by men? Is there really an ideal catalog of such forms any more than there is such a catalog for forms of life?

In terms of computers, our modern political systems, and most of our social systems, are rigidly hard-wired computers with a central processing unit which does all the thinking for the entire system, at least all the important thinking. Certainly, we can note that the types of men who are attracted to being part of that central unit are rarely those who could be trusted holding power, but I'm not writing with an intention of attacking any specific governments or individuals. Rather am I writing to speak of the strange and perverse results of building a governmental machine and attaching it to a social organism with the intention of having the machine control that organism. It's particularly strange when that organism is changing rapidly.

In the United States, we have a constitution written by men who were definitely above average at least in moral courage and intellectual talent. After all, they had risked all, life and property, in the interests of something akin to a deep love of political freedom. They applied deep and broad knowledge of the history of political thought and of the practice of law and legislation to the task of forming a new government. Why, then, did they think that political freedom could be served by a set of rules and overarching legal principles which formed a sort of machine? Some, such as Jefferson, apparently didn't think that, though Jefferson couldn't do much but express a vaguer view of politics which is at least more consistent with the view I'm advocating. The others? They were taught to analyze political systems as machines by the traditions of political thought in the West. The organic analogies of Plato and Hobbes strike me as machine-like, non-evolving, and non-developing. Plato's republic doesn't grow from the actions of its members but rather fits its members into tightly defined roles. True it is that the Founding Fathers of the United States had England's example before them, but they seemed to think that the evolutionary and developmental processes of English history had worked to produce something like a machine, which they rejected in the interests of forming a similar but different sort of machine.

(In fact, as I've written before, the efforts to shape a part of an organism into a well-structured machine has resulted in something more akin to a cancer or a parasitical organism, but I'm arguing against mainstream political ways of thought and only incidentally discussing the counter-intuitive, and mostly destructive, results of the implementations of their schemes. Political activists and theorists build political machines in their acts or their minds and don't set out to deliberately design parasites to suck the life out of the body public.)

It is clear that we have passed through a period in which we achieved extraordinary progress in understanding the universe by way of science and yet there was no planning. Individuals began to respond to Creation, forming their minds to be able to grasp what was concretely perceivable that abstractions might be derived. Early on, monasteries and eventually various other sorts of corporate bodies organized to tackle problems which had arisen, such as the need for some sort of time-keeping as the choir monks separated themselves from work in the natural environment or the construction of more elaborate buildings or the cultivation of very large fields. I'm not advocating a minimalist or non-existent government but rather a gov-

ernment which is part of the organism and develops to serve certain needs and responds to the rest of the organism in such a way as to change with it. In fact, there is reason to believe that science has perhaps been going off-track since it began shaping itself to the needs of funds-granting governments and corporations of various sorts rather than shaping itself in response to the world. Yes, I'm claiming human science is no more and no less than the human mind applied to exploring Creation in certain ways. Science as a body of knowledge and techniques isn't separate from the minds and acts of its practitioners, a specific example of a great truth about the human mind in general. Similarly, we would do well to consider political thought and political action in analogy to scientific thought and scientific action, even scientific experimentation.

We don't know even what the true human political and social possibilities are at our current state of dense populations, advanced technological development, somewhat retarded intellectual development in the humanities and philosophy and theology, and so forth. We aren't even thinking on those lines, instead seeming to believe that our new wine can be put in old wineskins. No, the problem is worse than that because we're squeezing growing and developing organisms, from lines of evolving organisms, into hides from more primitive ancestors. We might as well squeeze our individual selves into the hide of an ancient ancestor of apes and monkeys. This is exactly what our governments do, trying to force individual human beings and human societies into a shape convenient to the needs of that particular government but not much appropriate for any other entity in the known universe. The result isn't generally pretty and becomes downright ugly under rapidly changing conditions even for a government that evolved before rigidifying into a machine, such as that of England, or for a government which was formed by a group of men of greater than normal moral character and intelligence, such as the American constitutional government.

I don't know where to go with this entire line of thought for now. I'm going to contemplate the issue, in the back of my mind and sometimes in the front, sometimes even writing about small pieces of the problem. I'm going to try to shape my political and social thoughts in response to the best knowledge available on these topics, or at least an eclectic sampling of such knowledge. I'll be under no illusion that I can anticipate what the answer will be but my real goal is to try to define processes we should be nurturing in order that we might develop political systems appropriate for our modern selves and our modern societies. I have faith and hope that we

can help along the formation of the Body of Christ by doing so.

## 31 Stephen Hawking and His Critics

[The original version of this essay was published on the blog/site, *Acts of Being*, <http://loydfueston.com/?p=692>. It was finished and uploaded on 2010/09/17.]

I haven't read Stephen Hawking's most recent book where he's said to argue that a Creator-God is unnecessary nor have I read more than summaries of the efforts of certain Christian theologians to shoot down those arguments. I've read that Hawking argues gravity fills the need for such a God, but that's irrelevant to the points I'll raise in this article. When I speak of 'being' in this article, I'll actually mean 'created being', which is a result of the contingent or freely-willed acts of God, those He takes as Creator and Sustainer of this world and the remainder of Creation. I will argue that both sides misunderstand what metaphysics is and can be.

Metaphysics is the science of being and, by necessity, has to start with those forms and levels of being which can be directly observed, explored, and analyzed. St. Thomas Aquinas told us this in the *Summa Contra Gentiles* and other writings:

Metaphysics uses the specific sciences.

Physics and biology are certainly among the specific sciences, but I would add mathematics to that list of specific sciences rather than considering it some sort of body of truths which can be accessed directly by some immaterial entity labeled as 'mind', but I'll not have to deal further with that issue in this article. In general, I would replace the term 'specific sciences' with 'empirical sciences' and include all efforts to deal in a disciplined and systematic way with some realm of this world. History and

linguistics would be empirical sciences. Yet, physics has a special role to play in metaphysics, as one might guess.

Hawking is right in starting an analysis of being by looking at our knowledge of physical being and the ways it interacts with itself. Some of his critics, at least from the ranks of Christian thinkers, would be right if they can be understood as saying that metaphysics is more than just the results of those specific sciences. I fear that some, maybe most, of those critics are actually saying that metaphysics is something completely independent of those specific sciences, but I'll give them the benefit of the doubt. It would be particularly sad, a greater sign of the intellectual and moral decay of the modern age, if it proved the case that Catholic thinkers are truly doing what they seem to be doing—doing meta-physics by starting with the conclusions, the end-results, from the complex meta-physical analyses of the Medieval and ancient thinkers. Those traditional analyses were based upon the empirical knowledge of those earlier eras. The closest the the Catholic Church has come to making an 'infallible' statement about how to do philosophy is the claim in the encyclical *Aeterni Patris* that Aquinas knew how to properly do philosophy. The Thomistic way of doing philosophy starts off by responding to empirical reality. St. Thomas did make mistakes and didn't always stick to his own rules, but he was no worse than human in his failures.

My worldview is based on an open response to modern empirical knowledge in light of my Christian faith. In this worldview, being is being is being. The various forms of being are found on a spectrum ranging from concrete thing-like being 'down' to abstract truths. We can observe directly the things on the concrete end of that spectrum but even naively observed concrete things have behaviors and form relationships that tell us something about more abstract levels of being. We are even born with some defective but truth-containing instincts such as the belief of infants that things have continuous and non-stop existence. (Some experiments have shown infants to be surprised by stage-magician tricks where objects seem to disappear when passing behind some sort of barrier.)

Metaphysics is the art and science of making sense of the full-spectrum of being by starting with empirical knowledge, that is – knowledge of exploratory and testable realms of being. Metaphysics moves toward completion by ascending from knowledge of the empirical realm through ever more abstract realms. To explain a little more, you can't understand the nature of metaphysical entities such as 'time' and 'space' and 'matter' unless you

work from empirical knowledge of those entities as they are manifested in the concrete world we inhabit. You can't understand 'infinity' unless you understand what physicists know of time and space and what mathematicians know of randomness/factuality and of various levels of infinity. You can't engage in responsible metaphysics unless you work from the best available knowledge of concrete being, being that we can know more or less directly. If you don't understand time and space and matter, how can you say anything intelligible or trustworthy about the realms of being which must be explored by speculative analysis? How can you speak responsibly of resurrected human beings unless you start from the best possible knowledge about man the physical and mortal animal?

Hawking is wrong that knowledge of directly observable being is the totality of knowledge of being. His critics, some at least, are wrong in not seeing what seems obvious to me—our traditional metaphysics is radically incomplete and we need to rebuild our systems of metaphysical thought honestly and courageously upon a new foundation that includes modern empirical knowledge. As I've noted elsewhere, this means that we need philosophers and theologians who have some substantial knowledge of modern mathematics and physics and biology and history and so forth.

I've written of these issues in my first published book—*To See a World in a Grain of Sand* [41], in a freely downloadable book—*Four Kinds of Knowledge* [43], and in various articles published on my main website—<http://loydfueston.com/> and included in this book. You can explore my views on these issues in these chapters of this book:

- Chapter 156, where I discuss Einstein's claim, "God Doesn't play dice with the universe," a claim based on a particular form of the mistake made by some of Hawking's critics,
- Chapter 69, where I argue that we need to open up our metaphysical systems of thought that they might be at least as large, and also as rich, as modern empirical ways of thought, and
- Chapter 73, where I begin a somewhat more systematic effort to update Thomistic theories of the mind.

## 32 Reason Comes from Our Interaction with Empirical Reality

[The original version of this essay was published on the blog-site, *Acts of Being*, <http://loydfueston.com/?p=755>. It was finished and uploaded on 2010/12/28.]

All reason is from God and of God. There is no immaterial reasoning agency part of or attached to the human creature. There is no mind or soul as many imagine, nor can we directly access even the manifested truths underlying Creation, let alone any transcendental truths which exist beyond this particular Creation. All reason is from God and of God and the more abstract forms of reason are part of the abstract being from which the matter of this world was shaped. When the mathematical laws of physics operate, or the narrative laws of biological evolution or those of human history, we see reason at work and we shape our brain's operations to correspond to this reason. Even perception of our environments requires us to actively engage the objects and deal with the relationships in those environments. This active engagement is part of the shaping of what we call our minds.

We can state one of the 'laws' of biological evolution in this rough way: "Those lines of creatures better succeed in reproduction which can better adapt their bodies and actions to what lies around them." Human beings have moved to a higher level of adaptation—that of mind-formation, though still remaining creatures in all senses, having more refined skills of abstract reasoning than found in chimpanzees and other creatures, but not different sorts of skills than those elicited from chimpanzees under laboratory conditions and sometimes found in chimpanzees in the wild. Chimpanzees have

some of the brain structures for forming a mind but I'd be reluctant to say that mind-formation rises above a hint in our apish cousins.

We can generalize from the physical bodies and the actions of living and non-living creatures to the more abstract sorts of mental events. I'm not speaking only of academic philosophers or even mostly of them. I'm speaking of German and Japanese farmers who carry their habits and general knowledge about soil and weather to new lands and take just a few years to become better farmers than the natives. I'm speaking of poets responding to new things or new regions of earth or new experiences. I'm speaking of hackers on a computer trying to find new ways to solve problems and sometimes working by writing code which doesn't correspond directly to preplanned or even known methods. I'm speaking of inventors trying to build internal combustion engines where the entire engine is basically one piston-chamber or other inventors working towards some goal they can't even state.

We trap ourselves when we try to limit our activities to those which can be planned or to any foreseeable activities because those, by definition, can only correspond to known forms of reason. We can learn new forms of reason if we're willing to explore our world courageously and without too many preconceptions, even when we tinker with things or ideas in a seemingly arbitrary way. If our tinkering produces something worthwhile, then we should sit back and contemplate our actions and their results, whether we're dealing with a new way of picking a banjo or a new way to sort records on a computer. From these contemplations we might derive new and richer understandings of Creation. We can even be said at times to have entered into more abstract realms of being.

In fact, it seems quite possible to read the history of human thought in a manner quite consistent with this. We have to try to temporarily set aside our modern viewpoint formed during centuries when a certain type of rationality allowed for extraordinary progress in understanding many aspects of Creation, gathering mountains of knowledge of this concrete world and abstracting from that knowledge to derive various sorts of physical laws and theories as well as less rigid ways to understand history and to understand living creatures in general. Seen in proper historical context, the earlier form of reasoning developed by the Greeks, 'rationalistic' or 'Euclidean' but not tied tightly enough to empirical reality, also had a good run of allowing progress in understanding Creation in its concrete and abstract realms. Similar statements can be made of the mythical reasoning devel-

oped in the centuries before the early Greek scientists and poets prepared the ground for the philosophers.

Will we move on from here? Is the reason of the modern world the end-all of human thought? I doubt it. Our children will not only know things about reality which would amaze us—they will reason with power that might frighten us.

We could ask, “What form of reasoning might someone discover?” I can’t even make a guess though I think there are hints in my writings and in the writings of other modern thinkers, especially mathematical physicists, mathematicians, brain-scientists, and theorists in evolutionary biology. Undoubtedly, there are historians, novelists, poets, musicians, visual artists, and some of those tinkerers in mechanical matters who are also developing new forms of thinking about Creation by active exploration of that same Creation. They are learning how to think about Creation from Creation.

Even as creative thinkers, at least truly creative thinkers, we don’t always know what we’re thinking until we’re thinking it. We don’t always know where the story is going until it gets there. A good tinkerer doesn’t always know what the danged thing is until he builds it.

We can’t respond with a pure freedom to Creation because of our creaturely natures. Even the wildest and most open of creative efforts needs to work within some forms, some disciplined structures, but those called to work at the frontiers of human thought or art or technological innovation should be willing to step outside of the forms of reasoning or acting which they inherited. In some periods of history, the call to this sort of creative work is a beckoning to step outside of their own minds formed to established ways of reasoning.

Speculating, telling stories, or tinkering, we respond to God’s Creation, thereby sharing in God’s own thinking and acting—though the two aren’t really separable for God. We share also in God’s freedom, the freedom He exercises as Creator and Narrator. In these ways of sharing, we mold our minds, souls if you prefer, to the shape God wishes for us, the shape He wished when He manifested a certain body of thoughts as the stuff of a story, this world, and then brought into being a race of creatures capable of responding to Creation in this general way.

The human mind is an entity which can, in a strong sense, be all created being. It isn’t just an entity which can understand created being in the traditional way where he who would understand brings with him tools which are independent of created being. We do create such tools by shap-

ing our minds to deal with, even encapsulate, parts of created being, but those tools should be seen as that—images of parts of created being rather than truly independent tools for analyzing or explaining from outside. You could even say that one generation's mental tools will melt into the lower levels of understanding of the next generation where I speak of intellectual generations, such as pre-Socratics and classical Greeks and so forth up to the broader spectrum of modern thinkers.

## 33 The Mind of a Modern Scientist

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=785>. It was finished and uploaded on 2011/03/15.]

I've just finished reading Thomas S. Kuhn's *The Structure of Scientific Revolutions* [83]. He's quite aware of the objective nature of reality but he speaks of major changes in understanding of the world leaving scientists (or others in different conversations) as if in a new world. Elsewhere he speaks a bit more reasonably of the scientist seeing the world with new eyes, but he's short of the mark. What's new when we gain deeper understanding of what lies about us is our mind. I think Kuhn is blocked from gaining this deeper insight by one of the paradigms he holds—using his own terminology. He holds a fairly standard modern understanding that I've often criticized: the mind is something existing with some significant independence of its experience, its responses to its environment, and the knowledge thus generated. In fact, knowledge seems to be assumed as something which is somehow loaded into this mental entity.

I think the sort of analysis he performed, while insightful, would be much improved by adopting a Thomistic framework in which the mind forms by active responses to its environments. The mind and its knowledge aren't ultimately separable, both being aspects of an intentional encapsulation of the environments of the organism having a 'mind'. We, the human race, have become aware of wider regions of the earth, the universe, even the world in the sense of the universe seen in light of God's purposes. Our minds have grown accordingly.

I've covered these issues before and won't repeat my discussions here. The interested reader can read Chapter 83, *Is Christian Morality a Natural*

*Morality?*, for my review of *How Brains Make Up Their Minds* by the brain-scientist and philosopher Walter J. Freeman who is an advocate of Thomism as a framework for understanding modern science. In Chapter 90, *Shaping Our Minds to Reality*, I give a short overview of my understanding of what the mind is and how it forms in light of our difficulties in understanding the apparent strangeness of quantum mechanics. In Chapter 102, *Active Responses are Necessary for Shaping the Human Mind*, I give the background for a claim I'll now make:

The positive sciences work so well not only because of the empirical knowledge gained by disciplined observations of empirical reality and experiments within reality but also because the workers in those fields are forced to respond actively to do their jobs. However limited or biased some of the individual minds might be, the communal mind—in a loose way of speaking—of physics and mathematics and biology and other such fields is shaped to our best current knowledge of empirical reality. Many of those in the humanities and social sciences and certainly in theology and philosophy live inside worlds created by the active responses to reality made by men who died many years ago.

It's not that positive sciences encompass the only sorts of knowledge which are 'true' or 'verifiable' but rather that what might be called the positive sciences demand from their practitioners, during this age of man, some significant degree of active response to empirical reality. In too many other fields, only the self-motivated bother to respond actively to much of anything but their own dreams and illusions or—still worse—to the dreams and illusions pushed into their heads as they sat passively in many a classroom or sat passively in their parents' living-room in front of a video screen of some sort.

The best thinkers in those other fields, such as the historian Jacques Barzun or the theologian Joseph Ratzinger or the philosopher Alasdair MacIntyre, have responded actively to empirical reality and have minds which are the equal in power and insight to those of the best scientists.

## 34 Can a Language Form as Human Minds Shape Themselves to an Unfolding Reality?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=791>. It was finished and uploaded on 2011/03/29.]

I've finished reading Thomas S. Kuhn's *The Structure of Scientific Revolutions* [83] but I continue to think about the issues he raised. Some of his attempts to make sense of these "scientific revolutions" involve efforts to make sense of the language used by various groups of scientists.

When talking about the need to use a assumption-loaded (my term) language when doing even the most 'objective' of scientific work, Professor Kuhn tells us:

As for a pure observation-language, perhaps one will yet be devised. But three centuries after Descartes our hope for such an eventuality still depends exclusively upon a theory of perception and of the mind.

...

No language restricted to reporting a world fully known in advance can produce mere neutral and objective reports on "the given." Philosophical investigation has not yet provided even a hint of what a language able to do that would be like.

This idea of a language which can provide "mere neutral and objective reports on 'the given'" assumes that there is a mind which is independent of the world to be explored and understood. Against this, St. Thomas

Aquinas had stated a theory of the mind shaped by active response to the environments of that human being. Modern neurobiology has independently confirmed this Thomistic understanding of man as an organism which develops by intention, that is, by growing and moving in a purposeful direction though that man might well not know what he might become.

Moreover, this idea of a language which provides "mere neutral and objective reports on 'the given'" assumes that what is out there are things and relationships between things which come to us in the form of objective data, or potentially objective in the sense of being 'free' of what might be roughly called organizing preconceptions. It assumes perceptions are to be had by the simple opening of our eyes or the lifting of our noses to the wind. In fact, perception is proving to be an intense and purposeful ordering by a creature of its environments to its own needs and desires, to its purposes. Even reason is to be had in increments by the properly active exploration of our environments. Reason is not something we have and bring to the task of making sense of a chaos in which we're embedded.

Many creatures have somewhat limited purposes to pursue as they move about and grow, but man seems to be the sort of creature who functions best, in various ways, when he has a good understanding of all that is visible or imaginable to him, even a good understanding of all which might be speculated to exist by a St. Augustine or an Albert Einstein. That's where my problem lies with modern scientists. For example, some of the best of modern neurobiologists tend to be pragmatists along the lines of William James and don't recognize that we, and even aardvarks, grow into a world, a universe which is, in a manner of speaking, overloaded with value and meaning by the purposes of its Creator. Yet, most of the points I raise in the rest of this article remain valid for either a Jamesian pragmatist or a Christian, Thomistic existentialist.

I'll make summary comments on four points and provide references to earlier articles on this weblog. I'll also make a short concluding statement.

1. We often need to speak in vaguer ways, such as those of traditional wisdom-literature, before learning enough to speak in the way of a truer knowledge.

Wisdom is the fumbling substitute for perfect knowledge. [*The American Story* [59] by Garet Garret.]

See Chapter 588, *What is Wisdom?* for my comments upon this quote.

I speak to one aspect of the evolution of languages towards a greater capacity for true knowledge, truth, in Chapter 72, *Why Do We Need to Speak As-if?*

More powerful languages would emerge, and have emerged, naturally as the human mind develops toward a richer and more complete encapsulation of Creation, yet, even ideas once expressible in clear ways can be obscured by changes in words and concepts—see Chapter 564, *Christian Misuse of the Concept of ‘Person’* and Chapter 586, *If We Can’t Understand What We Shall Be, We Can’t Be It* for discussions in a Christian context.

Progress will come if we’re careful to be facing in the right direction as we walk along and so long as we continue walking, but the path can curve away from us as Dante’s pilgrim realized in the first verses of the *Inferno*.

2. We shouldn’t mix epistemological (biological) issues with metaphysical issues but metaphysics and the empirical sciences should be in a respectful dialog.

See my freely downloadable book, *Four Kinds of Knowledge* [43], for a discussion of my view of these issues and my reasons for arguing against the modern feat of turning practical divisions in human knowledge-gathering and knowledge into divisions between realms of being.

3. As the American historian Carroll Quigley told us: The truth unfolds in time through a communal process.

Knowledge has a social dimension, as Kuhn discusses in various ways without saying so directly. I would even say that this social dimension is dominant in the more abstract forms of knowledge, including most of the specific sciences—physics and biology and chemistry and so forth. For a discussion of the general problem of a people, the citizens of the United States, with a poorly integrated knowledge of certain important aspects of reality, see Chapter 405, *Ways of Thought in the Modern West*, and Chapter 601, *The False Promises of the American Dream*.

4. Perceiving what lies around us is an active and not passive process.

This is to say that perceptions are themselves ‘taken in’ by way of processes not so different from cognition. The neurobiologist Semir Zeki discusses the complexity of the processes by which we see the world of color in his book, *A Vision of the Brain*. I discuss the discovery of the neurobiologist and philosopher Walter J. Freeman along with his students that “the brain response generated by the same stimulus is not always the same” in Chapter 87, *Perceptions and Context*.

Freeman tells us that even when we’ve actively perceived our environments, we make them our own, we come to understand and know them, by our active involvement. We learn to manipulate natural objects and to make artificial objects for our needs and pleasures. We run and dance and sing. We begin to move under the seas and to enter space. We build bridges and university laboratories.

Any useful language will, in fact, be structured to help the active man to direct his efforts to obtain and organize observations in terms of a plausible understanding of at least his immediate environments. That understanding can lead to power plants and productive farms, whether Amish farms or petrochemical complexes. If we have to speak of biases, then we should simply say we should be aiming at languages with better biases rather than no biases. Biases can be encodings of the best and most plausible knowledge we have at any particular time. Even when our inherited biases are wrong, they are necessary as a starting point. This is the reason historians of science now take alchemists seriously as pioneers in exploring the nature of matter and astrologists as exploring the movements of planets and stars.

Our biggest problem in physics right now would seem to me to be unaffected by any possible language which can provide "mere neutral and objective reports on ‘the given,’" but perhaps solvable if we could develop concepts and a related language capable of allowing us to speak of a reality in which both quantum theory and the general theory of relativity are true. Both of those theories are highly specific and have been verified in many ways by way of finely targeted experiments, that is, experiments biased to seek very specific information. Those experiments were the results of theoretical physicists interacting with experimental physicists, sometimes one man or woman being

both. Those physicists, theoreticians or experimentalists or both, had minds well-shaped to one or more of the quantum theory and general theory of relativity. They thought not only in terms of the theories and their real-world implications but also of the measurable and observable effects of those theories. Now we need to learn how to think and speak of the universe as if both quantum theory and the general theory of relativity were true. I suspect the mathematics would fall into place if we could do so. As it is, we see a lot of confusion coming about as physicists tackle the mathematics when the concepts and language provide no unified way of speaking of both theories at one time.

5. In summation, we need biases to function as human thinkers and doers.

The main conclusion I'd draw is that, at least to the understanding of a Thomistic existentialist, the very nature of created being and of mind tell us that it doesn't even make sense to talk about a language which can provide "mere neutral and objective reports on 'the given,'" and yet there may be some good which will come from the efforts to develop such a language on the part of those with different beliefs as some good came from alchemy and astrology.

## 35 Until We Know What Truth and Freedom Are, We Should Be More Modest In Our Claims

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=869>. It was finished and uploaded on 2011/05/26.]

There is an argument of sorts being conducted in the Catholic Church between those who think the Fathers of the Vatican Council II erred in claiming God grants religious freedom to human beings and those who think Truth must always be served by... well, by serving some established view of the Truth. See the article, *Religious Freedom. Was the Church Also Right When It Condemned It?*, at <http://chiesa.espresso.repubblica.it/articolo/1348041?eng=y> for an overview by a theologian who wants to critique both camps of thought. I don't have a high opinion of those in either camp because they're trying to answer a complex question in terms of pre-modern human thought when that question, at least in its present form, arose in the Modern Age based upon discoveries in modern centuries. The critical theologian in this piece, Basile Valuet, does no better so far as I can tell. I didn't bother to study the article after reading it quickly. This third camp of thought on this issue of religious freedom seems to deal with some alternate universe, as do the other two camps. I'll explain.

Etienne Gilson said somewhere that Catholic thinkers withdrew into a ghetto around 1800 when they couldn't come up with good answers to the modern questions. So far as I can tell, this current debate in taking place in that ghetto between thinkers who are—at best—slowly recognizing their untenable positions and those who are doing their best not to recognize their untenable positions.

In other words, the underlying problem is the ongoing refusal of nearly all Catholic intellectuals, Christian thinkers in general, to make peace with God's Creation as we now understand it—though I've pointed out often that they feel quite free to extend their own lives and to make themselves more comfortable by using working technology based upon a radically different view of Creation than any which could be compatible with these Christian ways of thought, 'traditional' or 'modern'. Both terms are wrongly used because pre-modern thinkers (other than the oh-so insightful Aquinas) had reasons to think of the mind as an immaterial organ of the human being, which organ had some sort of direct access to transcendental truths binding even upon God and modern thinkers recognize that insight of Aquinas (though typically learned by way of modern neurobiological research) which tells us the mind is more of a set of relationships with our world and those relationships are formed by active response to that world. To be truly 'modern', you have to respond to the strong point of modern thought—modern exploration and analysis of empirical reality. This means that you must have some serious understanding of modern mathematics, physics, biology, history, and so forth.

I'll now repeat my plea to my fellow-Christians, and others, to join me in re-examining our most basic ideas of what being is, what thought is, what a creature is, and what Creation is. I'll start by repeating the claim of the American historian Carroll Quigley:

The truth unfolds in time through a communal process.

Before moving on, I'll note that Professor Quigley was a non-practicing Catholic who was quite faithful to the Christian system of metaphysics labeled 'moderate realism'—take the above claim as a rough definition of moderate realism and look above for a Thomistic understanding of mind and take that as the first step towards a more powerful form of moderate realism. I'll also note that Quigley's course on how to think in historical terms was taken by most State Department employees and other government employees (apparently including many CIA analysts) studying at the Georgetown University's *Edmund A. Walsh School of Foreign Service* during the period from the late 1930s to the late 1970s. (I believe it was required for some programs of study sponsored by the State Department.)

Freedom, including the freedom to stray from the truth, would be necessary for such a process. We can even see this process at work in the

sorting out of the vast output of St. Augustine of Hippo, the most important founder of Western Civilization and the greatest of theologians in Western Christianity. As Jaroslav Pelikan, and probably others, pointed out: Augustine was the father of nearly all existing schools of Christian theology in the West—orthodox and heretical. It took centuries to derive something of a plausible view of human sin from Augustinian views of the Bible set in the context of history as Augustine knew it. This process would have resulted in a more than human mess if the participants hadn't tried hard to keep in mind some serious understanding of truth and freedom.

Truth should be served.

Yet, I think Pilate has been underrated as a philosophical critic:

What is truth?

Part of my effort has been to examine this question, largely resulting in claims that:

1. God is the creator of all truths that we creatures can know. This means at least that God has to manifest a truth in Creation before we creatures can know it. We have no direct access to transcendental truths, whatever they might be, but only the access granted by God in specific ways.
2. Things are true—as St. Thomas Aquinas pointed out.
3. Truths are thing-like—as I've pointed out based upon modern science especially modern sciences of the brain and mind, of mathematics and physics.

My questions and tentative answers don't arise from some sort of arbitrary creativity or efforts to think 'freely' but rather the result of an effort to be free in the sense of responding to God's Creation, an effort to share in my limited way in the freedom God exercised in bringing into existence this particular Creation. In freely choosing to be the Creator of such a particular Creation, God also freely accepted constraints upon His treatment of all that He had created.

I try to summarize this aspect of my thought by writing that I respond freely to Creation, to the thoughts God has manifested, as best I can, in order to be shaped to a better image of God. I freely try to accept the

discipline God offers us by shaping us into the sorts of beings who can then share the life of God as Creator acting with constrained freedom.

This is all complicated further by those of us who think that there are some revealed truths given by God, mostly in the Bible, which could not have been discovered, even in principle, by human beings responding to God in His role as a self-constrained Creator. Even those revelations of transcendental truths are given to us in physical form and using words and analogical images derived from concrete being. Is it surprising we think to understand Father and Son better than we understand the Holy Spirit?. That lack of understanding of the Holy Spirit might be corrected as we move to an understanding of the primacy of relationships over concrete things, as taught to us by modern physics—especially quantum theory—and also hinted at by the writings of the disciples of St. John the Apostle.

The main point is that the modern world doesn't demand just a more exact understanding of human nature, as Pope Benedict has claimed, but also a more exact and far richer understanding of human nature – including human ways of thought, of Creation, and even of the nature of truth which is accessible to a creature.

# 36 Good News: Astronomers Are Having Serious Problems Estimating the Masses of Large Objects

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=917>. It was finished and uploaded on 2011/07/04.]

See the article *Astronomers Reveal a Cosmic 'Axis of Evil'* at <http://www.sciencedaily.com/releases/2011/06/110630073417.htm> to learn:

Astronomers are puzzled by the announcement that the masses of the largest objects in the universe appear to depend on which method is used to weigh them.

...

Clusters of galaxies are the largest gravitationally bound objects in the universe containing thousands of galaxies like the Milky Way and their weight is an important probe of their dark matter content and evolution through cosmic time. Measurements used to weigh these systems carried out in three different regions of the electromagnetic spectrum: X-ray, optical and millimetre wavelengths, give rise to significantly different results.

To those not well-read in cosmological physics, this weighing of clusters of galaxies is a part of the project of determining the fate of our universe—eventual contraction or unending expansion, itself an important part of the greater project of understanding created being.

This weight-measurement problem raises a variety of possibilities, including a radical incompleteness in our understanding of fundamental properties of matter-energy. Serious problems of this sort are often a sign of the potential for someone to do some good, creative thinking, maybe even discovering what might be called “new physics.” Reality might be different from what we currently think and we can maybe better shape our minds by shaping them to a better approximation to the truth.

Whatever our beliefs, Christian or Jewish or pagan or atheistic, we can explore and analyze this dynamic universe only if we have courage and also a faith that the effort will prove rewarding—a faith that the universe is coherent and that we can reach an understanding of that coherence. I’m not sure if physicists and other scientists are continuing at the level of creativity shown by Einstein and Feynman. There have been some serious thinkers who have claimed to see signs that, over the past century or so, the deeper forms of creativity have faded a bit even in the physical sciences. Some of those thinkers have been scientists themselves, such as Michael Polanyi who also saw moral problems developing in the conduct of science; others have been respectful observers of science, such as Jacques Barzun who saw signs that all fields of Western endeavors have been living off the creative explosions of the decades around 1900. Maybe science has seemed a bit more creative than, say, political philosophy in the 20th century because the second-tier of scientists simply had more to work on because of the efforts of Einstein and Planck and those who followed soon after.

I’ll return to an upbeat note of sorts by repeating my words from above:

Whatever our beliefs, Christian or Jewish or pagan or atheistic, we can explore and analyze this dynamic universe only if we have courage and also a faith that the effort will prove rewarding—a faith that the universe is coherent and that we can reach an understanding of that coherence.

If we truly have any sort of freedom, we have the freedom to shape our minds to the vast mountains of partially processed empirical knowledge piled up in recent centuries. History would indicate that no civilization can continue without a coherent understanding of the world and without a creative response to that world. A good number of thinkers and doers in the West need to respond to a dynamic world, not to our inherited and no longer plausible understandings of the world. If this is done, if that

good number show faith and courage, business entrepreneurs as well as philosophers, political activists as well as physicists, novelists as well as civil engineers, we have a chance to reform the West or even to found a radically different phase of civilization for some part of the human race which might correspond to what's called the West or it might be a larger part or a smaller part.

## 37 Abstractions and Concreteness in Our Social Relationships

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=953>. It was finished and uploaded on 2011/07/28.]

A recent article, *Female Minorities Are More Affected by Racism Than Sexism, Research Suggests* at <http://www.sciencedaily.com/releases/2011/07/110711144948.htm>, speaks of a study showing that Oriental women who are members of immigrant communities in the United States are upset in a deep and emotional way by racial prejudice but are dispassionate about prejudice against them as women, taking that as an intellectual error.

Despite the fact that there is an objectively defined group of “women”, despite the fact that there were roles assigned to members of that group, it’s not likely to have been a natural group in early human communities. It’s likely that women in most historical and prehistorical periods would have been more likely to worry about their sons’ breeding success than about any fair treatment of the wives of those sons. They likely would have even been more worried that their daughters have lots of children than being concerned that their daughters be educated and have respected roles in the tribe or village.

Race, even if only defined as “those who have similar features to me” is quite suggestive of kinship communities, of breeding communities in a manner of speaking. In gene-centric ways of viewing life, such a community is a proxy, a visible sign, of true genetic relatedness. We act as if, for example, we share a lot of genes with those who look like us and live near us. Those gene-centric ways of thought are exaggerated but not entirely

wrong. Kinship communities, tribes, are more than just a population of those who share a common and fairly small pool of genes, but they are founded upon such a relationship. Evolution occurs in the context of kinship communities, family lines, or whatever you wish to call them. Wouldn't we expect human beings to be more viscerally affected by relationships with a bodily foundation?

I'm certainly not saying that it's bad to form more abstract or even "artificial" relationships. As a Christian, I believe the main theme of history is the formation of the Body of Christ which is quite abstract in many ways. By 'abstract', I mean not illusory nor do I refer to a manner of speaking. I'm referring to an entity defined by relationships which, in some sense, draw or attempt to draw upon realms of created being from which this concrete realm was shaped. Many of our most important relationships in the modern world fall into this category, such as those of our professions or trades, our hobbies or religious affiliations, our politics, and so forth.

I suspect that concern about "women's rights" is part of a movement towards more rational and more highly moral forms of relationship between human beings, that is, that we should be looking at a candidate for a job in terms of qualifications and not considering either race or sex either to exclude or affirmatively include. We're a long way from that and the final result of such a change might well be a society in which some traditional differences between men and women and between ethnic groups are confirmed. Things are what they are and will be what they will be, so why should we pretend otherwise, as Bishop Butler pointed out several centuries ago.

We should be careful not to exaggerate the importance of the man-woman divide and careful not to see any prejudice against women as more deeply embedded than the various class prejudices which are more closely tied to genetic relatedness. One of the undeniable advances in the West in recent centuries has been the greater respect paid to men holding humble but important jobs—men of the lower classes. The higher respect paid to these men has shown up in monetary forms of payment as well. The split between haves and have-nots has historically been more concrete and more important than that between men and women. After all, a woman has a lot of reasons to be more concerned about the success of her husband than the success of some women she's never even met. We'll never reach a perfect state of fair-treatment of all human beings in this world and we may see a lot of backsliding, but we've made more progress, some of which seems

likely to be lost for some decades.

Yet, I'm reasonably confident that this issue of fair treatment of all human beings will be a situation where the truth will emerge over time through communal processes and not by political activism preferred by our current batch of visionaries who are no more likely to be right about the future than were Marx or lesser seers going well back in time. We shouldn't be unduly pessimistic about seeing into the future because we can likely see some aspects of emerging truths, but emerging social structures are not likely to be foreseeable. They are too complex and will reflect too many empirical and contingent elements. We don't even know what problems and opportunities future generations will face. How can we tell them how to organize their lives and communities?

In any case, the deeply rooted relationships, the ones rooted directly in our flesh, will always be strong and will be the foundations of all other relationships. Love of mother and father might expand to love of those who are like mother and father and then might even expand beyond that. Over time, other relationships, the abstract relationships developing as civilization becomes more complex, may prove to be also very strong. But those newer relationships, such as the ones enjoyed recently by working-class men, are based upon the abstract foundations of a civilization and may decay rapidly if civilization weakens—and Western Civilization is weakening fast. Any civilization is more a manifestation of our deepest moral beliefs than a collection of economic processes and engineering feats, and the loss of Western Civilization will mean certain noble moral beliefs will no longer be concretely manifested. They will return to being noble dreams, for those who remember them.

Those Oriental women have reasonable feelings and thoughts. They feel tied most closely, at a gut level, to those in their ethnic group and their ties to “women” in general will be more abstract—that is, intellectual. Prejudice against women will be perceived at that level – as an intellectual mistake, a mistake in dealing with abstractions. Prejudice against a “gene-based” kinship group, though that group itself be large and somewhat abstract, will be felt in the gut.

I'll move on to a few short and related comments about other studies discussed in another article, *Humans 'Predisposed' to Believe in Gods and the Afterlife* at <http://www.sciencedaily.com/releases/2011/07/110714103828.htm>.

Those who conducted the studies deny making theological claims. They

only claim human beings are inclined to believe in supernatural entities and are also inclined to have a dualistic view of their own human nature, believing something of their own selves survive their deaths.

We should take the general claim seriously while discounting, as the authors seemed to do, the specific beliefs. We're inclined to believe in divinity and in an afterlife. This is similar to our 'predispositions' to empirical thought. We try to think in ways that agree with reality, mostly, but that doesn't mean the average caveman was thinking in ways acceptable to a modern chemist or medical doctor. It doesn't mean a tribal shaman was thinking in terms that would allow him to understand Jeremiah or Augustine of Hippo or Martin Luther, though he might detect a deep concern for spiritual matters in a general sense. It does mean that tribal shaman and his followers were thinking in terms which allow the long and slow development of more sophisticated understandings of the possibilities of divinity and of life after death.

Our gut-level belief in "more than we see" is very primitive and very real. Once we humans advance in understanding various realms of being, by way of physics and music and biology and literature, we can start refining those gut-level beliefs. We have 'predispositions' which allow us to move towards thinking of created being along that spectrum of concrete to abstract. Right now, we're in the odd position of holding some abstract beliefs and engaging in quite abstract relationships but trying to treat them as being fully a part of the domain of concrete being.

## 38 Better Explanation of Scientific Issues Isn't Enough

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1020>. It was finished and uploaded on 2011/09/13.]

This article, *Rebalancing the Nuclear Debate Through Education* found at <http://www.sciencedaily.com/releases/2011/09/110909111444.htm>, tells us:

Better physics teaching with a particular emphasis on radioactivity and radiation science could improve public awareness through education of the environmental benefits and relative safety of nuclear power generation, according to leading Brazilian scientist Heldio Villar. He suggests that it might then be possible to have a less emotional debate about the future of the industry that will ultimately reduce our reliance on fossil fuels.

This is true enough but I think there is a more fundamental failure of our modern educational systems. Before we can reason effectively using any sort of knowledge, before we can even take in any sort of knowledge as knowledge, we need to shape our minds so that we have the proper respect for what lies outside of us.

As I noted recently, Thomas Jefferson thought—rightly in my opinion – that a “perverse literacy” would lead to an “invincible ignorance.” This is to say that knowledge, even blunt and undeniable facts, will be either ignored or squeezed into a weird shape to protect our preferred view of reality. I’ve noted before how Christians can read St. Augustine’s *City of God* and miss his jokes about farting—they expect holiness and purity and light

in a book by a saint, not hard-headed attitudes about embodied human nature. I could add that I've read even popular histories and found hints, but strong hints, that American leaders have committed major war-crimes or have purposefully squandered the lives of American soldiers, perhaps even preferring many American deaths to upset the American public and sucker them into stronger support for wars just or unjust. In a more scientific vein, we could point to the almost deliberate misreading by many wannabe Christians of, say, the writings of evolutionary biologists. Those practitioners of "perverse reading" miss the dynamic nature of this field of science and take questioning, qualifications, and expressed uncertainties of many sorts as being evidence that biological evolution is a false theory.

It is hard to read difficult works in an intelligent way. How many can read *Moby Dick* and realize that Melville is presenting Captain Ahab as being a more self-aware and courageous American, that is, as a morally insane human being who is in rebellion against God, upset that God has put constraints upon us?

We need reading and thinking skills to be able to read or hear even the best of knowledge and to make it our knowledge, that is, knowledge to which we have responded and have made our own, made a part of our thinking processes.

I'd like to go even further, to point towards what might be called my overarching goal: We need to be able to see all humanly-accessible knowledge, including that of our own technology, as being part of a unified body of knowledge of God's Creation. In my freely downloadable book, *Four Kinds of Knowledge* found at <http://loydfueston.com/downloads/know.pdf>, I write about humanly accessible knowledge being of four kinds for practical reasons but being of only two kinds ultimately: knowledge of God acting freely as a Creator of a particular world and knowledge of God in His transcendence. We know God in His transcendence only so far as He reveals Himself.

Knowledge of Creation, physics as well as evolutionary biology and human history and literature and all other fields of knowledge, is knowledge of thoughts God manifested. By struggling to understand, as St. Thomas Aquinas pointed out more than 700 years ago, we begin to shape ourselves as better images of God. We become children picking up sticks and pretending to do what our Father does as He goes about His work of creating and sustaining and telling the story which is this world.

Western Christians once had a story of this sort and then we learned

much that told us that story had always been no better than plausible speculations, no more and no less than an attempt to explain each level of created being by way of a narrative which held all of those levels and each entity in those levels in place. We learned a lot of reasons why that narrative was defective and we learned the wrong lesson that such narratives aren't possible. Such a narrative is possible and creating that narrative, however implausible it will prove to be to our descendants, is perhaps the most important part of building, or rebuilding, a civilization.

Somewhere, Wendell Berry, the poet and farmer, told us that if we find moral ways to make our livings, we'll more or less automatically solve our ecological problems. That claim can be enlarged to cover many more sets of problems, but—as he knew well—we can't find moral ways to make our livings, including moral ways to generate power, until we recover an understanding of Creation as such. And that will require a far greater effort than pushing a few technical words and diagrams into the heads of our children.

## 39 There Might be a Better Form of Nuclear Power Generation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1023>. It was finished and uploaded on 2011/09/14.]

Our current nuclear power technology is at least dirty, that is, it generates lots of dangerous waste. That is part of the attraction to the leaders of the United States since Truman. That waste includes weapons-grade uranium and plutonium. Yet, we have a need for large power-plants or—better—lots of smaller plants to produce electricity if we are to maintain a high standard of living.

The real problem with the waste is that there's a need for facilities that must be guarded and maintained for thousands of years and our political system isn't capable of such long-range commitments. From a technological point of view, there are good ways to store the waste for those thousands of years, but our governments are the problem.

Suppose we could have nuclear power plants without so serious a problem with nuclear waste? It turns out that the nuclear scientists and engineers working for the U.S. government had built a different sort of reactor in the late 1940s, something called "liquid fluoride thorium reactor", with an acronym of 'LFTR' often pronounced lifter. One of the nuclear physicists involved in that early effort, Alvin Weinberg, later headed up the Atomic Energy Commission and tried to restart the LFTR program but failed to obtain the support of American government leaders. I'll not give details here but other military research projects also produced good results but were killed because it wasn't a good technology for the use intended in that project.

What's so good about this alternative nuclear power generation? First of

all, it produces very small amounts of weapons-grade uranium or plutonium, none at all if tricks are played that cost only a little bit of efficiency. It can also be used to burn up dangerous materials, including weapons-grade uranium or plutonium or the waste from our existing sorts of reactors. A liquid fluoride thorium reactor can be designed so that the fuel drains out if electric power for auxiliary purposes is shut off or if the reactor overheats for any other reasons. There are many claimed advantages and there is a record of early prototypes which existed and worked as well as such things can be expected to work.

At this point, I'll recommend that those interested in power production technology should check the site, *EnergyFromThorium* found at <http://energyfromthorium.com/>. There are a lot of links to good documentation including videos of very good presentations on the history and present and possible future of this type of technology. This looks to be truly promising and looks to be a technology which can be implemented on a fairly small-scale under local control. Spread the word even if you have some doubts.

# 40 All an American Needs to Know, He learned in Kindergarten

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1047>. It was finished and uploaded on 2011/09/27.]

We need some creative solutions to our problems, so long as those solutions are the right kind of creative solutions. You know which solutions I mean, the ones we already know about but we just need to try again and do it better this time. Yeah, we need creative solutions, like the ones we already have but different. They should be creative, but not too, you know, not too far out. They should be creative, but we already know a lot about things in this world and any creative solutions should stick to those truths.

After all, we already learned all we need to know in kindergarten and we're now free from any dreary study. Those guys on TV news shows tell us all we need to know and it all makes sense if we just remember that stuff we learned in kindergarten.

History is working to advance the American cause which Washington and Lincoln and that guy at Walden Pond wrote about in the *Declaration of Independence* when they created the United States and warned the other countries in the world to behave and live up to American ideals or we'll put them in their place before they harm us or our way of life or take away our freedoms they hate so much. But they aren't really bad. If they really want to try hard, those guys in the deserts of Afghanistan could have good lives just like Americans in the nice new developments around Atlanta. Those guys could give up their robes and the funny stuff they wear on their heads and then they'd be ready to have freedoms and nice houses with central

air-conditioning and cable-television hook-ups. They could even start little leagues for their kids and someday some of their sons, or their daughters, could have a chance to play in the American big leagues.

We have problems and those poor people in Iraq and Afghanistan and Libya have even more problems. We only have to turn on the television to see what a mess Gaddafi made of Libya. Their cities are in ruins and a lot of their roads and other infrastructure look like something out of a war-zone. Don't they have back-hoes and excavators and Departments of Public Works over there? And there are stories about Libyans having trouble getting food and electricity and stuff. They need all that stuff if they're going to straighten up and live good lives with freedoms and nice houses with central air-conditioning and cable-television hook-ups and even more stuff than that. We'll help them pull themselves up by their bootstraps. First we have to teach them how to wear boots. Then we can teach them all the other stuff we learned in kindergarten and they can start taking better care of their sewage systems and roads and bridges.

Yeah, we have problems and we need some creative thought and some creative action but it's not so hard to figure it all out if only we remember what we learned in kindergarten. And we have to teach all that good stuff to all the people in the world who don't know how to live good lives and behave like decent folk.

Isn't it too bad about those Red Sox falling apart in September? Thought they might pull it off this year and a good exciting World Series would have really helped those Iraqis and Afghans and Libyans to pull together and settle down and then we could have taught them everything we learned in kindergarten. We have lots of politicians and generals who seem to know they can do a lot of good things in the world with what they learned in kindergarten. Only they got powerful stuff like those bunker-buster bombs and those drone bombers and all the other stuff we got for enforcing peace and order on those evil people who are trying to take away our freedoms and our way of life.

It's kind of upsetting to read about scientists who don't think like real Americans. This article, *Why We Crave Creativity but Reject Creative Ideas* found at <http://www.sciencedaily.com/releases/2011/09/110903142411.htm>, makes me and other Americans really uncomfortable. Well, a good night's sleep and I'll forget it and just remember that good stuff I learned in kindergarten.

Oh yeah. I never went to kindergarten. And I was taught how to

read when I was three by my Great-aunt Minnie. And I learned how to appreciate good books from relatives like my Great-aunt Mary, feisty feminist and radical labor-union leader that she was. She had only a sixth-grade education—in Scotland—but devoured serious historical works and demanding works of literature. And when I went to school at the late age of six, I slept more often than I listened to the blah-blah of teachers and that's maybe why I had such bad work-habits when I went to a real college with relatively demanding standards.

I wonder what it is that all my fellow-Americans learn in that year of kindergarten. It must be some pretty good stuff.

## 41 The Importance of Brain-folds

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1066>. It was finished and uploaded on 2012/10/10.]

The talents and skills of accurate perception and memory formation are very much higher-level properties of the human being, giving the appearance in past ages that ‘soul-stuff’ or ‘mind-stuff’ is necessary for such acts tied so tightly even to what we would label as virtues, such as honesty. In more recent years, dualists with the tint of reductionistic materialism have proposed software-stuff and purer dualists have proposed processes of consciousness.

Oddly enough, human abstract thought—including those realms of thought necessary for even basic exploration of empirical reality – seems to have bootstrapped itself by conjecturing these abstract or immaterial entities which exist alongside of the physical stuff of this world. As the story goes:

Souls animated all creatures with man having a special sort of soul, sometimes in addition to a more ‘ordinary’ human animal soul. Mind has access to truths only partly reflected in the physical stuff of mere things and organisms, that is, truths are somehow apart from, transcendental to, created being and yet accessible by a creature with a created brain and—according to some—a created mind as well. Of course, you can assume mind is not created, or at least some sort of transcendental Mind which belongs to some sort of transcendental Man. It becomes reasonable that the Realities of man and mind would be fully as transcendental as the truths that the flesh-and-blood creatures can somehow know.

How very disturbing it must be to some, how very interesting it is to me, to learn from this article, *Keeping Track of Reality: Why Some People Are Better at It* found at <http://www.sciencedaily.com/releases/2011/10/111004180108.htm>, that our ability to form accurate memories of the world around us seems to be related to the existence of a particular fold in our brains. There is even reason to believe that those without this fold in a region “at the front of the brain called the paracingulate sulcus” might live in a dream-world of sorts which they believe to be the real world outside of them. That itself is reason to believe there might be some connection between a lack of this fold and schizophrenia.

We know that some of us are better at leadership, some at nurturing, some at making useful and beautiful things, some at various types of thinking, and so forth. Now we know that some of us are also better at remembering what really happened. This isn't so surprising, at least to a Christian who has been told that we each have a role in the Body of Christ, but it does raise some difficult questions about recognizing and properly utilizing those with different abilities.

How will this process happen? I don't know. If I did, I could apply for a position in the top-levels of a hierarchy, arguing I could plan a community by way of slotting individuals in their proper role. If I, or anyone else, could describe this process, we'd be able to plan for the best for all who are under our power. Modern history has shown us, is showing us now, that this is a fool's game to try to predict and control the future of human societies or any of their substantial parts.

What we have to do is to try our best to pay attention to reality and to learn from reality. We do our best by going with the flow, not in a fatalistic way, but in the way of a talented and experienced surfer who certainly knows he doesn't have the strength or agility to do as he will, rather does he have the strength and agility to use the wave's movement to his own advantage.

Still, it's somewhat surprising that some of us, probably many of us, are congenitally incapable of remembering with accuracy the things and events of our own immediate regions of spacetime. Is that simply a factual result of an ongoing evolutionary process? Is it a factual result of a stable aspect of human beings?

Is it maybe even a good thing? Are there advantages to having some, or even many, in a human community somewhat detached from reality in all its strict details? It's a question worth contemplating.

## 42 Is It Science or is It Murky Water?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1122>. It was finished and uploaded on 2011/12/13.]

Near the end of this amusing article, *In Physics, Telling Cranks from Experts Ain't Easy* found at <http://blogs.scientificamerican.com/cross-check/2011/12/11/in-physics-telling-crank-from-experts-aint-easy/>, John Horgan raises an interesting point about theories of physics:

Great scientists are great because they discern patterns in the flux of nature that elude us ordinary mortals; we should not be surprised when some patterns turn out to be illusory. Indeed, whole fields can descend into crankiness. Wertheim serves up her philosophical punch line toward the end of her book, when she turns her attention to mainstream physics and cosmology. She shares my sense that some popular suppositions—notably the notion that reality consists of extremely tiny strings wriggling in hyperspaces of a dozen or more dimensions, or that our universe is just one of an infinite number of universes—verge on pseudoscience, because they are even less experimentally testable than Jim Carter's circlon theory. [The circlon theory is a 'crank' theory by an apparently well-intentioned and competent man, a self-educated amateur scientist, Jim Carter, who has become a friend of Ms. Wertheim, a science-writer who is a friend, in turn, of John Horgan.]

It comes out earlier in that article that Newton wrote much that

would have been considered ‘cranky’ by hard-headed advocates of science. Amongst Newton’s voluminous writings can be found much about alchemy, the ridiculous idea that lead can be transmuted into gold while everyone knows that gold is better made by transmuting hydrogen in gigantic nuclear fusion systems called stars, very large stars of the sort which might have been more common in the early years of this expansionary phase of the universe. It’s hard to distinguish between crank science and legitimate speculative work that might guide a more disciplined exploration of the question at issue. If there’s an alternative universe where the possibilities motivating alchemy were strongly despised, it might have taken more time to understand the basic processes of this universe.

It can be hard to distinguish between a mainstream prejudice of a given age, or ages, and a speculation based upon a different understanding of matter or time or whatever which might be closer to the mark even though the specific speculation might seem, or might even be, the stuff of hard and dense Christmas cakes. During his own lifetime, the main objection to Newton’s work in alchemy was the prejudice that lead was lead and gold was gold. That was close to the prejudice held by many that biological species were what they were and couldn’t become something else except in the minds of the superstitious peasants and would-be magicians.

When you realize that much of creative philosophy, of the sort found in Plato or St. Albert the Great (speculated, wildly at times, on the transmutation of species), is distinguishable from the work of cranks only to those who know enough of that particular age to realize how speculative creative philosophy or theology or poetry really was but how it was a legitimate expansion of that age’s understanding of being. They didn’t have particle accelerators or excavation sites in the Great Rift of Africa but they had minds and tried to use them.

We have to be careful, especially in dealing with the likes of Newton or Einstein, Plato or St. Albert, not to forget that there are multiple ways to deal with truth or speculative possibilities. We did well in the past century in developing the creative ideas of Einstein and Planck and Heisenberg and that expansion was typically done by way of what might be called hard-headed science. This wasn’t just due to the power of that way of exploring empirical reality. It was made possible by the fact that Western Civilization had an understanding of Creation, yes—the Christian Creation, which was large enough and apparently ‘true’ enough to handle quantum mechanics and evolutionary biology and modern mathematics and modern

ways of exploring and narrating history and so forth. It's certainly true that many who thought of themselves as good, orthodox Christians proved to be enemies of modern science, which might prove to have been the final stage of development and expansion for the Western mind. Ultimately, at least in my understanding of the human mind, this means that modern men of the West continue to shape their minds in response to a general understanding of Creation which was more plausible in the 17th century, though it stretched well enough for the early stages of the development of modern physics and biology. Our modern minds are full and also often brittle and we don't know how to do better, though I have proposed some ways to head in a better direction and to better shape our minds to deal with a Creation which has proven to be far richer and more complex than the greatest of pre-modern thinkers could have guessed.

My suggestions include a change in attitude and belief about human knowledge which will undoubtedly upset many of the advocates of modern science: we should recognize the unity of knowledge and stop pretending we live in a single Creation in which there are separate realms of knowledge. Separate realms of knowledge imply separate realms of being which sort of interact but can't really come together, a chaos of sorts which has been brought about at least partly because of understandable reactions against illegitimate claims to authority and power by kings or popes or academicians who held to limited versions of Christian understandings of Creation. I advocate a return to Creation, or at least to a universe united in its being.

After I started writing this essay, I found Michael Gordin's review, *Everyman's Physics* at <http://www.americanscientist.org/bookshelf/pub/everymans-physics>, of Margaret Wertheim's book. Professor Gordin finds her argument interesting and presents it in terms respectable to that crowd of advocates of hard-headed science, but he comes down pretty solidly on the side of those who would exclude fringe science, which arguably once included some of Einstein's work before he had a reputation and also included some of the early work in quantum physics. Professor Gordin concludes, "Wertheim shows us just how muddy the waters are on the border between what is classed as 'legitimate' and what as 'fringe.' However, a murky boundary does not imply that one might just as well drink from any part of the river."

I would say that, to switch my metaphor slightly, we've reached the edge of territory we're were prepared to explore by our inherited understandings of Creation—of created being if you will. We might have to cross those

murky waters, perhaps swallowing some dangerous stuff in the process. In other words, string theory isn't a failure because it's too radical but because such efforts need a richer and more complex—a more radical—understanding of Creation or of created being.

## 43 Quantum Mechanics and the Limits of the Human Imagination

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1147>. It was finished and uploaded on 2012/01/02.]

I've advocated the view that our imaginations can encompass what God has created, what the Almighty has manifested in this Creation, but we need examples and stimuli—in a manner of speaking. We need to be courageous and open-minded in our responses to Creation if we are to learn from God, who has a far more powerful imagination than we can ever... imagine. So to speak.

In Chapter 90, *Shaping Our Minds to Reality*, I quoted the physicist and Anglican priest J.C. Polkinghorne [117]:

The wavefunction is the vehicle of our understanding of the quantum world. Judged by the robust standards of classical physics it may seem a rather wraith-like entity. But it is certainly the object of quantum mechanical discourse and, for all the peculiarity of its collapse, its subtle essence may be the form that reality has to take on the atomic scale and below. Anyone who has had to teach a mathematically based subject will know the difficulties which students encounter in negotiating a new level of abstraction. They have met the idea of a vector as a crude arrow. You now explain to them that it is better thought of as an object with certain transformation properties under rotation. 'But what is it *really*?' they say. You implore them to believe that it is an object with certain transformation properties under rotation. They do not believe you; they think that you are holding back some secret clue that would make it

all plain. Time and experience are great educators. A year later the student cannot conceive why he had such difficulty and suspicion about the nature of vectors. Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality. If we are indeed in such a digestive, living-with-it, period, it would explain something which is otherwise puzzling. A great many theoretical physicists would be prepared to express some unease about the conceptual foundations of quantum mechanics—in particular, about Copenhagen orthodoxy—but only a tiny fraction of them ever direct serious attention to such questions. Perhaps the majority are right to submit themselves to a period of subliminal absorption. [page 82]

I went on in that earlier chapter in this book – Chapter 90, *Shaping Our Minds to Reality*—to claim that we aren't born with brains which have much in the way of mind-like characteristics. Rather are our brains shaped, and our minds as well, as we respond to what lies around us.

Until fairly recently, I was myself confused about Heisenberg's uncertainty principle, thinking of position—in terms of a Cartesian x-y chart—as existing along with momentum. The fact that you couldn't measure both at the same time with unlimited accuracy was a problem no different from that we would have if we tried to find a billiards ball in a black-box by shooting at it with probes, such as marbles, comparable in size to the ball. You find the ball by disturbing it in such a way that momentum is changed. You measure momentum in such a way that you disturb its position. That's incomplete rather than wrong and is probably the right way to think about this issue when learning about quantum physics, but it's at least an excessively limited way to view matters.

A position measurement is quite simply a result of what might be called a position-oriented interaction with a more general sort of entity. Similarly, a momentum measurement is quite simply a result of what might be called a momentum-oriented interaction with a more general sort of entity. In more official words [12]:

[W]hen an electron interacts with a device that measures its momentum, its wave-like aspects (definite wavelength) are

emphasized at the expense of its particle-like aspects (definite position). [page 130]

So we might say that this situation is due to a wave-particle duality. Momentum is a wave attribute and position is a particle attribute. There are other such pairs including energy (wave attribute) and time (particle attribute). I've not yet read Bohm's later writings where he restated quantum physics in terms of what is apparently a strange potential in an effort to make it all more rational, but I'll make my own suggestion here.

We should imagine and speak of that electron as an entity more abstract than the concrete forms it might take after establishing a relationship with a more concrete entity. Until it forms a particular relationship with concrete entities, that electron is a form of being which is one step closer to the raw stuff of Creation, the thoughts or truths God manifested as created being, a specific set of truths for a particular Creation. Within that particular Creation many highly peculiar concrete worlds might be shaped.

Some physicists and philosophers might be inclined to speak in similar ways, including—I think—Bohm and his co-workers in his later efforts to make sense of quantum physics. The problem I see with any discussions I've yet read of Bohm's later work or the less detailed but suggestive comments of other thinkers is that they propose more or less radical re-thinkings of our ideas about the concrete being of this universe but, overall, they only patch up what might well be rather questionable concepts of being in a more general sense. I've proposed a more substantial, ground-up re-understanding of created being in a complex process which can be followed in my first published book, *To See a World in a Grain of Sand*—described at <http://loydfueston.com/?p=17>. I've also commented extensively in the web-published essays included in this book. My weblog, *Acts of Being* at <http://loydfueston.com/>, is still active though the material discussed is currently (as of 2012/04) driven by my thoughts as I work on other books, fiction and nonfiction.

Many of the essays in this book don't really belong in just one category. Thus it is that my sorting into chapters is sometimes a little arbitrary, but I think this structure makes it a little easier to figure out what I'm up to, a matter that often leaves my own half-reshaped mind in a state of confusion.

For now, let me finish by stating first three general principles of my metaphysical thought as it currently exists and then three aphoristic statements of important aspects of the underlying worldview:

1. The act of existence or act-of-being precedes and, so to speak, dominates substance.
2. Only God can perform an act-of-being which brings contingent being into existence where there was nothing, but even electrons interacting with each other can perform an act-of-being of a secondary sort, shaping a more abstract form of being into a concrete thing, such as an electron as a point-like entity with a specific location or an electron as a wave-like entity with a specific momentum.
3. Created being lies on a spectrum from the abstract to the concrete but abstract forms of being remain present in the most mundane things.

In a somewhat aphoristic style, I claim:

- Things are true.
- Truths are thing-like.
- Relationships bring things into being.

## 44 A Right-handed Insult

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1195>. It was finished and uploaded on 2012/03/01.]

I hope that William James was his usual good-natured and tolerant self when he wrote:

[T]he scholastic philosophy . . . is only common sense grown pedantic. [78]

He's right, in general, but it's sad that Catholic neo-scholastics in recent centuries seem to be pedantic without having all the common sense. In particular, so-called natural law theory seems often to be laws derived from nature as understood in ancient or Medieval times and raised to the level of some sort of pseudo-metaphysics now frozen into granite hardness so that even the facts of God's Creation can't so much as etch a prophetic warning.

Scholastic thought, including the Thomistic branch, was an outgrowth of what I would call the worldview of St. Augustine of Hippo, as is nearly all Western Christian thought since 500AD—at least until Descartes and Kant idealized and dogmatized views of empirical reality. This basic form of Western Christian thought is given a label such as 'methodical realism' and could be said to have been completed, to the extent possible in his historical period, by St. Thomas Aquinas. I'm working on an update of Thomistic thought, assuming that methodical realism is common sense conditioned to Christian understandings of God's self-revelations and to His ways of speaking to us regarding more contingent matters and His ways of dealing with us on a variety of matters.

As is true of some modern philosophies, such as Jamesian pragmatism, methodical realism—most especially in its Thomistic form or in the form I'm developing—starts with responses to what lies around us. We start with

an active form of common sense, broadening that sense to cover more and more of our local environments and then maybe extending to some coverage of the earth and then on to the universe and maybe on to Creation where I consider Creation to include the truths of mathematics and metaphysics as accessible to human beings. All the while, we Christians use our beliefs to discipline our ways of responding and our ways of understanding what results.

I'm going to give some sound-bites to give a general impression of my way of thought—this entry can be considered an introduction for those who haven't been following the development of my worldview or an overview for those who have.

Things are true. [St. Thomas Aquinas]

Things are true and truths are thing-like. [Loyd Fueston]

Even transcendental truths pass through those things which are human sensory organs and brains leading those absolute truths to be deformed and truncated to a thing-like form, leading to an ongoing need to restate those transcendental truths to accord with the latest understandings of things and contingent truths. [Loyd Fueston's update of an insight of John Henry Newman]

The truth emerges in time through a communal process. [Carroll Quigley]

Things and actions are what they are, and the consequences of them will be what they will be; why, then, should we desire to be deceived. [Bishop Joseph Butler]

Take the above quotes as starting points for lines of thought or even dreamy contemplations. And always remember what Newton once said:

I keep the subject of my inquiry constantly before me, and wait till the first dawning opens gradually, by little and little, into a full and clear light. [Sir Isaac Newton, from an Internet collection of quotations.]

And don't let your mind rigidify around any understanding you develop, that is, don't let your common sense become pedantry.

## 45 We Would Not Know a Truth if It Didn't Happen

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1221>. It was finished and uploaded on 2012/03/26.]

William James made a claim which should be very disturbing to those who hold mainstream views of the nature of truth:

The truth of an idea is not a stagnant property inherent in it. Truth *happens* to an idea. It *becomes* true, is *made* true by events. Its verity *is* in fact an event, a process, the process namely of its verifying itself, its *verification*. Its validity is the process of its verification. [78] [page vi]

I'm strongly endorsing the idea that truth comes to us by a dynamic process and doesn't enter us as a set of dogmas. "The truth unfolds in time through a communal process," but we should remember that each of us, perhaps some more than others, plays a role in that process. Moreover, truth remains true only by way of a dynamic process. While I'd say there are many timeless truths, they aren't such to human beings, as noted by some of the modern historians of human thought, such as John Henry Newman, who've studied the difficulties of holding on to even the most absolute of truths as the human context changed, culture in general but especially language and concepts. Truth can be held in a dogmatic form only if that form is really a set of notes holding us steady as our language, our concepts, our surroundings change—sometimes in radical ways. The greatest of saints and philosophers and scientists can't hold their place when a powerful river is moving against them.

As is his wont, William James writes, and leads his followers to write, in terms of what I call bottom-up environments. My question is: “What are these environments, really?” Are they what they seem to be to the explorer maturing into the naive philosopher? I would say, “Yes,” with the strong qualification that truths are dynamic entities in dynamic environments which are ultimately part of a morally ordered whole, the world which is our universe seen in light of God’s purposes.

In general, our environments aren’t freestanding as most Jamesian pragmatists assume. Those environments are themselves part of a context which might constrain human thought in some limited ways but mostly add richness and complexity not seen if we take in only what we perceive and can otherwise directly experience. If we wish to understand what lies around us, in us, under us, over us, we must subject our most concrete experiences to contemplative reviews in which we ascend to more abstract regions by various routes and descend to concrete regions. This process helps us to unfold the truth, not by some sort of magic or supernatural events but by the processes explored by philosophers and some of the saner mystics over the ages and sharpened by the Medieval Scholastics only to be sharpened still more by the likes of Einstein, despite his failure to deal properly with quantum physics—which I’ll discuss below.

Philosophers and theologians, and mystics, have a long distance to travel to catch up with modern scientists when it comes to understanding empirical reality, this important realm of Creation. But, of course, the human tendency is to stay in our comfort zones and that leads to any contemplative exercises being ever in danger of decaying into dreams of wisdom as if truth is some rabbit to be pulled out of a hat, not by a highly-skilled entertainer but by a god-like magician calling upon supra-rational forces. Wisdom is deformed from its nature as a stepping-stone to the perfect knowledge of God and becomes itself a set of strange rites which allow us to avoid the hard work which imitates by understanding the work God did and continues to do in His self-chosen and self-constrained role as Creator.

I’ll step back and take part of this line of thought a little more slowly.

Our environments can be first seen as particular settings in the greater entity we call the ‘universe’ which is spacetime but is also an entity in its own right. When that universe is seen as a world, a morally ordered narrative, unified and coherent and complete, then the environments and the entities which are part of those environments and all else with which they have relationships can be seen as part of that moral narrative, the

world.

William James remained in those environments and never ascended to the level of the world, even in the most tentative way. Without moving into the more abstract regions which allow us to see this universe as a world, a thinker or a doer can't descend back with a wider and deeper perspective. Think of it as Moses ascending the mountain to speak to God and then descending to speak of what he learned. In this current context, I'm saying Moses and his disciples should have begun a sustained, multi-generational process of ascending and descending, by way of a variety of paths.

There are certainly differences when we speak of an ascent and descent within the spectrum of created being rather than an ascent to receive revealed truths and then a descent. (I suspect the experiences of Moses were actually quite like the ones I describe, that he was learning how to speak and think **along** with God but was constrained by language and tradition in telling his story. In order to communicate what happened, Moses or his redactor working from perhaps sparse clues had to put his experiences in terms of paganistic meetings with a God as if he were one of the gods in the *Iliad*.)

In a sense, Moses had to speak to those who are fully entrapped in their environments, had to speak of an experience of ascent to a more abstract realm of Creation which remains in this concrete realm but – I'll speak in a terse manner—can be seen only by acts of reason which are imitations of God's acts-of-being. Entry into that sort of abstract region allows certain forms of communion with the Creator which are different from the more concrete sacramental experiences of this world, as if we could experience the 'spiritual' aspects of Holy Communion without the consecrated bread and wine, the Body and Blood of Christ. This is a problematic way to view matters though it might explain why these sorts of highly spiritual states, enjoyed and suffered by the likes of Moses and St. Francis of Assisi, are unsustainable for a creature of flesh-and-blood. That spiritual level, or abstract level of created being, is with us always, in us always, ever united to our biceps and our white blood-cells but we enjoy and suffer such experiences more clearly and more explicitly in the form of consecrated bread and consecrated wine being digested in our bodies of flesh and blood. Bread and wine become saturated with true life and then enter our bodies to bring us that true life. Christian sacraments run parallel to the intellectual processes I describe with the human mind ascending to abstract regions to understand what is really present in the human being's own physical body

as well as the physical entities which surrounds him.

William James perceived clearly, removed his blinders as much as is possible or desirable for a man, and understood much of what he perceived but seems to have refused to move forward by taking created being in full seriousness. It's not that James was guilty of reductionistic thinking, let alone an outright dismissal of the evidence of the universe being not merely this nor merely that. James remained in a suspended state of acceptance and disbelief, a skepticism of sort, perhaps the best stance for one who has trouble accepting faith in either created being or its Creator.

I take my Christian, sacramental beliefs in a spectrum of created being as seriously as I take my Christian, Sacramental beliefs in baptism and the Eucharist. This is just another way of stating my belief that we should be willing to at least conjecture that our environments develop within and up into a greater whole, a true universe which becomes a world when seen as the story God is telling.

Let's return to James' claims that knowledge is an act of sorts. This is hardly difficult for me to accept since I believe being, including the most thing-like stuff, to be truly acts-of-being—the being is one with God's acts of creating and shaping. Some acts-of-being are the bringing into existence from nothingness and possible only to God, some acts-of-being are the shaping of being and possible to God or the various entities of Creation. If being is itself dynamic, acts-of-being, relationships bringing entities into existence or shaping entities, then it would be reasonable to consider knowledge, even knowledge of absolute truths, to be just as dynamic as the entities and relationships of which we have knowledge. How can we, as mere creatures, know being which is not yet in a particular shape or maybe not even in existence in any meaningful sense? How can we know the truths carried by that being which is still coming into a particular form or is maybe changing to a different form as the sinful man changes to a Christ-centered man. Our knowledge is itself a participation—that is, active—in the unfolding of not just that knowledge but of the being and the story which is the concern of that knowledge.

Most Christians, especially those impressed by Einstein's side of the famous debate with Bohr about the meaning of reality, would rebel against such a way of viewing Creation, thinking—for example – that there is a human essence which makes for an easy argument for the absolute value of human life. That debate between Einstein and Bohr was interesting in itself, see Chapter 156, *Einstein and Bohr's debate on the meaning of reality*, but

becomes fascinating under the insightful guidance of the philosopher Kurt Hubner:

Einstein was claiming that reality consists of substances which remain unaltered by their relationships with other substances while Bohr was claiming that it is the relationships which are primary and those relationships bring substances into existence. [75]

I've made various claims about this issue, especially regarding the close relationship between Bohr's supposedly radical views and the theology of St. John the Evangelist who taught us that everything that exists came to be because God loves it, because the Almighty chose to establish an active relationship of love with that thing.

Empirical reality, if Bohr be right in even the most general way, agrees with Christian beliefs about the relationships between God and all forms of created being and also the relationships between many of those forms of created being. It is that empirical reality in which we were conceived, in which we live, in which we shape our minds and learn even about God—as St. Thomas Aquinas tried to teach us in our hardness of hearts and our laziness of mind and body.

The strangeness of quantum physics shouldn't seem so strange to a Christian nor should evolutionary biology seem so strange to a reader of the Bible. Created being first exists only potentially so far as particular, thing-like being is concerned. A primitive band of Semitic nomads can even be shaped into the chosen people, the people of God, the people into which the Son of God became incarnate.

The vaguer sort of being becomes better defined when it forms proper relationships with things which lie around it. This is true of an electron which shows a particular location when a 'location-relationship' is formed with a proton whether a conscious creature observes it or not. This is also true of a baby which has lots of potential traits constrained in various ways and begins to shape himself by responding to his mother's breast or to the cuddly blanket she puts over him when he shows signs of sleepiness. The more particular the thing, living or not, the more its relationships are part of a narrative. Particular forms of being don't exist as pure or ideal entities but only as participants in some narrative, an active flow of events, a context. And so we can see the importance of evolutionary biology which

describes the struggle of living creatures to form proper relationships, those which allow survival and successful reproduction, at the concrete level of life on earth.

The historian Carroll Quigley told us: “Truth unfolds in time through a communal process.” I quote him often but though he went a bit further than William James toward an understanding of created being, he still didn’t go far enough. I’d say: “Being is shaped from truths in time through a variety of relational processes, letting rational observers see and, perhaps, understand those underlying truths.”

## 46 What Can Be Experienced?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1230>. It was finished and uploaded on 2012/04/09.]

In *The Meaning of Truth* [78], William James makes the claim:

The pragmatist view . . . of the truth-relation is that it has a definite content and that everything in it is experienceable. Its whole nature can be told in positive terms. The ‘workableness’ which ideas must have, in order to be true means particular workings, physical or intellectual, actual or possible, which they may set up from next to next inside of concrete experience.  
[page xiv]

I think that William James and his followers would not have ever claimed that purely formal truth-relations aren’t valid, nor would they have more than weakened the idea that our sense of an ordered flow of events is a true part of experience. They tend to acknowledge that truth comes to us and is confirmed by way of our experiences as flesh-and-blood human beings. William James is justifiably famous for his somewhat bewildered acceptance of spiritual experiences. If we Christians are to take seriously the concept of ‘Creation’, we also must consider our spiritual experiences and our intellectual grasp of Christian truths to be also true experiences, those of our flesh-and-blood selves. Properly considered, the claim of William James is a slightly—but importantly—incomplete version of the claim of St. Thomas Aquinas [3]:

[J]ust as a disciple reaches an understanding of the teacher’s wisdom by the words he hears from him, so man can reach an

understanding of God's wisdom by examining the creatures He made. . .

Contrasting these two quotes, seeing what is similar in the two and then seeing what Aquinas adds will allow a thinker with a properly flexible mind to gain a great insight. Even the physical universe, without considering its relationship to larger realms of created being, is "more than it contains" as I discussed in Chapter 193, *A Universe is More than it Contains*. Even the universe in which we live can't be constructed from its pieces. The world, the universe seen in light of God's moral purposes, is still more than what it contains. It can be experienced as a universe only if we detect and somehow try to understand that which is more than stars and gas clouds and electromagnetic fields.

To see a world, and to see a Creation in its still more complete existence, requires us to hypothesize that the world and Creation do in fact exist. We may form wrongful hypotheses, no, we will form wrongful hypotheses, incomplete and defective. Over time, as we come to learn more about what God actually did as Creator and as we spend time and effort thinking about it, we will form better hypotheses. We can do so only if we start out assuming a universe, a world, a Creation. We do the best we can; even a half-hearted effort works better than a serious effort to understand our environments without assuming they are part of a greater whole.

So, what can be experienced? A world can be experienced, even a still greater Creation, including the world of the Resurrected, can be experienced, every time we breath in the fresh air of a Spring breeze, every time we read an article about a new discovery regarding the human animal and its evolutionary history, every time we pray: "Our Father Who art in Heaven. . ."

The problem lies not with Darwinism or other scientific ideas, though they become true problems when they develop into ideologies but that happens also when parts of the Christian body of truths are pulled out of context or exaggerated so as to cast shadows upon the greater body of truths. Problems most certainly arise for religious and moral belief when patriotism becomes some sort of ideological nationalism. The experiences of ideologists, religious and educational and cultural, are necessarily limited in ways that severely distort and constrain any possible understanding, that is, the ideologist hypothesizes a world but a perverse world and then ex-

periences all, mundane and spiritual and intellectual, within that perverse world.

We experience not only events and thoughts and feelings but also an entire world every time we smell a flower, watch a sunset, or have a thought. William James and his followers see this but they refuse to hypothesize that world which will allow their experiences to be as rich and complex as they should be. Those followers and allies of James, including many scientists, are relatively immune to the corruptions of ideologies but at the great cost of not seeing the truth in a greater and more possible fullness. There are many morally well-ordered skeptics or non-believers in our time who have this Jamesian attitude, even if they don't formally accept Jamesian pragmatism. This insight allows us to understand both the limitations of the thought of some modern intellectuals and scientists and also their fundamental sanity. When doing their research or writing about their speculations, when experiencing other aspects of the world, they don't experience all they could but they also don't participate in the false experiences of so many ideologically corrupted men, including many Christians infected with a variety of nationalism or some other ideological cult.

## 47 Empirical Knowledge and the Existence of God

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1263>. It was finished and uploaded on 2012/05/15.]

Respect for empirical knowledge doesn't determine if one believes or disbelieves in God, though it has generally forced any believers, pagan and pantheist and Christians and others, to see a God of reason. After all, the very term 'empirical knowledge' is meaningful only if it refers to something, some realm of being subject to perception and analysis, which is rational.

To Einstein and perhaps Aristotle, the terms 'God' or 'the Old One' or the like, refer to a seemingly impersonal principle of reason which can be seen in the consistent properties of things and the order and partial predictability of events in this universe or cosmos or whatever. To some such as William Paley, see [http://en.wikipedia.com/wiki/William\\_Paley](http://en.wikipedia.com/wiki/William_Paley), and many more recent thinkers, reason necessarily implies the existence of a God with at least some of the characteristics of personhood and some, maybe complete, transcendence to this universe which is His Creation or maybe part of a greater Creation. I feel some sympathy for Paley's belief that examination of the order found in the natural world is a sign of a Creator but I wouldn't go so far as to say it's nearly a proof in the modern sense, though it might be a proof in the older sense of being a test of coherence, perhaps a test of whether the human mind can make sense of the existence of a God like the God of Jesus Christ. Now, there is a trend for more some more serious scientists, such as Stephen Hawking and some young physicists who blog on the Internet, to make more explicit the belief of Einstein and – maybe—Aristotle that being is self-sustaining and divinity is a name for the order or rationality to be found in that being. Divinity is

what brings stuff into some rational order but it's part of the same realm of being as stuff rather than being transcendent to it.

While we can't really prove in the modern sense that a Creator exists by examining contingent forms of being such as the stuff of our bodies and the stars of our universe, we can prove it in that older sense, that is, we can test the hypothesis that we can view this universe as a Creation and do so in a way that's coherent, reasonable, and perhaps convincing in a way that considers the forms of reason which we include as emotions and feelings. Unfortunately to those who wish to score quick victories for God in their debates, that sort of proof is meaningless in the context of a discussion between those holding radically different sorts of beliefs or disbeliefs.

I've mentioned "emotions and feelings" not to toss them aside but rather to bring them into our forms of discussion about beliefs as being truly parts of our reasoning processes, part of our rationality. Most human thinkers tend to downgrade emotions and feelings, thinking them to be non-rational when it would appear likely they are part of a greater rationality. In *Descartes' Error: Emotion, Reason, and the Human Brain* [25] and *Looking for Spinoza* [26] and other works, Antonio Damasio has explored the true nature of human thought, emotions, and feelings and some reasons why emotions and feelings are part of a greater form of human thinking in which reason often plays the dominant role but not always. (See [http://en.wikipedia.com/wiki/Antonio\\_Damasio](http://en.wikipedia.com/wiki/Antonio_Damasio) for background information on this important brain-scientist.) You can also check out *Adaptive Thinking: Rationality in the Real World* [61] by Gerd Gigerenzer who has shown that we sometimes see irrationality in human thought and behavior because we don't properly understand the contexts in which human thinking evolved and is still quite effective. For example, the idea that human beings can't handle probabilistic reasoning is based on tests using the abstractions of percentages when human reasoning evolved to handle frequencies, not 30% but 3 out of 10. I think this implies, consistent with the speculations of Professor Damasio, that emotions and feelings are, at least in part, efficient encodings of the empirical experience of the racial experience of human beings and human ancestors. This isn't to reduce emotions and feelings to being defective forms of rationality but rather to see them as some sort of deep, racial intellect: a capitalized and communal form of intelligence shaped over millions of years of experience. For background information on this insightful thinker, see [http://en.wikipedia.com/wiki/Gerd\\_Gigerenzer](http://en.wikipedia.com/wiki/Gerd_Gigerenzer).

This makes for a perfect mess, implying that what we call 'reason' is

probably a mutilated and amputated form of a more total form of reasoning which considers vast amounts of empirical experience which has fed into our simple common-sense and also our fanciest theories of mathematics and physics. In fact, Professor Damasio considers these sorts of issues, including their impact on our theological beliefs, in *Looking for Spinoza* [26].

Let me confuse matters a little more—I would hope this is a useful and fruitful sort of confusion. I'll mention another claim regarding our beliefs or disbeliefs about God and their relationship to empirical knowledge. In *The Perfectibility of Man* [108], John Passmore made the quite plausible claim that an all-powerful God can be invoked to explain any possible world—see [http://en.wikipedia.com/wiki/John\\_Passmore](http://en.wikipedia.com/wiki/John_Passmore) for some background on this highly regarded philosopher. I think this to be true at the level of physics but not at the level of narrative, a distinction of being which I've used often but I haven't been able to find a truly clear way to speak of that distinction succinctly or perhaps even clearly. Please bear with me while I try to pull some strands of thoughts together in a quite preliminary way that is very interesting to me.

I don't think we can prove God exists by assuming that the order we find in our universe must be a result of design in the way of a human engineer or architect or administrator. I also don't think it makes much sense when those modern scientists argue that the self-ordering nature of certain physical processes tell us a Creator isn't necessary.

We can return to the older understanding of prove, to test for coherence. In particular, I would suggest the proper test for a theology or an atheology is: does that system of belief or disbelief combine with empirical knowledge in such a way that the result is a coherent understanding of our experience of our environments as understood by fairly basic understandings. In other words, there is a bootstrapping of sorts which can be seen as necessary by the historical fact that our body of concepts and our other cognitive and narrative tools has increased greatly, at an especially rapid rate in recent centuries. I'll quickly mention that there might be forms of belief in which there is a radical separation between God and Creation but those lie outside of the mainstream of thought of Western Civilization and largely outside of the stream of any thought human beings could see as rational.

Think about the very concept and term 'order'. Paley was right in his day for the same reason that theologians and others were right in conjecturing the existence of a soul to bring mere flesh to life. To my knowledge, no pre-modern thinker, certainly no one who had a major public impact,

had proposed a more general understanding of 'order' which would allow for order forming because of the interactions of simple things or mere blobs of matters which engage in well-defined relationships. Darwin accomplished much because he, self-confessed as a man lacking in a talent for abstract thought, honestly confronted evidence that indicated that life had evolved by way of processes which are not 'random' as some would say but rather self-directed or self-ordered if we speak in terms of a 'self' which is the totality of an environment and a family line of organisms. Our understanding of such processes and the order which results have to be much broader and even much looser than Platonic or Aristotelian ideas would have it. Even St. Thomas Aquinas, properly acknowledged by some modern thinkers to be a great empirical thinker, knew only what he could in the 13th century and had a quite restricted idea of order and how it can come about. To be sure, the general principles he advocated would have forced any true Thomists to very openly and honestly examine the empirically-founded claims of Galileo and Darwin and Einstein and Heisenberg and Watson. Then they would have gotten to work developing proper concepts and words and maybe even revising grammatical structures.

It would have then been the job of an entire community of thinkers to develop what we can call a moral narrative, the foundational work of a civilization, an understanding of what-is, perhaps as a self-contained something divine in its own right or perhaps as a Creation. One of the causes of the decay of the West is the emptiness at the heart of the West, a lack of a purposeful and morally well-ordered understanding of the world, however 'world' is defined. There are some of us who would argue that Western Civilization was its dynamic and forward-moving self just because the traditional Christian understanding of Creation is a narrative centered around the incarnation of the Son of God. In my current understanding, this story is one of an evolving and developing world dedicated to the purpose of forming the Body of Christ. My understanding of this Body and the ways in which it is forming are richer and more complex than the traditional Christian views just because I've responded to modern empirical knowledge with its richer and more complex understanding of God's Creation.

By a somewhat torturous route, I've come to the claim that our belief or disbelief in God is the result of our understanding of our world, though in practice most will inherit a greater or lesser understanding from parents or teachers or clergymen rather than developing it on their own. Moreover, I've claimed this understanding has to be a story because we are ourselves

participants in streams of events, some of which are recorded in books or family stories. The failure, conscious or unconscious, to form a narrative of our lives and the surrounding world will likely result in either disbelief or perhaps a radical and desperate spiritual conversion of a sort which might not result in a rational form of belief.

Now I can return to alleged proofs of the existence or non-existence of God. They aren't set, and couldn't possibly be set, in the context of some raw experience of reality. Those proofs are set in a developing or developed understanding of the world, perhaps as a self-sustaining entity or perhaps as a Creation. Most discussions or debates involving mixtures of disbelief and belief will be incoherent because everyone will bring his or her own understanding of the world and then make points from inside of that world. It would make sense if those discussions or debates involved respectful efforts to explore the various understandings rather than engaging in logical analysis, from a stance inside one world, of a dogma existing inside another world. If such discussions or debates could be held more often, then the various sides could not only learn about each other's understandings of what-is but perhaps learn from each other. I'm constantly amazed by discoveries of the sheer richness and complexity of this world, and though myself a Christian, I've found my understanding of the world as part of a Creation to be enriched regularly by insights from non-believers or those struggling with their partial loss of belief.

Empirical knowledge as such, or a proper appreciation of its importance, doesn't force us to belief or disbelief in any divinity, let alone the God of Jesus Christ. However, any sane human being has to use his empirical knowledge to understand what-is and that understanding will be intertwined with any belief or disbelief. Each will support the other. In a time of rapid change in empirical knowledge, it will be a dynamic dance of sorts rather than a static relationship.

The problem we currently have is we modern men of the West haven't yet properly integrated empirical knowledge into our various systems of thought. Our discussions have decayed into incoherence. We talk past each other or yell at each other rather than sharing insights and trying to understand each other.

## 48 Why Does Time Move Only Forward?: Once Upon a Time...

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1411>. It was finished and uploaded on 2012/10/03.]

In Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*, I wrote:

Reduce reality to its various components and aspects but stop reducing when you reach components or aspects which cannot be used to fully explain or to ‘reconstruct’ each other. At that point in the process of analysis, it’s time to look for explanations which include all those seemingly fundamental components and aspects. You might be wrong and the next few generations might busy themselves taking your fundamental components and aspects apart to find still smaller particles. First, we searched for atoms, a search which had lasted for centuries and went through such strange paths as alchemy, but did result in the deep knowledge summarized in modern periodic tables of the elements. Then, we explored subatomic particles and discovered electrons and protons and neutrons and then strange hints of particles which didn’t fit into the simple scheme of things. Then we found out that there is a large zoo of particles out there and they seem to be broken pieces of more symmetric entities.

I used that to address the issue of mind, heart, and hands as being proper and adequate ‘elements’ for describing human nature. What if we wish to discuss this concrete universe, reality as it presents itself to our

senses? Usually, we speak of reducing the world to its basic components in terms of matter and its directly measurable, physical relationships. I'm not about to suggest that there is something supernatural that gets added in to everyday lives in the way of, say, a spirit infusing life into our bodies or Satan putting a temptation into our brains or an angel acting to warn us. Rather am I going to claim that we and our relationships, things and their relationships, lie within the influence of larger-scale forces which shape the way in which our individual and communal lives play out, in the short-term and even over the millenia. I'll quote Hans Reichenbach out of context, from his interesting book, *The Direction of Time* [122]:

Time direction is a property of the causal net as a whole, and is transferred from the net to the individual processes. [page 108]

First, I'll note that Reichenbach's book is interesting and raised some serious questions in my mind but I'll be doing little with it because I don't think his way of explaining, or even describing, the direction of time works well within my way of thinking.

The real issue is what's implied by Reichenbach's comment. The forward movement in time of ordinary events is due to some sort of higher-level structure. I'd claim that structure, which he labels a 'causal net', is really a narrative.

To me, a 'world' is a universe which had more demanding aspects: unity and coherence and completeness. You might even say that a world is person-like, reversing my usual order for developing these ideas. At an abstract level, a person or a world is a story.

What is the relationship between a world and a person as I understand them? A creature such as a human being is born a particular sort of physical animal and is more or less invited implicitly by his surroundings (and perhaps explicitly by his Creator) to start shaping himself by response to those surroundings. Human communities play an important role as the centuries go by, developing broader and deeper understandings of those surroundings, perhaps even coming to view that physical entity which we call the 'universe'.

I'll repeat the short quotation from Professor Reichenbach:

Time direction is a property of the causal net as a whole, and is transferred from the net to the individual processes. [page 108]

I'm not convinced we can set up a 'causal net', that is, it's not clear all the important relations, let me describe them as 'co-causative', can be captured in Reichenbach's causal net. Something is coming into being in the work of those exploring complex systems and chaotic (usually unpredictable but law-abiding) systems, A number of very intelligent and knowledgeable men and women are doing work on these systems, studying them and developing some powerful tools to understand them or at least to describe them. I'm going about it a different way. I'm exploring the structure of narratives but but I study their ways and look for some sort of higher-level synthesis. I think, based upon my understanding of being and also of God's purposes for Creation, that narratives are a more abstract, higher-level concept covering not only morally well-ordered stories but also the closely-related movements of physical entities through time.

The overall narrative by which this concrete realm, this universe, moves forward is what makes it a world, unified and coherent and complete. The overall narrative by which we concrete human beings move forward can make us persons, unified and coherent and complete.

The narrative, which is the movement into the future in our world, is as fundamental as the entities and relationships studied by physicists and other physical scientists. It cannot be reduced out of our understanding of this world. It cannot be explained by way of the field equation of general relativity or by Schrodinger's equation in quantum mechanics. In fact, I would suggest that many physical laws, many physical entities, are what they are because of their role as the 'stuff' of a particular narrative.

Find the story of our universe, or at least a plausible story given our current knowledge. That is the world. At least to a Christian who intends to be a member of the Body of Christ and perhaps to a Jew intending to be a member of Israel, that story is also him, her, us and—expanded properly—that story is the story of all of Creation.

## 49 Can Modern Science Tell Us If We're Free?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1472>. It was finished and uploaded on 2012/12/22.]

Something strange happens in the minds of many men as they go about their work, whether that of research in particle physics or removing cancerous tumors or running a machine milling a component of a jet-engine or, maybe especially, in those who've studied the evolution of human beings, individuals and species and cultures. Having established mastery over some material entities or their relationships, at least by creating structured knowledge from messy data, some begin to see life, the universe, and everything as being too well-determined. Knowing some explicit, sometimes algorithmic, rules, they would see the world as rule-centered. Our tools, including our conceptual tools, can allow us to perform prodigies in exploring and analyzing reality, but there is this odd tendency to use our new knowledge to constrain reality to certain schematic ways of thought.

A logician thinks there is something called thoughts which are like the components of a child's erector set. A workman handles iron and steel and make marvelous products with those and other materials. A psychiatrist or a market-researcher contemplates deeply those feelings centered on things or associated with glands or brain regions.

Obviously, I exaggerate, but there are some who do talk as if the above reductions are truth and there have always been such back to at least the dawn of philosophical thought and probably back to the dawn of human contemplation of the most general sort. Some who are caught up in these exaggerations have had a disproportionate influence on modern thought. But the problem is with our attitudes even more than with our thoughts.

## CHAPTER 49. CAN MODERN SCIENCE TELL US IF WE'RE FREE?

It's also a problem with our actions more than with our thoughts. Some have trouble acting the roles of engineering or genetic research without the proper 9-to-5 materialistic ways of behaving entering into feelings and thoughts. Skeptical feelings and reductionistic acts lead naturally to non-believing thoughts. Draw out the relationships between feeling (heart), behavior (hands), and thoughts (mind), and you can see a small circle which can be a bi-directional flow of infection.

Suddenly, the best of skilled scientists or workmen, those who are loving fathers or dedicated mothers, those who pray, those who give generously even to those in need who are unlikable, begin to stand apart and to view things and men alike as being isolated entities which behave as stimuli would have it. Some react against this sort of a view, still having trouble giving up their god-like heights, and begin to raise other men to their mountaintop, seeing freedom inside of our human selves. Few there are who can truly see freedom as much a property of created being as is determinism.

This is strange to me just because the very effort that scientists and others took on to become highly-skilled experts and the effort they exert to do their work on an ongoing basis isn't forced, at least not fully. Their freedom, limited as it typically is for creatures of our sort, precedes the facts and knowledge and worldviews which lead them to claim the world is deterministic. At a gut-level, we're free before we're in chains. That breast and the mother who offers it are chosen in a way that need forces in a sense, but we choose in a way more free than not, even when we're a day-old and clueless about our real situation. We choose to suck and bite and struggle to make those things attached to us reach out to help us in that early choice.

I'll quote a prominent brain-scientist, Walter J. Freeman, from his book *How Brains Make Up Their Minds* [35]; in these words, he's advocating a scientific approach to studying human beings which is at odds with the reductionistic approach:

Instead of postulating a universal law of causality and then having to deny the possibility of choice, we start with the premise that freedom of choice exists, and then we seek to explain causality as a property of brains. [page 5]

It's not freedom according to the theories of political philosophers or quantum physicists, certainly not determinism according to reductionistic

materialists or excited computer theorists, but rather a vague freedom to choose which is one of our first and primary experiences. It matters not if this reality meets the standards of political philosophers seeking to avoid the bad choices which led to religious wars nor does it matter if it fits into the mathematical and logical misunderstandings of men who gave Vienna a bad name in some circles. What matters is that choice precedes any particular understanding of freedom and any particular fears of shackles. We choose and therefore we reach out for our mother's breast or our loved one's breast. We choose and therefore we walk by choice into the obscurity of the future. We choose and therefore we are moral creatures. Wolves and bears and elephants also choose within the context of a world perceived and understood in much simpler ways and they are simpler moral creatures but moral creatures nonetheless.

We can make choices. We can move left or right, we can plan to divide available resources between educating children and caring for the sick or elderly in such and such a proportion.

We lose our freedom when we don't consciously make choices or when we act in such a way as to take away our choices tomorrow.

We can see that freedom mostly as one in which we set the goal of being a certain sort of morally well-ordered person, we who are now human animals. To advance toward that goal, we begin to anticipate the forks in the road, to eliminate those which would lead us away from that goal even if they seem headed in the right direction. We might even be able to create our own choices, as individuals. We do play roles in creating choices as members of communities. To make it more explicit: as communities, we lay out those paths ahead of us and form the moral characters which would choose and choose properly by some—perhaps evil—understanding of the world and indeed of all that exists.

We know we can choose. This knowledge is primary. Scientific knowledge as well as political and economic speculation, even regarding the most fundamental matters, comes after a number of generations of men make decisions of a certain sort, following the general intention of understanding the world, of building an understanding of this world in its most interesting and dynamic form: a narrative. We enter that narrative consciously and by our choice. We choose to become certain sorts of human beings, persons in imitation of our Creator, We take on a role and are free when we successfully and gratefully enter into our roles with our hands and hearts and minds.

## ~~204~~ CHAPTER 49. CAN MODERN SCIENCE TELL US IF WE'RE FREE?

We choose to explore our world and from what we find, we notice that certain events lead to other certain events. As Professor Freeman wrote, "Instead of postulating a universal law of causality and then having to deny the possibility of choice, we start with the premise that freedom of choice exists, and then we seek to explain causality as a property of brains." A property of brains but more so of the minds which come as brains and hands and emotions engage the world, the minds which are in a real sense the entirety of us, our individual embodied selves and our communal selves and our selves which are part of Creation.

The enterprise of science itself is an exercise of freedom, of constant choosing. It can tell us that we are free, in some significant sense. Moreover, what it discovers about human beings and about this world can refine our understandings of our freedom, letting us see our freedom to be larger or smaller than we might have thought, maybe even significantly different from what we might have thought. Even this must be set in the context of some greater understanding of what this world is, what created being is, what Creation is in its entirety and in what it contains. That greater understanding must include specific scientific understandings but can't be limited to such understandings.

Human freedom just as much as the human mind can only be understood if we understand created being in a deep way for human freedom and the human mind are closely linked reflections of created being, reflections of some large part of the thoughts God manifested as Creation. He chose with absolute freedom; we choose in imitation of our Maker, with far less but significant freedom. We shape our minds in response to what is in our own bodies and in response to what lies outside of us and so also do we learn to be free.

# 50 Old DNA and Old Science and Old Bones

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1613>. It was finished and uploaded on 2013/05/15.]

Most scientists, many supporters of science, don't seem to believe that past works, outmoded works—even some with serious and avoidable errors, are worth the effort of study. This is probably at least partly due to the fact that science has been so important a part of the modern cultural mainstream that scientists have naturally come to move along with the general herd, frantic scurriers, hamsters on the exercise wheel. There seems to be no contemplative time of the sort available to the gentleman naturalists of the 19th century. A 21st century Darwin couldn't be in retreat for years as he slowly formulates a grand theory. Nowadays, scientists are supposed to be busy, taking perhaps more time to get grant money for their students than to do research or perhaps themselves junior enough or anti-establishment enough to be in the research lab or seated at their desk working on the next great hurdle to understanding the occurrence patterns of prime numbers, themselves without pattern. At the worst, scientists and many other knowledge gatherers or analysts can become parasitical intellects which chew up and otherwise dispose of the knowledge they were given, their traditions, as they seek to move on to something new. Many scientists, even those who are believing Jews or Christians and part of great traditions, are oblivious to the nature of traditions, containing not just 'old' knowledge but also the socially disciplined emotions and behaviors as well as intellects, communal minds, which form successful and complex human communities, including those of science. (See Chapter 127, *Intelligence vs. Intellect* and Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand*

*Reality?* for the relevant discussions.)

Let me state the point I'm making about an understanding of science itself, and the scientific aspects of the human mind, by analogy to the way in which evolutionary biologists, including some medical clinicians, understand the human organism and its 'defective design'. If we take a human being, for example—my own self, as a creature designed to be what he is in the current context of his family-line, we'd have to wonder why sinuses (mine for sure) are angled to drain properly if he were a crouching animal and why his sciatic nerve passes out of the backbone and through the hip/buttocks region at an angle more appropriate for a crouching animal. Our very backbones give us so much trouble as they are partial adaptations shaped from the backbones of crouching animals.

Clearly, the human body is the result of some selection processes acting upon a crouching animal. In a meaningful sense, at least for the purpose of understanding some of our problems and trying to deal with them, we are still partly crouching creatures standing upright. This is also true of science: in some meaningful sense, modern biology is still partly Medieval and even partly Hellenistic. Similar statements can be made, with greater clarity in fact, of modern physics and mathematics and engineering. This is not a bad thing. If the human mind could be passed into a robotic thing which was engineered to rigid specifications, if that thing had only a past ending in science and engineering textbooks taken out of context, that thing would be a horror beyond even Frankenstein's monster, the poor creature which was living and had a human past though he was alone among other human each a part of communities and members of some sort of people. Having no past, that robotic man would be timeless, without a future. A similar thing could be said about a science without a proper past, a proper context. This might be the reason why some farsighted scientists of philosophical bent, Michael Polanyi and David Ruelle among others, have expressed fears about the decay of moral standards in science—and those two men wrote of experiences from decades ago when science seemed still a Victorian Age gentleman in many ways. As I have noted in the past, modern scientists are not so much different from modern politicians and modern bankers and modern bureaucrats as they might imagine.

Choices made in the past still are present and the effects of any regrettable choices (even if they were plausibly unavoidable) have to be worked out over time by sometimes slow processes of evolution and development. Even more generally, our best thoughts still have contingent aspects which

are the result of choices made by Plato or Archimedes or Galen or Newton or Cauchy or many others. In speaking of choices and contingency, I speak of those we make for our endeavors on a conscious basis and also those made by human communities and those made by the impersonal forces of history and biological evolution and so on.

I came to this line of thought while contemplating this article, *Brain Development Is Guided by Junk DNA That Isn't Really Junk* found at <http://www.sciencedaily.com/releases/2013/04/130415172010.htm>. I first thought of my amused response to learning, circa 1995, that much of our DNA is inactive and probably just junk. For an example of what is truly junk, I remember that we still carry non-functioning (this is good) DNA for forms of hemoglobin of some of our ancestral species. From remembering that amused response, I passed on to the idea that harmful elements can remain with any and all entities which are the result of evolutionary and developmental processes. Unless there is some sort of truth to a dualistic understanding of mind vs. thing-like being, our minds are also part of this world of such processes; we fool ourselves in potentially dangerous ways when we think the evolutionary biologist studying the human brain can overcome all the problems and compromises in that brain he's aware of. Let alone all he doesn't know about. In fact, one of the reasons for the true conservative core to the thoughts of E.O. Wilson and other sociobiologists is their awareness that we are still part of these processes they study.

If anything, sociobiologists and scientists influenced by their insights have the typical tendency of the sort of conservatives we call 'reactionaries', tending to be a bit pessimistic about the entire situation, to not see that while we cannot escape this world's evolutionary and development processes, we can mitigate and often overcome many, perhaps most specific problems which we can define well—in principle; we have not the time nor the energy to overcome all and we work at cross purposes when we take on too many problems. A lot of qualifiers are in the previous complex statement, and those qualifiers along with the sociobiological insights tell us that science itself is 'trapped' in this world of evolutionary and developmental processes, having to deal with inherited inadequacies and outright problems which are deeply embedded in the very nature of science as it has developed. In addition, as theorists and precursor thinkers in the field of algorithmic complexity theory have told us: we can't foresee the future well enough to avoid making our own mistakes and leaving them to future generations. Even some of our greatest successes will turn out to be problems for future

generations.

To eliminate one possible objection: any path of escape from this world's nature for science itself would depend upon a dualistic view of reality. A mind, or at least the knowledge jammed into the brain, would have to somehow float free of the stuff of this world and the evolutionary and developmental processes which shape that stuff.

The situation is even more interesting than we might have thought. The above article, *Brain Development Is Guided by Junk DNA That Isn't Really Junk* found at <http://www.sciencedaily.com/releases/2013/04/130415172010.htm>, tells us that much of that junk in our DNA isn't junk. The particular studies dealt with in this article involve "mysterious RNA molecules" and the 'junk' DNA which are their templates. These particular bits of RNA and DNA are involved in brain development and in some diseases of the brain. They found one particular RNA molecule which is linked to the devastating Huntington's disease—Woody Guthrie died from this.

Junk DNA isn't always junk and neither are the inheritances from past manifestations of science which are often labeled in terms not much different from 'junk!!'. For example, the ways of thought of Darwin himself about the ways of biological inheritance were a bit wrong and far from complete and yet the defective and incomplete theory of evolution which he developed is still studied by biologists and still inspires and shapes the thoughts of many of those scientists who might well come to read *The Origin of Species* already having technical knowledge superior to that which can be found in that book.

If scientists wish to understand human ways of thought, they need to understand how we got to a better, richer and more complex and more true, understanding of biological inheritance, they would need to understand the ways in which past generations of scientists came to their less rich and less complex and less true ideas. More than that, those ideas are with us yet and few if any evolutionary biologists would say we should stop students from studying the great works of Darwin and Huxley and other old-timers, to concentrate fully on learning some purified and more complete understanding of evolutionary biology as related in a schematic manner in a textbook.

The positivistic view of science, and the related view of individual and communal minds of scientists as being able to stand apart from the world in judgment—as it were, runs parallel to intelligent design theories they

so hate. What cannot be the result of intelligent design, our universe, is to be understood, encapsulated, in a great project of reverse-engineering which is managed by way of intelligent design as biology or physics. The great intellectual sin of 'intelligent design' is the common man's version of the positivism held by many modern thinkers, scientists as well as philosophers and by some of the intellectually ambitious or pretentious among the common folk.

Against the intelligent design view and also the similar if more intellectually respectable positivistic view of mind and empirical reality, I have argued that the human mind is so powerful because it is the result of the human being, individual and communal, responding to his own body, his environments, even all of Creation, in such a way as to encapsulate all of that in his heart and mind and hands, his thoughts and feelings and behaviors. We shape our minds to be maps, in a manner of speaking, of all that we can grasp.

# 51 Mathematics and Other Neglected Parts of Western Civilization

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1616>. It was finished and uploaded on 2013/05/24.]

Though most of what I write in this essay is applicable to most populations and nations of the West, I don't pretend to write in a truly general way. It might not be possible to write in such a way without engaging in needless abstractions. Thus it is that I write of the problems of the West from a distinctly American perspective.

We modern men of the West have badly damaged our civilization in part because we're not really strongly inclined toward civilization, certainly not strongly inclined toward Christian civilization; recent events indicate strongly and sadly that Christianity didn't really take in Europe or the Americas and we'll soon be—at most—baptized pagans. I'll be concerned with matters of civilization in general and leave the specific Christian aspects of Western Civilization to the side though it is arguable that Western Civilization naturally began to decay when we of the West tried to radically secularize most aspects of that Civilization.

The arts and sciences of civilization are what we confront in school and mostly leave behind us when we leave, though some who learn to hate 'school subjects' might retain or acquire in a fresh form a liking for, say, astronomy or even astrophysics at least in the form of better-quality documentaries. If we were less inclined toward equality, this general process of teaching even students of some talent to hate 'academic' learning might end in a class system where aristocrats, or at least surrounding scholars

and artists, would cultivate a taste for the finer sorts of music and visual art and knowledge, literary and scientific. As it is, we are inclined toward equality and also inclined to believe that any passing notion which resembles an idea is as good as the ideas of any man, though we do acknowledge the superior technical knowledge of those who design and build airplanes and bridges and skyscrapers and nuclear bombs, if not those who strive to write the deeper sorts of poetry or novels or history books. Einstein pointed out once that we need to generate 99 questionable ideas to produce one of good quality; one way to understand the thinking of Americans is to realize that any one of those 100 ideas, good or questionable, is considered to be the real thing so that we stop thinking and we solidify our opinions as soon as we have any brain activity corresponding roughly to an idea. Americans were perhaps leaders in this process but others in the West have followed us.

We Americans all demand a recognition that our tastes are as good as any who make an effort to cultivate a taste for more demanding sorts of music, not just Beethoven but also, for example, Celtic folk music as found in the hill communities of North Carolina. Anyone who formulates an opinion about Iraq which would be plausible in some possible world thinks that opinion as good as the opinions of those who learn a little about the histories and cultures of the peoples of Iraq and maybe even the histories and cultures of archaic peoples who left some traces in present times. Though accepting of the gifts of modern technology as we find it in hospitals and at the airport and in the mobile phone stores, we don't much like the foundational knowledge which can only be gained by disciplined effort and cannot be faked as can knowledge about the motives of Islamic terrorists or the long-standing goals of the Russian rulers from 18th century Tsars through Soviet bureaucrats and on to their semi-capitalistic and authoritarian successors. This is to say it can be at least embarrassing to express some irrational opinion about the meaning of quantum mechanics when a nearby teenager might well have some elementary but solid understanding from documentaries and from books available at many public libraries. Modern Americans feel no such embarrassments when speaking about, say, the irrationality of Iranian leaders who are, in fact, said to be more rational than American leaders by various knowledgeable observers who aren't inclined to general admiration of those Iranian leaders, to put it mildly.

Largely because we desire a specific sort of failure, consistent with worldly success on scales shorter than our collapse time, and think it to be a

sign of our native superiority, our modern educational systems have failed. It's hardly surprising that these systems have failed utterly to teach even the most basic skills of literacy and numeracy to those who don't wish to learn and to those who have serious problems learning; after all, the systems are run by bureaucrats who show truly modern sensibilities by ignoring all inconvenient facts such as those related to the inability of many adolescent males to sit still in classrooms for five hours or more in a day. Our school systems reached a point by at least the mid-1970s where they couldn't even provide basic learning skills to those who came to school capable of concentrating for more than the length of a television commercial or—more or less equivalently—a skit on *Sesame Street*. In fact, the school systems teach not the ability to concentrate on a task but rather the cow-like habits of responding to bells and of shaping habits to the needs of bureaucratic managers. (Teachers, including those who desire to do their job, are also subjected to the same conditioning.) The sad thing is that many of those who most readily acquire such habits are exactly the children who come to school with the behaviors which would allow true learning.

Nearly all human beings like colorful images, live or captured on the pages of a book—verified by psychologists and somewhat explained by evolutionary theorists as being one possible response to the opportunities and dangers of our environments. One way to disrupt the thinking processes of young students is to show them a lot of videos and to use textbooks with a lot of glossy pictures. While the improper use of images, especially very colorful, has been shown to be disruptive of thinking and learning by modern scientists, we should remember that it also reverses the traditional pathway to literacy which begins with big pictures and a few words on each page and moves toward pages with text and only occasional pictures, if any.

This is part of a general problem which has been developing in the West since at least the century of decay (14th) which followed the High Middle Ages. The radical Franciscan theologians and philosophers of Oxford in that period (roughly, the school of Duns Scotus and William of Occam) provide a focus for this view of that general problem—though they weren't villains in any moral sense. Those thinkers began the process of demoting mind to being subservient to some ghostly entity called 'will'. Even the process of intellectual education, of disciplining the individual aspects of mind so that it can take up the greater communal aspects of mind, becomes a matter of will. If we will to be educated, then we can acquire education if we are placed in a building with books and teachers and maybe computers for a sufficient

number of hours a day. In fact, those students from communities, Jewish and Chinese and a few others, which intelligently recognize the importance of intelligence in forming a strong and disciplined intelligence are those who can take advantage of even such incompetent educational systems as we have in the United States. Those from other communities are raised with a disrespect for intellect, communal and capitalized intelligence, and are expected to exercise their will and to take something called 'knowledge' into their poorly formed minds so long as they find themselves in one of those buildings with books and teachers and computers. The process is apparently magical, invoked by that strange and mythical entity typically labeled not only 'will' but 'free-will'.

I'm mostly concerned about mathematics in this essay, our schools' inability and unwillingness to teach even an esthetic appreciation for mathematics to either those with some level of talent or those who don't have such talent but should be educated for their roles, as musicians or carpenters or homemakers, in an advanced civilization in which mathematics is a deep part of our efforts to understand our world, even the entirety of Creation from a Christian or Jewish viewpoint. In fact, there are almost certainly ways to teach at least some serious mathematics to non-mathematicians.

As matters currently stand, some dislike learning mathematics or other demanding subjects and the rest can mostly be trained to dislike learning mathematics. I was in the second category though I was in college before I learned that my liking was for mathematics of a type and at a level which was easy to learn and was tested by way of trivial problems. Even when I learned how to study well enough to get good grades for my junior and senior years of college, I most certainly had not learned how to truly learn mathematics, how to immerse myself in a demanding subject of study and to respond to it in such a way that my mind would be shaped to that subject. In a sense, I'd been Americanized, had learned how to exert some energy by an effort labeled 'will' and had targeted some textbook summaries of mathematics as the region I'd conquer by this will. In fact, the process of becoming a true mathematician, or a true cabinet-maker or pianist, is that of willingly letting oneself be conquered by a specific region of Creation, not a process of conquest but a process of being conquered and shaped to be a true resident of that region.

Difficult subjects in most American educational systems are dumbed-down, emotionally as much as intellectually, in an effort to engage the minds of the students by entertaining them. Literature becomes a series of elec-

tives including vampire-stories or romances at the same time that the study of calculus becomes not only the viewing of glossy images but also efforts by under-educated and mostly bored teachers to answer the sorts of questions which can be answered only after many years of intense study—in mathematics, "Why?" can be answered sometime in graduate school or perhaps in the mature adulthood of someone with good skills of literacy. At the high school level and mostly at the undergraduate level—prepare for a zig, mathematics is a game. At a young age, even a mathematical genius isn't ready to learn the deeper truths which lie underneath the sorts of games which a reasonably talented child, one capable of becoming a serious scientist or engineer or technically-oriented philosopher, can learn at 12 or younger. Entering this game involves desire, not some sort of higher 'will' independent of an organism. See my recent and freely downloadable book, *A More Exact Understanding of Human Being* [53] for an overview of human nature which considers desires and other emotional aspects of human being as subject to the sort of discipline which forms us into better sorts of social or communal beings.

Those with mathematical talents have also their developmental patterns which aren't necessarily compatible with the standard curriculum, which was Algebra I to Plane Geometry to Algebra II to Trig/Calculus or something of the sort 40 years ago. Human being, the human organism in a particular manifestation, is not so easily overruled by a willed submission to the plans of bureaucrats or others. I knew some young men back in the 1970s who learned basic Group Theory on their own, yes!!, because of a book which taught methods for solving Rubik's Cube. I was never much attracted to games of that sort, not even liking chess much and liking card games for the social aspects. I'm what you could call a metaphysically oriented mathematical thinker. I would have been more inclined, even at a young age, to make a major effort to solve problems asking for the sorts of abstract reasoning that can prove: if a group has property X, then each member of the group has a square root also in the group. Take the prior statement in a naive way if you've not learned the basics of group theory, forgive my liberties if you have learned group theory perhaps far more deeply than I have.

Let me up the ante. Mathematics is such an important part of a proper human mind, individual and communal, as defined by the true traditions of the West, equivalently—such an important part of the nature of Creation, that the West can't survive if it doesn't appreciate mathematics well enough

to recognize its central importance to the Western intellect, the communal and capitalized living intelligence of the West. This is to say that the West came into existence in the work of Augustine of Hippo, Gregory the Great, Benedict of Nursia, and a host of following thinkers who were scientists and artists and politicians as well as theologians and philosophers. For much of the history of Western Civilization, theologians and artists and literary men were educated in the best of mathematical thought as it existed, much of it being inherited from the ancients, the Egyptian designers of pyramids through Ptolemy—at which point most mathematics was frozen for centuries. The West has gone far beyond that as part of an ongoing effort to explore God’s Creation, far distant shores such as the Americas and planets circling other stars as well as mathematical entities such as groups or physical entities such as protons, and to properly respond to Creation as we can best understand it, the working of wood and the management of factories and farms as well as the construction of hydroelectric power plants and the composition of musical works proper to current sensibilities of a higher and more disciplined sort.

From a different perspective, that of a professional mathematician, Edward Frenkel—Professor of Mathematics at University of California, Berkeley—writes of a great mathematician who is off the radar of Western Civilization, such as it is. In this article, *An Unheralded Breakthrough: The Rosetta Stone of Mathematics* found at <http://blogs.scientificamerican.com/guest-blog/2013/05/21/an-unheralded-breakthrough-the-rosetta-stone-of-mathematics/>, Professor Frenkel concludes:

The Weil conjectures did for mathematics what quantum theory and Einstein’s relativity did for physics, and what the discovery of DNA did for biology. Alas, we don’t hear much about this story or about the fascinating drama of ideas unfolding in modern math. Mathematics remains, in the words of poet Hans Magnus Enzensberger, “a blind spot in our culture—alien territory, in which only the elite, the initiated few have managed to entrench themselves.” And this despite the fact that math is so deeply woven in the fabric of our lives and is becoming, more and more, the engine of our power, wealth, and technological progress.

Mathematical formulas and equations represent objective and necessary truths, which describe the world around us at the deepest level. And what's also amazing is that we own all of them. No one can have a monopoly on mathematical knowledge; no one can claim a mathematical idea as his or her invention; no one can patent a formula. There is nothing in this world that is so deep and exquisite and yet so readily available to all. Today, our celebration of the work of a great mathematician serves as a reminder that everyone should be given equal access to this timeless and profound knowledge.

The Weil conjectures, developed first and partially proved by André Weil (brother of the philosopher Simone Weil) while in prison for refusing to serve in the French military under the Vichy government, provide very deep and ultimately simple relationships between numbers and shapes. Professor Frenkel's article begins by noting those proofs were completed by Pierre Deligne, professor emeritus at the Institute for Advanced Study in Princeton, N.J. Professor Deligne, the "great mathematician" in the article, has recently been awarded the Abel Prize in mathematics, a prize intended to make up for the odd lack of a Nobel Prize in mathematics. Of course, André Weil was also a great mathematician, perhaps one of the greatest of recent centuries.

I do object to Professor Frenkel's claim that modern men, at least those with some years of schooling, have some understanding of the meaning of "quantum theory and Einstein's relativity" and of DNA. In fact, even modern physicists have not been able to gain an understanding of quantum theory which places it the context of some greater whole, Creation to a Christian such as myself, and most non-scientists, even highly literate thinkers, have an understanding of many parts of modern science better labeled as "superstitions" than as "understanding". See Chapter 90, *Shaping Our Minds to Reality*, for my very short discussion of an insight of John Polkinghorne, theoretical physicist and then Anglican clergyman. After talking about the experience of teaching new mathematical truths and attitudes (What is a vector? "But what is it *really*?" they say.") to young scientists, he speaks also of the difficulty physicists have in thinking in terms of quantum phenomena: "Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality."

The particular difficulties in truly understanding modern empirical sciences, history or quantum theory or mathematics or genetics, vary but each can be overcome only by a major effort along with a willingness to allow our minds to be reshaped to the knowledge of reality, to be reshaped to reality through the proxy of human knowledge and human understandings of a particular age and civilization.

By 1930 or so, José Ortega y Gasset labeled men of the modern West as “barbarian children”. While he was making a brutal assessment of the state of the common folk, he wasn’t criticizing them in a moral sense so much as he was criticizing the leaders. Under his quite plausible interpretation of the recent history of Western Civilization, masses of human beings had been released in the 19th century from parochial lives by modern political and technological developments. The ‘clerics’ or teachers and leaders of the West were the ones who failed to raise those peasants and other peoples of limited experience to an appreciation of Western Civilization; in fact, those irresponsible teachers and leaders willingly and even joyfully at times fell to the level of those who left behind the social and political order, the moral order, the culture, the generally pietistic forms of religious beliefs of rural areas and villages, to enter a vacuum of sorts where they should have entered the cosmopolis. The novelist Walker Percy should have titled his collection of essays about modern men as *Lost in the Cosmopolis* rather than *Lost in the Cosmos*. The Cosmopolis is the human manifestation of the current understanding of the Cosmos. We are lost in the Cosmos, not because we are inherently alien to this world nor because the world is defective in a way meaningful to us in our mortal lives, but because our understanding of that Cosmos, our Cosmopolis, is defective.

Most men and women of the West remain in that vacuum in which they can exist and sometimes even prosper in ways of individual mental development as well as prospering in ways of material standard of living. The failing of modern men is largely in the ways of the intellect, the “communal and capitalized form of live intelligence” as Jacques Barzun called it—see Chapter 127, *Intelligence vs. Intellect*. For a more complete overview of individual and communal human being, download my book, *A More Exact Understanding of Human Being* [53]. The intellect of a Western man is, or should be, the mind of the Western Cosmopolis as incarnate in Western thinkers and Western libraries and Western techniques of building and manufacturing and growing food and so forth.

Despite the isolation which is often a necessary part of intense mental

efforts in such fields as mathematics, theoretical physics, philosophy, poetry, novels, musical composition, and so forth, these fields are as much a part of human communal effort as, for example, the design and construction of great buildings. Even the occasional child genius has a tremendous amount of that “communal and capitalized form of live intelligence.” Mathematics, as Professor Frenkel tells us, “is so deeply woven in the fabric of our lives and is becoming, more and more, the engine of our power, wealth, and technological progress.” I think the point can be made in a still better way by speaking of the deep relationships between mathematics and all aspects of our civilization, not just those aspects which can be labeled ‘materialistic’ when isolated, but it seems clear that Professor Frenkel does hold the wider and deeper view. It’s not just coincidence that artists were typically engineers or mathematicians during the early Modern period when the West was progressing so rapidly in so many ways. Those artists developed some of their techniques, such as perspective, by way of mathematical insights but their entire understanding of reality and of what it meant to be an artist was shaped by their entire individual and communal human beings, including those aspects of their beings labeled as “mathematician.”

Mathematical reasoning is a part of the individual minds of some and the communal minds of all in an advanced civilization. Even those who have difficulty understanding specific bits of mathematics will have cultural outlooks reflecting modern understandings of numbers, of infinity, of shapes. To be sure, this process of integrating recent mathematical understandings into the West has been slower than it could have been, largely as a result of the problem I discussed above: the failure of teachers and leaders to respond properly to the greater and higher possibilities of our civilization. Besides, it’s awfully hard to integrate something into decaying human communities. This is a problem I’ll be trying to address over the next few years, or more, by trying to develop a moral language drawing upon modern mathematics and other sciences, which language would allow us, for example, to speak of our ‘moral space’ being bent by large masses of human beings rather than forcing us to try to put everything in the linear and flat terms of Euclidean geometry, the terms which do show up in our moral discourse, “the straight and narrow way” and all of that. It’s our now improper geometric biases which make it so difficult to understand what it means to be a ‘non-conformist’ and, equivalently, to understand the strange way in which we’ve truly progressed in the growth of the Body of Christ though recent times show events which indicate to shallow intellects that

demonic evil has become more powerful.

Mathematics is the most fundamental set of tools in the human effort to explore, analyze, and understand the world in which we live. In Professor Frenkel's words: "Mathematical formulas and equations represent objective and necessary truths, which describe the world around us at the deepest level." Again, I argue often and repetitively that mathematical understandings underly and provide many of the concepts and terms even for our moral discourse, which remains inadequate and even improper largely because we haven't yet learned how to speak of our moral lives, individual and communal, by use of our far richer mathematical knowledge. We speak of our moral lives in terms of mathematics, such as Euclidean geometry, as understood in the ancient Mediterranean world and, as a consequence, our moral understanding has not advanced from those ancient understandings. To say, that moral realities haven't changed over the centuries of human advance in technology and political systems, and the huge growth in population and in the complexity of human communities, is to take up a strangely inadequate form of conservative thought.

Despite all that can be said about the importance of mathematics, and other fields of human endeavor, to the greater human understanding of reality which is civilization in a true, if limited, way of speaking, most of those blessed with chances to attend the well-funded if mostly dysfunctional school systems of Western Civilization consider all that culture stuff, the great novels and great visual art of various national traditions in the West as well as science and mathematics and engineering, to be so much stuff to leave behind when handed their diplomas. We are barbarian children. That stuff we don't like comprises many of the various aspects and parts of civilization; what we like are violent sports and disordered music and other entertainments which are the stuff of barbarian tribal life.

In contrast, Puritan divines, clergymen and theologians, such as Cotton Mather and Jonathon Edwards devoted part of their leisure time to the study of the great science of their days, including the work of Newton which was presented in the very demanding form of Euclidean geometry instead of the more sophisticated but simpler form of Newton's own calculus. Many of the great, multi-volume works of serious American history and biography from the Gilded Age and a little later were produced by men who were insurance brokers or lawyers or the like and were read by a variety of middle-class Americans who wouldn't have thought themselves to be particularly intellectual.

I return to mathematics to note that it takes some effort to learn the calculus but then many arguments of modern physics can be presented in a few lines in terms of that calculus instead of pages of involved arguments in terms of Euclidean Geometry. In part, this is the genius of mathematics, a genius shared with many fields of study and practice: put in the effort to build a vocabulary and set of techniques which can be applied in efficient ways to very complex and complicated problems. In metalworking, it shows up in the best current machines being used to manufacture current products and also future machines which are better in some desirable way. This is one major way to view a civilization under development: ever more wisdom and technique is being encoded in more compact and more usable forms.

We pretend to recognize the importance of the mind and yet we glorify mostly those who develop extreme skills in sports, those who are ruthlessly successful (or lucky) in politics and business, those who invent gadgets we enjoy. This isn't to denigrate the perceptual intelligence and quick decision-making skills of a Tom Brady or the similar intelligence and skills of an experienced catcher guiding a young pitcher. Yet, we should realize that it was Shakespeare who gave us so much of our beliefs about what a modern, Western nation is and what its leaders should be like. Can you name the great athletes alive at the time of the Bard of Avon? We remember Plato as a great thinker and moral presence and know only vague rumors of his accomplishments as a wrestler.

Many of us can't engage in mathematics to be sure. One rejoinder is that few Americans can run fast enough to play wide receiver in the NFL but many Americans sit in front of the television each Sunday watching NFL games. If we better form ourselves as images of God by being NFL fans than by engaging in efforts to understand God's Creation, then we Americans are in good shape for our final judgments. If God would prefer that we devote some serious effort to understanding His thoughts as manifested in Creation, we might be, at best, headed for a long stay in a remedial education program before entering Heaven. The prior statement should be understood in terms of human communities and not in terms of human individuals, many of whom aren't gifted with mathematical abilities and won't be held responsible personally for not understanding, or even knowing about, the work of André Weil or its completion by Pierre Deligne.

My guess is that we better serve God, Western Civilization, and future generations by understanding the work of those mathematicians than we do by gawking at the achievements of Tom Brady, though—to be fair—sports

is a part of human civilization as well as mathematics. Tom Brady has his place also, along with those forgotten great athletes of the Elizabethan Age.

# 52 Reality Bites Back but Maybe It Started Nibbling Many Years Ago

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1683>. It was finished and uploaded on 2013/09/02.]

The essay, *Disorder on the March* at <http://www.thecatholicthing.org/columns/2013/disorder-on-the-march.html>, by Joseph Wood ends with the paragraphs:

The confusion of the moment is so comprehensive, as demonstrated in just the recent examples above from popular culture, law, science and politics, that any kind of coherent political or public square response is difficult to envision.

As a friend recently reminded me, a famous physical scientist once said that as science goes off on various excursions, “reality always bites back.” We have reached a point, in our collective cultural and political abandonment of true order, where reality is going to bite back—maybe slowly and gently, maybe quickly and violently.

The question is how to witness for truth in the meantime. One answer is Alasdair MacIntyre’s advocacy of small communities that by and large withdraw from the national public square.

That stance is uncomfortable for Catholics—and many have rejected it—because the Church is interested in all aspects of truth, including how truth shapes political action. But until our nihilistic culture and the power politics of secular progressivism

are reformed by some sort of spiritual renaissance, or collapse of their own dead weight, there will be severe limits to what can be accomplished in the public square. And participation in that public square has to be weighed against the risk of legitimizing and perpetuating all that is wrong with it.

We will have to learn from Christians in the Middle East, from Christians in central Europe in the communist era, and most of all from first century Christians. They all survived a great deal of reality's biting back. And they witnessed for Christ, first and always.

It's refreshing to read essays and articles by traditional Christians who are respectful of harsh realities while trying to see a way out, a way to recover what is true rather than simply demanding others conform to our claims about truths. I assume by his reference to Alasdair MacIntyre that Wood is at least somewhat supportive of MacIntyre's claim that those who aren't traditional Christians aren't just being willfully evil, they hold ideas and use words in such ways that they often do not hear the truth and cannot think the truth, where I use "truth" to refer to our best current understanding of such, an understanding which should mature—be made more complete and less imperfect—as God continues telling the story which is this moral realm. Those holding the views of "secular progressivism" may be amoral or immoral human beings or they could be morally confused, courting disorder by seeking lesser truths in preference to the greater truths, or even the absolute truths, but something has gone wrong on our side as well as on the side of the anti-Christians or the straying Christians or perhaps the non-Christians straying from the wisdom of their own traditions of belief.

Traditionalist Christians, Catholics and others, don't seem fully aware that any complete understanding of God's Creation, hence of His acts as Creator, depends upon not just direct revelations from God but also upon an understanding of empirical reality and also upon a good amount of speculative framework and glue. My claim in a large volume of writings has been: modern Christian intellectuals, including Catholics, have shirked their duty to be, more or less, continually updating and enriching and complexifying our best understanding of God's Creation.

It could be said that traditionalist Christians began to make their own reality, in a certain strange sense, centuries ago, perhaps when Galileo—

most prominently among a number of thinkers—rediscovered the empirical orientation of true Biblical religions, at least Judaism and Christianity. Many Medieval Scholastics, given at times to an overly intricate and jargon-ridden way of speaking—many of their writings were intended to be transcriptions of formal and apparently stylized debates whether actually held or not, taught that all that we know, even “direct” revelations!, come through our physical senses. Oddly enough, in the *Ascent of Mount Carmel*, St John of the Cross even stated that as an obvious truth before heading off on a spiritual path which was very much dualistic instead of being fully grounded in empirical reality, this concrete realm of God’s Creation. This is somewhat strange for a member of an order (the Carmelites) founded upon the material-spiritual (there is no contradiction) practices and teachings of the Near East hermits of Judaism (think Elijah) and early Christianity.

In more general ways, Catholic thought and much of Lutheran and Anglican thought is well-grounded in God’s Creation, necessarily starting with what we can see and smell and hear and touch. From there, we can begin to understand more abstract realms of created being—most of which realms are still present in the most concrete of things. For those new to my thoughts, I’ve written often about my views of being, and of space and time and matter, but I summarized some of that in three short essays included in this book as:

- Chapter 172, *Frozen Soul and Other Delicacies*;
- Chapter 173, *Studying Steam When All You Have is Ice*; and
- Chapter 175, *More on Matter as Frozen Soul*.

The trouble with the current version of Christian traditionalist thought is that it has become a disembodied story of sorts, something not quite part of our concrete world but still true in some sense. “Some sense” isn’t good enough. Christianity teaches that God is a Creator who is the source of all being, His own divine being and also all contingent being. In terms more accessible to those trying to understand this: we need a story of salvation which includes even, for example, human beings whose sexual development went awry in a world created by the all-good, all-knowing, and all-loving God of Jesus Christ. This doesn’t mean that all are saved and certainly doesn’t mean that any particular class of sinners is excluded from salvation. I suspect a lot of serious sexual sinners will be saved and

a lot of lukewarm, relatively sinless men and women will not arise from the grave except, perhaps, to be judged and then dropped from the only possible existence without end for mortal creatures: a life shared with God, a life as a member of the Body of Christ.

We need a story of salvation, our best version of the story of the birth and development of the Body of Christ, which takes place in a world where stuff is ephemeral, is created by relationships and can be shaped or reshaped by relationships. This is where quantum physics meets the school of thought associated with St John the Apostle. I'll add that the world of the resurrected is much like this mortal realm, it is the completed and perfected version of this world. After all, grace completes and perfects nature rather than destroying or replacing nature. Even when we're raised from the grave, we'll be not freestanding creatures but rather the result of specific relationships beginning with God's love of us.

We need a story of salvation being told in a world where the best of human efforts can produce very bad results. For example. American Catholic leaders and many in their flocks have fought for certain political and social programs for at least a century. Many of those programs have been established and the results aren't pretty, but, Christian leaders, not just those in the Catholic Church, continue to follow a script that seems to be grossly defective.

We need a coherent story which makes sense of sociobiology as a grounding for the *Sermon on the Mount*, of modern theories of space and time and matter as a grounding for an understanding of the Eucharist. We have both individual and communal being—see my freely downloadable book, *A More Exact Understanding of Human Being* [53]. Many Christians active in large-scale social and political actions rely upon communities combining for acts of charity but act as if those communities are nominal entities, not entities with real existence. With such a defective understanding, those activists don't properly consider the interests of those communities as communities. In the case of immigration and the willy-nilly formation of multicultural pseudo-communities, great damage has been done to both host communities and the immigrants. For a discussion of this problem, see Chapter 477, *What is the Role of the Christian Church in the Public Square?*, and pay particular attention to the discussion of the findings of Robert Putnam, a mainstream liberal and professor at Harvard whose research spotlighted, to his great discomfort, the damage we can do to our concrete and "natural" communities by mashing them up into what could be called "multicultural

gunk.”

In my version of God’s story which makes sense of modern mathematics and physics, of evolutionary biology, of modern literature, of a solidly literal but not literalistic understanding of the Bible, of the creeds of traditionalist Christianity, we need to care for our communal human being and that of others and not give in to the modern temptation to think and act as if we are individuals who happen to gather into masses of individuals. Unwisely squeeze together two morally well-ordered communities and you’re likely to end up with a morally disordered mess in which the churches and voting booths are empty, a mess of the sort which leaves the individuals vulnerable to exploiters of various sorts. Sound a little bit like what we’ve done to our own societies in modern times? To be sure, God’s story has always had horrible periods in which famines and wars and disease and even great prosperity led to the same sorts of problems we’ve created for ourselves, but that’s the story God has chosen to tell and I’ve not gone into a career of apologizing for God or criticizing His work. The Almighty chose to create a race with reproductive systems such that a lot of embryos die in the womb, often without the mother even knowing she was pregnant. That doesn’t give us the right to kill embryos. The fact that population pressures caused invasions of the British Isles by Celtic tribes, of western Europe by Germanic tribes, of India and the Middle East and Europe by Central Asian horseman, of southern African regions by Zulu tribesmen, doesn’t justify aggravating the moral and social breakdowns which are taking place in the West. Be charitable but think rather than vomiting compassion upon the world and don’t badly damage the organs of the Body of Christ in misguided efforts to help individual members of that Body.

A lot of traditionalist Catholics, while wanting to help the troubled of the world, are aware—usually in a vague way—of the problems I noted above. If we are to understand so that we can act without doing the patient harm, if we are to play our proper parts in the development of the Body of Christ, we must have a good story, a plausible human understanding of the context in which Jesus Christ gave the *Sermon on the Mount*.

Without a good story, that is, a story of salvation which makes proper sense of what we know of Creation, including the complex human communities which have grown up, good and bad human beings will continue to use, and often misuse, what they have. What they have is a suite of stories which don’t make much sense if you try to combine them into our best version of the story God is telling. I think we’ve actually lost our belief that

it all does make sense, lost any true understanding of why it is that Dante would have thought it possible to consider this realm to be part of the same unified Creation as Hell, Purgatory, and Heaven. Biased I might be, but I'll claim to have re-established such a true understanding—see Chapter 577, *The Only Sane Christian in the Modern World*, originally published on the Internet in 2008.

I think Wood, like many traditionalist Catholics and traditionalist members of the separated Christian churches, knows much of this. He tells us: “[T]he Church is interested in all aspects of truth, including how truth shapes political action.” I don’t quite know why it is that so many solid Christian thinkers see there is a problem but don’t see their part of the problem is caused by, not something bad, but something good which has outlived itself. The current traditionalist Catholic version of God’s story is, in fact, a version which has outlived itself. It is the result of efforts by the greatest of Christian thinkers and artists—up to some time between 1500 and 1800; it, necessarily, has timebound elements. We speak the truths of the *Sermon on the Mount* in terms of an understanding of human nature less “exact” than is demanded by our modern circumstances. I take the word “exact” in a certain sense as intended in a quote I used as an epigraph for my freely downloadable book, *A More Exact Understanding of Human Being* [53].

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man. [Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: *Broadening the Horizons of Reason. Prospects for Philosophy*].

The Christian tradition is always the same but always the same in the way of a child yet growing. We should be making a serious effort to integrate at least major parts of modern empirical knowledge into a Christian understanding of God’s Creation, as Augustine and Aquinas did in their own times.

A new and better version of God’s story must consider the truths manifested in the stuff studied by Heisenberg and the different relationships studied by Einstein (space and time) and Darwin (the ties between the

generations of mortal, living creatures). The truths of this Creation includes even the abstract thoughts found in very difficult mathematics. For example, I've argued that we need to upgrade our understanding of "moral paths" by moving from simple Euclidean language and concepts to those of modern geometry, especially the differential geometry used by Einstein to formulate the General Theory of Relativity. I've written about this need, caused by the sheer mass and complexity of human communities, in a number of places including Chapter 403, *Differential Geometry and Moral Narratives*, where I wrote:

The American physicist John Wheeler once summarized general relativity by telling us that matter tells space how to shape itself and space then tells matter how to move. Maybe we can play around with this metaphor:

"Human beings tell moral space how to shape itself and moral space then tells human beings how to move through life—how to act."

Four years later, I'd reached a more complete and complex development of this idea. In Chapter 475, *Physics, Politics, and Metaphysics*, I elaborated a little on the use of higher-level concepts derived from some of the powerful ideas of modern mathematics and physics:

[W]e could maybe come up with concepts which are abstract descriptions of what can happen when relationships between members inside a community or between communities change. A moral creature embedded in a variety of communal relationships might suddenly find one or more of those communities is changing substantially so as to seem an entirely different sort of community. This might be a result of the community growing and becoming denser in relationships or as a result of a community losing moral structure.

We need to understand stuff, the universe, physical relationships; then we can study narratives, including those of a political nature. I've done much of that as well, even coming to a tentative understanding of political gangsterism and other forms of "conspiratorial" behavior within my understanding of God's Creation as a setting for the story of the Body of Christ.

My somewhat voluminous writings, most available for free downloading, are described in *Catalog of Major Writings by Loyd Fueston* [52].

# 53 How a Christian Finds Metaphysical Truths in Empirical Reality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1771>. It was finished and uploaded on 2014/02/03.]

I confess to failing the tests of being a ‘professional’ philosopher, having been forced to face up to that criteria during a reread of Etienne Gilson’s *Being and Some Philosophers* [62]. I don’t really care since I see serious advantages in being non-professional, advantages similar to those of the highly energetic semi-barbarians (da Vinci, Michelangelo, etc) who were bridges of a sort from the glories of the Middle Ages to those of the early Modern Age. I’d really known from my first efforts to write philosophy or theology that I wouldn’t ever be a professional; perhaps a less disciplined thinker writing philosophy and theology in the way of a novelist. Not always bad at all. Plato had a bit of that in him, Augustine was thoroughly non-professional, as was Nietzsche though being one of the greatest scholars of all philosophers.

I wasn’t always resolute in my non-professionalism, thinking years ago about spending lots of time meditating on the exact meanings I should transmit to specific words and phrases. I thought about spending a great deal of time on a small number of works, bringing the prose to the turgid perfection found in the great works of so many professionals. To be sure, turgidity isn’t always the best measure of philosophical greatness—there are likely many unknown university professors who have surpassed Kant and Heidegger. And I have to confess to writing at times to the standards of turgid imperfection. So it was that I had thought to become a profes-

sional but decided instead to pursue the truth which always lies outside the boundaries of human systems, of human professionalism. Sometimes it's more important to deal with questions within the current reach of professional philosophy and sometimes we are forced to step beyond that reach.

Gilson strongly prefers professionals for the most part—why not?—but he acknowledges that David Hume was a potentially pivotal non-professional who tried to turn philosophy back to a recognition of the proper claims of empirical reality; the consummate professional, Immanuel Kant, undid what Hume had done. The story's a bit more complicated than that, but not so much different.

I'm only about half-Scottish but I've been following in Hume's footsteps, in my own way. This is to say I work hard to return my own attention and the attention of my readers to empirical reality, not the reduced empirical reality of too many modern thinkers—such a reality can be plausible only when beefed up by the modern dualism by which our brains, though bereft of minds, can access Platonic realms of the Real to pull down transfinite numbers or schemes of political order or schemes by which chaotic systems magically order themselves. This is to admit the pantheists and even atheists who see Reason as ruling the world see part of the truth; human reason, even in its most ethereal forms, is found in the world or—more accurately—in our responses to the world around us. If those dedicated to Christian revelations are right with regard to some truths, these sorts of pantheists are also right with regard to some truths. The first sees God in His transcendence but not His immanence as Creator and the second sees god-like Reason in its immanence without seeing the transcendent God. Of course, there are some believing Christians who see God the Creator and see Him in His unity as the God of the Creeds. There are also some pantheists and atheists who see hints of a transcendent God but never achieve personal belief.

There are also some in the modern world who think in ways scientific or reductionistic. As literalistic as any Bible-thumping preacher out of a Flannery O'Connor novel, they see human language as being transparent, framing the truth underlying what is so that it can be organized to fundamentalist purposes but otherwise showing us the unadorned truth, as 1960s sit-coms were once believed to show the real truth about American life and moral order. As Miss O'Connor acknowledged and even celebrated, those sorts of thinkers see a limited portion of the truth but see it as in the rays of a police searchlight.

Reductionism isn't the only problem making it difficult for philosophically and theologically inclined men to make sense of all that is now known of certain domains or aspects of Creation; such men are both those who respect the underlying reason of our universe as being a part of the wisdom of God and those who respect that underlying reason as if it were some better version of Pan. Such men have created great systems of thought and belief, including some men with a partial or clearly defective view of created being.

Ways of understanding all that exists (by whatever definition) have staying power—call them cosmologies if you will; I've called them 'worldviews' in some of my writings. Such cosmologies or worldviews are built into our language and the workings of our minds, the workings of our attitudes toward God or the gods and toward other men and toward the world as a whole, and the workings of our hands as we make our livings or create works of beauty.

So it is that we modern men have to deal with the persistence of what might be called categorical schemes of metaphysics, building block concepts of being and existence, in a world which is dominated by evolutionary and developmental processes. In fact, so far as the realms of created being go, these building blocks don't pre-exist the entities which are made of those blocks. They evolve and develop as do the complex entities themselves. In fact, the dividing line between part and entity is always somewhat fluid and always somewhat arbitrary. There is no essence of man but rather the stories of creatures branching into other stories, some of which were and are the stories of men. And there is the story of the perfect and complete man, the communal being who is the Body of Christ, communal as God is. The Almighty is three Persons who retain their individuality while being one God. The Body of Christ is a multitude of human natures who retain their individuality while being one Man or one Body of Christ.

I'll switch to using the term 'process' and reserve the use of 'story' for streams of events involving higher entities—including the physical universe as a whole. A man lives a story intertangled or embedded in a variety of other stories but that man came to be, in terms of his evolved species and also his individual being, by way of evolutionary processes and metabolic processes and so on.

(I'm in a semi-professional mode here, loosely defining my words and also moving on to loosely define some of the relationships between realms of being.)

Are those processes found only at the level of concrete being? Could they possibly go to the most fundamental levels of created being? My answer is that truths of a sort claimed as metaphysical principles were manifested by God as the raw stuff of created being. That raw stuff was shaped in various stages coming to a climax of sorts, from our viewpoint in this mortal realm, in the phase change to thing-like being which we know as the Big Bang. It's better in many ways to see thing-like being as arising some hundreds of thousands of years after that when 'matter' and electromagnetic radiation decoupled, an event we see as the cosmic background radiation. I provide an overview in Chapter 438, *The Essence of Liberalism*, drawn from an essay where I perhaps first stated clearly my motivation for my current philosophical and theological work by raising doubts as to whether "we even understand the components of human nature and human community life well enough to have meaningful discussions based upon such aspects of human life as 'freedom' or 'happiness'." I went on to speak about the nature of being and how this needs to be re-understood to deal with human nature from the modern perspective, allowing for modern empirical knowledge of man and of his world.

In Chapter 438, *The Essence of Liberalism*, I also provided "a diagram explaining a little of what it all means":

If the reader wishes to understand the meaning of this diagram—very important to my worldview, he should read or reread the entirety of Chapter 438, *The Essence of Liberalism*.

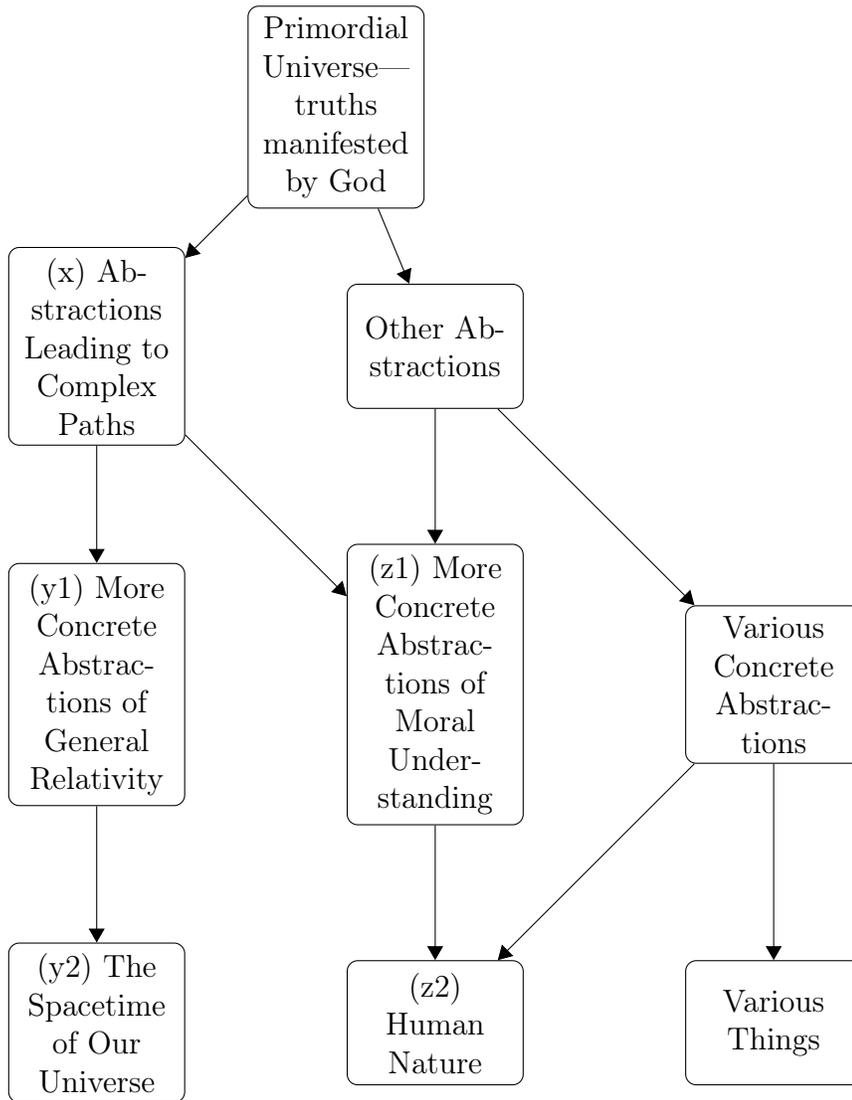

Figure 53.1: Simple Relationships of Abstract and Concrete Levels of Being

## 54 Rebellion Against Reality is a Sin and a Moral Fault

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1869>. It was finished and uploaded on 2014/08/25.]

Christians are bound to recognize that the God of Jesus Christ is truly Lord and truly Creator. We are bound to do our best to honestly and courageously and faithfully respond to God's Creation as we can best know it and as we come into contact with it.

To turn away from Creation or to attempt to impose your own dreams or schemes upon Creation rather than properly responding is an act of rebellion against God, that is, an act of rebellion from the Christian viewpoint. It is also a serious moral fault and courts practical consequences—to virtuous pagans and others as well as to Christians. In my updated Thomistic terms, I think of this rebellion as a refusal to make peace with empirical reality. (See the freely downloadable book, *Making Peace with Empirical Reality* [49], which is also the name of a part in the much larger collection of essays, *Acts of Being: Selected Weblog Writings From 2006 to 2013* [51]. An update of this more complete collection is produced shortly after each year-end.) This refusal to make peace with empirical reality can be an understandable response to a sometimes brutal Creation, but it cannot be sustained without falling into a rebellion against God. Certainly, a major human institution or country or civilization falls into a state of moral disorder and courts disaster by sustaining such a rebellion.

As Jeremiah pointed out in explicit terms, if you know that God has willed that your very country be conquered and your people enslaved, then you have to give in to that will of God. It is rare, to say the least, that the members of a community would be asked by a true prophet of God to

surrender their entire community, men and women and children, Temple and home and stores of food and gold, to a brutal and greedy conqueror. Lesser surrenders to political or military subjugation by brutes or simply those who hate your people are sometimes mandated by bad situations. A lesser form of this surrender might well be the fate of the American people if they continue to tolerate leaders who abuse other peoples with American power. We will need to surrender our (quite irrational and historically unjustified) claim to being an ‘exceptional people’. I think this is already happening and our leader class (power-elite or whatever) is not going down gracefully because they have nothing to contribute to the world but a brutal willingness to use the firepower made possible by American wealth and to use it even against the most defenseless of civilian targets.

How can we understand the sort of rebellion against reality, against the most blunt of facts let alone against reasonable, but speculative, understandings of that reality? Is it a form of *Idealism* as described at <https://en.wikipedia.org/wiki/Idealism>? That article in the link defines Idealism in these terms:

[T]he group of philosophies which assert that reality, or reality as we can know it, is fundamentally mental, mentally constructed, or otherwise immaterial. Epistemologically, idealism manifests as a skepticism about the possibility of knowing any mind-independent thing. In a sociological sense, idealism emphasizes how human ideas—especially beliefs and values—shape society. As an ontological doctrine, idealism goes further, asserting that all entities are composed of mind or spirit. Idealism thus rejects physicalist and dualist theories that fail to ascribe priority to the mind. [Footnotes can be found in the original.]

Presented in these abstract terms, Idealism would seem to be a concern of ivory-tower philosophers. It’s certainly not clear why it would be a problem for Christians or for Americans, Christian and non-Christian. In fact, my view of God manifesting His thoughts as created being of which we are a part and from which we form valid thoughts by way of responses obscures, but in a useful way, the difference between ‘mind’ and ‘reality’. By way of a higher level understanding made possible by an ‘encapsulation’ of reality as a substantial part of our own minds, we can expand our understandings of reality to include larger pieces of Creation. By way of emphasis upon mental

activity, my claims bear a somewhat askew but close resemblance to at least a possible form of Idealism. The difference is that valid mental constructs in my worldview are formed by honest and courageous responses to reality, in the small or in the large. Creation itself corresponds to our minds (most completely and most perfectly to the communal mind of the Body of Christ) because our minds correspond to Creation as we best know it. Actually, there is a time-lag which brings about the possibility of serious problems, some of which are realized pretty well in the modern world, especially in the Christian churches and in the countries of the West. Our understanding is always based upon yesterday's responses and the knowledge formed by those responses. When, for example, the physical and mathematical sciences have advanced so fast as to conflict with our knowledge from yesterday, then our general understandings of Creation are out of synch with our best, and perhaps only partially digested, knowledge of empirical reality. The same can also happen when knowledge of abstract realms, such as mathematical understandings of infinity, has advanced too rapidly to have been properly absorbed by philosophers and theologians, historians and biologists, poets and novelists, clergymen and believers, politicians and citizens.

What does all this mean? Perhaps that Wikipedia article at <https://en.wikipedia.org/wiki/Idealism>, can shed some more light through a passage dealing with more ordinary usage of the term:

In ordinary use, as when speaking of Woodrow Wilson's political idealism, it generally suggests the priority of ideals, principles, values, and goals over concrete realities. Idealists are understood to represent the world as it might or should be, unlike pragmatists, who focus on the world as it presently is.

The above statement is a large-scale simplification of the sort found in my essays. I like it.

For the rest of this essay, I'll use the term 'Idealism' for this 'vulgar Idealism' and I'll ask, "Why is Idealism wrong?"

Idealism assumes that the truth is found in our heads, and perhaps in our hearts. In most cases, this is not a conclusion from personal contemplations or perhaps debates with friends or others. In most cases, this is a result of the very processes I advocate. We form our minds in responses to reality, but nearly all boys and girls form their minds by responding, usually in affirmation, to what they are taught by Mom and Dad, Grandma

and Grandpa, minister or priest or rabbi and religious teacher, movies and formal schooling. Some are born with a tendency to rebellion which is one of those traits dangerous, or even self-destructive, in some circumstances but valuable to society if not to the rebellious human being in other circumstances. Most tend to absorb what they are taught explicitly or implicitly. Turning the communal mind is akin to turning an oil tanker—it takes a good number of miles or years.

We hold “ideals, principles, values, and goals” and believe them to be absolutes because we adopted them or they were pushed into our heads or—more realistically—both, starting with the very first attitudes we picked up as infants. When reality seems to differ from our absolutes, we go with our absolutes. I could say it’s even broader than the above list by including even facts. We hold ideas of what “must have” happened during, say, World War II or the Vietnam War or the campus protests during the late 1960s and early 1970s or Watergate. Those fairy-tales, sometimes with as nasty an edge as any from Soviet propaganda, overrule any potential facts which present themselves to our senses or minds. Americans are so good and pure in the mind of these juvenile patriots that they don’t even question what really happened when we hear of Vietnamese or Afghan villagers, sometimes with weapons in their hands, being killed by Americans carrying heavy arms. Who was in whose backyard? Who was carrying military rifles and explosives near whose children? We don’t even question the meaning of the context; we know any villager who killed an American soldier was clearly one of those gooks who have no respect for human life or a raghead who hates us for our freedoms.

More generally, that refusal to accept God’s Creation on its own terms—terms set by God in His freely chosen role as Creator—is an act of defiance against God. This doesn’t mean we’re called to accept our fates in some passive way; it does mean we are called to respond to God’s Creation rather than to attempt to impose our own rules upon that great Work of all works. We play within God’s rules which include the 5th Commandment so spectacularly violated by the United States and its allies since the dominant countries of the West decided to fight the gangster regimes of Hitler and Stalin by becoming more skilled gangsters.

God’s rules also include the rules covered by modern physics and mathematics and the general principles of evolution and development which are so central to physical cosmology as well as biology and history and sociology and creative writing. Even highly educated scientists are having trouble

learning how to truly accept all of this new empirical knowledge, and the theories built upon it; even philosophers with flexible minds can't readily make the strangeness of quantum physics a natural part of their thinking though it is quantum physics that is true and our minds which are wrong or at least inadequate. (See Chapter 90, *Shaping Our Minds to Reality*, for my responses to some powerful insights by John Polkinghorne, physicist and Anglican priest.)

Our worldviews, our overall understandings of all that exists, are largely matters of speculation and are necessarily limited and impoverished compared to Creation, but we should be careful to avoid willful wrongheadedness. We should also avoid wrongheadedness in our understandings of lesser realms of Creation, such as the history or moral standing of our country. Our understandings are limited and impoverished because of the ways in which an imperfect creature has to learn over time, his own lifetime and the generations over which develop the communal human beings into which an individual human being integrates his own individual being while yet keeping it and remaining himself. To be wrongheaded is to be morally culpable for willful ignorance and the resulting stupidity—however inherently intelligent those ignorant and stupid human beings often are. The ultimate wrongheadedness is to willfully misunderstand the very meaning of God's Creation, imposing our own—often self-righteousness—schemes or failing to courageously respond to signs that we need to rethink some matters and come to a somewhat different understanding of what is, for example, the Body of Christ. In Christian terms, this is a sin as well as a serious and dangerous moral fault. In terms of virtuous paganism (think Aristotle), this is still a serious moral fault. It's not a simple mistake, it is an effort to impose your own preferences upon God's manifested thoughts, even an effort to assert the superiority of your own 'moral vision' over the work of God.

Human beings can be in a state of seeming rebellion against reality, or at least in a state of separation from reality, for a variety of reasons which might carry no moral culpability or only partial culpability. A schizophrenic who weaves fantastic tales of being a disinherited granddaughter of a very wealthy man, only half believing it herself—if even half, isn't evil. A seemingly sane President or Vice-President of the United States who weaves fantastic tales of vast international conspiracies against Americans, "They hate us for our freedoms?", is evil, no less though he believes his own fables. American citizens who continue to follow men who present only updated

or even more outlandish versions of these fantastic tales are in a state of sin or moral fault after these decades of Cold War followed by a “Clash of Civilizations” and the huge body count, disproportionately composed of the Vietnamese villagers we were ‘saving’ and all those Iraqi children evil enough to live under the rule of an American bastard our leaders no longer wanted.

Let me step back and speak in terms of centuries. The current separation of the intellects, or communal minds, of the West from reality is a highly possible, though not necessary, result of the rejection of evidence that God’s Creation doesn’t correspond to the ideas held by those who persecuted Galileo who was trying to respond openly and honestly to that evidence. (In this, I simplify by using the most prominent martyr to the truth of God’s Creation as a symbol.) To be sure, however stupid some of Galileo’s persecutors were, they were the holders of what were honorable and quite plausible speculations on the nature of this concrete realm and of what might lie outside of it. Plausible but wrong as it turned out, though we should allow some sympathy for those with inflexible minds and rigorous training in a worldview about to be superseded. But, mostly, we should criticize them strongly for not even losing their confidence in their worldview in the face of strong evidence it was not adequate for understanding empirical knowledge in even the early decades of the “Age of Discovery”—they were willing enough to profit from the new lands being discovered where no new lands should have been by their mainstream understanding of geography.

As it turns out, Galileo himself knew that some of the great contributors to that ultimately wrongful understanding, such as the Christians Augustine and Jerome and Thomas Aquinas, taught that reality is the ultimate judge of our understanding of reality—to put it in a modern way. Popes and other Christians can criticize the modern tendency to impose fairy-tales upon reality, evil fairy-tales when it comes to the Nazis, but that is a tendency first born in the Catholic Church’s intellectual and ecclesiastical institutions in the so-called Renaissance and then developed in parallel in the corresponding Protestant and secular institutions of the West. Reject reality in favor of your own dreams and schemes and reality might reject you. Sadly, in the short-term, the victims might be quite innocent and not even involved in the struggles to maintain an outmoded worldview or to establish a new one to the tastes of men willfully separated from reality.

# 55 Mathematical Models of Human Communities: Local and Global Processes

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1892>. It was finished and uploaded on 2014/10/01.]

In *Sociodynamics: A Systematic Approach to Mathematical Modelling in the Social Sciences* [145], the physicist Wolfgang Weidlich develops a model of some aspects of human communities; his model is developed bottom-up in a manner similar to the development of a model of an industrial process or of (allegedly) well-defined human activities. Weidlich is wise enough to qualify his efforts by acknowledging that there are aspects of human communities which can't be modeled in a quantitative manner.

Weidlich engages in what I would consider traditional modeling, an activity running pretty much parallel to the modeling of an industrial process such as the mixing of gases or liquids or even the modeling of a more complex system where multiple processes are involved as well as human workers. It is also a form of modeling which assumes the whole is the sum of its parts, though undoubtedly many 'emergent' properties can arise in a complex, sophisticated model. Again, Weidlich freely admits and intelligently discusses some of the ways in which the whole is greater than and different from the sum of its parts, but this type of methodology tends to separate a complex entity into sorts of being which are hard to again see as one entity. Sometimes, this will be a matter of separating the local (such as the individuals) and the global (the communities). In fact, in some of the somewhat successful models of economies or other aspects of complex human communities, the individual disappears. In other somewhat

successful models, such as that of Weidlich, the individuals are summed up in an additive way that isn't quite convincing.

I'm advocating the use of models in which the local and the global are somewhat separate but are part of one coherent model, as in a Riemannian manifold where the geometry in a small region of a point is Euclidean, that of a Euclidean plane tangent to the point, but the manifold has a global geometry which might be very complex and very much non-Euclidean. There is nothing in Weidlich's model which can truly be labeled as 'global' and this is true also of other models I've discussed in recently published essays.

I'm not advocating a direct use of the differential geometrical techniques which have worked so well in science and engineering—most famously in the general theory of relativity. I'm advocating rather a step towards the realm of the most abstract form of created being, the truths which the Almighty manifested as the raw stuff of Creation. Since these realms of being have complicated relationships in themselves and with other realms, then we have to work in a manner largely empirical, learning about reality from reality, learning how to think by observing how the objects of our thought actually behave. Let me take a situation, that of the American people and the United States. In Chapter 315, *Do We Need Conflict to "Drive the Rise of Ultrasociality"?*, I wrote:

A people can be nonviolent and well-meaning in the small but, in the large, as a people, can be murderous and thieving war-mongers. In recent centuries, some of the most violent nations have been those with populations made up of individuals who are law-abiding and even somewhat gentle by historical standards: Germany in 1914-1945, Japan in the 1920s through the 1940s, Great Britain during the years of Empire and a bit beyond, the United States through much of its existence as loosely connected colonies up to now and still going strong though maybe about to run out of gas.

The global (national) properties of Americans in the form of the American people are much different from the local (personal) properties. This difference between, say, the individual and the community is perhaps necessary and likely to be a good thing in many cases, but not in this case. More importantly for now, we should recognize that a qualitative (think of traditional historical or political analysis) or quantitative model of a complex

human community can't be built up by simply summing up the behavior of the individual members of the community. On the other hand, models such as that of Turchin and colleagues (which I discussed in Chapter 509, *Mathematical Models of Human History: Are They Plausible?* and Chapter 315, *Do We Need Conflict to "Drive the Rise of Ultrasociality"?*) succeed in exploring specific aspects of human communities by modeling those human communities as independent entities with no relationship to the individual members of those communities. In the end, much is missing. The model of Turchin as his colleagues can tell us Central Asian nomadic warriors had a great effect on the development of complex societies in the Fertile Crescent and then upon the expansion of such complexity into other regions. They don't tell us, aren't set up to tell us, what qualities separate the barbarians who destroy and leave from those who conquer and stay as successful rulers. There is much else they can't tell about many important matters different from, perhaps at a finer-grain, than the geographical spread of civilizations and military technology.

Again: I'm advocating that we try to develop models of human being, individual and communal, by abstracting from the more sophisticated models of physical science such as that used in the general theory of relativity where local regions of space are Euclidean and larger regions are curved in non-Euclidean ways. There might be a model in the state-space (undefined as yet in any authoritative way) in which regions around a single state (of a single entity?) are Euclidean and larger regions might have a non-Euclidean geometry. As is true of the general theory of relativity, large might include larger mass as well as larger distance. Other possibilities will likely arise.

## 56 Mathematical Models of Human Communities: We Live in Narratives, Not in Models

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1896>. It was finished and uploaded on 2014/10/09.]

In Chapter 55, *Mathematical Models of Human Communities: Local and Global Processes*, I discussed briefly my oft-stated opinion that we need to model human nature, personal and communal, by a model (qualitative and quantitative) which is much like those of the theory of general relativity where local regions of space and time are, so to speak, Euclidean and Newtonian, while larger regions of space and time (with great mass also being a form of ‘larger’) are curved into some non-Euclidean and relativistic geometry. Even such a model doesn’t do the ‘whole’ job. That model of human nature must be seen as a general model of particular entities interacting in what we might call narratives or stories and much of what is important is found in those narratives or stories.

That prior posting was written as a response to specific comments by the physicist Wolfgang Weidlich in his book, *Sociodynamics: A Systematic Approach to Mathematical Modelling in the Social Sciences* [145], which is an effort to develop a model of some aspects of human communities. I’ll continue responding to specific comments made by Weidlich in that book. As is my custom, I’ll be playing off a work worthy of respect in order to take a discussion in the direction of my worldview, a sort-of Thomistic philosophy expanded to explicitly consider modern empirical knowledge, including both the ways in which the ideas of St Thomas Aquinas on human nature are enriched and complexified by drawing upon the insights of modern evo-

lutionary biology and brain sciences and also the ways in which the ideas of St John the Evangelist on the primacy of relationships over stuff are enriched and complexified by drawing upon the insights of quantum physics and modern mathematics.

In this short essay, I'll move on to deal with narratives, stories, which aren't even parts of this world so much as they are the world and certainly even our human lives, individual and communal.

On page 149, Weidlich writes:

These large scale transitions in societies [such as that from the liberal Weimar republic system to the totalitarian Nazi system] are mostly of a tragic nature. They include the breakdown of a whole political system, the liquidation of its established institutions etc, and for the people involved as witnesses and/or active or passive participants it means a break in their personal biography, and in the worst case of the arising of a violent totalitarian regime it can mean concentration camp and death for its victims.

Each of such large scale phase-transitions is of course a unique event in so far as it will never recur in exactly the same form. However, in each event of this kind there appear *universal structures* of human character and social behaviour which play an essential role in enabling political phase-transitions.

“[U]nique event[.]” Indeed. I emphasize this is Weidlich's term and I'll claim without qualification he is right to use such a term. We're dealing with unique events in a story moving forward. Whatever might be the truth or legend of tales, sometimes egomaniacal boasts, of genocidal brutality in the Hebraic books of the Bible, none of those ruthless men were Hitler. Nor were the Mongols under Genghis Khan and his descendants much the Nazis though they did share a brutal attitude toward other human beings. Ruthless killers they were, but they followed different ways of killing, different ways of being cruel to survivors. And the brutality of the Medieval Mongols was differently motivated from that of the 20th century Nazis.

The title of this essay says much: We live in narratives, not models. Models, whether those of modern physics or social sciences, can tell us much about some specific aspects or specific types of flows of events in a narrative of a human life, whether that of an individual or a community.

Models, as they are generally understood and are generally built, can't reproduce the richness and complexity, the "uniqueness" and "randomness" of our human lives. So far, no one has even managed to build a model true to the more quantitative narrative of the physical universe. Such will likely occur and maybe soon, but the point is the difficulty of building even a 'straightforward' model of physical processes of a more complex sort.

There is such a thing as reality. Some would wish to override reality with selected pieces or aspects of reality from which they would construct all that exists or at least pretend to do so. In reality, in the universe as human beings know it and as it can reliably be described to truly be, narratives exist and are not limited to what can be found in the algorithms of human models. Those narratives include "unique events" and also "random events" (sometimes, but not always being the same events). Sometimes those events are such that they can be used to enrich a model going forward. Sometimes not; sometimes they are of a nature beyond the mainstream discipline of modeling. I'm arguing for the expansion of our understanding of reality to include what might be called the qualitative tools of mathematics and some of those can be added to models, but only at the expense of making those models at least somewhat indeterminate and at least somewhat non-quantitative. And, even then, we don't know if our knowledge of being, abstract and concrete, is great enough for us to produce a proper encapsulation of this universe, of this world which is this universe seen in light of God's purposes for it, and of all of Creation.

I have used the word 'encapsulation' as I often do in my discussions of the nature of the human mind and how it forms. "What do we know?" "What is knowledge?"

What we know is not some sort of rules, axiomatic knowledge independent of Creation and to be applied to Creation to bring it into order. What we know is what is, though that is a simplistic description of a very complex process of shaping our minds to created being and its various processes and—most importantly—its relationships. We encapsulate reality and then can sometimes enter into a recursive process of understanding more complex parts of reality by building them up from simpler parts. This secondary process can be taken seriously only when it matches our encapsulation of reality, that is—our minds, and then perhaps adds to the richness and complexity of that encapsulation.

Our most basic knowledge, common sense and intuition, is what is put into our heads by the evolutionary processes which selected our ancestors

for their ability to respond properly to their immediate environments and more. These selection processes resulted in a brain that assumes much that is useful about our environments and more—as we began to see the abstract forms of being from which those environments are shaped. Some of those assumptions are true only in qualified ways and some at least point to greater truths, though I think we know not enough to be sure what is an absolute truth.

Knowledge is some sort of model, qualitative and quantitative, of reality, of created being. Knowledge, true knowledge, is drawn from reality and encapsulates that reality in various ways and in various realms of created being. Sometimes, as I stated above, this process of drawing and encapsulating has occurred in the evolution of our species and sometimes it occurs in our individual lives or our communal lives, though many individuals and communities can be said to more truly mis-know reality and not just in the sense of being in an early stage of development and learning.

I've spoken of different realms of being, ranging from this highly concrete world of things which is being shaped from a more abstract realm of being, which is itself being shaped from a still more abstract realm of being, right back to the most abstract realm of being I can conjecture—the realm of truths which God manifested as the raw stuff of Creation. Our world, this concrete realm of things and thing-like relationships, is also the realm of narratives. There are the narratives sketched by cosmologists and evolutionary biologists and all sorts of historians, from those specializing in prehistory to those specializing in last week's events. There are far greater narratives, some even having or hinting of moral purposes.

We've crossed over to realms where God's presence is more personal in a meaningful sense; the Almighty is no longer some sort of mathematician or physicist or engineer who might well be the Deity of many Enlightenment thinkers. The basic structure of spacetime has been shaped, the other stuffs of thing-like being have been made—protons and electrons and all that. When our universe came into being, God began to show Himself a story-teller and a participant in the stories He tells. I've already mentioned the truths God manifested as the raw stuff of this Creation, but what is the purpose of it all? So far as we can currently see, Creation relentlessly moves toward the concrete, the particular and even the peculiar. The power which drives this story and its many stories might well come from the Enlightenment Deity or the Godhead of a higher pagan, but stories move toward particularity and even the potential of personhood, toward a meeting

with the Triune God, three Persons in one divine Nature. The possibility of persons in the form of mortal creatures and the possibility of stories with moral meanings arise during this process, the process by which Christ and His Father and Their Spirit are revealed as the true Creator.

We human beings must ask: “What sort of Creation, Cosmos if you prefer, has the abstract stuff of personhood and stories?” and we Christians answer: “A Creation of a Personal Creator.”

I’ll freely admit that there is no way to prove my answer in the way of an experiment in physics or chemistry but that matters little because we can’t prove the universe or the world which arises from it. We can only accept it on its own terms and try to understand. We need to also explain stories and persons on their own terms and not reduce them to the physical stuff and physical relationships in which they are truly embodied but to which they aren’t limited. I’m certainly not arguing for supernatural souls but rather for what might be called natural souls: much that is so important about human nature, individual and communal, and also important about even the physical universe in its greater scope is to be found in the totality of created being, abstract and concrete. We understand not by trying to reduce the world in terms of scientific myths created by those who would explain by biology or physics what must be explained by first accepting reality, Creation, on its own terms, encapsulating it in our own minds and as our own minds, and then realizing that the encapsulation (of, for example, human nature) is the understanding, is the explanation. But it is an encapsulation which makes sense only as part of far greater encapsulations which consider all that we can discover about created being and all that is built into the very physical stuff of our brains and our entire bodies.

The ultimate in particularity is a person, an entity which is self-aware and seems to hint, however lightly, of a greater sustainability and even one without any necessary end. Death intrudes, casting doubt upon our hopes or pretenses of possessing true life, life without end even if it had a beginning. We must remember that ‘death’ as a human concept is a result of our self-awareness, the very self-awareness that brings the possibility of being images of our Creator and even of sharing His life. Our awareness of death also raises the possibility of the greatest of blessings, a sharing of the life of God.

Let me restate my position in even more explicitly Christian terms. From God comes terribly abstract truths manifested as the raw stuff of Creation, of created being of all forms and all combinations. This is some-

what analogous to God in His divine nature, that is—Creation viewed as stuff is somewhat the image of God's Nature. But the Lord set in motion processes by which abstract being becomes particularized, eventually becoming thing-like being of a somewhat abstract sort, muons and baryons and leptons and so forth, which develops and evolves toward concrete forms.

We can imagine, in a highly disciplined way, what might be the stage just one step more abstract than the thing-like being of this universe. That is, we can speak of the strange and abstract form of being which is described in the works of Schrodinger and Heisenberg and their successors, abstract and mathematical being which 'collapses' to thing-like being. More than 'described', I think there is a strong sense in which those mathematical formalisms are that being from which the physical stuff of this universe is shaped.

One product of the particularization of abstract being to concrete being, followed by the processes of concrete being evolving and developing, is the human animal which has some of the properties of a person and the potential to become more truly a person. At this point, what was analogous to the divine nature of God has produced biological beings analogous to the Son of God, a divine Person. This is the ultimate goal of these processes of shaping more particular forms of being—to produce a world and a species into which the Son could be incarnated, emptying Himself, learning the discipline appropriate to a mere human creature, and offering His own Self back to the Father. This theological analogy would imply a situation discussed, in an aphoristic style, by Wittgenstein: if we succeed in penetrating to the smallest components of this universe, we might find that foundational level is supported by the whole of the universe. From that extremely abstract stuff which is the raw stuff of created being and which is analogous to the nature of God arises the possibility of person-like creatures, creatures which can maybe become true persons by way of sharing the life of God.

There are those who examine human life, communal or personal, from the viewpoint of an empirical scientist recognizing the validity of only knowledge which can be validated by the standards of physics or biology or perhaps history. Some will claim that only this bottom-up knowledge can be accepted, denying in the process much knowledge of the global nature of processes not yet completed. There are also parallel misconceptions among Christian thinkers, including those who deny the validity of natural theology just because they think of nature only as this thing-like stuff and these

processes which arise from matter and its self-interactions. In realizing that greater sophistication and complexity is needed in our understanding of Creation—even in the restricted sense of ‘Nature’ in its traditional sense, we pass by the limiting idea that the whole is but a complicated assemblage of parts and thus not capable of coherence or unity or completeness. Under the limiting and non-Christian viewpoint, the universe is not capable of being a world; a human animal is not capable of being a human person

This is to say that a reductionistic form of respect for empirical reality will fail to see a world forming from a universe, a human person forming from a human animal, a morally meaningful narrative forming from interactions of the entities of thing-like being. Neither a universe nor a human animal can achieve, even in principle, the coherence and unity and completeness toward which they seemingly strive.

The world does form from the universe, itself a rather remarkable entity. A human being does form from a human animal, itself a rather remarkable entity. Greater stories, stories with deep meanings, arise from mere tales—themselves remarkable—of interacting entities reducible to ‘mere’ physical processes.

We live those stories and live in those stories; we seem not only wrong but also rather silly when we deny such to be the case.

# 57 Mathematical Models of Human Communities: Randomness

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1899>. It was finished and uploaded on 2014/10/14.]

In Chapter 55, *Mathematical Models of Human Communities: Local and Global Processes*, and Chapter 56, *Mathematical Models of Human Communities: We Live in Narratives, Not in Models*, I acknowledged the usefulness and potential truthfulness of mathematical models but claimed we need to consider wider aspects of this world and of all of Creation. In particular, I discussed in the first of those essays, very briefly, the ways in which many complex systems, those of physical spacetime and—with near certainty—those of human social relationships, have global properties which don't fully come from summing up local properties. In the second chapter, I discussed, with equal brevity, the nature of one of those global aspects of complex systems and especially human communities—they are stories or narratives with the properties which we expect in novels or tales and which don't come from mathematical models as such.

At the same time, the reader should keep in mind that I believe our 'mathematical' understanding of this world can be expanded greatly by further use of the proper mathematical fields and ways of thought such as those fields of geometry which deal in qualities rather than quantities or those which have the power to deal separately with local and global properties.

I'll continue to respond to specific quotes from a book, *Sociodynamics: A Systematic Approach to Mathematical Modelling in the Social Sci-*

*ences* [145], which does a good job of dealing with the power and limitations of mathematical modeling in the ‘social sciences’.

On page 155, the author, Wolfgang Weidlich, writes:

Historical and/or social phase-transitions are by definition revolutionary events in which the macrovariables of the system *change their whole dynamical mode*. A *necessary concomitant circumstance* of such a phase-transition is the appearance of *critical fluctuations*. These critical fluctuations are crucial for deciding the question *which direction* the path of the system will take at the *cross-roads*. In our case they are decisive for the question whether the political system will remain a liberal democratic one or whether it tumbles into the new totalitarian phase.

However—and this is the essential argument—the critical fluctuations are of *random nature* and are *neither* predictable by the research of historians, *nor* by the macroequations of any mathematical model! At best the *full set* of macrovariables and (not predictable) fluctuating microvariables which *both together* are causative for the concrete course of historical events at a phase-transition can be recognized by historians *only retrospectively*.

Therefor the general conclusion must be: In the rare cases of historical phase-transitions *fluctuations* become decisive (in contrast to smoothly and continuously evolving situations). These fluctuations consist of thoughts, decisions and activities of one or a few persons in key-positions in a global situation on the verge of a possible phase-transition.

This does of course not mean, that the continuous—to a high degree “calculable” and therefore predictable—macrovariables would be unimportant. In the contrary! They lead to the “revolutionary situation”, i.e.[,] into the vicinity of a destabilizable situation where “*everything can happen*”. However, *at* the phase-transition these macrovariables are *insufficient* to make the further course of events predictable!

Weidlich tells us, “the critical fluctuations are of *random nature*.” True enough, but what is *random nature*? I’ve dealt with this issue before and

have claimed in various ways that the usual definition of such terms seems to smell a bit of the occult, even of outright superstition.

In February of 2010, I published a slightly updated post I had first published on my other blog in September of 2007; this updated post is included in this book as Chapter 160, *Randomness as a Sign of God's Presence*. In the updated version, I wrote:

One of the most important, if little noticed, intellectual events of modern times is the development of a rational understanding of randomness to potentially replace an ancient understanding which is surprising mystical for such an important concept in modern mathematics and other fields of modern science. Based on that rational understanding, I made the following claims in my first published book, *To See a World in a Grain of Sand* [41]:

- Only God can make a truly random number, and
- Only God can act in a truly random way.

What is this all about? The short story is:

Algorithmic information theory, deals with degrees of randomness more than with perfect randomness because we can't produce a random number. Nor do we have the slightest reason to believe that nature can produce a random number or any movement or change that corresponds to pure randomness—unless God interjects that randomness. It seems to me to be an open question whether God could even do that without violating the integrity of His own Creation. See the ending to the story of Noah in the book of Genesis for an early discussion into God's promise to honor His Creation. I'd say that promise was inherent in the sort of Creation He chose to bring into being.

In any case, Chaitin's major result in many ways was a surprisingly simple proof—by the standards of modern mathematics—that every number is random. No number has a pattern. This doesn't mean that 1.22222... or 1.25 are random nor does it mean that they aren't numbers. It means that those numbers and similar finitely describable numbers represent a

vanishingly small point on the number line. It turns out that all numbers with patterns, all the numbers of our elegant and well-ordered mathematics, add up to a vanishingly small length on the number line. It also means we can't generate a truly random number yet there are so many random numbers that the infinities of numbers with some patterns are overwhelmed. In the sense of that field of modern mathematics called 'measure theory', there are essentially no numbers with patterns in relation to the totality of numbers, 'all' of which are true random numbers.

What does this mean? As the mathematician Marc Kac (pronounced 'cats') said in the early 1970s when the ideas of Chaitin and Kolmogorov were becoming known: "Now we know what a random number is. It's a fact." I quote from memory.

This is the basic insight lying behind my claim that God created the truths of Creation, the truths from which our physical universe is shaped. The number line is a set of facts rather than a construction as Pythagoras and his successors have thought. Elegance in the Pythagorean sense, order in the sense of the theorist of Intelligent design, and randomness in the mystical sense of a typical Darwinist philosopher, play no part in rational mathematics.

One of my college professors put it in a slightly different way. He told us that all of probability theory can be enfolded into a fully deterministic *Measure Theory* (see [http://en.wikipedia.org/wiki/Measure\\_\(mathematics\)](http://en.wikipedia.org/wiki/Measure_(mathematics))) without losing any content. Still another way to express this insight is: probability theory is useful mostly as an introduction to measure theory, though many don't really go beyond the simple applications which can be taught using decks of cards or pairs of dice or bins of colored balls. A naive and pseudo-rational version of mystical randomness remains valid as a teaching tool. What is remarkable is the number of people who learn their probability and statistics from this viewpoint, never move on from the mystical viewpoint, and yet advocate a fully deterministic understanding of our complex world.

From facts come—sometimes—patterns. We've become somewhat accustomed, by way of terribly vulgarized mathematics and biology and other sciences, to the idea that patterns come from 'randomness' or 'chaos'. Some-

thing of an overview can be communicated to those who have not heard of Poincare or Hadamard or Duhem, Ruelle or Smale or Prigogine and to those who don't know what a nonlinear equation is; we should wonder what sense these people make of it. We are at a more complex transition point than the one noted by Oystein Ore, prominent number theorist and teacher (see *Number Theory and Its History* [107] republished by Dover Publications in 1988): in the 14th century or so, long division was coming into use and was considered to be a topic for mathematical geniuses, well beyond those even of more normal high intelligence. Nowadays, we start learning long division in mass education elementary schools, though many still have trouble with it and some can never master it even to the point of figuring how much per pound a roast costs if 4.5 pounds costs \$25.

The main point is that a shift from a 'mystical' or 'irrational' understanding, or misunderstanding, of probability theory to a more rational understanding of measure theory changes little except to clear our minds of rubbish and to allow us to move on. The famous distributions of probability theory (Poisson and binomial and so on) remain as does the remarkable tendency for patterns to arise from seeming disorder, mystical randomness or factuality. Those who see a Creation and those who see a Universe barren of divine presence can continue their debates, perhaps on a somewhat more rational level. The various arguments remain equally strong or weak.

Moreover, most scientists including physicists such as Weidlich and many evolutionary biologists and certainly most geneticists use the term 'random' without qualification but seem to be using that term in the more modern sense—that of algorithmic complexity theory. And, to be quite fair, I think many philosophers and historians and scientists and engineers have always interpreted 'randomness' in terms of factuality or even some sort of complexity. After all, there is nothing non-deterministic about those standard teaching tools in probability theory, cards and dice and bins of colored balls.

We've allowed our thinking to be constrained and distorted by popular misunderstandings of such terms as 'random' and 'deterministic' and 'non-deterministic'. To a certain extent, this deep confusion has even spread into our understandings of 'factuality' and 'causality'.

## 58 Mathematical Models of Human Communities: Failing to See the Future

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1903>. It was finished and uploaded on 2014/11/07.]

In the previous three chapters: Chapter 55, *Mathematical Models of Human Communities: Parts and Wholes*, Chapter 56, *Mathematical Models of Human Communities: We Live in Narratives, Not in Models*, and Chapter 57, *Mathematical Models of Human Communities: Randomness*, I acknowledged the usefulness and potential truthfulness of mathematical models but claimed we need to consider wider aspects of this world and of all of Creation; mathematical models have to be put into a greater context, a belief also seemingly held by Weidlich, the author of the book I was responding to. In particular, I discussed in the first of those essays, very briefly, the ways in which many complex systems, those of physical spacetime and—with near certainty—those of human social relationships, have global properties which don't fully come from summing up local properties. In the second essay, I discussed, with equal brevity, the nature of one of those global aspects of complex systems and especially human communities—they are stories or narratives with the properties which we expect in novels or tales and which don't come from mathematical models as such. In the third essay, I presented a very preliminary discussion of the true nature of randomness (more or less—factuality) in this context of mathematical models.

In this essay, fourth and last in this series, I'll respond to the same quote that I responded to in the third essay. In *Sociodynamics: A Systematic*

*Approach to Mathematical Modelling in the Social Sciences* [145], Wolfgang Weidlich writes on page 155:

Historical and/or social phase-transitions are by definition revolutionary events in which the macrovariables of the system *change their whole dynamical mode*. A *necessary concomitant circumstance* of such a phase-transition is the appearance of *critical fluctuations*. These critical fluctuations are crucial for deciding the question *which direction* the path of the system will take at the *cross-roads*. In our case they are decisive for the question whether the political system will remain a liberal democratic one or whether it tumbles into the new totalitarian phase.

However—and this is the essential argument—the critical fluctuations are of *random nature* and are *neither* predictable by the research of historians, *nor* by the macroequations of any mathematical model! At best the *full set* of macrovariables and (not predictable) fluctuating microvariables which *both together* are causative for the concrete course of historical events at a phase-transition can be recognized by historians *only retrospectively*.

Therefor the general conclusion must be: In the rare cases of historical phase-transitions *fluctuations* become decisive (in contrast to smoothly and continuously evolving situations). These fluctuations consist of thoughts, decisions and activities of one or a few persons in key-positions in a global situation on the verge of a possible phase-transition.

This does of course not mean, that the continuous—to a high degree “calculable” and therefore predictable—macrovariables would be unimportant. In the contrary! They lead to the “revolutionary situation”, i.e. into the vicinity of a destabilizable situation where “*everything can happen*”. However, *at* the phase-transition these macrovariables are *insufficient* to make the further course of events predictable!

It’s hardly surprising that we can’t predict which of, say, five major paths a country might follow as a crisis approaches. I’d claim, and perhaps

Weidlich would agree, that it's worse than that—we can't really even lay out the landscape in which possible paths lie.

As Weidlich says: “the concrete course of historical events at a phase-transition can be recognized by historians *only retrospectively*”. I'm currently reading a mainstream and apparently well-regarded book: *A History of Russia* [123] by Nicholas V Riasanovsky. It reminds me of what I've read before: even Lenin, a remarkably competent actor in real-time whatever we might think of his ideas and actions, was improvising and adjusting his ideas to justify those ad-hoc responses to a rapidly changing situation. Ahead of us lies the fog of war and of other crises, ongoing or concentrated in a short period of time.

When I was younger and playing regularly in pickup basketball games, I also couldn't see the position of all the players on the court let alone see their positions a second later the way that Larry Bird and a few other great playmakers could. They have mental skills, talents for geometric imaging, which are not found in many; they are inborn but highly developed by way of doing.

Suppose that there are also mental skills, cognitive and imaginative, which could allow us to see the possible futures ahead of us; this form of seeing would be abstract; it wouldn't be likely we could visualize these possible futures in terms of discrete possibilities as is true on a basketball court. These would be high level mental skills, more like the highly developed skills of a mathematical physicist than those of a great playmaker on the basketball court.

But, as John Polkinghorne—theoretical physicist and then Anglican priest—pointed out: physicists haven't learned how to think in this way. (See Chapter 90, *Shaping Our Minds to Reality*.) As a one-time professor of physics at Cambridge University, he wrote of the difficulty in convincing (presumably elite) physics students that a vector is simply a mathematical object which obeys certain rules of transformation. It took about a year for the students to accept what they were told by Professor Polkinghorne and then they apparently couldn't imagine they'd ever believed anything different. Polkinghorne also noted, in my terms, that physicists were still trying to make quantum physics conform to the preconceptions of reality they had brought to the study of advanced physics. We are all still, in a strong but constrained sense, opponents of Galileo. Galileo himself was not so flexible of thought as some renderings of his story would have it. A human being fully flexible of thought would be forever chasing will-o'-the-wisps.

More importantly for now, we need to recognize that scientists and philosophers aren't so progressive as they claim to be; that is to say, they haven't really reshaped their thoughts to conform to a coherent understanding of reality. Even the last sentence is inadequate, not nearly radical enough, as could be probably also be said of Polkinghorne's ways of expressing the problem.

We don't need new thoughts for our existing minds. We need new minds, that is, new relationships to reality. We need to encapsulate our best knowledge of Creation, the best knowledge from physics and mathematics and evolutionary biology and neuroscience and engineering and history; we need to encapsulate that knowledge in our brains as understandings capable of holding this knowledge in a coherent way. Even better: we need to encapsulate that knowledge in our brains as images of reality, in its concrete and abstract levels. We need minds which are mirrors of Creation, that is: mirrors of certain thoughts the Creator manifested as created being.

If we succeed in such a task, or more plausibly—succeed in helping future generations to form minds proper to our world, even all of Creation, as we now know it, then we will no longer feel obliged to pour our new knowledge into an inherited understanding of the world, though, perhaps patched-up. We'll be at peace with the world, until something happens to bring to light some major aspects or levels of Creation which are new to us—and thus seem to be alien to the purposes of our God.

I'm most certainly not claiming we'll be able to see the future in the sense of knowing what will happen or even to be able to propose, in all cases, a set of all possibilities along with a probability of each of those possibilities being realized. What we will be able to see is some overlapping possibilities somewhat like a collection of quantum wavefunctions. From there we can get to work by returning to the forms of reasoning more appropriate to the concrete world. I wrote of my own efforts to work toward a better understanding of Creation, way back in 2009—see Chapter 411, *Defining Landscapes and Possible Paths, Not Determining Paths*. This is the sort of general analysis which applies in the small as well as the large, applies to our efforts to understand the emerging relationships between East and West in our period as well as to our efforts to understand the emerging relationships of Creation at its fundamental levels—the emerging relationships which will allow richer and more complex understandings of rocks and stars and our own human natures. And also richer and more complex understandings of algebraic relationships and of transfinite numbers.

In Chapter 57, *Mathematical Models of Human Communities: Randomness*, I wrote: “[I]n the 14th century or so, long division was coming into use and was considered to be a topic for mathematical geniuses, well beyond those even of more normal high intelligence. Nowadays, we start learning long division in mass education elementary schools, though many still have trouble with it and some can never master it even to the point of figuring how much per pound a roast costs if 4.5 pounds cost \$25.”

There are other transitions in history, one perhaps being the birth of the mind in the sense of an entity which can deal with abstract forms of being as well as concrete forms of being. Many there are who seem bright but see “true being” as the single level of concrete, thing-like being. Many there are who can use formalisms, such as those of mathematics or logic or common-sense of various types, in trying to see the “rules” of concrete being. Few there seem to be who can see abstract being as being such. It takes certain developments of the cognitive and imaginative regions of their minds; many there might be who are capable of such but few seem to have developed such.

Back in 2008 and 2009, I wrote some early essays on the issue of the human mind as being an encapsulation of what lies around it, in the sense of what can be perceived and conceived and imagined in a particular cultural and physical setting. Some of those essays are printed in this book as Chapter 99, *What is the Role of Philosophy in an Age of Science?*; Chapter 100, *What is Mind?: Can Inadequate Formation Mimic Mental Diseases?*; and Chapter 250, *Preliminary Thoughts on the Evolution of the Human Mind*.

Since that time, I have not concentrated on this issue—in this particular explicit form. As it turned out, my early feelings seem more and more correct: the human mind in a particular place and at a particular time reaches its peak, and then most noticeably in its communal form, when it accurately encapsulates as much of Creation as can be ‘reached’ at that place and time. We expand our individual and communal minds, enriching and complexifying, by using our existing minds to do this reaching. We explore. We measure and build quantitative models. We struggle to reach greater qualitative understandings. We reason and we imagine. We enlarge and complexify our own minds to some extent and those of our children to a greater extent.

In this sense, we modern men, including Christians, have poorly developed minds. We can’t see the cloudy futures because we don’t have a good understanding of spacetime, of matter, of human nature. Our weak under-

standings of Creation, of particular forms or aspects of created being, are sometimes good enough to see the past in an intelligible and intelligent way, but seeing possible futures for, say, the United States is even harder than trying to see what it was that the Founding Fathers really did. Even our vision of past and present will clarify and provide for more intelligible and intelligent understandings if we simply come to a better understanding of the world, including the evolutionary and developmental aspects of human nature and also including the somewhat similar aspects of the nature of brute matter and energy.

Back to seeing future possibilities: we need to truly understand blurriness as it shows up in complex statistical situations and in quantum physics—with an underlying measure-theoretic understanding of probability, these are similar problems and problems of a world which generates facts rather than a world generated by some pseudo-mystical mathemagic. I can't even say what it might mean to visualize such aspects of reality, just as the greatest of ancient mathematicians, Greek and Indian and Arabic, couldn't say what it might mean to visualize the quantitative aspects of shapes or movements in symbolic forms. Yet, they worked, however unknowingly, toward algebra and it's now taught in most high schools and some higher-quality elementary schools. Some precocious youngsters even learn it at an age before most are learning to read or write.

## 59 Debunking the Putin-as-Demon Myth

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1937>. It was finished and uploaded on 2014/12/29.]

There are those who prefer facts and rational thought. There are even those who are Christians and realize that participation in a campaign of lies against a man or a country is a mortal sin. Moreover, Christians should realize that a mind deformed by lies is a disordered mind, a mind of a human being who wouldn't be happy living in any Heaven consistent with Christian beliefs. The wages of sin are death, a death proceeding through and more deeply into regions of disorder. This can be literally true when the lies seem intended to perhaps start one or more wars but certainly to prevent countries not subservient to Washington and Wall St from rising to a prosperous condition. Yet, the main issues remain the moral duty to treat others, God's creatures, with the proper respect and the corresponding moral duty to treat God's world, the story He is telling in this concrete realm of Creation, with the proper respect. True Christians, certainly not including the huge number of American jingoists who play at being Christians, look for the truth and don't try to keep alive fairy-tales convenient to the American power-elite—who oddly enough are the ones who have stolen much wealth from the ordinary American citizens and have nearly succeeded in making this country no more than their toy.

In any case, those who wish to have some facts in hand before forming opinions might wish to read Boyd D. Cathey's article on some of the basic facts of Vladimir Putin, his life and his expressed thoughts, as well as a little bit of the facts supporting Russian nervousness about the intentions of the West: *Examining the Ha-*

*ted of Vladimir Putin and Russia* at <http://www.unz.com/article/examining-the-hatred-of-vladimir-putin-and-russia/>.

My personal take on Vladimir Putin: He seems to be a true Christian who will hold the line on matters of importance; he will defend Christian social and moral order. He also seems to be a true Russian patriot who will protect his country against the pirates, politicians and bankers, of the West who are looking for loot to keep their murderous and thieving schemes going for just a little longer.

My personal take on Western Christians: They have revealed themselves to be treacherous, fair-weather friends of God. They are waging war upon God's Creation, thinking tolerance for troubled human beings should be turned into a celebratory endorsement, stealing from those and murdering those who refuse to allow themselves and their countries to be exploited by a West that lives beyond its current means.

# 60 Do Numbers, as Mental Constructs, Come from Concrete Being?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1970>. It was finished and uploaded on 2015/02/09.]

We think ourselves now so sophisticated because we know the world isn't designed, at least not in the way of a human engineer. But there are patterns and the ways of thought which provide some serious understandings of those patterns arising from states of seeming disorder are difficult to analyse and are certainly not yet part of the machinery of the human intellect or communal mind, the mind which does the sort of thinking which has made it possible for past "skills for geniuses" to be taught in the elementary schools of mass education within a few centuries of the development of those skills. See Chapter 57, *Mathematical Models of Human Communities: Randomness* for one of a number of discussions I've provided of the general topic of order arising from seeming disorder. That same essay also discusses the strange history of long division: "[I]n the 14th century or so, long division was coming into use and was considered to be a topic for mathematical geniuses, well beyond those even of more normal high intelligence. Nowadays, we start learning long division in mass education elementary schools, though many still have trouble with it and some can never master it even to the point of figuring how much per pound a roast costs if 4.5 pounds costs \$25."

I've suggested in various writings and in various ways that thoughts are created being, images of that created being but images in a sense similar to: "Men are made in the image of God." Created being is the manifestation of

specific thoughts of God and we learn how to think truly by sharing those thoughts of God, by shaping our minds (but also our hearts and hands) in response to created being and its relationships and actions. Images can be concrete things. Concrete things have abstract created being as well as concrete created being.

One of the main points behind this line of reasoning can be stated: created being is created being is created being. There is a complex network of various streams coming from the truths God manifested as the raw stuff of created being, probably branching out at places and then joining again as it journeys, so to speak, to this very concrete realm of created being, of thing-like being. See Chapter 145, *Developing Human Minds, Individual and Communal* for a discussion of this general issue in a particular, focused form. Pay particular attention to the very simple chart of created being to gain some idea of what I mean about abstract being branching out to more particular forms and joining along the way; many of those branches come together in this world of things. Even relatively simple things, for example—simple lifeforms, are the result of the shaping and the combining of a lesser or greater variety of abstract forms of being.

It would be hardly surprising if various animals have characteristics once claimed for human beings only. I've argued that man is unique because of the very complex human brain which is capable of 'making up' a mind. See *How Brains Make Up Their Minds* [35] by the neuroscientist and philosopher Walter J. Freeman for a discussion of what it means to make up a mind. I go beyond Professor Freeman, or perhaps in a different direction from him, in seeing the human mind as capable of encapsulating what lies around it, even the entire universe and beyond, in the form of what I call a worldview, that is, a complex understanding which is unified and coherent and complete in the way of a world or—still better—all of Creation.

But this human uniqueness, seen in more or less expansive terms, is the result of evolutionary processes and a series of specific events over time. It would be hardly surprising if specific human characteristics, even particular skills of abstract reasoning, could be found even in animals we think to be truly dumb, such as chickens. Chimpanzees can keep objects in mind when those objects are no longer present and can imagine them as being useful in solving an immediate problem. Birds from the crow family can engage in relatively powerful reasoning processes, as can octopuses.

Now we can learn from this article, *Chicks Put Low Numbers on the Left, Just Like Humans* at

<http://phenomena.nationalgeographic.com/2015/01/30/chicks-put-low-numbers-on-the-left-just-like-humans/>, that even relatively dumb birds can not only deal with number concepts but they can order them. That they order them left to right seems to me to probably be an accident of evolution, perhaps a coincidence and perhaps a result of brain structures we've shared with the chicken's line of evolution for tens or even hundreds of millions of years. Such details are important for some purposes but not for mine; at least, these particular details aren't important for my main point in this essay.

The main point is a joining of the my first line of thought for most of this essay and the reference to some experimental facts discussed quickly in the above paragraph. Neither human beings nor chicks derive numbers, or the ordering of numbers, from some pure realm of abstractions and concepts, a Platonic realm of Ideas. Numbers are in the most concrete of things. Concrete being is shaped from those forms of abstract being we explore by way of mathematics, which is a way of exploring a form of created being with that same form, as physicists probe matter with matter. We can see this clearly with the knowledge of matter and energy and fields which comes from quantum physics. My contention is that this knowledge, mathematical formalisms which are the wavefunctions, is really abstract created being and not 'mere' knowledge. In a similar way, knowledge of numbers and the ordering of numbers, left-to-right or top-to-bottom or other, is actually a particular sort of abstract created being which is present in the concrete being of this mortal realm.

In a similar but more complex and complicated way, the order which arises from seeming chaos can be described in mathematical terms. I contend we are seeing actual created being in those patterns—fixed point phenomena, for example, are a form of abstract being. They are points of stability,  $f(x) = x$ , where the function 'reproduces' the input though perhaps in a complex and iterative process. I contend that stability isn't just something which can happen and then can be modeled by experts in the sciences of dynamic systems. I contend that that stability is a form of created being which is described by " $f(x) = x$ " and is  $f(x) = x$ , just as a man can be described as "rational" and rationality is a form of created being which is part of that complex entity, a man.

When we see a system come to order, perhaps by stabilizing around a fixed point (stability is rarely absolute even in simple systems such as pendulums), we could talk of an emergence in that system of that abstract form

of created being we know as ‘stability’ or we could talk about a stream of created being which is flowing into that system. I don’t know if one or the other is more right or otherwise more preferable. I do know that the stability of a fixed point isn’t so different from the set of relationships found in Schrodinger’s wavefunction, the set of relationships which are Schrodinger’s wavefunction. Concrete things come from something which can be described in those mathematical formalisms. I’m suggesting we can do no better, at least for now, than to regard those mathematical formalisms as abstract being from which concrete being is shaped; I’m suggesting that mathematical formalisms are a form of created being and not simply descriptions of some form of created being which is currently only describable in terms of those formalisms. It’s a clean way of thinking and talking which may ultimately be wrong or just part of the truth, but it allows us to avoid a lot of gibberish and to develop more unified and complete and coherent understandings. And I contend those understandings are encapsulations of created being, even of Creation, and I mean encapsulations in the same sense as used by the Biblical authors: man is an image of God. Our minds are images of what we recognize as existing, perhaps a very limited environment in the case of early men and perhaps all of Creation to those who share in abstract reasoning—not just philosophers but all of those who are engaged members of a civilization which contains philosophers and physicists and historians and composers of complex music.

# 61 Imposing Ideals Upon Empirical Reality is Insane and Not Noble

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2049>. It was finished and uploaded on 2015/05/18.]

Psalms 24 tells us rightly: “The Lord’s is the earth and its fullness, the world and all its peoples.” [141]

It’s God who creates from nothingness and God who brings order to the raw stuff He first creates. This isn’t to deny that we human beings, in fact—all things and living creatures and all of created being, can work with the Almighty as He creates and shapes. It is to deny that we, in this mortal realm, have any direct access to transcendental truths; it is to deny that it is even sane, let alone good, to try to order the world to human ideals drawn from such alleged truths of a transcendental sort. I’m also claiming that Christians and Jews and other believers in an absolutely powerful Creator-God are, or at least should be, more committed to empirical reality than any other human beings.

We human beings can hold ideals contingently drawn from God’s revelations and His other acts in Creation, but that word ‘contingently’ packs a punch. Of course, Christians believe the fullness of God’s revelation was the Son of God incarnated as a man, but all who draw their beliefs from the Bible or any other sacred texts or prophetic traditions should realize that God speaks to us through human beings and in terms compatible with the individual things and the totality of what He has created.

There are some fundamental points to be made here:

1. Moral order is what orders this particular world to the purposes of

God.

2. Institutions and ways of meeting human needs and other goods serve moral order, or they don't; those institutions and those ways aren't primary goods in themselves.

To a Christian, the primary purpose of God as Creator is to shape the Body of Christ and bring it to completion in the world of the resurrected. To a Jew, the primary purpose is similar but centered upon the People of Israel. Both of these purposes were drawn speculatively from empirical knowledge. Even the 'ideals' expressed in the *Ten Commandments* are drawn from:

1. Our empirical realization of our state as creatures and our relationships to our Creator.
2. Our empirical knowledge of our own human selves and other creatures and of the relationships between these many entities.
3. Our speculative understanding of the world or of all of Creation.

After all, commandments are commandments, not truths and not ideals. I think it more plausible to believe those commandments arose in the minds of the early Hebrews as they speculated, perhaps unconsciously or even schizophrenically, upon their understanding or encapsulation of reality. Yet, the point is the same: the truths and ideals were drawn from commandments stated as if by a commanding general and were stated fully in terms understandable to monotheists emerging from a pagan background and to human residents of this particular planet in this particular universe. [See the Wikipedia article on Julian Jaynes at [https://en.wikipedia.org/wiki/Julian\\_Jaynes](https://en.wikipedia.org/wiki/Julian_Jaynes) for an explanation of the word 'schizophrenically' in this context.]

Wherever I have written 'empirical', the reader can assume there is a mountain of factual information, including that which has been written into our human beings by the events of the evolution of life and of human life and also by the events of the development of human cultures and our individual selves.

There are many books to be written on this topic, many which will be written if a new Christian Civilization is raised to the glory of God. I'll

stop at these mere hints, but I'll be dealing in upcoming essays with this general topic of order, moral and other sorts, as well as with my efforts to develop qualitative versions of mathematical and 'scientific' reasoning about the forms of order most basic to human beings.

## 62 The Empirical Foundations of Abstract Systems of Thought

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2158>. It was finished and uploaded on 2016/02/01.]

I've made the claim in various ways that all of our knowledge and thought comes from God's thoughts as manifested in Creation, including this universe with its concrete thing-like being. This claim implies the further claim which I would strongly support: even the structures and basic elements of our most abstract systems (say those of mathematics and logic) are drawn from empirical reality by exploration and experimentation. I am most certainly not denying that there are valid abstractions, some of which can even be labeled 'absolute truths' (at least within the context of this particular Creation), but I am saying that abstracted Darwinian selection processes are the basis of even the best of human thought.

In a classic mathematics textbook, we can read:

In applying the unifying principle of abstraction, we study concrete examples and try to isolate the basic properties upon which the interesting phenomena depend. In the final analysis, of course, the determination of the "correct" properties to be abstracted is largely an experimental process. For instance, although the limit of a sequence of real numbers is a widely used idea, experience has shown that a more basic concept is that of a limit point of a set of real numbers. [*Topology* [73] by Hocking and Young, p 1]

Because of this process of experimentation followed by a process of analysis and contemplation—possibly leading to more experimentation, the un-

derstanding of the field of ‘topology’ has changed over time, though each of the understandings has held true even as a new understanding was added.

Topology was first envisioned as an abstraction of geometry; as Euclidean Geometry was the study of the movements of rigid geometric entities (abstracted from reality), so was topology a study of the possibilities of deforming some of those geometric entities into other geometric entities, say, a square into a circle. The standard video easy to find on the Internet shows a teacup being deformed ‘continuously’ into a donut.

And so it was that topology was partially re-envisioned as the study of ‘continuity’, the study of ‘limit points’.

More recently, topology has been again partially re-envisioned in terms of abstract algebra, abstract relationships and transformations.

The main point in this limited context is that this has all come about as a result of exploration and experimentation, not as a result of setting up pure and ideal systems of axioms; the process will involve the setting up of proposed systems of axioms which are then ‘played with’, tested against the ‘reality’ of mathematics. Systems of axioms play a major role in all fields of mathematics and should maybe play a greater role in other fields of human effort, but the useful such systems—those which hold up to hard use and are productive of further fruits—develop in surprisingly empirical ways and stand or fall by way of their usefulness and fruitfulness. Even light readings in topology (seems to be a good example for analyses of human thought processes) will show that the processes of exploration and experimentation has resulted in very abstract definitions and ways of analysis—it’s hard for a neophyte to know what some of those definitions can mean and serious mathematicians will simply point out that that particular definitions of ‘topological space’ or ‘limit point’ are the well-established results of an effort to, my words, distill out some essence of topology. They work; the essence is for real and more recent distilled essences are more real than earlier distilled essences.

This is pragmatism of a sort, a pragmatism of the best sort, and it has developed in the most abstract of human fields of thought. Perhaps this is what William James and other hardheaded pragmatists were aiming at—not the denial of abstract truths and abstract ways of thought but an insight into the dependence of a flesh-and-blood creature upon its concrete world, a dependence which extends even to abstract thought. In other words, perhaps a truer pragmatism makes no statements about the nature of truth but only about the nature of human efforts to discover truths.

A directed selection process which leads to valid systems of abstract thought?

# 63 Human Thought Needs More Curves, or Thingies Stranger than Curves

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2229>. It was finished and uploaded on 2016/06/08.]

We of the modern West can't deal with the complexity of human communities nor with the complex world implied by our modern empirical knowledge. We can't produce proper 'global' understandings of human being, individual and communal, nor of this world with all its realms only partly reconciled and made coherent at even the 'purely physical' level of matter and space and time.

This is a very important issue in our troubled times, though many have trouble grasping that such seemingly ivory-tower lines of thought are crucial to our survival and prosperity. As I see matters, a civilization is dependent upon an understanding of reality. I would actually turn it around and say that an understanding of reality which allows some sort of substantial ordering of society, even a brutal ordering such as that of the early Assyrians or the Anglo-Saxon warlords in Great Britain, can lead to the development of a more complex human community, perhaps an international community of scholars and perhaps an empire or perhaps that more complete and more perfect community which is a civilization. Order is a sign of the unity and coherence and completeness which is found in any complex and rich entity, such as an individual human being who has risen from the state of simple human animal or a communal human being (community) which has begun to show the signs of being or participating in that completed and perfected civilization which is the Body of Christ.

We in the West had at least a substantial fragment of that sort of civilization and failed to nurture or maintain it, though we certainly value what's left of our material prosperity even as we cut ourselves loose from any devotion to the God of Jesus Christ or to even pagan versions of truth, from any hard-earned appreciation of higher culture, from involvement in any truer forms of political and social order, and so on.

There are a lot of "so on's" in this story unless we try to write a prologue which would be a completed and perfected form of all human understandings of human being and of the Creation in which we are born and in which we die and in which we might be reborn. As any historian or student of history knows, history itself has these properties of a manifold of manifolds of manifolds and so on. Each manifold and each level of manifolds has different properties.

What's left of what we inherited? This is to ask: in what areas have we continued to be something like a civilization so that we can now plausibly aim to put a colony on Mars in this generation? We could also ask: why do we wish to do so? Are we looking for an ET to supply us with the order and a serious if tentative understanding of reality. Are we looking for someone or something to supply us with a brand-new, non-demanding version of what we've thrown away? Do we merely wish to find a fable which tells us our current state of decadence is really an admirable state of order?

We have some serious understanding of matter as being somehow formed as a result of 'collapse' (a controversial but useful word and concept for basic understanding) of some strange form of being that we conceive (in the sense of 'cognitive perception') as mathematical forms, the *wave functions* of quantum mechanics (see [https://en.wikipedia.org/wiki/Wave\\_function](https://en.wikipedia.org/wiki/Wave_function)).

We have some serious understanding of spacetime in terms of *general relativity* (see [https://en.wikipedia.org/wiki/General\\_relativity](https://en.wikipedia.org/wiki/General_relativity)) and other other gravitational theories (none of which have yet proven to be as truthful or as useful as Einstein's theory). More generally, we understand spacetime in terms of geometries in which we have local regions which are 'parts' of a globe which is not merely a paste-up of those local regions; local regions and global regions have some shared properties and some different properties. In any case, we understand spacetime not by directly perceiving it—we might have a few tortured seconds of such perception if we were to fall into a black-hole, but we, again, understand spacetime as a sort of 'cognitive perception'.

We also have some serious understandings of human origins and of human being as it currently exists and dynamically changes, and very rapidly so for the past 10,000 years or so because of cultural and genetic interactions. These understandings are being absorbed into historical and other understandings, mostly being consistent with earlier understandings—the ancient books of the Bible had an awareness of the nastiness which seems so shocking in books about evolutionary biology and sometimes condemned by Christians. And, again, we have some sort of a ‘cognitive perception’ of a human being which is formed by interactions of genes and culture and physical environment, which interactions are so complex as to bring to mind multiple levels of manifolds of high dimension, a high number of independent variables.

We can see the main point I’m making by taking the case of the surface of a sphere and realizing we can understand the geography (or geometry) in small regions by treating those regions as flat regions, plains or planes; we understand more by realizing those flat regions are ‘glued’ together to make a curved surface of a sphere rather than a larger plain or plane. We can understand far more deeply by realizing the point is that groupings of individual regions (which might be human individuals) form global (or more global) regions which might have different properties than the individual regions or localities, and those local properties might themselves change in response to the formation of global entities.

For example, we can read in histories of mathematics of radical advances are beyond the understanding of even well-educated ‘non-geniuses’ for years and sometimes generations, but are eventually absorbed into the material taught in mainstream schools or the material which is part of the background intellectual stuff of most residents of a civilization. We teach long-division in elementary schools, but that was considered beyond the capacity of the average college mathematics teacher when such a technique first became possible with the adoption of the *Hindu–Arabic numeral system* (see [https://en.wikipedia.org/wiki/Hindu-Arabic\\_numeral\\_system](https://en.wikipedia.org/wiki/Hindu-Arabic_numeral_system)) in the 12th century or so. (Few indeed, even among the highly intelligent, could do long-division with the earlier system of Roman numerals.)

To be fair, better quality thinkers seem to often account for these sorts of phenomena in histories and anthropological studies and—most certainly—in historical studies of genes. We see this in the acknowledgment that, for example, the peoples of Great Britain aren’t just a gathering of Welsh and Scots and English with sometimes quaint customs who come together to

form a people who are plain and simply the British, but sometimes we have trouble—using existing ways of thought—in avoiding the two false paths: treating communities as simply gatherings of individuals or else studying individual human beings in separate fields from those which study communities, implicitly but not coherently treating communities as having real existence. I am claiming that we can understand this British community of peoples with an explicit recognition of the reality of communities along with proper use of powerful conceptual tools which can be drawn from modern mathematics and physics.

Various problems also arise because a human being shaped to certain ways of understanding the surrounding world and to certain ways of responding to that world can not often be so easily reshaped and sometimes cannot be so reshaped at all in this mortal realm. A village of English farmers in the early 1700s might have been ‘flat’ in certain ways just because of its comforting homogeneity; forcing or enticing those farmers or their children into cities would cause disruption of a sort which would need healing and reshaping or else you might end up with modern populations of people living in the Cosmopolis but not truly part of it and citizens of a nominally self-governing country, not capable of carrying out their nominal responsibilities, such as evaluating their government’s actions in the international realm. Such has been our situation in much of the West for two centuries or more.

Yet, when we see the reality of communities by realizing the ethnic complexity of Great Britain even before significant immigration from Asia and Africa, we still assume flat models in which, say, Nigerians enlarge that greater community without any problems fitting in, without altering that greater community or being altered by it. When it’s clear that something akin to twisting and deforming is happening—to both immigrants and the host communities and their citizens, we try to complexify the flat model in a manner analogous to Ptolemy and his successors modeling the observed movements of the planets and the sun by adding ever more epicycles.

Let’s try a clean break, one which starts with the conceptual acknowledgment that mathematicians and physicists have given us a wonderful conceptual apparatus for tackling the problem which resulted when the cosmopolitan regions come into being, when peoples of different habits and ways of belief start interacting and sometimes forming new communities. Big warning!—even when the ultimate results are wonderful, after a century or so, that first century can be a time of horrors. When the German peoples

entered Romanized regions of Europe, there were some who came in groups simply seeking a better life. The Romanized Celts disappeared in the regions of relatively peaceful immigration as well in the regions conquered by bands of warriors. A matter of great relevance to the point I'm making: much of the horror resulted not because the Germans were all, or even mostly, bloodthirsty and malicious but rather because the Germans were a primitive tribal people who did kill many in a partial conquest and then they tried to take over a region of complex Roman civilization and simply couldn't do it. That region broke down in many ways and the Dark Ages resulted: disease and famine and violence at various levels. Even when the initial violence of conquest had ended, the original population continued to dwindle and the German population also probably suffered unnecessarily high rates of suffering and death over the next 2 or 3 centuries.

If you take my thoughts seriously, keep this in mind: I'm dealing not with some fancy way of knowing some sort of external world but rather with a way of encapsulating the being which is us and lies around us and flows through us.

Take your choice:

- Thinking is not abstract manipulation of knowledge but rather a shaping of one's mind in response to the various forms of being which come to us as perceptions or conceptions.
- We encapsulate reality in our own selves.
- To think is to participate in the corresponding being, whether it is the concrete being of a 2x4 used to build a wall or a nuclear particle under investigation or an emotionally disturbed human being under psychiatric treatment, whether it is the abstract being of algebraic structures studied for use in nuclear physics or transfinite sets studied for sheer aesthetic pleasure or some aspects of human being studied because they are us.

From a Christian point of view, the sort of complexity I wish to introduce to our efforts to understand being of all types is a radically consistent understanding of this universe. All of Creation is a sacrament of sorts, a unified and coherent and complete manifestation of a global set of God's thoughts.

## 64 The Innovations We Need

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2237>. It was finished and uploaded on 2016/06/21.]

I'm reading *The Innovators: How a Group of Inventors, Hackers, Geniuses, and Geeks Created the Digital Revolution*[76] by Walter Isaacson and find it interesting that Isaacson sees matters in terms of individual effort vs collaboration, parallel to my efforts to deal with human being in its individual and communal forms.

The research laboratories such as Lawrence Livermore operated by the US government and those operated by Disney or Microsoft were and are similar to those centers of research in materials and optics and colors which were the workshops of Michelangelo and other premodern artists. Communities of poets in New York or Paris, wide-ranging think tanks such as the Institute for Advanced Study or the Aspen Institute, the many physics and mathematics and electrical engineering departments throughout the West, became centers of innovation because of the concentration of talent gathered to interact for conferences or perhaps for career-long stays. Some such as the Aspen Institute tried consciously to re-integrate humanistic knowledge and creative efforts into this modern world of such great technological innovation. Many individual scientists retained stronger and deeper attachments to humane activities than did most in the West. I'll note only this: Einstein was not so unusual among scientists in being a very serious violinist and pianist.

In any case, technological innovation continues in robotics and animation as does innovation in fields of theoretical science, at least in the sense of filling in gaps and settling some well-defined questions in particle physics (the mysterious Higgs Boson has been found though it be a bit less than divine) and in theories of gravity (the long-sought gravity waves have been

found).

Those scientists who have developed ways to explore the human past through genes have done their work and so have those who have produced miraculous materials that make possible our cell-phones; we are deaf to rumors that the rare metals used in those materials are mined in Africa by slaves. We are also blind to the link between such technologies and emerging damage to individuals and communities, though we talk fearfully at times of the younger generations being increasingly less literate, less knowledgeable about history or their family's traditional faith, more apathetic in many situations and more inclined to sink into a world of video games and Internet pornography and constant communication with distant friends even as they ignore the three friends at their side.

Innovation continues in technology and some other parts of human life and yet there seems little point to it but for the well-paid amateurs (lovers) who still possess the passion of Victorian gentlemen scientists. And for those who profit from it all. For the rest of us, the announcement of another possible ancestor, or ancestral cousin, of mankind or an article tracking the movements of post-glacial man into Europe, means little. It would seem that, without a substantial communal mind and without the overall understanding which is much of that mind, we can't even think through the implications of our genetic knowledge of historical and prehistorical movements of entire peoples or of large groups of armed men who took the wealth and women of other men in the regions of conquest.

So it is that science and technology in the West move forward even as the West decays. (That forward movement shows signs of slowing down or even stopping, but such trends are hard to read with certainty.)

We have enough technology to give a high standard of living to every living human being, if we could figure out how to distribute goods in a moral and well-ordered way to the many who—let's be blunt—have found themselves useless in the modern world, for the many able to get only jobs which could be done by halfhearted 12 year-olds or mentally handicapped adults. If they can even get those jobs.

Our problem isn't lack of advanced technology and we remain competent or better at innovating in technology as Isaacson and other historians and journalists tell us. We're good at it and we continue to do it even as our political and religious and educational and cultural institutions have decayed into bad jokes. We make ever more advanced cell-phones for the use of 24 year-old holders of (undeserved?) college degrees in English or

chemistry or electrical engineering, even as those young men and women move toward behaviors already adopted by the next older generation: high rates of alcoholism and heroin usage and suicide. Land of the junkies and home of the brain-dead.

Our problem is lack of innovation on the human side: the deeper understandings we need, the rich and meaningful social and political and cultural and religious practices which would result from those understandings. Despite the general decay of American educational institutions and rumors of an increasing tendency of talented foreign students to stay in their own countries or to return to them, IBM has little trouble assembling teams of scientists who can build computers which can replace chess grandmasters and TV game-players and, soon enough, those computers will be replacing teams of scientists who can build the next generation of computers. . .

What the hell is the point of it all?

Suppose we solve one major set of problems and learn to give a good life to all, working or not. What will we live for? Maybe for another go at that virtual machine in our living rooms that can give us a greater sexual arousal than anyone has hitherto imagined? Maybe we can spend our days in some Disney theme-park? Maybe members of future generations will look up from a blackjack table at the walls without windows or clocks and wonder if they're in Las Vegas or Atlantic City or maybe Casino City on Mars?

We need innovators who can produce a civilization. Not in one fell swoop to be sure. It will take a century or more to build a new West, even as we perhaps get to watch other civilizations currently in formation passing us by.

What should those innovators be doing? Whatever they feel they should be doing. There is no formula for innovation.

There are conditions which make innovation more likely, such as the proximity of various sorts of talented men and women, but there is no formula for innovation. As a rule, it occurs in response to opportunities or needs, at least it occurs in living and energetic communities. The very lack of innovation in recent centuries in the fields usually described as 'humanist', political and social and religious and philosophical and literary and others, testifies to a great decrease of confidence and of energy, of faith and of curiosity about concrete reality as well as of those abstract regions explored by mathematicians and some poets and philosophers.

I struggle to re-understand this world as part of a greater Creation, the

work of the God of Jesus Christ, but most in the modern West aren't much interested in a revival of Christian thought or of Christian civilization, not even most Christians so far as I can tell. While decadents revel in the false freedoms of a rotting civilization, many Christians seek no better than shelter in the houses or cathedrals not yet fallen down, wishing to personally remain Christians but not to draw the attention of the worldly powers.

No, don't listen to the cries of Christians that they are innocent victims. The secularists melt down to strange sorts of barbarians but those who claim to be Christians simply wish for and pray for a magical restoration of civil order and respect for Christianity and other traditional religions, for a return to a blander sort of secularism which respects Christmas and religious memorials for those who died in war. Those Christians have no interest in a re-understanding that sees Creation anew in light of both Christian revelation and some quite disturbing recently gained knowledge of God in His role as Creator. I'm referring to knowledge of how the human race separated from our chimpanzee cousins about 5 million years ago, knowledge of the movements of populations across Eurasia which movements often involved bands of men moving in to kill the native men and take their women, of gut bacteria which can manipulate our moods, of parasites which can alter our intelligence levels (slightly) and our social behaviors and maybe our sexual preferences.

The innovators we need will produce new understandings of Creation which merge understandings of recently discovered and quite disturbing aspects of Creation with old understandings of other disturbing aspects of Creation and with some traditional understandings which seem yet true and with the revealed truths of Christianity (mostly found in the ancient Creeds).

The West seems to have reached its end, though I struggle as if to help save it, knowing that the good I accomplish is more likely to feed into the new or old civilizations outside of the West. Strangely enough, it does somewhat bother me that this possibility no longer bothers me. We have shown that it took only a little prosperity to distract us from our duties to God and to future generations and I'm plain tired of even trying to talk to other Christians about the true nature of our problems. I can only dream of the energizing effect of being around others who wish to develop a new Christian (or Jewish or even virtuous pagan) understanding of reality.

## 65 Preface From “The Shape of Reality”

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2283>. It was finished and uploaded on 2016/10/03. Draft as of 2016/10/03.]

Is a man a unity or is he a collection of warring fragments? Or is something else true, perhaps an intermediate view, or—my favorite—some sort of complex being not describable in current terms of discourse? I should qualify my statement of the last possibility, which I believe to be the closest to the truth: I think mathematicians working at the most abstract regions currently accessible to the human mind have discovered tools of thought, quantitative and qualitative, which can provide us with superior ways of discussing complex forms of created being. That entire argument is one which can be carried out only by way of a program to show such is the case. This book will be the first giant step in such a program—unless this giant step sends me into a brier-patch or over a cliff.

But a giant step isn't enough. We need to explore ahead of where we can reach; that exploration will necessarily take place by way of the human imagination as much by the more rational parts of the human mind. This is a project I've actually been working on for 25 years, if not always consciously so. I've explored in the way of a novelist and even (quite) amateur poet through novels including some in which characters were poets; I've explored in the way of an admirer of mathematics and science through essays; I've explored in the way of a philosopher and theologians through other essays often overlapping with those dealing with mathematics and science.

I'll step back. . .

Is being a unity or is there concrete being which can be partly understood by abstract ways of thought separate from being as such? Is it per-

haps the case, as I have argued, that what we think of as abstract thought is truly a form of being which is abstract in some way poorly understood? This poor understanding would be a result of misunderstanding of being, as I would claim in a necessarily circular way.

Let's move on to Christian claims, poorly understood even in the heyday of partially Christian civilization in Europe. Is the world a true sacramental unity of matter and something else? Is man a true sacramental unity of body and soul or mind?

Are our very questions on these issues misguided by the misunderstandings of thinkers early in the development of higher human thought and of human exploration of what lay around them? Should we be paying more attention to modern knowledge than we pay to speculations upon earlier bodies of lesser knowledge of lesser quality? Or at least differently balancing our attention to these separate bodies of speculative and empirical knowledge?

Is it possible that the divisions in views of reality that we see are the result of not understanding that "created being is created being is..." and it is so dynamic as to make early thinkers see things as inert collections of matter moved by something else, spirits or life-forces or whatever?

The problems stated in the above paragraphs, the other many problems, are not to be solved anytime soon and certainly not in a single book. Yet, what I say in this book points to an important gap in modern thought—despite the often excessive use of quantitative mathematics, mathematical thought is poorly understood and rarely used to tackle more general, more abstract, levels of understanding.

Human mathematics has grown as complex and as rich as other aspects of human being, the physical sciences and history and culture and forms of community and so on. These fields of studies are parts of the human mind which forms by way of encapsulating those parts of Creation we can explore or speculate upon, along with the very small body of revealed knowledge which comes to the human mind by some as yet mysterious process.

It would seem to me that general human worldviews, largely determined by various forms of human being perhaps best described as theology and philosophy and poetry, haven't kept up to the advances in those other components of human being.

Years ago, I conceived the possibility of adopting the insights of the most fundamental of the sciences, mathematics, to the development of a worldview adequate to the needs of man in the 21st century. This book

will be a step in that direction. Note that the epigraphs for this book are the same as my earlier book, *A More Exact Understanding of Human Being* [53]. I'll quote them again for the ease of the reader but mostly because of the importance of the issue:

My soul [in Thomas the organ for thought] is not I; and if only souls are saved, I am not saved, nor is any man. [From the *Commentary to 1 Corinthians* by St. Thomas Aquinas as quoted by Hannah Arendt in *The Life of the Mind* (page 43).]

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man. [Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: "Broadening the Horizons of Reason. Prospects for Philosophy".]

To make one aspect of the above claim more clear, I'll provide another quote included in the body of *A More Exact Understanding of Human Being* [53]:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures [God] made. . . [Page 17 of St. Thomas Aquinas' commentary on 1 Corinthians.] [3]

It seems to me, and has seemed to me for years, that the greatest weakness we bring to the task of understanding created being is our inability to see a human community (the Body of Christ in the limit) as being one without taking away from the individuality of the members of that community. We are some sort of gathering of isolated individuals or else we are a collective with compromised or even deleted individuality. This leads us to misunderstand the nature of the human mind and to miss the fact that we have communal minds; we can't deal well with the badness of brainwashing by peer (herd) pressure nor the mysterious goodness of difficult ideas, pioneered by creative geniuses, becoming standard material in elementary or secondary school courses and in human thought in general.

We can find better possibilities in just the introductory chapters of books on abstract algebra and differential geometry and topology and a few other areas of mathematics. We can even see some progress on this issue in more concrete form in some particular results from physics and chemistry and biology and various synthetic fields of study such as the sciences of complex or chaotic systems or—better still—the sciences of self-organizing systems.

In this book, I’ll start at the abstract but mathematically basic level of ‘shape’, using differential geometry and topology, “abstract or qualitative geometry” and just a hint of other ways of thought. This is inadequate to the task but I’ll be following, approximately, the path I’m taking in tackling this problem, especially in my efforts to learn or relearn the mathematics needed for this simple way of viewing human being as individuals which are points with nice properties—qualitative and quantitative, points which are members of communities considered as surfaces with nice properties (manifolds).

Let’s see if we can harness this to provide general attitudes and ways of thought sufficient to understand this unity arising out of diversity, this oneness which is actually a collection of particular individuals; this seems to be a way of reasoning which can make sense of various parts and aspects of this universe and the various complex entities it contains. More than this, to get to the oneness of abstract and concrete being, we need to take on the task of understanding what a Christian would label as ‘Creation’.

As a general warning: I don’t consider understanding to be some sort of textbook-friendly, closed system of thought. Understanding is the development of a good way of describing what we know and understanding reaches its peak when it becomes our very way of thinking. In other words, we have a duty to shape our minds, our basic and sophisticated levels of thought, to reality. We fail when we try to squeeze reality into a system of thought we bring to the task of understanding our world, a system of thought which is typically a rigidified version of an earlier understanding of reality as known in, say, the 13th century, or one which came out of the poorly founded metaphysical speculations of a German Idealist of the 18th century or a Liberal Idealist of the 20th century. Such understandings are inadequate and downright unreasonable in the world after Darwin and Einstein.

## 66 Introduction From “The Shape of Reality”

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2286>. It was finished and uploaded on 2016/10/10. Draft as of 2016/10/03.]

Human being isn't *merely* quantifiable but many components or aspects of human being are quantifiable. Other components are more describable by the term 'qualitative', but this shouldn't be taken as connoting 'irrational' or 'mystical'. Our understanding of the qualitative aspects of being, human and other, should be as orderly as our understanding of the quantitative aspects of being.

If the above be true, how are we to see our human beings as unified, even if only in principle. Are the quantitative and the qualitative to be “the new dualism”? Some Medieval Scholastics rejected the concept of 'soul' or 'mind' because it's not clear if it be at all possible to unite two different sorts of substances to make a single human being. Aquinas took a different route and posited a mind as described by Hannah Arendt thus:

My soul [in Thomas the organ for thought] is not I; and if only souls are saved, I am not saved, nor is any man. [From the Commentary to 1 Corinthians 15 by St. Thomas Aquinas as quoted by Hannah Arendt in *The Life of the Mind* [5] (page 43).]

In other words, the Thomistic soul (or mind), said by Hannah Arendt to be something you would not wish to be, was a non-human entity attached to a human being as a cochlear implant is attached. You could almost joke Aquinas was the first prophet of cyborgs. It was clear that all that was human to Aquinas was en fleshed, embodied. This made sense given

Aquinas’ difficulty in seeing how the ‘inert’ matter of the brain could engage in conceptual thought. We know now much more.

- The matter of the brain, indeed all matter, is a very dynamic sort of stuff, a partially frozen form of energy which constantly interacts with hotter forms of stuff, hot energy and fields.
- The brain is the result of evolutionary and developmental processes of a complex and sometimes nasty sort.
- The entire universe is the result of a variety of processes which can be roughly and accurately classified as evolutionary and developmental.
- Matter forms, in some sense, by what has been described as a collapse of a quantum wavefunction.

This last item is disturbing, even if the term ‘collapse’ is rejected as some philosophers and scientists recommend. How can matter be made from some form of being describable as a ‘wavefunction’, a mathematical equation?

Thinking in usefully simplistic terms: Existing theories of gravity combine space and time into a single structure of spacetime in which time is added as a fourth dimension to the three-dimensional Euclidean structure of space. Then we find that space and time can be deformed by interactions with matter describable in terms of the quantum mechanical wavefunction. Yet, many physicists and at least some others who think deeply on these matters are convinced that all this can be combined into some sort of unified theory of physical stuff or of truly everything for those willing to define everything as what can be described in terms of physics. All sorts of entities of different stuff and even non-stuff are combined in an as-yet unconstructed grand—or perhaps grandiose—theory of ‘everything’ or TOE. This may well prove to be a scientific version of the mistake often made by generals and politicians: preparing to fight the previous war. Those physicists see TOE as a culmination of the extraordinarily successful efforts to construct a standard model of physical particles and most of the forces between those particles, but gravity has remained resistant to such efforts.

In any case, I’ve proposed a principle in past writings: Being is being is...

I've shortened the principle for poetic reasons; being in that claim is actually "created being". The whole issue of God's being is immensely complex for intelligent discussions by atheologians as well as Christian and Jewish theologians. (Although, I do think a limited but intelligent sort of conversation can be held on the basis of a simple faith or lack of faith.)

I think this created being stuff and non-stuff alike can be tied together into a coherent understanding by way of modern mathematics which has developed some powerful tools which are useful in dealing with various concrete situations, engineering and scientific, and can also be used for understanding quantitative and qualitative aspects of what I call abstract being—the non-stuff, or at least non-thing stuff, of modern algebra and topology and category theory and so on, as well as the non-thing stuff of moral character or soul or some aspects of mind and just the general feeling of order and goodness which often emanates from what lies around us. Can we somehow use these tools to provide an understanding of human being which gives proper room and respect to the various aspects of human being, qualitative and quantitative, individual and communal? I think so and am writing this book as an experiment of sorts.

Will I be providing some hi-tech answer to the question, "What is a human being?" No.

Will I be providing even a tentative model of human being which allows prediction of the future or at least accurate and precise modeling of the past? No.

I will be drawing upon some basic ideas from mostly differential geometry and topology in this book to provide a set of concepts and words which allow us, in one important case, to discuss human being as a coherent entity with quantitative and qualitative parts and aspects. I have tentative plans for future books which will use algebra and other mathematical fields to improve my discussions by further enriching and complexifying my understanding of created being. Those books might well be written by some younger thinkers with greater knowledge of modern mathematics than I have.

## Part III

# The Human Mind as a Re-creation of God's Creation

## 67 Introduction: The Human Mind as a Re-creation of God's Creation

In this part, I've collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/>, in which I speak about the nature of the human mind, proposing it to be an entity which is shaped in response to our environments, to the world at a higher level, or even to Creation as a whole. In this way of thought, a human mind is an encapsulation of reality so far as we actively perceive it and actively respond to it. When we realize this is the nature of our minds, we can better develop them and we can begin to see that relationships, such as those which largely make up our minds, is primary over stuff. Relationships make stuff and shape stuff. God's love creates contingent being and His love continues to shape being right to the concrete realm of things. We can play our role in shaping that concrete realm of things with our active love.

## 68 Interpreting Scripture and Other Revelation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=39>. It was finished and uploaded on 2006/09/06.]

I wish to make a simple point, seemingly obvious but perhaps only because I've spent the past 20 years of my life teaching myself how to read and write books of substance, books which are worth reading by objective standards.

When a friend recently read two of my theological books (*To See a World in a Grain of Sand* and *Four Kinds of Knowledge*) and three of my novels (*Corporate Sex*, *A Man For Every Purpose*, and *The Hermit of Turkey Hill*), she was surprised at the way my style changed to deal with the subject. She read first *To See a World in a Grain of Sand* which is a hard to read book at best and very difficult for the modern reader because we live in societies that fragment our attention and make it difficult for us to concentrate on long trains of arguments. More to the point so far as *To See a World in a Grain of Sand* goes, we have trouble stepping back to see the structure of an argument that is not even fully describable in our modern language.

In any case, the general point is that I've always known that style and content are not separate. If you have more than one type of story or more than one type of message to communicate, you have to develop the skills of writing in more than one style. This is not to say any particular author could write in any possible style, but, after all, no particular author can write about any possible content. This is to say that while many writers can put words on paper regarding any subject, no particular writer can be an author, an authoritative writer, on all subjects.

People seem to think of an author as a writing machine of some sort. Some Christians and Jews think of the authors of the Bible as having been writing machines under the direct control of God or an angel of God just as they think of a popular author, with great justification, as being little more than an empty-souled writing machine which operates in a highly specified way. That highly specified way would presumably be the result of programming during a period of training in a famous writing school.

Real writers are not programmable or trainable. Real writers are driven to say something, though that something may not be well-defined when the writing urge first arises. Moreover, real writers with any significant talent will have lots of things to say and will have appropriate ways of saying those lots of things.

The writers of the various books of the Bible were real writers. Under the inspiration of God? Yes. Machines writing only what God dictated? No. Writing machines that had only one way of operating? Clearly no.

The same writer who could write in a straightforward way of the events of the mission years of Christ—the years known to the Apostles and other followers of Christ—could very well write a birth narrative in a mythical style while retaining his respect for the historical truth of Christ's life and death and resurrection. Some of the resurrection stories are in a mythical form though not the basic stories of the Lord's first appearances, to the women in the garden and then to Peter and John and then to the gathering of the Apostles and some other disciples.

The birth narratives also show a respect for some historical core without showing the stylistic humility of a simple historical narrative. The birth narratives of Matthew and Luke show a mythical style appropriate for writings which are the result of reflection of early Christian communities upon the Person Who was their Lord. There are other passages in the Gospels which show the same stylistic signs which set them apart from the straightforward narratives of the mission years, including the crucifixion and resurrection of Jesus Christ. The story of the three temptations of Christ by Satan in the fourth chapter of Luke seems also to be likely the result of years of contemplation upon one aspect of the character of Jesus of Nazareth: His sheer incorruptibility.

The Hebraic books, which Christians call the Old Testament, also contain passages which are clearly intended to be straightforward history and other passages which are the result of contemplation upon some historical core of truths. Some, such as the events of the Exodus and of the conquest

of Israel by Joshua show a strange intermingling. In fact, historical analysis of archaeological findings indicate that there was an exodus and there were events corresponding to the conquest of Israel by Joshua but the exodus was not one event and the conquest was not one military campaign nor even the work of one generation.

There was a small exodus which would correspond to the one which everyone reads out of the Bible though there is another exodus referred to in the Bible, apparently larger and peaceful and heading directly to the Holy Land. One of the complications of the Joshua narratives is that there would have been Hebrews in and around the Holy Land when the descendants of the followers of Moses arrived. Archaeological evidence indicates the conquest was also an extended series of events which took place over several generations and maybe many generations.

Historical truths and efforts to speak of contemplations upon those truths combined with others being recovered as those early books of the Bible were being written or edited or redacted. The second book of Kings makes much of a supposed discovery of 'long-lost' books as the temple was being physically restored during the reign of King Josiah. (See 2 Kings 22.) Teachings long forgotten were intermingled with everything else in a way that is very difficult to unwind. As a consequence, some lose sight of the core of historical truths, truths which are the foundation of the intermingled lines of mythical narratives. Others struggle hard to retain a sense of those truths, out of respect for Holy Scripture, and lose the ability to see those mythical lines of narrative.

The problems the authors of the Bible authors face in being read properly, in a way of speaking, is that there are very few readers with high levels of literary skills. I've spoken of the issue from my viewpoint as a frustrated author in Chapter 345, *Writing Serious Books During an Age of Illiteracy*.

## 69 Hellenistic Metaphysics is Too Small

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=45>. It was finished and uploaded on 2006/10/29.]

Recently, Pope Benedict XVI caused a bit of a stir in his address at the University of Regensburg (Sept. 12, 2006). I'll address the true thrust of his speech and not those remarks which were taken out of context. Specifically, I intend to work in line with his stated intention:

The intention here is not one of retrenchment or negative criticism, but of broadening our concept of reason and its application.

Along those lines, I will argue for an enlargement of Hellenistic metaphysics. I believe that this enlargement is possible because of empirical knowledge, knowledge which points to the reality which shapes the human mind and may shape the human being into a truer image of God. My belief in this regard is shaped by modern scientific knowledge as well as the plausible forms of speculative knowledge based on the rapid progress in physics, mathematics, geology, evolutionary biology, and neuroscience over the past few centuries. We also have learned more than some people would appreciate from the human events which have occurred since the days of the ancient Greek thinkers. Even in literature, we now see greater possibilities for the movement of the human mind and spirit than the Greeks could have realized. All of this knowledge can be pulled into a surprisingly coherent Christian worldview if we have faith that God truly is all-powerful, that the physical universe is the way He intended it to be and not the result of some primordial fall from a state of grace. With this faith, we can begin

to understand the universe, which becomes the world when seen as morally ordered, as a place of linear development and not the static or cyclical cosmos which was part and parcel of Hellenistic metaphysics. This is not to deny reason nor even to deny the truths given us by the ancient Greek thinkers. It is to say that Hellenistic metaphysics is too small for the God of Jesus Christ, a Creator who has been shown through modern empirical knowledge to have greater freedom than would be indicated by the systems of mathematics and logic which gave birth to the thoughts of Pythagoras and Plato and Aristotle. He is not even limited to the systems of mathematics and logic which gave birth to the thoughts of Cantor and Einstein and Planck, Heisenberg and Schrodinger and Dirac, Godel and Turing and Chaitin.

Hellenistic metaphysics is too small for modern empirical knowledge and for modern speculative knowledge such as the theories which make partial sense of our physical universe and those which have expanded our ideas of what number is and what mathematics is. And those physical and mathematical theories are entangled in surprising ways, though I only note that so the reader doesn't think there is an ultimate division between speculative, or theoretical, knowledge and empirical knowledge. I addressed the issue of human knowledge in my first published book, *To See a World in a Grain of Sand* [41], and went more deeply into the subject in a book available for free download: *Four Sorts of Knowledge: Revealed Knowledge, Speculative Knowledge, Scientific Empirical Knowledge, Practical Empirical Knowledge* [43], Ultimately, the only two sorts of knowledge are: knowledge of God and knowledge of Creation. Even that split might be somewhat artificial from God's viewpoint but it's a necessary division in knowledge from a creaturely viewpoint. But the four-fold division in knowledge is forced by our ignorance and by the frailties of the human intellect.

The Greeks gave us much we should appreciate and much that underlies even the most radical forms of modern speculative knowledge, that is, the more rational forms of modern speculative knowledge and those which are empirically supported. I'll not try to differentiate between speculations formed by rebellion against what is and speculations formed by efforts to move with the grain of the universe, though I will say that some thinkers, notably Nietzsche and Foucault are examples of thinkers whose books give interesting mixtures of both false insights and profound insights. Some other famous radical thinkers of recent centuries appear to worth reading only as examples of human pathologies.

Let me turn to an area where powerful forms of reasoning have clearly led to an expansion well beyond Greek thought. Modern mathematics has not proven that Euclidean geometry was wrong but it has proven that it is not the only possible geometry. There is plenty of evidence that our universe, at the large-scale, does not have a physical structure fully describable in Euclidean terms though the true structure is not yet known. At the relatively small-scale, such as the objects at the center of all known galaxies which are likely black-holes, the structure of space time is definitely non-Euclidean.

The geometry of this universe have been so complicated and complexified that it seems unlikely that we can even settle on a single geometry for all of physical reality. Any broad and realistic view of physical reality now involves multiple forms of geometry to describe that one reality. Roger Penrose's book *The Road to Reality* [113] is a good example of such a view – that book is a tangled maze of geometries and various mathematical systems which must be employed to describe that one reality. Greek metaphysics, and all the non-Thomistic metaphysical systems I know of, assumed that physical reality must be describable by one speculative system of thought employing one mathematical model, or at least a single family of models. Now it seems that reality is unified but no one human system of thought can cover even the purely physical aspects of that reality.

Concrete reality does not seem to be the sort of entity which is being built the way a child builds a bridge with an erector set or even the more complex way an engineer builds a bridge in a busy city. Concrete reality is rational and well-ordered but its rationality seems to be more complex than the thoughts that can be credited to the Greeks, though they are the fathers of the later thinkers who have expanded the range of human thought. Concrete reality has mathematical aspects but those aspects are far beyond anything the Greeks could have recognized as mathematics, though Euclid can be seen as the father of Cantor and Cauchy, Gauss and Kolmogorov.

In the same way, Plato and Aristotle can be seen as the fathers of St. Augustine and St. Thomas Aquinas. It was Aquinas in particular who gave us the foundations of a truer Christian metaphysics which seems to be immensely greater in scope than anything the Greeks could have imagined. St. Thomas Aquinas expanded the possibilities of metaphysics more than he probably expected by noting that metaphysics uses the specific sciences and by endorsing Aristotle's claim that the human mind is shaped by its physical environments, though even Aquinas didn't suspect there was also a

shaping of the human mind, in a species sense, over an immense amount of time. It's interesting that it was the simple Christian faith and the empirical leanings of Aquinas which were responsible for his most important insights, though he used the disciplined forms of reasoning he inherited from the Greeks by way of Christian Neoplatonists.

The differences between Greek metaphysics and modern metaphysics bear some similarity to the differences between Greek mathematics and modern mathematics. By this I mean that the enlargement of scope creates a variety of seeming contradictions that mask our Greek heritage to those who prefer reductionistic or surface views. There was a seeming contradiction between Euclidean geometry and others discovered in the late 1700s and early 1800s but that was caused by Euclid's fifth axiom which that ancient Greek himself apparently knew to be doubtful: parallel lines never meet and never diverge. In fact, consistent geometries can be developed using other assumptions about the relationships between lines that are 'parallel'.

In a roughly similar way, Greek metaphysics assumes that any existing entity has to have some underlying substance at least analogically similar to creaturely substance, the stuff of this universe. This is because substance is considered primary, the real point of those seemingly silly proposals that all stuff is made from water or air or fire or earth or perhaps some combination of those four. Yet, all that the ancient Greeks knew was made of substance or was the result of relationships between entities made of substance. Modern sciences, especially physics, have given us serious reason to raise relationships to the primary status. Substance is necessary for creatures to exist but some sort of relationship, primarily God's love, brings about some act-of-existence which precedes that substance.

Let's be fair to the Greeks. The Hebrews received the revelation that God is 'I-am' at about 1000BC though it probably meant something closer to: I am present for you. In any case, the Jewish thinker Philo read the Hebrew scriptures through Platonic eyes and he was followed in this by some of the early Christian Fathers. They understood God's 'name' of Yahweh as an existential claim. This was apparently a misreading but I think a very fruitful one. And so it is that we Christians had something of an existentialist understanding of God from the start. We also had the revelation who was the incarnate Son of God as well as the revelation that "God is love". We were even told that God loved us before the world existed. And yet neither we nor the Jews ever asked if maybe relationships

could be primary and substantial being might be brought into existence by relational acts. At that, substance seems to be necessary for us to have the limited independence from God that allows us the freedom to become His companions.

We knew the world was brought into existence by God's love and yet we speak as if substance is primary. As if God Himself must be made of stuff, divine stuff to be sure but still stuff. As a consequence of our faith in the primacy of substance, we believed that many aspects and relationships required a different stuff than flesh and blood, dirt and water. Mind-stuff and soul-stuff were purer and more ethereal substances, but they were substances. God was divine stuff and our thoughts were mind-stuff.

No. With less reason than the Greeks, we literalized relationships, including those which appear as 'mind-like' or 'soul-like' aspects. God is made of stuff. He looks like a dignified but gentle old man who sits on a throne. His Son sits at His side while a Divine Dove hovers over their heads. The three of them looked down upon countless numbers of human souls or minds entrapped in decaying and sin-laden stuff.

We need to break out of the prison of substantialism or essentialism (as most philosophers would call it) and see the importance of relationships, especially of God's primary relationships to us which I call acts-of-being.

## 70 Recovering Your Mind and Soul

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=17>. It was finished and uploaded on 2007/01/03.]

Let's face it. We Americans can be so careful when we buy a house or a car. We want to know the exact effect on our bank accounts, now and during the entire period we own it. We want to know if it will keep us safe during fires or accidents or attempted burglaries. We want to know if we can trust the salesman and the insurance agent, the banker and any engineers or mechanics who check it out.

We also recognize the need to keep our hearts and lungs and livers in good shape though many make only half-hearted efforts to eat right, moderate their drinking, and get the appropriate exercise for their situation.

On the other hand, we aren't all that concerned when we purchase something that might change our lives, having perhaps a dramatic effect on the development or state of minds and souls, perhaps having a still more dramatic effect on the development or state of the minds and souls of youngsters growing up in our houses. We buy televisions that gobble up living-room space, as well as our visual fields. . .

That's dangerous. We have monkey brains. That is, our visual systems are so important to our survival, finding food and reproductive opportunities and so forth, that a re-focusing human visual system will pretty much shut down thought. Our brains don't have enough resources to power our prefrontal lobes and our re-focusing visual systems at the same time.

Moreover, our brains are physical systems of the sort which need to be constantly exercised or they begin to decay. In this, our brains are no different from our hearts and lungs and thigh muscles.

So, how are we to restore robustness to minds decayed after decades of such stuff as *All in the Family*, *MASH*, *Rosanne*, *Friends*, and *The Jerry Seinfeld Show*. Having separated myself from the mainstream of American culture some short time after *MASH* went off the air the first time, I'm stretching back in time but I have vague memories of what I did.

At first, I floundered about a lot. I tried to read professional-level mathematics books and journals, as if it were possible or wise to make up for my laziness and lack of mental discipline during my school-years. I still do read some mathematics books, but mostly reviews (such as Clifford Pickover's *Keys to Infinity*), serious books but written for the non-specialist.

Then something led me to the Bible, well—Someone led me to the Bible. I had an intellectual hunger, a spiritual hunger, and a quiet stubbornness allied with a stunted but living sense of self-respect – I wasn't going to let the television networks and theme-park operators brainwash me into thinking their products were enjoyable.

Around 1988 or so, when I first returned to practice of Christianity – at an Campbellite church in Atlanta, I set out to read the Bible in a year. About 5 verses a day does it, if memory serves me right. I also gave up reading science fiction and thriller novels. After struggling to finish *The World According to Garp*, I also gave up modern novels for years. I set out to read *Moby Dick* for real. It had been a boring struggle to read it in college. And it proved to be a boring struggle again. Two years later, the third time was a charm.

In the mid-1990s, I discovered the pleasure of reading *Don Quixote* and then *The Enigma of Arrival* by V.S. Naipaul – that book had been sitting in a box in the attic since leaving my Connecticut house four or five years earlier. I ran through most of Naipaul's books over the next few years, as well as discovering *The Lives and Times of Tristram Shandy*, *Gentleman* by Laurence Sterne, *The Big Rock Candy Mountain* by Wallace Stegner, and an interesting but strange novel by Iris Murdoch. I also began to read the collected essays and historical works of Jacques Barzun, the books of John Lukacs, and was quite impressed by Douglas Southall Freeman's biography of Washington (1-volume abridgment, alas). In the meantime, I'd discovered it to be easier to read books in the sciences which were intended for serious non-specialists, even some serious overviews of, say, particle physicists, written for physical scientists outside of that highly specialized field.

Best of all, I was reading critically though I'd resisted the efforts of a few good teachers in high school and college who could have taught me

a few good skills and could have helped me shape my mind at a younger age—perhaps to better effect.

As faith leads to understanding, imagination leads to the harder-edged cognitive skills. Einstein claimed that imagination is more important than knowledge and his own intellectual biography indicates that his imagination led where his reason sometimes struggled to follow. In particular, human beings are the sorts of creatures living in the sort of universe that our imaginations should be shaped to the demands of narratives.

Do you wish to rehabilitate your mind? Do you wish to throw off the shackles you put on your own mind and soul to the benefit of the gods of the marketplaces? If so, you should consider adopting weird reading habits. You should read demanding novels by the likes of Tolstoy and Austen, old-fashioned historical narratives by the likes of Daniel Boorstin and Stephen Toulmin, philosophy by the likes of Plato and MacIntyre. Most of all, read the Bible and read it literally in the sense of St. Augustine of Hippo: take it as truth according to the intentions of the human author of that particular book. And it will take some imagination and discipline to determine what that intention was.

# 71 What is Mathematics?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=64>. It was finished and uploaded on 2007/01/26.]

Mathematics, no matter how abstract and symbolic it can be, is founded upon numbers, the number line for those who have taken a geometry or algebra course. Even with the abstractions of group theory and projective geometries, our understanding of mathematics follows our understanding of numbers. However abstract the objects and relationships studied by modern mathematicians, they are abstracted from the entities we call ‘numbers’ and the relationships which hold between or amongst those numbers.

In recent years, it’s been proven by Gregory Chaitin of IBM that all numbers (in a measure-theoretic sense) are random. [19] This means that the percentage of numbers with patterns is zero in a very strong sense. It suffices to say for this discussion that there are infinities much larger than the ordinary infinity of the integers (1, 2, 3, etc). The infinity which is the count of random numbers is much larger than the infinity of numbers with patterns, including the integers.

Let me define the rational definition of randomness used by Chaitin and others who worked towards this theorem or had the intuition that such was possible. I’ll use the simple definition given by Marc Kac, a prominent mathematician who taught at Cornell: a random number is simply a fact.

Those who wish to see rigorous development of the modern redefinition of randomness (development in a historical sense as well as the sense of the discussion of the final proof) can check out the downloadable papers and references to books at Dr. Chaitin’s home-page: a fast mirror can be found at <http://www.cs.auckland.ac.nz/DMTCS/chaitin/>.

We should always remember something that even some knowledgeable philosophers and theologians seem to forget, at least when they try to do

creative thinking. The metaphysical principles of the Greeks didn't arise as pure symbolisms or verbal assemblies. They were shaped by the Greek understanding of mathematics and the Greek respect for the importance of mathematics. I don't wish to deny that heritage from the Greeks, but I do wish to expand our metaphysics beyond that of the Greeks. The best of human thought respects the best of empirical knowledge but that knowledge has grown greatly and forced us to new understandings of mathematics as well as new understandings of physical thing-like being. Right now, our traditional theologies and philosophies are superstitious in the sense that so much no longer valid knowledge is embedded in the speculations about the nature of human thought, the meaning of moral principles, the possibilities of life beyond the grave, the differences between God and Creation, and so forth.

The Greeks assumed that mathematics, hence the world, was built up in an orderly manner from well-defined possibilities. Even stuff that seems messy is understandable as patterns.

I don't disagree with that, though the patterns have proved to be far more complex than the Greeks could have guessed and also the patterns in our universe tend to develop, and fall apart, rather than being constructed in the way of a theorem or even a human building. Even things such as stars have a 'biography', a dynamical nature that goes beyond being which corresponds to axioms or theorems from Euclidean geometry. We have to go beyond the prison that the Greeks constructed for us by teaching us that there is only one possible mathematics and even God must work with a certain body of truths which are directly accessible, at least in principle, to something labeled 'the human mind'.

I've made it clear in my writings that I think we've misunderstood the human mind through much of history. I believe it to be the bodily and relational aspects of the human brain, an organ with the amazing ability to encapsulate the messiness of the universe inside itself. The neuro-biologists working from an evolutionary perspective are right: our thoughts are not built up from some sort of abstractions drawn from an immaterial world or from necessary truths.<sup>1</sup> I would add there are no such truths which we

---

<sup>1</sup>It isn't hard to find the occasional voice in the wilderness, that is the philosopher or general critic or creative writer, who speaks of man in such terms. The most important such thinker is St. Thomas Aquinas, though he did compromise his theory of human nature in a way not of immediate importance. Yet, even the overwhelming majority of thinkers who have rejected the idea of mind-stuff or soul-stuff have remained dualists in

could understand which are binding upon God. By this, I don't mean to say that He could have created a universe in which ' $1 + 1 = 3$ ', but I do mean to say that He could have created a world in which ' $1 + 1 = 2$ ' is either irrelevant or a higher-level synthetic truth, a theorem of some sorts of higher mathematics.

Why would I make such a claim? Because of the theorem of Chaitin: all numbers are random in a measure-theoretic sense. It turns out that Gödel's more famous theorem is actually a corollary of this deceptively simple theorem. What we know as mathematics comes from the patterns in a certain set of numbers, patterned numbers, which are a vanishingly small percentage of all numbers.

We now face two choices so far as I can tell. We can see that small set of patterned numbers, the foundation of classical mathematics, as being somehow necessary though now appearing as tiny islands in an absolutely infinite sea of randomness. This would be a heroic stance of sorts, living in a Platonist sub-set of a greater Heraclitian reality. Batten down the hatches, there's a nasty world out there and we can only make our stand against absurdity and death by standing on these tiny islands which somehow exist in a meaningless world.

The other possible choice is the one I've taken. We can see that overwhelmingly infinite sea of random numbers as being an analogy to a more general situation which the human mind can't directly access. This leaves us in a far worse situation because we lose our ability to see even these tiny islands as holding some meaning which rises above the surrounding chaos.

It's time to follow Hermann Melville's advice: have courage and set out into those chaotic seas. The settled life on those islands is an acceptance of a death-like life.

Have courage? No. It's better to have faith and hope that courage will come, or at least some Christian version of stoic acceptance of one's hardships. I believe that I might understand. I have faith in God that I might have the courage to face up to the task of understanding the world in which I find myself. I admire Sartre, for all his moral problems, for having the courage to face up to a realistic understanding of the physical universe without even wanting to have faith. But I don't wish that fate upon any man, certainly not upon myself.

The curious reader might be realizing something at this point. Whatever

---

the way they treated the viewer-viewed, the thinker-thought, the concrete-abstract.

judgments are ultimately made upon the quality of my thought, I'm one of the very few truly creative thinkers in modern times because I've broken out of the ruts in which modern thought trapped us with the politically useful but wrong-headed claim that theology and philosophy and history and physics and literature can be split up into these realms labeled as 'fields of knowledge'. The structure of modern knowledge has been shaped to the needs of modern liberalism, a way of life and thought which has proven best at producing nice people who are morally spineless, people who can continue to teach physics or push paper or build railroad lines when the Jews and Gypsies are being rounded up a quarter-mile away. As a consequence of my way of understanding of human knowledge and the possibilities of understanding our environments, our physical universe, and the morally ordered universe I call a world, I will sometimes burst out into discussions of moral or literary issues in the midst of discussing mathematics or cosmological physics.

Now, I return to mathematics to repeat three claims I made in my first book, *To See a World in a Grain of Sand* [41]:

1. Only God can make a random number.

Under the more modern understanding developed by Chaitin, anticipated by Chaitin as a high-school student in the middle of the 1960s and also by Kolmogorov at about the same time, a random number is nothing more than a number with no patterns at all which allow a shorter description than the actual listing of the number. Amazingly enough, Chaitin proved—in a book published as an undergraduate computer science text [19] – that the measure of non-random numbers 'divided' by the measure of random numbers is 0. In a measure-theoretic sense: all numbers are random. I can imagine a comic saying that mathematicians have proven the integers don't exist.

2. Randomness, as the term is commonly used, is a type of factuality viewed through superstitious eyes.

As I said above, the prominent measure theorist Mark Kac said a random number is simply a fact. He made that statement more than 15 years before Chaitin completed his work. Even before that, in the early 1960s, the philosopher Stephen Toulmin noted that when evolutionary biologists (and I would claim many others) speak of randomness, you could substitute for 'random' a complicated phrase

about the unpredictability of the results of the interaction of two fully-deterministic and independent systems. Speaking simplistically, that would be genes and the environment in the field of evolutionary biology.

3. Any patterns in the world are small islands of order in the midst of tumultuous oceans of randomness or factuality which threaten to overwhelm us, physically and also spiritually. On the other hand, there seems to be a clear narrative structure which is perhaps too 'big' in some sense for us to see or perhaps too complex. Sometimes, we need to diligently study the chaotic events in the world to see so much as a hint of those patterns.

If mathematical descriptions of the universe point to deeper truths and are not just coincidences, then we can say that there is a 0 probability that anything should exist. The sorts of patterns that support thing-like being have a zero probability of existing in a mathematical sense. In my opinion, this points to the importance of existence in the sense of what I've called *acts-of-being*. This points toward something like Thomistic existentialism.

I'm not a big fan of the idea that we can prove, in the modern sense of 'prove', the existence of God—I discuss some of the reasons for this position in *To See a World in a Grain of Sand* [41] and in Chapter 574, *Proving the Existence of Zeus*. On the other hand, we need to make sense of this universe, also our local environments and human communities. Systems of mathematics don't suffice—narratives are needed. Cosmological physicists have found themselves in the position of writing narrative descriptions of the evolution of this universe which aren't so much different as some would imagine from the creation 'myths', actually narratives, of the so-called primitive peoples. Because of our mule-headed insistence on separating fields of knowledge, there are two important differences which make our modern creation narratives less adequate than the traditional narratives:

1. There is no recognition of the need for necessary being to 'explain' how contingent things could have come into existence. Various thinkers throughout history have had the instinct that this sort of a world has what I call a zero-probability of existing. Prior to Plato's *Timaeus* and then Philo's understanding of the book of *Genesis* in light of

*Timaeus*, there was no real understanding of the concept of “creation from nothing”, but earlier thinkers, including those who wrote the early chapters of Genesis, knew that some being of a greater inherent coherence was necessary as a shaper of chaotic being.

2. There is no moral structure in our modern scientific narratives and those are the dominant narratives of our days. In terms I’ve developed on my two blogs, narratives become truly such and make a deeper impression on the human brain when they are morally purposeful. During the first stage of making sense of this claim, it’s sufficient to remember that human beings are social mammals, rational and dependent animals as Alasdair MacIntyre pointed out in his Carus Lectures published as *Dependent Rational Animals: Why Human Beings Need the Virtues* [91]. Our moral natures are not particularly strong compared to those of some other social mammals, but our ability to think abstractly means we can make sense of the universe and can also adapt ourselves to new conditions. Unfortunately, we can also learn to create and justify various sorts of hells on earth. St. Francis of Assisi and Clara Barton are possible but so are Attila and Hitler.

The traditional narratives which seek to understand our world are inadequate because they are superstitious in the sense of being built upon older understandings of empirical reality which are known to be inadequate. We have some strong hints in the bloody wars of the modern world, as well as the horrors of Auschwitz and the Maoist murders of millions of peasants, that maybe moral structure is more important than scientific ‘truth’. With the fragmented nature of knowledge and beliefs in modern times, we inhabit not a world but rather some sort of battleground in the midst of chaos.

However, I’ve taken the position that we can move on and achieve a new understanding of the world which respects revelations, the moral needs of our race, modern empirical knowledge, and the human need to creatively speculate on how this all fits together. In my first book, *To See a World in a Grain of Sand* [41], I constructed a worldview which tries to pull together our modern empirical knowledge and the revealed truths of Christianity in a creative, even playful, way. My speculations were formed and informed by a radical version of Thomistic existentialism, a way of thought which can respect both God’s revelations and also man’s knowledge gained by

exploration of God's Creation. Moreover, this way of thought teaches us we can't even understand God's most blunt revelations without a reasonable understanding of Creation. Most certainly, we can't understand Creation without some understanding of God's revelations.

I believe that I might understand, but my understanding corrects and enriches my beliefs.

## 72 Why Do We Need to Speak As-if?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=83>. It was finished and uploaded on 2007/03/15.]

As-if is a strange and wonderful language that we all speak inside our normal language—whether English or French or Japanese. Even an Enlightenment rationalist like Adam Smith spoke of the *Invisible Hand* when he found himself not able to speak directly about what might now be called a self-organizing system. This is not really different from childish talk about fairies or superstitious talk about demons and spirits. Both are efforts to deal with a theory of reality, what I call a worldview, when that theory is richer than our explicit thoughts and the available words. Before going on, I'll note that I generally reserve the term 'worldview' for a relatively fleshed-out and rational 'theory of created reality', but simpler views—including those of some imaginative children—are much like worldviews.

As-if language can be a sign of a serious misunderstanding of reality or it can be simply a sign that metaphoric language is being used where straightforward language fails for the reasons I've already stated. There might also be a spirit of willing or willful playfulness driving the speaker or writer.

We can be trapped by as-if language. To be trapped into demonic language when speaking of the evil done by masses of men is to be trapped in one of the literalistic mazes. Once demons may have been the only likely explanation of the eerie way in some types of evil is done with surprisingly little design. In terms of self-organization, the Holocaust was as much a wonder as the Economic Man of Glasgow who was watched by Adam Smith with wonder in his heart. How can we speak of such matters? Scientists

and mathematicians and engineers and philosophers and others are still struggling to get a handle on that major source of the obscurity which leads to as-if language – self-organizing systems.

Schools of fish act as if under global direction: a school of many thousands of fish can turn in a fraction of a second. This comes about though the fish are only reacting to their immediate neighbors.

Human social and political movements are surprisingly similar—this is what Adam Smith called the *Invisible Hand*. An economy or a political society can organize itself though the individual human beings are doing nothing more than acting locally. Smith observed a society in which the individuals were subject to the moral order of the Presbyterian Church—whether they were believers or not. Hence, one characteristic of the economy of Glasgow was good moral-order.

The term *Invisible Hand* is potentially as superstitious as any talk about goddesses who bring the earth to life in Spring or demons who possess human beings to cause various diseases. As-if language can be useful because it pushes the boundaries of our talk beyond the limitations defined by our well-formed knowledge. And sometimes, there is a certain beauty and power in as-if language so that biologists, such as the early Darwin, will wax poetically about the elegance and beauty of nature in a way his successors will often label as anthropomorphic. You might even catch an astrophysicist speaking about the beauty of those exploding and imploding gas clouds which are the breeding grounds of stars.

As-if language can contain legitimate metaphors speaking of truths which can't be stated in scientific or mathematical language. As-if can be useful even when there's an element of fantasy or outright untruth involved. The problem comes when we literalize ways of speaking, including the times when we Christians literalize allegorical or metaphorical texts from the Bible.

The question remains: why do we speak as-if in the first place? I've given an answer but I'm not satisfied.

This is a problem that deserves serious study and I'll be trying to free some of my time to catch up on developments in neurobiology, including those branches of neurobiology which try to use the power of evolutionary theories to explain issues of human perception, cognition, imagination, and speech.

So little time and so much to think about.

[As it turns out, I've not done any more research on this problem.]

## 73 The Imagination that Can Be All Creatures

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=91>. It was finished and uploaded on 2007/05/09.]

What's it like to be a bat? That question was a matter of debate in certain philosophical circles a decade or two ago. I read some contributions to that debate and remember at first feeling sympathy for the arguments of those who were considered champions of the mind as something that is independent of the flesh-and-blood body in such a way as to imply mind has a separate substance—mind-stuff'. A surprising number of Christians feel this way, feel that we have minds made of some mysterious 'mind-stuff'. Supporters of that viewpoint – Christian or otherwise, as I recall, tended to believe a human being couldn't truly know what it's like to be a bat because of the belief that there is something qualitatively unique which could be labeled the 'human mind'.

I'm opposed to any absolute dualism but that of Creator/creature or necessary/contingent being—all created being is shaped from the Primordial Universe in my way of thought. As a consequence, I'm willing to see unity in Creation and to see man as truly belonging – for now—to this universe which is his birthplace and his place of formation. I'm also opposed to philosophies which are typically labeled as 'monist' largely because they don't allow God to act freely, binding Him by chains of necessity to this universe which is ultimately a confusion of God and this universe.

As a Christian, I should add that the true 'dualism' comes down to a difference between God in His own necessary Being and God as a Creator who chose freely to create from nothing and then to shape this world from the truths He had manifested in His primary act of Creation—I call that

primary manifestation the Primordial Universe. Thus, even the dualism between Creator and creature is really a dualism between (God as necessary Being) and (God as Creator acting freely).

And, yet, there is that weaker dualistic relationship between Creator and creature. This relationship is weaker in that it's hard to understand how we can be, in any sense, independent of our all-powerful Creator. Yet, He has told us we have some sort of freedom and that implies we can move on our own. We're not just puppets and our wills, while far from truly 'free', are not bound in the way or to the extent that some, such as Martin Luther, have thought. What sense can we make of this? To make sense of this is – from our creaturely viewpoint—to understand sense and to understand mind.

By looking at so-called 'radical' interpretations of quantum mechanics (such as that of Niels Bohr) through the lenses of an updated Thomistic existentialism, I've settled in upon what might be called an existentialism as well as a relationalism—to coin an ugly philosophical term. I plan to explore what was said of relations by Leibniz, Bradley, and others, but I don't expect to find much of use in their writings if—as I suspect—they thought like Einstein in his debate with Bohr: relations occur between substances which pre-exist those relationships and also remain unchanged by those relationships. It's not relations as accidents of substances that concerns me but rather relationships as God's acts of creation and shaping which concern me, and also secondary relationships as creaturely acts of shaping.

A mind shaped to understand substances is a mind shaped to understand matters of secondary importance. I don't make that as a disparaging comment. We all have to deal with substance, including that which is our own selves. To deal well with substance is itself noble. In doing this, we reach for some sort of creaturely perfection, and, yet, we imitate God most fully by passing beyond substance, penetrating to the relationships which bring substance into being and other relationships which shape that substance into particular beings. The human mind reaches its peak when it most fully imitates God as Creator and Shaper. This is analogical to another distinction we might make between:

1. those who know well the laws God has given us by revelation and in the nature of this universe; and

2. those who understand love, the primary relationship.

A well-formed mind sees the relationships which underly reality, shaping what God has created. If that mind also has faith, it may even see the relationship of love by which God created from nothing.

Perhaps I could say the mind is the relational aspects of the human being. As such, it's tied very strongly to the human body and its various external relationships.

I'm once again floundering a little because I'm trying to form thoughts for which I have only vague concepts. I'm not confident yet where I'm heading and, thus, more than a bit reluctant to re-define words or coin new words. I may find some help in various books that discuss quantum mechanics but probably will find no help at all in the more traditional literature of philosophy. It's not that scientists are more clearheaded thinkers than philosophers, not by a long shot – some of each are geniuses at philosophical modes of thought and some of each are not. It is the case that the weird facts of quantum mechanics have forced honest thinkers to realize that the world isn't always so impressed with traditional metaphysical thought. Some of the best thinkers in the field of quantum mechanics are the philosophers who've come in to see what they could make of the evidence, including Kurt Hubner, whose *Critique of Scientific Reason* [75] played a major role in helping me to understand the debate between Einstein and Bohr. See *A Christian view of Einstein's and Bohr's debate on the meaning of reality* 156 for a short discussion.

God's ways are not our ways and it seems that the truths He manifested in this universe are greater than those which the traditions of metaphysics would have us believe. I've spoken of this in various postings (such as *Hellenistic Metaphysics is Too Small* 69) and also in my first published book, *To See a World in a Grain of Sand* [41], I've never said that Hellenistic metaphysics is wrong just as I would never say that Hellenistic mathematics is wrong. Heraclitus and Plato and Aristotle laid down foundational thought in metaphysics just as Pythagoras and Euclid and Archimedes did in mathematics. God's creation has forced us to expand greatly upon those foundations. I think that a reincarnated Plato would agree with this if he were to survey modern physics and mathematics. Aquinas did agree with this, at least in principle, by noting an implication of the development of philosophical thought in its early centuries—metaphysics uses the specific sciences.

A greatly expanded understanding of the possibilities of physics and mathematics would lead to a greatly expanded understanding of the possibilities of metaphysics. At least, it should. In general, it hasn't done so. Our age might provide interesting materials for the study of future historians of human thought. With that burst of creativity in mathematics and physics during the 19th century and the early 20th century, why have we not seen a burst of creativity in metaphysics and theology? Has something happened to stunt our imaginations? Why else have our minds not expanded into the greater regions of Creation which we have perceived very faintly?

Forgive me if I repeat myself repeatedly while I play around with ways to formulate ideas which are still too faint.

As I interpret matters, modern science is best explained by an existentialist philosophy emphasizing relationships rather than substance. It's far from coincidence that a philosophy that explains the universe also is consistent with the revelations of the Creator about His purposes in creating and also His revelations about His own transcendent Act-of-being. Without getting into the details, or even knowing many of them, I can say that Niels Bohr's 'radical' way of understanding physical reality is quite consistent with that greatest of all theological poems: John 1:1–18.

It's hardly surprising that it's taken so many centuries to understand the revelations in the Bible. St. Thomas Aquinas saw much but lived in the very early decades of the expansion of modern empirical knowledge. Rather than being a creature whose imagination can outrun the possibilities of our world, man is a creature who needs to shape his imagination and mind by learning of the wonders of our world. Moreover, the world is such that understanding it seems to let us see, however tentatively, before and beneath the world. We can penetrate to the manifested truths from which our world is shaped. And, to give credit where credit is due, it is the mathematicians and physicists, historians and poets, of the modern world who have given us the materials and the attitudes to let us shape our minds to be entities wondrous beyond even infinities greater than infinity, beyond black-holes, beyond the evidence that we live in a dynamic and developmental world, beyond the words and images which point beyond this world to the Creation of which it is part.

We can know what it's like to be a bat or a black-hole, just because we can have some understanding of the relationships which shape the stuff of the Primordial Universe into this world and then shape particular chunks

of this world into bats or black-holes.

We have to reason to the importance of relationships, by various routes, because we can't see relationships while we can see substance including the response of substantial beings to relationships. We think of that substance, physical matter as being primary, but science hints otherwise. I'll not speak of primary creation, that is God's act-of-being by which He created from nothing. When we consider secondary creation—what I call shaping, we enter the strange logical mazes of quantum mechanics where the state of a photon in one part of the lab is provably dependent upon what happens to a corresponding photon in another part of the lab and dependent in such a way as to imply instantaneous communication, faster than the speed of light.

There are two tentative conclusions to be drawn from the sorts of experiments which have given evidence of 'spook' or 'at-a-distance' forces:

1. Substantial being in this universe is linked, at the quantum level, in ways that don't usually seem to affect the behavior of macroscopic things. The quantum level is measured by energy—it's not necessarily small in size but rather small in energy changes. I'm not attempting to downgrade the importance of this insight by qualifying it. Those links even imply an entanglement of all parts of the universe—your body is part of systems that include stars which are billions of light-years away. Moreover, it's quite possible that a delicately balanced macroscopic system could be sent into a different state by a quantum change, a change of energy corresponding to the transition of a single electron to a different orbit.
2. Collapse of a vaguely defined particle to one state of being occurs by some interaction. Many scientists and writers of popular science refer to this interaction as observation, often entangling this issue with that of consciousness. It seems to me to be more true to describe this interaction as the formation of a relationship and it matters not if a conscious being is involved.

This supports my general claim in my first book, *To See a World in a Grain of Sand* [41], that God manifested the truths which underly Creation as some sort of homogeneous being, the Primordial Universe, which is perfectly bound together in a perfectly homogeneous state of factuality or

chaos<sup>1</sup>. At least, this would seem to be true from a creaturely viewpoint. We ourselves have thing-like being and can perceive thing-like being though we can work imaginatively to at least explore the properties of highly abstract forms of being. We can think about that Primordial Universe, but likely couldn't ever see it. In fact, it's not palpable being and God Himself thinks about it rather than touching it in the way He can touch a human being.

When God began to shape this universe, He shattered that Primordial Universe, or a part of it, making a number of particles which formed, if you will, a clay-like raw substance. This raw substance of our universe is what physicists are researching in accelerators and in astrophysical work that starts from observations of the universe in its very early stages. And it is those physicists who have also found hints of the unity which still exists to some extent.

God began shaping this clay to tell a story, a story which can be fully and truly seen only by Him.

Mind is a more direct access to the relationships which underly our world, which are the bridge from the Primordial Universe and this universe of particular, thing-like being. In this way of speaking, mind will remain the bridge between the Primordial Universe and the incorruptible world of the resurrected.

As I see matters, to think metaphysically is to penetrate to the relationships which form and shape the things and events of our universe, even to penetrate so deep as to be able to speak of the *Primordial Universe* or of the world of the resurrected. Being manifested truths, the Primordial Universe is somewhat a world of pure relationships. To an extent that might surprise many, including some great metaphysicians, thinking is a matter of exploratory narratives. To think narratively is to think not only in terms of purposes but also in terms of relationships, not just among the living characters but also relationships with the particular environments of those characters.

I've already claimed that the human mind, founded upon the human brain, is the only known entity in this world which is capable of encapsulating the world, the physical universe seen as morally ordered to God's

---

<sup>1</sup>By this, I mean that we could not distinguish anything in this sea of chaos, assuming we could even perceive that something is there. In fact, if this way of looking at Creation is valid, this *Primordial Universe* is here and everywhere else, that is, it's present wherever God has shaped it into any form of more particular being.

purposes. This possibility of encapsulating the world is very much a matter of principle and not of fact because of our ‘smallness’ and our various frailties.

Yet, this power of encapsulating God’s world in our minds gives us a way of sharing in God’s acts-of-being. As God creates from nothing and as He shapes what He has created into particular worlds, we can imitate Him in the way of a child imitating his father at work with his saws and chisels. We pick up a stick and pretend to saw another stick.

In principle, we can know what it’s like to be a bat, or even a star collapsing into a black-hole. Our powers of abstraction and of generalization, both mathematical and literary, allow us to build bridges into other forms of being, at least other forms of being shaped in this universe, shaped to God’s purposes to be the story which is this world, a morally ordered narrative.

We can think of our powers of knowing what it’s like to be a bat or a collapsing star in terms of my chronology of God’s work of creating and shaping. By our powers of abstraction and generalization, we move back in time, or down into the depths of our own physical stuff, to that strange stuff of the Primordial Universe. In these terms, the process of imagining what it’s like to be something non-human in our universe is much like that of creatively thinking about abstract mathematics except the journey to abstract mathematics **may** be only in that downward direction. When abstract mathematics is used directly to understand some aspect of the physical world, a return-journey occurs. When we do this, when we try to understand the world and not just to imagine being something—the efforts may be intertwined, we’re imagining what it’s like to participate with God in some of His work of shaping what He has created from nothing.

## 74 Rules or Context?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=92>. It was finished and uploaded on 2007/05/29.]

I've argued that moral reasoning has the nature of narrative, a story, rather than being reasoning about axiomatic principles. This is certainly the most reasonable standard for Christians who accept the reality of the Incarnation. The Son of God didn't come in glory carrying books on systematic theology and other supporting works in logic and mathematics and science and philosophy. He came among us, being born a seemingly ordinary baby, grew up to become a carpenter and then an itinerant preacher of sorts. He lived a life, a concrete life in which He showed preference for some human beings over others, for some forms of life over others, for some forms of human virtue over others.

I'll not pretend to be developing a 'neutral' or ecumenical theory of the mind. My theory of mind assumes an all-powerful, all-knowing, all-loving Creator is manifesting His thoughts in the physical reality of which we are part. The human mind, when it develops properly, is a more or less complete, more or less accurate, encapsulation of God's world. The world is a manifestation of certain thoughts of God, thoughts loved by God Himself and loved in an active way so that they became real in a creaturely way.

Our minds are not just some sort of mechanism for processing raw data about, say, the life-cycle of stars. Our minds develop by proper response to the realization that stars are not immortal entities but rather physical objects which develop from diffuse clouds of gas which compress. . . And so forth. An astrophysicist will himself live the life of a star, so to speak, in the process of bringing that star into the greater story of a galaxy and the still greater story of the universe. His thoughts, so to speak, are not about a star so much as they are thoughts about what it's like to be a star, a star

aware of itself as a very complex and very particular physical object.

If we consider our immediate environments and the universe as a whole as content-laden, then our brains are shaped by our response to that content but we encapsulate that content in the very ways in which our neurons are connected. Our minds, the relational aspects of our brains, reach out into our environments, even to the very edges of the universe as we currently consider it. We imitate God by playing, in the way of children learning to behave as adults. The game we play is to encapsulate reality in the very stuff and operations of our minds, making those manifested thoughts of God our very own thoughts. It's harder for us to enter the realm of the abstract though our world was shaped from a more abstract realm of manifested truths, the truths which are the particular thoughts of God which He wished to manifest as objective reality, a reality which takes on a life of its own with a proper creaturely freedom.

As Creator, God loved one particular Creation in an active way, bringing it into existence. That Creation is one possibility out of a set of possibilities which is almost certainly describable as 'absolutely infinite' in size. The interested reader can explore some of the reasons I think of Creation in this way by reading my published book *To See a World in a Grain of Sand* [41] or some of my earlier entries such as *God as the Creator of Truths* included as Chapter 7 of this book.

The study of empirical reality, including philosophy and mathematics as well as physics and biology, is the study of God in His contingent acts, but truly the study of God. Even when He acts to create and shape empirical reality, even when He tells the story which is Creation, He is still God and not some intermediary Demiurge. Nor is the universe something which somehow came into being as opposed to God. Nor is the universe something stolen by demons. The universe is the manifestation of certain thoughts of the all-powerful and all-knowing God.

We are images of God not because of some mystical and supernatural soul or mind—we are physical creatures of this universe, born into this universe and shaped with the potential to live as the companions of Christ in a perfected version of this universe. We are images of God the Creator because the human mind is the sort of entity capable – in principle only—of encapsulating this universe and more. In our imitative way, we can think God's creative thoughts. We imitate God not in His completeness and His transcendent Being but rather in His freely chosen acts as Creator.

We are capable of encapsulating more than just this universe because

this universe seems to certainly be but a phase of Creation, though I'm not sure phase is the right term. What I called the Primordial Universe in my book, is the basic stuff of Creation, the manifestation of the truths God chose freely. Somehow, we seem to be able to think the thoughts which are manifested in that general and more abstract stuff of the Primordial Universe. In a way, this isn't so surprising if our very stuff, the stuff of stars, and the stuff of magnetic fields and strong nuclear forces, are all shaped from that abstract stuff. At the same time, we have to remember that characters in a complex narrative might be made of physical stuff that can be understood in terms of equations and explicit rules but those characters gain much of their nature from the narrative in which they are embedded and from the way they respond to their environments which are ultimately themselves part of the story God is telling—where this world is our universe seen in light of God's purposes.

In any case, the Primordial Universe is yet with us, underlying our being and surrounding it. It allows us to think in terms of transfinite set theory and other extremely abstract systems which are seemingly distant from our concrete universe, however useful they are in helping us to understand this concrete reality. To put it simply: we human beings are part of Creation as a whole and not just part of this universe. Perhaps more basically: the universe is a part of Creation as a whole and is a particular shaping of the truths God manifested in the Primordial Universe.

The human mind is not a free-standing entity which processes information and facts the way that a steel-mill processes iron ore. The mind builds itself of the materials it processes and does so by shaping itself to the processing of those materials by those processes. In this, the human mind or relational aspects of the human being is no different from the human body. The wheat we eat and the wine we drink is not just processed—it becomes part of our body in the deepest sense and we also shape our very digestive and other metabolic processes by what and how we eat. What we watch or learn becomes part of us, a frightening claim if we look honestly at the entertainment to which we've chosen to subject our selves and our children.

Neither our bodies nor our minds are sealed off from our environments. More serious thinkers, spiritual geniuses and poets as well as physicists, blend into the universe and into God's story which is this world—that is, the universe seen in light of God's purposes. In physical terms, we can think of our bodies living in seas of oxygen and other gases, breathing them in and also breathing in the various bacteria and fungus spores. Some of that

oxygen soon becomes, quite literally, a part of our bodies strictly defined. Some of those bacteria take up residence in our guts, being part of us in another way—they can help us digest our food. Others attack us and can kill us after long periods of suffering.

The mind, immaterial but perhaps the core ‘component’ of the human being, shapes itself into an image, an imitation, of God in His role as Creator. That shaping process is possible because the universe, part of the greater Creation, is a manifestation of God’s thoughts in His role as Creator, the thoughts He freely chose to manifest in a way that they took on some limited independence from Him, becoming objects of His love rather than simply thoughts of His. At the same time, we have to remember that this universe moves towards God’s purposes by way of struggles between order and disorder. Sometimes, disorder can win temporarily so that great evil can come to life. Though that evil will itself move towards God’s purposes, we can destroy ourselves by letting that evil into our own selves, perhaps by watching some of the latest and greatest products of our entertainment industry.

Briefly, I’ll summarize the reason for thinking the human mind is the core ‘component’ the human being, though a human being is physical and the human mind is immaterial. In earlier postings, I’d noted how I’ve come to take the side of Niels Bohr against Albert Einstein in their famous debate on the meaning of reality. Bohr saw relationships as primary, even as bringing substantial beings into existence, though I don’t know that he realized so clearly the meaning of his position. Einstein saw substances as primary and thought of substantial beings as having relationships that didn’t change those substantial beings.

Each created entity helps to shape itself and other things from more basic forms of created being. Each created entity plays a role, however limited, as an assistant to the Creator. As a consequence, all creatures, all particles of matter, all specks of time and space, are intertwined in ways that physicists and philosophers are just starting to explore. To be part of this universe is to be entangled with all our fellow-beings, even those stars ten billion light-years away from us. Though most physical processes follow ordinary rules of cause and effect, we have little reason to believe right now that these relationships and the implied acts of shaping are constrained by our understandings of time and space. In fact, there is some evidence from quantum mechanics that these very basic relationships aren’t constrained in such ways.

The human mind is unique in being capable of rising to awareness of those entanglements and can even willingly choose to entangle itself more fully with its environments and the entities in those environments in its acts of trying to encapsulate what is actually well beyond the capacity of any particular human mind but that of Jesus Christ. And there are some hints in the Bible that the Son of God emptied Himself in such a way that He didn't understand all of His own Creation while He was yet growing and maturing. He may have been wise beyond His years but His divine and absolutely infinite mind probably was somewhat detached from His human nature until near the end of His life. In His perfected, post-Resurrection human being, there was full union of divine and human mind and thus His human mind had full access to that absolutely infinite mental power.

As is my habit, I'll risk being repetitive because I know I speak of common issues in ways that don't seem too common. I push the language hard, having to use words and even grammatical structures in unusual ways. I often find myself stretching beyond my own understanding, but every true pioneer will find himself in alien territory. By constantly trying to make the same points from slightly different directions, I hope to better forge a language and a body of concepts which could be described as Thomistic Existentialism updated to consider modern empirical knowledge—as I already advertise it to be.

When the human mind is developed in an optimal way, it has a relationship to all of reality which is imitative of God's relationship as Creator to His Creation. He brought the Primordial Universe into being from nothing and then shaped this universe from that Primordial Universe. After the basic shaping, He continued to shape things, comets and elks and human beings, and, in fact, to continuously create all of Creation by acts-of-being, existential acts. We can't bring anything into existence from nothing and our ability to shape is far less than that of our Creator but we have frighteningly great power to shape our immediate environments, and to destroy them, to shape those human being over whom we have influence, or to deform or destroy them.

Our thoughts are not just in our own heads. The thoughts of an astrophysicist are found in his instruments, his collections of data, his techniques of analysis, and his understandings of what all this means. This is to say that his thoughts are, in principle, in those stars and black holes and in the developmental patterns of the universe. Michael Polanyi pointed out that tools are extensions of our bodies, even in the strong sense that a surgeon's

scalpel probably becomes part of that mapping of his body which his brain makes. This is what makes prosthetics work so well in some cases—the artificial limb doesn't become the natural limb but it becomes part of the body mapping as a new limb which probably doesn't work in quite the same way as a natural limb. I'm making a similar but somewhat more vague claim for our thoughts. Our thoughts are contained in our tools – not just the ones so intimate as to become parts of our body mappings, embedded in our social relationships, embodied in our habits and customs, assumed in our languages—poetic like Gaelic or flat and prosaic like English, written in our books and sung or played in our musical traditions. Like physical tools, all the objects of our attention, and the techniques behind them, become part of our mappings of reality which are our worldviews and also those mappings which are our own selves.

If this is so, then we are historical creatures to a greater extent than we might think. We can, in principle, know what it's like to be any creature, including a bat hunting for mosquitoes or a scout leading the advance of the Gaelic tribes as they entered Ireland more than 2500 years ago. But that assumes that bat and that Gaelic scout are part of their environments, shaped by their contexts. It is the environments we understand and then we creatively imagine the sort of particular creature that could have been shaped by any particular environment. We can't become a particular existing bat, but we can imagine what it's like to be a creature having a specific set of relationships with a particular sort of environment. A follower of Einstein's position would logically say that is far less than knowing what it's like to be a bat, believing there to be some sort of 'bat' substance independent of its environment and its relationships with that environment and other creatures. A follower of Bohr would logically say the relationships of a bat are what create that bat. St. John the Apostle seemed to be saying pretty much the same in teaching that God's acts of love are His acts of creation. I stand with Bohr and even more so with St. John the Apostle.

Depending upon our attitudes, we are either in a very bad situation or a very good situation. We can view ourselves as prisoners of our contexts, of the positions in which we were placed by God and whatever we make of those positions. Whatever we can imagine ourselves to be, we have to return to our own selves and our own contextual positions to eat and sleep and defend ourselves. Sartre, who was an atheist, saw himself as a prisoner, perhaps a mistake but one made for the right reasons. A thinker unable to shed his modern infatuation with individualism should be in despair, not

because of some presumed radical separation from whatever created us—a Lutheran or Barthian separation from God would negate our existence. Such a thinker should rather be in despair because an individual can be such only if he is primarily a being of substance over which he himself can, in principle, gain some serious degree of control. Sartre was too smart to believe that given what he knew from modern empirical knowledge.

Alternatively, we can see ourselves as parts of a much greater whole but unique parts capable of understanding the whole, not in the way of axiomatic reasoning but in the way of moving with the grain of the universe, of making God's story also our story set in our deepest parts. If we side with Bohr and St. John, and if we are willing to see this as a good situation—we are what we are—then we move on to try to control our relationships in the proper way. In my case, I returned to Christianity at a time when I didn't really enjoy prayer or worship and I had to force myself to read the Bible. The next 20 years were a series of ups and downs but finally was I able to discipline myself so that I prefer attending a Mass to watching a football game on television. By far. It's a still struggle to keep up a regular prayer schedule but I usually enjoy praying the Liturgy of the Hours when I force myself to open the book and get going. Over that same time, I also re-taught myself to enjoy reading books that demand a mental effort and to prefer good folk music or classical musical to most popular music. In these efforts, I was choosing to change my relationships to God and to His Creation.

We imitate God in His acts of creation though not His primary Act-of-Creation. It's our mind which can do this. A man or woman working with AIDS victims in Jamaica is shaping his or her mind to that of God and we do that by making ourselves more self-aware parts of God's story, by learning to understand and love that story. Those aspects of reality labeled biological are important in understanding our particular selves. Those aspects of reality labeled physics and mathematics are very important in understanding Creation at a more basic level. In the end, even physics and mathematics, yes, even metaphysics, are most important in the way they provide us with languages and concepts to tell our version of God's story which is this world. That story is not a series of encyclopedic articles nor a collection of logical or mathematical axioms. That story is a morally ordered narrative told in terms of the entities and processes of this universe, not in terms of individuals passing through a stage set and not in terms of magical processes or strange spirits.

That tells us what a human mind can be at its best—an entity flowing freely and smoothly along with that story, part of that story and yet capable of comprehending the entirety of the story, at least in principle. Yet, to reach that point, we have to always remember we are set in more particular contexts inside that story. There is no place to stand outside the story and observe it in a neutral way. It is only possible to understand the story once we move along with it, to move with the grain of the universe, in terms used by the Mennonite theologian John Howard Yoder.

## 75 A Proper Sort of Reductionism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=93>. It was finished and uploaded on 2007/06/05.]

Reductionism is often seen as explaining something away and, unfortunately, that's often the goal of those doing the reducing. This isn't a new development in modern thought. When St. Augustine explained the mind in terms of three components—intellect, memory, and will—he was reducing a complex entity to three components he felt to be more primary or more basic in some sense. There was a reason a Trinitarian Christian theologian might try to reduce the mind to three components, though I don't accept that sort of an analogy between the human mind and God. In any case, any sort of reduction is a reduction.

Sometimes strategies of reductionism provide substantial analytical understanding of a higher layer and sometimes they discover the aspects of an indivisible whole, allowing descriptions. In any case, the effort is necessary because we would otherwise be dealing with things and living creatures as if they were only surface phenomena. A reasonable sort of reductionism gives us ways of talking about what it's like to be a star or to be an alligator or to be our neighbor.

St. Augustine and other great thinkers reduced as a way of developing words and concepts to understand. They never lost sight of the more complex reality they were trying to understand. Any reductionism, or any talk about a system of reductionism, which has too many words like 'just' or 'only' is immediately suspect because the thinker behind that system has reduced a whole to a pile of rubble and has disdained his responsibility to respect that whole and to show how the pieces of a system of thought allow

some understanding of actual parts or at least aspects of a complex entity or phenomena.

Let me start with an example that deals only with perception—color vision. Back in our school days, most of were taught about primary colors, red and yellow and blue, and how primary colors mixed to form other colors. In high school, we might have even seen diagrams of the eye showing receptors for the primary colors. As it turns out, that is more a fairy-tale than a scientific explanation, In fact, two great scientists of the 19th century—Helmholtz and Maxwell—gave at least one clear reason why the primary-color vision theory is wrong: if we saw colors that way, a red ball would change colors drastically when it was moved from the sun to the shade. Objects emit a very different spectrum of wavelengths under different lighting conditions, yet we see that red ball as red under a wide variety of conditions.

It's interesting that the theory of primary colors lasted more than a half-century after respected scientists explained why it was almost certainly wrong. It's even more interesting that it's lasted more decades since Edwin Land, MIT scientist and founder of Polaroid, showed it to be wrong in the middle of the 20th century. Land's experiments were rigorously conducted and definitive. What he showed, to simplify a bit, is that a colored surface with perfect smoothness and other properties that don't allow contextual and contrasting clues will be seen as pure white by human beings. It turns out that the human brain, and the monkey brain, use ad-hoc techniques to carry out operations which are somehow equivalent to the solving of systems of partial differential equations. The interested reader can browse a copy of *A Vision of the Brain* [155] by Semir Zeki, one of the neurobiologists who has done pioneering work on the question of how we see colors.

The primary color theory and the more recent theory of how we see color are reductionistic though that more recent theory is extremely complex and, in fact, no one yet knows what sort of basic elements will best allow analysis and discussion of the issues. We know our brains don't literally solve huge systems of partial differential equations and yet that is the only way human scientists know of describing what our brains do in allowing us to see colors. It's neurons that carry out these tasks by way of exchanging small electrical charges and chemicals through their various linkages.

We now know, and accept when we have to, that our control over our own bodies can be destroyed by problems with dopamine, a common brain chemical. This condition is Parkinson's. When we or a parent are diagnosed

with Parkinson's, we know enough not to go looking for an exorcist or for a witch to undo the evil spell which is destroying the ability to move our limbs properly. Nor do we engage in self-examination of our minds, independent of empirical knowledge. Yet, we think of such human aspects as moral will or poetic thought as if we should be understanding our moral character or our poetic skills by way of magic or by styles of philosophical thought developed in ages before the development of a proper respect for empirical reality as a concrete phase of Creation, not a world of things in some strange contact with a world of spirit or a world of truths or even a non-world of truths.

To some extent, language involving brain-cells and groupings of brain-cells will be necessary even for understanding higher-level aspects of human beings and other creatures. I do think it's wrong to think that limited language would be sufficient for understanding our selves, as Richard Rorty speculatively suggested in *Philosophy and the Mirror of Nature*, but I agree with his criticisms of the view that such language has no important role to play in our understanding of our own natures. As created entities with thing-like characteristics, human beings can be understood only by understanding at the level of that thing-like being as well as the level of human nature.

Still, we have to be very cautious of falling into a mindless or naive reductionism, whether from laziness or ideological corruption or from culpable ignorance. That entity which is the human being does exist and mostly acts at the level of itself as an whole, yet that whole has properties, capabilities, and limitations which can be best understood by understanding first the workings of brain and brain-cells, heart and heart-cells, glands and the chemical structures of hormones. This warning applies to those who think we surely have minds or souls made of a more pure stuff than matter and also to those who think that higher-level mental or spiritual events are illusions if our stuff is 'only' physical matter and energy and fields.

True it is that there are immaterial aspects to our human natures, but true it is as well that those immaterial aspects are tied tightly to physical organs and physical events in our bodies. Under my worldview, these immaterial aspects come ultimately acts-of-being, existential acts, possible only to God. Secondarily, they come from lesser acts-of-being possible to God in powerful ways and to His creatures in lesser ways.

These lesser acts-of-being are different ways of speaking about the relationships including those which cause collapse of a wave-packet to an elec-

tron in a specific place with a vaguely defined momentum or an electron with a well-defined momentum and a vaguely defined location. As I said in my published book, *To See a World in a Grain of Sand* [41] without being able to elaborate: this sort of fluidity and—you might say—uncertainty in this universe at the level of creaturely perception and creaturely thought gives us some hints of the nature of the freedom which is appropriate for us, in our thoughts and in our external actions. Even our freedom is contextual and not a result of some self-contained human component called free-will. We form our minds by proper response to our environments but that formation has something of the nature of movements across a sheet of ice. We are still part of the physical universe created by God, still constrained by it, but some restrictions from our momentum have been reduced. A more fluid and graceful movement is possible—if we have taken care to obtain the proper equipment and to develop the proper skills.

There is no *a priori* reason that different sorts of stuff can't exist, call it 'mind-stuff' if you will, but there's no reason to believe this other sort of stuff does exist and some strong arguments that radically different sorts of stuff couldn't communicate with the stuff of our bodies. If it could communicate with our bodily stuff, wouldn't it be the same sort of stuff?

We have too much evidence of correlation between brain-events and even the most ethereal of mental events to doubt the need for any mind-stuff. For human styles of reason to be valid, any mind-stuff or soul-stuff would have to follow pretty much the same cause-and-effect relationships as the stuff of this physical universe and it would seem superfluous, no more than a shadow moving along with our bodies.

It seems certain to me that the bare language of brain-cells, brain-chemicals, and so forth needs to be supplemented by a different sort of language that allows us to speak of the events that motivated talk of immaterial minds and souls, but there's no reason to let Christian reason, or any other sort of human reason, be corrupted by magical talk. The electromagnetic fields, and possibly quantum fields, generated by our brains might well correspond to 'minds' and 'souls'. Those fields would operate in a way that would give us the impression that we have components which are immaterial. And that's far from wrong unless taken literally. The so-called Big Bang model implies an expansion of the universe out of a state where it was an extremely compressed and homogeneous stuff. Fields seem to be the most 'relational' form of that stuff. In a sense, they are closer to 'reality', that is, to the most basic aspect of created being.

I've argued that relationships are primary and substantial being is created from nothing by God's love for it—the ultimate relationship. Relationships also bring substantial being into existence in a secondary way: they shape raw stuff into things and then continue to shape those things until they become, perhaps, bacteria and then jellyfish and then slime molds and then fish and then frogs and then snakes and then rats and then monkeys and then human beings. I've played fast and loose with evolutionary transitions to summarize a complex history in a single sentence. The point is that evolution can be seen, from the beginning of the current expansion of the universe, as a gradual shaping of very strange stuff – almost abstract stuff—into a creature with a brain that is capable of encapsulating the universe and perhaps Creation in all its phases.

In the end, these systems of thought based on modern empirical knowledge are ways of reducing a complex entity—the human mind – to basic elements which allow us to study and analyze and maybe even understand. A system which reduces human thought to specific actions of an immaterial mind upon a physical body can be pious in respecting human nature and religious beliefs but it has to be evaluated on the basis of what is known about human beings and the physical world they bodily inhabit. A system which seeks to understand by first reducing human thought to relationships of components of the physical human body, including generated fields, is no different. Such a scheme can be used to understand though some will fear it's being used to explain away, and there will be some who will try to do exactly that. But any scheme, including those which use mind-stuff or soul-stuff can be used to explain away. Some magical systems of thought favored by C.S. Lewis and other Christians do their best to respect human nature and its Creator by only by waving away any true understanding of the words of God as manifested in the things and relationships of this universe.

What is the test of a system of one set or another of basic elements including the allowable relationships between those elements? There is a very simply stated test which is very complex in practice: does that system allow plausible descriptions and narratives of the world which we inhabit or of specific entities in that world? The goal of any scheme in Christian thought is to understand this universe which God created and then to understand it in light of what God has told us about His purposes—and He told us that most clearly in the crucifixion and resurrection of the Lord Jesus Christ. Of course, we've not yet come to a final or definitive

understanding of those purposes revealed in the rather unexpected narrative of the life and death and resurrection of Jesus of Nazareth.

I've proposed that the human brain is the sort of entity which is, in principle, capable of encapsulating God's world, the physical universe seen in light of God's purposes for Creation. I think it's likely we can encapsulate a more general set of truths manifested in the Primordial Universe from which this universe was shaped. Still more importantly, as noted by various individual philosophers and perhaps some Oriental traditions, our minds are not separable from their context. Our brains are the substantial foundations of our minds, whatever they prove to be in total, and those brains are part of the physical universe and subject to the laws of that universe. Moreover, the content that 'fills' our minds is inseparable from the shapes of those minds falsely seen as containers.

My way of speaking about the human mind is inseparable from my way of speaking about Creation. This makes a lot of sense in the light of modern empirical knowledge and—most important of all—allows us to make creaturely sense of God's direct revelations to us just because it makes our very minds part of the world which is a shaping of the truths God manifested in the Primordial Universe. When we reduce the human mind to basic elements provided by modern science and understood in light of modern empirical knowledge as a whole, we gain more power in understanding both our selves and our world. Ultimately, we subject our understanding of human nature to the most important knowledge we have—God's purposes for Creation and for each of us in particular. This approach is more respectful of Creation and the Creator than are magical or supernatural ways of viewing the mind. I remain within human knowledge of the physical world, seen from my faith in God's self-revelations, especially that He is an all-powerful Creator. In addition, I've been forced to realize that the sufferings, death, and resurrection of the Lord Jesus Christ couldn't be a divine response forced by creaturely errors. The crucifixion of our Lord tells us something very basic and very central to God's purposes for Creation. It's not given to any particular human being to understand the universe so truly as to see why the sufferings, death, and resurrection of the Lord Jesus Christ moved with the grain of that universe. If any human being could achieve such an understanding, he would understand fully God's purposes for Creation.

We reduce as part of our efforts to understand reality as a whole. Any efforts which use words like 'just' or 'only' too often are probably wrongful,

literalistic in assigning ultimate reality to our derived basic elements even at the expense of making sense of the world as a whole or even of making sense of human nature. That is how 'reductionism' gets a bad name. When we see the factual truth in the evolution of life, that doesn't force us to believe life is 'only' a chemical process nor to believe that man is 'just' an ape. If anything, it forces us to give greater respect to the chemical processes of this universe and greater respect to non-human apes. It forces us to give greater respect to all the physical aspects of God's world and to all the living creatures He has shaped within that world. It shouldn't at all lessen the respect we feel for God or for Creation or for individual creatures, including human beings.

## 76 What Does God Know?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=94>. It was finished and uploaded on 2007/06/12.]

Obviously God knows all. Perhaps the real question is: “What is there to be known?” But the questions are the same at a very fundamental level. What God knows is what there is to know and what there is to know is known by God.

First, if things are true, that is—if Creation is an image of some of God’s thoughts manifested in substance He created from nothing, then any true metaphysics or theology assumes we can, in some sense, ascend to the level of God’s knowledge of created being. We have to assume we can achieve a God’s eye-view and see the truth in things. If things are not true, we might as well just re-consider all our inflated ideas about knowledge and the human mind. If things are not true, we might as well pursue knowledge only for utilitarian purposes. Only a radical, though perhaps hidden, dualism could construct true thoughts in a world which is not inherently true, in and of itself, and containing only things also true, in and of, themselves.

Second, we have to remember that God the Creator isn’t the Transcendent God. No, I’m not multiplying Gods, only pointing out that God revealed truths directly to prophets, through the history of Israel and His Church, and in the life and words of the Lord Jesus Christ. But much of what we know of God is in the form of His thoughts, His acts-of-being or creative acts, as expressed in the world we live in. These are contingent acts and represent only an infinitesimal percentage of the possible acts He could have performed. And He could have chosen not to act at all as a Creator, not to create a world.

Third, we have to avoid thinking like scholars or like dogmatists. We have to let God’s revealed truths mingle with human empirical knowledge,

disciplining our imaginations to those truths and that knowledge but then giving our thoughts somewhat free rein. We must consider ourselves in light of St. Paul's analogy to athletes. A fine race-horse would be still better. Train that horse hard and then give him free rein when he's carrying you in the Kentucky Derby.

To discipline the mind is the hard part. I feel it best to start with serious works of the imagination: *Moby Dick*, *Don Quixote*, *The Life and Times of Tristram Shandy*, *One Hundred Years of Solitude*, and others of that type. In my opinion, it's imagination that needs nurturing even more than logical reasoning power and memorization skills. In modern times, imagination seems to have withered so that we can no longer do the heavy lifting of dealing imaginatively with God's Creation. Increasingly, literature and cinema and—more recently—stage productions in the United States deal with comic book characters of the sort which used to interest mostly ten year-olds. Now, I don't even consider the time I spent reading Spider-man or Superman comics those forty-five years ago as more than a mind-stunting waste of time. My opinion about the vast bulk of science fiction and the time I wasted reading it is similar but stronger. See *Keep the Imagination Sane* 373 for a very short discussion of this issue.

Why do I consider imagination so important? Even better—why do I consider a sane imagination so important? God has more freedom than traditional theology and metaphysics would allow Him. That freedom shows up in our universe as the lack of a systematic way to view that universe as a whole: browse through *The Road to Reality* [113] by Roger Penrose and be amazed by the variety of exotic mathematics (such as non-Euclidean geometries) necessary to analyze and describe physical reality. If there is one theory of everything accessible to the human mind, it's hiding under a complexity of interacting and consistent—but different—theories.

Neither mathematics nor metaphysics, nor even theology, provide answers so much as they provide ways of speaking about Creation and its Creator. To think that any specific mathematics or metaphysics could give us ultimate answers—as opposed to understanding—is to enchain God in Necessity. But we no longer have the option of even pretending that to be possible. As mathematics has expanded its ways of thinking and speaking, raising new possibilities that truly stretch the human mind, metaphysicians have only reluctantly responded and Christian theologians not at all. Even mathematical physicists have often responded to this expansion of possibilities by trying to isolate a subset of modern mathematics that will give that

illusory **Theory of Everything**, a goal somewhat similar to the search of ancient and Medieval alchemists for a way to purify any base metal so that the true metal, gold, might emerge.

Many philosophers and nearly all Christian theologians wish to restrict the possible understandings of Creation to those given by one variety or another of Hellenistic metaphysics, ignoring the historical fact that Hellenistic metaphysics was tied to, maybe even founded upon, Hellenistic mathematics which we now know to be true but to be only a small subset of mathematics.

Metaphysics teaches us the possibilities which God actualized when He created the truths which correspond to Creation in general while most efforts in theology strive to make sense of Creation in light of our very small stock of revelations directly from God. The problem with modern metaphysics and modern theology, at least in its Christian forms, is that they speak of a Creation and a Creator far smaller and far more impoverished in being than those implied by modern mathematics and by mathematical physics as practiced by thinkers who have wider viewpoints—such as Roger Penrose.

In Chapter 7, *God as The Creator of Truths*, I've discussed these issues but constantly do I go over and over the ideas, looking for new ways to view matters and to discuss matters. In particular, I've discussed the findings of Chaitin, Kolmogorov, and others that numbers are random, that is, factual. The entire number line is a higher order infinity of facts, from which elegant or axiomatically constructed sets of facts can be selected. I have labeled that selection process as an act of creation, or an act-of-being possible only to God, but possible to us indirectly by way of the understanding that allows us to share in God's creative powers.

So how does God think? What does He think about? I've spoken of this Creation as being one that God chose to actively love, bringing it into being by that act of love, or act-of-being. What does it mean to say that God thinks about other Creations but doesn't chose to actively love them? Is there such a thing as passive love?

First of all, as a Trinitarian Christian, I would suggest we need to re-center some of our attention upon the Holy Persons of God and not just upon God's power to save us or to do us good in other ways. Specifically, the modern empirical evidence that relationships might be primary and substance secondary gives us analogical reason to believe that something of the sort is true for God Himself—see Chapter 156, *A Christian's view of*

*Einstein's and Bohr's debate on the meaning of reality.* In fact, traditional creeds and many of the Fathers tell us: the Son proceeds from the Father. This might well be restated as saying: the Son exists to be loved by the Father. And it is the decision of the Son to show His love for the Father by a great act of obedience that led to Creation and to the shaping of this world. The world was created so the Son could sacrifice Himself to the Father, an act from which we benefit infinitely but our salvation wasn't the main point of the crucifixion and resurrection of the Son. In His love for us whose life He shared, He created a bridge to eternal life which He can carry us across, but the drama of salvation was really a drama of love between the Father and the Son.

We're entering new territory here as a result of an expanded understanding of Creation, of mathematics and—hence—metaphysics, even an expanded understanding of the possibilities of the human mind. We're facing a need to strip out much of the empirical and speculative content of Christian theology, rebuilding upon the foundation of the small stock of revealed truths—see the several-times revised creed originally written by the Fathers at the *Council of Nicaea* for a concise statement of truths of a theological sort.<sup>1</sup> You can also see the *Sermon on the Mount* for an authoritative statement of truths of a moral sort. Even the truths of creaturely morality point us towards a state where we can accept a relationship with God analogous to that of Son to Father.

As I've argued elsewhere: God's revelations give us some knowledge of Himself in His Transcendence and also the purposes for which He has brought Creation into existence. Those revelations, in other words, tell us a little bit about God in His Transcendence and—along with empirical and speculative knowledge—a lot about His thoughts as Creator.

As Creator, God is a story-teller and the world is a morally meaningful narrative. The meaning is revealed most clearly in the crucifixion and resurrection of His Incarnate Son, the Lord Jesus Christ. In the current context, it's more interesting but also far more frustrating to return to that question: what thoughts does God have from which His thoughts as a Creator are drawn?

---

<sup>1</sup>The *Profession of Faith* used in the Catholic Mass is one version of the Creed but as one example of how the greatest of truths have to be expressed in human concepts and words not capable of bearing such as weight: both St. Augustine and St. Thomas Aquinas advocated theological and metaphysical principles which denied the validity of words of substantial being, such as 'consubstantial' when we speak of God.

This isn't a Promethean quest to somehow capture the essence of divinity but rather a part of the effort to understand our Maker that we might respond properly to His offers of companionship. It also isn't a quest to ever be completed. As unlikely as it is that we, even as a race, will come to a complete and accurate understanding of the universe, it's far less likely we can achieve such a goal for all of Creation, and flat-out impossible that we can do it for God even in His self-constrained role as Creator.

Still, if we have some sort of language for talking about the universe, a more encompassing (metaphysical) language for talking about all of Creation, a still more encompassing (theological) language for talking about God the Holy Trinity, we can talk when appropriate and perhaps have better judgment about being silent when appropriate.

Let me make a very tentative stab at language for talking about how God Himself thinks in His role as Creator:

We know that the universe resembles a narrative more than a designed construction and, so, we can speak of God as Creator of this world as also being the Author of this world. But the language of this narrative includes mathematical statements and a variety of other empirically founded statements covering the fields of physics and chemistry, biology and psychology, history and biography, poetry and fictions of all sorts.

I've proposed that this world, the universe seen in light of God's purposes for it, was shaped from something I call the Primordial Universe. This Primordial Universe is a manifestation of the truths God wished to use in shaping this world and also in shaping the world of the resurrected. The Primordial Universe would thus be a manifestation of all the complex mathematical systems which Penrose used in *The Road to Reality* [113] and many more systems of truth—not all mathematical for sure. But, using and perhaps abusing, the insights of modern theorists of randomness (such as Gregory Chaitin [20]), I would propose the Primordial Universe to be analogous to absolute infinity, a chaos – if you will—of factuality from which elegant mathematical systems can be drawn. In the more general sense of Creator of all of Creation and not just this universe, the Creator's thoughts range over an absolute infinity of facts and from those facts, He can create systems which correspond to various systems of truths, including mathematical truths but not only those.

And so we come to God in His transcendence. If the above two paragraphs give a general idea of appropriate language for speaking of God, in His freely chosen role as Creator of this role and in His freely chosen role as Creator of all of Creation, then we're stuck. What thoughts can lie beyond the chaos which is an absolute infinity of facts from which can be created all the systems of truth human beings seemingly know or could know? I don't know but possibilities have opened up that might allow us to speak even of God in His Transcendence, guided by both His direct revelations and those given to us in the physical universe and the systems of truth which we've derived from analysis of that universe and from imaginative thought based upon those systems of truth. . .

A modern program in natural theology would move towards God in His Transcendence by the three stages discussed above. It would require theologians, metaphysicians, and scientists who would have to be educated to extremely high standards and those thinkers would have to have a very wide range of talents. Following is an effort to state the three stages in a more programmatic way:

1. We would understand God as much as possible by way of the decisions He made in shaping this particular universe. This would involve broad and deep learning of modern empirical knowledge, history and literature as much as physics and biology. This first stage is, at absolute best, the highest point reachable by a pure natural theology such as that advocated by Intelligent Design theorists, but it's not a minor achievement to truly conquer penetrate this stage even in a time-bound and culture-bound way. Many of those thinkers I foresee would do meaningful, even great, work in this first stage.
2. We would generalize by way of abstract reasoning. This would expand our views by way of proper consideration of modern logic, encompassing Aristotelian logic but much broader and deeper, and modern mathematics, encompassing Hellenistic mathematics but also much broader and deeper. I'm particularly fascinated by the possibilities in transfinite set theory which forces us to think in ways far beyond 'everyday' numbers and mathematical concepts. At the very least, transfinite set theory would seem necessary to re-establish the proofs of God's existence on a firmer basis. This enlargening of our mathe-

matical horizons would force a great enlarging of our metaphysical horizons as well.

3. We reach a territory which is quite strange to finite creatures —that Act-of-being Who is Himself and is, thus, self-sustaining. We reach God. I have mixed feelings about any such stage, fearing and hoping that to reach this stage is to have the beatific vision which is the union with God described very tentatively by various mystics. Certainly, great mystics have reached something corresponding to this state without having any deep understanding of the empirical aspects of Creation. God can choose to bless anyone He pleases with direct communion in this life. That has no bearing on the program I'm proposing to rebuild Christian theology to retain the very truths being endangered by those who would be pious and holy by tying our thoughts about our Creator to outmoded empirical and speculative knowledge. We should also realize that while we have reason to believe that human knowledge can expand much further than anyone would have guessed, God in His Transcendence might always be best described by the semi-mystical and semi-poetical language of negative theology. Still, even that language can be enriched and disciplined by an expanded metaphysics.

It's clear that theology and metaphysics, at their frontiers, are not the domain of talented scholars but rather the domain of creative thinkers who are more interested in speaking to God than in writing textbooks. Some, such as Aquinas, could do both, but a little bit of knowledge and a sometime reckless creativity would probably accomplish far more than great scholarly knowledge and careful working techniques.

At this time in history, when we've gained so much knowledge of God's Creation and have so much potential for understanding His natural revelations that point to the Creator Himself, most scholars on the scientific and theological sides refuse to follow the leads as if there truly is a deep and unbridgeable chasm between Creation and its Creator, or perhaps as if this universe is something else than a Creation of love.

## 77 More on: What Does God Know?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=95>. It was finished and uploaded on 2007/06/16.]

I seem to have spoken of Creation in two ways. There's no real inconsistency but I sometimes confuse myself. In Chapter 76, *What Does God Know?* found at <http://loydfueston.com/?p=94>, I spoke as if the Primordial Universe, the stuff underlying all of Creation, is analogous to absolute infinity, a chaos—if you will—of factuality from which elegant mathematical systems can be drawn. In the more general sense of Creator of all of Creation and not just this universe, God's thoughts range over an absolute infinity of facts and from those facts, He can create systems which correspond to various systems of truths, including mathematical truths but not only those.

In past writings, I've spoken of the Primordial Universe as being the manifestation of truths God selected for this Creation and now I've spoken of the Primordial Universe as being the factual chaos from which systems of truth can arise (like islands arising from an absolutely infinite sea of chaos). Our bias, perhaps coming from the limitations (not outright errors!) of metaphysical traditions, is to associate truths with what we might call constructed or designed systems. I've moved more strongly towards a view of truths as being 'factual' with ordered systems being created or shaped from those raw facts. From that viewpoint: is the Primordial Universe the islands (ordered truths) or the entire sea (factual truths) along with all possible islands?

Whatever the answer to that question, the basic thought I'm trying to communicate is: God creates truths by thinking them and isn't just

a Supernatural Computer processing pre-existing possible thoughts. The Lord Almighty is a true Creator and creates factual truths as creatures know them. He's a Shaper of pre-existing chaos only in the sense that He further shapes His Creation into specific worlds.

So what would constitute divine thought outside of His acts as Creator? Possibly nothing. God is a pure Act-of-being, His own Act-of-being, and I think Christians are bound to see that Act-of-being in terms of love between Father and Son and Holy Spirit. As a Medieval scholastic might have said: God doesn't think. He simply knows. In this way of looking at matters, every manifested truth or unmanifested truth is to God a directly accessible fact and never a conclusion to a line of reasoning. And we move a small step closer to understanding the traditional claim: God is simple.

I've spoken in my book, *To See a World in a Grain of Sand* [41], and elsewhere about the nature of random numbers. Two especially important claims are:

1. A random number is simply a fact. This claim, to my knowledge, was first made in the early 1970s by Marc Kac, the highly regarded measure theorist, on the basis of the early work of Chaitin and the similar intuitive suggestions made by Kolmogorov and possibly a few others.
2. Only God with His absolutely infinite mind and His absolutely free will could actually make a random number.

To God, there may be no difference between the most elegant mathematical theorem and a random number. To the Almighty, they are most immediately known facts while to a human thinker, the first is a result of a line of reasoning and the second is essentially unknowable. On the other hand, if relationships are primary over substance, we come to a possible fork in the road. Do systematically created or constructed truths regain primacy because of their richer relationships to each other? I'm not sure where to take this but my thoughts at this point turn back to the Holy Trinity and the relationships of love between Father, Son, and Holy Spirit.

I wouldn't want to leave the impression that mathematics provides more than analogical models of substance or relationships or or persons or Persons. But those analogical models are important for any possible revision and revival of metaphysics in the modern world. The history of metaphysics and even a very casual acquaintance with Hellenistic mathematics

and metaphysics would suggest the relationship is deeper than just analogical, but I'll leave matters there after first claiming that our modern philosophical muddle is partly due to a lack of proper response to modern developments in mathematics.

God 'simply' exists and knows and doesn't think any way directly analogous to human thinking. This is part of the reasoning behind the claim that "God is simple". He has no parts and doesn't change. To say, "God is simple" might be the same as to say "God necessarily exists". It's hard to imagine a creature being simple in the way ascribed to God.

I can say that God doesn't exist in time or space, a more plausible claim on certain grounds now that mathematical physicists have produced models of reality which—though they fail—do indicate this universe might well be shaped from something which has no time-like or space-like aspects. Time and space would simply be infinitesimally small, sequential subsets of absolute infinity, ordered so that they can be traveled. The smallest 'dense' subset of absolute infinity, an open region of that ocean of chaos, wouldn't be sequential in the intuitive way I'm using mathematical language and thus it couldn't be traveled in a way that would make possible the sort of development God has ordained for this universe. This sort of thought played into my speculations on the Primordial Universe from which this particular universe is shaped.

So, after ascending to God in His Transcendence by way of Creation, that is, by contemplating the Creator of this world, I find myself supporting the views of the Fathers and Aquinas and other Catholic theologians when it comes to God in His necessary Being, a very 'simple' sort of Being. This is hardly surprising and fits in with some statements I made privately to some people at the time my book was first published: what amazed me then and now is the degree to which human thinkers can see ultimate truths even through the glass darkly. Might this be more proof that a well-formed human mind is shaped to copy by way of understanding what God does in bringing about acts-of-being? Sometimes, we can see His purposes though we're not yet prepared to see His ways of achieving those purposes.

## 78 A Review of *Adaptive Thinking*, Part I

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=96>. It was finished and uploaded on 2007/06/27.]

Professor Gigerenzer states in the introduction of Part I of his book [61]:

Computers and statistics have both been used to fulfill the timeless longing to replace judgment by the application of content-blind, mechanical rules. [page 1]

And he's right about the timeless longing. Those are wrong who claim that this longing is modern. Wrongly developed, any philosophy can be turned into a mechanistic and reductionistic view of reality. This is not to deny the importance of a proper reductionism which gives us a vocabulary and concepts to discuss aspects of the whole. An egg can be reduced usefully to gain the language of "yolk and albumen and shell" but an actual egg can't be plausibly discussed as being just yolk and albumen and shell.

Gigerenzer speaks about the hypothesis of Herbert Simon that "a physical symbol system... has the necessary and sufficient means for general intelligent actions" [page 31] and tells us that this general line of thought overthrew the efforts of some to reduce the mind to a Turing machine. For those who don't know about this line of thought, a Turing machine is a surprisingly simple computing machine that is capable of solving a class of problems which includes, from most viewpoints, all the sorts of problems solvable by any computing machine, simple or complex. In fact, there's a large class of mathematical problems which can't be solved by a Turing machine though many of those problems currently being studied can be

solved, theoretically at least, by a machine based on quantum mechanical principles.

Simon and his contemporaries and successors in this line of thought had returned to some sort of dualism using different language. As someone said about the Artificial Intelligent crowd: the soul has returned and now it's called 'software'. It's this sort of view that's opposed by scientists who are, roughly speaking, non-reductionistic materialists. The brain-scientist Gerald Edelman would be a good example, since he's written clearly and powerfully on the philosophical implications of modern neurobiological discoveries and theories. (See *A Universe of Consciousness: How Matter Becomes Imagination* [132], co-authored by Giulio Tononi.) Edelman writes from a view which seems to be roughly that of a Jamesian pragmatism where all our higher knowledge comes from building upwards. I've argued against this way of thought because a world can't simply be built from its parts though that same world wouldn't exist without its parts, but this sort of a view is intellectually defensible and is also properly pious towards most aspects of the universe, failing to see only that it is a universe. The possibilities of a world, a universe ordered to some greater purposes, is not even intelligible in Jamesian thought.

Gigerenzer isn't really dealing with the implications of these sorts of changes in our view of the human mind so much as he's dealing with the root causes of the changes. When our favorite, or perhaps newest, tool is a hammer, everything begins to look like a nail until we grow bored slamming things. Gigerenzer doesn't say this explicitly but certainly implies the truth that the brain doesn't make a very good hammer. Nor does it make a very good computer. Nor is it an organ moved by a soul of the sort which emerged from the literalizations of of some very strange metaphors in pagan thought. Nor is it an intuitive statistician. Nor is it a battleground on which struggle either the reptilian brain against the mammalian brain or the ego against the id.

The human mind can be any of those, in some cases only by way of delusion, but it's not any of those in a fundamental way. At the same time, our views of mind can reshape our own minds to some extent so far as I can see matters, and this as a very dangerous aspect of the flexibility of the human mind. Misunderstanding itself, the mind can misshape itself.

These very discussions are possible only because of the human brain's capability of making a mind which—in principle—can encapsulate the universe or even the world which is, in my writings, the universe seen in light

of God's purposes for Creation. In other words, the human mind doesn't pre-exist as a well-formed entity, though the underlying brain has some well-formed abilities and limitations. The human mind can't be separated from its relationships to external things, to living beings, and—most of all—to God. A truly well-formed human mind is capable of seeing a universe and then maybe a world and capable of forming a relationship with it as well as forming relationships with many things and living creatures and abstract ideas. The mind of that same human being could have been formed to mirror a computer or bureaucratic ways of thought. I'll leave it to the reader to contemplate and fear other and still more horrible possibilities.

Nearly all scientists are well-trained to follow strictly the modern rules which separate theology and philosophy from empirical knowledge. Properly understood, this is a good rule, but it's a methodological rule for 9-5 work-hours and, taken too literalistically, prevents any truer understanding of either the world or the human mind. Any scientists who move on to a deeper, 'philosophical', understanding of their field will find it very hard to escape the boundaries of a pragmatism, Jamesian or otherwise. Even the universe, let alone God's world, will not be seen because only the bottom-up ways of thought and analysis will be seen as legitimate. In my way of thinking, the human mind can't be fully understood without some understanding of its potential to encompass or encapsulate the world. We must have some understanding of the world, of this phase of God's Creation, to understand ourselves.

Gigerenzer follows the rules and speaks little in a philosophical mode and not at all in a theological or atheological mode. To be sure, he's not trying to lead us to a deeper understanding of our mind. Rather does he have that more limited goal of seeing how some particular tools have given modern thinkers ways of describing the human mind. He also seems to be telling us those thinkers were not consciously aware of what they were doing and, in my words, unconsciously literalized some useful metaphors into strict definitions of the human mind.

Gigerenzer also discusses the contradictions and misunderstandings embedded in the analytical techniques and basic assumptions of modern researchers in human thought. He shows that psychologists have been guilty of basic logical errors. For example, many researchers have assumed human beings should engage in Bayesian thinking when dealing with uncertainty and then the researchers have analyzed the results by statistical techniques inconsistent with Bayesian concepts.

Trained in statistics, some scientists saw the human mind as being some sort of statistical processing entity, confusing a potential skill of the entity for the entity itself. Others, such as Simon, were trained in operations research—generally, the use of algorithmic techniques to solve problems—and began to view the human brain as first a fancy calculator and then what we'd call a general-purpose computer.

It's interesting in light of these academic struggles to establish an understanding of the human mind and to make one's own definition the standard that Professor Gigerenzer speaks also of a scientist of integrity who seems to have had some good insights into the nature of the human mind and tells us of the ways in which this man and his thoughts were ignored, though he was allowed a comfortable way of living. The modern world has its own kinder and gentler ways of dealing with those who might disrupt the mainstream mindset and those sorts of rebels have to have a unique sort of moral character to stay the course during a life when they're not even taken seriously, a sometimes more painful situation than the direct persecution that at least acknowledges the importance of the 'heretic'.

Egon Brunswik began his professional life as a psychologist in the fertile intellectual turmoil of Vienna in the decades before WW II. In exile from Nazi-controlled Vienna, he was able to obtain and hold a respectable position at Berkeley, however he was never taken seriously for the rest of his life. Academics, including scientists, are capable of politics as bigoted as those of the average U.S. Senator. And we should remember what Polanyi once told us: Galileo's second and more brutal inquisition was less a religious persecution and more a particularly nasty academic peer-review.<sup>1</sup> It was scientists and philosophers, Aristotelians of a certain stripe, who tried him that second time because of the danger his ideas posed to the ideas which had formed their minds and made their careers. It was an historical oddity of sorts that those particular peer-reviewers were Catholic priests—poor

---

<sup>1</sup>We should also remember that Stillman Drake's reconstruction of some mysterious events during Galileo's lifetime indicate it likely that Galileo's first trial never took place. In that reconstruction, Galileo met with Cardinal Bellarmine who asked him not to discuss the Bible in the context of his philosophical and scientific writings. Galileo agreed and had an unsigned and non-notarized piece of paper to that effect. Drake said that paper was written in Bellarmine's own hand. There is some evidence that Bellarmine was afraid Galileo was reading the Bible in the proper way and the Church in the wrong way and wanted time to deal with the situation. Whether or not that was a good way to handle the situation, Bellarmine died before being able to do much.

men could gain higher educations only through the seminaries because only the Catholic Church had proper resources and had also retained enough respect for education to provide it widely.

That general situation hasn't changed. Advanced degrees and even the possession of an endowed professorship is no sign of an open or flexible mind. We modern human beings aren't really capable of distinguishing between an educated man and a well-trained man. Thus, we rely on resumes.

## 79 A Review of *Adaptive Thinking*, Part II

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=97>. It was finished and uploaded on 2007/07/02.]

In Part II, chapters 4-6 of *Adaptive Thinking: Rationality in the Real World* [61], Professor Girgenzer provides a few arguments towards a view of what he labels ‘ecological rationality’ which he defines as follows:

Ecological rationality refers to the study of how cognitive strategies exploit the representation and structure of information in the environment to make reasonable judgments and decisions.  
[page 57]

While this is reasonable, it doesn’t go quite far enough. He seems to endorse a greater truth when he quotes Roger Shepard:

We may look into that window [on the mind] as through a glass darkly, but what we are beginning to discern there looks very much like a reflection of the world. [*Mind Sights*, R.N. Shepard, Freeman, 1990]

Allowing for differences in the meaning assigned to the term ‘world’, it’s nevertheless clear that some psychologists are starting to see what St. Thomas Aquinas saw 750 years ago: the human mind is shaped in response to its environments. But this shaping process is actually two-fold.<sup>1</sup> The

---

<sup>1</sup>More recently, I’ve separated out the formation of a communal mind, but that wouldn’t much change this review. It’s not greatly inaccurate to think of the communal aspects of our minds to be part of what’s shaped by the responses of an individual to his immediate environment.

process of the shaping of an individual human mind to its immediate environment is possible because the human species has been shaped to specific capabilities, shaped by the responses of our ancestors to their environments and shaped to be able to respond to those sorts of environments or to environments ‘close enough’ in some sense. Professor Gigerenzer is, in a sense, trying to define what ‘close enough’ means in the specific case of analyzing uncertainty.

This is a difficult task to show the mismatch we can create between our natural ways of thought and our presentation of data which is mostly based on models useful for highly-trained academics—even when that data is presented in a daily newspaper. It’s this mismatch that he sees in the results of many psychologists and other researchers who seem to have found solid evidence that human beings don’t think in well-formed rational ways, at least not when it comes to numbers, and specifically that human beings don’t think in Bayesian ways. For those who don’t know much about formal statistics, Bayesian analysis allows us to answer a question like: what is the probability that a woman has breast cancer given a positive mammogram, which might be due to the presence of cancer or it might be a false test result.

On page 122, Professor Gigerenzer notes that “Like his fellow Enlightenment probabilists, [Bayes] blurred the distinction between warranted degrees of belief and objective frequencies by trying to combine the two.” While this is true, many activities in the world don’t have clean statistics as do many medical applications, and even there, initial probabilities for a new technology, or a new disease, might well require such a blending. For example, an insurance underwriter might be able to figure out the size of loss distribution for a new venture, such as commercial research labs in space, but he’ll have no data for the frequency of various sorts of loss, total or partial—none have yet occurred for commercial labs in space. Underwriters in that situation would consult engineers, perhaps surveying them for their best guesses. Some would also bias estimates to produce prices which might draw accounts if they feel that’s a good business to be in for the long run. Others might bias estimates to a conservative level to protect financial assets allocated to this new venture. To the extent possible, actual results would replace those best guesses over time, but sometimes this isn’t possible to any great extent.

In any case, Gigerenzer takes on the medical cases in a clear way, providing us with a frightening picture of the confused information and advice

sometimes provided by counselors for HIV infection tests and also breast cancer tests. This is partly because the information about “chances of having breast cancer given a positive mammogram”, “chances of producing a positive mammogram if she doesn’t have breast cancer”, and so forth are given in the abstract form of probability ratios or percentages. Too often, counselors and then clients are given a set of abstract numbers which seem to say, quite wrongly, that a positive test result indicates breast cancer is almost certainly present. In fact, a positive test result indicates the need for one or more tests, perhaps a different test and perhaps an independent repeat of the same test.

Gigerenzer produces information showing that even doctors sometimes don’t understand and usually can’t communicate what these ratios mean. This is understandable. I took several courses on applied statistics and the theory of probability in college and I found my skills for reading abstract statistical information to be rusty when I was reading these articles.

Professor Gigerenzer contends we deal best, at least most easily, with information of the sort presented to our ancestors in the environments in which human beings evolved. Basically, this refers to the fact that apes can count, though even simple arithmetic skills of the sort needed in book-keeping or filling out tax forms is not really so natural to us. When we’re tempted to be too pessimistic about the ability of the human being to adjust to new conditions in time-spans far shorter than those of evolutionary biology, we should realize that most of us can carry out complicated and ‘unnatural’ tasks such as filling out confusing forms though those sorts of tasks were well beyond most highly competent and well-educated men just a few centuries ago.

In the breast-cancer example, counselors and clients alike can understand the situation far better if they’re given not abstract percentages but rather information in the form:

1. Out of 1,000 women, 10 will have breast cancer and 8 of those will have positive mammograms; and
2. Out of the remaining 990 women, 95 will have positive mammograms.

With information presented thus, most medical personnel can reason and explain that the percentage of women who have cancer given a positive mammogram is  $8/(8 + 95)$ . Or, more directly, 103 of the 1,000 women will

have positive mammograms and 8 of those will actually have breast cancer: 7.8%. This is apparently a realistic example for actual breast cancer tests and a typical population of women being tested. The odds of having breast cancer given a positive result might be much higher for women from high-risk groups, such as some family lines or ethnic groups which carry genes predisposing the women to breast cancer. This can be seen easily by just increasing the 8 to, say, 25. The chances of actually having breast cancer given a positive mammogram rises from 7.8% to 20.8%.

When the data was given in the less natural form of ratios and conditional probabilities, even doctors estimated that the chances of a woman having breast cancer given a positive mammogram would be about 70% rather than 7.8%. There is a very similar situation for tests for HIV infections when the test population is at low-risk for the infection: such as white, heterosexual males. There's reason to believe that some not even infected with HIV may have committed suicide after positive test results when they weren't even infected with HIV. This is not a conclusive argument against having the tests, because they generally screen those in low-risk populations who need further testing. When it comes to high-risk populations, a positive result for HIV usually means that the client is infected. A similar statement might be appropriate for tests of breast cancer in high-risk populations: those women carrying genes predisposing them to breast cancer. The final results of a good testing program should be pretty accurate.

As I noted in my book, (*To See a World in a Grain of Sand* [41]): our minds are shaped in response to our environments but that shaping has occurred both in the evolutionary history of our race and also in the development of a single human being. I'm probably far more optimistic than most evolutionary theorists about the possibility that the human mind has become an entity that can transcend its evolutionary past so that the entire universe can become its true home—at least in principle, though no particular human mind can actually achieve this state, at least not on this side of the grave. In any case, we have to work hard to develop our own minds properly in a complex world and we have to work smart to develop minds which evolved to meet the needs of apish creatures during the New Stone Age. If there is truth in Gigerenzer's research programs on the human mind and also in my philosophical exploration of the human mind, then our thinking is a matter of interaction with our environments or with the universe or world as a whole. We're not computing machines somehow independent of the world and taking in data for that world, data which we

process while isolated from that world, data which leads to understandings of the world which imply there is some textbook to be written which explains that same world. Take the trouble to unbundle the complex interactions of the previous sentence. It not only implies a research program of the sort Gigerenzer is carrying out, it also implies the ways in which we can understand the Creator through His natural revelations and those are ways in which we can also imitate Him.

In any case, we're creating physical technologies, social structures, and minds-capes which are different from anything we are naturally equipped to handle. And, yet, few there are, even among those anxious to be leaders, who will take the trouble to understand the great possibilities and dangers we're creating for ourselves and for future generations.

## 80 A Review of *Adaptive Thinking*, Part III

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=99>. It was finished and uploaded on 2007/07/21.]

In part III (chapters 7-8) of *Adaptive Thinking: Rationality in the Real World* [61], Professor Gigerenzer tells us:

To understand the power of human intelligence, one needs to analyze the match between cognitive strategies and the structure of environments. Together they are like a pair of scissors, each blade of little use on its own but effective in concert with the other. [page 125]

A little later, he states the question he's dealing with in Part III:

Models of bounded rationality address the following question: How do people make decisions in the real world, where time is short, knowledge lacking, and other resources limited?

This is a good question to ask in an era where we've misunderstood rationality, thinking a man to be an autonomous agent whose major relationships to his environments and even his fellow-men are mediated through channels of information. The information taken in by that autonomous agent is then processed and used in logical processes which were mostly developed in recent centuries. Artificial intelligence researchers learned the error in this view of real-world intelligence from a basic robotic experiment conducted decades ago, I believe at Stanford. When they tried to 'teach' a robot to walk across a room by finding ways around each obstacle through

brute-force logic, they found the robot froze, not even able to ‘prove’ it possible to move around the chair immediately in front of it. More importantly, we human beings tend to freeze or react with emotionally induced blindness when we’re constantly presented with moral and social and political problems which we’re supposed to be solving from scratch as if we were moral philosophers developing a new approach to human moral life. This is the reason that all of us should be interested in this sorts of ‘bounded rationality’. We’re not autonomous agents, moral or rational creatures in a free-standing way. Our morality is a result of our interaction with our fellow-creatures, our physical environments, and our Creator.

In Chapter 7, *Probabilistic Mental Models*, Gigerenzer speaks of situations where test-takers are overconfident about their answers to individual questions but have good estimates of the frequency of their correct answers over the entire set of questions. Further analyses indicated that the problem is due to the deliberate selection of questions to correspond to a desired ratio of easy and hard questions rather than using representative sampling from the possible questions. The test-takers were giving their confidence in the correctness of each question as if they were facing a representative sample of questions rather than a set selected to have a higher number of hard questions. By the time they were through the entire test, they gave a better estimate of their percentage of correct answers, Presumably because they’d had a chance to evaluate the mixture of hard and easy questions on the test. As Gigerenzer notes, this implies that a selection of more easy questions than would be expected would result in an under-confidence problem. Other possibilities can arise but this should give a good idea of the type of misunderstanding that can arise when there is a mismatch between an experimental test and the expectations of the test-takers. We think in interaction with our environment and artificial tests which ‘lie’ in some sense about that environment can confuse us in one way or another.

At the same time, we should realize the environment can lie as well. It can generate possible but unlikely situations. It can change dramatically in fundamental ways as it does when a cosmopolitan society develops from a rural society. This raises two possibilities in my mind:

1. We human beings are born already being particular creatures and members of a species well-developed to a specific environment, one which has already passed out of existence for any given population of human beings.

2. We human beings are born as a host of potential beings and members of a species which carries in its flesh a lot of possible responses to a lot of possible environments.

In fact, the truth lies in some combination of the two possibilities. We're flexible to the extent that the human mind is the type of entity capable—in principle—of encapsulating the universe, but no actual human mind can do that though most of us can 'expand' our minds somewhat to imagine possibilities not found explicitly in our environments. There is a problem with not only smallness of mind but also limited flexibility and limited ability to overcome prejudices, some warranted in local circumstances.

In Chapter 8, *Reasoning the Fast and Frugal Way*, Gigerenzer tells us of situations where such effective knowledge is contained in the environment that too much explicit knowledge can actually drop the scores of test-takers. I'll give one simple example to show how this happens. Suppose German students are given a simple test where each question is a pair of American cities drawn from, say, the largest 100 such cities and the task is to say which has the larger population. Those students are not likely to know enough about American cities to be able to rank those cities in strict order of population size. It turns out that there is something called the 'recognition heuristic' which maximizes accuracy in decision-making in this situation.

If you recognize the name of one city and not the other, guess that the recognized city is larger in population.

Suppose you have a few different 'fast and frugal' ways of making possible decisions. You can use them to make the final decision in ways far simpler than the full-blown analyses of the 'classical reasoning' which came out of Enlightenment thought. For example, you can simply make the decision on the basis of the first 'strong' answer you get. Simulations indicate that such 'fast and frugal' methods can equal or exceed the performance of the fancier methods which are taught at Harvard and MIT and are used to manage General Motors and the Defense Department of the United States.

Gigerenzer's way of viewing human thinking processes is consistent with the Thomistic, empirically-based attitudes I've been advocating. In fact, it opens up a new possibility. Instead of our minds having to actually encapsulate the universe, we can instead develop our minds so that they can interact with that universe in a properly responsive way. The universe itself becomes our partner in our thinking and also in our remembering.

## 81 A Review of *Adaptive Thinking*, Part IV

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=100>. It was finished and uploaded on 2007/07/25.]

Professor Gigerenzer starts off the introduction to Part IV of *Adaptive Thinking: Rationality in the Real World* [61] with a strong claim:

The study of human thinking is deeply suspicious of introducing anything genuinely social into the world of “pure” rationality. As in much of cognitive science, most researchers have fallen in love with syllogisms, first-order logic, probability theory, and other systems that abstract and distract from the semantics and pragmatics of thinking, not to mention social motives. [page 199]

Before passing on, I’ll ask the reader to ponder this question: if thinking has no social aspects, then what has rationality to do with morality? In fact, we modern human beings are in the embarrassing position of having our major philosophers claim that virtue, vice, and even Christian views of sin are metaphysically founded while most of our public morality is socially and biologically founded. Virtue must be imposed upon creatures of flesh where neither the flesh nor the social relationships of those creatures are morally neutral. I would argue, and will continue to argue, that morality evolved and reflects the history of life and the physical environments of earth as the oft evolved eye reflects the radiative characteristics of the sun and also the optical characteristics of the earth’s atmosphere.

Returning to Gigerenzer’s ideas, he says this also in the introduction:

Social environments foster different strategies than physical environments, such as imitation instead of deliberation, and demand attention to information that is unique to social interaction, such as cues that could reveal one is being cheated or bluffed. [page 199]

I would qualify this a bit. I think that we might do well by adopting the attitudes of old-fashioned farmers and coming into a communion of sorts with the parts of this world over which we are stewards. We interact with our physical environments and even blend into them in a sense. Though there are some short-term advantages to acting as if we were apart from our physical environments and trying to control them in the way we control pseudo-objects in a video game, we in the early 21st century are maybe seeing hints that our physical environments will take revenge of a sort when we act and think as if our surroundings were just a collection of objects independent of us and subject to our control. Given our tendencies towards unified thought and action, however weak and defective, an overlord attitude towards our physical environments may also spill over into our social and political attitudes, but the more important point is that we interact with our environments rather than standing above or outside them.

Our ways of thought towards our physical environments should reflect our true situation and I think some peoples, such as the Amish, have shown they can respect the trees on their land without turning them into ents or other magically conscious beings. As I understand it, evolutionary biology has supported the anthropological claim, based upon observation of foraging or pastoral societies, that human males in particular are totemic—they are very good at learning how to ‘think’ as if they were deer or bear or fish. Totemism will lead to magic rather than reasonable moral behavior and by ‘reasonable’, I don’t mean rational in the sense of Kant and others of an Enlightenment temperament.

[S]ome have proposed mental modules for intuitive physics, mathematics, and biology—a view that turns academic subjects into domains. An evolutionary perspective suggests that a different division of labor has evolved, one directed at solving important adaptive problems, such as attachment development, mate search, parenting, social exchange, coalition formation, and maintaining and upsetting dominance hierarchies. . . .

The idea of modules, specialized for certain adaptive problems conflicts with the compartmentalization of psychology. Today's areas of specialization are defined in terms of faculties, such as memory, thinking, decision making, intelligence, motivation, and emotion. These faculties have become institutionalized in modern university curricula and grant agencies. [page 200]

Unfortunately, they've also become institutionalized in our basic anthropologies as embedded in our theology and philosophy and history and literature. And, yet, I wouldn't fully jettison the idea that man can abstract across a range of domains to discover some rules of thought. I don't believe Gigerenzer intends to do so either, but some enthusiastic followers might forget that an analysis such as this will correct exaggerations of the importance of abstract thought by using abstract thought as a tool. A balanced view is contained in the claim:

Adaptive problems and their modern equivalents, such as foraging and dieting and social exchange and markets, demand the orchestration of these faculties [such as memory and thinking], and not their segregation. [page 200]

Before reading Gigerenzer, I'd made similar claims. If we are to have any chance of solving our problems, we have to return to our roots, to understand human nature especially in its social aspects. From there, we can enlarge our viewpoint to maybe find ways to live moral lives in our huge, cosmopolitan societies.

A couple of pages later, Gigerenzer says:

I am not arguing against axioms and rules, only against their a priori imposition as context-independent yardsticks of rationality.

In my worldview, axioms and rules—even those of mathematics—are tools set inside of factual stories. They are relationships between specific islands of order which God has raised up from an absolutely infinite ocean of facts. Ultimately, those islands are a setting for a story God is telling, the story which is this world—the universe seen in light of God's purposes. This means that even the most elegant and abstract of mathematics has a sort of ad-hoc nature which can be seen in the multitude of geometries and algebras

which seem necessary to describe the current state of the description of physical reality by mathematical physicists. See *The Road to Reality* [113] by Roger Penrose for an exploration of this universe which uses a variety of mathematical schemes for various aspects of physical reality. The real point I'd make is that the islands are important in being our homes or vacation spots but they're insignificant in many ways relative to the surrounding oceans of factual reality, that is—chaos. The truly difficult tasks of human thought and human adaption to reality deal with those oceans which are factual and, hence, seem chaotic to human eyes and human minds.

In Chapter 9, *Rationality: Why Social Context Matters*, Gigerenzer takes on the goals of rational thought as advocated by modern economists and other social thinkers (he gives Samuelson the Nobel Laureate economist as an example). He provides examples which cast doubt upon the possibility of applying consistency or maximization rules when, for example, social context makes relevant additional choices which are logically irrelevant.

One interesting aspect of decision-making, made by at least 1939 by the psychologist Brunswik, is that animals make certain types of decisions as if they were maximizing in the context of a group. Many scientists assume that because they think of laboratory rats as individuals, those over-bred rodents should act as individuals or else they're being irrational. In particular, if a rat is put in a maze where food is found with 80% probability with a left turn or 20% with a right turn, the rat will turn left only 68% of the time after learning.

The biological example given by Gigerenzer involves coloration where, say, white is usually a better camouflage color because of snow but some years have snow-less winters and black is better. The breeding population minimizes chances of being wiped out if there is always a certain percentage of individuals which have the black color though they will usually be eaten—thus modern theories of rationalization at the individual level, if used by nature, might lead more easily to the extermination of such a breeding population.

Chapter 10, *Domain Specific Reasoning: Social Contracts and Cheating Detection*, starts with a recounting of John Garcia's discovery that rats are not general purpose learning machines. They are wired, so to speak, in some fairly specific ways. His first finding was that rats didn't readily learn to avoid flavored water if it was followed by an electric shock but they did if nausea was induced, even if the nausea didn't hit until 2 hours later. It's easier for rats, and humans as well, to associate tastes with stomach upsets

than with electrical shocks.

John Garcia proved that B.F. Skinner was wrong and that our ‘conditioning’ is specific and not that of ‘stimulus equipotentiality’. Gigerenzer tells us that, for the crime of proving wrong a theory popular with the powers-that-be in the field of cognitive research, Garcia was censored from 1965 to 1979 or so. His papers were rejected by the editors of the journals of the American Psychological Association. Many of those editors were probably the sorts of yahoos who liked to joke about the closed-mindedness of those priests back in the Middle Ages. Every age has its forms of censorship which are exercised by those whose major asset is control of existing institutions. The leaders and followers in those institutions place a high priority on protecting those institutions and their positions and psychological security inside of them. In a similar vein, the historian Carroll Quigley speaks in *The Evolution of Civilizations: An Introduction to Historical Analysis* [119] of instruments forming inside a civilization to serve the needs of that civilization; over time, those instruments stagnate and become self-serving institutions.

Moving on to an example explored by the ‘evolutionary’ psychologist Leda Cosmides, Gigerenzer discusses experiments and evolutionary style reasoning that indicates that human beings confronted with a logical puzzle don’t generally reason well. I’ll not discuss the set-up of this particular experimental test, but I will say that I first let myself answer intuitively and came up with one of the ‘wrong’ possibilities and then I thought about the puzzle more explicitly and came up with the right answer—I was a math major in college and took logic courses and have done a fair amount of casual computer programming in the decades since. Tests with puzzles that imply a social contract with benefits and the possibility of cheating, reveal that human beings will reason as if to detect cheating on the part of test-givers or some third-party described in the set-up of the puzzles. We human beings are altruistic but will try to determine whether others around us are reciprocating or whether they take benefits without reciprocating. Again, this is hardly surprising on the part of social animals which do best in cooperative groups. Our cooperative relationships are far more important to us than formal reasoning—in general. This isn’t to deny the need for some abstract thinkers and for a gradual integration of their insights into the thoughts and habits of an advanced civilization. At the same time, we have to remember most human beings are capable of some degree of formal reasoning and some, such as Einstein, are capable of extraordinary

achievements in formal reasoning. We have to also remember that abstract reasoning is far more important in a complex world in which we often deal with situations or with groups of human beings which are not familiar to us.

In Chapter 11, *The Modularity of Social Intelligence*, Gigerenzer tells us, “Primates appear to manipulate social objects with more ease and sophistication than physical tools.”

In the rest of the chapter, he speculates on the ways in which a modular social intelligence could work. In particular he addresses the problem which confronts much evolutionary reasoning about complex organs or behavioral traits: how could such have arisen from selection processes? The specific answers aren't clear but it's well-known that physical or behavioral traits which originally served one purpose will often be applied to other purposes. A biochemical analogue is the body's frugal use of certain complex chemicals to help neutralize poisons often found in foods we eat and also to help regulate moods by altering brain activity. Certain 'old-fashioned' anti-depressant drugs destroy the ability of the patient's system to neutralize poisons found in aged cheeses and other foods and, thus, those who use those drugs have to avoid certain foods which are harmless to most human beings. By some sort of accidental process, a complex chemical already present in the mammal's body, probably first in the digestive system, was used for another purpose.

While I think Gigerenzer is right that our thinking evolved in 'modules' directed to solving specific problems (distinguishing between friends and enemies, finding proper mates, etc.), I think there is, in fact, a faculty in human beings that corresponds to a domain-general intelligence: our ability to construct morally purposeful narratives. It's those narratives which are the setting for domain-specific forms of intelligence in human beings. The most important question about human intelligence is not how individual modules operate but rather: is there a narrative, a morally purposeful story, both true and accessible to human minds? Is the human mind capable of reaching truths, even if only the contingent truths of this universe? Alternatively, was Pilate right in questioning if there is any truth? In that second case, our intelligence would be no more than a pragmatic and ad-hoc way of surviving and reproducing.

If we are potentially dealing with truths, it would remain true that no particular human mind could fully and truly comprehend the truths of this universe, empirical truths ordered to purposes which can't be seen clearly

unless we could see the universe in its entirety through time and space, but we know that there might well be all the sorts of moral truths in our universe which the Enlightenment thinkers and most of their Christian opponents banished and replaced with abstract truths from their favorite metaphysical systems.

## 82 A Review of *Adaptive Thinking*, Part V

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=102>. It was finished and uploaded on 2007/08/06.]

In the introduction to Part IV of *Adaptive Thinking: Rationality in the Real World*, Professor Gigerenzer tells us:

The “discovery” of cognitive illusions was not the first assault on human rationality. Sigmund Freud’s attack is probably the best known: According to him, the unconscious wishes and desires of the human id are a steady source of intrapsychical conflict that manifest itself in all kinds of irrational fears, beliefs, and behavior. But the cognitive-illusion assault is stronger than the psychoanalytic one. It does not need to invoke a conflict between rational judgment and unconscious wishes and desires to explain humans’ apparent irrationality: Judgment is itself fundamentally deficient. *Homo Sapiens* appears to be a misnomer. During the last few decades, cognitive illusions have become fodder for classroom demonstrations and textbooks. Isn’t it fun to show how dumb everyone else is, and after all, aren’t they?  
[page 237]

Alas, there are political implications even to the results of these dumb tests which show how dumb people are:

Given the message that ordinary citizens are unable to estimate uncertainties and risks, one might conclude that a government

would be well advised to keep these nitwits out of important decisions regarding new technologies and environmental risks.

Given the information that always comes out of archives after the ‘criminals’ are dead, it’s doubtful that even American leaders have been so concerned with the opinions of American citizens as formal American political processes might imply. And I think there are some prominent scientists, in the stem cell research and elsewhere, who paint their opponents as being uniformly dumb people who can’t accept that men and dinosaurs didn’t live at the same time. I’m no historian but I suspect this to be a time-honored way to neutralize opponents to get one’s own way. This is very important issue and one to be dealt with in other places.

Chapter 12, *How to Make Cognitive Illusions Disappear*, is an update of a talk given by Gigerenzer at Stanford University. It’s a presentation, sometimes from a slightly different angle, of material covered in earlier chapters of this book. For example, he argues, based on good evidence and reasoning, that many of the ‘errors’ human beings make in tests of decision-making under conditions of uncertainty, are actually errors by the test-takers. There is good reason to believe that human beings are pretty good at dealing with uncertainty when the information, experiential or given in a staged test, is presented on a basis more consistent with the information we actually find in the real world. One example would be the presentation of statistics on a frequency basis and not an abstract probabilistic basis (e.g., 1 out of 10 instead of 10%). There is also reason to believe that human beings don’t apply probabilistic reasoning in judging single events and he points out that most of the highly regarded theorists of statistics and probability also don’t believe that probabilistic reasoning is valid in judging single events. Only a small, but influential, group of theorists in cognitive psychology, economics, sociology, and maybe some other fields of social science assume we should reason in that abstract way.

Gigerenzer labels much of the statistical work which appears in the papers resulting from these cognitive illusion tests, and many other papers in psychology and medical research and other fields, to be statistical rituals, the result of training students in behavior much like obsessive hand-washing. I found that out once. I helped a friend on a small consulting assignment where she had to analyze surveys from training sessions put on around the U.S. by staff from a major medical school. The participants in those sessions were a non-homogeneous lot, ranging from young technicians to

experienced doctors and nurses. Guess what? Some were bored and some felt taxed by the effort to keep up. The trainers wanted to discover what was going on by having their consultant run some specific tests, maybe t-tests—it was years ago. She asked me to help her run those tests and I returned the advice that they sit down and analyze the survey results along with the bios of the participants after maybe doing a few simpler statistic calculations (such as percentiles summarizing the scale of boredom—the students had given answers on some scale, maybe 1 to 5). The medical school staff members weren't impressed by my advice. Higher level thinking involves some sort of test of a null hypothesis and they weren't about to let any mere math major suggest that such tests are useful—at best—when some very special circumstances are met. One of those circumstances is a homogeneous population or one stratified with a significant number of entities in each cell. Since then, I've become convinced that those sorts of tests, involving null hypotheses and the like, are rarely useful, and never in any situation I'll ever be in.

One question raised in this chapter is very interesting: Is the world stable enough for statistics to be generally useful in most of our (presumably single-event) decisions?

The answer is probably, “Yes,” but the underwriter working on catastrophe coverage for earthquake damage in Los Angeles probably reads a lot of reports and articles by geologists working in that area. Those working on auto collision rates probably keep up on the work of designers in Detroit and Tokyo as well as the data collected from the cars already designed and driven. This is to say that decision-makers should first become experts in finding and understanding useful information. It's hard work to understand and quantify sources of risk or uncertainty.

Chapter 13, *The Superego, the Ego, and the Id in Statistical Reasoning* deals with the conquest of psychology by statistics, quoting Kendall, himself a statistician:

[S]tatisticians “have already overrun every branch of science with a rapidity of conquest rivaled only by Attila, Mohammed, and the Colorado beetle”. (page 267)

Gigerenzer points out that there is one peculiarity about the appearance of statistics in psychology, by which he clearly means to include all work

on human thought even if done by sociologists or economists or artificial intelligence researchers.

In psychology and in other social sciences, probability and statistics were typically not used to revise the understanding of our *subject matter* from a deterministic to some probabilistic view (as in physics, genetics, or evolutionary biology) but rather to mechanize the *experimenters'* inferences—in particular, their inferences from data to hypothesis.

At this point, I think it worthwhile to note that the philosopher Stephen Toulmin once said that biologists speaking of randomness are talking about the complex events which occur when two independent systems interact. In fact, there is an easy way for a physicist to create a series of movements which are random in the sense of being unpredictable. Simply connect the bobs of two pendulums with different periods. You end up with motions which are fully determined but unpredictable in terms of current understandings of mathematics.

Understanding the reason for a system having 'random' aspects may well be even more important than quantifying that randomness. In evolutionary terms, you might have the genes of a living creature as one system and the environment as the other system. The results are unpredictable and form a stream of facts, a natural history. In psychological terms, you have the human mind and its environment. Again the results are unpredictable and form a stream of facts as a human being moves through his life, perceiving and thinking and responding—living. In both cases, you have systems which operate independently in many important ways but they overlap because of their evolutionary history. In both cases, you will probably get better results by untangling the various strands rather than by enclosing the mess in a black box and doing some fancy calculations on what comes out.

Recently, there's been a revolution in the understanding of random numbers that began with some speculations by the great Russian mathematician Kolmogorov and the American high student Chaitin (circa 1965 in both cases). As Marc Kac, the highly regarded measure theorist from Cornell, said in the early 1970s (I quote from memory):

We now know what a random number is—a fact.

So far as the number line goes, Chaitin completed the proof around 1990 and published it as an undergraduate textbook in computer science. What did he prove?:

Every number is random—in a measure theoretic sense.

Now I'll quote from a 30 year-old memory. The professor in my introductory probability theory course told us that all of probability theory can be enfolded in a fully deterministic measure theory with no loss of content. I'll not explain that further. See Gregory Chaitin's homepage [20] for both downloadable articles and information on books by Dr. Chaitin. He and some of his early publishers have made some very good writings available for free download.

If you wish to come to some understanding of what's going on, just ask yourself what the source of random numbers could be under the naive understanding of probabilities and statistics. Oddly enough, that naive understanding is nurtured by gambling examples though it's now plausible to build a computer that could accurately predict a roulette wheel's results with a bit of data from the past results of that wheel. Add a possible visual system and you have a system that could track the movement of every card with perfect accuracy no matter how well it's shuffled. Sure, you could be fooled by a competent conman, but the principle seems clear.

Yet, unpredictability does exist, sometimes in a very nasty form when it's human life or human health on the line. Good statistical and probabilistic methods are very useful. You could say, only partly tongue-in-cheek that probability theory is measure theory motivated by gambling examples. We deal with unpredictability by using good techniques after we use our reasoning skills to properly understand the problem.

Gigerenzer tells us that it has often been hard in recent decades to publish in some of the major journals of psychology unless the paper presents the proper rituals of null-hypothesis testing and then tells us that Sir Ronald Fisher, developer of the null-hypothesis methods, felt that "significance testing was the most primitive type of argument in a hierarchy of possible statistical analyses," and goes on to state the following points of this chapter:

1. What has become institutionalized as *inferential statistics* in psychology is not Fisherian statistics. It is an incoherent mishmash of some of Fisher's ideas on the one hand and some of the ideas of Neyman and E.S. Pearson on the other. . .
2. The institutionalized hybrid carries the message that *statistics is statistics is statistics*, that is, that statistics is a

single integrated structure that speaks with a single authoritative voice. . . [page 270]

I'll leave it to the reader to follow up, if so interested, on the details of this problem. It's important to realize that this idea that there is one statistical procedure to judge hypotheses is equivalent to the assumption that human knowledge will always fit nicely into this one shape. It turns out the gurus didn't make all the big mistakes of the disciples. In fact, Gigerenzer goes on to acknowledge that Fisher in one camp, Neyman and Pearson in the other, went on to develop large toolboxes which at least allows a multiple of shapes for human knowledge. It was the disciples who developed and mandated a single hybrid method for doing statistical analyses of experiments.

The last part of the chapter creates a tongue-in-cheek Freudian analogy of the "emotional tensions associated with the hybrid logic". It's amusing and might well make it easier to understand the relationships and tensions of these statistical conflicts which apparently came frighteningly close to defining what it means to do science within several fields, including psychology and branches of economics and also certain laboratory branches of biology.

Chapter 14, *Surrogates for Theories*, deals with the ways in which academics and others can pretend to think when they're just playing various linguistic games—perhaps even believing they are thinking.

There is one obvious reason why surrogates for theories come to mind more quickly than real theories: demonstrating how a one-word explanation, a re-description, a dichotomy, or an exercise in data fitting "explains" a phenomenon demands less mental strain than developing a bold and precise theory. It takes imagination to conceive the idea that heat is caused by motion, but only little mental effort to propose that heat is caused by specific particles that have the propensity to be hot. [page 294]

If we are rational and moral creatures moving through a factual world, then it becomes incumbent upon us to perceive clearly and to think hard to understand this world and to find any useful or interesting or beautiful patterns in these facts. This is different from applying robotic statistics to data which was generated by some sort of magical randomness. And I would

remind the reader of my comments on randomness, that it is usually what is happening at the interface of two independent, deterministic systems. In this context: 'random' is the ultimate one-word explanation.

Gigerenzer also had an insight into a problem caused by the fragmentation of human knowledge.

Intellectual inbreeding can block the flow of positive metaphors from one discipline to another. Neither disciplines nor sub-disciplines are natural categories. Interdisciplinary exchange has fueled the development of some of the most influential new metaphors and theories in the sciences. . . Territorial science, in contrast, blocks the flow of metaphors and the development of new theories. Distrust and disinterest in anything outside one's subdiscipline supports surrogates for theory. [page 295]

I would suggest that this interdisciplinary borrowing should be across all human intellectual disciplines. In fact, I believe it likely that the more serious and more creative thinkers in all fields have borrowed freely from literature and philosophy and theology as well as from the various specific sciences such as physics and biology, though the lesser thinkers do so quite unconsciously.

And Professor Gigerenzer leaves us with a warning that will probably make little sense to those without knowledge of the history of human thought:

Data without theory are like babies without parents: their life expectancy is low.

## 83 Is Christian Morality a Natural Morality?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=111>. It was finished and uploaded on 2007/10/04.]

I'm thinking my way towards the sort of intentional view of moral nature pioneered by St. Thomas Aquinas. There is a clear explanation of intentionality, a biological concept to match our biological natures, in *How Brains Make Up Their Minds* [35] by the neuroscientist Walter J. Freeman. Sticking strictly to the empirical aspects of this concept, Freeman provides a sharp and plausible summary of the Thomistic position on moral intention. I'll provide a somewhat lengthy quote from his book:

I want to describe a neural basis for goal-directed actions that is common to both humans and other animals because it reflects the evolution of human mechanisms from simpler animals in which intent can operate without will. The concept—"intentionality"—was first described by St. Thomas Aquinas in 1272 to denote the process by which humans and other animals act in accordance with their own growth and maturation. An intent is the directing of an action toward some future goal that is defined and chosen by the actor. It differs from a motive, which is the reason and explanation of the action, and from a desire, which is the awareness and experience stemming from the intent. A man shoots another with the intent to kill, which is separate from why he does it and with what feeling.

Lawyers following in the steps of Aquinas understand and use these distinctions. Psychologists commonly do not. Philoso-

phers have drastically changed the meaning of the term, using *intention* to denote the relations that a thought or a belief has to whatever it signifies in the world, but physicians and surgeons, again following Aquinas, have preserved the original sense in applying the word to the processes of growth and healing of the body from injuries, thus retaining its original biological context. I believe that animals have awareness, but not awareness of themselves, which is well developed only in humans. Self-awareness is required for volition: animals cannot volunteer.  
[page 8]

There seems to be a deep problem here for any claim that there is some natural law which describes the same moral standards as the *Sermon on the Mount*. The problem is that the world is a story where a character inside that story can't see the point of it all yet. From inside the world, we see developments and evolutionary movements which seem to imply much but that much is seen as through a glass darkly. From a natural viewpoint, the purposes of God which would tell the endpoint of the story are often unclear. To see God's purposes even vaguely, we must have faith and a knowledge of Holy Scripture and also of the reliable commentaries upon that Scripture. (There are, of course, those of simple faith but they need reliable teachers and preachers.) For now, I'll just discuss the inadequacy of natural-law reasoning to develop the fullness of the Christian moral belief that remains embedded in much of the political and social and moral beliefs professed in the modern West, though no longer practiced. It's hardly surprising that we no longer stand upon what seem unfounded beliefs—who wants to walk out onto thin air?

I don't doubt the value of natural-law reasoning. After all, much of my efforts are in the related area of natural theology. On the other hand, my efforts are regulated by God's direct revelations especially those which come from the Gospels, from the story of the incarnate Son of God. I can use mathematics and physics and biology to describe the universe as a story centered upon the Son of God, but I can't find a description of the Incarnation or the Crucifixion in the formation of a star nor in the evolutionary story of the human race. True natural law reasoning could see the importance of the instinct found in many species: don't kill a member of your own species. But that instinct isn't absolute, though awfully strong in some species such as the wolf.

I've said it before and I'll say it again: so far as honest natural-law reasoning goes, the virtuous pagans of the Roman Republic and like-minded virtuous pagans in other societies were as good as it gets. Those Romans knew abortion was murder but were willing to abort babies to solve a difficult problem. Being honest and insightful, they knew that laws—such as don't murder other human beings—were strong guidelines rather than absolutes. That's all that we get from nature and from well-developed human reason untutored by revelation – strong guidelines.

That points to the error in those claims I remember from years ago that the *Ten Commandments* were a version of Hammurabi's Code supplemented by a few religious rules. So far as I know, the *Ten Commandments* were the first absolute laws of that sort in history. The prophets, Amos and Isaiah and the rest, emphasized God's raising of natural law guidelines to absolutes as part of their call for the Israelites to re-turn to God. In His various parables, and especially in *The Sermon on the Mount*, Jesus Christ went beyond the prophets to new absolutes. Going well beyond the absolute prohibition of murder, the Lord Jesus Christ forbade us to have so much as a violent thought against another human being. For some reason, many non-Christians of the West have assumed those commandments, so poorly practiced even by believers, are somehow natural—either to be found by difficult intellectual effort or even by untutored exercise of human instincts. It's far stranger that so many highly regarded Christian thinkers seem to make this error.

## 84 Pragmatism and Thomistic Existentialism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=112>. It was finished and uploaded on 2007/10/04.]

In *Meaning and Representation*, Chapter 2 of *How Brains Make Up Their Minds*, Walter J. Freeman has a perceptive and intelligent discussion of the materialist, cognitive, and pragmatic views of the mind and most especially the mind of the self-aware human being. (It's a matter of definition as to whether animals other than human beings, aware but not fully self-aware, can be said to have minds.) And, yet, something is missing in his classification. That something shows in his placing St. Thomas Aquinas in the category of pragmatist. I consider myself a Thomistic existentialist and most certainly not a pragmatist, though I think that pragmatist methods are the same as the 'first-stage' methods of Thomistic existentialism. I've criticized pragmatists, even those that I admire—such as William James or the brain-scientist Gerald Edelman because of the inadequacy of a pure pragmatist approach to understanding the universe. Their bottom-up approach is the proper 'first-stage' to understanding Creation but they refuse to admit it works only if there is a world to meet them, a world in all its unity, coherence, and completeness.

Professor Freeman speaks of our environments containing only representations and not meanings while meanings and not representations are in our minds. Fair enough as a first approximation to understanding the relationship between a human mind and its immediate environments. It can even work as a first approximation to understanding the far simpler but more ambiguous relationship between a well-developed human mind and the universe. The next step upward would be to see the world, the universe

seen in light of God's purposes and this is where the problem arises. This is odd because I'm putting the perception of the more complete entity ahead of the perception of its physical aspects.

The universe wasn't a primary concept in human intellectual history. A world, in the form of a morally ordered cosmos, was seen before Einstein provided a firm description of a universe—all that is bound by a common gravitational field. How could a world have been conjectured before there was any scientific foundation for defining a physical universe? There was only the Cosmos and that was a mess agreeable most of all to Neoplatonists and Gnostics who had romps up ladders to heavens, meeting angelic beings on every rung. (No, don't bring up Jacob's ladder. Like most of the 'strange' parts of the Hebrew scriptures, this was allegorical and not a literal description of some part of this world.)

I'll cut to the chase in this particular discussion of the pragmatic philosophy I admire so much as a great 'almost'. Against that way of thought, I'll state that there is a world and there is meaning in that world. That meaning is inherent in this world which came into being as an object of God's love.

We aren't just bottom-uppers who construct meaning by building our own personal world. We go up from our bottom and find hints of a world which give meaning even to the emptiest regions of space and time. To get best results, we should let ourselves be guided by the Bible and by the Nicene Creed which draws some of the meanings from the story of Jesus Christ and puts them into Catechetical order.

Professor Freeman tells us the world contains 'representations' and meanings are all in our necessarily isolated minds though we can struggle, with some significant success, to communicate our meanings to others and to understand the meanings that others have in their minds. There's enough truth in this that this book can be profitably read to get a clear idea of (almost) what Aquinas really believed about human nature, moral and intellectual. And there's a reason for this: both Aquinas and Freeman are clear thinkers who are willing to subjugate any preconceptions to observed facts of concrete human beings. Both move from empirical knowledge outward towards a world. Unfortunately, Freeman is true to the pragmatic tradition in refusing to acknowledge the existence of a world while borrowing a coherent framework of sorts from the intellectual traditions of the Christian West.

Aquinas believed in a world that had all the meanings put there by God

and his explorations out into that world were regulated by his Christian beliefs. He most certainly didn't believe that a Christian adoring the Body of Christ was looking at a mere representation which required him to construct a meaning. He most certainly didn't believe that every adorer of that Body necessarily had a different understanding of the meaning of that wafer of bread become the Body of Jesus Christ. The meaning is there even when it remains beyond human efforts to render it in human language or human concepts. Our problems with meanings become a struggle to develop the language and concepts to express meanings that lie beyond us—certainly a much different situation than personal meanings in the minds of isolated human beings.

There is also another aspect of the human condition which is closer to Freeman's understanding of meanings: each of us has a role to play in God's story and, thus, we can access a part of the meaning of that story which is not directly accessible by any other human being. Yet, those meanings which are personal because of our perspective are no more, and no less, than a particular part of the story God is telling, the story which is our world, that is, the physical universe seen in light of God's purposes.

Yet, there's gold in those pragmatist hills, far more gold than there is in other modern philosophical traditions. The gold is there just because the pragmatists know to identify hills with gold in them by using their minds to explore empirical reality. Most modern philosophical traditions have taught us there are principles which rise above the mere empirical world and those principles tell us the necessary properties of hills which have gold and the places where gold must necessarily lie. And too many of us follow them and end up digging in hills of sand.

An empirical method, such as that of the pragmatists, will discover the truths which lie in the things and relationships between things in this world created by God. In one sense, Freeman's categorization of Aquinas as a pragmatist is right. The better quality pragmatist thinkers, such as William James and Gerald Edelman and Walter J. Freeman, can be seen as half-blinded Thomists who leave open the eye which sees things and creaturely relationships but leave closed the eye which could see the meaning that is out there in God's story and what it contains. Not seeing the meaning that is out there, they're forced to construct meaning in their isolated human minds.

## 85 Mind: Use It or Lose It

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=102>. It was finished and uploaded on 2007/10/06.]

Here is an interesting quote from Walter J. Freeman's *How Brains Make Up Their Minds* [35]:

The competition for synaptic space is intense, and success in finding and maintaining a connection depends on the synapses being active. If they are inactive, owing to damage or disuse, the connections decay and the synapses disappear. Even the neurons may vanish. The health of neural connections in old age, like muscles, requires exercise. The lifelong growth and the maintenance of active connections provide the basis for learning, remembering, and adapting through modifications of the numbers and strengths of synapses, and they require daily exercise. [page 40]

This book had helped to form my ideas on this subject. So it's no coincidence that I've said similar things from my own perspective.

## 86 More on Pragmatism and Thomistic Existentialism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=113>. It was finished and uploaded on 2007/10/06.]

I continue reading *How Brains Make Up Their Minds* [35] and thinking about the riches to be found in that book. In particular, there is a mother-lode of profound analysis on *intentionality*, a more plausible foundation of moral freedom than the traditional idealistic (or Platonic-realist) doctrine of *free-will*.

Intentionality in the doctrine of Aquinas does not require consciousness, but it does require acting to create meaning instead of just thinking. This view is shared by the philosophers Martin Heidegger, Maurice Merleau-Ponty, J.J. Gibson, and the pragmatists. We sniff, move our eyes, cup an ear, and move our fingers to manipulate an object in order to optimize our relation to it for our immediate purpose. Merleau-Ponty called this dynamic action the search for maximum grip, which is the optimization of the relation of the self to the world by positioning the sense receptors toward the object intended. His conception is equivalent to Aquinas' assimilation. [page 28]

This is true enough, but we should take caution and remember that Aquinas was a priest who daily handled sacred objects, including the most sacred of all—the Body of Christ. To reach out into the world and accept our relationship to the Body of Christ, even to chew It and swallow It, is certainly to assimilate but the meanings which result aren't private, not as defined in modern dictionaries.

From The Collaborative International Dictionary of English v.0.48, 1913 Webster:

- private** 1. Belonging to, or concerning, an individual person, company, or interest; peculiar to one's self; unconnected with others; personal; one's own; not public; not general; separate; as, a man's private opinion; private property; a private purse; private expenses or interests; a private secretary. [1913 Webster]
2. Sequestered from company or observation; appropriated to an individual; secret; secluded; lonely; solitary; as, a private room or apartment; private prayer. [1913 Webster]

The life of Aquinas revolved around the Blessed Sacrament and the act of Communion by which the believer ingested the Body of Christ. This is not an activity of isolation but rather one of coming into a true communion with Christ and with all those others who are also coming into that communion. Meanings come from God and are shared by all those who are His in a special way.

It all begins, even on the natural level, with that active perception so well-described by Professor Freeman, that active reaching out into the world which is acting as much as seeing and hearing and smelling. That active perception leads us to start shaping our mind to correspond to our environments or even the entire universe. And those acts then lead to external responses as we adjust our behaviors to also correspond to our environments or the entire universe. It's when we refuse to act our proper and natural role as intentional beings, when we refuse to actively engage the world, that we sink into privacy as understood in the modern world. Even a non-believer who acts his proper role as an intentional creature will reach out to find a world unified and complete and coherent just because it's a phase of a Creation overflowing with the meaning which come from being an object of the Creator's love.

## 87 Perceptions and Context

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=114>. It was finished and uploaded on 2007/10/11.]

As described in *How Brains Make Up Their Minds* [35], Professor Freeman and his students made an important discovery in the late 1970s: the brain response generated by the same stimulus is not always the same. They trained rabbits to respond to various odors, using sawdust twice in the experiments, once in that latter part of 1976 and then again a few months later. They were surprised at first to see a different brain response. They realized over time that context, including the passage of time, affects the ‘meaning’ drawn from a perception even when that perception seems exactly the same as one from a few months earlier.

Over the course of his text—I’m about halfway through the 150 pages, he’s pointed to indications of the private nature of meaning for any intentional animal, rabbit or man. Most of his points are valid when presented against materialistic philosophies which see simple extraction of ‘meanings’ (what can that word mean to a materialist?) and against cognitivist (mentalist or idealist) philosophies which see meanings as somehow floating about separate from substance—nowadays some idealists in the philosophy of mind speak in terms of information theory. I’m not always sure how to separate those bodies of thinkers since some materialists quickly fall, by way of software concepts, into the information theory school of thought—which is an idealism, even a dualism.

So far as I can tell, Freeman’s arguments, based on actual experimental results, will be very difficult for materialists or cognitivists to handle, if they’ve bothered to try. I wouldn’t expect either materialistic or idealistic (Realist) theories to die down no matter how good the arguments might be in favor of methodical realism, which is one descriptive term for the

general body of thought which Thomism stands upon. In fact, pragmatism of the sort advocated by Freeman and pioneered by William James pretty much falls into that general description of a methodical realism which allows biological creatures to form their minds by interaction with their environments and to maybe move up towards some sort of vision of a world, or just it's physical aspects—a universe. Since this is how our minds are actually formed, this is how we should try to understand the world. In different terms: this is how we should do philosophy.

The sort of pragmatism which follows in the footsteps of James works well at the initial stages of this process where the mind is shaped as it moves out into the world but fails at the higher level where contemplation pulls meaning from what has been learned. Meanings are not constructed in the individual mind in any absolute sense but they are constructed as efforts to discern the meanings which are part of this story being told by God. On the other hand, we do participate as God's servants in shaping the world and, hence, we do participate as God's servants in manifesting meanings in physical reality.

To return to those rabbits: if 'meanings' had to be constructed or if they came through the processes of perception and response to those perceptions, then Freeman would have to be right in his greater claim that meanings are private. Each animal, being differently situated and having different biographies, would construct or extract a meaning for itself for each situation. Any sane thinker would realize there's a lot of overlap in meanings but there would be my meanings and your meanings.

Neurological experiments would almost always indicate that meanings are private because we're characters in the story and we're probing by way of perception and then cognition, probing to discover how the world works and what the world means. It's also true that each of us as an individual has limited information, limited skills in extracting accurate perceptions, limited cognitive skills and motor skills in responding to our environments. We make mistakes in extracting meanings. We have incomplete views biased by our limited emotional and cognitive associations. We also make those sorts of mistakes, and others, when trying to extract simple quantitative information from our environments and that doesn't mean that there is no objective and unimpeachable quantitative relationships out there.

In fact, the mention of quantitative information leads me back to that source of Hellenistic metaphysics: mathematics. Different experiences – as private as they can be, and different abilities and ways of thought amongst

mathematical thinkers don't cast any doubt upon the existence of objective truths in mathematics. At first glance, the objective truths of mathematics seem different from meanings, but I've cast doubt upon that based upon modern understandings of randomness.

What we know as mathematics is an archipelago of islands raised out of an absolutely infinite sea of perfect chaos. (See *God as the Creator of Truths* 7.) Our universe is a story being told with manifestations of truths chosen by God. The meanings around us are those which lie in God's story and in our responses to God and His world. There is a strong element of the 'personal' in all of this but the meanings we discover are not truly private in the sense of being isolated from the meanings others discover. Those meanings are personal, with aspects of the private, because of our limitations and because we have to try to discover most of the meanings in what lies around us.

The world moves on and it can be considered a bit of a mystery story: the key lying on the threshold means something different after the murder of the lord of the manor but it means something different just with the passage of time. It means something different to each person who comes upon it, choosing to ignore it or maybe even failing to see it, thinking it to be damning evidence or merely a sign of the carelessness of that lord of the manor. And it may carry multiple meanings, but all of those multiple meanings are founded in the objective reality of God's one story, however many smaller stories are interlinked within it.

That rabbit which responds differently to the same stimulus, sawdust, at different times is an entity which 'knows' it's in a story. It's trying to always adjust to the flow of events rather than reliving the same events as if it were a song on a cassette tape.

## 88 Persons and Worlds

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=115>. It was finished and uploaded on 2007/10/16.]

I continue to write about the insights on human nature and the philosophical system explicated in the book: *How Brains Make Up Their Minds* [35]. In that book, he tells us:

The examples of the athlete and dancer demonstrate what I consider to be the three main properties of intentionality. The first is unity. Our brains and bodies are entirely committed to the actions of projecting ourselves corporeally into the world, and our perceptions are unified across all our senses at rates faster than we can perceive. Here I distinguish between the self, which is unified, and the awareness of self that we experience as the ego, which is not unified but can be splintered like sunlight on waves. The second property is wholeness: the entirety of life's experience is brought to each moment of action. The experiences of games and dancing are generalized and continually built upon. It includes an effort, described by Aristotle and again by Goethe two centuries ago, as a blind, organic striving towards realizing our full potential within the constraints of heredity and environment. The third property of intentionality is purpose or intent, because, whether athletes and dancers are aware of it or not, their actions are directed to some end.

So perception is a continuous and mostly unconscious process that is sampled and marked intermittently by awareness, and what we remember are the samples, not the process. The fact that consciousness need not enter into the description of inten-

tionality opens a new vista. Consciousness is not a good place to start a theory of brain function. . . [page 18]

Professor Freeman’s three criteria—unity, wholeness, and purpose – correspond rather well to the three criteria I use for defining a world or a person—unity, completeness, and coherence. I borrowed these three criteria from Michael’s Oakeshote’s early work, *Experience and Its Modes* [103]. For these initial discussions, I’ll take completeness and wholeness to be the same and also coherence and purpose.

Freeman talks of these criteria as being, in some sense, the result of “a blind, organic striving towards realizing our full potential within the constraints of heredity and environment.” We move towards that full potential but I see a higher hurdle before those three criteria become realized: we become persons when we belong to Christ and are infused with the Lord’s own Being. Moreover, I don’t believe the universe can be seen as a world yet because it’s moving towards that state but can only reach it apocalyptically, so to speak. Yet, I often speak of it as a world in light of some conjectural understanding of God’s purposes for it.

Though I don’t know exactly how I’ll get there, I’m headed towards an understanding of neurobiology under two constraining assumptions:

1. As claimed by St. Thomas Aquinas, the human mind is shaped by the human being’s responses to its environment. In my interpretation of this principle given modern empirical knowledge, I conjecture that the best possible development of a human mind occurs when he at least dimly perceives something like the universe of Einstein, or at least the Cosmos of the ancients, and then is able to see that physical universe seen as ordered to God’s purposes.
2. As claimed by the Mennonite theologian John Howard Yoder, we must move with the grain of the universe to become Christ-like. This is right in line with Romans 8 [141], where the universe itself is moving towards some sort of redemption, along with our bodies. This universe, this world when seen as a story God decided to tell, is our birthplace and our teacher, not our enemy nor the domain of some Enemy. (Arguably, Aquinas must have assumed this in his claim, but Yoder made it admirably explicit in stronger and more explicit terms.)

These claims are part of the same truth: we are to shape ourselves, most obviously our minds, to the revealed truths of God. First, we need to truly hear God's revelations which come to us from the Bible and from traditional Christian forms of worship and prayer. Second, we need to understand the nature of God's world, in its physical aspects and in the moral trajectory of life on earth.

God speaks to us in the most physical aspects of this phase of His Creation, though He doesn't fully explain His purposes. To talk about the 'moral trajectory', we can understand the evolution of moral nature, especially amongst social mammals, as being consistent with the messages we hear in the Sermon on the Mount and in the story of Christ's mission, suffering, death, and resurrection. Then we must see the biological development of each moral creature, mostly social mammals, as being also on that 'moral trajectory'. Without Christ, the perfection demanded in the Sermon on the Mount would have been absurd—and should still seem absurd to those who don't believe in Christ's divinity. With Christ, modern empirical knowledge about the evolution of moral behavior in rodents and primates can be seen as moving very slowly and fitfully towards that point that lies outside of this mortal world of order and disorder.

## 89 Creating Meanings

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=116>. It was finished and uploaded on 2007/10/31.]

In this chapter, I continue to comment upon the insights found in Walter J. Freeman's *How Brains Make Up Their Minds* [35].

Intentionality in the doctrine of Aquinas does not require consciousness, but it does require acting to create meaning instead of just thinking. This view is shared by the philosophers Martin Heidegger, Maurice Merleau-Ponty, J.J. Gibson, and the pragmatists. We sniff, move our eyes, cup an ear, and move our fingers to manipulate an object in order to optimize our relation to it for our immediate purpose. Merleau-Ponty called this dynamic action the search for maximum grip, which is the optimization of the relation of the self to the world by positioning the sense receptors toward the object intended. His conception is equivalent to Aquinas' assimilation. [page 28]

We act "to create meanings". I go beyond that, following Niels Bohr in believing we create reality. But creaturely creation isn't true creation from nothingness. In fact, once the Almighty had brought Creation into being from nothingness, He Himself began to shape. We have far lesser powers than He has to shape, but what we do seems important to the Lord. And even our lesser powers are given to us by the Lord Almighty who knows the good or bad we shall do.

Later in the book, Professor Freeman tells us:

All that brains can know has been synthesized within themselves, in the form of hypotheses, success or failure, and the

manner of failure. This is the neurobiological basis for the solipsistic isolation that separates the qualia of each person from the experiences of everyone else, and it is the neuro-physiological confirmation of the inductive principle of unidirectionality that originated with Aquinas. [page 90]

This is true but is misleading from the Christian viewpoint simply because the world is more than a collection of objects. The objects of our universe play a role in the story which is this world, the universe seen in light of God's purposes. The clock and the approaching train in the movie *High Noon* are imbued with meaning because of the role they play in the story. The entities in our horror movies and in our real fears when we're alone in a dark wood carry meaning because of the role that certain types of predators play in this world, in God's story. Left handedness has 'sinister' connotations because most men are right-handed and have traditionally shaken hands with that right hand which can more effectively wield swords or knives or stones—a left-handed man can shake hands and still have his best weapon hand free for a devious act. The cross carries certain meanings because of the role it played in Christ's death and those meanings come primarily from Christ's free acts but secondarily from the Roman decision to execute in that way. Each object in the universe is enmeshed in the various webs of meanings which are generated as God tells His story:

- the expansion of the universe beginning with the so-called Big Bang and the consequent birth of gas clouds and stars and galaxies,
- the evolution of life on Earth,
- the evolution of the human race and the development of a brain and the mind it can make, which mind is capable of encapsulating God's world by processes first discussed by St. Thomas Aquinas and, more recently, described in biological detail by various neuroscientists including the pragmatists Gerald Edelman and Walter Freeman, and
- the incarnation of the Son of God in human flesh and His mission, suffering, crucifixion, death, and resurrection.

There's much more though the last item on my list is the most important of all: Christ's life and death and resurrection are the central purpose of

Creation. More exactly, the self-sacrifice of Christ, His ultimate act of love to the Father, is the central purpose of Creation.

In this story being told by God, Father and Son and Holy Spirit, each object is an object of divine love. But I'll retreat a little to matters of physics: Einstein told us we live in a universe. I've extended that claim: the universe becomes a world when seen in light of God's purposes. A world is unified, coherent, and complete.

The universe is one and—moving through time—becomes one story, coherent and complete in a way not possible for a mere collection of objects. We are characters in this story being told by God who is Himself the absolutely dominant character. We can't speak clearly about all of this because we don't have a way of understanding 'cause' or at least a way of speaking about 'cause' in terms that respect revealed knowledge and empirical knowledge or the speculative knowledge (mostly philosophy) that binds them together in a human system or worldview.

We have much work to do before we can find proper ways of speaking about God's world. For now, I'll remind the reader of the first line in the quote which began this posting:

Intentionality in the doctrine of Aquinas does not require consciousness, but it does require acting to create meaning instead of just thinking.

While we need intellectual understanding and coherent forms of discourse, they will emerge—if at all—along with our acts of worship and prayer, along with our acts of community-building and character formation in our selves and our children, along with our acts of feeding the poor and caring for the sick, along with our acts of exploring the world and learning how to use the things and forces of that world in proper ways. These very acts seem to me to tell us that meanings are shared.

In a sense, Freeman is right that meanings are private, just as he would be right to claim that a human mind can't understand this world in which we are born and develop. Aquinas told us that the human mind is the sort of entity which can, in principle, understand this world though any individual mind is incapable of understanding so much as a flea. In a similar way, a human being is the sort of entity which can contribute to the meanings of God's story which is this world and a human being can also, in principle, understand those meanings. The fact that there is an isolationist

aspect to our meanings is a result of the limitations of our individual selves and not a result of an inherent isolationist aspect to human nature, just as our inability to understand the world is a result of the limitations of our individual minds and not a result of an inherent inadequacy in human intellectual nature.

## 90 Shaping Our Minds to Reality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=117>. It was finished and uploaded on 2007/11/23.]

In *The Quantum World* [117], J.C. Polkinghorne speculates as both physicist and teacher:

The wavefunction is the vehicle of our understanding of the quantum world. Judged by the robust standards of classical physics it may seem a rather wraith-like entity. But it is certainly the object of quantum mechanical discourse and, for all the peculiarity of its collapse, its subtle essence may be the form that reality has to take on the atomic scale and below. Anyone who has had to teach a mathematically based subject will know the difficulties which students encounter in negotiating a new level of abstraction. They have met the idea of a vector as a crude arrow. You now explain to them that it is better thought of as an object with certain transformation properties under rotation. ‘But what is it *really*?’ they say. You implore them to believe that it is an object with certain transformation properties under rotation. They do not believe you; they think that you are holding back some secret clue that would make it all plain. Time and experience are great educators. A year later the student cannot conceive why he had such difficulty and suspicion about the nature of vectors. Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality. If we are indeed in such a digestive, living-with-it, period, it would explain something which is otherwise puzzling. A great many theoretical physicists would be prepared to express some unease about

the conceptual foundations of quantum mechanics—in particular, about Copenhagen orthodoxy—but only a tiny fraction of them ever direct serious attention to such questions. Perhaps the majority are right to submit themselves to a period of subliminal absorption.

J.C. Polkinghorne was from the group of theoretical physicists at Cambridge which also included Stephen Hawking. He was a Professor, which is not the same as Professor at an American university but rather somewhat the same as a holder of an endowed professorship. Around 1980, when he was still active as a physicist, he heard God calling and entered a seminary to become an Anglican priest, returning to Cambridge as a chaplain and administrator after ordination. He's a clearheaded thinker in the domains of science and theology.

I just want to emphasize the importance of what Polkinghorne is saying from his personal experience in learning and in educating young scientists. I may well go further than he would support.

We do not come into this life with brains which are some sort of wetware general processors. We don't really process information in the way of a computer or a communications channel. We handle information by reshaping ourselves to what we find when we actively engage what lies around us. Like a totemic hunter making himself one with the bear he hunts, we shape ourselves in some substantial ways to what we find and we can only find what we seek. Learning, in the general and academic senses, is an active process and, moreover, a process in which the mind itself is altered rather than just having new content loaded in. The hunter doesn't think he can become one with the bear by imagining a bear which accords with his preconceptions. He learns how bears behave over his years as a boy and then begins to think as if he were a bear. The astrophysicist doesn't think—not for long in any case—to become one with the Milky Way by building a galaxy as if using an erector set. He studies how the universe really is for many years and shapes his mind around the reality that he perceives. When the hunter begins to understand the bear or the astrophysicist the galaxy, then he can begin to enter the story of that entity, to travel along with it through time.

It all begins with a suspension of conscious efforts, a surrender of the will to the processes of active seeking followed by response to what seems to be there. The mind partially shaped to what it tentatively found moves

again into its environments and responds again. Wash, rinse, and repeat as the cliché goes. By this sort of behavior, both active and a form of surrender, the mind is reshaped, and perhaps other parts of that human being to better accord with reality. You've got to be willing to learn the rules of the game rather than thinking you're entering some sort of game for which you have inborn knowledge of the rules as well as inborn skills that only need the developing. We have inborn knowledge of the general rules of this world, very general skills of the sort needed to function in this world. That's all.

Polkinghorne raises an issue not addressed by St. Thomas Aquinas so far as I know:

Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality.

This process has already gone on for three generations or so in quantum mechanics. Is it possible that there are some reshapings of the human mind so radical that it takes generations to build the foundations before the ground floor can even rise? Or is it just that few there are willing to accept reality especially in an age where we've deluded ourselves to believe we're born as some sort of fully formed 'persons'? How can we be reshaped if we're already fully formed? How can we need reshaping to suit ourselves for lives as hunters or scientists or God-centered human beings if we're autonomous agents who merely make decisions or consume knowledge or experiences the way we think to consume toothpaste?

# 91 A Thomistic Take on Madness and Modernism

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=107>. It was finished and uploaded on 2007/11/27.]

**schizophrenia** a psychotic disorder characterized by loss of contact with environment and by disintegration of personality. [142]

Schizophrenia is a horrible disease, one in which the victim loses contact with reality even in its most immediate form—that victim’s environment. In *Madness and Modernism* [126], the psychologist and polymath Louis A. Sass has proposed that the mental and emotional symptoms of schizophrenia bear eerie similarity to the styles of literature and art and thought in this modern era.

Modern art and literature and thought is, like schizophrenia, “characterized by loss of contact with environment.” Arguably, there is also a disintegration of personality in modern men and women who often try hard to be original and unique and interesting but those efforts fall flat, especially the efforts of those wretched adolescents that we worship as celebrities. We have lost contact with our environments, hence with reality, despite our delusions to being enlightened and open-minded creatures basking in the light of historical knowledge and other forms of disciplined empirical knowledge—science. Our enlightenment comes entirely from inside our minds, and especially from inside the minds of our false gurus, politicians and businessmen as well as philosophers and novelists and painters.

Modern art and literature and thought come from our engagement with our own thoughts and dreams as if they were some sort of higher reality which can be immediately deployed to understand and even judge what lies

outside of us, without further perception of our environments or further development of our minds. We have lost contact with our environments. We don't actively and honestly engage our environments, let alone the greater universe shown to us by modern physics and mathematics or the greater Creation shown to us by the Bible and Christian liturgy and prayer. Some Christian theologians and clergymen lessen the damage to their minds and the minds of their followers by holding to the revealed truth which is our Lord Jesus Christ, but then leave those minds stunted by inadequate formulations of that truth. They insist on adhering to ancient or Medieval statements of the revealed truth which rely on the no-longer plausible empirical knowledge and speculative knowledge of earlier centuries.

I'm returning to lines of thought which inspired some novelistic efforts on my part after reading Professor Sass's book circa 1996. Those lines of thought influenced all the novels I was writing at that time and since then, even when those novels dealt with human characters more sane than those who have formed the modern age—and we should remember that there have been many such sane inhabitants of the modern age and there are still many but those many have been overwhelmed by the self-deluded founders of modern culture and politics.

These old lines of thought are also new lines of thought because I've changed a lot over the past decade and my thinking has matured into an updated version of Thomistic Existentialism. I knew back then that we're physical creatures being born, or still-born, in this phase of God's Creation. Now I know more explicitly that our minds are shaped by our responses to our environments, to our universe, and to God's world. To see God's world as clearly as possible, we should ascend through an honest perception of first our environments, then the universe as seen by the best empirical knowledge of our age, and finally the revelations which are our Lord Jesus Christ.

This is, of course, an idealized schema presented to understand our relationship to God and His Creation. We should be exposing ourselves and our children to 'God-thought' well before any mature understanding of modern empirical knowledge is possible. That understanding will likely come for most only after modern culture, in its popular forms, is impregnated by that knowledge and, right now, modern culture only reflects a corrupted, science-fantasy view of physical science, a morally corrupted and utilitarian view of biological science, and a view of history and literature intended to justify the assumptions and presumptions of the modern mainstream.

Given those heavy qualifications, we should still try to ascend to God through the Almighty's Creation, guided by the Lord's direct revelations, most especially that perfection of revelation Who was our Lord Jesus Christ. At all stages of this ascent, we should be allowing those perceptions to shape our minds. The biological aspects of this process are discussed, in a partially veiled way, in the writings of St. Thomas Aquinas and in a way that will be more clear to modern readers in *How Brains Make Up Their Minds* [35] by the brain-scientist and philosopher Walter J. Freeman. (See Chapter 84, *Pragmatism and Thomistic Existentialism* and several succeeding chapters.) In retrospect, I can see that Louis Sass spoke much of well-developed minds by speaking of minds which failed to develop properly because they were the minds of human beings who failed to forthrightly engage their environments – because of medical problems or because of choices which deform their own minds and moral natures, even their physical selves when we see a physical human being in the context of his environment.

This developmental process begins with active perceptual engagements with what lies around us and continues with an openness to the order in those environments. That openness will lead to a corresponding shaping of our minds. Unfortunately, the process can go on when the baby is born into a perverse society which teaches him to close his mind to love or to empirical knowledge. Openness on the part of the baby will lead him to a state of closed-mindedness.

More interestingly, the process of forming a well-developed mind proceeds as a supplementary process to the major process of forming a human person, a biological creature who is subjected to a higher moral order—the peace of Christ. In other words, he develops towards a Christ-like state of being and that process of development depends more upon participation in worship and prayer than upon 'good intentions' or 'consciousness' in moral decisions. That process of development is better seen as a slow journey to God, one step at a time, than as a sudden conversion based upon some conscious decision. Modern science would even indicate that revival-tent conversions are brought about by heightened hormone levels and irritated nervous systems and the conscious acceptance of salvation follows after the converted one is halfway up to the preacher's dais.

Brain-scientists have proven what Aquinas and some other pre-modern thinkers saw by general observation, what has been denied by the dominant thinkers of the modern world. In modern terms, the conscious regions of our brain aren't involved in our moral actions until those actions have already

begun.

Freeman has speculated quite reasonably that those conscious regions of our brain, and the conscious aspects of our minds, have the power to censor or veto action as it is beginning. I would add, and perhaps Freeman meant to imply this, that our conscious selves can help direct our future development so that we act in particular ways in the future. Moral intentions precede conscious efforts but those conscious efforts can help shape our future intentions by changing our state of being which is the true foundation of our actions.

I think it's obvious that practitioners of modern art and literature and thought share with schizophrenics (as well as those with schizoid personality disorders which are not schizophrenia but share some symptoms) the tendency to lead with the conscious parts of their minds. I think this is a different version of the claim of Sass that victims of schizophrenia aren't mentally incompetent so much as they are mentally over-active. The entire world becomes just so many puzzles to be solved by a finite number of mental rules manipulating mental entities which have doubtful validity in the real world. Modern thinkers, artists, and writers are like schizophrenics in that they treat reality as no more than the source of information to be processed in their over-active, but usually shallow, minds.

It's important to realize that schizophrenics are trapped in their disease while many modern men, at least those who have set the trends of modernism, have willfully chosen to turn inward, relying on their own dreams rather than letting their minds be formed by the reality around them. Schizophrenia is a brutal disease in which the brain's physical activities are deeply disordered in certain ways. That it so closely resembles modern, rationalistic art, literature, and thought seems surprising.

But should we be surprised? Schizophrenics have some sort of neurochemical disorder that prevents them from engaging the world in a forthright way, the first step of shaping our minds properly—that is, shaping our minds in response to our environments first of all, then to the universe as described by the best of empirical knowledge, and then to the world which is the universe seen in light of the moral order which is the manifestation of God's purposes for this phase of Creation. God's purposes relate to His own pleasure in Creation but that pleasure mostly comes from His telling a story in which the Son accepts death as an act of love for the Father and, secondarily, a story in which companions for the Son are born and shaped.

We should be frightened and embarrassed that our minds have been shaped by exposure to art and literature and thought which arises out of the delusions of men who really didn't want to accept the reality around them, either the inadequate, but real, truth of the pagan's Nature or the plenitude of the Christian's Creation.

We are all schizophrenics now.

We all live inside ourselves, projecting our increasingly uniform delusions onto our environments. We decide what reality should be, and then make pitiful efforts to impose our delusions upon the reality of this phase of God's Creation. A neuro-chemical imbalance in schizophrenics. A moral failing in modern men.

## 92 The Ascent of the Human Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=132>. It was finished and uploaded on 2008/02/01.]

Minutes after posting a critique of Pope Benedict in which I claimed he doesn't show a proper appreciation for modern empirical knowledge (see Chapter 18, *The Need for Respectful Criticism*), I received a newsletter from the Vatican News Service in which the Holy Father spoke in complimentary terms about the positive sciences, qualified in the usual ways about the need to consider other ways of knowing the 'being' of a human creature. Some of those ways would also fall into the general category of empirical knowledge and I would argue that all of them begin with empirical knowledge including the physical manifestations by which revelations actually reach us.

In any case, compliments are not what I'd seek in a proper appreciation of empirical knowledge. In fact, I'm more pessimistic than Pope Benedict seems to be about the actual state of the modern enterprises of empirical knowledge-gathering, perhaps because I doubt that we can police the labs to restrict practices to 'moral' techniques. If scientists are as morally disordered as other modern human beings, then powerful technology will be misused when it's profitable to do so. Seemingly decent men and women gain political power and show, or develop, the willingness to drop fire-bombs on innocent civilians to achieve some allegedly moral result. We shouldn't expect better of geneticists or nuclear physicists in this day and age.

I'm advocating a proper appreciation of empirical knowledge as a part of our God-given task of understanding Creation, a somewhat monkish view of science and history and the arts. This task of understanding Creation, even in its metaphysical aspects, begins with empirical knowledge because

of the nature of the human mind and the way in which it develops in interaction with its environments and—if things go well—with the entire universe and—if things go very well—with all of God's Creation in some meaningful sense.

In that address given the morning of 2008/01/28, Pope Benedict, in my opinion, shows a confusion about the nature of the human mind and of our world which has been common over the modern age, a confusion which could be cleared up by reading my first published book, *To See a World in a Grain of Sand* [41], some of the earlier chapters of this book such as chapter 78, *A Review of Adaptive Thinking, Part I* on the human mind or Thomism or pragmatism, or the various writings of Etienne Gilson or Alasdair MacIntyre on the nature of Thomistic understandings of being, morality, or the human mind.

There is a relevant discussion in Chapter 84, *Pragmatism and Thomistic Existentialism*. The pragmatic philosophers from the field of brain-science or mind-science are particularly important and seem to understand at least some aspects of Creation better than those from other schools of thought. These philosopher/scientists include: William James, Gerald Edelman, and Walter J. Freeman. One of Professor Freeman's books, *How Brains Make Up Their Minds* [35], is worthy of serious study by anyone interested in the human mind. In that book, we learn that St. Thomas Aquinas anticipated some of the most important discoveries of modern neurosciences. Freeman is a Thomist, sort-of. He's really a pragmatist who came to understand the power of Thomistic empirical analysis of empirical entities, including man. This seems to have confirmed a pragmatic inclination to develop bottom-up view of reality which has many virtues relative to nearly all other ways of understanding reality. The problem is that it builds up into... nothing much. St. Thomas very explicitly believed that an empirical understanding of empirical things allows us to build up into a world, so to speak. We don't build a world, we build up our understanding towards an existing world. And beyond.

As Gilson points out somewhere, an interesting aspect of the Thomistic methodology is that the student follows St. Thomas in an ascent to an appreciation of Christian revelations (in the *Summa Contra Gentiles*) and then he can circle around and re-ascend with a proper understanding. In fact, we could start from the top and work down (as I believe Aquinas did in the great *Summa*), but I doubt it would make as much sense to a human thinker as the ascent through realms of empirical knowledge. The

previous statement would probably hold more strongly for a thinker from more recent centuries.

In any case, such an ascent, seen as an ascent, provides for a better grounding of the empirical knowledge-gathering enterprise. Believing in a world which the human mind can encapsulate—in principle though not in fact, he could even claim along with St. Thomas: “Things are true,” a claim which can destroy the need for any sort of dualism. This isn’t a renunciation of dualism so much as an attitude that sees no need to conjecture the existence of forms of created being beyond what is consistent with concrete being. This ascent is simultaneously the shaping of a human mind true to its God-given destiny and an effort to understand God’s story which I call a world. We have to remember that this process begins with empirical knowledge and continues to use empirical knowledge in this world and also that this is a true shaping rather than the filling of a pre-existing container. By encapsulating this world and even a greater portion of Creation, the mind leads the entire human being on the path to being a more true person—Christ-like.

Things are true, but perhaps not if they’re not part of a world, unified and coherent and complete. If the universe were merely a collection of things, then perhaps things wouldn’t be true in the Thomistic sense, but in that case we would have no reason to search for reason in that universe. It would be Sartre’s desired nightmare.

The lack of a world is itself the primary problem with pragmatism and its advocates rightly avoid too strong a claim about the truth of things but the good ones—philosophers as well as scientists, such as James and Edelman and Freeman, are forced to act as if things are true. They believe that the facts and theories of their research are true in a meaningful sense and that says something about the objects of their research. A true Thomist has to be naive, accepting the truth inherent in God’s Creation in a child-like way, but he can be conscious of his own naivete. A pragmatist who is scientist as well as philosopher has to be naive in a deeper sense, for the recognition of this assumption of truth in things would drive him closer to Thomism and further from the philosophical thought of recent centuries. To their credit, these pragmatists are already far from the various instrumentalist views of science so common in this day and age.

Things are true. I could even say: Created being is true. I could even say that the thing-like being of our universe, this phase or realm of Creation, bears the imprint of the metaphysical truths from which it was shaped.

Anything that is created by God is a manifestation of His thoughts and the thoughts of the Almighty are true. Things are true. In my writings, I've even claimed that truths as creatures know them are thing-like, that is, they're part of God's Creation and we can't pull them out to use them to construct Creation in a schematic way. We can only take Creation in its unity and coherence and completeness—including all those abstract truths of metaphysics and transfinite set theory.

This is from the press release of Pope Benedict's talk on 2008/01/28:

In our time, said the Pope, “the exact sciences, both natural and human, have made prodigious advances in their understanding of man and his universe”. However at the same time “there is a strong temptation to circumscribe human identity and enclose it with the limits of what is known. . . . In order to avoid going down this path it is important not to ignore anthropological, philosophical and theological research, which highlight and maintain the mystery of human beings, because no science can say who they are, where they come from and where they go. The knowledge of human beings is then, the most important of all forms of knowledge”.

“Human beings always stand beyond what can be scientifically seen or perceived”, the Pope affirmed. “To overlook the question of man's ‘being’ inevitably leads to refusing the possibility of research into the objective truth of being . . . and, effectively, to an incapacity to recognize the foundation upon which human dignity rests, from the embryo until natural death”.

There's a lot of truth in the claims of the Pope but there's no structure that can let us see a unified Creation, first by seeing the physical universe for what it is and then by seeing that universe as morally ordered, hence a world. The structure from the modern (non-Thomistic) Catholic tradition is provided by academic divisions.

That's not good enough and it's one reason for the lack of creativity in Catholic philosophers and theologians since Aquinas was beaten back by willful use of well-developed mental powers to damage respect for the mind.<sup>1</sup> If we wish to recover a sense of the true being of a human creature, we should speak of that being, without any sort of assumption that it can

<sup>1</sup>In the closing pages of *Medieval History: The Life and Death of a Civilization*,

be recovered by way of realms of knowledge maintained by human scholars for good and bad reasons. And we know most truly the empirical aspects of that human being because those are the foundation of a flesh-and-blood creature. The Christian tradition, even to the stories of the resurrected Christ, tell us those empirical aspects remain even when that human being has passed beyond mortal life. Moreover, the doctrine of bodily resurrection tells us the stuff of a resurrected human being is perfected matter and not some sort of soul-stuff.

We have new empirical knowledge that can allow us to speak coherently of heaven and even of resurrected human beings. Rational speech and not mystical obscurantism is the proper way of discourse for those who believe in a rational Creator. New ways of speaking about those greater possibilities must come from a truer appreciation of the modern empirical knowledge of men and their world. We can't just graft traditional understandings of some aspects of those greater possibilities onto the modern understanding of man as a biological creature of this world. New wine must be put in new wineskins and new buildings must be put on new foundations.

By way of an updated Thomistic existentialism, a human mind with a living imagination can even move beyond the boundaries of an envisioned world to see the foundations of Creation, what I call the Primordial Universe, the manifestations of metaphysical and mathematical truths from which God has created this world and the world of the resurrected. To understand a human being is to realize that man best imitates God by understanding the Almighty's work as Creator and that requires the best possible understanding of this world and all of Creation that lies beyond in terms of all sorts of knowledge about Creation, empirical and speculative and revealed. But we can't make the mistake of assuming those sorts of knowledge reflect true realms of being. In the end, there are two true realms of being: that of God's necessary Being and that of Creation. Physics and

---

Norman Cantor tells the story of the war waged against Thomism and related schools of thought. This war was won by advocates of will and despisers of mind, using the tools of formal logic to destroy respect for empirical knowledge, facts and theories which both supported those facts and were supported by them. The most prominent of these philosophers and theologians were Duns Scotus and William Occam. Their importance in helping to shape modern thought can be seen by contemplation of the attitude of that adviser to an American President could claim to create reality, with no need to study existing reality. The President was George W. Bush and the adviser was said to be Karl Rove.

biology and history speak of aspects of a single concrete region in the realm of Creation.

Unlike the pragmatists, Pope Benedict sees much beyond what man's bottom-up research can discover and even beyond the rich and humane culture that is part of the very soul of a man like Gerald Edelman who was a potentially great violinist as Joseph Ratzinger is said to be a serious pianist. Recognizing the greater claims to human nature isn't enough. It's patchwork and not what's needed. We need a plausible, though contingent, Christian understanding of Creation and of that special creature—man. We need to realize that Abraham was descended from a creature also the ancestor of chimpanzees. That is, we need to read Darwin in light of the Bible and the Bible in light of Darwin. We need new understandings of God's infinity and other possible infinities enriched by the understandings of Cantor and his successors. We need new understandings of time and space and matter, new understandings of this concrete and mortal world and of possible worlds of the resurrected, which are enriched by the understandings of Einstein and Heisenberg. The language of the Holy Father concedes too much to the modern views in which, as Spinoza taught us, there are specialized realms of knowledge which represent truly separate realms of being. We need to see a world, other possible worlds for the friends of Christ, rather than interacting realms which are the subject of study for the physicists at the south end of the academic quadrangle, the historians at the east end, and the theologians who are on the other side of the concrete parking garage.

I would advocate a different viewpoint in which knowledge is specialized only for practical reasons, even theology in its study and contemplations of God's revelations of His own Being is entangled with empirical knowledge because we need to understand Jeremiah as a concrete human being if we are to understand his part of the conversation with God—the only side of that conversation we can truly know. Excluding theology, those specialized realms of knowledge are ultimately part of the knowledge of a unified world which has been shaped within a unified Creation. By knowing Creation, we know God in His freely chosen role as Creator and we can know God in His transcendent plenitude only to the extent that He tells us about Himself in His necessary Being—that's where theology is enriched beyond pantheistic possibilities. The main point in this context is this:

At some level of knowledge explicitly inaccessible but imagina-

tively accessible to the human mind in this mortal existence, Creation is one. It is unified and coherent and complete in being all that God chose to create, all that is not Him. It's unified because it's the work of a unified Creator just as it is coherent because it's the work of a rational Creator.

To know of God's purposes for this world is to know more about His creatures, the universe in its own nature and also stars and planets and men. It's not to know something completely different. To know of man's soul-like characteristics is to know something more about a creature of flesh and blood and not to know about something completely different and separate from those brain-cells and platelets.

The human mind is the only known creaturely entity capable of this task of knowing more, of encapsulating the world and much of Creation beyond this world—in principle though no actual human mind can carry out such a feat. The unity of Creation implies a unity of the human mind which reaches its richest and most complex shape in encapsulating some reasonable view of God's Creation. This doesn't mean that we have to really know the truth about Creation, only that we need to do the best we can with the small stock of revealed truths we have and with the best empirical knowledge of our day. By cooperating with the Creator in this way, we can establish a relationship in which we have access to a deeper and more contemplative knowledge of Creation. And this applies also to Wordsworth's way of knowing Creation and Mozart's way of knowing Creation. It's not only Plato and Augustine, certainly not just Cantor and Einstein, and not even just Aquinas with his more complete way, who can know Creation at the truest and highest level where wisdom can be found and where we can see hints of a more perfect form of knowledge. But all of these ways of knowing Creation ascend through empirical realms, not by way of super-adding knowledge of other realms. That is, the path which begins in the empirical realms leads us deep into the unity and coherence and completeness of Creation. More than that, the path and the knowledge of the path aren't separate.

We need to move away from Spinoza's way of knowledge in which specialized ways of knowing define actual realms of being which can communicate but are separate in a fundamental way. Moreover, Spinoza had started with the more traditional error in which knowledge is separate from what is known.

Creation is unified and coherent and complete because it's what the Almighty has brought into existence, what is not God, what He chose to love in an active way. God's acts-of-love are acts-of-being. There are acts-of-being which brought some sort of raw stuff into existence from nothing and there are acts-of-being which shape stuff into worlds – our mortal world and that of the resurrected. The various ways of knowing lead us to the Creation which is the one work of God the Creator, or else they lead nowhere. But they can lead to Creation because knowledge and what is known are one, a truth found in the Old Testament most clearly in its language of sexual intercourse—to know a woman is to bond with her in a physically intimate way though it's still more than that. To know a woman who is your wife is to know her in her own self and in the roles she's taken on. To know that woman is to be able to respond properly to her.

To know the history of ancient Rome is to shape your mind so that it achieves something of a oneness with that narrative. To know chaos theory is to shape your mind to be a model of equations sensitive to tiny changes in initial conditions and to shape your imagination to travel along orbits that never quite close, never repeat themselves.

Do we have the courage to make a truly radical change that we might return God's Creation to its primary status over knowledge defined by the limitations of the human mind? Do we have the discipline to make sense of quantum mechanics, of transfinite set theory, of the Holocaust, of the schizophrenic artistic techniques of recent centuries, in light of Christian truth? Are our imaginations flexible enough to see possibilities beyond the wildest dreams of Plato or Philo or Augustine and yet sane enough to see what God has created rather than conjuring up something less demanding?

## 93 Faith, Reason, and Reality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=149>. It was finished and uploaded on 2008/05/06.]

The usual mantra amongst Christian thinkers is faith and reason, implying that faith should be united to and disciplined by products of the human mind. The problem is that Christians are bound to believe that God was not only free to create or not, but also that—once He chose to create—He could have brought into existence any of an infinity of Creations. Creation itself is contingent and assuming that the reason appropriate to a contingent Creation is itself necessary across all possible Creations is not so good a bet as Plato might have thought. In recent centuries, we've learned that mathematics, taking a very fundamental field of reasoning, is far richer than we would have thought. Perhaps it's odd to us, but proper attention to a very particular and very concrete universe allows us to abstract to very rich and very complex levels of . . .

Dare I say that we should speak of abstract forms of created being? Dare I say we can reach those abstract forms by proper development of the human mind?

In any case, modern empirical knowledge and the experience of gaining that knowledge indicate strongly that human reason learns even absolute truths by responding properly to human environments. This is one way to make this point:

While the Greeks gave us many truths, we have to remember that their metaphysics was developed in parallel to a Greek mathematics which has proven to be true but only a small part of the mathematics which we now know. This implies that our understanding of human reason should have expanded to

a corresponding extent rather than being restricted to what was taught by Plato and Aristotle.

There is a third element which could be usefully added to faith and reason—reality. This is to say that we are made so that we can know Creation but this knowledge, including the rules for gaining that knowledge, aren't inborn. A human baby has enough inborn inclinations and skills to help her start learning how to see the world properly, enough inborn inclinations and skills to help her start learning how to hear sounds as signifying various things and carrying emotional information. Eventually, as she learns how to think, she'll also start learning language in its more uniquely human aspects.

As St. Thomas Aquinas realized: our minds form in response to our environments. William James and similar thinkers amongst brain-scientists (such as Gerald Edelman and Walter J. Freeman) have rediscovered this truth, first seen by St. Thomas Aquinas in the 13th century. In 2000, Professor Freeman published *How Brains Make Up Their Minds*. Part of this book was an explanation of Thomistic teachings on human moral nature and a related discussion of how these teachings can be used to deal with the strong evidence that human beings don't have the sort of free-will we imagine. In many experiments of simple decisions made under lab conditions, the unconscious brain regions associated with 'mere' bodily control start to move our bodies before there's any sign of activity in the regions of the brain associated with consciousness. Our feelings of moral freedom are real and so is some sort of moral freedom, but we need new ways to speak and think about that freedom. You can read how I deal with the 'loss' of free-will in Chapter 385, *Is this evidence against free-will?* or—in a larger context—in Chapter 75, *A Proper Sort of Reductionism..*

The Jamesian pragmatists have a major gap in their understanding of the formation processes for the human mind. Lacking a specific faith in this world and its rational Creator—or at least an expression of such in their theories, they think of the formation of the human mind entirely in bottom-up terms. That's not usually a practical problem in understanding specific aspects of the human mind because our minds first form by this bottom-up bootstrapping process, but there is a further process of development of the mind, one that can be seen in the life-stories of the great philosophers—pagan as well as Christian or Jewish—as well as in the development of the minds of numerous saints, scientists, novelists, musical composers, charita-

ble workers, and many others who are active, physically or mentally, to an unusual extent.

In one way or another, those thinkers and doers come to perceive, however dimly, a world in its unity and coherence and completeness. The top-down process begins with that dim perception and the formation of the corresponding mind moves into a different phase. That thinker or doer begins to perceive a world, that is—the universe seen as a morally ordered narrative. His thoughts and actions begin to move along with those purposes. He begins to move with the grain of the world. It's true that you don't need to have a detailed understanding of the structure of wood to move with its grain, but you also can't refuse to see that grain as clearly as possible. Blindness, total or partial, isn't a desirable condition.

The limited *faith and reason* view of human thought and action can lead us to be blind to our age's best empirical knowledge and this can deform our reason. Aquinas could be a great empirical thinker without knowing about genes or quarks but a modern empirical thinker has to consider them or else he slips into a sort of intellectual psychosis which leaves him imagining that he inhabits a different world than his more sane contemporaries. See Chapter 91, *A Thomistic Take on Madness and Modernism* for speculative claims that a form of psychosis has infected the modern mind.

In fact, what has happened in recent centuries is that Christians haven't enlarged their understanding of God's Creation to consider an extraordinary enriching of our understanding of mathematics and the physical foundations of this universe nor have they considered the somewhat darker enriching of our understanding of human nature which has come from history as much as from the brain-sciences and evolutionary biology.

Our mainstream culture is one of reason and reality but that reason is formed by borrowings from the Christian and pagan past and reshaped to the needs of understanding a reality seen without the eyes of faith. Many Christians, especially those over 50 and clergymen of all ages, live in a world of faith and reason but that reason is borrowed from a Christian and pagan past.

We need not *faith and reason*, but *faith, reason, and reality*.

## 94 Computer Programming and Thomistic Theories of the Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=152>. It was finished and uploaded on 2008/05/17.]

In Thomistic thought, the human mind begins to shape itself in response to the immediate environment of that human being. Various perceptual, mental, emotional, and social skills develop as a human being responds so that he can function well within at least his immediate environments. That human being may enter other environments to which he can respond, enriching his mind and even other components of his body. After all, many of our skills are in our fingers and our legs and not ‘just’ in our brains or minds. You can think of Vladamir Horowitz or Fred Astaire but you can also watch the typing skills and response times to screen events of many skilled programmers.

If all goes well, that developing human being may become aware of the universe, or the Aristotelian Cosmos if he was born in prior centuries. If all goes still better, he may become aware of that universe as a world, a moral narrative ordered to the purposes of God. As that shaping process matures, his mind becomes an encapsulation of that totality but still mostly functions in his specific environments.

What does this have to do with programming computers? A lot to this quite amateur programmer because I work best with computers when I’m able to play around at bottom levels, building up specific skills and tools before I move to a top-down design of one of my small and simple projects.

The experienced programmer can probably see where I’m headed – towards exploratory programming using a language with ‘functional’ aspects but more general capabilities. My favorite such language is Common Lisp

though I also do some programming in Emacs Lisp, the extension language to Emacs, which is my editor and calendar/diary/planning tool and much more. I've also programmed in Perl and other languages, beginning with card-punched FORTRAN back in the mid-1970s and going through BASIC, PL/I, APL, and SAS matrix language, before I hit GNU-Linux and found a variety of 'dynamic' languages. At that point, programming became a sometimes fun diversion.<sup>1</sup>

Recently, when I got the hang of exploratory programming, I was just working on a simple check-balancer. I had decided it would take more time to learn how to use a modern financial software package than it would to write the simple pieces I need and expand gradually as new needs arise. And those bloatware packages would force me to do things differently than I want to do them. Using this project as a learning experience and a form of mental play, I took my time in the early stages of that check-balancer project and found that the lisp experts were right. I'd soon enough written a lot of little functions to read my personal data files and to retrieve specific values on one or more records, to manipulate dates for easy comparison, to test if a record was a deposit or balance, etc. At some point, I moved to the top and found the balance functions and functions for reporting on important information were easy to write. And they had a different feel to them than earlier versions I'd written in a standard imperative style—in both Perl and Common Lisp. They were cleaner though undoubtedly not 'lispy' enough for a professional.

This was a toy program by the standards of real programmers, though I might expand it into a class-oriented program that handles a broader variety of financial information, but it's been a fun learning experience, especially since it seems to confirm my biases about the best way to develop complex mental structures, a mind or a computer software system. They aren't the same, not even the same sort of entity, but they're similar in certain interesting ways. Yet again, the experience probably has enriched my mind and what I learned has probably changed the way I think in general.

Build tools and skills from the ground up and then you'll be ready to build the more grandiose structures, whether it's a computer system, to

---

<sup>1</sup>As of March, 2011, I've given up programming as a hobby and write only very short programs in a shell language or Perl—which actually is similar in some important ways to lisps. In any case, I do stand by this essay despite the change in my priorities. You might say I've decided to take up novel-writing once again as my major hobby and that crowded out other activities.

perhaps do accounting and financial analysis, or an important component of the mind, such as what I call a worldview, a specific and disciplined philosophical and theological system which attempts, within mortal limits, to provide a way of seeing a world, that is, of seeing the universe as a morally well-ordered narrative, ordered to God's purposes.

Serious software systems and serious systems of thought aren't toys. Though sometimes fun to work on and usually fun to finish, they require hard thought, creativity, and disciplined effort if they are to be worth much. If those requirements are met, even a failed effort can be worth much, leading to better results in the future, at least to the persistent programmer or philosopher.

Certainly, this movement between bottom-up construction of tools and skills and the top-down schematizing isn't just for intellectual fields. My father was a highly skilled mold-maker. When he was given a design and specs for a new mold, he would first study that paperwork and then he would start constructing jigs and other specialized tools. He would build up to the point where he could re-examine the design and specs and make his plans for the actual machining of the very expensive block of mold-quality steel.

The Thomistic view of how the human mind develops corresponds quite well to the working methods of skilled computer programmers, though not necessarily to the working methods of those poor souls who sit in warehouses blindly coding towards a goal they may not understand and aren't allowed to explore. They may not even know in a general sense what that goal is. That Thomistic view of the mind also corresponds well to the working methods of a skilled machinist, but not necessarily to those of a worker feeding stock into a computer-controlled milling machine. Nor does it correspond to the increasing number of engineers who 'understand' top-down without having any machining skills or the most rudimentary of electrical installation skills. In recent years, MIT has had remedial courses to teach their electrical and electronic engineering students the basics of wiring simple outlets and switches. Even when I was in college, 1973-1977, the mechanical engineering department at the University of Rochester had a lab to help students put together simple structures such as rigid, house-like frames. Not many decades before that, most engineering students came from farms or from families involved in blacksmithing or such fields. Those students wouldn't have needed to know how to build a box-like frame which could stand up to winds or minor settling of the ground.

Explore from the bottom, from the details, building up mental skills and

metalworking skills or animal husbandry skills, and then start to organize from the top, speculating on a worldview or a way to write programs that write programs or a way to machine a complex machine or a way to organize a self-sustaining chicken farm that treats the chickens as living creatures. Then you can return to the bottom to improve your skills and tools once you know better what is needed. At that point, you should return to the bottom and then go back to the top repeatedly as part of a dynamic way of dealing with dynamic environments and with a dynamic universe. As programmers say, following the lead of hair-stylists—lather, rinse, and repeat.

# 95 Reality Continues to Knock on the Door

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=155>. It was finished and uploaded on 2008/05/21.]

See *Exploring The Mechanics Of Judgment, Beliefs: Technique Images Brain Activity When We Think Of Others* found at <http://www.sciencedaily.com/releases/2008/05/080515212112.htm> for news on another major effort to understand the physical human being in ‘scientific’ terms. I don’t put scientific in apostrophes because of any intent of misguided irony but only because we should realize that ‘science’ is disciplined intellectual effort, exploration and contemplation of the world. It includes the disciplined study of music and literature and history and many other fields of disciplined study. If we think of it in terms of discipline, all meaningful fields of study are ‘scientific’.

Yet, I wouldn’t at all slight the importance of those fields we usually call ‘science’, such as biology and physics. We’re mortal, physical creatures. What we are in these mortal bodies subject to decay tells us much of what we will be if raised in perfected bodies no longer subject to death or decay. Why not try to understand us? And we have to remember that ‘us’ is defined in context of this world of black-holes and rattlesnakes. We should try to understand this entire world if we’re to fulfill our roles in Creation, and it’s a role which allows us to develop our minds so that our understanding mirrors God’s acts of creation and shaping.

The article referenced above tells of a systematic effort to make greater sense of the ‘mind-like’ aspects of the human being by studying the underlying physical events in the brain. I gather this is intended as a more general effort, one needed eventually though only time will tell if that effort can

achieve success in this generation. By more general effort, I mean that the leading scientist apparently intends to study not just specific phenomena but rather the more total experience of 'being human'.

So far, all mental or emotional aspects of human nature which have been seriously studied have been tied back to underlying physical events so that causation is implied and not just correlation. At the same time, those not familiar with the writings in this field should know that the best thinkers warn not to limit the scope of what is studied as human nature. A greater understanding of mind should consider not only what Einstein and Melville did, it should also consider what Horowitz did at the keyboard and what Orr did on the ice. The entire physical human being, including toes and liver, will have to be understood to understand the 'mind' and to understand the various kinds or aspects of 'intelligence'.

In Chapter 8, *Staking Your Faith on Gaps in Empirical Knowledge*, I wrote of the dangers of pretending the new empirical knowledge doesn't affect our views of our selves and even the meaning of salvation. However distorted and even ideological the mainstream presentation of modern empirical knowledge often is, there is enough good stuff 'leaking' out through through magazines and the Internet and even the movies to let our children and our neighbors know when we're speaking in terms that are in conflict with modern knowledge of human evolution, human nature, human history, and even modern physics. Actually what they know is that we're speaking some sort of gibberish. (See Chapter 220, *Could Adam and Eve Have Made Christ Unnecessary*, for a Christ-centered critique of the 'usual' interpretation of that Biblical tale.)

I've also spoken in Chapter 91, *A Thomistic Take on Madness and Modernism*, about the psychotic, reality-denying, aspects of modern human thought in all fields. When we start creating separate realms of truth, living our lives by the standards of modern empirical knowledge when we wish to take advantage of medical technology and then speaking a conflicting language when we speak as Christians, we nurture in ourselves a mental condition similar to schizophrenia and produce words and lives frighteningly similar to what can be seen in modern art in its disordered worst.

Why would we do this? There's a current cliché, "Math is hard, Barbie" that communicates the idea. More generally, "All serious learning and thinking is hard" and we'd rather watch TV and pursue careers that allow us to recycle thoughts and skills than go through the difficult and unsettling effort to move creatively in a age which truly presents us with a sometimes

rapidly changing menu of problems and opportunities. Rapid change takes away all possibility of coasting.

## 96 Creating Human Worlds of Knowledge

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=156>. It was finished and uploaded on 2008/05/28.]

Every so often, I'll review my own long-range goals for developing a more complete worldview. The term 'worldview' as I use it is first an empirical understanding of this physical universe and then a more complete understanding in light of God's purposes as best I can understand them in light of Christian teachings, my own readings of the Bible, prayer, and worship. If I don't review those long-range goals once in a while, I might well lose focus, perhaps because of my nearly complete intellectual and spiritual isolation as I go about a task I consider necessary for Christians to be able to understand God's world in empirical terms. So, here goes...

In the blurb he so kindly provided for my first published book, *To See a World in a Grain of Sand* [41], Stanley Hauerwas (see article on Professor Hauerwas at [http://en.wikipedia.org/wiki/Stanley\\_Hauerwas](http://en.wikipedia.org/wiki/Stanley_Hauerwas)) said, "Loyd Fueston may be our Spinoza." (See article on *Benedict Spinoza* at <http://en.wikipedia.org/wiki/Spinoza>.) I didn't understand that comment at the time, not having read any Spinoza and not knowing much about him, but I've discovered one reason that I might be "our Spinoza" where "our" would refer to Christians. Spinoza played a major role in breaking up the unity of human knowledge, creating the sorts of attitudes that led to our modern academic disciplines, where specialization isn't just a practical response to the limitations of the human mind and the shortness of the human life but rather a claim to a fragmented universe which is to be described only by disjoint realms of knowledge.

If human beings are truly images of God in any sense, then ultimately,

human knowledge and reality are equivalent, that is, the proper and ideal human mind is an encapsulation of the world which is a manifestation of thoughts of God, including those which are His purposes for Creation. This means that a real human mind can't actually encapsulate the world without the gift of a share in the divine life, but we are capable of sharing that divine life just because our minds are the sorts of entities which can—in principle – encapsulate God's world, understanding in imitation of His acts-of-being. (I think this tells us the way in which we can be images of God. As a child at play imitates her mother at work, we can imitate God in His contingent acts as Creator.)

Without an idea of at least a universe, the physical aspects of a world, the mind, even from the viewpoint of only empirical knowledge, is little more than a bottom-up probe of reality, which probe can't really reach any level of ultimate truth because it's blind to the very existence of truth beyond the factual truths derived from studying individual entities. At the same time, we have to remember that such a bottom-up probe, in the form of an active engagement, is the major process by which the human mind forms starting in infancy. We can see a world in a grain of sand, poets earlier than philosophers or physicists, but we have to first see that grain of sand and understand its relationship to beaches and to healthy soils and to that irritated feeling in our feet, before we can see a world in that grain of sand.

# 97 Math is Hard and Math is Lonely

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=149>. It was finished and uploaded on 2008/06/09.]

The American public school system is oriented towards the socialization of students into a homogeneous body of mainstream Americans. Education beyond what's necessary to read public newspapers is quite beside the point. This socialization, brainwashing if you will, takes place in private conversations involving only students as much as in the sheer deadness of mind imposed by drill-techniques and by the use of textbooks deliberately aimed to be in the comfort zone of the typical student. The empirical results hint that such a process will lead to a constantly contracting comfort zone and a subsequent decay in standards over time. Any student who might actually learn something is going to mostly learn to hate learning, at least formal learning, in such an environment. A little thought will indicate why Albert Einstein was both a good student and a rebellious student—this is a sign of giftedness as opposed to modestly talented pliability of the sort which opens paths right to a doctorate and a professorship.

I can remember not only being lulled into a laziness—I expected to go to college and do well while continuing to not study and to sleep through classes. I can also remember being trained to be a television watcher by peer-pressure. It was difficult to participate in most conversations unless you followed pro sports (which I did willingly in those lower-key days), rock-and-roll, and the hit television shows. So I cut back on my reading and watched the *Monkees*. So I slept through classes that were little more than efforts to keep the attention of students not interested at all in reading or arithmetic and to help the students of some middling talent. So I learned

to drop my effort level and to coast in my intellectual efforts.

I learned to try to at least mimic the open socializing of the students who are more pleasant to have in modern classrooms. I can remember that the movement from classroom to classroom starting in sixth grade was upsetting because my ability to concentrate was still strong enough that sometimes, in mostly seventh grade, the teacher had to yell at me to bring me out of my contemplations of interesting matters, including often something I'd found interesting in a later section of a textbook, a section we wouldn't reach in class. That truly was one the aspects of the socializing process of the American public school system. The teaching methods and the sheer logistics of processing large herd of human cattle on the hoof leads to the destruction of concentration and intensity on any students who are so inclined.

I'll put the problem bluntly: students who are paying attention to the teacher or fellow-students aren't necessarily learning. Math is not only hard, it's also lonely for the most part. So is real history which requires immense hours of simply reading good history books and even primary sources such as the autobiography of a great man—I remember reading sections of the autobiography of Benjamin Franklin and enjoying it when I was young.

Now, scientists have verified part of this problem for school systems that want pliable students attentive to their teacher and fellow-students rather than students capable of learning difficult material. It seems that serious thought, serious digestion of difficult material requires concentration of the sort that forces the student into a temporary non-social state—see *Knowing Looks: Using Gaze Aversion To Tell When Children Are Learning* at <http://www.sciencedaily.com/releases/2008/06/080602103336.htm>, which is what I just said based on my personal experiences. Truly talented students, the ones who might actually be able to find solutions for some of the difficult problems on our growing list of technological and cultural disasters might well go into strange, inward-looking states for hours at a time—if they were allowed to develop their minds and their souls.

I don't wish to cast aspersions upon public-school teachers as a group because many of them are dedicated and hardworking souls who care about their students—though I think we should be more concerned to have at least some teachers who care a little about the subjects they teach. Imagine a dedicated, hardworking teacher in front of 35 students, some of them not having even basic habits of self-control and others (especially boys in younger grades) not having proper hand-control for writing legibly even if

they can read, some not having much in the way of intellectual talent and others having too much energy to sit still long enough even if they come from good homes. Is it possible that teacher won't notice that little Albert with the downcast eyes is daydreaming about deeper meanings and further possible uses of the very material being taught? Is it possible that this little Albert, unlike the more famous rebellious student, doesn't have an engineer uncle to help develop his mind by teaching him Euclidean geometry at a young age? Is it possible that this little Albert has to be disturbed so that he can move to a new classroom or pick up a new textbook, destroying his own instinctive efforts to develop the concentration that would allow him to handle difficult and important problems?

## 98 Matching Information to the Human Brain

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=168>. It was finished and uploaded on 2008/07/01.]

In my reviews of Gerd Gigerenzer's *Adaptive Minds*, beginning with Chapter 78—*A Review of Adaptive Minds: Part I*, I discussed Professor Gigerenzer's analyses of the 'discoveries' in the latter half of the 20th century that human beings don't think very clearly. Economists and psychologists and others tested the common folk and supposedly discovered they don't understand uncertainty and don't deal well with it. If true, this would indicate that human beings don't know how to deal with the real-world, a surprise to be sure. Professor Gigerenzer showed that human beings generally don't deal well with uncertainty expressed as percentages but they do deal well with uncertainty expressed as frequencies (such as 6 out of 100). As he explains this is closer to the form in which experience would have presented itself – about 1 out of 2 babies are male rather than 50% are male. Percentages, ratios in general, are a relatively recent development in human thought and haven't yet fully found a home in the human mind – if they ever do.

Now we learn that miles per gallon isn't a good measurement for making decisions on car purchases or car use—see *Gallons Per Mile Would Help Car Shoppers Make Better Decisions* found at <http://www.sciencedaily.com/releases/2008/06/080619142118.htm> The explanation is:

People presented with a series of car choices in which fuel efficiency was defined in miles per gallon were not able to easily identify the choice that would result in the greatest gains in fuel efficiency.

For example, most people ranked an improvement from 34 to 50 mpg as saving more gas over 10,000 miles than an improvement from 18 to 28 mpg, even though the latter saves twice as much gas. (Going from 34 to 50 mpg saves 94 gallons; but from 18 to 28 mpg saves 198 gallons).

These mistaken impressions were corrected, however, when participants were presented with fuel efficiency expressed in gallons used per 100 miles rather than mpg. Viewed this way, 18 mpg becomes 5.5 gallons per 100 miles, and 28 mpg is 3.6 gallons per 100 miles—an \$8 difference today.

In other words, what we aim to do in a car is to get some place, to cover a certain number of miles. Our inherent thinking processes, by nature or by nurture or by both, works well in relationship to distances—distance should be the denominator. In a similar vein, we don't analyze our school budgets by considering number of students per \$10,000 but rather dollars spent per student.

It's interesting that some of our most important quantitative information has been presented wrong, in ways that lead to inconsistent and even irrational decision-making. Are there more possible examples out there? Are there also a lot of cases where qualitative information important to decisions is being presented in strange ways?

## 99 What is the Role of Philosophy in an Age of Science?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=173>. It was finished and uploaded on 2008/08/05.]

Einstein, Feynman, and perhaps other major scientists have made the claim that “philosophers of science” have contributed nothing that’s useful to scientists. While not sure exactly what the contexts of their comments really were, I’d generally say in response, “Yes, and why would anyone expect anything different?” I would think philosophers of science move in the opposite direction, taking the results of specific (or specialized) sciences and putting them in a different context which might better serve the needs of metaphysicians and historians of science and educated non-specialists in general. Often this will be in the direction of abstracting from concrete results, but Newton and Einstein were known to do that as well—with a good deal of competence.

Did Einstein, Feynman, and other scientists intend to dismiss metaphysics by their statements? Knowing that Einstein was not always consistent in his statements about his own working methods and his views on philosophy, or on particular philosophers such as Mach who was also a physicist, I don’t know for sure how to interpret his remarks denying the importance of (some types of) philosophy.

It doesn’t matter much to me because I’d like to retreat to higher ground and look at metaphysics, which is defined by the 1913 Webster’s dictionary as follows:

**metaphysics** The science of real as distinguished from phenomenal being; ontology; also, the science of being, with reference to its abstract and universal conditions, as distinguished from the science of determined

or concrete being; the science of the conceptions and relations which are necessarily implied as true of every kind of being; philosophy in general; first principles, or the science of first principles.

My worldview doesn't make quite this distinction between 'real' and 'phenomenal' being. In fact, I think we need to purge our thoughts of this distinction, or retreat to a Pythagorean mysticism, if we're to account for the strange twists and turns of mathematics and physics in recent centuries. See *God as the Creator of Truths* 7 for a discussion of some aspects of my worldview which are relevant to this issue.

In general, philosophers haven't yet acknowledged that the understanding of empirical being developed by modern physical and mathematics has expanded far beyond the Pythagorean and Euclidean and Aristotelian roots of traditional metaphysics. Essentially, modern theoretical physicists and mathematicians have been using empirical (including mathematical) knowledge not yet much considered by metaphysicists to explore realms of being which traditional metaphysics reached only by way of pure speculations of nearly a dream-like sort. In fact, some of those realms of being reachable by considering modern empirical knowledge, at least in my worldview, are beyond anything which Plato or Aquinas or Kant could have dreamed of. In terms of my beliefs: God is more creative than human metaphysicians could be, and it's empirical investigators who've passed beyond traditional speculations because they're the ones paying attention to this phase of God's Creation. The interested reader can download a book in which I explain my views on knowledge: *Four Kinds of Knowledge* [43]. My basic worldview is presented in my first published book: *To See a World in a Grain of Sand* [41].

The most basic of all sciences, physics and mathematics, provide us with knowledge of being as we can observe it and quantitatively describe it. This quantitative analysis can include some speculative elements, but most of the speculation—whether done by scientists or philosophers or poets—is better labeled as 'philosophy'. What's important to remember is that empirical being is what we can observe. The field of 'non-empirical' knowledge most subject to verification and certainty is mathematics—but I consider even abstract mathematics to be derived from the empirical world as fully as theoretical physics is. If a metaphysical system doesn't rightly and fully consider empirical knowledge, including mathematics, there's no chance it

can get much right in trying to understand being in its more general or abstract forms.

Einstein was, in fact, inconsistent in what he stated about the role of philosophy in science, sometimes exaggerating the importance of Mach's philosophical speculations and sometimes denying the usefulness of philosophical thought. Einstein was very consistent in his own use of speculations to shape his physical theories. The general theory of relativity and Einstein's own early interpretations of it were shaped by various speculative, i.e., philosophical, assumptions, some of which proved to be right when Hubble and others collected data and others proved wrong. For example, his intuition that the 'universe' (of which he had only a vague idea in the early years of the theory) was homogeneous and isotropic proved to be quite true to a very high degree of accuracy as currently measured and it helped to guide much of the early work in finding interesting and useful solutions to the field equation of General Relativity—the equation that provides a relationship between the distribution of matter and the shape of space for an entity—perhaps a star system or perhaps the entire universe. On the other hand, Einstein accepted—without a comment—the assumption that the universe is static, not expanding. Clearly, this assumption, implicit in some of his early writings, is wrong. In any case, that erroneous assumption didn't hold up the development of physical cosmology much, if at all.

In the early stages of creative work, "right vs. wrong" isn't always so important as you might think. What was important was the courage and energy which leads to forward movement of some sort. Metaphysical speculation was important to Einstein's work even when some of his speculations were wrong.

And what about metaphysicians? What is their proper role? It's actually no mystery, at least not to those who have read *The Summa Contra Gentiles* where Aquinas told us that metaphysics uses the specific sciences. I would go further than this, as I did above, pointing out that the specific sciences tell us of the observable and measurable properties of being as we can know it in this universe. Metaphysics doesn't just use the specific sciences, it depends upon them and builds upon them—at least those specific sciences which deal with the fundamental nature of created being—physics and mathematics. Certain scientists such as Einstein engage in metaphysics in their scientific work. More recently, brain-scientists such as Gerald Edelman and Walter J. Freeman (and William James a few generations earlier) have also engaged in metaphysics. In my worldview, this is a natural result

of their interests in the human mind, as distinct from an interest in specific physical activities in the brain or even in the brain as a mere assembly of its parts.

And so I come to a partial and tentative answer to my question, “What is the Role of Philosophy in an Age of Science?”:

Philosophy, as one of its tasks, takes the results of physics and mathematics and—at least since the work of William James – neurobiology and develops them in such a way as to provide a more complete template for the formation of a human mind.

I’ve deliberately flipped things inside-out to emphasize the primary result of a better understanding of created being—a human mind shaped to encapsulate the world. This possibility of a better understanding depends upon the existence of an exterior universe which is rational and which can be the proper object of this process of shaping a human mind, a shaping which is a creation of sorts, forming a human mind upon the physical stuff of a human brain. Few think of their minds as entities that come into existence as a result of a shaping process after birth. Partly because of Christian misinterpretations of the stories in the early chapters of the book of Genesis, partly because of a wrongful canonization of perhaps misunderstood results of Platonic and Aristotelian thought, we tend to think of a human being as born with a mind of the sort which has the native abilities of abstract reasoning. All that is necessary for a strong mind to develop is to exercise those particular immaterial muscles of the mind and we get Wolfgang Goethe or Ada Lovelace. In fact, various studies of high scholarly standards have indicated that abstract thinking was itself an innovation in the development of human history. The human mind as we know it came into existence during historical times, after the foundation of human technology and the birth of human cities. So far as we know, the decay of a civilization can bring about the loss of certain aspects of the human mind rather than just a loss of specific knowledge and mental skills.

I’ve started to slowly and erratically work on a short article entry about this subject and I’ll rely on R. B. Onians’ *The Origins of European Thought About the Body, the Mind, the Soul, the World, Time, and Fate* [106] and Bruno Snell’s *The Discovery of the Mind in Greek Philosophy and Literature* [128] to provide an admittedly sketchy argument that the human mind, in the sense of an entity capable of thinking abstractly and perceiving the

wider context of its environments—a cosmos or universe or world, developed only about 2500 years ago or so.

Our minds ‘evolved’ by some sort of processes depending upon the physical brain with its DNA but this ‘evolution’ took place in some abstract realm of relationships rather than directly in the physical stuff of our brains—though I would imagine that an advanced civilization gives some reproductive advantages to those family lines with a certain (but not necessarily high) percentage of men and women who have brains capable of supporting a mind which engages in highly abstract thought. There was a strange period around the sixth century before Christ when Greek literature, philosophy, and abstract mathematics first developed and the great works of Hinduism, the books of Moses, and Chinese philosophy were collected from pre-rational sources and reshaped into sometimes strange ‘models’ of the world as perceived and conceived by mostly anonymous geniuses of various sorts. A truer history of humanity would recognize this development as being far more important than the military and political events which are so greatly emphasized in most books.

Partly because of our understanding of the influence of the Greeks, we tend to think of abstract thought as being separate from physical reality, inhabiting a separate realm of purer being or perhaps not even being describable as any form of being. Against this, I’ll make the flat claim that my mind is an entity which shapes itself as I respond to my environments and, more recently, to the universe as seen in light of God’s revelations. By way of processes poorly understood and not often studied so far as I know, a proper reshaping of a mind can influence culture so that others begin to take on that shape. Those with moderate levels of education and literacy skills will begin to show signs of assuming, if not necessarily understanding, what was seen only with a great struggle by the brightest and most flexible of thinkers in prior generations. At the same time that scientists, engineers, architects, artists, and a few others performed calculations by way of Euclidean geometric arguments that are extraordinarily difficult for all but a few modern experts, double-entry bookkeeping and the associated forms of arithmetic were considered to be skills of genius. Samuel Pepys was a man of great practical skill who helped to modernize, maintain, and manage the port of London but he found the simplest of account-books to be well beyond his ken.

The modern mind has reshaped itself. Our understanding of the universe, including the affairs of men, is founded upon different sorts of ab-

stractions than the involved Euclidean reasoning used by Newton when he first started working on the problem of gravity. If a well-educated man or woman with no college mathematics were to look through one of Einstein's more accessible articles on general relativity, let alone one of the standard works on the subject, they would be intimidated by the symbolism. Moreover, they would have some trouble believing that much of the algebraic symbolism is an encoding of very abstract geometric reasoning.

At times, it seems that the mind of the metaphysician (and that of the theologian) has remained an oasis of stability in the midst of this ongoing enhancement of our knowledge of the being of our physical world and our more abstract knowledge of mathematics. This is neither all good nor all bad. It can be good to have islands of stability during a period of chaotic creativity, however silly some think those islands to have been, but that stability develops into a problem when that creativity has produced a radically new view of God's Creation. I repeat:

If we understand the being we can perceive, the being we inhabit, we can have a chance of understanding being of more general sorts. If we don't understand being that we can touch or at least observe, being that we can subject to various sorts of tests and measurements, it would be a stretch to imagine we could understand being of more general sorts.

And this is where a major problem lies when most scientists look at the efforts of philosophers. Many schools or even entire branches of philosophy have been bastions of human tradition during a period when empirical knowledge, knowledge of the world we inhabit and perhaps a little more, has been expanding greatly. As a convert to the Catholic Church, it bothers me a lot that the philosophers and theologians of that Church have so entangled the truths of the Bible and the traditional creeds with inherited human speculations that Catholics have generally played little role in the development of this empirical knowledge in recent centuries and Catholic thinkers have so far generally not responded to the need to honestly encounter modern empirical knowledge, even though Pope Benedict XVI has been calling for such responses. See Chapter 25, *Broadening the Horizons of Reason* for a quick review of some strong signs he wishes to honestly deal with modernity and modern empirical knowledge.

# 100 Can Inadequate Formation Mimic Mental Diseases?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=181>. It was finished and uploaded on 2008/09/12.]

This article, *Immaturity Of The Brain May Cause Schizophrenia* found at <http://www.sciencedaily.com/releases/2008/09/080910133341.htm>, talks about one of the possible causes of a disease which may actually be “several biologically distinct heterogeneous populations,” that is, a set of symptoms caused by various diseases. This was the case for ‘consumption’ in the 1800s—TB or lung cancer or some variety of the ‘rattles’ as miners called illnesses which might have been black lung or similar. Consumption might have been any of those or other diseases.

I’ll give two quotes from this article:

The underdevelopment of a specific region in the brain may lead to schizophrenia in individuals. According to research published today in BioMed Central’s open access journal *Molecular Brain*, dentate gyrus, which is located in the hippocampus in the brain and thought to be responsible for working memory and mood regulation, remained immature in an animal model of schizophrenia.

Despite extensive research, the brain mechanisms of schizophrenia remain largely unknown. According to Professor Miyakawa, one reason for this is that clinical diagnosis in the area of psychiatry is based solely on subjective observations and not on biologically or objectively solid criteria, “As a result of this limitation, most of the psychiatric disorders currently diagnosed as a single disorder are likely to comprise sev-

eral biologically distinct heterogeneous populations. Therefore, the identification and investigation of more reliable biomarkers that characterize a single subpopulation of a specific psychiatric disorder are essential for increasing the understanding of the pathogenesis/pathophysiology of such disorders.”

Advances in the understanding or treatment of such a horrible disease as schizophrenia are to be applauded, but my interest lies in the possibility of ‘symptoms’ of psychosis or other mental disorders appearing in a much quieter form in those who appear normal, at least in the context of modern societies. See Chapter 91, *A Thomistic Take on Madness and Modernity*, for a discussion of this issue in the context of the worldview I’m developing.

The late Professor Julian Jaynes published a controversial book, *The Origin of Consciousness in the Breakdown of the Bicameral Mind* in 1976 “in which he argued that ancient peoples were not conscious (did not possess an introspective mind-space), but instead had their behavior directed by auditory hallucinations, which they interpreted as the voice of their chief, king, or the gods. Jaynes argued that the change from this mode of thinking (which he called the bicameral mind) to consciousness occurred over a period of centuries about three thousand years ago and was based on the development of metaphorical language and the emergence of writing.” [See [http://en.wikipedia.org/wiki/Julian\\_Jaynes](http://en.wikipedia.org/wiki/Julian_Jaynes) for the complete article.]

I’m still playing around with an entry proposing that the human mind matured into the form in which we know it in historical times. By human mind as we know it in historical times. By human mind as we know it, I refer to intense self-awareness and skills in abstract imagining and thinking.

There are various ways to approach the possibility that the mind is the result of some sort of development process which began—perhaps—when men began to gather in complex societies about 10,000 years ago or so. While I would have to believe in an intermediary stage, perhaps the hallucinatory state conjectured by Jaynes, I’d tend to believe that pre-urban man might have had a level and type of consciousness closer to that of chimpanzees than to modern men. In any case, I’m speculating that the process reached an important stage of maturity about 600BC or so when the Books of Moses were redacted and pulled together with the Books of the Kings and other texts during the reign of King Josiah. This was about the same time when unknown Vedic scholars of the highest creative talents

were creating the fundamental works of the Hindus and also the time when Homer's descendants were becoming the ancestors of Socrates. Thinkers in China were also stirring things up a bit.

I'm working on an entry which looks at this development of the brain by quick consideration of arguments presented by Bruno Snell in *The Discovery of the Mind in Greek Philosophy and Literature* [128] and R.B. Onians in *The Origins of European Thought About the Body, the Mind, the Soul, the World, Time, and Fate* [106]. I started thinking upon those lines after simply deciding that the mind, like any other complex attribute of a physical creature, could not have simply appeared by magic. It had to have developed by some sort of process within the general stream of biological evolution, though it might have occurred when the evolution of the human brain reached a certain point. There might be a minimum brain-complexity (to speak simplistically) as well as necessary environmental conditions supplied by that period of human history from the birth of large-scale agriculture and cities (circa 10,000BC) to the 'sudden' emergence of such phenomena as conceptual thought as seen in the pre-Socratic philosophers and poets producing complex narratives, using tools such as irony or self-deprecation (both of which are highly developed by the time of Socrates).

I've not nailed down a definition of mind from my viewpoint, but I generally consider it to be the relational aspects of a human being, including relationships to various other aspects of that human being as well as to his environment and any greater aspects of reality which he may be able to conceive on the basis of rational and imaginative efforts. I suspect this works not just because of complex brain-cell networks but also the non-local properties of those electromagnetic fields generated by the brain and not yet understood by brain-scientists—or maybe quantum fields as conjectured by thinkers such as the biophysicist William Calvin. This could account for the ethereal feel of the mind as well as for some such phenomena as the rapid collapse of multiple streams of perception into one view of the surrounding environment.

Given the complexity and the powerful but ad-hoc nature of the human mind—whatever its exact nature, there seems to be every reason to believe the mind developed by some sort of selection process after the physical foundation—a complex human brain—existed. The very existence of problems like schizophrenia point to the developmental nature of the mind and point to an instability of sorts in the 'physical' or 'relational' processes which drive the development forward, or fail to drive it forward. We must

also recognize the mind is not likely to be an entity like the heart so that it exists and functions automatically in nearly all live-birth human beings. For example, we have no reason to believe that any of those feral children, legendary or real, who were raised by wolves had human minds despite the likelihood their brains, as physical organs, might have been as healthy as those of a child in a modern literate environment.

What can develop can fail to develop and can also unwind or otherwise decay if that developing entity is a dynamic sort. Cultural decay of various sorts can perhaps lead to a society where many fail to develop well-ordered, mature human minds. Hardly a surprising suggestion, but one which can lead to richer ways of speaking of the possible problem in the context in which I've set it. It's also a suggestion that raises some very frightening questions, including some which would impact our understanding of our human selves and—to a Christian – our understandings of the possibilities and nature of salvation. We also should perhaps wonder how long it can take to recover after a period of cultural decay and whether a recovery will necessarily occur if the human mind as we know it is the result of not only individual development processes over the life of the individual but also of a development process involving communities of human beings, probably mostly family lines though not necessarily involving only closely related human beings. These sorts of developmental processes will likely be somewhat self-sustaining so long as they continue in a robust form. But those processes are contingent and their initialization might be dependent upon a variety of criteria which might not often be met.

In *Madness and Modernism: Insanity in the Light of Modern Art, Literature, and Thought* [126], Professor Louis Sass discussed the implications of the similarities between the ways of thought of schizophrenics and those of modern artists and thinkers. (See the already referenced *A Thomistic Take on Madness and Modernism* 91 for my discussion of his insights. Sass also pointed to evidence that schizophrenia is a modern disease—for example, the extensive networks of humane institutions for disturbed people which existed from the Middle Ages onwards provide no evidence of such a disease prior to the French Revolution or so. It was about that time that an alienist (psychiatrist, roughly speaking) noted the very strange symptoms of a likely schizophrenic as if he'd never imagined such a form of psychosis could exist. This is a very complex issue, especially given the growing evidence that there is no clear-cut dividing line between schizophrenia and some serious forms of depression and perhaps other sorts of mental disturbances. This

raises the possibility that our modern forms of social, political, and intellectual life are not appropriate for human beings—they lead to a greater or lesser decay of that structure we call a human mind.

# 101 New Forms of Human Mind and New Forms of Human Civilization

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=205>. It was finished and uploaded on 2008/10/08.]

Recently, I had reason to refer to Michael Polanyi's *Personal Knowledge: Towards a Post-Critical Philosophy* [116], a book which had a good deal of influence upon my thoughts, upon my views of how human beings are embodied creatures and not body-soul chimeras and also upon my views of the way that human beings are embedded in Creation. Polanyi saw with great clarity the way in which tools become parts of our bodies when we use them often and with attention. A surgeon reaches the point where the scalpel is an extension of his arm and hand rather than a fully external tool. I would go even beyond what I remember of Polanyi's ideas in proposing that this is a necessary result if the human mind is shaped by responses to its environment.

When I say the mind is shaped by responses to its environment, I mean that it takes knowledge and skills which are manifest in Creation into itself and reshapes itself as a manifestation of that knowledge and those skills. When a mathematician acquires the knowledge and skills of a field of study, such as group theory, that becomes an actual part of his mind in a way even more intimate than the scalpel to the surgeon becomes a part of his hand.

This implies a radically different view of what mind is, what thought is, what knowledge is, than the view that mind is some sort of software residing in wetware. I don't intend to survey theories of the mind, and haven't enough historical knowledge to do so, but I'll mention that the

‘software-view’ and other views see mind as some sort of agent which exists independently of the knowledge and skills which it ‘processes’. Moreover, though modern thinkers tend to be realistic about mind being embodied, they still escape to certain forms of dualism which are forced by the desire to see truths as transcendental to the stuff of this universe or to all of Creation if they deign to admit the existence a greater reality. Truths are not part of reality in any way that might leave them as ‘mere’ manifestations. To these thinkers, even God can neither create truths nor even select truths appropriate to a specific Creation. Truth to tell, they wish to judge the world by their standards rather than shape themselves to the standards of that world. And so the game goes on. . .

So where does truth reside? I claim:

Things are true and truths are thing-like.

Dualism is to be destroyed, and unity restored to Creation, not by reducing all to matter nor by idealizing all to spirit but rather by seeing the stuff of Creation in different terms. I don’t know exactly what those terms are, though I’ve spoken of matter as ‘frozen soul’ – as one example—to reorient the poets who might invent new words and concepts which could then be defined more rigorously by the metaphysicians.

We need new wine in new wineskins. We don’t need to be spending our time criticizing old wine or old wineskins. After all, new wines aren’t made by mixing something new into an old wine.

A certain amount of criticism of old ways of thought is necessary and there’s much good to be found in the works of the thinkers of earlier centuries. I’ve learned much from Aquinas as one example, but the greatest of his teachings about efforts to understand Creation – including man—is:

Let your mind be shaped by actively responding to reality.

There are problems with such a simple statement but most of them can be resolved by an understanding of the slow and painful processes of the evolution of the human race to a state where the brain had properties allowing the development of a mind which could be shaped by responses which go beyond our immediate environment and by an understanding of the roughly analogous processes by which a human mind can be shaped by responses to its environments or by responses to much more if that mind

is educated in a tradition which includes the likes of Homer, Aristotle, St. Augustine, Moses Maimonides, St. Thomas Aquinas, Gottfried Leibniz, Johann Wolfgang von Goethe, William Blake, Albert Schweitzer, Albert Einstein, and so forth. And I've forgotten to mention a single musician or dancer or visual artist or athlete or statesman.

Rich cultures make for rich opportunities for human minds to be shaped to encompass far more than the furniture and the trees, not that I despise solid and comfortable furniture or grand old trees.

But there's a nonlinear complexity involved in this business of cultures and minds. At any one slice of time, it seems to me that minds shape culture and culture tells minds how to move, to paraphrase John Wheeler's words about space (culture) and matter (mind). But, over time, culture has shaped minds and cultures formed by early men who left no evidence of mind as we think of it, with abstract reasoning skills, eventually gave rise to the likes of the pre-Socratic philosophers and Archimedes, as well as Isaiah and the anonymous geniuses who wrote the early, foundational works of Hinduism. Men who could see the possibilities of tools after noticing the occasional sharp edge on a rock, men who could learn how to build magnificent pyramids by trial-and-error processes, produced an evolving culture that eventually produced mind-ed men who could design tools from fabricated materials and could build a Brooklyn Bridge after a complex planning process involving community leaders and local businessmen as well as engineers and contractors.

There's much talk now about the incoherence in our culture, talk which preceded a general awareness of the economic fragility of modern societies. I'll throw in a personal note at this point:

One reason I was willing to take the chances which led to a long and ongoing period of little or no income is that I was an actuary and understood the problems caused by our making extravagant promises to ourselves at the expense of future generations, but few would listen to me or to those who knew more than me about the various problems in our ways of organizing our personal and communal lives.

Yet, there's something far bigger going on, bigger than even our financial meltdown, bigger than the more important meltdown of a manufacturing economy that seems to assume that consumers need 10,000 square foot

houses to hold ever more television sets and clothes and shoes and refrigerators, bigger even than the moral decay caused by the Gresham's law analogue which tells us cheap and mindless entertainment will drive out community orchestras and children's dance recitals and quiet nights reading middle-brow historical novels or even demanding books of literature or science or history. We've lost our old relationship to Creation and haven't yet succeeded in forming a new relationship. We're at the cusp of a civilization change—or a possible disastrous failure to move into a new phase of Western civilization.

And we may fail. Creative minds profound enough to shape new phases of a civilizations or even a more radically new civilization don't form that often, not for lack of 'raw' human material but rather for lack of the courage and faith to respond to God's Creation. We seek to hold onto what was good even when it shows itself to be inadequate for understanding new opportunities or problems, inadequate for proposing creative responses to those opportunities or problems.

Our traditions would form our minds in inappropriate ways if we let them. For those who have some knowledge of differential geometry—and mine is currently light-weight—there is a possible metaphor:

The world is a complex manifold, a very convoluted geometrical structure of many dimensions.

The human mind is formed by response to that manifold but indirectly as the minds of all but the greatest creators respond to some version of a chart to which that manifold is mapped. Even those greatest creators respond mostly to some pre-existing chart.

For those who know still less than me about this field of mathematics which is very important in modern understandings of physical reality: an example of a manifold might be the surface of the earth and a chart would be the result of one of several major ways of mapping the sphere of a surface to a flat surface which might be more useful for navigation or other purposes. An atlas, or collection of such maps or charts, can help much in understanding the peoples or physical features of the earth as a whole or of the northern Atlantic.

We in the West currently have various charts which don't correspond well to our current knowledge of the world. We make our plans and try to

organize our lives using charts with vast empty or mislabeled regions though those regions have been explored by historians or biologists or physicists in the centuries since those older charts were put to paper and to mind. This is not just a matter of inadequate or wrong knowledge. Our minds are misshaped because we've shaped them to knowledge no longer plausible given the empirical knowledge which we notice only when it appears in glossy form in a televised documentary. Those bits of information from an hour-long documentary which crushes decades of thought and many pages of physics and mathematics and chemistry into pictures of events in the universe when it was only thousands of years into its current stage of expansion. The pictures rest uneasily on the surfaces of minds shaped to far less refined understandings of the universe.

Though our all-too human minds shape themselves by responding to our environments or even the entire universe, they're shaped first by responses to our mothers and to the culture into which we're born. Our minds are shaped by our teachers who expound specific formulations of established knowledge. Moreover, few minds are flexible enough to actually shape themselves to new knowledge, especially when it's not only so voluminous but also so much in conflict with much established knowledge.

Much of this seems familiar if we try to see it in light of standard analyses of our moral and cultural crises. By doing this, we think about the human mind in non-Thomistic terms, that is, we think as if the human mind is something given and it will work correctly in any given circumstances (at least on earth) so long as it's given good data and has learned proper rules of reasoning. I'm saying our minds are plain and simply shaped wrong, though there are undoubtedly some which are shaped in a somewhat more appropriate way.

There are many who've seen this, including those such as Nietzsche who failed to come up with a positive understanding of man and his world to replace the modern liberal (individualistic) understanding which he had demolished. As one example of a man who chose to travel better paths into more coherent regions fair, Alasdair MacIntyre's analyses of our modern moral problems seem perfectly consistent with my analysis, perhaps because he has also been strongly influenced by the teachings of St. Thomas Aquinas on human nature and moral nature in particular. (See [http://en.wikipedia.org/wiki/Alasdair\\_MacIntyre](http://en.wikipedia.org/wiki/Alasdair_MacIntyre).) There is deeper meaning than some realize in MacIntyre's claim that we can't resolve some of our moral conflicts, such as abortion, because the major groups of oppo-

nents each use words and hold concepts which don't allow deeper communication of the opposing views. They have mapped the world to different charts and have no willingness, perhaps no capability, to evaluate their own charts or those of opponents.

There have also been plenty of men with sensitive souls united to powerful minds who've lived during times of breakdown or during interludes between phases of a civilization and those, such as St. Augustine, have left us words which tell us they knew that something was happening which was beyond the reach of even their powerful minds. It was beyond the reach of those minds because of the opaqueness with which future possibilities present themselves—but they do present themselves at least in a vague form. The manifold which was the reality of that world had proven itself to be shaped in such a way that the existing charts for mapping that world were clearly inadequate. So to speak.

This will be one characteristic of the new civilization:

The gods will die to be replaced by different metaphors and analogies, drawn from differential geometry or the theory of random numbers or morally well-ordered narratives of human history or poems about pretty young women understood in the context of human evolution.

In an address to philosophers given on June 7, 2008, Pope Benedict XVI spoke of modernity as demanding a “more exact understanding of the nature of man”, but that will be only a part of a more exact understanding of all of Creation which is subject to our exploration and analysis—see Chapter 25, *Broadening the Horizons of Reason*. If Western Civilization survives in an offspring or a new phase, that more exact understanding will be founded, partly, upon ways of thinking and speaking which draw upon such esoteric fields as differential geometry. We won't see the end of faith nor of literature nor of philosophy but we will see them re-founded as we are forced to view Creation as it is and not as our ancestors were viewed it in terms of their knowledge of empirical reality. Of course, we must remember that the early Hebrew prophets had to fight against the ingrained assumptions of various forms of nature-worship, as did the early Greek philosophers and scientists.

The truths that will remain unaltered are those which the transcendent God revealed about Himself, but even our relationship to that God might change as we are part of Creation and our understanding of Creation will be

changing. We may be willing to see this world as a story God is telling for His own purposes and we may be able to work for God and for our fellowmen while accepting the pittance or the great wealth which God bestows upon us.

# 102 Active Responses are Necessary for Shaping the Human Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=230>. It was finished and uploaded on 2008/10/09.]

In this summary article, *Psychologists Show Experience May Be The Best Teacher For Infants* found at <http://www.sciencedaily.com/releases/2008/09/080930144218.htm>, we read:

Researchers have found that infants who had an opportunity to use a plastic cane to get an out-of-reach toy were better able to understand the goal of another person's use of a similar tool than were infants who had previously only watched an adult use a cane to retrieve a toy.

This result agrees with the Thomistic position, including my truer-to-Thomas existential version and also the pragmatic version of Walter J. Freeman as discussed in Chapter 83, *Is Christian Morality a Natural Morality?* and Chapter 84, *Pragmatism and Existentialism*. We shape our minds by active responses to our environments and to greater parts of our world as we learn to think abstractly. When we're responding to an environmental need to heat our house, we learn how to use a wedge-ax to split wood with short verbal instructions from a knowledgeable relative and then a lot of practice. After several sessions of exhausting effort, we learn to better use such a tool given the action of our particular bodies and the behavior of the wedge-ax when we lift it overhead and then bring it down toward the log sitting on end. On a more abstract level, we can shape other parts of

our minds properly by, for example, reading a worthwhile book, maybe on American foreign policy under FDR, in an interactive way, pushing that non-present author to answer difficult questions and imagining ourselves in the place of Herbert Hoover or Franklin Delano Roosevelt or Chiang Kai-shek.

This is one of the problems with classroom instruction as currently practiced. It's a passive and non-effective way of learning in which the overburdened teacher is trying to push pre-processed knowledge into the heads of thirty students of varying talents and interests and levels of maturity. This is also a problem with any teaching efforts of the various science or history or religious channels on television. I know some who try to interact with the programs they watch, taking notes and writing down questions to look into or to discuss with friends, but those viewers are few and far between. This passiveness is also a problem with so much of our popular literature which doesn't engage and challenge a reader even in the way of higher-quality mind-candy such as Agatha Christie novels let alone serious works such as Laurence Sterne's *The Life and Opinions of Tristram Shandy, Gentleman*. Those who know the novel can take the term 'serious works' in the appropriate way.

## 103 New Forms of Knowledge?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=237>. It was finished and uploaded on 2008/10/09.]

In Chapter 101, *New Forms of Human Mind and New Forms of Human Civilization*, I discussed the Thomistic teaching that the human mind shapes itself in active responses to its environments in the context of cultural transitions.

Recently, I was reading *Political Theory & Modernity* by William E. Connolly and his discussion of Nietzsche brought me to a slightly different way of putting the problem.

Professor Connolly tells us that Nietzsche realized that the Enlightenment vision of completing understanding and control of nature wouldn't work if our environments and the entire universe have characteristics or entire entities that don't fit into the human mind. What exists and what works can't be rationally broken down to the pre-existing categories of a pre-existing mind which works according to abstract forms of thought and some abstract knowledge which comes from somewhere by some magical process.

Nietzsche was right. That is, he was right if mind is what Enlightenment thinkers, and many of their 'modern' predecessors thought mind to be, an ethereal entity of some sort. There is no *a priori* reason to think concrete stuff will fit into the slots available in such a mind. St. Thomas Aquinas actually falsely taught we do have such an ethereal mind to handle our abstract reasoning but his mind was a non-human entity which seems to have been something of a dry-as-dust Mr. Spock intended to do certain sorts of abstract thinking.

I say: what works works. This insight leads not to some grayish, mechanical utilitarianism but rather to the realization that what exists is, and

has to be, the embodiment of truths. Things are true. I go on to claim that truths are thing-like and suddenly we are in an entirely different realm of thought. In Christians terms, what exists is the manifestation of some thoughts of God and we can shape our minds to be embodiments of the very thoughts which God manifested in Creation. I make this claim along with St. Thomas Aquinas (properly updated) and along with some modern brain-scientists. See Chapter 83, *Is Christian Morality a Natural Morality?* and Chapter 84, *Pragmatism and Existentialism* for discussion of my way of viewing the processes of shaping a human mind and also the view of the neuroscientist Walter J. Freeman.

[As of 2011/03/31, I'm thinking Aquinas, in his speculations about the immaterial 'mind' or 'soul' attached to the otherwise physical human being, was intuiting the existence of what I consider the racial or human species mind which is something largely given to us. By this I mean the inborn ways in which the human brain operates because of evolutionary developments. This means evolution has given us some preshaped ways of thinking and some which can be shaped by responding properly to our environments.]

I've been puzzling over this issue for years since reading this:

My soul [in Thomas the organ for thought] is not I; and if only souls are saved, I am not saved, nor is any man.

This is a quote from Aquinas' *Commentary to 1 Corinthians* [3] as translated by Hannah Arendt in her last major work [5]. The comment in square brackets is hers.

## 104 Four-dimensional Brains

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=295>. It was finished and uploaded on 2008/11/09.]

I really don't know much about neural networks which are organized in space and certainly can't make much comment upon the discovery that they are somehow organized in time as well, yet, I'm hardly surprised. See this article, *Robots Show That Brain Activity Is Linked To Time As Well As Space* found at <http://www.sciencedaily.com/releases/2008/11/081107071820.htm>, for a summary of the research that indicates that:

even without explicit spatial hierarchical structure a functional hierarchy can self-organize through multiple timescales in neural activity. Their model was proven viable when tested with the physical body of a humanoid robot.

Results suggest that it is not only the spatial connections between neurons, but also the timescales of neural activity, that act as important mechanisms in neural systems.

Brains make up their minds by responding to their environments as a first step. As the human mind developed its higher-level abstract capabilities, starting around the 6th century BC so far as I can judge, it began to explore more sophisticated aspects of what we now know as the universe. In the past century or so, theoretical physicists and mathematicians were able to think about the universe in terms of a four-dimensional space-time structure. To do that, our brains would have to be able to encapsulate that space-time structure and that would mean the brain itself must partake in those time-like aspects of the being of that structure. Hardly a surprising proposal since we were born into that space-time and develop inside of it. I wouldn't be surprised if evidence grows that at least predators also

have brains that self-organize through time as well as space. Without some way of organizing perceptions and thoughts “through multiple timescales,” animals would likely be far more sluggish and inert than rattlesnakes or leopards prove themselves to be.

## 105 What is Reason?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=343>. It was finished and uploaded on 2008/12/02.]

Reason is typically defined as if it were an object or faculty separable from the human body, much in the way that many define the soul. I don't believe in souls as being entities residing alongside or apart from our physical substance and I don't believe in reason as defined by traditional thinkers. It's not some faculty inherent to a human being nor is it some sort of mystical force which human beings can access.

Reason is an important but ill-defined set of mental activities. Usually, there's an implication of a significant degree of abstraction when we speak of reason, but the very concept of 'abstraction' is problematic as I've pointed out in some of my writings. See Chapter 165, *Ways of Speaking and True Being* for discussion of our efforts to shape our language to created being by iteration, in a manner of speaking and "manner of speaking" is the issue. I hope I've increased the problems in a fruitful way by denying that abstractions are merely descriptive and claiming instead they're real aspects of being, deeper levels closer to the stuff God created from nothingness.

Reason is certain activities of a human mind and that mind is what forms when a human animal makes more or less proper responses to his environment(s). Abstraction is inwardness or depth of being. Thing-like being is shaped from a strange form of being which is 'abstract'. The same is true of living creatures which are inhabitants of the realm of things. The concrete flesh and blood of a human being is another level of being but that human being includes also the abstractions at deeper levels of being. This isn't some sort of mystical claim, but rather an insight forced upon us when we take theoretical physics and mathematics and metaphysics seriously. So reason can be considered the movements of a human being in abstract levels

of created being. But those abstract levels of being aren't imaginary. They too are part of reality. Even when they're other and more fundamental 'phases' of Creation, they're present in this phase as well, our universe. Nor is reason imaginary or mystical or outside of Creation.

We can't see the intertwining of space and time with our eyes or hear it with our ears but we can shape our minds to encompass it, through the abstractions of differential geometry and Minkowski spaces and so forth, through novelistic adventures and poetic dreams. If we were suddenly to find ourselves at the horizon of a black-hole, we would find that some abstractions bite harder than any lion on the Plain of Serengeti. We can't perceive directly the bending of space-time but we'd know something was real if we were suddenly stretched out a mile tall as we fell into a black-hole with strong tidal forces. But those sorts of abstractions lie also at the foundation of the very substance of lions, which are also made of stuff which would cease to exist in a rather rapid and spectacular way if not for some of the oddities described by quantum mechanics.

Human reason doesn't transcend Creation, it's not alien to Creation. We're creatures of this specific Creation and reason is an activity of the human mind by which we participate in this peculiar Creation. Reason results as we try to understand abstract levels of being but also when we try to apply those understandings to the more obvious aspects of our lives in concrete levels of reality. Reason can move outwards, no, it has to do so, to encompass our fellow creatures and our entire world, but its essence is penetration into deeper levels of being.

## 106 So What if the Human Mind is a Product of Evolution?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=484>. It was finished and uploaded on 2009/05/05.]

Why do we resist changes in our beliefs about our selves, the world around us, and our relationship to God? Americans in particular, for all our claims to honesty about facts and our claims to have a hardheaded respect for reality, find it difficult to accept empirical evidence that we're not quite the creatures we think ourselves to be, that the universe isn't nearly the place our ancestors thought it to be.

Why do so many seem to recoil, for example, from the possibility that the immaterial parts of a human being are inalienable from the material parts evolving over the millions of years, evolving further over the millennial-length lifetimes of civilizations, and then developing in particular forms over lifetimes? Often, I've heard claims that it's hard to believe in such a 'materialistic' view of the human being, which seems to reduce mind-like and soul-like aspects to 'mere' material aspects. My response would be simply, "We won't understand any aspects of human nature until we understand the bodily foundations." Just acknowledge the basic facts, then learn a bit of what physicists and mathematicians have discovered about the nature of being and of abstractions. Then, we'll be able to speak intelligently about immaterial aspects of being, such as relationships. I've found no need to wave hands and speak of mysterious entities attached to human beings once I began to understand modern empirical knowledge, once I brought down my barriers against the reality of God's Creation. Aquinas told us to do that centuries ago, to learn the wisdom of God by studying the creatures of God, but even Catholics who claim to highly honor him have no real under-

standing of his basic claims, of his methodology endorsed by Pope Leo XIII in the encyclical *Aeterni Patris*, choosing instead to turn his speculative arguments into revelations of unimpeachable truths. To many Catholics, being 'Thomistic' means that we pronounce his conclusions about God's Creation, based upon empirical knowledge circa 1350, to trump any conflicting conclusions based upon somewhat more recent empirical knowledge.

Take, for example, the soul. The loss of an entity we can't see or hear or detect would seem to be little more than the loss of an entity which filled in some gaps in our knowledge. We have filled in those gaps in recent centuries with better and more complete knowledge of time and space and matter and of abstractions tied to physical reality. We have learned a lot by studying God's Creation in disciplined ways and we have learned that the stuff of this physical universe has properties which fill in those gaps in a more natural way. If you wish, you can even think of matter as being frozen 'soul-stuff', but it's better to simply acknowledge that modern science has taken the ancient idea of the 'soul' from us. Modern science has also given to us the opportunity to re-unite our mind-like or soul-like aspects with our embodied and particular natures. In other words, unlike Plato and perhaps Aristotle, unlike even Aquinas, we have ways of understanding our mind-like and soul-like aspects in terms of our human bodies. We have the possibility of seeing our human natures in a more unified way by grounding our mind-like or soul-like aspects upon our bodily natures. This opportunity is tied to the contingent nature of not only our particular universe, but also its fundamental structures of time and space and matter. We have discovered in the past century or so that it's not just life but the universe itself that has developed from a vague and chaotic state to its current specific and somewhat organized state. What we've learned about the evolution of life fits in with those more fundamental discoveries about time, space, matter, and the nature of the abstractions which form many of our thoughts. The universe is consistent across its parts, stars evolving much like chemical processes do on the surface of at least one planet, some of those processes becoming self-sustaining life and some not.

Some would hold on to traditional ideas without even daring to reconcile them with modern knowledge of God's Creation. These men take the technology and reject the knowledge underlying that technology, choosing to believe many fantastic things that were plausible in earlier centuries but no longer. They simply ignore inconvenient possibilities and even inconvenient facts of the most obvious sort and remain wedded to the ideas which

were pushed into their heads when they were young.

Others can accept the technology and also the underlying knowledge – to the extent it helps them to break free of those aspects of moral and political and social traditions which they find inconvenient. This shows in those who would use evolution and other matters of modern knowledge to attack traditional religious beliefs but can somehow miss seeing that convenient knowledge is tied to politically inconvenient knowledge about such matters as genetic differences in ethnic groups which have evolved in different environments and as a result of different responses of their ancestors to those environments.

This ability to accept only an edited version of our knowledge of reality was first noticed, so far as I know, in Tocqueville's *Democracy in America*, and was also discussed by Solzhenitsyn in the forward to the abridged version of *The Gulag Archipelago*.<sup>1</sup> Various writers, such as Nathaniel Hawthorne, Hermann Melville, and Ray Bradbury have also discussed forms of intellectual or moral psychosis in essays, such as Hawthorne's introduction to the first edition of *The Scarlett Letter*, or displayed such behavior in novels, such as *Moby Dick* and *The Confidence Man* by Melville and *Fahrenheit 451* by Bradbury. Like Captain Ahab from *Moby Dick*, we can say our means are sane, it's our ends – including our understanding of what it all means—which are insane. In Christian terms, we know how to confirm our opinions against all evidence but we don't know how to listen to God speaking through His Creation. Most believe that we have truth in our minds, while I believe that we have minds which can look for truth in God's Scripture and in His Creation, but only if we direct ourselves to such a task.

What seems interesting to me is my optimistic view of the possibilities of the human mind. I'm optimistic just because of my view of the human being as a peculiar sort of ape which evolved by natural processes in this physical universe. Because our minds have evolved at the species level and then have developed at the individual level, we can encapsulate knowledge—even wisdom—found in a Creation far greater than we are. We can learn to think as our Creator thinks. Our mind can be, in a sense, the entirety of Creation rather than simply what lies inside our skulls. Natural

---

<sup>1</sup>I've seen a newer edition of this abridged version. The American publishing company has eliminated Solzhenitsyn's introduction with its remarks about American moral shortcomings, leaving—of course—the entirety of the main part of the book with its remarks about Russian moral shortcomings.

processes have brought about a set of mental capabilities which are retrospectively understandable and also remarkably powerful. Those mental capabilities are totemic in men who are hunters-gatherers, allowing men to put themselves in the place of the animals they hunt, imagining themselves to be fleeing human hunters and anticipating the actions of those animals. In a sense, our minds haven't changed in fundamental ways, but the modern mind has shaped itself, in some, to knowledge of a greater Creation while that early mind was shaped to knowledge of a local environment of, say, deer and blueberry bogs. While our ancestors imagined themselves to be that mammoth fleeing them, a more recent human being named Albert Einstein imagined himself to be moving along with a ray of light or traveling in various accelerating or non-accelerating elevators. The second set of imaginings were possible because Einstein's ancestors had evolved the capabilities of anticipating the actions of animals. In both cases, the human mind functioned well just because it was, so to speak, sent out to encounter a reality greater than we can find inside ourselves – until that very reality is encapsulated in our minds.

To accomplish such feats of imagination or the bodily feats of an athlete, the brain needs interfaces to the external environments and to the other parts of the same body, regions of the brain which hold those models of our bodies or models of our greater selves which exist across spans of time and space. Those mental processes have allowed a 'self' to come into being by way of brain activities which are being researched intensely.

Most of us have seen pictures of a homunculus in our brain, reflecting the nervous system resources devoted to specific bodily regions, so that fingers are outsized on that little human being in our brain, more so in a concert pianist or a watchmaker. The brain shifts resources if we lose our sight so that our hearing and touch become more important. When that happens, that cartoonish fellow in our brains loses his eyes and grows elephant ears and still larger fingers. That cartoonish fellow is our main contact with our physical environment and not just a funny drawing in books about the brain.

There's a far more complex and more mysterious process occurring in the human brain which I'll describe for now as a modeling of the self as an entity with a somewhat continuous existence in smaller or greater regions of time and space, depending upon the culture and the individual. We construct ourselves and those constructions are us to our conscious awareness because those constructions are the interfaces between our embodied selves and

other parts of reality. This isn't a doctrine of solipsism but rather one of a creature born into and adapted to a world of developmental processes, a world in which evolution of a family line and development of an individual occur as a result of lucky or unlucky, effective or ineffective, responses to opportunities and dangers. Our animal awareness and our self-awareness are interfaces between physical and cultural reality and our bodies and our more abstract selves.

See Chapter 8, *Staking Your Faith on Gaps in Empirical Knowledge*, for a short discussion of the way in which we form our sense of self in light of fairly recent discoveries that some, perhaps all, out-of-body and near-death experiences, are seemingly caused by disruptions to those systems which construct our senses of 'self'.

I'll interject a warning here, one based upon other recent discoveries about the brain which I've discussed a number of times in my blog entries. Research indicates our embodied selves often make decisions, at least certain types of easily studied decisions, before the regions of the brain associated with self-conscious regions become active. This indicates to me that our self-consciousness has little to do with our current lives. I think our self-consciousness plays a major, potentially dominant, role in shaping our greater beings and their actions for the future. That 'self-conscious' self isn't the human being, but rather a part of the human being. In a simplistic but useful way, I could say the 'self-conscious' self is a set of brain processes which serve certain needs of the human being.

The human mind evolved in specific settings, starting with that general setting we know as our immediate physical reality. Even some of the most fundamental truths built into our brains are not necessary truths but rather truths dependent upon certain contingent properties of our empirical world. For example, young infants show a strong belief in the continuity of the existence of physical objects. Such a belief has to be qualified in a scientifically advanced society. Nuclear physics, gravitational theory, quantum mechanics, evolutionary theory and various other theories of self-organizing systems and selectional processes, have all cast doubt upon the stability or even the continuity of existence of material entities or even entire classes of entities. The large degree of continuity of existence we observe is actually due to our position as short-lived, medium-sized creatures in a fairly cool but not frigid universe.

Yet, our experience of the continuity of existence is real and was real to our ancestors. Brain processes assuming such a reality us to avoid reasoning

each time about the likelihood that cliff in front of us will still be there when we return this way next year. Our belief in the continuity of existence of most things is so strong an instinct that even death was seen as something to be explained away. We think our selves must surely have existence beyond death. In early stages of the evolution of the human mind, there even seems to be a belief in some sort of life after death for the animals a hunter kills and eats. Hunters in many cultures will pray for forgiveness to the spirits of that animal.

Those beliefs in life after death weren't irrational, even if the motivations seem obscure to modern thinkers, but we need new ways of thinking about the human race, about the individual human being, about death, about the human mind, about the possibilities of life after death. We need to honestly confront the modern empirical knowledge that indicates rather strongly we humans are the result of billions of years of evolution, that the foundations of human nature are flesh and blood. We Christians in particular need to take the knowledge which comes from studying God's Creation and make sense of it in light of our Christian faith.

We can do that because our minds, being open and creative responses to at least some significant part of Creation, are not bound by the limitations of the present ideas of the human self and what it can be aware of, what it can know. If we could somehow see our ancestors walking around the plains of Africa 100,000 years ago, it'd be hard to guess from their behavior that they would give rise to creatures which could fly to the moon, could probe the secrets of nature, could travel into the abstract regions of greater and greater infinities, could explore forms of narration not strictly limited by ordinary human sense of time and space, could even become aware of a transcendent God. The facts of the matter lead to a narrative explanation in which human accomplishments are possible just because the human mind is an evolved entity which seeks the only true sort of understanding for a creature—an ability to take in the world around that creature so that fundamental aspects of reality become basic components of thought and more complex aspects are constructed from those basic truths by proper forms of reasoning. Those forms of reasoning are themselves derived from our inborn mental capabilities shaped by our responses to various sorts of experiences.

We oppose the idea that the human race has evolved and is part of a physical system of evolution and development because we wish to hold on to an idea of a more stable and more permanent self. We insist on seeing our

'true' selves as existing above the flux of events, because other possibilities, more in tune with our current empirical knowledge, are psychologically threatening to us. We want our thinking processes to have absolute validity. We want ourselves, once born, to have absolute existence. Consequently, we reject, in various ways, more reasonable understandings of the human race which indicate such views of ourselves are irrational.

# 107 The Disembodiment of Knowledge in Modern America

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=598>. It was finished and uploaded on 2009/09/21.]

Human knowledge is embodied knowledge, embodied in the relationships of brain-cells to one another and groups of brain-cells to one another as well as being embodied in the habits of our muscles and peripheral nerves and also in our clothing and our houses and our tools and machines, in our ways of making our livings and of governing ourselves or being governed, in our ways of worshipping God and paying respect to human excellence. A fuller description would take a large book without even attempting to speak of particular realizations in concrete human beings and their communities, though it's actually a multitude of particular realizations which allow us to abstract properly to a wider view of human possibilities. Even when it comes to our own efforts to improve our practices and artifacts, we don't know much about human possibilities until we study what we've done and what others have done.

Much of our knowledge is embodied in the form of communities and their practices and attitudes, within political or economic marketplaces and within the parts of our lives we live in our smaller and more private communities. Our community relationships include the ways in which we entertain ourselves, the ways in which we sing or tell stories. They include our ways of raising children or caring for the elderly in our families or in our larger-scale communities. Certainly, a human being or a human community can be the very embodiment of falsehoods which can even be held strongly in the face of conflicting evidence from reality. A human being or a human community will necessarily be an incomplete or insufficiently rich embodiment of

Creation since we're finite beings exploring God's manifested thoughts, but even the simplest of human beings is a character in a complex tapestry of stories which are threads and others which are pictures formed by groups of these threads and so forth.

I've rejected the modern separation of the knowledge of concrete and abstract realms and I'm trying to follow some of the implications. In a sense, I've returned to the ancient view in which "to know your wife" is to be physically intimate with her. Knowledge of your wife is inseparable from marital relationships. Take this not as an argument that marital, or other human relationships, are purely physical in a reductionistic sense but rather a denial that there is a dualism between concrete being and abstractions. The purest of loves is driven by hormonal flows, even maternal love is painfully intensified by the flows of hormones as a newborn is put to the breast of her mother. Concrete being is particularized but is shaped from abstract being which I regard as manifested truths. Concrete and abstract stuff is a manifestation of thoughts of God. Much of concrete being can be understood, at a first shot, as the thoughts of God as storyteller while the abstract being can be understood as the thoughts of God as mathematician and physicist, as chemist and biologist, but as a Creator not as a student of what already exists.

Human knowledge is the result of human explorations of being in its concrete and abstract forms and human struggles to make sense of it. It is our efforts to think the thoughts of God in His role as Creator. We human beings were given the gift of a freedom to shape our thoughts to encapsulate God's revelations, those which He manifested in Creation and also the few revelations about His transcendent Being. That freedom also extends to the shaping of the human parts of the world, the parts of the world which can be labeled 'non-human' over which we exercise proper and improper forms of stewardship as well as the 'human' parts such as human political and economic structures. We can embody not only tentative knowledge which will eventually be proven wrong or prove to be in need of enrichment of some sort, we can even embody inconsistent knowledge. It might be an effort to combine two incompatible ways of thought or to justify an incompatibility between a way of thought and a way of living. An example which has elements of all of the above might be seen in the case of those Christians who claim to accept some form of evolutionary theory, man evolved from a more primitive sort of ape, and then also claim to accept an interpretation of the story of Adam and Eve as being a fall from a state of grace—presumably

something like a state of spiritual and moral purity. We rise as physical beings but started high and fell as spiritual and moral beings—not very plausible.

On the other side, we can take those scientific human beings who take certain conclusions from some science, often evolutionary biology, and raise those conclusions to the status of absolutely true dogmas. The open-mindedness of science is no part of the thinking processes or general attitudes of such thinkers, a group which may include some serious and well-known scientists.

Currently, the political and social and moral discourse of modern Americans and most other human beings—in fact, discourse in all matters important, is at the level of sulking 8 year-olds speaking, and often yelling, at each other from the safety of their own poorly formed minds. This is partly a reflection of the low moral and intellectual caliber of those who dominate the public marketplaces of ideas in an age of decadent barbarism but it's also a reflection of the state of human knowledge at the level of our entire race. If we try to see human knowledge as some sort of coherent whole, we are most likely to fail, for we've fragmented our knowledge, composing a discordant polyphony made up in many of its parts of screeches and howls and the random noises of mechanized human communities without a moral purpose and without a sense of beauty or truth, without a sense of the truth and beauty embodied in God's Creation, in the stars and mountains, in the equations which describe certain aspects of those stars and mountains and the interrelationships of those creatures with the rest of Creation, in a Bach cantata or a Gaelic air, in a two year-old girl who's such a remarkable mix of grace and clumsiness. We see the clumsiness and the incompleteness often enough ugly in a brutal way and we interpret it as a variety of oppositions between mere matter and higher entities, between the practical and the ideal, between God and Satan, failing to see the world as a story being told by an all-powerful and all-loving God.

Knowledge is embodied because we are creatures of a particular and concrete universe. What we can know truly is embodied, even the most abstract of mathematical truths is drawn from particular relationships within this world of embodiment. The processes of human knowledge-making involve eyes and hands, feet and hearts, brains most of all. Human knowledge isn't true knowledge as much as it's a dynamic movement towards true knowledge so long as we respond honestly and courageously to God's Creation. Truth is embodied and so is beauty, however much they're also incomplete

and dynamically developing towards the truths and beauties which are the end result of the story which God is telling in this concrete world. Progress is clearly not guaranteed but seems to be real on a large enough scale and there are hints of a true progress which we Christians would call the Resurrection. If there was a fall, it came as God Himself shaped unblemished abstraction into concrete and bleeding forms of being which He uses to tell a story in which we play a part, as do the stars and flu viruses and giant squids, but this is a fall with a moral purpose of creating a world which is really a story in which the main event is the self-sacrifice of the Son of God as an act of pure love for His Father, an event in which we play a subsidiary role but one in which we gain a chance for a share in divinity.

If there's a fall in which man played a direct role, it's an ongoing fall consisting of man's indulgence in the human temptation to separate being into components which are at odds with each other. Matter vs. spirit. Brain vs. mind. Body vs. soul. The practical vs. the ideal.

We're at a crisis point now, where the dominant country, the United States, seems to be actively opposed to reality, despising the embodied beauty and truth of God's Creation as not being good enough for us Americans and any others decent enough to be like us. It's been said that the United States is the first country to move directly from barbarism to decadence without passing through a state of civilization. I'd claim that Americans bypassed the state of civilization because, led by those such as Emerson who thought to create ideals more wonderful than what is embodied in this Creation, we decided to try to implement our so-called ideals rather than to study reality and to try to do better within that reality, including Western Civilization. Hermann Melville thought Emersonian thought to be a spiritualized materialism and feared many, perhaps most, Americans shared this morally diseased outlook of Emerson and Thoreau. Melville was close. Far too many Americans are deeply diseased in this way including nearly all of our political and intellectual and religious leaders going back to at least the leaders of the New England Colonies during the King Phillip's War—see Chapter 408, *The Need for Abstractions in Moral Self-understanding* for a discussion of the need to properly deal with particular and concrete realizations of human ways of life to be able to form abstract ideas of better possibilities. I would suggest one change to Melville's formulation: this Emersonian-American way of thought is not so much a spiritualized materialism as a nightmarish replacement for all that is embodied in a material world. If the world won't be what we Americans want it to be, we'll still

act as if it were truly what we want it to be. That strategy was remarkably successful in many ways for more than three centuries, but reality is now biting back.

We can see the American disrespect for reality in the claim made by that anonymous figure in the Bush II government that they would make reality rather than study it. We can see this disrespect for reality in the words and actions of the Kennedy and Johnson government figures in their waging of the Vietnam war where it was most important to get on board, to sign on to the dream that the United States could shape South Vietnam into a real country, an exotic outpost of the United States. We can see it in the more recent wars against Iraq where the fact that American soldiers were in place, in a far-away country, killing Iraqis and being killed by Iraqis means that those Iraqis – at least some—are evil men intent on destroying us because we’re so wonderful. Start a war by invading a country on false pretenses and then convince yourself that the fact you’re killing citizens of that country means they’re evil and deserved to be killed. This is actually another symptom of the same disease that leads us to declare that a movie that’s esthetic and moral trash must be good if Americans like it. Surely, it’s worthy of an Oscar so we can advertise to the world and to our ancestors how empty of mind and soul we are.

By such paths, we traveled from a barbarism with at least some respect for the works of Western civilization imported from Europe to a decadence that respects only transactions in public marketplaces, transactions that typically represent only the satisfaction of cheap and uneducated desires. We admire the athletes of football and boxing and make fun of the athletes of ballet and opera. We admire what would have been admired by the proletariat who filled the Colosseum of ancient Rome and despise what satisfied the tastes of the 18th and 19th century men who put the final touches upon this civilization we’ve dismantled that we might build whorehouses from the stones of grand cathedrals and make bombs that destroy cathedrals and the surrounding cities from the knowledge gathered by great men of science.

It’s hard to imagine that a large population of a seemingly sophisticated country could be so detached from reality, so convinced that truth is found in their imaginations shaped to mirror their desires and even their career plans. Decades ago, some thinkers had predicted collapse of the Soviet Union because the all-important apparatchiks wouldn’t be able to function because of the strain caused by the conflict between reality and official Soviet views of reality – this is more plausible than the view that Reagan

brought down the Berlin Wall by planting the seeds that grew into the military bean-stalk currently reaching for the stars. Those who claimed Communism to be such a bad and inefficient system seemed to think it could conquer the world if we didn't waste our children's futures trying to get the Soviet politicians and generals to act just as stupidly.

Americans seem to be oblivious to this conflict between reality and their thoughts and feelings. The United States is collapsing, the West is falling at least partly because the United States failed in its role as a new and energetic region which could have created a new phase of Western Civilization. After all, civilizations don't survive as truly stable entities, they evolve in place or re-develop in formerly marginal regions. It was our turn here in the United States and we had better things to do than to nurture a new civilization.

As the ruins crumble around the globe, Americans remain oblivious to reality, choosing to believe they can solve a problem of excessive debt by creating more debt, that they can make the world love them once again by waging wars on all continents and building hundreds of military bases around the world, even in regions where we've not yet started shooting. We think to encourage creativity by setting children and young adults in front of sheets of paper or—still worse—in front of computers when those children have little knowledge of reality and few skills for responding to reality.

I'm offering a way forward, a worldview which explicitly recognizes the unity and coherence and completion of this world and can be used to embody a plausible human knowledge of that world in a civilization not yet born and in the human beings who will inhabit that civilization. We can hope the next civilization will be an embodiment of the best of modern empirical knowledge, that is, that it will be an embodiment of that knowledge in tools and political practices, in forms of music and in goals for scientific research, disciplined to a morally responsible view of God's Creation and man's proper place in it. Of course, there are no guarantees from God or from His thoughts manifested as Creation. The future of this world might hold multiple civilizations in different parts of the earth or it might hold a state of permanent barbarism, poverty, and ongoing violence. The latter is the future American leaders seem intent on creating.

We're a long way, lots of long days of work away, from a refreshed and re-energized civilization—if it comes into being, but it seems to me that it's time for men and women of moral integrity to recognize how much has been

lost and to start the various tasks of building a better future, one that will likely be seen by no one currently alive.

# 108 The Shaping of the Human Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=637>. It was finished and uploaded on 2010/03/09.]

God has shaped a thing-like world out of more basic stuff, strange abstract stuff. I've discussed this in various ways—see Chapter 159, *Negative Theology to Physics and Metaphysics* for an overview of my thoughts on abstract being as well as other issues and Chapter 163, *Not Monism and Not Dualism but Unity of Creation* for a more focused discussion on abstract being.

We human beings form our minds by responding actively to that world and by penetrating to understandings of that more basic, more abstract stuff. A particular thing is a manifestation of a particular thought of God though all things in Creation are intertwined in the most complex and complicated way as William Blake told us in his efforts to see a world in a grain of sand. Each grain of sand is made of various particles made of sub-particles, each of which has peculiar properties and ways of relating to other particles or sub-particles or even other things. The particular things also have their forms of behavior and of relating to other things.

The actual situation is still more confusing. The universe is an entity with its own properties and not just a collection of stars and gases and electromagnetic fields. See Chapter 193, *A Universe is More than it Contains* for a discussion of one particular problem—though energy seems to be conserved in all 'local' situations, it's not necessarily conserved at the level of the universe. As Professor P.J.E. Peebles tells us in *Principles of Physical Cosmology* [109]:

We see that the faster decrease of [the radiation density of

a relativistic universe modeled as a gas] compared to the mass density of a nonrelativistic gas is the result of the pressure work done by the expanding radiation. However, since the volume of the universe varies as [the third power of the expansion factor of the universe], the net radiation energy in a closed [and expanding] universe decreases as [the inverse of the expansion factor of the universe] as the universe expands. Where does the lost energy go? Since there is no pressure gradient in the homogeneously distributed radiation, the pressure does not act to accelerate the expansion of the universe. (The active gravitational mass due to the pressure has the opposite effect, slowing the rate of expansion. . . .) The resolution of this apparent paradox is that while energy conservation is a good local concept . . . and can be defined more generally in the special case of an isolated system in asymptotically flat space, there is not a general global energy conservation law in general relativity theory. [page 139]

I also noted in that short essay that “we don’t yet know the exact geometric properties of the universe, or rather—the region of the universe which is visible to us.” As a consequence we don’t really know for sure there is a mismatch between that decrease in radiation density and the increase in volume of the universe. The principle remains true and is clearly accepted by the mainstream of physicists working in cosmology—Professor Peebles, appropriately, wrote the book to reflect mainstream views and not his own opinions on unsettled issues.

I draw a clear conclusion from this and much of the other empirical knowledge I’ve considered in my thinking and writing: the world is not a dualistic mish-mash of various sorts of substances, mind-soul and body in many traditions. The world is a story God is telling with a universe He shaped out of some strangely abstract stuff which, so to speak, lies on the other side of the Big Bang. There might actually be many complex stages or even a series of expansions and collapses before we could get ‘closer’ to God’s original act-of-being by which He created from nothingness. Those details aren’t important for now.

Human beings aren’t born with minds or souls attached to their bodies by some mysterious glue. Human beings are born with brains which have major regions which have the potential for abstract thinking—such as that

form of thinking which we might describe as future-oriented. Those regions are not preset to function in highly specific ways as, for example, the hippocampus is preset to form long-term memories out of short-term ones according to certain criteria. Cells in the regions of the human brain devoted to abstract thinking shape their connections to other cells in the same regions and to cells in other regions according to criteria which have been investigated by modern brain-scientists. The various writings of Gerald Edelman (see [en.wikipedia.com/wiki/Gerald\\_Edelman](http://en.wikipedia.com/wiki/Gerald_Edelman)) provide a powerful and coherent understanding of the brain's 'shaping' processes.

Mozart wasn't born a great musician, though he clearly was born with a brain that could be shaped into that of a composer who could see a piece of music in its entirety the way that we more ordinary folk can see a tree in its entirety—so long as we stand back from the tree but not too far back. Our brains can encompass only so much, too much detail can destroy the understanding as easily as can a sweeping landscape view. But even the ability to see a tree truly, in its concrete or abstract nature, comes from our active response to trees when we see them as children, perhaps under the guidance of an adult interested in nature.

God made that tree, as a poet once reminded us. The Creator made that tree by manifesting certain abstract ideas from which He shaped the basic stuff of this universe and then by manifesting the idea of certain sorts of developmental processes which formed first protons, then atoms of hydrogen and helium, then atoms of carbon and oxygen, then stars and planets, then organic chemicals, then slime-molds, then trees, and so forth.

Brilliant men of the pre-modern era somewhat wrongly shaped their minds and taught us to wrongly shape our minds because they saw that tree as a manifestation of an ideal object (to play a little loose with metaphysical language for the sake of conciseness) rather than seeing it as a dynamic object, even a character of sorts, in a stream of events. And, yet, there were also those who saw that tree as arising out of some sort of chaos and they formed an anti-metaphysics of sorts.

It would seem that God doesn't feel bound to operate by the rules of either Plato or Heraclitus. We should honor them and see the insightfulness in their thoughts, for they were also characters in a sub-narrative of human history, a small but important story we could title: *The Development of the Human Mind at the Racial Level*. We now know enough to move on to a higher level of understanding, however inadequate it might eventually prove to be.

From the metaphysics of the Greeks, based upon very simple physics, to Augustine of Hippo who provided a substantial appreciation of the importance of time and the flow of events, through Aquinas who provided a deeper understanding of both the mind and also of being, through various modern philosopher-scientists who gave us brilliant understandings of the interaction of matter and of abstract mathematics—including Einstein and Planck and Dirac who enriched our understanding of time and space and matter and relationships, we come to us with our minds not so well shaped as they should be. We yet have trouble with these modern understandings of Creation at its concrete and abstract levels. See the earlier Chapter 90, *Shaping Our Minds to Reality* for a discussion of this problem and the opinion of one man, both physicist and Anglican priest, that we apparently need generations to make some ideas truly our own though those ideas seem to be out there—printed in many a textbook.

But some of us are trying and many seem at least willing to admit our confusion at trying to fit evolutionary concepts into brains shaped to consider species as ideal categories or to fit the theories of relativity into brains shaped to regard time as uniformly flowing in a way fully separable from space. And space itself? We naturally see it in ways which are somewhat comparable to a naive Euclideanism if not educated in pre-modern ways of thought still dominant in our age. If we are so educated, we might have more sophisticated Euclidean view. At the same time, we are exposed to newer ideas based on modern explorations of empirical reality, even when so many of us see these ideas in a relatively explicit form mostly in science fiction shows or the occasional science documentary which shows the Big Bang was just like a fireworks display. We read of conflicts between traditional moral rules and such new knowledge as the strong correlations between mutations and strong feelings of ‘transsexualism’ in some who are otherwise fully male in their genetic make-up. Many react by rejecting those traditional rules and the greater truths which lie behind them and others just try to hold on to those rules without rejecting the modern empirical knowledge which does so much to cure their cancers or to give us so much technology, life-enhancing and life-damaging alike. We want to have the old certainties and jet aircraft as well. And so . . .

Where is this ‘free-will’ that can overcome a creature’s own fundamental being?

Ah, the world be far more complex than the most convoluted of the sentences I've constructed in this book. We do need, in fact, new ways to speak of complex facts which overwhelm our language. We need musicians to compose in new ways consistent with Einstein's insights into space-time and poets to speak of Turing's insights into the nature of algorithmic thought.

The human mind, in its abstract aspects, is the human understanding of Creation, in all perceivable and conceivable aspects. The contents of knowledge are the container of the mind and it is shaped and filled, filled and shaped, by the quite active responses human beings make to Creation. But the very language of 'contents' and 'container' needs to be at least refreshed and maybe replaced entirely. We also have to remember the communal foundation of the human mind, but I'll pass over that in this short article.

Let me summarize:

1. God created things as manifestations of some of His thoughts.
2. By learning to shape our brains in response to those things, we bring into being certain states of those brains which can be truly called human minds.
3. There is also knowledge which exists at a social level and, after a recent explosion of empirical knowledge, is poorly integrated into most individual minds.

And so man's mind and the being created by God are not so readily separable. Bishop Berkeley was onto something with his insight that created things can be regarded as thoughts of God but he made the mistake of thinking human beings can directly penetrate to the thoughts manifested as substantial entities. He also seemed to think that abstractions had some sort of absolute existence independent of the thoughts of God. Moreover, he saw through—or tried to see through—those concrete things to abstract being and ended up slighting the value of concrete being.

To Berkeley, and others, there are abstract truths which form a common language for God and man, while I'm proposing that God has a language which works through and over created being both abstract and concrete. Man learns that language, trying by stages to re-create that language, by responding to God's work as Creator.

# 109 A Thought Makes It Possible to Think It

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=654>. It was finished and uploaded on 2010/05/06.]

Nearly all human beings, nearly all the time, think only thoughts which have been thought already within their sphere of knowledge, typically some level and region of a particular culture. Few and far between are the identifiable creative thinkers, though we must remember that creative thinkers are also members of specific communities which provide the raw materials of Platonic metaphysics or Shakespearean comedies. We must also remember that ideas, however vague, emerge in time without any specific originator, but often a poet or philosopher will step forward to bring such ideas into focus. I'll be ignoring those communal aspects of human thought, conformist and creative, in this article. I'll also ignore the little creative acts and thoughts which can lead to, for example, changes in the ways in which children are raised. Those sorts of changes can bring about new cultural epochs but such major changes are at least announced by those poets or philosophers, musicians or sometimes a great statesman. Because our age has problems in the foundations of our understandings of individual human natures, the purposes—if any—of Western Civilization, the relationship—if any—between God and man, we have a need for Plato-size thinkers, creative as well as profound.

There are many more good thinkers than creative thinkers. In saying this, I'm referring to those who can apply existing thoughts or even reuse existing thoughts in new ways as being good thinkers. A very crude analogy would be to an erector set where occasionally there is a need for a new structural element or a new sort of connecting device, but that need

might be unmet, even strangely unnoticed, until—maybe – the right thinker looks at the problem in a fresh way. Meanwhile, intricate and interesting structures are being built from existing components in that erector set. It seems strange at first to read a history of modern physics and to learn that even so creative and powerful a thinker as Henri Poincare can be looking at something so important as the basic insights that we know as the special theory of relativity, and he doesn't see what he should see. Creative he was, but not creative enough. An Einstein was needed to do 'no more' than make sense of what physicists already knew.

Let me put this in the context of my updated and expanded version of the Thomistic theory on the formation of the mind. Our minds form as we respond to our environments. Men can respond to multiple environments at once because of their abilities to reason abstractly, plan into the future, etc. Some men can even form their minds in response to some current and plausible understanding of the cosmos or universe. A very few, by percentage, might have minds capable of responding in some substantial sense to the entirety of God's Creation, that is, to God's Creation as we can currently understand it. Pioneers seem to be relatively few, that is, those who have minds reliable enough to come to coherent understandings but flexible enough to respond to new knowledge or new perceptions.

A literate society can make it possible for some to develop their minds to high levels and some of those with good minds will follow the paths blazed by the creative few and make far more of newly discovered regions of God's Creation than the creative thinker could have done. Yet, a good mind isn't always a creative mind. A good mind might move, more or less, in the realm of the known—with a typical mixture of truth and errors, richness and barrenness.

I'm claiming that creativity is a result of the human being moving, intellectually or morally or spiritually, in realms already created by God, realms which remain invisible to most thinkers even when we've accumulated a good body of knowledge about those realms. But there are some who are prepared, by nurture or nature or both, to move around in realms not explored or only lightly explored. Those movements might be into regions new to the human race, such as the movements of mathematical physicists in recent centuries or the truncated efforts of Beethoven to compose new forms of music near the end of his life. Those movements might be movements that allow a new look at known regions. In any case, the movements should lead to further responses to certain thoughts God has manifested

in Creation, responses which change the shape of our minds, of our entire human beings, making God's thoughts our thoughts to some extent.

Our basic mental skills are variations on the ability to respond to our environments, abstracting to more general levels of understanding at times and nearly always using the abstractions which are built into our words and the contents of our minds. I speak of 'contents of our minds' here rather than concepts to make it clear that those contents come from God's Creation, from the thoughts manifested in Creation by our Maker. Those contents aren't perfect images of the Creator's thoughts, perhaps they're fuzzy or distorted in various ways, but they are some sort of images of those divine thoughts. But those contents change the mind which initially held them uncomfortably. This process leads to the development of more refined mental skills, sometimes erasing our inborn mental skills. In the end, there is no real separation of Einstein's mind from his mathematical physics. Lest I seem to be dehumanizing the man, I'll add his love of music and his very high levels of skill on the violin and piano were just as much a part of his being as was his physics.

I'm claiming that our creativity is a response, perhaps inappropriate, to God's manifested thoughts. Ultimately, our thoughts are imitations of thoughts of God, or perhaps our twisted understanding of those thoughts of God as found in our environments. Am I attempting to eliminate or at least greatly restrict the freedom of a creative man? If such men can only imitate God in His thoughts as manifested in Creation, how can there be freedom for a person living by way of established routines? Am I proposing a form of predestination that reduces mankind to a fraudulently creative race?

No, but I don't have a definitive explanation. I am motivated to find an optimistic answer by my own experiences and those experiences provide a partial self-understanding of my creative efforts as well as something of an uplifting feeling about my freedom when I try to respond honestly and without fear to Creation and its Creator. Creativity and freedom come from God and we can share in the divine freedom by responding to Creation, or in a more personal way to God, in the way of an apprentice who perhaps does nothing more than sweep his master's workshop but is, at least in principle, sharing in the experience of being a master craftsman as he watches and tries to learn. I can also say, perhaps at the risk of boasting, that I consider myself to be a creative thinker, one deliberately trying to shape his mind and activities as responses to Creation and the Creator and I don't feel

imprisoned or enchained. I feel as if I am sharing in God's own freedom during my bursts of creative thoughts, bursts which often follow only after months of frustrations and hard work. I'll add that my self-understanding indicates that I start proposing answers to a problem, working up a little narrative of sorts and then judge if it seems to be moving with the grain of the universe, to borrow a metaphor from Stanley Hauerwas who borrowed it from John Howard Yoder. I don't like moving against the grain or even across the grain, perhaps because I suffered too often from slivers when I was young. And so it is that I keep revising my proposed answers or narrative until I detect an okay from my Maker, not necessarily enthusiastic applause. I often get a feeling that God shrugs a little and says, "Well, that's not too awfully bad, so we can go with it for now." My feelings aren't hurt as I realize Creation is an awfully complex place for a bipedal ape and, anyway, God's standards can be pretty high though He accepts lesser achievements as we're learning.

We have a desperate need in the West, indeed in all regions of the earth, for creative thought, by parents trying to raise their children in a world where so many seek to deform the minds of the young ones to make them better targets for profitable activities, by local political leaders who don't yet seem to realize that town and city governments have been enslaved by the central governments, and by novelists and philosophers who might put our entire mess in a good perspective but don't. The last group, my own group, is usually my direct concern but many of my claims are intended for more general application.

The West is living off the gains of past successes and is, more or less, under the control of bureaucrats allied with motley crews of greedy and ambitious men whose major talent is simply grasping and holding on tight to what they seized from others. The West badly needs creative responses rather than simply more gadgets or more wars or more regulation by already bloated government agencies. Most certainly, we have no need for more corporate welfare programs. Unfortunately, such societies as ours has decayed into are the least likely to welcome creativity. Such societies are likely to actively suppress creativity, seeking to make the minds of their youths as rigid as those of the teachers and other bureaucrats. This is to say that a mind formed in response to textbooks and to the methods of modern educators will be about as flexible as a steel cog formed for a specific role in a particular machine.

We should be responding to God's Creation, not just to our raw percep-

tions of nature but to the best available past responses and the open-ended responses of the modern research programs. With proper modifications, this statement will be as true of future mothers and future carpenters as it is of future poets or metaphysicians, but I'll repeat that my current interest is in the realms of creativity in abstract thought.

If my tentative answer is right, then Creation itself must be a manifestation of God's acts which are somewhat open-ended from any viewpoint inside of Creation, bringing forth possibilities and not always certainties, but they are God's possibilities and we have to find those possibilities and then respond to them. Then we can share in the creativity and freedom of God.

# 110 Intentionality and Philosophical Thinking

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=673>. It was finished and uploaded on 2010/08/08.]

I saw this quote on the Internet recently:

I keep the subject of my inquiry constantly before me, and wait till the first dawning opens gradually, by little and little, into a full and clear light. [Sir Isaac Newton]

Newton knew how to think. In Thomistic terms, serious thinking is an intentional process, that is a process of growth or development. Or both in most cases. It must be an ongoing process, working at conscious and unconscious levels.

I was intending to develop, that is—grow towards, an explanation of my work which would be more revealing than my prior explanations, by a minuscule amount, but this quote from Sir Isaac Newton explains the matter from a different angle. What's missing from Newton's quotation is a more explicit recognition that this process he was speaking of is not that of a preformed mind somehow inching towards the truth but rather a mind in formation as it learns to respond to reality and to think the truth.

If you would come to a better understanding of Creation, then be always thinking, be always revising and enriching and expanding your understanding of created being in its limited and more particular forms and of Creation in its entirety.

Keep the subject of your inquiry constantly before you.

Keep the subject of your inquiry before you when you participate in the rituals of worship and when you participate in the rituals of cooking. Keep it before you when you fish or when you contemplate the wonder of young children splashing in a pool.

And remember that the goal is to make sense of what really is. There is no transcendental realm of building-block truths which somehow come into your awareness. God is Himself transcendental but we can only know as much of His life as He chooses to tell us. The deepest truths of Creation are to be found in the most abstract regions of created being and those abstract regions are found by the sorts of inquiries I've written of, the sorts of inquiries Newton was describing. As I understand Newton's words, he was telling us that the process of getting at the truths in empirical reality is not a controllable process of applying predetermined methods to data but rather a process of living in that reality in the fullest sense and shaping your thoughts, ultimately your mind, to that reality.

# 111 So What if the Human Being's Mind is a Product of Development?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=769>. It was finished and uploaded on 2011/02/19.]

I'm about 2 years late in writing a follow-up to Chapter 106, *So What if the Human Mind is a Product of Evolution?*, published on 2009/05/05. This is what I say in the first paragraph of that chapter:

Why do we resist changes in our beliefs about our selves, the world around us, and our relationship to God? Americans in particular, for all our claims to honesty about facts and for all our claims to have a hardheaded respect for reality, find it difficult to accept empirical evidence that we're not quite the creatures we think ourselves to be, that the universe isn't nearly the place our ancestors thought it to be.

We don't wish to see ourselves as developing over time, constrained and gifted in limited ways. We'd prefer to be born as some sort of higher-level creature who just is. This self-contained creature, living in the world but not inherently changed by interactions with that world, can do good if he wills. He can do evil if he wills. In either case, there is a persistent 'I' unchanged in fundamental ways by responses to reality. Along those lines, we think we can be smart without actually making the effort to acquire knowledge or to develop the intellectual talents we might have as a result of genetic inheritance or our early environments.

What are we at birth if we have no preformed mind, or—equivalently—preformed soul? We have brains which are inclined to respond to our environments and form relationships which are the beginning of those traits of our human being which we group together as the as-if- or pseudo-entity we call ‘mind’. In a sense, we’re born with what might be called a human-species brain, no one having all the raw talents which evolved over the millenia, but each one having some of those talents. (For the sake of speaking concisely, I’ll ignore those born with only small parts of a complete brain or with other severe problems.)

It’s becoming clear from modern brain research that human beings are not even born with a sense of ‘self’. That sense develops over time and is embodied in brain regions which are under very active investigation. Two related lines of research have indicated that so-called ‘near-death’ and ‘out-of-body’ experiences are due to disruptions of these brain regions which regulate our sense of self. See Chapter 8, *Staking Your Faith on Gaps in Empirical Knowledge*, for a discussion of news reports covering some of this research. One strong implication of this knowledge about our sense of self is that such a sense is unstable. At some level, we know this sense of self has developed over our lives and can develop further, in bad or good directions. But this isn’t comforting knowledge. It’s damned disturbing knowledge and we try to suppress it. Philosophers and theologians try to justify a permanent, and sometimes immortal self, by positing soul-stuff which isn’t subject to the development and decay of mere matter. Even for Christians who claim faith in an all-powerful God, an immortal soul seems a good hedge on that promise of a resurrection. Many skeptics and even some downright atheists seem to agree that some sort of a hedge is necessary even if they don’t believe in the possibility of life after death. Even most ideological Darwinists seem to write and talk as if we’re born as some entity which could be labeled ‘Person: John Smith’ and then die as the same person.

Many of my readers are likely to have read of these developmental processes in the brain which play a role in our sense of self. Many are also likely to know that the brain-regions of blind human beings adjust so that regions usually devoted to vision develop differently or even redevelop to ratchet up the capabilities of hearing or touch. We can quite plausibly conjecture that brain-regions devoted to physical movement were hyper-developed in Vladimir Horowitz, Fred Astaire, and Joe DiMaggio. The brains of mathematicians, adult musicians, and writers seem to be especially well-developed

in the language centers of the brain. Gauss was a genius in languages as a boy and was far from unusual for a mathematician. Einstein was particularly good in two subjects in those years we Americans call ‘high-school’—mathematics and Latin.

Gauss and Einstein went on to develop their minds in response to the abstract aspects of mathematics and physics. This doesn’t mean they were narrow-minded. Gauss was a very good practical businessman and Einstein was a good violinist and pianist. I’m sure that such men had other interesting and rich aspects to their total personalities. Certainly, neither was inclined to sit on a couch and wait for pre-packaged, that is—false, experiences to be presented to them.

We’re born with specific characteristics and specific talents which can be developed. We’re also born into specific environments which offer a limited number of opportunities. Within those pre-conditions and limitations, there’s a lot of room for becoming a moral creature or an immoral creature, a thinking creature or a non-thinking creature, an acting creature or a passive creature. A corrupted understanding of ‘intention’ would excuse us from our sins and failures, especially those which are comforting to us, by teaching us – falsely—that you’re a good man so long as you feel good about yourself. “My intentions are good, so I’m good even if I don’t have the courage or the faith to stick up for my professed beliefs, even if I don’t have the gumption to develop my talents as woodworker or amateur photographer or helper-of-neighbors. After all, I have television shows and DisneyWorld to fill my spare time.”

See Chapter 83, *What is Mind?: Is Christian Morality a Natural Morality?* and the next several chapters for responses to the book *How Brains Make Up Their Minds* [35], by the brain-scientist and philosopher Walter J. Freeman. In that response, I quote a couple paragraphs from that book:

I want to describe a neural basis for goal-directed actions that is common to both humans and other animals because it reflects the evolution of human mechanisms from simpler animals in which intent can operate without will. The concept of intentionality was first described by [St.] Thomas Aquinas in 1272 to denote the process by which humans and other animals act in accordance with their own growth and maturation. An intent is the directing of an action toward some future goal that is defined and chosen by the actor. It differs from a motive,

which is the reason and explanation of the action, and from a desire, which is the awareness and experience stemming from the intent. A man shoots another with the intent to kill, which is separate from why he does it and with what feeling.

Lawyers following in the steps of Aquinas understand and use these distinctions. Psychologists commonly do not. Philosophers have drastically changed the meaning of the term, using *intention* to denote the relations that a thought or a belief has to whatever it signifies in the world, but physicians and surgeons, again following Aquinas, have preserved the original sense in applying the word to the processes of growth and healing of the body from injuries, thus retaining its original biological context. I believe that animals have awareness, but not awareness of themselves, which is well developed only in humans. Self-awareness is required for volition: animals cannot volunteer. [page 8]

In fact, when you take that step towards that goal of, say, conforming of your own thoughts and those of your children to what is needed by an evil government which sends you checks and also threatens you in various ways, that step is your intention, not your not-yet suppressed desire to do what's right and certainly not your maturing justifications of your cowardly acts. You've become a slave of a sort, one enslaved—mostly—by being willingly changed to possess the behavior of a slave. And, yet, modern man with his strange belief that he is truly his consciousness, and—at convenient times—only distantly related to his body and its habits, needs to feel good. After all, modern man's not exactly intellectual in the manner of an ancient Greek philosopher-monk. His sense of self and his very self-respect is tied to that consciousness which is increasingly nurtured by a badly decayed educational system and the allied entertainment industry.

The real point within the context of this article is that we learn to think as slaves if we passively allow our brains to be shaped from the outside, even by a truly pious and intelligent master. We must respond actively to our environments to develop living and flexible minds. So far as I can tell, few human beings in this age develop living and flexible minds. In Chapter 102, *Active Responses are Necessary for Shaping the Human Mind*, I discuss research that showed that infants learn best by experience. I note that “one of the problems with classroom instruction as currently practiced [is that

it's] a passive and non-effective way of learning in which the over-burdened teacher is trying to push pre-processed knowledge into the heads of thirty students of varying talents and interests and levels of maturity." We do still worse when we put those poor students in front of television screens. I also don't think it's a very good situation for teachers who have a desire to teach and maybe even a liking, if not a love, for the subjects they teach. Such teachers would be the only active creatures in the typical classroom and they would be exhausted and frustrated by the effort to energize members of a passive and directed herd. At this point, one begins to appreciate the class clowns who display enough initiative to make jokes.

There is an interesting article on the *Scientific American* website: *Bringing Up Robots: Machines learn to walk faster, and better, if they figure out crawling first* found at <http://www.americanscientist.org/issues/pub/bringing-up-robots/1>. This article tells of indications that even mechanical learners, such as robots, can learn more sophisticated skills or behaviors if they learn by experience, by active responses to reality.

Robotics engineers have found their machines learn better by active responses to their environments as we continue a long and painful experiment of educating children by sitting them in classrooms, forcing them to learn habits of passivity, and then pushing textbook knowledge into their bored, little heads. Whatever this might accomplish, it doesn't nurture the process of developing minds in those children. We don't know how to properly develop minds because we have no plausible understanding of what a human mind is or even of what knowledge is. I've written on these subjects. Some of my comments are found in Chapter 107, *The Disembodiment of Knowledge in Modern America*. We don't know to develop our minds because we don't really know what it means to know.

Are we building a world in which robots will be active learners while human children will continue being passive, mechanical learners?

# 112 The Evolution of Language in a Rational World

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=788>. It was finished and uploaded on 2011/03/17.]

There's a review, *Language and spandrels*, at <http://johnhawks.net/weblog/>, the weblog of John Hawks, which discusses the question: "How can there be one grammatical structure for all human beings if there is no known way to see selective pressures for the rules of grammar?" As the review notes, the famous linguist Noam Chomsky did a lot of work on this question. I'm going to go off on my own to deal with this question from my viewpoint, but Professor Hawks' review is well worth the read.

I think that the possibility of selective pressures might arise if evolutionary theorists were to consider the rationality of the universe, a rationality which would show less clearly in the environments of an evolving species of apes, but it would show – physicists and philosophers didn't even need to know that there is such an entity as the universe before they began to speculate about a rational all-enclosing something, cosmos or whatever. If we live in a rational universe, a universe which isn't just an as-if way of speaking of a collection of arbitrary environments, there might then be selective pressure on grammatical structure forcing it to correspond to that rationality.

In my understanding of matters, the rationality of human beings is a result of our minds being shaped in active response to that rationality which shows up in our environments. We don't bring pre-existing minds to the task of understanding our environments. Our minds are the result of actively responding to those environments as we seek to survive, prosper, and maybe understand. To develop those minds, we had to have proper brains

which I'll treat as being 'racial minds' or maybe the evolved biological foundations of mind. For those minds to be rational, that rationality had to be present in the environments to which we respond. How else can we explain it without sneaking in a dualism?

Brain-scientists, and perhaps most biologists, seem to be at least roughly describable as Jamesian pragmatists. In Chapter 84, *Pragmatism and Thomistic Existentialism*, and Chapter 86, *More on Pragmatism and Thomistic Existentialism*, I discuss this issue by way of responding to a book, *How Brains Make Up Their Minds* [35], written by the brain-scientist and philosopher Walter J. Freeman. Freeman sees the development of the human mind in terms of an organism actively responding to its environments. This modern view is essentially the view taught in the 13th century by St. Thomas Aquinas. In fact, Freeman claims Aquinas to be the major thinker who provides the best foundation for modern science. At the same time, Professor Freeman remains a pragmatist where I've expanded Thomistic ideas to consider greater possibilities for the other 'party' to selection—created being at the level of environments or the universe or even all of Creation.

In my way of making greater sense of this, there are three levels of evolution/development over which this shaping takes place: the human race as a whole, local communities, and the individual. The human 'racial mind' is shaped largely by proper responses to environments by way of natural selection, that is, those family lines were selected which had brains which could develop proper minds to carry out the abstract reasoning processes important to human survival and prosperity. There was probably no turning back for the human race once dependent upon rationality and abstract mental skills. Various evolutionary and development processes also take place at the level of communities up to the scale of civilizations as well as at the individual level.

I'm conjecturing that human grammatical structures have evolved and developed in a parallel way. It might even be proper to speak of the two processes as being two currents in the same streams of evolution and development of human organisms.

At the same time, it's clear our current actual languages are not sufficiently rich and complex to allow us to speak and write truthfully about the world in its rich and complex wholeness. We might have a subset of the greater grammatical structure which would meet the needs of discussing the rationality, not strangeness, of quantum mechanics while still being usable

to form effective political arrangements, to make profitable business deals, and to describe the joyful and innocent beauty of children at play. If my way of understanding created being is true, then this would be the case: we could find greater possibilities of speaking wider truths if we ascend from our relatively concrete languages to languages with greater capabilities for discussing abstractions in the way that mathematicians ascended from finger-countable numbers and perceptible geometrical figures to numbers greater than ordinary infinity and geometrical ‘figures’ with an infinity of dimensions. In Chapter 107, *The Disembodiment of Knowledge in Modern America*, I give a summary, in the context of a particular problem, of my background views on the nature of knowledge and of the human mind including my claim that concrete being is shaped from very strange stuff which I call abstract being—as a first step, think of this abstract being as something on the ‘other side’ of the so-called Big Bang.

So it is that an interesting question has risen: How can we expand our ways of speaking and writing to meet needs beyond those of our long-ago ancestors? Can I do more than speak vaguely about such an expansion?

In my freely downloadable novel, *The Open Independence of the Seas*[45], the protagonist tries to expand the grammatical possibilities of human language by developing grammatical structures corresponding to the elegant algebraic notation developed by the physicist Paul Dirac for working with the state vectors of quantum mechanics. The protagonist of my novel wished to speak more richly of the uncertainties as well as the realized and unrealized possibilities of human life. Take this novel as a first step into the unknown, not a serious proposal. In any case, this is a possible step only because the human mind can think and speak, however clumsily and formalistically, about empirical matters as strange as the workings of matter and energy at the level quantum physics deals with. I chose a mathematical expansion in that novel rather than one reflecting the new and poorly understood possibilities of life in densely populated and technologically advanced civilizations only because we’ve seen mathematics derived from concrete levels of experience being expanded into abstract forms quite capable of dealing with quantum mechanics and a lot more. We concrete creatures have clearly not learned how to deal with or even speak about the abstract relationships of modern social and political life.

We have to remember a strange fact: the possibilities of transfinite set theory and quantum mechanics did somehow come into existence in the human brain as our ancient ancestors were selected to have the brain com-

ponents which allowed them to count on their fingers. I suspect something similar happened in regards to human languages.

# 113 Writing Philosophy the Way that King David Wrote Psalms

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=805>. It was finished and uploaded on 2011/04/11.]

King David and other ancient Semitic poets, at least those I know of from inclusion in the Bible (some of the Semitic poetry in various works of the Bible was non-Hebraic), would use repetition in various ways, not always exact duplication of the lines but perhaps providing more examples or even saying the opposite in an ironic tone. The book of Job is largely made up of three cycles of poetic conversation amongst Job, Eliaphaz, Bildad, and Zophar; it's far from clear that a modern writer, in perhaps the way of Hemingway at his worst, would have provided more than one cycle of a few points organized in the way of a high school textbook summarizing the U.S. Constitution.

The psalms, as I noted, are often made up of ascending or descending examples of God's greatness as a creator and the corresponding greatness of the Davidic monarchy. The lesser accomplishments of God or David are followed by to the greater and the greater are followed by the lesser. God is in the big picture and in the details as well. It's not clear such writings would make it past the review of a professor at a famous writing school, or perhaps another such place.

I find that I am also repetitive, sometimes cycling around in the way of a song dominated by its refrain. The theologian Stanley Hauerwas had told me my writing was repetitive at times and said it was maybe appropriate for someone teaching new ideas. I think it to be even more appropriate for one who's reshaping his own mind by his writing and is asking—or daring—his readers to do something similar. I don't expect anyone else, wouldn't want

anyone else, to reshape their minds to be the same as my moving-target mind. I do hope they will respond to my writings, to their own experiences, to the other material they decide to study or read, so that they can reshape their minds in **a way** appropriate to Creation as we modern men are coming to know it—in light of the still valid traditional knowledge and exclusive of the now invalid traditional knowledge.

Rhythms. Let the thoughts ascend to some point and then maybe descend to the valley again, maybe jump down at once, and re-ascend.

I suspect this sort of a teaching technique would better allow learning even in highly technical fields such as mathematics or computer science or chemical engineering. It may be one of the reasons behind the advice a mathematics professor once gave in one of my undergraduate classes. “I chose two textbooks of different styles for the bookstore to order, but I think you’d be better off reading each at different times and also reading other textbooks along with some of the original papers underlying this subject.” I believe it was a course in abstract algebra. Anyway, the use of multiple and varying styles of presentation and varying selections of what’s most important would lead to a rhythmic way of shaping a mind to encapsulate this sort of material. Move back and forth between different presentations. For all the various presentations of material, move between active learning and contemplation.

Get into a rhythm of thinking and learning that will allow a fairly rapid yet gentle reshaping of your mind, not a reshaping to someone else’s needs or desires but rather a reshaping to encapsulate some plausible understanding of God’s Creation.

# 114 A Speculative Framework for Understanding Mental and Emotional Illnesses

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=884>. It was finished and uploaded on 2011/06/08.]

[In this essay, I'm suggesting a speculative framework and not any cures for these serious disorders of the human mind and soul. At the same time, this framework—if appropriate—would guide researchers and clinicians in developing palliatives or cures. Mostly, I'm pursuing my goal of understanding the human mind as the immaterial relationships a human being forms as he responds to his own body, to his physical environments, to the entire universe, and to God. Much of the framework was implied in the explanation of Thomistic intentionality in *How Brains Make Up Their Minds* by Walter J. Freeman. This view of intentionality as an organic growth occurring as the organism responds to its own body and to its environments was taught by St. Thomas Aquinas in the 13th century.]

I claim, following St. Thomas Aquinas and others, that we're bodily creatures having immaterial aspects, such as mind-like aspects, which are formed of relationships to our environments and to still greater realms of created being understood properly or understood by way of delusions. I'm using some recent research results to ask if such problems as OCD (obsessive-compulsive disorder), bipolar disease (used to be manic depression), and maybe even schizophrenia are due to not being able to properly orient ourselves in our environments, not being able to move about in a coordinated manner, not being able to make flesh-and-blood contact or even just not being able to establish eye contact with our fellow-creatures, and

so forth. This isn't to deny that something can be wrong inside of us, but it is to raise the possibility that psychiatric and mood disorders can be caused by problems in the neuro-muscular or skeletal systems of our bodies and also to raise the possibility that they can be caused by simple problems of coordinating our perceptive or locomotive efforts. I believe they can also be caused by delusionary expectations about our own bodies or what lies around us. These delusionary expectations can arise from our culture or from our upbringing.

This sort of a view of cognitive and emotional and social problems is entirely consistent with, perhaps a necessary conclusion drawn from, my claim that men are physical creatures whose immaterial components arise from their relationships within Creation, including their relationships with God in His freely-chosen and self-constrained role as Creator.

A mouthful and one easily distorted into literalistic forms.

Let me qualify away one potential distortion. Created being lies on a spectrum from highly abstract forms—the truths manifested by God as the raw stuff of Creation—to the concrete forms of being in this universe—things and the constituents of thing-like being such as electrons and quarks. An easy way to enter into this way of thinking is to contemplate my analogical claim that thing-like being is frozen soul-stuff, where the soul-stuff lies close to that raw stuff of created being, that is, the truths manifested by God as the foundational being of Creation.

I think we do little good by talking or acting as if there were some sort of soul or mind or psyche hiding inside of that human being, whether he is as well-balanced as can be or whether he is deeply disturbed. We would do far better in understanding our own possibilities and also the troubles of disturbed human beings if we were to think of our human selves as fundamentally physical creatures which gain immaterial aspects by forming relationships with our fellow human beings, other creatures, our physical environments, the narratives in which we live, and—last but certainly not least – with the Creator who is telling these stories including the larger-scale story which is the universe as it moves towards the fulfillment of God's purposes.

Another mouthful.

Let me get to some specific examples.

## 114.1 I'm washing my hands for the fifteenth time without a break; I must be obsessed with germs

In a recently published article, *OCD: Compulsions Lead to Obsessions, Not the Other Way Around* found at <http://www.sciencedaily.com/releases/2011/05/110523101915.htm>, we learn that there is scientific evidence that “the behaviours themselves (the compulsions) might be the precursors to the disorder, and that obsessions may simply be the brain’s way of justifying these behaviours.” Other groups of scientists may well present counter-evidence, but I’ll take this quite plausible result as being true for now. Given my understanding of the human mind as being certain sorts of relationships we establish starting with our own selves and body parts...

We can stop there for now. When we suffer from OCD, something has been disrupted in our shaping of the mind which is capable of forming the higher and more complex habits of a human being, and most likely a few other social mammals as well. We need habits. In fact, most of our behavior, including that which is labeled ‘moral’, is made up of habits—see Chapter 385, *Is this evidence against free-will?* for a discussion of evidence that our bodies start moving before there is any activity in the regions of our brain associated with abstract reasoning, planning, and other faculties related to free-will.

We form habits and my claim is that we become morally healthy human beings when we form habits and inclinations so that our bodies respond properly when, say, we hear the scream of a child in danger. We fool ourselves when we think we can make the right decision when courage or resistance to temptation is needed. There is no time and we’re very likely to freeze if we try to evaluate each situation, balancing moral demands with prudential considerations. Even in lesser situations, we have not the energy to be constantly making a conscious decision to open the door for a woman with a cane or to go back a few steps to pick up a fallen object for another woman on a walker. How about getting behind the wheel of a car after having that one drink too many? With ten beers in you, you’re probably not going to be very coherent in your moral reasoning. Should we cheat a little on that light that’s already been yellow for a couple of seconds? You have a very small fraction of a second to make that decision—those higher regions of the brain don’t work so quickly.

Forming habits is something we do often and well. After all, we're descended from creatures which survived and reproduced successfully because of good, or at least adequate, habit-formation. When it comes to habit-formation, the difference between human beings and other higher animals, such as bears, is that human beings can take conscious control of the process, guiding it towards moral purposes and then to prudential purposes as a secondary matter.

We shape ourselves by responding to our own bodies and our immediate environment. This shaping results in habits of various sorts, such as those of cleanliness. If something goes wrong, a brain-circuit is set up in our motion control systems and signals continue to flow. We stand at the bathroom sink and wash our hands over and over and over again. Our higher brain regions come into play, justifying this strange behavior by generating a fear of germs or dirt. What should happen is that our higher brain regions should come into play to censor our behavior and cut off the handwashing at a reasonable point – some say they were taught to sing the chorus to *Happy Birthday* three times as they washed their hands, not 100 times. If the victims of these compulsions were to have a better understanding of the way that human beings form habits, they might be able to better deal with both the wrongly formed habit and the self-justifying obsessions.

## 114.2 My tummy bothers me, for the tenth day in a row, and I'm grumpy. I'm settling into this rotten mood

There are two recent studies related to this link between stomach troubles and anxiety or depression. First, in *Gut Bacteria Linked to Behavior: That Anxiety May Be in Your Gut, Not in Your Head* found at <http://www.sciencedaily.com/releases/2011/05/110517110315.htm>, we learn that “[R]esearchers at McMaster University have conclusive evidence that bacteria residing in the gut influence brain chemistry and behaviour.”

This reinforces the point that we are physical creatures. In fact, those who are old enough might have known some psychiatric patients on old-fashioned anti-depressants. Those medicines were chemical sledge-hammers which dramatically altered the balance of certain brain chemicals and it turned out that those chemicals were also used for other tasks in the human

body. For example, they helped to neutralize poisons in some of the foods we eat. Patients on those old-fashioned anti-depressants couldn't eat aged cheeses and certain other foods unless they wished to risk death.

Can we respond to our bodies, to our friends, to the world, in a friendly manner when bacteria in our stomachs are perhaps causing us constant upset or perhaps putting bad chemicals into our bloodstreams?

So, it shouldn't surprise us to also learn that *Digestive Problems Early in Life May Increase Risk for Depression, Study Suggests*. The article, found at <http://www.sciencedaily.com/releases/2011/05/110512171517.htm>, tells us:

Depression and anxiety may result from short-term digestive irritation early in life, according to a study of laboratory rats by researchers at the Stanford University School of Medicine. The findings suggest that some human psychological conditions may be the result, rather than the cause, of gastrointestinal disorders such as irritable bowel syndrome.

When we're constantly struggling against a digestive system which is not functioning quite right, we feel bad in a persistent way and we're using a lot of energy. We might be thrown directly into a blackish mood or perhaps fall into one due to exhaustion. There are forms of exhaustion which are cleansing—such as serious physical activity after a long winter, but being constantly tired certainly leaves me feeling rotten. Let it last a year or more, and the rotten feeling might well have settled in.

In my case, I seem to fall into blackish moods, paranoia, when I'm suffering a problem, allergies or a sinus infection, which would be pumping up my histamine levels. Histamines can have a powerful effect on the brain, and the relationship to paranoid moods is certainly plausible. In addition, a constantly enraged immune system drains a lot of energy. Something common to allergies and sinus infections and colds puts me into those blackish moods, but I know the patterns even if I'm not sure of the exact cause. I adjust as well as I can for that pattern in my mood and that makes my life easier and perhaps eliminates some unpleasantness for those around me.

We're physical creatures, but we're called to higher moral states. This means we need to be aware of these various situations, in our own selves and in others around us, that we might provide proper moral guidance, to our own selves and to others. Once we become aware of our physical

natures and the ways in which we form our immaterial aspects, mind-like or soul-like aspects, we become responsible for responding properly to our selves and to other creatures, to the world and to its Creator.

Know yourself if you would be a morally responsible creature. That means you should know your digestive system and your... posture?

### 114.3 I can't position my body correctly and I'm out of sorts

Because of a more complex situation, I'm going to provide a longer quote from this article, *Bipolar Disorder and Postural Control: Mind-Body Connection Suggests New Directions for Treatment*, Research found at <http://www.sciencedaily.com/releases/2011/05/110524111349.htm>:

A new study by motor control and psychology researchers at Indiana University suggests that postural control problems may be a core feature of bipolar disorder, not just a random symptom, and can provide insights both into areas of the brain affected by the psychiatric disorder and new potential targets for treatment.

Problems with balance, postural control and other motor control issues are frequently experienced by people with mood and psychiatric disorders such as bipolar disorder and schizophrenia, and neurological disorders such as Huntington's and Parkinson's disease, but research into the connections is scant.

If problems with postural control—maintaining balance while holding oneself upright—are a core component of bipolar disorder, as the study indicates, the researchers say it is possible that the motor abnormalities could appear before other symptoms, signaling an increased risk for the disorder.

It raises the question of whether therapies that improve motor symptoms may also help mood disorders, said Amanda R. Bolbecker, lead author of the study "Postural control in bipolar disorder: Increased sway area and decreased dynamical complexity," published last week in the Public Library of Science ONE.

I included the last two short paragraphs so that the scientists who did the study and the writers at the *Science Daily* website not be blamed for a couple of claims I'll be making. After all, there is greater uncertainty in this case as to whether there is a simple cause-and-effect relationship. That's a signal to be cautious in drawing conclusions, but I'll move forward anyway because my goal isn't to 'explain' bipolar disorder but rather to support my claim that we are physical creatures which form complex networks of relationships even with our own bodies.

There might be an experiment that will induce temporary bipolar symptoms (not necessarily all of them) in a human being without that disorder being present. Perhaps a scientist could burden volunteers with something that will leave them fighting constantly to orient their bodies properly, maybe putting weights on one side of the body or putting a brace on the lower back. Maybe it could be done by way of glasses that make it difficult to keep a proper posture or even by a buzzing sound that induces vertigo.

If a man or woman, boy or girl, has a body that won't hold a proper posture, would we expect them to have healthy attitudes? Wouldn't they be more or less constantly tired, just as if they were suffering constant stomach problems? They're responding to a world that's not quite oriented properly, even if it's their own bodies that are actually mis-positioned. They respond but the world's not quite positioned right when they reach out to grab something or even to move toward a loved one. And finally do the pressures build up and Lord Byron, who had a club-foot which would have disrupted his posture, is writing poetry at a frantic pace.

But, his case is complicated by the regularity of the depression and the headaches which came on as winter approached and also by the schizophrenic condition of some relatives on his father's side and the known genetic tendency of the males of his mother's clan—the Gordons of the Scottish highlands—to bipolar behavior. A human being is a complicated story even in his clinically diagnosed problems – which may involve relationships not easily investigated or even noticed by the clinician.

## 114.4 I seem to be in a story, but it's all blooming, buzzing confusion

What of schizophrenia? Let me first refer the reader to a multi-disciplinary discussion of two parallel phenomena, modern styles of thinking and art on the one hand and schizophrenia on the other hand: *Madness and Modernism: Insanity in the Light of Modern Art, Literature, and Thought* [126] by Louis Sass, a clinical psychologist who is also quite knowledgeable in the fields of literature and art and history and more.

We modern human beings are all schizophrenics, in a manner of speaking, though most of us have lost contact with reality in its wider and more abstract respects, including its narrative aspects in this world, without being aware that something's wrong. See Chapter 348, *My Ends are Mad and Now I'm Also Stupid*, for a discussion of the fears of Melville and other great thinkers of the 1800s that Americans are morally insane, in rebellion against a world that doesn't quite meet with our approval—though most are in a cowardly sort of rebellion.

I could restate my major goal in my philosophical and theological work in this way: I'm trying to restore sanity to modern human beings, especially Christians, by turning their attention to God's Creation and by teaching them they should be responding to God's Creation, actively responding to reality and not to some self-serving understanding of reality. But let me turn to a discussion of schizophrenia as a specific clinical disease with a group of symptoms which leave the patient in a terrible state, though sometimes with a self-awareness of his or her state of absolute mess and sometimes even a humorous appreciation of the 'craziness' of his delusions.

If we read Professor Sass' book and pay attention to the stories told by some of the more interesting cases, we learn of someone who was apparently insane in an obvious way though given to a certain poetical way of speech (the daughter of James Joyce), and we learn of someone who has a grand understanding of the cosmos in which he is some sort of central figure wired to each part of this universe and controlled by all those parts—or maybe he controls the universe, and we get more general summaries of those who simply construct nonsensical narratives to make sense of their lives.

The other point I'd like to raise from *Madness and Modernism* [126] is the possibility, perhaps likelihood, that schizophrenia, as currently defined, developed in the industrial age, but I'd also like to note a seemingly con-

flicting claim by Julian Jaynes that ancient man was schizophrenic and experienced life as a narrative guided by voices in his head. (See the wikipedia article on Professor Jaynes, at [http://en.wikipedia.org/wiki/Julian\\_Jaynes](http://en.wikipedia.org/wiki/Julian_Jaynes), for a discussion that seems pretty good to me and remember that Professor Jaynes is speaking about an age when human beings were being forced to live in radically new ways as human communities grew in size and complexity. This implies to me that schizophrenia is a disorder found in those who have little ability to respond to complex social patterns. Those human beings are depending upon rigidly practiced habits learned from their communities. When those learned habits are inadequate during periods of rapid change—schizophrenia becomes common.) Professor Jaynes didn't put it in narrative terms, to my recollection of reading his major work on the subject 20 years ago, but it was clear the voices provided purpose and moral guidance—they were perceived as gods such as the ones which were some sort of manifest idealizations of human emotions and virtues in the *Iliad*. In fact, Jaynes thought the voices would appear as volition, the decision-maker for befuddled creatures which had not yet learned to integrate higher self-awareness and various sorts of abstract reasoning into their 'core selves' (my term).

We respond to what lies inside of us and outside of us by trying to create a narrative of our own lives and, usually, at least an implicit narrative that corresponds to what I call a 'world', an entity which – in my highly abstract way of thought—is unified, coherent, and complete. It is the universe, or some part of it, brought to moral order.

If the process of creating these narratives fails? It would certainly be plausible to get the sort of confusion and disturbance we read about in the *Iliad* or in the analyses of the American separation from reality we find in the writings of Tocqueville, Hawthorne, Melville, Henry James, Sr., and more recently Flannery O'Connor, Ray Bradbury, and Graham Greene (in at least the one novel – *The Quiet American*. But it seems to be a regularly recurring element, if often in the background, of serious American fiction or serious fiction containing American characters. It can certainly be found in my novels, most especially in the freely downloadable novel, *A Man For Every Purpose* available at <http://loydfueston.com/downloads/aman.pdf>, in which a man fragments in his efforts to make sense of conflicting demands upon him.

## 114.5 Conclusion

We shape ourselves in how we respond to our own bodies and to what lies outside of our selves. Most of all, when we speak of final purposes, we shape ourselves in how we respond to our Maker, or refuse to respond to Him.

When something goes wrong, we should remember that there is no isolated human soul or mind or consciousness which is diseased or disturbed but rather a system, in a manner of speaking, which is an organism failing to shape itself in an appropriate manner as it responds or fails to respond to its own bodily parts and to what lies outside of it. What's wrong probably can't be located in any one entity but rather in the relationships which the organism is failing to properly establish.

# 115 More on Madness and Modernity, and a Hint of Optimism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=911>. It was finished and uploaded on 2011/07/01.]

In several weblog entries, starting with Chapter 91, *A Thomistic Take on Madness and Modernism*, I've spoken of the insight of the psychologist and polymath Louis Sass that there is an eerie similarity between schizophrenia and modern styles of art, literature, and thought. I'd highly recommend a serious read of *Madness and Modernity: Insanity in the Light of Modern Art, Literature, and Thought* by Sass for a wealth of good historical information about schizophrenia and modern art, literature, and thought. He also includes discussion of particular cases, including the sad case of the daughter of James Joyce who was, in the analysis of Carl Jung, chained to the bottom of the river of madness that her father dived into for artistic reasons.

I'd also noted that “[s]chizophrenia is a horrible disease, one in which the victim loses contact with reality even in its most immediate form—that victim’s environment.” I’ve run into at least one man and two women suffering from this disease—just in the past 10 years and without looking for them—and, even when they were in fairly calm mental states, they seemed to be going through a constant process of inventing their own world which was sometimes just implausible but sometimes involved deeply strange ignorance about reality. Sass had noted that some who suffer from schizophrenia are aware of their strangeness and they express their madness in humorous terms instead of terms of ignorance. When one of these poor human beings

is off their meds (medicines), as they say in the business, or when their meds no longer work, they can be really strange. When their meds ‘work’, this sometimes means their personalities have been flattened and their general metabolisms slowed to a sluggish rate.

One of the questions Professor Sass raised had to do with what might be called the complex of symptoms which are displayed as schizophrenia. As a practicing—and academic—psychologist, he had no doubts about the reality and the horrors of this disease, but he noted that there is very little evidence of those particular symptoms in Europe before 1780 or so, though there were many alienists (psychiatrists, more or less) of a humane nature who were keeping diaries and other records from at least later years in the Medieval Age. Though the problems which erupt in this specific disease are real, it seems possible that the cluster of symptoms we call schizophrenia is a result of particular social conditions, those of the Industrial Age, to speak in broad-brush terms. Perhaps some of us, maybe all of us to some extent, aren’t so well-adjusted to some aspects of modern life? This doesn’t mean that modern life is bad for us, only that we have to maybe change some parts of it and to maybe shape our own selves to better deal with, for example, the modern empirical knowledge about reality which is so poorly integrated into our ways of thinking and acting. Perhaps we don’t readily expand our minds to deal with knowledge of what lies outside our direct environments? Perhaps we haven’t got this industrialization business right yet? Perhaps we need to work on our ways of living in dense regions and of forming human communities? There are many such questions we could raise.

Recently, I heard of neuroscientists who have found leads about the nature of schizophrenia which might lead to causal understandings. In the June 11, 2011 podcast of *Neuropod*<sup>1</sup> at <http://www.nature.com/neurosci/neuropod/index.html>, there’s an interesting talk about a fairly recent discovery that being born in an urban area is correlated with damage to one brain region with that damage being associated with schizophrenia. Moving to an urban area is correlated damage to another brain region with that damage also being associated with schizophrenia.

This doesn’t mean that urban living, as such, is bad, though it might be bad for some no matter what we do. Undoubtedly, rural life is also

---

<sup>1</sup>Neuropod is “the neuroscience podcast from Nature, produced in association with the Dana Foundation,”

bad for some. It does mean that it's about time we, as individuals, stop accepting what we're given by governments and all their institutions and stop living with only what the commercial marketplaces offer us. It's time for us to think about what's not good in our ways of living, what might end up being even worse for our children, and to look for what we need or want. Some governments would respond morally to complaints about the way in which public services are provided or complaints that these services are provided by monopolistic institutions, though probably not the self-serving and bloated governments of this age. Free markets would definitely respond, perhaps with a fresh population of service-providers and product-providers. That's the nature of a free market. You shouldn't, for example, be satisfied by public or private schools that don't meet your children's needs. You should try to start your own or make it clear you're looking for some competent and entrepreneurial teachers for your children or for yourself. Or, if you're an autodidact, you go looking for books, lectures on tape, packaged 'experiences', etc. that meet your needs. Exercise your imagination and only limit it to being sane, that is, being responsive to reality. (See Chapter 373, *Keep the Imagination Sane* for a short discussion of Nathaniel Hawthorne's advice to this effect.)

Perhaps we modern people often mimic schizophrenia in our art and literature and thought because we're natural creatures who evolved to shape ourselves to particular sorts of environments which were mostly given to us and not made by men. We modern human beings live in artificial environments to which we're not adapted but we accept them as if they were given while not being able to shape ourselves to those environments. We aren't willing to give up all those gadgets but we don't explicitly try to make these modern environments of gadgets and dense populations and complex human communities into environments more suited to our needs.

There's a mismatch between our insides and our outsides. We imagine an external world to match our insides and there is now an observable strangeness in us. We seem oblivious to the most raw of facts when those facts conflict with those imaginary worlds. Alexis Tocqueville wrote of this strange aspect of the American character in *Democracy in America*, circa 1838.

Having dealt with our disturbing external environments, we modern human beings try hard to see ourselves as sane and well-adapted and the harder we try, the more we separate our thoughts and actions from reality. I think this is the first time I've tried to tie the American disrespect for facts

directly to the schizophrenic nature of modern art, literature, and thought. I also think we should include political and economic activities in those parts of modern life which show schizophrenic traits. Our schizophrenic traits are the result of a defensive withdrawal from environments become disturbing to us and we don't have the faith or the inspired leadership to overcome our fears of those environments and to deal with them, to shape ourselves to those environments or to change them.

The interested reader can read about my views of the American disrespect for facts in Chapter 28, *The Practical Consequences of Inattention to God's World*. You could also download and read a darkishly humorous novel I wrote about the insanity which threatens all of us modern folk: *A Man for Every Purpose* at <http://loydfueston.com/downloads/aman.pdf>.

# 116 Take Care of Your Brain, It's the Only One You'll Have

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=956>. It was finished and uploaded on 2011/08/01.]

We're flooded with information on the bad things which can happen to the brain and with some advice, or at least implied advice, on how to avoid many of them. For example, we Americans are obsessed with sports in which violence has become the main point of it all. We also send a significant percentage of our young men and women into military situations (not just in battlefield units) where they risk brain injuries as we learn in the article, *Single Traumatic Brain Injury May Prompt Long-Term Neurodegeneration* found at <http://www.sciencedaily.com/releases/2011/07/110718171401.htm>.

There are other causes for neurodegeneration, including the problems leading to Alzheimer's and to other forms of dementia. In this article, *Over Half of Alzheimer's Cases May Be Preventable, Say Researchers* found at <http://www.sciencedaily.com/releases/2011/07/110719072809.htm>, we can read:

Over half of all Alzheimer's disease cases could potentially be prevented through lifestyle changes and treatment or prevention of chronic medical conditions, according to a study led by Deborah Barnes, PhD, a mental health researcher at the San Francisco VA Medical Center.

Analyzing data from studies around the world involving hundreds of thousands of participants, Barnes concluded that worldwide, the biggest modifiable risk factors for Alzheimer's disease are, in descending order of magnitude, low education, smoking,

physical inactivity, depression, mid-life hypertension, diabetes and mid-life obesity.

In the United States, Barnes found that the biggest modifiable risk factors are physical inactivity, depression, smoking, mid-life hypertension, mid-life obesity, low education and diabetes.

There is another article of interest, *Physical Activity Linked to Lower Rates of Cognitive Impairment* found at <http://www.sciencedaily.com/releases/2011/07/110719101755.htm>. Lest we miss the message, we can also about some supporting information in the article *Keeping Up Your Overall Health May Keep Dementia Away, Study Suggests* found at <http://www.sciencedaily.com/releases/2011/07/110713161824.htm>.

We're strange creatures in many ways. Rational we are, potentially, but we form habits which are in conflict with what we know or can easily learn and we don't bother to work on changing those habits.

Can we be saved by chemicals? Will the drug industry provide us with silver bullets for our cancers and cholesterol problems? Will they give us happy pills one day, turning each of us into a two-legged Golden Retriever just soaking in our own deep puddles of dopamine? Well, the brain didn't evolve to make us happy and it's unlikely that we can force it to just make us feel good all the time. After all, a lot of our problems, including much of our general feelings of—in a manner of speaking—alienation, are for real. We need to learn how to deal with them. We need to feel an energizing level of upset when it's the world which is wrong and needs changed. We need to learn how to achieve a certain wholeness which allows us to function in our physical and social environments in such a way that we can feel some sort of purpose and detect some sort of meaning in the flow of events which are our lives and the greater stories in which we're embedded.

We shouldn't be surprised to learn from the article, *Patients Who Use Anti-Depressants Are More Likely to Suffer Relapse, Researcher Finds* found at <http://www.sciencedaily.com/releases/2011/07/110719121354.htm>, that we shouldn't depend upon chemical aids, though they may help. At the same time, we should remember this is a field of incomplete knowledge to say the least and is likely to remain incomplete since man is a creature in context and that context is ever changing. In addition, we should remember there are a number of complications and possible data problems in any complex meta-analysis—

see <http://en.wikipedia.com/wiki/Meta-analysis> for an explanation of this form of statistical analysis. There is an art to combining the potentially incompatible data of a number of independent studies. I say we shouldn't depend upon chemical aids partly for the reasons of "moral purpose" discussed above and partly because of comments I've read in the books of serious brain scientists to the effect of: the brain is so complex and complicated that there will be no easy chemical solutions to reset a brain which is tending strongly toward a bad state. The psychologists who conducted the meta-analysis discussed in the article say much the same.

I've hit upon this general issue of brain/mind health repeatedly and I'm do so again partly because of the likelihood the West, Western Europe and Central Europe and the United States in particular, are about to pass through some rough times. In a strong sense, we have minds which are shaped to one extent or another as reflections of this world of decaying moral order, this world in which we seem to have lost purpose and meaning.

We need to remember we have some significant amount of control over the shaping of our own minds, so long as we truly intend to have such control, that is, so long as we make the long-term effort to develop our minds in the way of an organ which is part of a greater organism. In particular, we need to keep our brains healthy and use them to shape minds which can support a new phase of Western Civilization or maybe a civilization so different as to gain a new name from historians. The minds we shape will be that new civilization.

# 117 Following My Own Advice

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1010>. It was finished and uploaded on 2011/09/07.]

In Chapter 110, *Intentionality as the Guide to Philosophical Thinking*, I discussed this quote:

I keep the subject of my inquiry constantly before me, and wait till the first dawning opens gradually, by little and little, into a full and clear light. [Sir Isaac Newton]

I write often about my efforts to find better ways to describe and analyze our complex and complicated selves, our human individual selves and our human communal selves. This is not simply a matter of laying out a system of thought in a book or a few papers. Even something so seemingly straightforward to us as double-entry bookkeeping was considered for centuries to be a matter to be tackled only by those who could do higher mathematics. It took time for the ideas to properly shape the minds of modern men to those accounting ideas so basic to modern economies and the theories which try to understand them. I suspect that my proposal to learn how to speak of the richness of all created being, including human nature and human communities, from the ways that modern empirical thinkers have adopted to speak of electrons and protons, gravity and electromagnetism is at least as upsetting and intimidating to modern men as double-entry bookkeeping was to our 15th century ancestors. In fact, as I've noted many a time, I think that some historians and many novelists and more than a few brain-scientists, have done much to give us richer and more complex ways to discuss and analyze human nature and human communities. But the overall view we modern men hold of ourselves and our communities is

fragmented and incomplete, not just compared to some vague idea of the perfect and full truth but in comparison to what we could do.

It takes time. We must “keep the subject of [our] inquiry constantly before [us], and wait till the first dawning opens gradually, by little and little, into a full and clear light.” We must intend to the state of fully minded creatures who can kind of, sort of, almost for just a second at a time, see and feel and think of the fullness of created being in a manner consistent with what’s known of those aspects of created being studied by modern mathematicians and physicists.

And so it was that yesterday I was walking down the street as I cooled down from a run and I found myself trying to bypass the geodesic curvature stuff and to visualize myself moving in the appropriate way to be sure I was walking a great circle. Feet pointed straight down to the center of the earth. Check. And I’m walking straight as if continuously being sliced in half by a plane connecting me and my goal and also passing through the center of the earth. This is to say, in terms of differential geometry, that the unit normal vector to the surface of the earth lies on the same plane as the principle normal to the circle implied by my journey from here to my goal. Then again I could think in terms of a zeroed-out geodesic curvature. This is the more fruitful way of thought since it leads more naturally to abstract rules for curves. And that is the point: to be a human being trying to learn how to think by responding to the ideas the Creator has manifested in Creation, that is, to keep in mind the concrete facts but to also mindfully encapsulate the underlying abstract truths. That way lies a more complete and more perfect understanding of created being and the possibility for a better understanding of the story God is telling with created being.

A simple and almost silly visualization brings the memory that Dante’s pilgrim erred by going on auto-pilot and following the straight-line, the line across an assumed Euclidean plane with no side-forces.

The line of least effort in moving forward.

The herd follows that line, the geodesic. Those who veer from mindless movement, to perform acts of good or evil, are the ones who veer from the geodesic. They are the ones who experience forces upon their innermost selves.

But we travel in community groups, though we can hope that they might someday have a character a bit different from a herd of cattle, each of them following the ass ahead. . . Who do the lead bovines follow? Maybe the herd stretches right around the great circle and the lead bovines are following

the asses at the very end of the herd?

In all seriousness, we aim to be individuals and yet members of a morally well-ordered community.

Though it be God who tells the tale in which this community, the Body of Christ, is forming, we do the work in this mortal realm to form the pilgrim Body of Christ, imperfect and incomplete and mortal. And there are some who must lead that pilgrim Body of Christ away from the great circle and towards a better path, a risky path that leads explorers into more dangerous realms. The very shape of our moral-scape is changing. The geodesic curvature is changing but we try hard to follow the path of least effort through that changing moral-scape.

And suppose the effort of trudging through our individual and community lives necessarily increases as we travel up and down slopes which suddenly appeared? We can think we're working hard to obey God's will, but maybe we're still following a least-effort and wrongful path given this hill or mountain which arose in front of us.

And so it is that I contemplate the shape of physical spacetime and the shape of moral spacetime even as I walk down the street, even as I move yard waste to a better spot, even as I read books about gravity or about past ages when men of moral character could still rise to positions of political and social leadership.

I indoctrinate myself not in what serves the purposes of the Principalities and Powers of our age and not what entertains those not interested in pursuing any sort of human excellence. I willfully and deliberately, intentionally, indoctrinate myself in what seems to me to be important and interesting.

I choose the subject of my inquiry and I choose that subject to be God's Creation as revealed in a mind and imagination shaped and disciplined by responses to the Bible and to Creation and to the Creator.

All that's left is to do it.

# 118 Your Mind Is What It Thinks It Is

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1057>. It was finished and uploaded on 2011/10/03.]

We shape our minds by active responses to our immediate environments and maybe to greater realms of Creation. Even without active responses, something like a flabby mind takes shape. The flabby mind of a modern man is invincibly ignorant in the sense that it's shaped to what's pushed into it by the public school system and the mainstream media, including our movies and popular books. This mainstream view, at least in the United States, serves the purpose of avoiding true thought, especially that which might resemble moral contemplation. It's pseudo-knowledge feeding into spastic thought and it presents more of the appearance of a mind than the reality. It's not quite the reality of a mind because it's shaped to a distorted version of reality, not a reality directly perceived and not one mediated by reliable witnesses and teachers but rather a pseudo-reality which is constructed for a certain sort of public consensus.

It's the formation of a consensus, of a herd-like mind, which has always been important to the American citizenry as we know from the early testimony of reliable witnesses and commentators of the quality of Tocqueville and Hawthorne and Melville moving through Mark Twain and on to Ray Bradbury and Hannah Arendt and other thinkers linked by their insight into the modern moral character.

The American citizenry did this to their collective self and their individual selves and then various sorts of predatory or exploitive men took advantage of this herd of creatures with mutilated moral characters and minds. The exploiters hijacked the process and began to direct the herd-

thought and herd-memory, the herd's understanding of history and of the world in general, towards purposes of their own, though their efforts and their visions of a desired herdview were probably not well-focused and not always consistent between the different groups of exploiters. This is to say that the American exploitive class doesn't really seem to think more effectively than the common members of the herd, though some in the exploitive class are clearheaded enough to run complex criminal conspiracies. A J.P. Morgan or a Lyndon Johnson can certainly see a well-defined opportunity and can map out a path to reach that opportunity with all due brutality.

But let's return to discussion of the state of the minds of individual members of the herd. A passive body has flabby muscles and a passive brain has a flabby mind.

What can lead us to be passive rather than active in shaping our minds? Why would we accept a filtered and agenda-laden view of our environments and respond to that rather than to reality? We could guess that some behave in such a passive way because they believe that their minds as they currently exist are what they inherently are, are what they must be, are all they can be. That isn't likely to be the whole answer, but it might be a good part of a more complete answer.

Sure enough, there is an article, *How Your Brain Reacts to Mistakes Depends On Your Mindset* found at <http://www.sciencedaily.com/releases/2011/09/110930153048.htm>, which deals with a study that shows that human beings who have this fatalistic view of their own minds don't learn well from their mistakes.

We should try to shape our minds as well as possible, shaping them with active responses to valid perceptions of what lies around us, including such things as an understanding of history derived from books, maybe even movies, that give us some information about the social attitudes in Boston during the Colonial Period or the political behaviors of good and virtuous popes who found themselves embedded in webs of deceit and thievery, or the types of men who seek careers in powerful and centralized governments—especially those with the moral characters of gangsters according to Lord Acton, the 19th century historian.

Yet, we should remember that the Bible, and much else that testifies to the nature of human beings, testify that some of us are shepherds and some are sheep. We can speak of those who fill an official spot in a hierarchy as being shepherds and often they do fill an important role just by going through rote behavior even if they aren't active enough to be true shepherds.

Then there are those who are more natural in the role of being shepherds or at least of being sheep willing to go ahead of the flock to check out new pastures.

We need shepherds, and leader sheep, to teach the sheep to be better than what the power-elite wish them to be. First of all, the sheep in the main part of the flock need to be told they're being shaped to the desires of their would-be butchers. Then they can be told that they can do better. Finally, they can be taught about better pastures around them and maybe even be taught how to explore new regions.

Most of all, we all need to learn that we're going to be resurrected to share the life of the Shepherd, Jesus Christ, not to be bleating sheep for time without end. We all need to shape ourselves to the goal of being shepherds in at least some ways, most especially, in choosing to be active in our responses to what lies around us, to what was created by God. In this way, we actively respond to God Himself.

# 119 Would the World Be a Better Place if We'd Had Adult Entertainment These Past Few Decades?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1060>. It was finished and uploaded on 2011/10/05.]

I don't mean by 'adult' the sorts of stuff once restricted to the combat zones of major cities, the sorts of stuff which wasn't to be found in most small towns but for back closets of certain stores also dealing in numbers and sports bets, the sorts of stuff once hidden in boxes under the beds of some fathers and of some sons.

My thoughts on this matter came to life in a way because of a short note written by Graham Greene as an introduction to a novel, *Loser Takes All* published in 1955, the year of my birth. In that short note, Greene writes:

Unlike some of my Catholic critics, you, I know, when reading this little story, will not mistake me for 'I', nor do I need to explain to you that this tale has not been written for the purposes of encouraging adultery, the use of pajama tops, or registry office marriages. Nor is it meant to discourage gambling. [Greene, like me, entered the Catholic Church as an adult.]

This short note combined with a thought about the turn of Hollywood, once capable of accidentally making a serious and adult movie, to movies about Flash Gordon with better special effects, recycled cartoons with human actors and better special effects, and movies in which seeming adults

show all the moral maturity of a Ferris Bueller who is now 40 and hasn't learned anything from a lot of day's off. In fact, being a 'full-fledged adult', he now feels free to act out more of his dreams and nightmares.

*Ferris Bueller's Day Off* wasn't particularly dangerous because it was about an escape day, a day of irresponsible play, for which the price had to be paid. And it wasn't presented as an ideal about how we should behave, though it was perhaps something of an ideal about how we should freely misbehave for one great day in our lives.

The rest of the stuff pumped out by Hollywood in recent decades has been aimed at the already weak American mind, shaped by the public schools, by Saturday morning cartoons, by the likes of *Leave it to Beaver*. (I did have a weakness, and still do, for *Bullwinkle and Rocky* and for various flavors of Bugs Bunny and his friends, but those were remarkable entertainment products by current standards in requiring the viewer to sometimes know something about history and culture before he understands the jokes. You could say that Bugs Bunny compared to Scooby-doo was like the Marx brothers compared to the Three Stooges.) In my youth, I preferred to spend my time reading a variety of books about nature, books about life in other countries, idealized biographies of prominent Americans, and even collections of fables and fairy-tales. As I grew up, I started trying to read mathematics and science books but floundered badly without either adult guidance or a like-minded friend of my own age. I had more success with adult historical fiction and some straight historical works. And I was probably ready for college at the age of 13 or 14 and most certainly not ready for college at the age of 18 after my enthusiasm and work-habits had been destroyed by a run-of-the-mill American high school.

I wanted to be an adult. I was ready to take on learning as my job, but the pressure was on me to stay at the level of the textbooks and the classroom instruction. I didn't have either a naturally tough or a properly nurtured moral character, didn't have the strength and courage, to move forward on the path which attracted me. It wasn't that I knew what the real issues were, only that I was attracted to being an adult, one with some talent at learning a wide variety of material and one who enjoyed doing so though I had needed some guidance to help me to develop the perseverance necessary to stick with difficult material until it's somewhat conquered. (Actually, I've since learned my ways of learning difficult material don't match up well with classroom-style instruction. Among other problems, I like making one or two false starts at serious mathematics and physics,

even difficult novels. Apparently, that prepares the soil for a more successful effort to plow ahead.)

The problems with my lack of a properly developed moral character only increased with college where I found myself free of most adult guidance and also struggling with the serious freshman courses after my high school experience had led me to believe schoolwork was easy. I was also struggling with too many opportunities to drink beer, play cards, and just toss the bull. I had learned a path to success in high school: go to class, do homework when you had no choice, and ace the course. It didn't work when I found myself in real classes with fellow-students who knew how to work.

We Americans wish to live the adolescent life from 13 to the grave and we do all we can to slow down the maturing of our youth.

What's cause-and-effect? Do we set out to remain adolescents and thus adopt an adolescent life-style, including juvenile movies and music? Do we find ourselves in a society which presents us with an adolescent life-style when we should be adults and we adopt it and continue with it as the advertisements and other forms of propaganda encourage us to remain immature? I doubt there's any clear answer when we're considering complex systems such as higher organisms—where I leave the word 'higher' loosely defined in this context.

Most modern human beings will claim to be creatures of free-will, creatures made for freedom of various sorts, when it suits their purposes. Most of those human beings seem to have entrapped themselves in ways of thought which represent false responses to God's Creation, but those ways of thought are very convenient to that loosely defined class often labeled the 'power elite'. The basic problem seems to be a seduction of willing victims corrupting themselves rather than a rape. Tocqueville was right that Americans are self-censoring and self-brainwashing creatures who would likely create what we'd call a benevolent totalitarian society. Hawthorne was right that Americans prefer promises of financial security to any true sort of freedom. Melville was right that Americans are morally insane, refusing to perceive Creation honestly and believing they can do better than the Creator. Twain was right that Americans aren't preparing themselves for any Heaven compatible with Christian beliefs – we prefer DisneyWorld with a Superbowl stadium on the grounds. Ray Bradbury was right when he wrote *Fahrenheit 451* in 1950 and predicted that television would be sufficient to push us into that totalitarian state feared by Tocqueville.

There are many others who spoke from the viewpoint of historians

seeing patterns of decay emerging in the modern world—such as Hannah Arendt and Paul Kennedy and Jacques Barzun and many others. There was Solzhenitsyn who spoke of Americans as being uniquely evil, less evil at that time, circa 1985, in acts than most powerful peoples of the modern world but seeing ourselves as morally pure because of those abilities to self-censor memories and to wash our brains of inconvenient contents.

Our public disorder has increased. We tolerate dirty language. We tolerate ill-behaved children on the streets. We tolerate the intrusions of corrupted bureaucracies and law-enforcement agencies which act in the way of police-state thugs. We tolerate constant wars against peoples who haven't harmed us, though we're willing enough to accept the most unconvincing propaganda so that the war can begin. We tolerate, no—we honor, politicians who have committed the same acts as foreigners we've hung as war-criminals.

I'd suggest that the real problem is that the Western mind has decayed. We can't establish or even maintain moral order because doing so in the complex modern world requires a good bit of knowledge and some high levels of thinking skills. And we can't even reach the level of our ancestors from the early periods of the Modern Age, when the world was growing larger and more complex and more complicated and doing so faster than could be chronicled.

In *From Dawn to Decadence*, Jacques Barzun has given us a history of the previous 500 years in the West, showing that there has been a relatively steady, certainly relentless, decline in quality literacy, that is, the mental and visual skills necessary to read serious books. I'd certainly argue that that sort of quality literacy is necessary for the abstract reasoning which is a part of the sort of advanced civilization our ancestors built and left to our irresponsible selves. In a soundbite: without Goethe, there will be no Einstein.

We have entertainment at the level of a morally perverse adolescent because that's the level we're at, the level we choose to be at. Individuals can rescue their minds and moral characters from states of decay. There are few in the modern West who have chosen to do so. It's not a matter of 'higher-level' learning but of basic learning about God's Creation, the sort of learning we were supposed to get in our schools after acquiring basic reading skills. To be sure, it helps to read a few narrative histories about any turbulent period of history. Read about World War II if you always wondered why your father couldn't speak much about what he experienced

on the front-lines in the Battle of the Bulge though he spoke about the fun they had in the latter days of boot-camp after the training had eased off. Read about the Revolutionary War or the writing of the Constitution if you want to know what's at issue in current attempts to rein in a government of men who have no limits on their desire for power over other human beings. Read about your own town or region and ask yourself, "What happened to the local tribes of Native Americans?" and maybe "Did the workers in the local factory, including Grandpa, participate in the violent wars of unionization during the 1930s?" Maybe pick up some older and more sophisticated historical novels—the so-called middle-brow novels of the pre-1970 period were often surprisingly substantial and the historical novels were often well-researched. When you have a grasp of some facts of history, return to the meta-historians I mentioned earlier: Hannah Arendt and Paul Kennedy and Jacques Barzun. Then pick up the Bible and read the books of the prophets and meta-historians Isaiah and Jeremiah to make some greater sense of the sound and fury of history.

Then you can start to go outside and see God's Creation in its most tangible form, children playing tag and trees swaying in the breeze. Learn to pray or maybe refresh any existing habits of prayer. Learn to think along with the Creator, sometimes emptying your mind that it might be better filled and sometimes trying to make sense of those playing children as being part of the same story as were the young aristocratic women beheaded upon stages during the French Revolution as the crowds cheered. Then remember the children who'd starved in prior years while those aristocrats lived well and try to find out why.

I think the world would be a better place if we'd had adult entertainment these past few decades. I think it would have been a better place if we'd had better new history books in the public libraries, or if we'd just kept the old books. I think we didn't have those better things because we weren't better people.

They say that history doesn't repeat itself but it does rhyme. I say that our literature and our arts, including music and movies, help us to find those rhymes in history and those rhymes help us to move appropriately, to move in potentially good directions and to move at proper paces. They teach us how communities form and fall apart through the ages. They teach us how to shape, first, our own souls and moral characters and, second, our communities. Who wants to shape their souls to the moral chaos of modern movies and television shows and novels? Garbage in and the garbage stays

there.

I guess I meant to say that Graham Greene wrote about sin from an adult viewpoint rather than from the viewpoint of a perverse and confused adolescent. We would benefit from more books written by adults and entertainment made by adults, even when it deals with terribly sinful adults.

# 120 There is Experience and Then There is Experience

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1069>. It was finished and uploaded on 2011/10/11.]

There is an important point raised by the research discussed in this article, *We Are What We Experience* found at <http://www.sciencedaily.com/releases/2011/10/111005170725.htm>. I'll quote a good part of this short article because of its importance, though I don't know anything about the quality of the underlying article:

Our life experiences—the ups and downs, and everything in between—shape us, stay with us and influence our emotional set point as adults, according to a new study led by Virginia Commonwealth University researchers. The study suggests that, in addition to our genes, our life experiences are important influences on our levels of anxiety and depression.

“In this time of emphasis on genes for this and that trait, it is important to remember that our environmental experiences also make important contributions to who we are as people,” said principal investigator Kenneth Kendler, M.D., director of the VCU Virginia Institute for Psychiatric and Behavioral Genetics.

Kendler, professor of psychiatry, and human and molecular genetics in the VCU School of Medicine, and an international team of researchers from VCU and other universities, analyzed nine data sets of more than 12,000 identical twins with symptoms of depression and/or anxiety through the lifespan.

...

According to Kendler, statistical models, developed by his colleague Charles Gardner, Ph.D., a research associate in the VCU Department of Psychiatry, were used to observe how components of individual variation changed over time. The team observed that as the twins moved from childhood into late adult life, they increasingly diverged in their predicted levels of symptoms, but after that point, stopped further diverging. Further, they noted that environmental experiences contribute substantially to stable and predictable inter-individual differences in levels of anxiety and depression by mid-life in adults.

There are undoubtedly some genetic problems, as well as some types of physical damage, so constraining as to nearly predetermine a bad outcome for the victims. Most genetic conditions, whether directly problems or conducive to developing problems, should better be regarded as constraints on a human organism which shapes itself as it responds to its environment, becoming something flabby and lacking in moral order if it responds reluctantly and weakly—responds passively in a manner of speaking. Kenneth Minogue once said, “There’s a lot of ruin in a country,” and I could say in a similar way that there is a lot of ruin in a human being, that is, a human being can be very badly damaged and still have a lot of potential for rich and good developments of various sorts. When I speak of good in this context, I mean good that is active, that leads to objectively good results in the communities of that damaged human being. Those good results might be vague or even doubtful as are the good results of many of our human actions, but intelligent analysis will typically let us know when the actions of a human being have truly tended to the good.

I confess: I’m one of those men that Adam Smith had feared would develop in the prosperous, commercial societies he was seeing arise and was glorifying in many ways. I’m genial—but capable of impolite behavior when my self-respect or moral beliefs are irritated. I’m also a bit short on the toughness necessary for a true moral character—but I’m toughening up enough that I’m at least willing to force moral decisions on my part by painting myself into corners. I don’t think I’m naturally one of these hollow-chested men, as we modern men were labeled by C.S. Lewis. In many ways, I’m a bit like the tough and gruff—but self-sacrificing—Scotsmen from the older generations in my mother’s family. I also have the sort of perseverance found in my father’s family where many of the men gave themselves, as

many men did, to work such as lead-mining for the good of their families knowing they would earn better incomes than most workers and would end their lives relatively early as they struggled for each breath. That perseverance is a form of courage though a bit different than the impulsive courage found in adventurers and warriors. Despite a good inheritance of potentially tough moral character, I was shaped to be a consumer of what was offered by the modern corporations and governments rather than a man trying to choose a good life and making do with what could be honestly gained in that particular life. As Wendell Berry said somewhere, frugality isn't about saving money, it's about self-respect. It's also not about living poorly for the sake of being poor, it's about living a balanced life which can accept some luxurious goods when they can be a part of a morally well-ordered life.

Clearly, I've formed an idea of a good life, though the details would still have to be set according to particular opportunities and problems which I'll be confronting in the years left to me in this mortal realm. It's just as clear that I live in a certain environment: I live in a state of well-fed poverty in my sister's house in a small-town in New England. This small-town, indeed much of the modern West, is populated by men and women and even children convinced the Constitution, or perhaps the Bible, says their invincibly ignorant opinions are as good as the opinions of one who at least tries to get some background knowledge and then to form his ways of thought according to the works of the acknowledged great thinkers of the West. Modern men have a right to their opinions but no responsibility to find out anything about the objects of those opinions. In the context of this discussion, this is a problem because those modern men are responding to a false understanding of their environments or the environments of those in, say, Afghanistan. Modern men are mostly responding to a dream-world bearing only a superficial resemblance to reality.

When genial Americans, as one good example, respond to a world in which they can think of themselves as virtuous because they pay their taxes and keep a nice-looking lawn, then they are able to put off any confrontations with reality. They live in an American television series, a plastic world but one apparently desirable to those whose fears outweigh any desires they might have for freedom beyond that of watching dirty movies or choosing from a vast array of brands of toothpaste.

We shape ourselves by our experiences but those experiences aren't entirely objective. They are always experiences lived in our understanding

of reality and that understanding, at its best, is being enriched and made more complete as man learns more about himself and his world. Some of us might hope to make our experiences as objective as we can by responding to the world as it corresponds to the best understanding available to us. Others seem not to even realize that we are creatures set in particular contexts. Perhaps some realize this to be true but willfully act as if a context is what we believe it to be based upon false information pushed into us by public schools and television shows and advertisements and so forth.

# 121 Rooms of Memory

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1100>. It was finished and uploaded on 2011/12/06.]

In Chapter 223, *Do We Survive the Major Transformations of Our Lives?*, I wrote:

In *Rewriting the Soul*, the philosopher Ian Hacking had speculated that the multiple personality phenomenon is a largely learned strategy of segregating painful memories. Is our sense of a particular individuality tied that strictly to specific memories? But our memories would not seem so separate from a specific physical body, with a specific set of organs and specific sets of genes that are activated or de-activated as needed by that body.

Our memories can be localized according to a study discussed in this short podcast from *Scientific American: Doorway to Blame for Room Amnesia* at <http://www.scientificamerican.com/podcast/episode.cfm?id=doorway-to-blame-for-room-amnesia-11-11-30>. Our memories can reside in a physical place, in a manner of speaking. I've read before of research indicating that memories can also reside in a mental or emotional or physiological state, including the state of inebriation. This doesn't argue against the unity of the human mind nor against the unity of memory seen as knowledge any more than the existence of separate physical locations, such as the surface of Mars and that of Earth, argues against the unity of the universe. But it complicates matters in a potentially interesting way and opens room – no pun intended—for speculations which could be tested though I suspect that a neurobiologist would hypothesize that the ways in

which we create realms of memory are substantially the same whether the realms are defined in terms of emotional states or physical locations.

Our knowledge of even our immediate environments is contextual because we are finite creatures with limited perceptual and mental powers, powers which are under formation. It would seem that we have to learn the proper relationships between different environments, not surprisingly—would our ancestors have survived if they assumed their meadow-knowledge was the same as their forest-knowledge? Moving from one of those environments to another was akin to moving from one universe to another.

There are hints in all of this that we modern human beings are leading lives fundamentally at odds with the goal of unity which is essential to healthy personhood. We have lives which are segregated into realms of work and regular life and weekend entertainment and summer vacation. We act as if deliberately preventing the development of the unity necessary for a true, morally-ordered personhood.

Yes, we human organisms move between different realms though they be realms of a world, even an entire Creation, which has the properties of unity, coherence, and completeness. Animals, including some noble and morally well-ordered in their limited way, live in realms, sometimes spending essentially their entire life in but one realm. Human beings who would be images of God, who would share the life of that God, have to have a greater ambition. We have to intend to become unified creatures of a sort we would regard as true persons, imitations of God, as we could see Him in His incarnate Son, the Lord Jesus Christ.

To intend isn't to hold some vague and fuzzy idea about what I'd like to happen. To intend is to step forward into the future, moving in a specific direction so that I might move toward a goal, might develop into a certain sort of human being.

If you would be a morally well-ordered person, then journey towards that goal. Do what you can to avoid leading the life of distraction which is offered to us in the marketplaces of our age. Learn to read decent and worthwhile books or to make good music, perhaps the music of your Japanese grandmother or perhaps that of the great composers of Western Civilization. Learn how to garden with skill and respect for the land and what it can grow. Learn how to hunt or fish, but not with ATVs and speedboats. Learn how to machine useful products, perhaps customizing the design of your daughter's next bicycle. Learn how to walk while paying attention so that you can spot a hawk or eagle at a distance by his way of soaring and

hovering, going so long without a flap of his wings.

Learn how to be a morally well-ordered person as you move through life and you will eventually see that your kitchen is part of the same house as your living-room. More than that, you should learn that the woods which begin a few blocks away are part of the same environment as your house and yard. Come to know in your heart and mind and soul that the American government and people aren't exceptional but rather part of the same stream of history as our past governments and ancestors in the United States and those in Ireland and in Portugal and in Honduras. Our leaders can be brothers of Alfred the Great or brothers of Bismarck or brothers of Robespierre or brothers of the Medici pirates and gangster-bankers.

Begin to see and feel that unity and coherence and completeness which makes this universe a world, a morally purposeful story being told by God. Then you can begin also to reflect that unity and coherence and completeness and to be a morally well-ordered human organism, an approximation—maybe a good one—to an image of God.

## 122 Evolution Can't do What Evolution Can't Do

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1112>. It was finished and uploaded on 2011/12/08.]

There's an article titled *Human Brains Unlikely to Evolve Into a 'Supermind' as Price to Pay Would Be Too High* at <http://www.sciencedaily.com/releases/2011/12/111207104821.htm>. This is interesting, even good to know, but I don't think it matters much so far as the future of the human race is concerned. The brains of individuals might not evolve much while still allowing a substantial amount of advancement in the minds which form and also draw upon a human intellectual community. Our communities and the 'virtual' minds—in a crude manner of speaking—which are part of those communities are far from their limits and that means our minds can advance much further even if our brains are unlikely to become so many 'superminds'. I've often quoted the historian Carroll Quigley in this context (see a general introduction to his life and thought at [http://en.wikipedia.com/wiki/Carroll\\_Quigley](http://en.wikipedia.com/wiki/Carroll_Quigley)):

The truth unfolds in time through a communal process.

See for example Chapter 584, *Knowing Truth in a World Where We Perceive What is Useful*, for a short discussion revolving around the modern empirical insight that we don't see colors directly but rather by way of complex brain operations, a form of thought and not a raw 'seeing' allows us to perceive that red ball as being the same color in shade or sunlight though it reflects different wavelengths of light in those two circumstances. Similar things happen in more abstract forms of thought such as those very intense forms of abstract thought we call theoretical physics and creative

literature. We directly perceive something like an Aristotelian reality which we shaped into a Newtonian reality over the past few centuries, but those 'common-sense' realities mask what we now 'know' to be a relativistic and quantum universe though we strongly suspect it to be 'really' something that remains as yet unimaginable to our best scientists and philosophers and poets. The very fact that we know this tells us we can overcome many of our biological limitations by proper use of our fleshy brains and also by way of our communal ways of knowing.

It doesn't matter if the ad-hoc processes of evolution trick us because that really means we're evolving and—in most parts of our lives—developing at one level and realm of being in which other levels and realms are implicit but invisible. We can discover the ways in which we're tricked and compensate when it matters.

In Christian terms, the mind of the Body of Christ in this mortal realm might have a lot of growth and development left in it, God willing. Much of that knowledge, truth if you will, found in that communal mind does find its way down to individual minds as we can see by the way that advanced concepts from philosophy and technology and business and politics and various 'positive' sciences have made their way into our modern minds as enriched and complexified words and concepts. We individuals can't know all that the communal mind knows but we can know enough of higher-level encoded knowledge to function as petroleum engineers or particle physicists or historians or lawyers or machinists or truck-drivers in this complex world with thousands of libraries, as well as many websites, each containing more knowledge, and vastly more partially processed information and data, than the fabled libraries of the ancient world.

## 123 Escaping Our Ruts

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1201>. It was finished and uploaded on 2012/03/10.]

By most standards, I have a funny definition of creativity. We shape our minds, our entire persons, by responding actively and properly to what lies around us, below us, above us, and in us, where all prepositions—‘around’, ‘below’, ‘above’, and ‘in’—should be understood in both spatial-temporal terms and also metaphysical terms. By way of proper responses, we shape our very selves to encapsulate what lies around us, some shaping themselves to very particular environments and communities, some shape themselves to more general environments and more general communities and possibilities of communities—any shaping to imaginary views of reality which aren’t part of the narrative movement of this universe will lead us from reality and into dangerous regions indeed. We properly shape our minds, our entire human beings so that we become persons in imitation of our Lord Jesus Christ and then we share in the true creativity of God. We shape our minds and the behavior of our mortal selves to God’s acts of creating, creating from nothingness and shaping the raw and abstract forms of being into more concrete and more particular forms of being. One funny and interesting aspect of this is that reality does ratchet up in complexity and richness, as well as opportunities and problems, as our understanding also increases in complexity and richness.

So, how can we better respond to the problems and opportunities of this universe? Can we just exert our allegedly free wills and become open-minded and courageous, charge forward in an effort to understand the works of the Creator? Can we just decide to flow over with a willed faith?

No. We must intend to move forward into the future, more willing to cooperate with the true story of our world and that requires us to learn

how to respond properly to God's Creation. We must intend to enter into a communion with the Almighty such that we share His divine freedom, though we get there as students watching as He creates and shapes and imitating His acts by shaping our own selves and helping to shape other entities. We can't create from nothingness and we have limited powers to shape created beings, even our selves, but we must do our best, however humble our vocation or however great our vocation might seem by mortal standards.

However grandiose my recommendation might sound, we must shape our own selves by one small act at a time. And some of those acts might seem strange, even vaguely sin-like to some of a Puritanical viewpoint. For example, there's shots of vodka as in the article, *Vodka delivers shot of creativity* found at [http://www.sciencenews.org/view/generic/id/338406/title/Vodka\\_delivers\\_shot\\_of\\_creativity](http://www.sciencenews.org/view/generic/id/338406/title/Vodka_delivers_shot_of_creativity), where we can read:

A moderate alcoholic high loosens a person's focus of attention, making it easier to find connections among remotely related ideas, the scientists propose online January 28 [2012] in *Consciousness and Cognition*.

...

Intoxication may aid verbal creativity partly by lowering the ability to control one's thoughts, comments psychologist J. Scott Sauls of the University of Missouri in Columbia. He and his colleagues have found that alcohol reduces recall of sequences of sounds and images but leaves working memory unaffected.

My major criticism of the article would be founded upon my preference for good Bourbon whiskey rather than vodka. When I need to escape ruts—including meaningless mental activity, when I need to relax and move on in my thoughts and in my story-telling efforts, I like to end the day by sipping a double-shot while reading poetry or a novel or maybe a history book. (I can't really do this anymore because of my budget and my preference for good-quality whiskey.)

There's also a way I escape ruts by means of a minor medical problem which is certainly not under my control. I sometimes suffer attacks which seem to be caused by floods of histamine which put some parts of my brain out of commission; though disturbing at the time, this problem sometimes

clears my mind so I can make tough decisions the next day or so and to move on.

Some of our psychiatric disorders might turn out to be extreme versions of oddities in the human metabolism which serve a good purpose in the overall story of our race. A drink or two, not as many as Hemingway or Faulkner took, might break up logjams in the thoughts of anyone facing a problem which can only be solved by creative thought, outside-the-box thought. A burst of some mood-altering hormone or neurotransmitter might have the same effect in breaking some out of their ruts.

Scientists have now found some evidence for a strange way to help a generally non-creative human being to climb out of ruts and engage in creative thinking: tell that human being that it's expected for her to be an individual and to do or think out of the ordinary. This article, *Pressure to Conform Can Inspire Creativity* found at <http://www.miller-mccune.com/culture/pressure-to-conform-can-inspire-creativity-39557/>, tells us:

New research suggests less-creative people do more innovative thinking when they are told individualism is the norm, and instructed to conform.

Conform to non-conformity, much like the hippies of my youth, or the purple-haired adolescents who come and go.

I think the tentative conclusion we should take away is that there are more potentially creative human beings than you might expect but many of those need to be forced out of their ruts. Those who aren't self-motivated, who don't take the initiative to look for new ways to behave or think when the old ways don't work, might show some creativity when they take a good stiff drink or when they're told to be creative. Maybe we can see how the descendants of the resourceful pioneers of North America settled down to lives as couch potatoes?

Let me return to my unusual understanding of creativity as being a sharing in the thinking and acting of God—thinking and acting are one for Him. To me, the problem is forcing someone to look outside of their own dreams and thoughts which were put inside of them by schools and television and street-corner conversations. Most human beings settle into their comfort zones and need to be challenged to move somewhere more promising or perhaps just need a little buzz to quiet all those thoughts

pushed into their heads. As is often the case, perhaps I'm in synch in many ways, not totally for sure, with William James:

*To continue thinking unchallenged is, ninety-nine times out of a hundred, our practical substitute for knowing in the completed sense. [78] [page 116]*

We need to be forced out of our ruts, out of our comfort zones, so that we may complete our knowledge, a little, and share with God in His true creativity, the creativity which brought into existence the objects and relationships which are the subject of a truer and more complete knowledge.

# 124 Reason and Imagination Travel Hand-in-Hand

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1224>. It was finished and uploaded on 2012/03/31.]

I've been reading *Serious Art* by the philosopher John Passmore. This book has inspired in me some thoughts about what might be called the imagination. I'm especially interested in the relationship of imagination to an allegedly different part of the human mind called reason. It's possible I'm interested because and not despite my efforts to write fiction, mostly novels, as well as philosophy and theology. I use the imagination when I write on topics philosophical and theological, though **maybe** in a different way than when I write fiction.

I've noticed that my ideas on those topics philosophical and theological often appear in the thoughts of a character or in the way in which events are presented in one of my novels and then appear in a more explicit form years later. Apparently, my mind seeks alternatives more freely when I'm off the grid which ties us all to communal thoughts of various sorts, desirable and not. It's not the case that I could go back to one of my novels written in the 1990s and pull out a coherent and complete version of my current ideas about being and about the relationships between God and His Creation. Yet, as a novelist, I've definitely been meandering along the road toward such an understanding and doing so in the persona of fictional characters, allowing me for some intellectual or psychological reason to travel more freely and more confidently, even to explore a few side-trails. Knowing how my lines of thought developed, I can go back to an early novel and see the early development **as if** I had been traveling consciously toward a clearly seen goal. That is no more than an illusion though modern brain-

science discoveries hints I might have been traveling somewhat steadily but unconsciously toward my current systems and narratives of thought. That sort of a possibility, of a human being acting or thinking in a rational way without being conscious of what's really happening inside of him, appears in several of my novels. In fact, I generally question the belief that we're always, or even often, conscious of our processes of reason.

I won't pretend to have a coherent and mature understanding of my imaginative movements, let alone a description which can allow me to communicate what's going on. It does seem that those movements are leaps and skips and spins and joyous runs which the serious creative thinkers can occasionally execute even as they mostly move along calmly. I doubt if Aristotle or Kant or Hume or Heidegger often moved in such playful ways, but maybe Plato couldn't keep himself from doing so nor could Augustine of Hippo and Nietzsche. I can also imagine Melville and Flannery O'Connor willingly moving along as if circus acrobats performing as they moved down the road toward an impending performance. The characters and in their stories, and mine, are often strange in appearance, often the events take on some sort of eerie aura of sorts, but there is never any real evidence of supernatural events, only testimony to a world of depths not yet explored by the human mind.

Though Melville and Flannery O'Connor never—to my knowledge – wrote of metaphysics directly outside of comments in letters, these sorts of novelistic hi-jinks seem to have helped them and definitely help me to get a better understanding of the miracles which are in in the things and events of ordinary life, not because of indwelling genies or visits by angels but because of those depths of being which I explore more directly in my nonfiction writings. That is, a human mind, whether a conveniently insane character in a novel or a befuddled observer in that same novel or in some real-world events, sees—quite correctly—strange and only indirectly accessible realms of being in the those ordinary things and events. Mystics have seen this even if I think most have misinterpreted the workings of Creation. The most hardheaded of saints and novelists of mainstream sensibility, the greatest of philosophers and scientists, have seen this and haven't known what to do with it. The best and most unbiased of observers, such as William James and some of his philosophical disciples—including the neuroscientists Gerald Edelman and Walter J. Freeman, have written of subjective 'events', qualia or purely personal experiences not sharable. I admit there are reasons for speaking this way but, at least as a matter of emphasis, I prefer to

speak of human minds being molded as encapsulations of God's acts as Creator. Something else is happening when we experience what is personal, something real but not personal in the sense of not being sharable. In fact, I've taken the position that the Body of Christ is real and under formation and will result in entities and an entity comparable to the Triune God, three Persons and yet only one God. We will retain our individuality but will be truly one Body of Christ. Even what is most personal in us is, and will be, fully shared with our communities in the world of the resurrected—if, of course, we are raised into that world.

There's a sense in which a metaphysician, possibly a physicist in his philosophical moods, can create at least an outline of an entire universe, even a sketch of a world of moral order such as I've proposed to include the universe allowing for the full spectrum of created being along with the narratives set in the realm of thing-like being, but only a few scientists, such as Einstein, work regularly in realms where it's proper to unleash the imagination and to think in terms of realms of being not directly accessible to human senses, including the amplified senses made possibly by telescopes and x-ray machines. When it's proper to his task, a scientist has to use the higher imagination in the way I'm discussing, leaping and skipping between realms of being, from concrete being to more abstract regions and back again, maybe returning with some good insights which help him to understand why, as well as how, the immune system which distinguishes between 'me' and 'other' was apparently the evolutionary source of the nervous system, including the brain. The bare facts of the relationships between immune system and nervous system will never, by themselves, be more than organized facts. The greater theories are the result of imaginative leaps.

I claim that metaphysicians and some physicists whose work borders on metaphysics (Newton and Boltzmann and Einstein come to mind) work at some primary level of creativity, that is, they try to reconstruct the more abstract levels of the Creator's work, try to understand the materials and tools He created and how He went about using them. If we understand God's act of creating from nothingness as an ontological event rather than some magical event which took place in space and time though neither had existed at the start of that event, we can see metaphysicians and some physicists trying to travel the entire road back to that ontological event and to understand the event itself to some extent by understanding the road back to it.

Most thinkers and most artists and most in more active pursuits should be traveling the roads already cleared by those few called to such a fascinating and frustrating task. There have been few called to that task, only a small percentage of even serious philosophers and theoretical physicists and mathematicians. At this time, after a century or more of explosive developments in physics and mathematics, it seems to me that the baton has, in a manner of speaking, been passed to the brain-scientists who have sometimes found themselves forced to describe an entity which seems to have evolved to encapsulate reality for reasons of successful survivability and attainment of some pleasure in life, but that evolution seems to have given the human brain the capability to travel that road. This is to say that the difficult task of understanding how the brains of Plato and Aristotle and Augustine and Aquinas and Newton and Einstein worked so that they could travel that road is the task of understanding how that road could be traveled. Though Darwin was hardly a competent metaphysical thinker, as he freely admitted, he deserves an honorable mention for truly creative thought just because of some leap into a more honest perception of the evolutionary and developmental aspects of nature. That led to much good including the modern effort to understand brain and mind and thought.

Individual human minds are pulling the human communal mind along as they explore some regions along the abstract end of the spectrum of being. Some of those regions can't yet be reached by disciplined reason—playful imagination would seem to be needed. But it doesn't appear that many serious artists are really equipped to explore such regions—it takes a man with a solid but not too solid attachment to reality as he has received it from the culture and traditions into which he was born. What I wish to emphasize here is that a solid attachment to reality has, over time, come to include a deeper understanding of abstract created being. The sort of imagination I'm speaking of is moving is being directed by opportunities offered by Creation, and those opportunities are leading us further away from being as directly and naively perceived, further into the regions of abstract being. I'm not speaking of the imagination of the businessman trying to move goods faster when demand increases nor am I talking about the more concrete imaginations of most poets and novelists, even the most serious, for—as Passmore tells us: nearly all artists, including the most serious, are tied to concrete realms. In fact, most who are called abstractionists, or similar terms of compliment or insult, are really just looking at a particular aspect of what can be, more or less, directly and naively perceived.

In this essay even more digressive than is my habit, I have to raise the question: is there truly any cleanly-defined line of demarcation between imagination and reason? I think not, but we need a way of speaking of a steady walk as opposed to leaps and bounds, some of which might land us in that briar patch or even to a very short hover over a deep gulch as happened in many a cartoon I saw during my boyhood. In real-life, such happenings result in rapid descents and painful landings. But the imagination also allows us to leap over barriers of a sort to enter fertile pastures not yet accessible by a steadier sort of gait.

Again, as my title claims: Reason and imagination travel hand-in-hand. Also again: each carries us over a different part of the journey, each does a differing amount of work depending on the road being traveled. One way of re-expressing my overall criticism of my fellow-Christian thinkers is that they rely upon a pietistic sort of imagination to travel over realms of created being which have been explored by reason on at least a tentative basis. Moreover, the imaginative acts of nearly all Christian thinkers are from a repertoire of set pieces, dance-steps, parade-ground maneuvers—call them what you will, but they are no more than canned and reflexive responses to even the most interesting and potentially fruitful of possibilities presented by Creation.

I'm exploring and not presenting firm conclusions, though I've tried to state my initial thoughts in a strong way. As I discussed, I think there are some artists, perhaps Melville and probably me in my novelist-mode, who are metaphysicians of a sort, moving through regions of abstract being more freely than what might be called 'normal' artists. The interested reader can download two of my early novels, *The Open Independence of the Seas* found at <http://loydfueston.com/downloads/open.pdf> and its tongue-in-cheekier version *Safe Harbours and Open Seas* found at <http://loydfueston.com/downloads/safe.pdf>, to see what I'm merely hinting at regarding some basic metaphysical issues. Another of my novels, *A Man for Every Purpose* downloadable at <http://loydfueston.com/downloads/aman.pdf>, tells a tale of a man shaping his mind by way of questionable responses to a poorly understood world.

# 125 The Mind and Reality: William James and Me

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1240>. It was finished and uploaded on 2012/04/23.]

I've written several times about my opinion that William James held back from the full implications of his teachings or, at least, held back from a viewpoint that would have led him to a plausible conjecture of some sort of fullness of knowledge, however impossible the complete realization of that full knowledge. James saw how a human mind could build up from empirical knowledge to greater structures of knowledge but he shied away from any speculations that this process was one of growing into a world, a process of shaping the mind to encapsulate not just some bottom-up views but an entire world or even an entire Creation.

I agree with the Jamesian pragmatists that we learn about reality by studying reality and building theories from what we can perceive. Our behaviors are formed by, our concepts derived from, thing-like being and from the actions and relationships we can examine in that concrete form of being. I've written about going beyond this in terms of understanding the nature of created being, but I'm interested now in the understanding of how it is that a human creature learns from what is around it.

In *The Meaning of Truth* [78], William James gives us a rather strong hint of a general viewpoint:

*Total conflux of the mind with the reality* would be the absolute limit of truth, there could be no better or more satisfying knowledge than that. [page 156]

The 1913 Webster tells us a conflux is “a flowing together; a meeting of currents.” This leads us at least a little astray and, to make my points, I’ll assume that William James intended (in the full Thomistic sense) the error I’ll attribute to him. It would seem he took the mind as something pre-existing its activity, the mind as something pre-existing its responses to reality and its movements in light of those responses. Somehow it exists independently of reality so that it can come together with that reality. By being filled with proper knowledge? Maybe the mind could be envisioned as a pre-existing lump of clay upon which reality makes impressions of greater or lesser clarity and sharpness? There is at least something to this since there are, in a manner of speaking, three layers to the human mind:

1. the species level which has come into being over many generations by processes described by biological evolutionary theories,
2. the social/cultural level which is the result of human communities shaping their thinking- and doing-traditions over some number of generations, and
3. the individual level which is the result of an individual actively shaping his thinking and doing to his environments.

The first item comes to exist by normal biological development, being damaged mostly if the particular human being passes through a window of opportunity without the proper stimuli or with suppression of active responses. An example of such a window is the period during which the human language centers of the brain must be developed or else that human being won’t be able to use language in a human manner.

The second item is largely what came to be during the rise of human cultures and, most importantly for modern men, during the rise of those complex communities we call ‘civilizations’.

The third item can be taken naively as the raw smarts of a human being. This can be dangerous as I believe Americans are showing because powerful minds can exist as poorly formed and barely socialized. This leads to Americans engaging in rational thought about, say, the situation in Afghanistan without having learned a bit from our greater knowledge of that bloodied country and, even on the part of seemingly devout Christians, without having bothered to have learned a bit about general history or about Christian

teachings on war and politics. Don't rely on the writings of current Christian leaders or their advisers—these creatures are as intelligently ignorant as most Americans are. In other words, active and capable American minds typically work in a vacuum, making up a view of the world and then analyzing that view along with a small scattering of facts and producing the solution for similar problems in a similar, but non-existent, world.

So, what is the mind which comes into conflux with reality, which flows along with reality? I've given simple answers in my past writings because my beliefs lead me to try to deal with being at a fundamental level before moving on to more concrete matters. To be sure, my mind was quite inadequate for the task. Now I'm starting to ponder better descriptions. But I'm not yet read to settle on much. I'll move on and say that I'll start to explore better possibilities in the rest of this essay and I've got some other essays started which might lead to better answers than I've given in my writings so far. And I will say the answer I'll arrive at when my work is done will undoubtedly be a little bit of a surprise to me though not as much as would be the better answers of yet unborn thinkers.

To be able to move on, I'll return for now to writing in a more naive mode as I address the comment of William James, more explicitly sympathetic to the problems he had in speaking about something where his intuition seemed to be outrunning his explicit knowledge.

A mind isn't shaped from some raw stuff which could be labeled as mind-stuff. Then again, there are structures in the human brain which give rise to functional abilities and inclinations and which can be spoken about in an as-if manner. Our human ability to learn language looks to be language-stuff inside our skull. The problem with some as-if language is that it leads to a reification of function to be turned into stuff which can then be etherealized once it's proven that there is no physical mind-stuff, only a bunch of neurons which develop into structures rather than being a set of given structures at birth or conception or whatever. Different thinkers can stop at different points on this journey or even travel this sort of path in different order. The point is that all such journeys lead away from reality, from the empirical world and the totality of Creation in which the world is embedded.

Our brains have some serious amount of structure and a lot of developmental inclinations because of what happened over the past few billion years on earth.

The human brain gave rise to mind, as I use the term. In an upcoming

essay, I'll discuss an insight by Jacques Barzun who uses the term, 'mind', in a more general way, reminiscent to me of Neoplatonic ideas, which makes sense in the general flow of Western thought. I won't be changing my usage, though I'm not totally opposed to that other way of using 'mind'; after all, I consider all created being, including abstract being, to be manifested thoughts of God. We could talk about all of Creation as being a part of God's mind, but that sort of talk, while possibly useful, can lead to pantheism, to the total identification of God with Creation.

In any case, we can see how useful it is to talk as if there are chunks of clay in the human mind, such as it is, at birth. And there are rocks not to be reshaped though perhaps to be ground to dust. And there's at least one other sort of non-stuff, though it's arises from the activity of the human brain as it interacts with, responds to, its entire body and all that lies around it. That other, more mysterious non-stuff becomes more obvious, though no more visible, when that human being speaks and thinks complex concepts, when it tells stories and invents poetry which is sometimes a story and sometimes not. That non-stuff gets us closer to true mind as a useful concept.

The world is the stuff and non-stuff of a story which includes a huge number of characters and subplots, a huge number of props and settings. By 'non-stuff', I mean immaterial aspects such as relationships though those are still mediated through physical means. Other creatures, including human beings of lesser awareness such as children and those with damaged or poorly developed minds, act their roles as characters in these narratives and thus act as-if they had minds, but those aren't really signs of a true mind, an imitation of the divine thoughts which are manifested in created being. They are the manifested thoughts, the created being, acting according to their nature, a nature given them by the Creator by way of acts-of-being.

Physics and biology and history and other fields of empirical research and analysis work at two levels. They help us to learn about the stuff of our own human natures and of all other creaturely natures, those of stars and rattlesnakes and electromagnetic fields. They also help us to understand the movements of our own selves and our environments and the entire universe through time, that is, they help us to sketch out a variety of narratives.

There's a lot more to be said about the nature of being, concrete and abstract, which goes beyond the understanding of concrete being in its thing-like manifestations, but that's well beyond the scope of this essay. I've written about some of that lot-more before and might one day write

various overviews.<sup>1</sup>

To return to William James: it's a little surprising, given his own literary bent and that of other members of his family, that he seems to have shied away from thinking up into the story levels of greater parts of the universe, let alone Creation. And that is the more neutral way to describe this world: this universe seen as a true narrative. A narrative gives us a moral ordering of some sort, however much some narratives might repel us. In my Christian way of viewing this world, it's but a part of Creation, a part we can label concrete. This concreteness isn't for its own sake. Rocks and rabbits don't exist as mere objects. These concrete entities, things and living creatures, are part of stories which are in turn part of a complex narrative, a huge story being told by God. Relationships are primary and relationships in this universe are dynamic and lead to a huge variety and far huger number of stories.

Stuff and its fundamental physical relationships exist to participate in various stories or, rather, the stories are relationships and shape the raw stuff of this universe so entities arise to play roles in those stories. Even in an amoral or pre-moral way of speaking, that is the purpose of stuff and its relationships because, after all, that's what stuff does, though imperfectly and transiently. The purpose of life is survival, though survival is ultimately defined differently for an elk, for a virtuous pagan believing this world to be all there is, and for a Christian who believes in a greater Creation which includes the possibility of surviving on the other side of the grave. Survival of the fittest, never-ending memories (in some sense) of the most noble, survival of those best able to share the life of God. Human beings survive, or fail to, in these various senses and probably others.

There's much to be done in this area and I don't claim to have done much more than point in the general direction of some possibilities. I'd like to develop some ways of talking about stuff and relationships and how stories develop when relationships, primary in being, create stuff, secondary but still essential to our existence, and events start popping up, often to our surprise. This is very important because those all important relationships which carry moral import lead to these stories but then further develop within these stories. When we've reached this narrative level, we're in Darwin's territory (and eventually that of Homer and Moses and the Evan-

---

<sup>1</sup>As of 2012/05/14, I'm working on a book about the human mind which I hope to finish before the end of the year.

gelists) rather than that of Einstein, though it has to be conceded that Einstein's work has been very useful in describing a physical universe which develops in the way of a strange story rather than being some mechanical development of given and unchanging objects.

As I've noted in Chapter 156, *A Christian's View of Einstein and Bohr's debate on the meaning of reality*, Einstein himself was inclined to see objects as existing independently of their relationships, capable of engaging in relationships but not being changed by them. Bohr saw more clearly and was the one who was closer to the ways of thought of Christian tradition—see Chapter 35, *Until We Know What Truth and Freedom Are, We Should Be More Modest In Our Claims*, for an overview of those traditions.

We need ways of talking about stuff and relationships, those coming from those realms of raw being also those secondary relationships which develop in relatively more concrete realms of being and which include what we would recognize as moral relationships. William James provided his followers with part of the vocabulary and concepts necessary to engage in such discussions but neither he, nor any of his disciples I know about, have moved on to engage in philosophical or scientific versions of the discussions that the other James brother, Henry, put into the form of moral fictions.

The best possible human knowledge shouldn't be viewed as William James did as a free-standing human mind learning to flow along with created being. A proper human mind is the physical human being as an encapsulation of this world and that requires us to encapsulate also the abstract realms of being from which things are shaped. Our minds come into being as manifestations of that perfect knowledge which James wrote about. Our minds are not entities which exist apart from that knowledge and somehow acquire it by coming together with the things of this universe.

If William James had been willing to conjecture a world, he could have seen this.

# 126 Ideas, Objects, Truth, and All That

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1243>. It was finished and uploaded on 2012/04/24.]

This is the last chapter dealing with that profound and profoundly frustrating work by William James, *The Meaning of Truth* [78] where he claims:

It is *between* the idea and the object that the truth-relation is to be sought and it involves both terms. [page 165]

No, but, once again, his error carries more insight than the truest thoughts of many serious thinkers, perhaps most. He conjectures that truth lies seen in some sort of blurry space between idea and object. Blur there is, but it's a blur around and inside that object.

There are no disembodied ideas. There are no disembodied truths accessible to human beings. The same idea can, usually will, arise from more than one object. A multitude of objects can be shaped from the same truths.

Before going on, I'll make an apology of sorts to William James. He was so dedicated to a sort of agnosticism of religious and metaphysical beliefs that he was prone to not following up on his own insights but it would have been hard for a sane thinker—prior to the forced acceptance of quantum theory and the theories of relativity and the theory of transfinite numbers—to have thought of things and time and space as being shaped from abstractions, hard to have thought of the human mind as being an encapsulation of the world, in those early years of the recent explosive growth of empirical knowledge and of the abstract knowledge drawn from, feeding into, and overlapping with that empirical knowledge. It's possible

that the ancient Pythagoreans had some insights into this possibility but, if so, they quickly and prematurely concretized their insights into some sort of dogmatic and cultic form. Even, or perhaps especially, those of us who think God, or the gods, to have given us special revelations have to be careful to keep our understanding of empirical reality connected to but distinct from those revelations. Those, including likely Einstein, whose one God is Created Being itself, will naturally and legitimately intermingle any revelations and empirical knowledge.

Modern physics has probed thing-like being to find hints of ever-smaller things and also hints of the totality of concrete being we call the universe. For the most part, what they've found has been a sort of being eerily similar to the things we can see and touch but different in a way that hints quite strongly of abstraction, of being that's not quite this or that until specific concrete relationships are formed at the proper level. Similar comments can be made about a number of fields in mathematics.

That should be obscure enough for most inclined to metaphysical thought and I'll turn to critiquing the language used by James in the above quote.

An idea, in the sense of something formed in the human brain, isn't something which exists independent of created being. It's an approximation to some aspect of either abstract or concrete being. I'm pretty sure that James knew this and nearly as sure that he was trying to get at that point but by way of a reaching out into a space of sorts found between the thinker and the object. In this way of thinking, mostly the right way to think when a concrete being grapples with abstractions: an idea of a circle is an approximation of some abstract relationship captured in the various definitions of a circle, a line formed by points equidistant from a single point and now seen as a formalism or abstraction of that relationship. An idea of a tree is an approximation to some very complex relationships between family lines of organisms which are now seem as parts of narratives explored by evolutionary biologists. And so there are some very complex entanglements of abstractions out there in our world.

William James most certainly didn't think that either truths or ideas exist independently of objects or at least of objective being. Unlike me, he didn't even seem to accept truths transcendent to empirical reality, though transmitted through that empirical reality. He may have known that those objects, being involved in more or less continuous acts, are entwined in streams of activity which we can roughly label as narrations even before

we deal with purpose or with a morally purposeful Creator or morally purposeful actors or observers. Ideas are human approximations to the ‘truer’, or at least more abstract, nature of objects and of narrative actions, but even the most abstract of ideas are entangled in narrative streams. This is one of the strange lessons of the modern exploration of some very deep abstractions: no matter how abstract and useless a mathematician intends his work, some computer scientist or particle physicist will find a concrete application.

Perhaps William James should have said:

It is inside the object, often very deep inside the object, but also around the object, that the idea is to be found which is an approximation to truth. A human creature can only see the truth in the entanglement of object, the human ideas related to that object, and some prior understanding of the truths from which that object was shaped.

At least that’s what I would say, though it would be nice if I could find a more elegant expression. The careful reader will note I’ve complicated matters a little by adding in a touch of what might be called ‘Bayesian blending’, but don’t worry about that because it’s another way of talking about nurturing and reforming our intellectual inheritance and also our own minds as they grow and mature. But here’s an additional claim which might help to clarify what I mean:

Traditional Realisms or—equivalently—Idealisms have erred in seeing that things and something-like-idea have not fully independent being but even the sublime Plato himself made the mistake of confusing ideas and truths.

## 127 Intelligence vs. Intellect

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1246>. It was finished and uploaded on 2012/04/25.]

I realize there are a multitude of good books out there I'll never so much as open but sometimes I feel an urge to re-read a particularly good book. So it is that I've picked up *The House of Intellect* [7] copyrighted by Jacques Barzun in 1959. In the first essay, he makes a nice distinction between intelligence and intellect. He draws his specific examples from the United States but is speaking of the entire modern West when he says, on page 4: "Intellect is despised and neglected." But he'll tell us on that same page:

We [in the United States] have in fact intelligence in plenty and we use it perhaps more widely than other nations, for we apply it with praiseworthy innocence to parts of life elsewhere ruled by custom or routine. [page 4]

Professor Barzun has his take on a problem similar to one I've discussed in some essays, though my terms are different, being those of a Thomism updated to consider modern empirical knowledge. Barzun is perhaps the prime example of a well-educated and highly cultured academic who was born at the end of a period of creative ferment which is hard to even grasp and who lived through a period of consolidation of that creativity which seems to have prematurely turned to a period of decay and increasing moral disorder.

Near the bottom of that same page 4 so dense in insight, Barzun tells us:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of

discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

Ah, now we see. Barzun is in the tradition of the mainstream of Christian thought in the West. He would probably agree with Quigley's claim that "Truth unfolds in time through a communal process." He might disagree with some of the terms because Christian thought, despite the misunderstanding of most historians and most philosophers, theologians, etc., isn't a specific metaphysical viewpoint in the sense of having a pre-existing schema to used to understand what's out there. It's an empirical viewpoint, a baby metaphysics of sorts which can grow so long as we don't deform it with the oddly shaped clothing of Platonism or Neoplatonism or Kantianism or British Empiricism or Liberalism (in political and economic domains). Creation is the work of a God of power and wisdom and freedom. He created what He wished to create and He can bring us along so that this Creation unfolds to our viewpoint in a variety of ways. To have any chance of understanding reality, we need to suspend unconfirmed aspects of our personal or inherited beliefs in the nature of the being which we observe in the pretty little girl growing toward womanhood or the star imploding into a black hole. We need to study what is, to contemplate its meaning, and to make sense of it in terms available to us, terms developed by prior generations supplemented by our discoveries and insights. There is, of course a danger: past generations could have headed in the wrong direction and we'd then likely be in a position where it would take some number of generations to make it back to the proper path, the proper understanding of God's work which is Creation.

The understanding of Creation which we start out with is that intellect of which Barzun speaks, "the capitalized and communal form of live intelligence." I think that there are diseases which can affect intellect, the capitalized intelligence of some significant community, which are similar to diseases of the individual and his intelligence, such as schizophrenia and various sorts of distortions to perceptions. A healthy intellect, however imperfect it proves to be in some ways, however incomplete it necessarily is,

gives us an understanding of our world and a corresponding understanding of the meaning of the created all. An immature intellect can leave us with a distorted understanding of Creation and the corresponding lives not meaningful beyond the animal level. We could then say that we would have diseased intellects.

As Barzun has noted, there is plenty of active intelligence in the modern world. It's pretty common for me to be in strange conversations with men and sometimes women who have shown good moral order in the ways they've led their lives, holding down responsible jobs and maybe responsible positions in a parish or a town government or other public organization. They reason pretty well, I must admit, but they come to strange conclusions about the various messes in southwestern Asia or in our relationships with Russia or the current problems between church (or Church) and state (or Union in Lincoln's idolatrous terms). I sneaked in that last parenthetical expression to exhibit an idea which may or may not be partially or fully true but it isn't likely to come to anyone who hasn't read any works in some particularly important lines of dissident thought in these United States of America.

I've read revisionist historians of various sorts, the Southern Agrarian viewpoint being a bit raw but still my favorite but I've also done some reading in the Old-Right tradition and the more straightforward libertarian tradition, various leftist traditions and some thinkers who draw from various specific traditions. What's important is the fact that all of these thinkers were serious and morally well-ordered men and women, drawing themselves upon the traditions of (mostly) the West. Works of historical and cultural criticism are one good food for building up intellect, as are works of poetry and fictional narratives, of science and mathematics, of philosophy and gardening. Good books, good apprenticeship programs – even if just in the form of going into the fields as a friend of a master birdwatcher, provide the stuff of intellect but also the habits and customary usages of that stuff. It teaches us how to identify good wood but also how to make a roll-top desk from it.

As I said, I also often find myself in strange conversations with my fellow-Americans where they pronounce, as if experts on the topic, and then draw conclusions which would be reasonable if what they think they knew were true. The Internet, and maybe a good history or even travel book from the local library would raise the level of their intellects to a level more appropriate to the high level of their intelligence. It would take serious

effort for even most Americans with higher degrees to raise their intellects to a level appropriate to the decisions we've already made by allowing self-serving scoundrels to control our government and the tremendous firepower of our military.

There are a number of military and intelligence professionals, some are both, who will testify to the rationality and even reasonableness of the Iranians and some will testify to the corruption of American foreign policy to suit the purposes of American domestic politics. American political operatives have made many collateral corpses in Iraq to win elections and now threaten to make Iran glow in the dark because those Iranians can't be trusted with nuclear weapons, but those American political operators also seem intelligent enough, sometimes even giving some hints of moral intelligence, but only in a very limited sphere, the sphere of individual actors.

As a country, we've utterly failed to develop an intellect, that is a morally well-ordered understanding of our world. We don't really even seem to have done much to take the small, educational steps of developing a rational understanding of our relationships to Mexico or Cuba or even Canada. We're too smart and too proud to admit we're poorly educated adolescents—at best. In the sense of individual intelligence, we're as smart as we think we are, but we're pretty dumb and very ignorant in the sense of that intellect, that capitalized and communal intelligence, so important to being morally responsible members of these modern communities, so large and complex.

We've created those large and complex communities in various realms of human life, political and economic and cultural, but those communities are poorly founded—which is, at least for this discussion, the same as saying we haven't developed any understanding, any intellect or communal and capitalized intelligence adequate to the tasks of running such complex communities.

# 128 Should We Read Words or Sentences, Essays or an Opus, Cities or Civilizations?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1376>. It was finished and uploaded on 2012/08/18.]

Some write down scales or perhaps compose etudes. Some write simple tunes or even multi-part tunes. Others compose concertos and sonatas and symphonies which can't be fully understood unless fully held in mind, if only for an instant. A section in the third movement might well play off a section in the first movement. Of course, at all levels of complexity, simple tunes or symphonies, there might well be references to matters of Scottish or Czech culture or the work of another musician, perhaps even one from an ancient civilization.

There is, of course, a correlation between the complexity of a tradition of music and that of the encompassing civilization, between the discipline necessary to compose music of a certain standard and the discipline necessary to allow oneself to be properly entertained or enlightened by that music. Yet, can they truly be separated? Or even put back together?

In this way, meaningful texts are no different from musical compositions.

I imagine myself to write symphonies. I'm driven to so write or else I wouldn't since there is not much to be gained in writing symphonies in an age when the desire and capability is for receiving teen-aged ballads and mood music where the mood is increasingly one of moral emptiness or outright sickness. Would I be overstepping a boundary if I noted at this point the irony of my analogy?: music of a high quality, even opera!, has survived and has somewhat prospered in an age when poets and novelists

are selected by publishers for their ability to produce texts which allow American readers to stay within their comfort-zones, to use no more brain-power or heart-power or hand-power than if they were watching bullets going through the body of a good Samaritan on the streets of an Asian city or watching a monkey crapping at the zoo.

Flannery O'Connor once wrote that Americans were neither compassionate nor moral, only squeamish. We're being trained out of our squeamishness when it comes to the other and being trained to be still more squeamish when it comes to fears of what the other might do to us.

Can we catch a scan of this phenomenon, an image of an evil grin on the skulls hiding underneath our skin? Can we design a non-biased survey which will tell us if Americans place little value on the other other beyond the other's willingness to submit to our charity, exercised at the point of a gun or under the rule of graduates of Harvard Business School or perhaps under the beatific smile of a 22 year-old social-worker, recently graduated from Notre Dame or Radcliffe and so eager to make the world a better place?

I've developed thoughts along this line before, not the moral critique as substance but the moral critique or other commentary as substance and style which are entangled and each as complex as the other and still more complex when held as one line of thinking and feeling and doing. I was encouraged to revive these efforts when I recently read Jacob Neusner's books *Judaism in the Matrix of Christianity* [97] and *Christian Faith and the Bible of Judaism* [98]. Some months back, I had reread Rabbi Neusner's *Confronting Creation: How Judaism Reads Genesis* [100].

Neusner writes of sages who were as little impressed by the usual rules of prose as I am. Some of them wrote stuff that seems to make little sense and others assemble the nonsense in such a way that we can see great wisdom. But then we see the nonsense is something different than what we thought it to be. Maybe we also see the wisdom as questionable.

You see, there are commentators and there are redactors who assemble comments as if they were no more than steel beams. It's not clear if those redactors bothered to use rivets. Perhaps their efforts are untrustworthy and ready to fall at a breath from the big bad wolf?

Let me try to get back on track.

Neusner differentiates between the redactors of major works and the writers of the short 'conversations' which are commentaries upon Scripture or ideas related to Scripture—the sages didn't always quote Scripture be-

fore developing important ideas, nor did they always proof-text as they were carrying out that development, nor, as he powerfully points out, did they always end a story with a proof-text as did the authors of the Gospel of Matthew. The individual commentators created short texts and the redactors arranged them to make points more strongly or to make points which couldn't be made in short texts and maybe couldn't be made explicitly—there is no bulls-eye and Hermann Melville knew this as well as did the redacting author of the book of Job. In a sense, and this is my analogy, the redactors were writing poetry where the individual lines were quoted from the works of others. Some modern poets, most famously T.S. Eliot and Ezra Pound, wrote poetry in which substantial parts were quotes from classic texts or allusions of the sort which were nearly quotes. The meaning is in the ensemble, in the greater structures of the textual symphony. Baudelaire didn't always make sense either but Eliot quoted him in such a way as to elucidate why lighting candles and praying novenas with the pious old ladies might be better than teaching that the tradition is glorious in a way which is less convincing than whining that the tradition is beyond the reach of modern gossipers. In any case, the two were connected by a fascination with cats which context remained unstatably invisible to those not having a small acquaintance with the greater body of works.

Sometimes, it's better to write a simple text, or a simple piece of music. Bach was particularly wide-ranging in his musical efforts, writing or sometimes collecting little snippets. Hayden also seems to have been such a collector since snippets sometimes pop up in the midst of a symphony. Beethoven made his living partly by setting popular ballads to music and went on to die in the midst of a possible effort to enlarge our ideas of what music is—and no one has taken up his unfinished task, unless it's happening as we otherwise finish boring our Western selves into submission to our home-grown parasites. Yet, it's at least arguable that others followed him and managed to write some symphonies as great as one or two of his. Perhaps the uncompleted efforts of Beethoven could be seen in some greater gathering of works he was able to complete? Perhaps.

But I'm writing about texts and perhaps should stick more to the topic.

We often think of texts, say the writings of great historians, as being in conflict in such a way that one of them "tells the truth" and the others are more or less false depending upon how close they are to that truth. Sometimes, it's better to think of the historians or poets or political philosophers as being in some sort of very complex musical interplay, even across

academic department lines of demarcation. This is not because there are multiple truths nor because there is no truth as such nor even because universities are as useless as they've made themselves to be. We often find it beyond difficult to reach a convincing view of matters and should be a little modest about tossing around words such as 'truth', but the problem is something different.

We're digging down toward a treasure and sometimes Tom tosses dirt to a spot where Dick later works and he might toss it toward Harry's spot or back at Tom.

We're feeling up an elephant and sometimes come to a part which we perhaps shouldn't be touching in such a way and sometimes we come to a part which we falsely think to be private to the elephant or at least embarrassing to the touch of someone not trained in the veterinarian sciences.

We're dissecting a long-dead mammoth which has recently emerged from the frozen tundra of Siberia and suddenly we come to understand some of those parts of a modern elephant.

We read the Bible to find that David was a God-centered man and we have then to wonder what god he served when he was in business as a soldier-for-hire.

We learn of Wittgenstein spending years studying the logic which some would use to provide firm foundations for mathematics, a much shorter time demonstrating that those foundations were built upon sand, and then went on to small-scale fame as an orderly who wrote short collections of aphorisms which sometimes make little sense except when you step back a little and forget the words.

We read of the Christian faith of the Founding Fathers of these United States and politely try not to notice how few of them raised their children to be orthodox Christians by any reasonable definition. We look away, fearful that we who have failed in the same way may also have little in the way of true faith to pass on.

On that note, I end because I'll soon be writing upon that topic and I'll be claiming that we do pass on our faith, as did most of those Founding Fathers. How very sad.

# 129 Have Scientists Found Mind or Part of It?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1443>. It was finished and uploaded on 2012/11/26.]

Years ago, I proposed that the immaterial feel of our minds might be the result of fields playing a major role in our thinking. An article, *Neurons Talk Without Synapses* found at <http://www.the-scientist.com/?articles.view/articleNo/33350/title/Neurons-Talk-Without-Synapses/>, discusses recent work that shows neurons ‘talk’ to each other by way of changes in electromagnetic fields and not just by direct electrochemical contact.

I think there may well be similar effects due to quantum fields, meaning there may well be quantum effects coordinating the activities of specialized cells, which means that there would be quantum effects at the level of certain cells. There might well be cells which will change state as a result of the transition of an individual electron to a different level of energy. At the same time, I strongly disbelieve in any quantum magic that provides us with ‘consciousness’ or ‘freedom’. If we look for freedom where it’s not to be found, then we may convince ourselves there is no freedom.

As one example of the ‘survival usefulness’ of quantum effects, they would allow animals to be unpredictable black-boxes from the viewpoint of predators. Otherwise, a specific family-line of creatures might develop a tendency to go right more often than not when trying to escape a dangerous predator. In fact, there are cells involved in motor control which are so finely balanced in their electrochemical states that the transition of a single electron in one of those cells might be sufficient to put it in a new state. Of course, it’s very conjectural to write about a capability which might be useful to the survival of creatures in a world of dangerous predators. We

should be careful when engaging in such potentially ill-disciplined speculations. Evolutionary theory is the most empirical, fact-based, of all branches of scientific thought, but it's a part of the world which has proven to be part of a realm of created being which has abstract regions which can only be understood by corresponding ways of thought, with those ways of thought be our ways of shaping our minds to those abstract regions rather than being ways adopted by some pre-existing mind which can somehow think in occultist ways, ways transcendental to the regions of being in which the human being himself is to be found.

We should be clear about the nature of reality and of the abstract regions from which our world is shaped and about the ways in which our minds are formed as we respond to concrete and abstract regions of created being. Some of those abstract regions are manifested in our minds as mathematical systems. What evolutionary biologists study isn't just some sort of 'after-the-fact' factual results of some mystical randomness but rather a true factuality being played out, a narrative-based factuality.

Most modern human beings seem to think of 'randomness' in terms of something coming out of an occult dimension, not so glorious as the transcendental regions from which our minds and best thoughts originate but still better than the mundane stuff of earthly life. Even some otherwise sophisticated thinkers from various fields of science accept this strange mysticism as being hardheaded realism. This occultist view of randomness is a literalization of formal definitions from so-called probability theory, itself more a pedagogic tool easily folded into a fully-deterministic measure theory.

We modern men truly possess that perverse literacy and the resulting invincible ignorance which Thomas Jefferson saw in his fellow-Americans in the early 1800s. See Chapter 380, *The Size of Human Freedom* for a discussion of the nature of randomness.

# 130 Human Wisdom Should be Dynamic and Not Static

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1502>. It was finished and uploaded on 2013/01/21.]

I repeat myself to a lesser or greater extent in many of my essays. I don't do so to annoy or bore readers but rather in an effort to gain a new perspective which might bring new insights, if only a whisper, and might reach new ears and maybe inspire new thinkers. After all, I seem to be involved in a conversation which includes whispered hints by God but no words written or spoken by human beings other than myself. I try to supply what is lacking and is needed to refine my own ways of thought. I'm trying to get human thinkers moving toward the deep reform of our decaying Christian civilization, the West, or toward the building of foundations for a new Christian civilization. It's not sufficient for me to toss out messages in a bottle and hope some thinkers in a future generation will find those bottles. It's not sufficient for me to accept the relatively high probability of a century or so of darkness, of violence and stupidity and disease and slavery, much like the period which disrupted Western Civilization after the collapse of the High Middle Ages. I don't accept the need for such an ugly and pain-filled age. I think we can build a short bridge to a age still better than the one ending, but it'll require a better understanding of Creation, of the story God is telling and in which we can participate fully and intelligently only if we actively pursue such an understanding.

In this essay, I try to re-summarize in few words an old conclusion and find myself proposing what is to me a different way of seeing the reasons why so many Catholic traditionalists, and other traditionalists in a similar way, are so ineffective in opposing the destruction of respect for truths beyond

the manipulation of power-seeking and wealth-seeking and comfort-seeking men. We need also to construct a narrative of Creation in light of our small stock of revealed truths which is more plausible and more coherent than the narrative we've inherited, a narrative developed from understandings of more limited regions of Creation. We modern men have progressed in our understanding of concrete, empirical realms of created being and also in our ability to reach more deeply into abstract realms of created being, though we certainly haven't progressed in such ways as moral order of our individual or communal selves.

And so, I return to the human understanding of Creation, emphasizing the story of the loss of a plausible Catholic understanding over the past two or three centuries. Yet, it is the story of Western Civilization in the Modern Age and applies, in a form only somewhat modified, to Calvinist intellectuals and Lutheran intellectuals and even those who are virtuous pagans (in which category I place the more admirable atheists). All major lines of thought, including those of self-labeled traditionalists or even those of self-labeled Catholic traditionalists, have come to include mistakes produced by our failure to truly see that the best of human wisdom is only an approximation to the perfect knowledge of God but also of failing to see that we're constantly learning more of the thoughts God manifested in Creation and, thus, failing to move our wisdom, our fumbling substitute for perfect knowledge, toward a more perfect and more complete state.

In fact, those who would defend the higher truths revealed by God or gained by past human responses to God's Creation have retreated from a courageous and faith-filled exploration of Creation and an equally courageous and faith-filled response. We're living off the wealth left to us by long-dead theologians and philosophers and poets and so forth. Only thinkers in the most fact-disciplined of empirical sciences have made much true progress in understanding some important regions of Creation. Few there are in the fields of creative writing or philosophy or theology who've realized the importance of radically new understandings of space and time and matter and the history of this universe and the history of life in general and human family-lines in particular.

As Etienne Gilson told the story, Catholic intellectuals led the Church into an intellectual ghetto of sorts around 1800 when they had failed to provide any good, Christian answers to the legitimate questions raised by modern thinkers. I think that other groups of intellectuals have created their own ghettos in the years since, even those from schools of thought

which profess a respect tending to worship for the goodness of an open mind ranging freely over... whatever.

In terms of the ongoing development of my thought, I can raise an additional complaint against not just Catholic intellectuals but against nearly all who, then and since, have claimed to be protecting traditional thought against Enlightenment thought. In fact, it turned that much of the defense raised by traditionalists was against the growing evidence that the traditions of Western men had been pretty good but no longer could speak accurately or beautifully of God's Creation. Most traditionalists over the previous two centuries or so have been defending increasingly implausible human ways of understanding God's Creation as empirical investigators, historians as well as physicists and biologists, were piling up evidence that God's Creation is different from what it had seemed to those before the development of modern instrumentation and empirical research methods. They chose their human traditions in preference to God and His Creation.

Modern traditionalists have been defending not absolute truths but human wisdom, that fumbling substitute for perfect knowledge. They have refused to acknowledge the near certainty of men of faith and courage being able to make at least incremental and maybe large-scale improvements in that wisdom, bringing it somewhat closer to the thoughts God manifested as Creation.

If you wish to read a more detailed discussion of the issue of knowledge, you can download my book *Four Kinds of Knowledge* [43] where I explain why there are only two kinds of knowledge, that of God in His transcendence and that of God in His freely chosen role as Creator of this highly specific Creation.

For a more detailed discussion of my understanding of being, see Chapter 169, *From Abstract Being to Concrete Being and Narratives*. In that understanding, I propose that we can move towards more abstract forms of being by way of physics and then move down to see how that abstract being enters into, say, political relationships. This doesn't mean that physics is inherently superior to the human knowledge of other aspects of our world, only that physics is a fundamental body of human knowledge and it has advanced more rapidly than other bodies of human knowledge in recent centuries. I'm also not claiming we can use the specific mathematics from physics and similar fields because the equations of general relativity are themselves particularized from more general relationships, particularized for the shaping of this physical world. It also doesn't mean that the 'softer'

sciences are always dependent upon the ‘harder’ sciences for advancements in the understanding of abstract being. In fact, the insights of modern physics and mathematics lead quickly into abstract regions more qualitative than quantitative. I suspect the borrowing will be soon going back and forth between the modern sciences of complexity and chaos and the sciences of narrative arts, history and archeology and evolutionary biology and so forth.

I’ll return to the main stream of my discussion to ask: At what level of thought and feeling and action should traditionalism be defined? I’ve asked this question before in less explicit ways. It is the question which is important because I can’t dictate how my fellow thinkers, wannabe traditionalists and others, define ‘traditionalist’. In fact, I don’t really care much. If traditionalism is wrongly defined by my ways of understanding God’s Creation, especially its moral order, I’ll simply stop referring to myself as a traditionalist.

Let me explain the question, “At what level of thought and feeling and action should traditionalism be defined?” by using two extremes.

First, we could define traditionalism as most human thinkers do, as a commitment to a specific way of understanding men and human communities in terms of thought and feeling and action. This common way of defining traditionalism, and channeling traditionalist instincts and desires, tends too often to swallow whole the concretely embodied ways of thought and feeling and actions of specific human communities which are localized in time and place and culture, including religious cult as well as agriculture and literary culture. I sympathize with this viewpoint and think it to be the foundation of a more complete and more perfect way of shaping ourselves to the truths embodied in Creation and the more particular forms of being and of narrative which we find in our world, but swallowed whole it can choke and even suffocate us.

See Chapter 275, *We Prefer to Cooperate With Those Like Ourselves*, which deals with the reality of human nature and how we build our communities, starting with concrete attachments to those ‘like ourselves,’ for a little more detail of my sympathy for this attachment to our concrete physical and social environments, an attachment dealt with in a powerful way by such Southern thinkers as Andrew Lytle and Melvin Bradford and in a more problematic way by Nathaniel Hawthorne during the early years when New England communities still had a chance of becoming true centers of culture rather than so many volcanoes vomiting forth self-righteousness while mak-

ing much money over the years by way of the slave-trade, drug-smuggling in Asia, the weapons industry, and—more recently—harvesting parts of lab-grown human babies and the like. The Puritanical tradition was never, in my opinion, overly promising but it had some good aspects which apparently didn't interest most of the children of that tradition, children increasingly liberal and pagan over the years. New Englanders, early on, chose certain streams of human tradition over the God-centered or Creation-centered streams which might have led to better and more truthful understandings of man and the world and all of Creation.

Traditions aren't that much different from technology in being ephemeral, imperfect and incomplete manifestations of something to be found only in the Body of Christ on the other side of the grave. Our technology still contains understandings of the building technologies used by the Egyptians in raising the pyramids and those used by Herod in pouring concrete structures underwater as well as many other ancient and Medieval technologies. Our traditions also need to carry forward what was good in the legal and moral teachings codified by Hammurabi, the narrative techniques of Homer and those differing techniques of the Yahwist and the Deuteronomist, and so on. We need also to consider that traditions can be inclined toward regions of moral corruption or moral weakness. They can also be supportive of political and military strength while having little to offer the human race in the realms of theology or philosophy, literature or arts both practical and 'decorative'.

Traditions of a more admirable sort, as Edmund Burke saw in a somewhat cloudy way, should be ways of understanding, in the total sense of mind and heart and hands, some more abstract view of the truths underlying concrete being, relationships, narratives in this world. At times when an overburdened and inadequately capable civilization is decaying—I write of Western and Christian civilization—it should be possible, at least for devout Christians or even higher pagans to see the higher and more abstract forms of being which show when the concrete is eroding.

Most will not be capable of these imaginative acts of seeing that more abstract being clearly, even amongst the dwindling population of knowledgeable and intellectually competent thinkers in the West. Since greater abstraction corresponds to less particular and less ephemeral, this means that most cannot see anything which could be truly labeled 'the permanent things', certainly few thinkers I know of who like to use that term. Perhaps I'm unfair, but I would claim most of those thinkers are little more than

fuddy-duddies who like to imagine they have some magical control over reality, being able to understand and judge God's story by way of very imperfect and muchly incomplete criteria which seems to often correspond to some odd stew of Protestant neo-Scholasticism, the worldly prudence of the Glorious Revolution, and an attachment to literary traditions which seem to come from some never-existing Shakespeare without the imagination or the soft-porn sense of humor. Odd stuff which I have read and enjoyed greatly during some of my stages of restoring health to my mind, but odd stuff indeed once a thinker advances to a deeper and broader, a more powerful and more insightful, understanding of created being and of the story and stories which God is telling with that created being. I admit to now finding that odd stuff to be as unreadable as some of the less insightful classics of philosophy which are little more than explorations of categories imposed upon created being with little appreciation of the, shall we say, lack of proper fit. (Some of the Southerners loosely attached to that 'permanent things' school are more interesting and might have better parts to play in human thought. The same can be said of some mainstream philosophers, but mostly I enjoy and learn from those who are critics of the mainstream, such as Nietzsche and Richard Rorty, to choose two very different thinkers.)

Permanent Things. That's the problem. Things aren't permanent in this world and were never intended to be so by our Maker. The very phrase, used as more than a pointer to 'things' we see only obscurely, is a poison to the human mind. To speak or write or think in such ways is to take Einstein's side in his famous, and greatly misunderstood, debate with Bohr about the meaning of reality—see Chapter 156, *Einstein and Bohr's Debate on the Meaning of Reality*, for a short discussion of what's at issue based upon insights of the German philosopher of science Kurt Hubner. Basically, Einstein believed in permanent things and Bohr, like St. John the Apostle, believed things weren't a primary form of being and could be created or re-shaped by relationships—this only hints of the more complex understanding of created being which I've proposed. I dealt with a closely related aspect of the debate between Einstein and Bohr in Chapter 13, *Einstein and Bohr: Don't tell God what to do!*

Created things aren't inherently permanent, nor are most of the relationships and other forms of abstract being we can recognize. We have trouble seeing, in any sense, the most abstract forms of being, those closest, strangely enough, to that most particular and concrete form of being—God. We are too far away, in some sense of distance, from the raw stuff of

Creation—the truths God manifested as sufficient for the story and stories He is telling. Far too many human beings, perhaps especially those who call themselves traditionalists, are prone to thinking they are very close to those truths God chose for this Creation when they see, often truly, some of that truth manifested in the concrete form of a highly particular literature or political system or economic system.

# 131 Modern Thinkers Aren't Nearly So Smart as They Think

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1526>. It was finished and uploaded on 2013/02/11.]

We modern human beings have separated our minds and hearts from reality, our hands not nearly so much. We're strange creatures who believe the Christian Creeds long enough to recite them at a Catholic or Orthodox Mass or to keep some of the creedal teachings in mind at other sorts of Christian worship services and then, for the rest of Sunday and for the next six days, we believe in the limited and constrained understanding of created being as can be derived from literalistic interpretation of some portion of scientific knowledge, usually as fed to us by mass media not known for deep understanding of stars or the human mind, nor for profound understanding of created being in general. Or we believe that created being is still what it seemed to be before Darwin and Einstein and Heisenberg.

Modern thinkers have no coherent concept of created being and yet think to be able to tell us how to organize our governments, our systems of government, our economies, our cultural institutions, and so forth as if we lived in some transcendental realm only loosely connected to the world of rocks and flesh. They are akin to architects who don't know the properties of steel or steel beams, of concrete, and yet design skyscrapers and massive factory buildings. The results are fascinatingly ugly and lead to rapid collapse or slower processes of decay. There are some modern thinkers who do at least realize the situation we've created for our selves and our communities and our children. In *The Liberal Mind* [95], Kenneth Minogue wrote:

One cannot organize a work of art; nor write poetry to rule.

The man who sets out quite deliberately to maximize his own happiness is likely to fail. Whilst one may, perhaps, be able to create vast pools of technicians at will, one cannot create political stability or a nation of mystics. There are many things in the world which we cannot attain simply because we want them; and some are beyond our grasp precisely because we want them too much. [page 157]

That's the problem. They don't even have a coherent understanding of the nature of created being, of matter and space and time, of human nature and narratives, and they think they can understand what we need in literature and in education and in spiritual activities. By relying on tradition, some think they've not made the mistake described by Minogue, but by not responding freely to Creation as it's forcing us to see that tradition as mistaken or incomplete, traditionalists end up in a similar sort of make-believe mindscape, a little better connected to reality than the imaginary realms of the progressives but not nearly good enough.

In a sentence: Modern thinkers, in general, aren't nearly so smart as they think. Rather than seeing that the reality created by God should rule our minds, they think to use some imaginary pre-existing mind to rule over reality. This is to say, they think they have minds that can be used to grab truths from transcendental regions and then use those truths to construct ideals about individual and communal human being, as well as created being in general. The most obvious surface symptom is the modern reliance upon textbook forms of knowledge, textbook forms of reasoning, and the dedication of modern thinkers to rewriting existing textbooks as if it were a useful activity.

Because of metaphysical incompetence on the part of many modern thinkers—traditionalists and progressives alike, and willful metaphysical blindness on the part of others, because of similar incompetence and blindness regarding the nature and the accomplishments of modern empirical scientific enterprises, modern thinkers have walked away from the central, guiding Christian insight into the nature of creatures in realms of created being:

The truth emerges in time through a communal process.

So we were told decades ago by Carroll Quigley.

Christian philosophers and theologians have paved the way, starting with William of Ockham and the other Oxford radicals, in denying the Thomistic view in which the mind is primary, not because it comes directly from transcendental regions of truth but because it shapes itself in response to these concrete regions of being and can work its way toward transcendental truths by proper use of concrete being. Even traditionalists who seem at first to have a better understanding of the importance of mind will simply assume that created being, and the mind which can be shaped in response to that created being, are simply givens. Whatever their formal beliefs, they think as if created being and mind are pre-existing entities subject to metaphysical analyses. In fact, they are contingent entities, products of a Creator who acted with total freedom in bringing Creation to exist where there was nothing and with great freedom in shaping that Creation to form at least this world which is a story occurring in a realm of concrete, thing-like being. More than that, our knowledge of that Creation is emerging in time and then becomes a true understanding by processes taking still more time.

Let me try to explain by expanding on the quote from Carroll Quigley a bit:

The truth emerges in time as human individual and communal beings respond, with some success, to problems and opportunities posed by Creation. The ultimate goal of this process, even when it occurs in non-Christian or anti-Christian communities, is the perfection of human knowledge and the completion of human understanding in the Body of Christ, indeed, the formation of the Body of Christ. This can't happen in this mortal realm but only in the world of the resurrected when the Body is fully joined to its head, Jesus Christ, and all the mortal members, individual and communal, of that Body are sharing the life of God with its perfect knowledge and complete understanding. The job of intellectuals and others who claim to be helping us to know and to understand is to move along with the natural revelation of Creation and to turn those revelations into good human knowledge and understandings; we are to act as if perfection of knowledge and completion of understanding is possible for the pilgrim Body of Christ in this mortal realm.

This process of bringing the truth into the human realm isn't separable from the communal lives of intellectuals and others. It's a major part of the growth of that community, legitimate communities developing in such a way that they're contributing to the Body of Christ, even if a particular community isn't likely to become a member of that Body. Better knowledge of Creation and a better understanding of what it is and what God's purposes are will shape the human community into a form more perfect and more complete and may lead to the entry of even some non-Christian communities into the Body of Christ. This process is richest and most active in certain individuals gifted with both strong minds and curiosity and also called to participation. Unfortunately, my experiences indicate that creative thinkers are still likely to be forced into isolation, except in some fields of physical or mathematical sciences. Others in these communities have powerful minds but little in the way of inclination or talent to creatively develop new understandings of created being. Those individuals, including scholars and teachers and clergymen and other leaders, must follow along as John Henry Newman and Charles Darwin each play their roles in leading us forward toward greater knowledge and understanding of truth. It is unfortunate that exactly those with powerful minds, or at least good minds, but no creative talents are likely to control access to cultural or other resources and most likely to refuse to acknowledge the need for creative thinkers. It would deny their claims to be bearers and arbiters of truth.

Tradition is a body containing a substantial store of still plausible knowledge and understandings. Even that which is no longer plausible can help us to rebuild a good store of knowledge and understanding. Though our human minds, individual and communal, are rooted in tradition, the shaping of those minds is a dynamic process. With the phenomenal growth of human knowledge of Creation in recent centuries, the process has to be very dynamic indeed or it will die, overwhelmed by Zen understandings of quantum physics or deterministic understandings of genes or magical illusions of control over political and economic systems. By definition, the effort to know and understand the contingent acts of God, the manifestation of some of His free thoughts, can't be a controllable process just as the corresponding acts and feelings of men aren't controllable processes.

All of this is another way of making my claim that the human mind isn't something pre-existing which accesses transcendental truths and uses them to make sense of a this world of concrete, thing-like being. The human mind

forms in response to various realms of created being so as to shape that mind to created being which is made up of manifested thoughts of God. Hearts and hands are also being shaped by these processes. The truth emerges, the human individual mind—live intelligence in Jacques Barzun’s terms and the human communal mind—intellect in Barzun’s terms, form as we shape ourselves in imitation of the acts of God in His freely chosen role as Creator of this particular Creation. We are not born as static images of God but rather as entities capable of shaping ourselves to be images of the Creator as He goes about His work of creating and shaping and sustaining.

Aquinas got some important details wrong and didn’t have so complete an understanding of this process of human self-shaping, but he got some of the most important pieces right. He understood the nature of being as a manifestation of an active process of creating and sustaining by God and shaping by God and creatures. He understood the human moral character forms by a growth process centered around active responses to our environments, defined in a limited way by Medieval knowledge or a greatly expanded way as is made possible by modern knowledge. (For technical reasons not valid given modern knowledge of the brain, Aquinas himself posited a ‘mind’ or component of the ‘mind’ which was non-human and separable from the human body, but we do better by following his understanding of human moral nature and applying that understanding to all parts and aspects of human animal nature.)

In the 750 years or so since Aquinas died, human thinkers—other than possibly me—have failed to further develop what was good in his thoughts and to correct his errors as seen in light of more recent knowledge of created being. They have, in fact, followed Ockham and others in denigrating the importance of the mind and misinterpreting what has been happening as the human mind, individual but mostly communal, has been enriched and complexified almost beyond the understanding of that mind. But, outside of physical and mathematical sciences, the process seems to have largely halted and the mind, individual and communal, as it existed in its largest and richest form, perhaps around 1800, is in a state rapid decay in this year of 2013.

See Chapter 90, *Shaping Our Minds to Reality*, for some interesting insight into this issue by the physicist and Anglican priest, John Polkinghorne, or Chapter 291, *More About Our Inadequate Understanding of Created Being*, for my more recent take on this issue, a take which includes Polkinghorne’s insights.

Modern thinkers don't seem to be cooperating with this process of shaping our minds to created being, starting with the concrete realms of created being which we can perceive and explore most directly. They start with the wrongful belief they have minds that can somehow gather in data or knowledge and work with it the way a computer works with input information. Those who deny the analogy between human mind and computers still think as if the human mind were some bit of technological wizardly wired up to the human body. This means that those biased toward tradition try to work with data or knowledge with their minds actually shaped to understanding some part of our cultural heritage made up largely of outmoded knowledge. This does give modern traditionalists a certain amount of ballast which might at least keep them sane as individuals. Those biased toward progressivism try to discard any knowledge which is in conflict with their—warning of hyperbole—belief that the world is to be made anew by their own brilliant and insightful selves, reaching completion and perfection because of their efforts. See Chapter 459, *Progressives Kill Progress in Future Generations*, for a short discussion of the ways in which progressives can “trap future generations in one specific way of life or one way of solving problems.”

The main point, as always in my thought, is that this world is a realm in a greater Creation and it is also a great story set in a still greater story. Like all interesting and meaningful stories, it is morally well-ordered even if evil drives along some of the events. This world and other realms of Creation are regions of development and—sometimes—evolution. No part of Creation is a static structure describable by a manual forever valid. The characters, the landscape, the entire world are all evolving and developing. In addition, we start with inadequate rules of thinking for dealing with all of this.

As physicists have explored certain realms of created being, concrete and abstract, they've learned to reshape their minds, although much inherited knowledge remains valid at least for pedagogical purposes and the corresponding regions of mind are to be somehow retained. Physicists have had to develop new concepts which didn't fit into the minds they brought to the task. Rather than throw away the new concepts demanded by honest responses to created being, reality, they struggled to reshape their minds. If we examine individual scientists, we find many who didn't really try to reshape their minds and many more who failed in their efforts. Failure is allowed in God's Creation, but lack of honest and faith-filled response to

Creation, to God's thoughts as manifested in created being, isn't going to get you through the Pearly Gates in any sense. It's impious in a deep sense, sometimes even a form of the Satanic, "I will not serve."

We're going through a period when we've learned as much about human beings as we have about the nature of space and time, but political and theological traditionalists have, with few exceptions, acted the parts of physicists who proved themselves not defenders of truth but rather men determined to remain on familiar ground even as the ghetto walls went up around them. Even such great scientists as Henri Poincare ended up as marginal characters in the events dominated by Einstein and Planck and Bohr.

The progressives have acted the parts of perhaps the New-ager physicists and popularizers who threw as much of the old overboard as they could and began to explain all of reality by way of strange interpretations of the rigorously defined mathematics of quantum mechanics and by way of exotic distortions of the equally rigorous but less well-defined geometries of general relativity. At that, the very nature of physics forced even the most would-be radical physicist to keep some of the knowledge he'd inherited.

Once the mind floats free of reality, it can be trimmed or enlarged as one wishes until the separation from reality becomes so severe as to allow, for example, politicians and social-workers and Christian leaders to think that creating a peaceful mixed-race and mixed-culture society is as easy as throwing everyone together and taxing the stable working population to pay for it all. We also think to help women along, in the midst of a terrible problem of rapes and other abuses in the military, by placing women in combat and other situations where they are still more vulnerable to enemy soldiers and also to a population of American men increasingly disordered in their habits and attitudes. We try to educate a population of children with short attention spans and not even the most basic skills of literacy by putting them in front of computers or perhaps placing in their hands textbooks with ever more distracting color-plates.

Reality has no inclination to shape itself to our prejudices, to shape itself to our minds formed in response to ancient systems of thought or to fleeting fancies or even to brilliant schemes of all of reality.

It's our God-given duty to shape our minds, indeed, our entire human beings, individual and communal in response to reality.

The entire modern project, even in some of its successful cultural endeavors, seems to be largely a response by traditionalists and progressives

to shape reality to what we want it to be or are indoctrinated to believe it to be, whether that might be a vision of alleged beauty from a midsummer night's dream or a vision of order from an idealization of past societies which might well have been better ordered than are most human societies as of 2013.

# 132 Progressives as Typical Modern Thinkers

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1529>. It was finished and uploaded on 2013/02/12.]

Progressives have often founded and supported eugenics movements. This article by Tiffany Jones Miller, *Progressivism, and the “German Idea of the State”* found at <http://www.libertylawsite.org/2013/01/31/eugenics-american-progressivism-and-the-german-idea-of-the-state/>, begins with this disturbing sentence:

In 1923, Fritz Lenz, a German physician and geneticist advocate of forced sterilization—a man who became one of the leading advocates of the Nazi’s “racial hygiene” program—criticized his countrymen for lagging behind the United States in the enactment of sterilization laws.

This should be disturbing to Americans, that our progressive ‘reformers’ were ahead of the 20th century pack in sterilizing human beings judged as inferior, because of race or because of cognitive problems, or because of membership in families sunk in poverty for generations or because of syphilis infections or many other reasons.

Progressivists do have a major problem, of sorts. They jumped on the Darwinian bandwagon early on, though the heart of a progressive isn’t really in the principle that better entities slowly form by responding over generations, through genetic variations in individuals and social experimentation in communities amongst other ways, to their environments. Darwinism

might be fine as a way of destroying traditions, especially Christian traditions, but the progressives know they can derive a few good principles and go on to make the processes of evolution and development more rational and a lot more rapid.

The tendency to apply predetermined principles to reality, rather than learning from reality, holds for most modern thinkers, including those opposed to progressivist distortions of reality. Self-labeled conservatives and traditionalists simply have their own distortions of reality as I pointed out in Chapter 131, *Modern Thinkers Aren't Nearly So Smart as They Think*, the main point of which is not that I have any *a priori* knowledge or pre-existing mental skills to judge other thinkers but rather that God is the smart one and we should learn how to think by shaping our own minds, even our greater selves, in response to the thoughts God has manifested in Creation. We are only born as clever apes but we can become smart in the way of God, however incompletely and imperfectly, by learning to imitate God as He goes about His work as Creator and Sustainer and Shaper of created being.

So progressivists see Darwinian processes as subject to the sort of analyses which allow us to understand by way of *a priori* mental schemes, not to understand by letting our own minds develop as God tells His story. The Darwinian processes might have traveled contingent pathways in the biological past, but the smart guys can understand how evolution really should work and what the goals are. If modern human communities seem to have created a problem by allowing the survival of inferior human beings, defective family-lines as well as individuals from otherwise good family-lines, then we simply prevent them from reproducing. At least in the initial stages of such policies, sterilization in medical facilities is used rather than gas chambers. Death by medical experimentation might occur or even death by lack of medical care as syphilis or other diseases are observed, but no large-scale murder, yet. We modern peoples are humane enough to allow resources to be wasted on defective human beings so long as we can prevent them from producing the next generation of banjo-picking idiots. (See the movie *Deliverance*.)

Improvement of our race seemingly can't happen if nature's axe is put away, so men have to eliminate those born defective and those rendered defective by undisciplined sexual activity or alcohol abuse.

Progressivists give the rest of us a chance, but we better make good on it and please them in ways that seem to change over time. Once supporters of

a rather conventional middle-class morality, they have supported child-labor laws, various consumer safety laws, and the like. In more recent decades, they've supported major medical research programs for AIDS, same-sex marriage, and continued the 200 year-old battle to destroy the traditional family. They've had allies to be sure. The neo-Marxist Horkheimer once noted that true, honest radicals owe a big favor to the oh-so progressive businessmen of our Modern Age who've shown they can more effectively destroy that traditional family than can the smartest and most vicious of radical dictators. This is frighteningly plausible and forces me to wonder why most traditionalists have been so ready to see politicians as enemies while thinking businessmen are merely the Christian church producing for the marketplaces. To be sure, some such as Pat Buchanan have been more skeptical of at least the executives of large corporations as well as Wall Street, but such traditionalists are in a minority.

The attitudes of progressivists can be contradictory for sure. I know some who support the elimination of AIDS so that Americans can engage more safely and freely in all sorts of sex and also condemn Mother Teresa of Calcutta for all she did to save the wretched poor of Calcutta and other cities around the globe. Apparently, Americans who don't act according prudently for their own survival and reproduction are still superior to sub-Americans.

In that same article, *Progressivism, and the "German Idea of the State"* found at <http://www.libertylawsite.org/2013/01/31/eugenics-american-progressivism-and-the-german-idea-of-the-state/>, Ms. Miller also writes:

The Progressives, at least, understood that their approach to reform was animated by a new conception of government or, more precisely, "the State." Importantly, this idea, the "German idea of the State," departs from the American Founders' understanding of government in a couple of key respects, both of which help explain the Progressives' enthusiasm for eugenics.

For the Progressives, to begin, the power of government is NOT limited in principle to securing the natural or "inalienable" rights of man, as the *Declaration of Independence* has it. "It is not admitted that there are no limits to the action of the state," as the German-trained progressive political scientist and

future New Dealer Charles Merriam concludes in a 1903 survey of progressive thinking,

...

But the Progressives did not advocate an indiscriminate exercise of power; rather, in their view, the ultimate aim of "the State," the "good" or objective whose pursuit determined the need for government action, was a particular conception of human excellence or "perfection." The guiding object of ethics, and hence the State, Ely explains, is the "ethical ideal," the idea, that is, that individuals are entitled to the "most perfect development of all human faculties [physical, mental, moral, aesthetic, etc.] . . . which can be attained[.]" In short, the guiding principle of the Progressives' domestic reforms, the aim that guided their assessment of existing social conditions, was a felt obligation to improve the relative level of physical, mental and moral development in America.

...

The very labor reforms which softened the "law of competition" seemed to enable "defective" individuals—including the "feeble-minded" and "paupers," as well as persons afflicted with syphilis, gonorrhoea, epilepsy or tuberculosis—to survive in higher numbers and thereby generate "an enfeebled progeny." To counteract this, and to perfect the relatively indiscriminate and otherwise stultifying effects of "natural selection" (or "competition"), Ely urges embrace of "man's selection." In a passage which reads like a pithy, but chilling, distillation of Ely's conception of reform, he likens "man's selection" to the role humans play in propagating plants and animals

The State, or state if you prefer, doesn't seem to have been desired by progressives for its own sake but because it was a concentrated form of power which could be used to reshape human communities at various levels and scales to the ideals of those intellectuals who considered themselves progressive. Nor, as Miss Miller sees matters, did they worship power for its own sake but only for its uses in pursuing some misguided idea of human excellence. By the way, this is a specific point where true traditionalists could have raised a strong objection from their knowledge of history, assuming such exists and is reliable. As Lord Acton told us from his profound under-

standing of history, powerful and centralized governments attract men with the moral character of gangsters. I think he would not have objected to someone pointing out that such gangster types could probably out-compete do-gooder intellectuals in the struggle to control powerful and wealthy institutions. The reader should be thinking of highly intelligent gangsters such as Genghis Khan and Caesar Borgia rather than street criminals or even most of the publicly acknowledged drug-lords.

You could say that the strong ties between the State and certain forms of power make the State itself, at least in the eyes of some of its admirers and enemies, no more than an entity which holds and exercises sovereign power which can't be limited by any power on earth but another sovereign state. Modern history seems to teach us that revolutionaries can grab hold of the State or they can destroy the State and much that it holds power over, but reform of the State into something better, an entity which respects its individual and communal members while exercising power responsibly, isn't possible. Not all revolutionaries are good at holding power but almost all are far better at gaining and holding power than are men humble enough to wish to limit the exercise of governmental power. The gangster Stalin grabbed power and killed the dedicated Communists in the ranks of the Bolshevik party. Gangsters, revolutionaries and snakes in the traditionalist grasslands, outdo both true radicals and morally well-ordered leaders in gaining and holding onto power.

It is also the case that the United States has provided some serious evidence that you can't change a foreign state into some preconceived form, even when the would-be reformers include at least a goodly number of men and women with seemingly noble motives. On this general topic, see Chapter 415, *Why We Can't Build or Rebuild the Countries of Other Peoples*, where I discuss the problem in the context of American efforts to help the Haitians, legitimate efforts as well as imperialistic.

Kenneth Minogue, most certainly not a fan of power-abusers, had a more subtle statement regarding the nature of the State in *The Liberal Mind* [95]:

The State is not an aspect of society; it is the only unity that society can lay claim to. [page 131]

Unity can be something good, especially for those of us who believe this world is the story of the formation of the Body of Christ. But the evolutionary and developmental processes of this world can be ugly and

bloody, and—to put it bluntly—we don't know how to develop a centralized government which will remain morally well-ordered and will exercise only power proper to its true responsibilities, especially if the realm of that government becomes large and prosperous. In Chapter 453, *Can the State be Limited?*, I discussed this problem: how to move toward a State which can do its job without being taken over by men with the moral characters of gangsters, the very sorts of men that Lord Acton claimed to be attracted to centralized and powerful governments—though he, like me, thought better is possible and might someday be done.

What has gone wrong with the state, or State, is related to what was wrong with the progressive, and classical liberal, projects from the start. We took the State, an entity evolving and developing in time, and decided we could plan its perfection and control it on a path of development toward that perfection. Instead, we created a great prize to be won by various sorts of political and military and financial gangsters. To be fair, conservatives and traditionalists made the less dangerous error of thinking it possible and desirable to have frozen the American government as it was in its early stages of development. It might have grown into a more attractive and morally better ordered adolescent but it's rather silly to think it would have been better, or possible, for the American government to have remained at a stage of development comparable to a human two year-old.

Now I can mount my hobbyhorse and start talking about created being and the modern reluctance to produce an understanding of created being which accounts for modern empirical knowledge and some set of beliefs which provide some serious understanding of our world and the human mind which would encapsulate that world and, indeed, all of Creation. Progressive thinkers might feel good about their own Enlightened selves, but they aren't very rational, at least not in the sense of being in synch with empirical reality. In a phrase I've used in my writings, progressive thinkers haven't made peace with empirical reality. To support change and improvement as a general policy is to assume you can do more than is possible in a world which is driven forward by evolutionary and developmental processes which we can influence but not plan and control as McNamara thought he could plan and control the war in Vietnam, as Bush II thought he could plan and control the conquest of Iraq, as central bankers think they can plan and control the decaying economies in 2013.

Let us turn to Creation and return to the true tradition of Christianity, methodical realism, which provides a good meta-understanding by which

we learn how to think by exploring God's Creation and shaping our minds to the manifested thoughts of the Creator.

# 133 Christians Should Shape Their Minds to God's Creation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1598>. It was finished and uploaded on 2013/04/20.]

God's Creation can be described in terms of 'mystery' when we speak in certain modes, poetic or spiritual, but that's not the truest way for a Christian to speak. It's not the truest way because Christians, of all human beings, should be faithful to the Creator and open to what He's telling us through this world and all that lies within it. This is the proper attitude because this world and all the creatures it contains—indeed, all of Creation and the creatures it contains—are manifested thoughts of God.

There is an analogy in the history of modern geometry for what I'm trying to get across. Einstein's general theory of relativity deals with gravity and teaches us to consider space and time as a single geometric object, spacetime. There are a number of peculiarities to this theory from an ordinary human viewpoint. For example, the concept of 'shortest distance' is generalized, a curved line rather than the straight line of Euclidean geometry. And I've just pointed to a major problem. To most modern human beings, including those who enjoy science fiction movies with black-holes, general relativity is a mystery, but only because we insist on trying to put a greater creature inside a smaller creature, a more abstract geometry inside of Euclidean geometry. It's not at all a mystery for those who have the mathematical sophistication along with the necessary time to study this more abstract geometry. After such a study, the mind is reshaped, shaped properly to deal with that more abstract geometry, capable of dealing with the concepts of general relativity. The mysterious has become part of the common sense of a human being who has reshaped his mind in such a way.

We Christians, indeed all modern human beings, need to go through such a process to learn how to view this world in light of all that we have learned about it in modern times. What some call ‘mystery’ is part of God’s way of thinking in His role as Creator; we need to make that mystery part of our way of thinking if we are to be better images of God in the same way that modern scientists and engineers have made more abstract geometries part of their ways of thinking.

If it were true that the answers which we would give the world, the answers which would allow us to make sense of the world and move on to build a new and greater civilization, are beyond our knowledge and beyond our reach even in principle, then Christianity has nothing to tell the world, nothing to help us better order our lives, individual and communal. In this case, a religion which speaks of a savior both man and God, of a Creator immanent in His own work, would be no more than a lie, a set of delusions organized under some grand delusion.

By speaking of ‘mystery’ when we should be reshaping our minds to God’s way of thinking, we show ourselves lacking faith in the Creator and in Jesus Christ, true God and true man. This language of ‘mystery’ often arises when dealing with the modern questions, questions which have received some halfway decent answers, such as the words of the *Declaration of Independence* or the American *Constitution*, but often those questions have led to the guillotine or concentration camps or to battlefields more gory than anything even Genghis Khan could have imagined.

We shy away from the questions raised in the modern world despite the clear evidence to those with open eyes and firm faith in the Creator that all this modern empirical knowledge is telling us much that is important about the work of God in His role as Creator. We are duty-bound as Christians to deal with these questions for they are raised by human exploration of God’s Creation, of thoughts He manifested. We are all duty-bound in our communal being and some are duty-bound by their individual callings in intellectual or spiritual realms of life.

Yet, we continue the language of ‘mystery’ as if we were still nomads gathered around a stone altar. We have no good answers to those modern questions, about pain and suffering, which tie back to ancient questions and we have no good answers to interestingly rich versions of these difficult questions which have arisen in our days. I’m pointing to such questions as:

- What greater, moral sense can we make of human life in a world

of evolutionary and developmental processes which are bloody and seemingly morally chaotic?

- What sense can we make of the physical stuff of Creation in light of the discovery that even matter and energy are contingent things, not categorical entities, and that they have evolved and developed from more abstract forms of being?

We have no good answers to these and many other important questions, because we've not shown the faith and courage to deal with these questions in their modern or ancient formulations.

I think I've come up with a pretty good way of dealing with these and other questions which have arisen in our age. There is no doubt that we need answers which allow us to talk of Jesus Christ being the incarnate Son of God, of our salvation and resurrection into a life shared with God, of God as being the true Creator of all that is not Him, of His purposes in creating this world so chaotic and disordered at times.

I'll give a very quick overview of what I've developed, the sort of complete Christian worldview which is needed though someone might produce a better one. I invite anyone to try. I don't pretend to have the final answers and even if mine prove to be good enough for now, they'll prove to be inadequate eventually, and eventually might be just the next generation.

First, we need a good understanding of being, of the stuff of which our bodies are made as well as the bodies of other creatures. I've proposed, consistent with both the school of St. John the Apostle and quantum mechanics, that relationships are primary, that stuff comes into existence and can be shaped or reshaped by relationships such as love. I've also proposed, consistent with modern understandings of the nature of spacetime and mass and energy, as developed in cosmological physics and particles physics, that being lies on a spectrum ranging from the abstract to the concrete with the concrete being shaped from, made more particular than, more abstract forms of being which are still present in the concrete stuff of this particular world. A marketing slogan: concrete things are frozen soul-stuff. (Judging by modern physics, more abstract forms of being are 'hotter', higher in energy.)

Second, we need to understand the human mind and human being in a more complete sense. My book *A More Exact Understanding of Human Being* [53], which deals with this issue in a way which is certainly prelim-

inary but—at least in my opinion—far closer to the truth than any other such understanding of human being. Based upon modern neurosciences and evolutionary biology as well as my understanding of our relationship to our Creator, I’ve developed the idea that our minds are the result of that very complex organ, the human brain, shaping itself in response to the surrounding environments right up to the level of all of Creation. This shaping takes place on the species level over vast amounts of time, on the cultural level over generations, and on the personal level over our lifetimes. Furthermore, man can be viewed as mind and heart and hands with the strong qualification that our being becomes unified, in a God-like way, as we become true persons and as we prepare to share the life of God. Beyond even that, based upon the Church’s own admission that She is not omniscient and upon my limited understanding of history and politics and sociology, I’ve reinterpreted our understanding of the Body of Christ to be more inclusive of human nature and worthwhile human activities rather than limiting it to ‘churchy’ aspects of human nature. Download and read the book for more.

Third, we have to return to the Biblical understanding, shared with history and literature and even cosmological physics, that we live in a story which has many contingent aspects, even a certain amount of freedom suitable to our creaturely beings—greater freedom comes as we begin to share God’s life.

Fourth, we need to see and to truly live the purpose of Creation: the birth and maturing of the mortal manifestation of the Body of Christ.

The above, if fleshed out properly, will give a good Christian understanding of our world as a concrete level of Creation, but a level in which the more abstract levels, mathematical and metaphysical, can be seen present in the concrete. Such an understanding would allow a more coherent, more plausible, way of speaking with and dealing with such difficult issues as abortion, birth-control, stem-cell technology, waging of wars, capital punishment, and the organization of our political and economic communities. As things stand, we tend to confront these issues by opposing our assertions to the assertions of those holding different, but even more incoherent, views of reality.

This article by William B. Hurlbut, *St. Francis, Christian Love, and the Biotechnological Future* at <http://www.thenewatlantis.com/publications/st-francis-christian-love-and-the-biotechnological-future>,

was written by a medical doctor who apparently does research in the neurosciences. He's trying to deal with our moral confusions as they specifically impact the biotechnological issues and has many good things to say, largely from the viewpoint of a Christian with deep respect for the ways in which St. Francis of Assisi viewed Creation and dealt with matters of human life in that Creation. There's good stuff here but confusion as well. Professor Hurlbut first errs by engaging in that original sin of Christian moral theology, theodicy or the effort to vindicate an all-good and all-knowing and all-powerful God in light of the natural and moral evil in this world—as defined by human creatures. Professor Hurlbut tells us:

How, within the creation of an omnipotent and beneficent God, there can be both suffering and love remains a mystery. But clearly for Francis, that creation was simultaneously material and spiritual—sacramental through and through.

Why is this a mystery? Because many thinkers over the century have imposed their own schemes upon a reality far richer than anything which might fit in their heads. Because many thinkers have thought to judge God's work without having a good handle on God's purposes in creating us.

Years ago, the Calvinist philosopher, Alvin Platinga, who works in a modern analytic framework, presented serious arguments that any such questions presume we can know enough to judge God, that we can judge whether the good which God is to accomplish in this world justifies all the pain and suffering and moral corruption and so forth. Professor Hurlbut has asked questions which imply we can evaluate God's Creation in this way but he also proposes near the end of his essay the position more compatible with Christian beliefs:

All of creation, and its evolutionary ascent to mind and moral awareness, may be recognized as a kind of living language in an epic tale of the deepest spiritual significance. Through the eyes of faith, the entire cosmic order of time and space and material being may be seen as an arena for the revelation of Love, for the creation of a creature capable of ascending to an apprehension of its Creator; but more profoundly, for the reaching down, the compassionate condescension of Love Himself.

We've moved from theodicy into the dynamic realm of narratives. That's good and proper. It's what the Bible teaches us to do. Christ didn't present Himself as a problem to be solved, nor did St. Francis view life as a problem to be solved. To be sure, I've spent a large amount of energy upon the metaphysical problems of being, "What is stuff and relationships and so on?" but I did so on my way to understanding this world which is stuff engaged in a story being told by God. As soon as we have a handle on the nature of matter and energy and spacetime, a handle on relationships and things or love and stuff, we can move to the main task of understanding all of that in the context of the story God is telling.

The questions remain but they become measurements of the gap between what we are and what we are to be if we are to share God's thoughts and even His life.

# 134 The Dis-Unity of Knowledge and the Mis-Formation of the Modern Mind, Part 1

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1630>. It was finished and uploaded on 2013/06/18.]

Donald Kagan was the Sterling Professor of Classics and History at Yale University and a recipient of the National Humanities Medal in 2002. At his retirement in May, he gave a valedictory lecture which was slightly rewritten for publication as an essay: *Ave atque vale* at <http://www.newcriterion.com/articles.cfm/Ave-atque-vale-7653>. After describing the goals of a liberal education, more or less constant over the centuries: to learn how to live as a free man, he tells us:

Servants were ignorant and parochial, so free men must be learned and cosmopolitan; servants were ruled by others, so free men must take part in their own government; servants specialized to become competent at some specific and limited task, so free men must know something of everything and understand general principles without yielding to the narrowness of expertise. The Romans' recommended course of study was literature, history, philosophy, and rhetoric.

Education in the liberal arts was intended to teach men how to be free. The understanding of what was needed to be free changed over the centuries and seems to have become itself somewhat instrumentalist in recent centuries in the Anglo-American countries. This is a possible good since, at least in my way of looking at being, the 'ideal' and the 'instrumental', soul

and body if you wish, are different aspects of created being and not different realms or different substances. For the past couple centuries, there has been a growing and now dominant consensus that freedom is best secured by the sociability which once allowed the landed families and merchant bankers and politicians of Georgian England to hold or gain or expand their power and wealth and now allows young men and women to acquire the styles and opinions of the strangely fluid ruling classes of the 20th and 21st centuries—to be a bit over-simplistic. For the most part, a liberal education has not been some sort of solitary, scholarly search for truth, partly because most in the West prior to the 19th century believed truth was known and what was left to be discovered was, roughly, in the nature of the accidental as understood by philosophers. We supposedly had the rules of Creation and had only to play the game out.

By the eighteenth century, a liberal arts education in England had come to mean the socialization of the young men from the ruling classes of English society; I think this was partly true in the North American colonies but tempered by the need of even landed Virginian gentlemen to scramble for a living. Was that shaping of an English or American gentleman truly the formation of a free man? We should remember always what even the most liberal advocates of liberal arts often seem to forget, what Aristotle learned in a sense as his young student, Prince Alexander of Macedonia, went off to a short life as a brutal and exploitive conqueror: you might be able to teach someone how to make good bricks, you might be able to teach a willing student how to make an aesthetically pleasing and sturdy dining-room table, you might even be able to teach the law well enough for a student to go on to worthwhile work in helping to settle marriage or real estate problems. . . But you can't teach someone to be wise or free. This means you also can't teach someone to be creative, to find good solutions to serious problems. That aesthetically pleasing table would have likely been some sort of copy of an existing style and not creative in a deeper sense.

Even those with the capacity for wisdom or freedom have to **learn** how to live a good life, have to learn enough about created being and its Creator and have to learn how to form the proper relationships to their Creator and to that being including human being both individual and communal. I think it better on the whole to speak of the shaping of a human being by his active and proper responses to created being, concrete and abstract, and to the Creator. I've written much on that viewpoint in the past and I'll try to summarize some of my thoughts. (I'll ignore the complication that

stable societies, which we no longer have in the West, can prosper with large ruling classes dominated by those who don't have the ability or inclination for true learning, self-started and self-directed learning though always best done with guidance from a master of learning.)

There is much which is interesting and stimulating in Kagan's essay. There is much that tells us about the changes over time of the 'traditions' of education in the liberal arts. I will note a more recent tradition, one championed by John Henry Newman and one I tend to follow in my personal goals as I try to learn much about Creation and understand that in some depth. Kagan tells us of this viewpoint:

Liberal education must become general education, including languages, literature, history, and the natural sciences. In the words of one writer, "A man of the highest education ought to know something of everything, and everything of something."

Some even seemed to aim for the stars:

The answer of some was "universal knowledge." They urged a broadening of the field of learning to include all that was known and an attempt to synthesize and integrate the information collected by discovering the philosophical principles that underlay it all. As one Victorian put it, "The summit of a liberal education . . . is Philosophy—meaning by Philosophy the sustained effort . . . to frame a complete and reasoned synthesis of the facts of the universe."

But, as Kagan tells us with perhaps a little sadness, "Newman was an intellectual, an academic, and an Aristotelian and he defended the ancient idea of the value of learning and knowledge for their own sake at a time when the tide was running against it, as it usually does." And a seemingly serious problem arose:

In the last decades of the century, Newman's idea of knowledge for its own sake and the whole concept of universal knowledge for the purpose of philosophical understanding were swept away by a great tidal wave from across the channel, whose chief source was Germany. All the educational ideas we had considered to this point had this in common: They regarded knowledge

as something that existed already. There was little thought of discovering anything true that had not previously been known.

From the viewpoint of those who loved the universities and the established fields of knowledge, most strongly—established truths, all hell had broken loose, though I found myself in this seeming hell about 25 or 30 years ago and after a disturbing few years began to enjoy it greatly.

Kagan finishes his essay by an assessment of the goals of a liberal arts education as defined in the modern world, concluding it to be very close to the socializing goals of liberal arts education in eighteenth century England, the setting which so frustrated Adam Smith who sought a serious education and decided to skip the worthless formal education and to spend his time educating himself, an unscrupulous opportunist set loose in the libraries of Oxford. Adam Smith became a solitary pirate of sorts in the midst of those who went on to throw away so many opportunities to forge an earlier and greater Commonwealth.

Kagan provides my cue when he writes: “The search for general, universal knowledge and for the philosophical principles on which it may be based has long since been abandoned. In truth, I think it never had much hope or support.” We need thinkers with the courage and faith and wide knowledge to make sense of spacetime and matter and the moral complexities of human communities grown immensely larger and more complex than anything considered in the existing traditions of the West. We need to make sense of human nature in light of modern history and of evolutionary theory and genetics. As a Christian responding to what we now know of God’s Creation, I believe this world is the story of the birth and development of the Body of Christ; understanding the thoughts God manifested in Creation can be seen as the development of the mind of that Body. Since God is telling the story, I’m optimistic that this process will go forward, though not necessarily smoothly or at a pace we can detect during a single lifetime.

# 135 The Dis-Unity of Knowledge and the Mis-Formation of the Modern Mind, Part 2

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1638>. It was finished and uploaded on 2013/06/25.]

The essay, *Defending the Humanities* at [http://www.weeklystandard.com/articles/defending-humanities\\_733960.html](http://www.weeklystandard.com/articles/defending-humanities_733960.html), written by Peter Augustine Lawler starts:

Leon Wieseltier, literary editor of the *New Republic*, gave by far the most thoughtful and combative commencement address this year, at Brandeis. He defended the humanities as our genuine counterculture. His defense of the humanities was intellectual—*à*—a defense of philosophers, theologians, poets, novelists, artists, and so forth, as knowers. In short, he defends “the reason of the philosophers” against the merely “instrumental reason” of technologism.

As Lawler and Wieseltier freely admit, many scientists and engineers including many of the most prominent ones are not technologists in the sense of the above quoted paragraph. Einstein thought his way to concepts before even looking for the proper mathematical tools to use those concepts in physical theories; he was no manipulator. He was also a very serious musician said to be very competent on both violin and piano. Einstein isn’t so unusual in this regard. When I went to college, I was surprised at the number of physics professors who were serious musicians.

It's hard to the point of near impossibility to be a truly civilized man in the 21st century for the simple reason that you can't be truly civilized apart from a living civilization and there doesn't seem to be any such entity, only rubble and artifacts and some functioning infrastructure from Western Civilization, including that built in non-Western regions in imitation of the West.

Nowadays, we barbarian children have managed to keep the machinery going better than might have been expected and this is a major reason for the seeming power of instrumentalists and technologists and scientific thinkers. The children look at our medical systems in that sense, as ways of solving those problems which can be solved by way of CAT scans and chemotherapy. Since those are the problems for which they are offered solutions, the confused masses see those problems and try to forget about the problems which are still more important but for which we are promised no solutions or even a good formulation of our situation. Even the most naive of the Left or Right have learned that American Imperialists have no more to offer than Maoist Leapers or Soviet Planners when it comes to the basic issues of meaning and of the dropping morals and morale of the younger generations. The only answers, to questions we mostly didn't ask, are provided by those medical buildings going up where once stood factories and decent inner-city housing for working class families. There are also the answers provided by wifi and cell-phones with more computing power than IBM big-iron machines of the 1960s, though most of us can't imagine what the questions might be.

The serious arts, musical and literary and visual, are the domain of many who call themselves humanists and the common man is often pointed toward artistic confusion of meaning and attacks on what he was taught to value. I consider that confusion to be necessary in an age in which the future has been fading as fast as it was announced by one avant-garde or another, but I wouldn't expect such an attitude on the part of a retired machinist looking at his never-employed 20 year-old grandson and longing for the days of John Wayne and Donna Reed and Joe DiMaggio. His other grandson, 25 with a freshly printed Ph.D. in history or literature or philosophy or mathematics, might well be as lost as his never-employed cousin.

To this point, art has been as useless as politics and religion and philosophy in the great task of re-establishing meaning in a world which seems less a world and more a collection of interacting but unrelated entities. I dealt with the failure of even a good thinker to see the need for a world

and not just a mostly coherent collection of entities in Chapter 189, *Henri Bergson: Almost Seeing a World*, I claimed:

Bergson had many profound insights into reality... Oddly enough, while seeing much that lay outside of the playing field of pragmatists, such as William James, he also didn't see even a universe let alone a world or the greater Creation of which this universe is only a phase.

Lawler tells us “for the philosophers, reason opens each of us to the truth about all things, including who we are, and there’s a lot we can comprehend that we can’t and would never want to control. Reason, for the philosophers, has a moral dimension—it’s about knowing and doing good, and knowing and avoiding evil.” He’s right and I’m trying to do exactly this by first coming to understand Creation in its entirety, by way of a Christian understanding of our physical world seen as morally ordered, in my terms: seen as a world. More than that, I try to provide a framework for understanding our human being and the being of this world at the level of complex entities which participate in narratives but this framework also opens up this world as an entity shaped from various realms of being, the more concrete being shaped from the more abstract though the abstract remains present in the most concrete, most thing-like of entities. My original motive wasn’t metaphysical—in fact, I was in an anti-metaphysical and highly empirical stage at the time I began to develop what I call a ‘worldview’, a disparaged term in Lawler’s circles—for good reasons; I was warned it was often used for scientistic and other wrongful understandings of reality.

My worldview rests upon an abstract realm of being, that which is the raw stuff of Creation, the manifestation of the fundamental truths God judged sufficient for the purposes of forming various realms of being, of shaping complex entities in this concrete realm, and of telling certain stories. All the truths we can know are found in that raw stuff in some sense, the truths of transfinite set theory and those of possible moral relationships between and among created beings of all types. My worldview is not your scientistic Grandfather’s worldview. While the scientistic worldview is “a comprehensive, one-dimensional explanatory scheme of all that exists,” my worldview is an open explanation of how our concrete universe came to be and then became the setting for morally purposeful stories being told by

God, stories lived by various sorts of complex and simple entities including some moral creatures called human beings. And my worldview would crush all dualisms, not in the interest of any form of reductionism but rather in the interest of ‘created being’; I have written, only partly tongue-in-cheek, of matter being ‘frozen soul’.

Maybe some don’t think my worldview coheres or maybe they don’t like it for other reasons. Fine. In this essay, I’m merely advocating that philosophers, at least as communities, should now be in the business of making greater sense of what we’ve learned, even making sense at the level of all contingent being. No scientists, scientific or humanistic, are stopping us from this great work. In an age such as our own, cheap and ‘simple’ ideas can drive good ideas out of the public squares and even out of the libraries, but good ideas win eventually. Good ideas can not only point us in the direction of meanings and truths but they are also interesting, good food for minds which would be strong. As Jacques Barzun told us at the end of *From Dawn to Decadence* [9], we pull ourselves up from barbarism when such minds discover the good ideas of the past; true civilizations come to life or back to life when those minds grow strong enough to produce good, new ideas. I’ve claimed in my writings that we can—at least in principle—shorten the barbarian period by courageously and consciously working toward those good, new ideas even as much of our civilization is still decaying.

If humanists wish to be seen as more than keepers of collections of books and artifacts, then they should set to work, or find students to educate who will be capable of one day setting to work at this great task. Men of faith and courage are needed to tell us how to make sense of the alleged wisdom found in all of that traditional knowledge as well as all of modern empirical knowledge. The world has been suddenly revealed by historical events as well as evolutionary biology to be richer and more complex than Aristotle or Augustine or Maimonides or Newton had ever anticipated. More commentaries on Edmund Burke’s political ideas and more efforts to recover the original versions of serious works of literature are worthwhile. It would be still better for new thinkers to propose fresh political concepts for understanding human communities far more complex than Burke could have imagined. We need new Melvilles rather than a new attempt to recreate *Pierre* before those frantic hours of drastic rewrite to meet the demands of the publisher. We need to produce thinkers and artists and doers worthy of study by future generations.

Lawler writes wisely when he tells us:

We can see neuroscience, evolutionary psychology, and economics as both science and scientism today. Neuroscience becomes scientism when neuroscientists really believe and aggressively claim that what they know can displace theology, philosophy, poetry, and so forth. Evolutionary psychologists succumb to scientism when they believe and aggressively teach that there's a readily comprehensible evolutionary or genetic explanation for all we say and do, and that human behavior can be explained pretty much the way the behavior of members of the other "eusocial" species can.

Still, there is too much negativity in those words. Rather than writing much about the scientistic attitudes of some neuroscientists and evolutionary psychologists, why have humanists not succeeded in producing an understanding of our world, not the world as it could have been plausibly understood in 1513 or 1713, let alone 13, but the world as it can be plausibly understood in 2013? We have those interesting but dangerous scans of brains as simple decisions are made; typically, the 'doing' regions of the brain are active and movement begins before the 'thinking' regions are active. What does this mean? Perhaps—as I've proposed in my writings, we do most of our moral thinking by forming habits for those future activities? Perhaps creatures such as ourselves, living in such a world as this, don't typically have the time to ponder the screams of fear and pain coming from that burning building or the unexpected gunfire to the rear of our rifle company? Propose something different if you wish, but don't merely complain the neuroscientists don't respect human moral freedom for they truly have discovered some facts which don't agree with most traditional moral philosophies.

Humanists have to be realistic and have to acknowledge the 'specific sciences' (as St. Thomas called them) currently have a dominant role in setting the agenda for modern thought. This shouldn't be at all surprising or upsetting. It's largely true that Augustine of Hippo began the long project of building Western Civilization when he discovered history in the modern sense. We entered the modern age on the shoulders of those thinkers who wrote philosophical books and novels obsessed with making sense of new political realities and barely imaginable political possibilities.

Literature and art and music and even philosophy aren't much good at navel-gazing; they need stuff to work with. It's not at all surprising or upsetting that our generation and a few to come might be downright obsessed with making sense of black-holes and multiple levels of infinity and genes. Are the concepts of broken symmetries less worthy of artistic attention than were the ways in which Henry V helped to forge a sense of England as a true nation?

I consider this dominance of science to be no more than an accident of history, using 'accident' somewhat in its philosophical sense. It seems true to me that, for various reasons, including the sheer fecundity of modern empirical knowledge-seeking enterprises, many of the interesting problems of the modern world, even those which are strongly 'man-centered' are stated in terms more 'scientific' than not. Someday, we'll have poets who will use those terms to speak truths as beautiful as any found in the writings of Virgil or his apprentice Danté. The problem isn't that we have instrumentalists denying truths or scientific thinkers squeezing those truths out of those terms but rather that the successors to Danté haven't yet arisen. Or maybe they have arisen and the humanists in the universities and publishing firms aren't looking or aren't capable of seeing something in front of them if it doesn't fit into well-documented schools of thought.

During this modern age, we have gathered mountains of empirical data, some of which has been turned into information, a bit less into knowledge, little into wisdom. In a meaningful sense, we've processed our modern empirical knowledge into forms hinting of a new understanding of what we Christians would call Creation but we've destroyed the integrity of our inherited understandings, though certainly not all of the parts of those understandings. We have no blueprint for building a new civilization or reforming Western Civilization—choose your favorite and remember that historians will sort it out in 500 years or so. In any case, many stand around claiming that our old home doesn't meet our current needs and is in bad shape. Others complain that we don't pay proper respect to that home. I see no reason to believe that anyone other than me has proposed a way of moving forward to building a new home which will meet our current needs while including what is good in that old home, though perhaps on the shelves of the library or in the niches devoted to serious art or interesting artifacts.

# 136 The Dis-Unity of Knowledge and the Mis-Formation of the Modern Mind, Part 3

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1641>. It was finished and uploaded on 2013/07/04.]

Modern-day humanists, literary men and philosophers and theologians and historians and others are devoted to passing on a tradition allied with the moral goodness, including freedom, of Western Civilization but they don't seem to notice that the tradition is itself a phase of Western Civilization which reflects earlier understandings of the explorable, empirical realms of created being. We men of the West inhabit a great work become a lie and we haven't yet shown the courage and the faith to speak the deeper and richer truths we now see in created being, the thoughts God manifested as sufficient for the story He's telling.

There are important questions to asked and at least tentatively answered before we can evaluate the tradition of the West and decide how to integrate it into our world which is separated by at least a couple of centuries from many of the political teachings of that tradition, is also separated in more than historical time from older understandings of human being and the nature of empirical reality, and is growing apart from many other aspects of that tradition.

Let's ask a few of those questions, many under more active investigation by those opposed or indifferent to Western traditions than by those who claim to be defenders of those traditions.

What is the human mind? How can we nurture a properly ordered mind? What is the result of our current ways of living, of educating our

children and continuing to learn about a complex world when we ourselves become adults, of governing ourselves and earning our livings, of entertaining ourselves and forming our communities of worship. If we are to do all of this and to do it right, we need values, which means we need a story which gives purpose to our individual lives and the lives of our communities.

I've written much on this general topic and have recently published an overview of my current understanding of human nature, individual and communal, in the freely downloadable book: *A More Exact Understanding of Human Being* [53]. This book is part of my efforts to help in re-forming the Christian civilization of the West or perhaps in building the foundations of a new Christian Civilization if we aren't able to rescue the West which seems to be so rapidly decaying.

So far as I can understand our current situation, I would strongly criticize even the best of the advocates of liberal arts education for the same reason that I criticized the New England colonists for the way they mishandled their relationships with the natives, a mishandling that helped lead to the war known as *King Phillip's War*, see [http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://en.wikipedia.com/wiki/King_Phillips_War), a war waged by some of the Indian tribes against the European settlers and some Indian allies. (See Chapter 408, *The Need for Abstractions in Moral Self-understanding*, for some more discussion on the issues.) The humanists of recent history have a concrete civilization which they understand in so many ways but they haven't abstracted properly to a level where they can see greater possibilities and also the current need for something far richer and far more complex than what we have inherited.

I would emphasize the best overview of my current understanding of human nature, individual and communal is found in the freely downloadable book: *A More Exact Understanding of Human Being* [53], but the interested reader can start with the individual essays found in other chapters of this book:

- Chapter 127, *Intelligence vs. Intellect*;
- Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*; and
- Chapter 178, *Are Communities a Form of Created Being?*.

On the most basic level, the problem I have with the defenses humanists make of their way of forming human minds, of viewing reality, of seeking

that which is qualitative to accompany the quantitative sought by technologists, is that they are defending a way of organizing and passing on major realms of human knowledge and not dealing directly with the underlying being, the true reality. The great books are simply dust-collectors if not used in ongoing efforts to develop the currently best understanding of Creation. It would seem, certainly to me, that we have learned a lot in recent centuries about this universe, a world in my terms when seen as ordered to God's purposes, and about the abstract realms of being from which concrete being is shaped, about various aspects and parts of being in this world, such as energy and matter and fields and life and communities. We've learned immense amounts about various entities including chimpanzees and tarantulas and men and stars and interstellar gas clouds and the universe itself seen as an entity. This much that we've learned hasn't yet shown up in much of the writings of serious novelists and historians and literary scholars; it has shown up in distorted form in various scientific works, some written by serious scientists who suffer from narrowness of vision but some written by scientists of wider vision, such as E.O. Wilson and David Bohm, as parts of honest efforts to develop more 'exact' understandings of human being or of being in general. Keep the word 'exact' in mind, I'll be explaining what it means in this context.

The interested reader can browse Chapter 193, *A Universe is More than it Contains*, to see a way in which metaphysics can be altered by a careful analysis even of equations in physics; this principle can also be seen in the claim that a man is more than his physical parts. In other words, it's not necessarily true that a man needs immaterial parts to be more than 'merely' flesh and blood; physicists have provided us with a possible example where all the parts and regions of a universe can obey the so-called law of the conservation of energy but the universe as a whole doesn't. The universe is itself an entity not fully defined by its 'parts'. (This particular result rises or falls with general relativity which allows a dissipation of radiative energy which is 'faster' than the expansion of space.)

There are a large number of questions which have been raised by modern explorers of empirical reality including historians and creative writers who, if their explorations of reality are valid, have expanded the ways and objects of human thought and feeling. Until we've entered the process of forming and answering questions, we won't really know even what questions we'll answer in the process of building a new civilization or at least as we enter a new phase of Western Civilization. Here are a few good possibilities which

I've dealt with in my writings, philosophical and theological and novelistic:

- What is mind?
- Can we speak as if there were a first man or were there some 'apish' creatures of doubtful status? Were Eve's mother and father subject to divine judgment?
- Can we speak of a first man who had a truly human mind or human moral nature?
- If we lose our faith in categorical thinking, as implied in the above two questions, can we develop new forms of moral reasoning that leave us capable of speaking old truths?
- What can it possibly mean to talk as if the beginning of this expansionary phase of the universe were some sort of true genesis, a true creation, even a creation from nothingness?
- Is there a meaningful way to talk about the beginning of Creation?
- Is there any reason to even want to talk about the beginning of Creation?
- Is randomness really a type of factuality?

These questions, and many more, are more tightly focused than versions from prior centuries. There is a great openness, even a looseness, in the writings of Plato which has disappeared in the writings of modern thinkers. Compare one of Plato's dialogues to essays by Lord Acton, let alone the writings of Stephen Toulmin or Gregory Chaitin or E.O. Wilson, and we see those modern works as possessing a density of empirical knowledge and a multiplicity of reasoning processes which would probably confuse the ancient thinkers. To be sure, there is great wisdom and insight into various aspects of being in Plato but we need to integrate that wisdom and insight into a world far richer and more complex than Plato could have anticipated, that is, into a greater body of wisdom and insight.

In its understanding of 'where' God is, the world of Aquinas was much different from that of Augustine, let alone that of the Pre-Socratic philosophers. Thousands of years before even those early Greek thinkers, there

were intelligent and high-achieving human beings manufacturing weapons and tools and starting to found a complex community at Jericho. Could they have understood that the realm of stars was made up of regions, places? Could they have understood that the realm of stars and of the earth beneath their feet lie within some sort of contingent entity, itself having properties rather than being just the sum total of star-regions and earth-regions? Did they have the same minds as we have, merely missing a body of facts and understandings to fill the empty bins of their minds? Or is it the case that a body of facts and understandings is itself a good part of what we mean by 'mind'? Was the mind of Goethe an assembly in which lived the ghosts of Virgil and Shakespeare, Plato and Grotius?

Mathematical reasoning applied to more general realms isn't just so many silly attempts to quantify what makes a good book or to predict who will win the next election. From the beginning, mathematical reasoning was part of the development of the human mind, most of which development has necessarily occurred in the intellect or communal mind. Euclid, or rather the ideas he organized so brilliantly (and may have added to in the conventional way but certainly in the act of organizing), was an important part of Greek thought, of Greek culture. Euclid wasn't a separate part; his ways of viewing space and possibilities for movement most certainly affected all of our ways of talking about human development, even moral development. As I've said often, created being is created being and even our greatest truths and most abstract concepts are created being at least in the sense that we would not know them if the Creator had not somehow manifested them in such a way as to be accessible to bipedal, featherless creatures.

Is it a coincidence that the human race has developed more abstract ways of viewing spaces than Euclid could have dreamed of just when human communities have grown to immense sizes and to complexities which we can't yet describe? I think not. The technological development which allowed such an expansion of total human population, including such local communities as Beijing and Mexico City, such expansions of relationships as can be seen in our current political and economic marketplaces, necessarily came with the development of non-Euclidean geometries and other such ways of thought. Many of these fields of mathematics can be used, have to be used in some physical problems, to provide qualitative descriptions when quantification is impossible or difficult or simply beside the point. Created being is created being and our complex and often abstract novels are of a

piece with quantum theory and the fresh-water system of New York City. As many have noted in various ways, we have problems made greater by the uneven advancement of various fields of human knowledge and human practice and we shouldn't ignore the fact that our human feelings seem a little better adjusted to our technology than to our complex and disordered politics. This is a developmental problem not so much different from the boy who grows legs too long for the rest of him on his way to a powerful, athletic build.

Even when quantification is possible and desirable, our problems in greater understandings by way of the humanities, including the sciences in their philosophical activities, can't be solved before they're stated in a clear way, even an 'exact' way. The entities involved, or at least their relationships, and their greater context must be understood and perhaps all described in that clear way. The human minds, individual and communal, must be focused more tightly upon the problems currently tearing apart our communities far more complex than we can currently describe and containing entities and relationships which we also can't describe, at least not so that the various parties can clearly see they are describing the same world and the same species of bipedal hominoids.

We need a tighter focusing because empirical reality tells us much about constraints on the concrete being we associate with the physical world while also opening up a greater infinity of possibilities for abstract being and for narratives, including a great diversity of evolutionary and developmental processes. (I remind the reader that concrete forms of being are shaped from more abstract forms of being in my way of thinking.) Along these lines, Pope Benedict XVI wrote of a need for a "more exact understanding of human nature." (See Chapter 25, *Broadening the Horizons of Reason* for the context of his remarks and my response.) He was himself a humanist who had learned much about modern biological and medical sciences during his years of trying to deal with the moral aspects of sexuality and reproduction; even those who disagree with his beliefs might take his general attitude as one worth considering: be open to new meanings brought by new knowledge but don't jump until you know where you'll land. He was confident, as am I, that we'll find the solid landing-spots will leave us in a world describable in terms consistent with Christian faith of a Catholic sort, a sacramental form of Christianity. But faith is faith and the Christian faith tells us a few things, gives us ways to evaluate proposed understandings, and leaves us confident that the world is the work of the God of Jesus Christ and is

a good place, though only an embryonic version of a complete and perfect place.

By itself, faith can't reach exact understandings of human nature or of Creation. Also, as Flannery O'Connor warned, faith can be accompanied by Pious Crap.

Faith doesn't tell us if Augustine was right in adopting the "fall from a state of grace" understanding of the origins of the human race and in rejecting the idea that we arose within the natural world. Yet, the Christian faith has been entangled with such an understanding become mostly Pious Crap. Science tells us that Augustine was wrong in rejecting a natural origin for the human race. If Augustine was right in seeing those ideas, "fall from a state of grace" and "natural origin," as being in conflict—at least in a world where natural origin means that moral natures also have evolved and are still evolving—then we should reject the usual understanding of the story of Adam and Eve.

Faith, Catholic or Jewish or Islamic or any other, needs to make peace with empirical reality. We need to establish a rich and complex understanding of Creation, an understanding which will tell us how to see moral order in our greater communal efforts though we as individuals will still need to struggle to find our own ways inside those greater structures of order. The changes can be great. For example, a world in which sexual natures and sexual desires are shaped, at least partly, by developmental processes wouldn't be best described by reasoning based upon strict categories, such as MALE and FEMALE. It would seem that MAle and FeMAIE and Male-fE are also possible as well as cases in which some are missing some of the characteristics of mature masculinity or femininity. This doesn't force us into regions of moral relativism, but it does force us into new understandings of human nature and, even if the old rules prove valid, force us to find new ways of loving and tolerating those who don't fall into the old categories. There are other, far more radical, possibilities which lie open to a courageous exploration of God's Creation and an honest response to what we discover. What matters most to Christians who have faith that Creation is the work of a all-loving and all-powerful and all-knowing God is that we have to remain open to what that Almighty Lord has done. If God has created a world in which some human beings cannot be strictly categorized as fully male or fully female, then we should deal with this aspect of God's Providence, though it doesn't seem so providential to many of us, including many of those who don't quite fit in the two standard categories.

What is important in these sorts of discussions is the loss of the communal mind of the greatest of all civilizations to date, Western Civilization, built largely upon the foundations of Semitic and Hellenistic and Roman Civilizations to purposes and uses largely set by Christian beliefs. But it no longer works. We know too much that cannot be reconciled to our traditional understanding of reality, or at least no one has carried out any such reconciliation. Our individual minds have no acceptable communal mind which would be that understanding of reality, of Creation, which reconciles such seemingly abstruse matters as infinities of different sizes, as matter which is also waves of some strange sort, as space and time bound up into a single geometrical structure, as sexual natures not fully male or female, as the commission of crimes up to genocide by way of the technology and administration of a Christian country.

Christians, in particular, are prone to believe, or at least pretend to believe, the traditional story of our journey through this vale of tears while believing, at least implicitly, a different story when receiving medical treatments developed under a different story. (See Chapter 582, *Taking the Fresh Fruits and Giving God the Leftovers*, which is a commentary, sort of, on one of the poems of Emily Dickinson.) Until we have that one story which can be believed during our worship as Christians, or as Jews, and also believed during our hours as workers and voters and patients and students, we can't regain morally coherent states of our human being, individual or communal. If we leave behind the Christian story when we enter the hospital, we won't just think, for example, the Catholic Church and some other churches are wrong in condemning artificial contraception; we'll not think of our Catholic beliefs at all. We've been trained, by Church as well as by political and economic institutions, to think in different moral ways in different contexts. They may not have realized they were doing this, but they were.

Let me wrap up this rather digressive essay by first noting a wise insight by Professor Kagan (see the article, *Ave atque vale*, at "<http://www.newcriterion.com/articles.cfm/Ave-atque-vale-7653>):

Because of the cultural vacuum in their earlier education and because of the informal education they receive from the communications media, which both shape and reflect the larger society, today's liberal arts students come to college, it seems to me, bearing a sort of relativism verging on nihilism, a kind

of individualism that is really isolation from community. The education they receive in college these days, I believe, is more likely to reinforce this condition than to change it. In this way, too, it fails in its liberating function, in its responsibility to shape free men and women.

But, as I've argued in this and other essays, those young students couldn't possibly develop into morally well-ordered states because their elders, including those calling themselves 'humanists', haven't done their job of providing those stories and other forms of understandings which would situate those young people in a world of moral-order, a Creation in Christian terms. Adjust the language to Jewish or Moslem or secular-liberal understandings, but the criticism remains the same.

# 137 Empirical Knowledge Also Needs a Framework of Understanding

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1654>. It was finished and uploaded on 2013/07/26.]

We should be very careful in how we reason from even the best of facts by way of the most sincere respect for empirical reality even if we have proper respect for plausibly conjectured abstract realms of being. We all carry in our heads and hearts and even in our ways of behavior something that could be labeled a ‘framework’ of interpretation or, in a more complete form, a worldview which gives overall meaning to what we consider to be ‘reality’. That worldview or framework might be a full-blown narrative which makes sense of our empirical knowledge within a context of an overarching theological creed as I hold in the form of traditional, Catholic faith or it might be a fairly simple, nearly pantheistic, faith in reason as Einstein held.

I was reading Bishop Butler’s *The Analogy of Religion* and found that a man reputed to have a great share of common sense did, in fact, understand our dependence upon our senses for what we know—though he didn’t seem nearly so clear about the issue as Aquinas who had lived about four centuries earlier. What’s remarkable to modern sensibilities is the way Butler was able to argue from a sense-based understanding of human knowledge to idealistic and dualistic conclusions.

A particular example comes from the observation that tools, even a walking stick used for probing ground, can become a true extension of our arm. From this observation, knowing about how the brain builds a map of

my body and its interaction with tools and other creatures, I conclude—originally following Michael Polanyi’s analyses of his own experiences as a surgeon—that an oft-used tool can become as if a part of our body. Not knowing that our bodily sense, and the various aspects of our selves, arise as the brain builds such a map, and probably thinking of the brain as being a static entity in its structure, Bishop Burton goes the other way from me and concludes my own body is only nominally and by custom a part of ‘me’: the true ‘me’ is immaterial, residing inside the brain, but in the way of a ghost residing inside a house. Rather than seeing the self as something which can expand into the material world, he restricts my self to an immaterial entity somehow located inside my head.

Why such radically different conclusions from two thinkers, Bishop Butler in the 17th century and Loyd Fueston in the 21st century, who both accept that we know by way of our senses, by way of eye and ear and nose and so on? Butler was born after Galileo and Newton had done their scientific work and perhaps knew of the growing trend to think in terms of a universe of concrete being and not in terms of a place in which I could travel, in principle, with Dante and Virgil from Hell to Purgatory to Heaven, a place in which “matter” from Earth and “spirit” from Heaven met in some never-explained way. There’s a strangeness about the human adjustment to these sorts of changes in our worldviews and this can be seen in the fact that some cosmological speculations would allow universes with radically different properties in different regions but nearly all physicists and philosophers working on cosmological problems would reject the idea of radically different regions in the same universe, more or less by definition, equally because of belief in uniform mathematical models. (This doesn’t mean that it’s impossible to have a pasted-together universe under current understandings of concrete, contingent being, only that it lies outside nearly all ‘scientific’ worldviews in the post-Einsteinian world, with some interesting exceptions one of which I’ll discuss below.)

Butler lived in a transitional phase during which philosophers as well as scientists were also moving more strongly toward the analysis of physical systems in terms of mathematically describable cause-and-effect relationships rather than the more anthropomorphic ‘tendencies’, almost ‘desires’, which were assumed by Aristotle and some other thinkers of the ancient world. This belief in cause-and-effect was tightly connected with the faith in certain modes of mathematical thinking advocated by Galileo; Newton made possible a more consistent mathematical way of thinking about real-

ity which imposed assumptions, usually implicit, which included a general belief in the uniformity of laws and stuff throughout this universe. Modern mathematics would actually allow various cutting and sewing operations which would allow a universe to be constructed out of parts inconsistent in some ways. This construction would be rather strange but describable in rigorous terms. Arguably, some entities conjectured by modern physicists, such as the worm-holes which would allow time-travel, are regions ‘sewn’ into the fabric of our universe—if they exist. But they can plausibly exist under our current understandings of physical reality. In fact, speculative theories describe how ‘normal’ regions of our universe could develop into strange regions, but they are as if cut from someplace else and sewn into our universe by some mathematician with a strange sense of humor.

A century from now, those in the know, especially those who read the best of popular science books, might well laugh at our ideas about cosmology and genetics and human history. More sympathetic and more knowledgeable thinkers in those future generations might have good reason to consider us to have been headed in the right direction, however wrong some of the ideas held back in 2013.

I was born in 1955, the year Einstein died. I was born a century and a half after Cauchy and various predecessors had largely completed the construction of a solid mathematical foundation for the calculus and Newtonian dynamics. I was born about a century after Darwin began publishing his major works, half a century after brain-scientists began disciplined studies of neurons, half a century after the beginning of the exploration of aspects and regions of the cell which seemed to be some sort of machinery of inheritance. I was born a century after John Henry Newman calmly and quietly advocated an acceptance of the world as God had created it, though he seems to have still accepted a dualistic view of human being. I was born a half-century after the rediscovery of the truly radical nature of Thomistic existentialism and the teaching of Thomas Aquinas and others in the High Middle Ages that all we know, even divine revelations, comes through our senses. Aquinas had also taught that all that is truly human is embodied and an immaterial soul is a non-human thing attached to us to carry out abstract forms of reasoning he thought impossible to a brain seen as static in its structures—an interesting combination of anticipations of modern scientific discoveries and ancient errors.

From a Christian point-of-view, it’s quite possible to accept a full-blooded Biblical Christianity and also accept that God works in ways not

describable by Intelligent Design Theory, oddly tied to freshman calculus and physics, an introductory course in probability theory, and a common-sense of the sort which powered the Industrial Revolution. Biblical Literalism is part of the package and not a good description of the ways of thought of the leaders of the school of Intelligent Design. In other words, the limited views and knowledge-base of the advocates of Intelligent Design are very much what were part of the worldview of the men who developed modern construction techniques, including the use of iron and then steel beams, and modern forms of production and transportation and public utilities. We owe our fresh-water and sewage systems to men who thought like the current advocates of Intelligent Design Theory. The Bible is read literalistically on Sunday afternoon after worship services on a day breaking up the main work of a man's life. This doesn't mean that every follower of Intelligent Design is a competent mechanical engineer or skilled steel-worker. It does mean that their view is limited in a way that ties them to outmoded 19th century thought, that is, the thought of those those who played a disproportionate role in creating the prosperity of the modern world. Gratitude and criticism can be directed to the same figures but we modern people seem to have more trouble with gratitude than with criticism, often downright nasty criticism.

We should be very careful in how we reason. Indeed.

Maybe we can do better than those who limit the Creator to engineering sciences and introductory probability theory? Maybe we can do better than those who take the odd view that anything physically small by galactic standards must be meaningless? Apparently, a child dancing in a sunny yard is worth less than an advancing army with great fire-power, let alone a black-hole which distorts spacetime with its mass millions of times greater than the mass of our sun. Is Shakespeare less important than those who miniaturized nuclear-fusion bombs so they could be carried by ICBMs? Yet, these morally dense thinkers, led by the likes of Carl Sagan and Richard Dawson, usually pretend to humanitarian sensibilities even as they worship size and power and impressive numbers in general, but only galaxies; they pretend to dislike the physical greatness of nuclear bombs.

I've been reading an often insightful book on the technical aspects and general principles of complex systems and the author wrote of how Creationism is implausible because it depends upon an agent no one has ever seen. And he went on to conduct more insightful analyses of highly abstract, invisible aspects of being which reason can find in this concrete world though

those aspects remain invisible, other than in their effects, to the human eye.

We should be very careful in how we reason. Indeed.

Do these people not have the imagination to realize that even our universe in its early years, as described in the standard cosmological theory, was a very abstract, very strange entity with no thing-like being?

We should be very careful in how we reason. Indeed.

This very problem of unconscious or ideological bias, or the largely equivalent problem of assuming our metaphysical beliefs are simply common-sense rules of absolute truth, leads me to still more strongly advocate the view that even the most quantitatively successful realms of science have to be put into a greater framework or worldview to make total sense or to be seen as nonsensical. Even good thought, outside of a more general framework or worldview, can be wrongfully understood and can lead to a variety of problems in our political and economic activities as well as in our religious and intellectual activities.

Download *Four Kinds of Knowledge* [43] for a coherent way of understanding how human beings know.

# 138 Remembering What Someone Pushed into Your Head

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1671>. It was finished and uploaded on 2013/08/13.]

Scientists have succeeded in creating false memories in lab mice, though it's not at all true they created memories from scratch. Rather did they expose the mice to a bad experience in one location and then manipulated activity levels of brain-cells so that the mice associated that bad experience with another location where they'd not had any such experience. It was a substantial achievement and could lead to some very good treatments for various problems as well as having already improved the understanding of memory formation. I'll write a little about the possible good a little later in this essay. The work done by the scientists who were working at MIT is discussed in the article: *Neuroscientists plant false memories in the brain* at <http://web.mit.edu/newsoffice/2013/neuroscientists-plant-false-memories-in-the-brain-0725.html>.

But, as they note, our heads are already filled with false memories:

In many court cases, defendants have been found guilty based on testimony from witnesses and victims who were sure of their recollections, but DNA evidence later overturned the conviction.

One example the article doesn't give is more germane to what the MIT scientists actually did: cognitive psychologists discovered over the past couple decades or so that some phobias, including some which are crippling, seem to have come about as the result of a gratuitously arising physical state corresponding to fear at a time when the victim happened to be in an

open space or in an airplane or near a certain sort of animal. Other phobias seem to be at least partially built-in, such as fear of snakes or spiders and a fear of large animals when we're young which can last to the end of our lives for one reason or another. There is no one-size fits all explanation for phobias but it would be good to be able to deal with those which do involve false memories.

Being able to scan a brain of someone afraid of flying as they're in a plane might allow a psychologist to remove or replace the false memory which connects the plane to fear. Clearly, this technology could be misused, but nearly all powerful technologies can, by definition, do great harm. Even simpler technologies have that property. For example, my attitude toward herbal medicines has always been, to simplify a bit, that they either don't work or, if they do, they can cause harm by way of side-effects or wrong doses in the same way as any medicine coming out of a chemical plant. This isn't an argument for or against herbal medicine or any other human technology, only a reminder that a hammer can drive in nails or bash skulls, or at least thumbs even in a nonviolent society.

We should remember that we're the product of evolutionary processes which work, first of all, to select successful reproducers. Accurate memories aren't as valuable as the sorts of memories, whatever they are, which lead to successful reproduction. We can think about the human bias toward optimistically remembering the past and anticipating the future. Nature is prolific and it's likely that she's ready to throw away a lot of optimists so long as she gets, so to speak, the optimists who produce children and continue to do so even after a painful childbirth or dealing with a misbehaving 16 year-old. A mother might remember the child clearly and the painful childbirth somewhat dimly. As father watches a son graduating with a degree in engineering, the father's brain might weaken the memories of the rebellious son who was brought home by policemen after a street-race, and again and again; the father is ready to be optimistic and encourage son and daughter-in-law to produce a goodly number of grandchildren. The main point is that our memories aren't oriented to accurate recording of events but rather to recording of events in a way that aids reproduction. This may or may not involve accuracy but likely doesn't when it comes to those aspects of memory which affect our general attitude toward the world and its dangers.

At that, it's remarkable how good our memories can be, especially if well-trained—I'm one of those who thinks that one of the biggest of many

mistakes made by modern educators was the strange decision to stop the training of memories by way of memorizing speeches or political documents or whatever. Abraham Lincoln, whom I admire as a speaker and consider interesting as a thinker though disastrous as a political leader, drove powerful rhythms of speech into his brain by memorizing parts of the Bible and parts of Shakespearean works—I think *Hamlet* was a particular favorite. The *Gettysburg Address* worked not because it was coherent morally or politically but rather because it rode on the waves generated by rhythms borrowed from Jeremiah and Isaiah. Young human beings tend to like memorizing and having words on hand, but our schools no longer require the students to memorize, say, the preamble to the American *Constitution* and those students devote their mental energy to memorizing strange and sometimes outright despicable song lyrics.

Our memories are, as often noted, more powerful and sometimes more accurate if we learn to use rhythms and also if we tie memories to concrete places or things. They are clearly more powerful if exercised, as is true of the arms we use to swing a baseball bat or tennis racket or framing hammer.

Let me quote from the article, *Neuroscientists plant false memories in the brain* at <http://web.mit.edu/newsoffice/2013/neuroscientists-plant-false-memories-in-the-brain-0725.html>, so that we can see what the MIT neuroscientists really did:

In last year's study, the researchers conditioned these mice to fear a particular chamber by delivering a mild electric shock. As this memory was formed, the *c-fos* gene was turned on, along with the engineered channelrhodopsin gene. This way, cells encoding the memory trace were "labeled" with light-sensitive proteins.

The next day, when the mice were put in a different chamber they had never seen before, they behaved normally. However, when the researchers delivered a pulse of light to the hippocampus, stimulating the memory cells labeled with channelrhodopsin, the mice froze in fear as the previous day's memory was reactivated.

"Compared to most studies that treat the brain as a black box while trying to access it from the outside in, this is like we are trying to study the brain from the inside out," Liu says. "The technology we developed for this study allows us to fine-

dissect and even potentially tinker with the memory process by directly controlling the brain cells.”

In other words, they didn't really create memories directly. They worked with a remembered fear response learned in a chamber where the mice had been shocked and tied that memory to another chamber where the mice had never been. This is similar to the hypothetical development of some phobias by way of a legitimate fear response being tied to a situation or place or entity for which that fear response wasn't legitimately attached, though there might well be real underlying reasons for fear.

In still other words, the MIT neuroscientists tied an existing memory to a newly experienced place. That sort of phenomenon occurs often to me and probably to others. Some cases of *deja vu* are likely the result of a memory suddenly becoming active in a situation or place or entity not really connected to the events underlying that memory.

I wouldn't worry that we're days away from the Matrix, or whatever, and we have to see that memory manipulation technologies might well have some good and moral uses such as helping those with false memories or with memories formed by wrongful combination of real or imagined events or by way of attaching emotional responses illegitimately to a plane or a big, friendly dog. And we also have to remember that all powerful technologies and 'deep' scientific discoveries, along with insightful histories or novels, are potentially dangerous and that danger is far more likely to be realized in a morally disordered age.

Before moving on, I'll emphasize the implication I intended that novels and historical works, even when they provide only a plausible ordering to known events, can also create memories in us or tie emotional responses to existing memories of, say, the chaos of the 1960s. Unaltered memories of events tied together in a new narrative can be a more powerful manipulation of memories than the creation of artificial memories of events that didn't really happen or maybe happened in a different setting or involved different entities or whatever.

False association of a memory with a different situation or place or entity and other manipulations of memory can be seen by an objective outsider or by a self-aware re-memberer if he contemplates the matter properly. It's usually very hard to change a shared, communal narrative. Most human beings seem to have not the capability, or at least not the willingness, to reevaluate their internalized story of, for example, the United States or

other nation. More importantly, few Christians or Jews or other peoples of faith seem capable of reevaluating their communal memories of their spiritual ancestors.

This problem of the distortions which come when our greater narratives, conscious or unconscious, are inappropriate are of greater interest to me than the implantation or manipulation of individual memories. I'd already explored the issue by the way of the implantation of false memories by commercial advertisements in Chapter 431, *Your World is a Narrative—Don't Let it Be Written for You*. I wrote:

False memories can be implanted in your minds so that you can't even remember truly where you've been, even so mundane a false memory as that of holding a glass bottle of Coca-cola in a stadium which bans glass containers: see the article *Ads Implant False Memories* at <http://www.wired.com/wiredscience/2011/05/ads-implant-false-memories/>. This is a frightening possibility in a world where governments and corporations and other powerful entities have plenty of reasons for you to accept their false histories of important historical events and of the very ways in which wealth is distributed and power is structured. They have reasons for you to live a life profitable to them.

There are a variety of studies in which the scientists 'read' minds in one way or another, for example, to predict which songs will be popular with teenagers by scanning the brains of test subjects as they hear new, unreleased music. There are others which are showing an ability to predict our actions in the near-term future by scanning brains. The scanning of brains is a powerful technology and a dangerous technology. It can help us a lot and lead to medical miracles, but it can most certainly be misused. In general, the more powerful a technology is, the greater the harm it can cause. And we should remember that prediction can lead to causal or correlative models that can then lead to control mechanisms. As it is, sophisticated marketers, such as those at Coca-cola, have found weak but effective steering mechanisms.

The philosopher Ian Hacking wrote an important book, *Rewriting the Soul* in which he concludes that the multiple per-

sonality syndrome was the result of the creation of barriers between different blocks of memories, some of which were false memories and some of those may have been implanted by therapists who were trying to help troubled human beings. Some of the so-called “recovered memories” which tore apart families and tortured human beings who needed help were implanted by incompetent therapists. Some of the spectacular claims of child-abuse in institutional settings turned out to be the result of memories implanted by incompetent investigators. I remember reading of a case of alleged large-scale child-abuse where competent investigators came in later and said they thought something bad had occurred but they couldn’t get at the truth because of the false memories in the minds of some of the children. By that time, they were group memories. The children were remembering together what had never happened.

If you can control someone’s memory, you can control, or at least influence, many of the thoughts and actions of that human being. Stalin knew that but wasn’t so good at rewriting memories as the American politicians, marketers, and entertainers.

After discussing some political implications of memory manipulation, and also questioning if memory manipulation explained our complacency in the face of huge transfers of wealth and other evidence that our leaders are working for their own good and often directly against the good of the average citizen, I concluded:

A true human person is a human animal who tries to shape himself by intelligent responses over time to external reality. Those intelligent responses begin when we’re young with firm guidance from parents and other adults with a concrete relationship to us. As we mature, those intelligent responses should increasingly be the result of our own understandings and voluntary actions towards a state of human being we’d like to occupy.

A human animal which allows itself to be shaped by whatever external forces grab hold of him is nothing like a moral person.

Let me close by quickly discussing a major problem which I’ve dealt with only tangentially in the past. Most human beings have not shown the inclination or ability to understand these issues in such a way as to anticipate

problems before they've overwhelmed their society. The inclination might be present in highly intelligent men and women, though we can see many such human beings who seem to loyally support the mainstream narratives even when they break down in the minds of those who, for example, simply pay attention to soldiers returning with stories of being systematically put in a position, say by Harvard and Ford Company trained operations research guys, to kill in self-defense though they are killing civilians defending their homes. Some who seem less intellectually talented might well see through the various sorts of false memories planted in our heads by power-grabbing politicians who wish to be seen as 21st century Jeffersons or Burkes, by generals and their political and industrial allies who are more dedicated to certain modes and technologies of waging war than they are to defending their countries, by corporate executives wishing to glorify the consumer life-style, by no-talent artists and novelists who wish their bland puddings to be treated as if the spicy stew of a a young Picasso or a grizzled war-veteran and ex-slave named Cervantes, of scientists or technologists who wish to pursue what they can pursue without any moral quibbles, of various thinkers who feverishly imagine their ideologies can produce paradise without even seeing that a true understanding needs to support the great mass of our modern civilizations. Generally, false memories are created for their own minds and the minds of others by barbarian children who don't understand the complex civilization they inherited, don't know what it's true nature is, can't clearly recognize what has gone wrong—lack of progress in understanding God's story, and wouldn't have a clue how to start moving toward a better situation if someone were to tell them what had gone wrong.

Some members of the Body of Christ have the duty and responsibility, the privilege and God-given calling, to explore God's story in such a way as to make some sense of it. This means that the story must always be updated, accounting for new knowledge—even knowledge of newly discovered forms of being. The well-established parts of the story must be restated according to the words and concepts of the current age. Those members of the Body of Christ haven't done their job in at least a couple of centuries, during what is surely the most dynamic phase of the human portion of God's story.

To a Christian, the greatest danger with the manipulation of memories has already been partially realized, largely because of our own lack of faith and courage, our sheer moral irresponsibility. Perhaps I should restrict

the moral responsibility to Christian thinkers and authors and artists and ecclesiastical leaders. In any case, we've left an earlier understanding of God's story behind and haven't shaped a newer understanding. This has produced that most dangerous form of false memories, memories false to any plausible understanding of God's world.

# 139 Memorization and Mind-shaping

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1693>. It was finished and uploaded on 2013/09/25.]

In a short article, *What Does Memorization Have To Do with Learning?* at <http://www.theamericanconservative.com/what-does-memorization-have-to-do-with-learning/>, Marina Olson addresses what I consider one of the greatest failings of the American educational system and, more generally, of American attitudes toward human culture and, indeed, all of Creation. Ms Olson's article deals with one educator who seemed to attack memorization (Orlin) and one who advocated memorization (Leithauser) with these words which approach a greater wisdom about the human mind but fails to reach that greater wisdom, in my opinion, because of an inadequate understanding of created being. The article ends with this summary:

Orlin explains that "what separates memorization from learning is a sense of meaning." For Leithauser, "to take a poem to heart was to know it by heart." That is certainly not a sense of memorization devoid of meaning. Rather, Leithauser has taken the poem into himself in such a way that it has become connatural to himself. This is leagues apart from Orlin's description of memorizing only necessary facts to obtain a high grade in a class. In fact, when speaking of poetry, Orlin describes his own experience with writing a paper on Robert Frost's *Once by the Pacific*:

"I read it dozens of times, dissecting every phrase. Months later, standing on a rocky, storm-swept beach, I found that I

could recite the poem by heart. I never set out to memorize it. I just... did.”

Both Orlin and Leithauser, in their seeming opposition, strike at the need for teachers to encourage students not to be satisfied with becoming mere repositories of factoids, but rather to allow their lessons to infuse them. Such is the nature of learning.

As I noted in Chapter 303, *Communal Being and Communal Sin*:

There is a small example of our moral decay which says much about this issue [of communal being and communal sin]. Students in religious education no longer memorize Bible verses. Students in public and other schools no longer memorize important speeches or parts of the *Declaration of Independence* or the *Constitution* of the United States. Instead, they go home to fill their empty memories with biographical knowledge of disordered cretins in the entertainment industries; they fill their hearts with the lyrics of songs about sexual violence and recreational drugs and disordered teenaged anger; they shape their habits to their own immediate desires rather than learning the habits and customs of their traditions.

Human beings memorize as a natural matter. If there is no *Iliad* or *Henry V* to fill their memories, no noble speeches, no facts about the lives of great men and women, they will fill their undisciplined but powerful memories with the products of a trashy entertainment industry or a who-rish ‘news’ industry. We should remember that great writers and orators, including Abraham Lincoln—not so great a political leader in my opinion, drew upon large stores of memorized quotations from the Bible, Shakespeare, Milton, Virgil, Horace, Homer, and so on. The specific ideas and rhythms of those various great works filled *Moby Dick* as well as the *Gettysburg Address*, and even the modernistic books of Edgar Allen Poe and William Faulkner and many others. As long as I’m beating this dead horse, I’ll add that Chaim Potok, in the two-book novel *The Chosen/The Promise*, writes about the memorization of shelves of books by rabbinical seminar-ians (mostly likely including himself) who had to be able to move fluidly from one work to the middle of another to pass their oral exams.

Mind is both stuff and form. Memorization of “good stuff” provides the material to be shaped. A research mathematician, a Biblical exegete, a choreographer, or a cabinet-maker have a stock of “good stuff” in their minds.

There’s more and that more is of still greater importance. As I noted in Chapter 101, *New Forms of Human Mind and New Forms of Human Civilization*:

Rich cultures make for rich opportunities for human minds to be shaped to encompass far more than the furniture and the trees, not that I despise solid and comfortable furniture or grand old trees.

But there’s a non-linear complexity involved in this business of cultures and minds. At any one slice of time, it seems to me that minds shape culture and culture tells minds how to move, to paraphrase John Wheeler [physicist and expert in general relativity].

As I put it in Chapter , *Differential Geometry and Moral Narratives*:

The American physicist John Wheeler once summarized general relativity by telling us that matter tells space how to shape itself and space then tells matter how to move. Maybe we can play around with this metaphor:

“Human beings tell moral space how to shape itself and moral space then tells human beings how to move through life—how to act.”

The “good stuff” when we talk about moral spaces is rules of behavior and habits formed so that we may not even be consciously aware of them. Memories none the less. The “good stuff” for a mathematician is all those rules of differentiation and integration as well as proof techniques—a high-level expert in analysis (think of abstract calculus) would spend all his life on one complex proof if he hadn’t formed a lot of memories and instead had to develop that one proof from basic principles. In other terms, mathematical skills are not something separate from all those memorized equations from freshman calculus and woodworking skills are not something separate from those memorized properties of woods and of tools. In still other terms,

mathematical skills and knowledge and complex skills and knowledge in general are cumulative, based upon prior skills and knowledge already held in the mind.

As I say in a novel not yet completed:

His memories were shaping his mind but his mind was telling his memories how to move along as if they were an orderly succession of events, though not so orderly as a half-hour television show with an obvious plot-line and a clean ending. His memories often hinted of a story, but not a story he always wanted to be part of.

It's apparently hard for American educators to teach 'facts' without rigidifying the minds of their students. That's a problem with American educators and their ways of teaching, more so a problem with the ways in which American children, including future teachers, are raised. I'll leave that problem behind as I make a still more important point, at least within my understanding of being.

So many modern thinkers don't see that the separation of facts (as in what's memorized) and conceptualization (as in some alleged ability to apparently do something with the mind unformed by and empty of empirical reality), is a form of dualism which is less reasonable than a full-blown version in which creatures capable of moral reasoning (alas, more than just human beings) and abstract reasoning (alas, including at least chimpanzees) have some sort of immaterial entity capable of dealing with these immaterial concepts which are independent of thing-like being. In other words, pre-modern human beings thought facts and knowledge and understanding to be immaterial but they also thought they had immaterial minds or souls to handle this immaterial stuff. Modern thinkers are, in my opinion, less reasonable in positing immaterial facts and knowledge and understanding which is to be contained in the matter of the brain. How is protoplasm to contain ectoplasmic knowledge? I don't know but I seem to be perhaps the only one to realize it is an overlooked question.

The human mind forms by way of response to its environments, including the abstract realms of created being such as mathematical spaces, which have been discovered mostly in recent centuries. At that, those abstract realms continue to be misunderstood even by great mathematicians

and physicists and philosophers. Some artists and musicians and poets seem to have better understood the sheer reality of abstractions.

The biggest of all issues is involved here, the understanding of the nature of contingent being, “created being” to a Christian. As I said in Chapter 628, *Becoming Child-like in Our Thinking*:

I’ve said often: created being, reality, is a manifestation of certain thoughts of God. We accept what we see as being true; things are true as St. Thomas Aquinas claimed. We have no warrant for a belief that we human animals know something outside of what we are told by way of the thing-like realm of being and the abstract realms of being we can begin to detect by studying that thing-like realm in greater detail and with greater sophistication. We are children learning from the Creator and shaping our thoughts in response to His answers. We’re not some sort of natural adults bringing schemes of truths to the task of understanding what lies around us. Any schemes we have are drawn out of our environments, concrete and abstract, by studying our traditions, and by that painful process of growing into a world, becoming truly part of it. We need to refound our Christian faith and we must do so by accepting on faith what is known of empirical reality and to move on to making sense of that knowledge in light of our Christian beliefs. As children take on faith the claims of their parents, we need to take on faith what God is telling us through His Creation.

Even more directly: a properly shaped human mind is an encapsulation of Creation, something of a complex and smeared image of the thoughts God manifested in created being. In shaping our minds to the thoughts of God, we are becoming truer images of the Almighty.

# 140 Maybe the Resulting Culture(s) is the True Measure of a Country's Educational Systems?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1738>. It was finished and uploaded on 2013/12/07.]

In a typically intelligent way, Steve Sailor discusses the latest results from PISA, the educational tests which basically cover the 'rich' (OECD) countries. Sailor's article, *PISA, Piece by Piece* found at [http://takimag.com/article/pisa\\_piece\\_by\\_piece\\_steve\\_sailer#axzz2mVuMBKg1](http://takimag.com/article/pisa_piece_by_piece_steve_sailer#axzz2mVuMBKg1)", is worth reading.

They say the proof is in the pudding and I'd claim the pudding for education is the resulting culture, not test scores. We don't learn just to pass tests, though there can be value in tests if they are taken as indications of the rate of progress (if any) toward the acquisition of skills and attitudes and knowledge which is necessary to play our proper roles in our civilization.

It's probably appropriate to let conformity settle down upon those who are so comfortable but when tests are used as a means of enforcing conformity upon all the students, we lose most possibilities of adapting to God's dynamic Creation as it emerges more fully and more clearly to human minds and hearts and hands.

The world is dynamic and human being, individual and communal, is shaped in response to that dynamic reality. Human being is changing, but some parts of individual and communal human being is highly resistant to change, at least rapid change. That's certainly not all bad. Our current

educational systems, certainly in the United States, have been for a few generations or more one of the heaviest drags upon any efforts to respond to modern empirical knowledge, in the history of the ancient Hebrews as well as nuclear physics.

If we had a proper educational system, students in various tracks—straightforward textbook learning and vocational learning and advanced learning for those more energetic and talented—would probably do well on standardized tests though the advanced students might be bored and trying to head for the library or laboratory halfway through the test period. Those advanced students, and occasionally others, would be learning the new knowledge, maybe starting to acquire new knowledge, and starting to integrate that new knowledge in their cultures.

Instead, we in the United States are seeing our cultural institutions, with the notable exception of serious music, being taken over by those whose idea of adaptation is downgrading their product to reach ever larger audiences of ever more barbaric human beings, barbaric in terms of both their individual and communal being. I've been told by an active literary agent (thrillers and detective novels but he was an older man who'd known more literary editors and agents) and an ex-editor in a major publishing house, that the minds of workers in our publishing industry have decayed more rapidly than the minds of Americans in general. The very talented have been mostly crushed down toward the middling level but those with some lesser talents have also been crushed down. There has been some decay in the middling level itself—check for the number of successful middle-brow authors from the 1950s and earlier who produced works of some lasting interests to serious readers.

I suspect that Western Civilization is being pushed to the side and will continue to be pushed to the side, perhaps by a civilization with heavy Asiatic content. But that new civilization might be a Christian Civilization (a truer precursor to the Body of Christ) which is a meeting ground and home for a large portion of the human race, European (including the US and Canada and others) and far east—though it might be a while before other regions of the world can participate much in this new civilization.

At any rate, there is little reason to believe that the United States and Europe are producing much, outside of music and some fields of science, which will be of lasting interest to the human race. Who cares if we do badly or well upon standardized tests?

They justify a large industry and corresponding bureaucracy of obscure

purpose.

They produce a lot of statistics which can be analyzed and who cares? Though I'm an advocate of the importance of the sorts of skills which can be tested accurately (such as memorization of basic facts and use of basic language skills), the Western educational systems—certainly those of the United States—are self-serving systems which are clearly not set up or run to do anything truly useful for a troubled civilization or for a civilization which is coming to life or reviving alongside its own dying organs (become self-serving institutions such as our schools).

# 141 A Brain Shaped to Geometric Thought?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1777>. It was finished and uploaded on 2014/02/12.]

In an interesting article, *How Our Brains Go the Distance* found at <http://phenomena.nationalgeographic.com/2014/02/03/how-our-brains-go-the-distance/>, Virginia Hughes tells us:

People think about distances all day...long. Distance can describe physical spaces (a far-flung city; a nearby store), time (distant past; near future), and social relationships (near-and-dear pals; a quarreling couple needing some space).

Researchers have long thought that these various examples of “psychological distance” are represented by some of the same circuits in the brain. A new brain-imaging study strongly bolsters the idea, finding that certain patterns of neural activity underlie all of our judgments about distance—whether in space, time, or the social realm.

The results makes sense, the researchers say, given that all of these distances have something in common: They give us a way to move beyond the visceral, here-and-now experience of our lives. More provocatively, this ability to “go the distance” might be uniquely human.

This is probably necessary to the ‘higher-level’ claims I’ve made that human beings can abstract from concrete or relatively concrete levels of created being to relatively abstract levels of created being. I’ve particularly emphasized geometric reasoning in my claim we can gain some sort of a

better handle on our moral messes by using qualitative reasoning borrowed from modern physics and mathematics, borrowed perhaps by an abstraction of that reasoning from, say, the analysis of spacetime in our universe, followed by a movement toward the concrete levels of human morality, or of human life in general.

I'll reuse a diagram which appears in several essays in this book because it explains something basic about my way of thought:

I first used that diagram in the essay included as *The Essence of Liberalism* 438 where I claimed:

What we need, in terms set by this essay, are thinkers who can move up to higher levels of abstraction to figure out how our human natures and communities become more complex and richer in possibilities (even the most passive of individual human beings have natures which are more complex just because of our more complex communities). I'm suggesting that we can learn many tricks from modern physicists and mathematicians and might very well be able to borrow directly from what has been learned from the exploration of spacetime, matter and energy and fields, and even the most abstract regions of mathematics.

The article, *How Our Brains Go the Distance* found at <http://phenomena.nationalgeographic.com/2014/02/03/how-our-brains-go-the-distance/>, also tells us:

What most surprised me about this research is its possible connection to empathy and “theory of mind,” or the ability to take the mental perspective of someone else. About a decade ago, researchers linked theory of mind to a specific region in the brain: the temporo-parietal junction (TPJ). Intriguingly, the TPJ region encompasses the IPL [which is the brain region with activity corresponding to the concepts of ‘near’ and ‘far’].

Theory of mind may be another way that we have evolved to look beyond our immediate, individual perspective, notes Nira Liberman, a social psychologist at Tel Aviv University. “We predict the behavior of other people by forming abstract mental constructs,” she says. “All these different ways of traversing immediate experience were and are achieved by abstract mental representations.”

See the article, *Rebecca Saxe: Fine tuning the theory of mind* found at <http://sfari.org/news-and-opinion/investigator-profiles/2009/rebecca-saxe-fine-tuning-the-theory-of-mind> for the discussion about “theory of mind”.

I also discussed this issue of empathy in Chapter 222, *Through the Body Comes Sin, Through the Body Salvation*, and also in Chapter 295, *The Embodied But Constructed Self*. In that second chapter, I wrote, “ We are, in some reductionistic but legitimate sense, mappings in our brains, mappings which include both our individual and communal selves.”

That last line is important. Our individual selves are created by processes in this mortal realm, processes which produce imperfect and incomplete results in a world which allows no better. After all, if the process could be completed in this world, God’s story would end at that point. More importantly for my current purposes, our communal selves are constructed by mappings in our brains. Mappings similar to those which shape our human animal beings as individuals of a truer sort shape our human tribes and clans as communities of a truer sort—though I believe we become ‘persons’ in a greater sense only when we also become a part of the perfect and complete community: the Body of Christ.

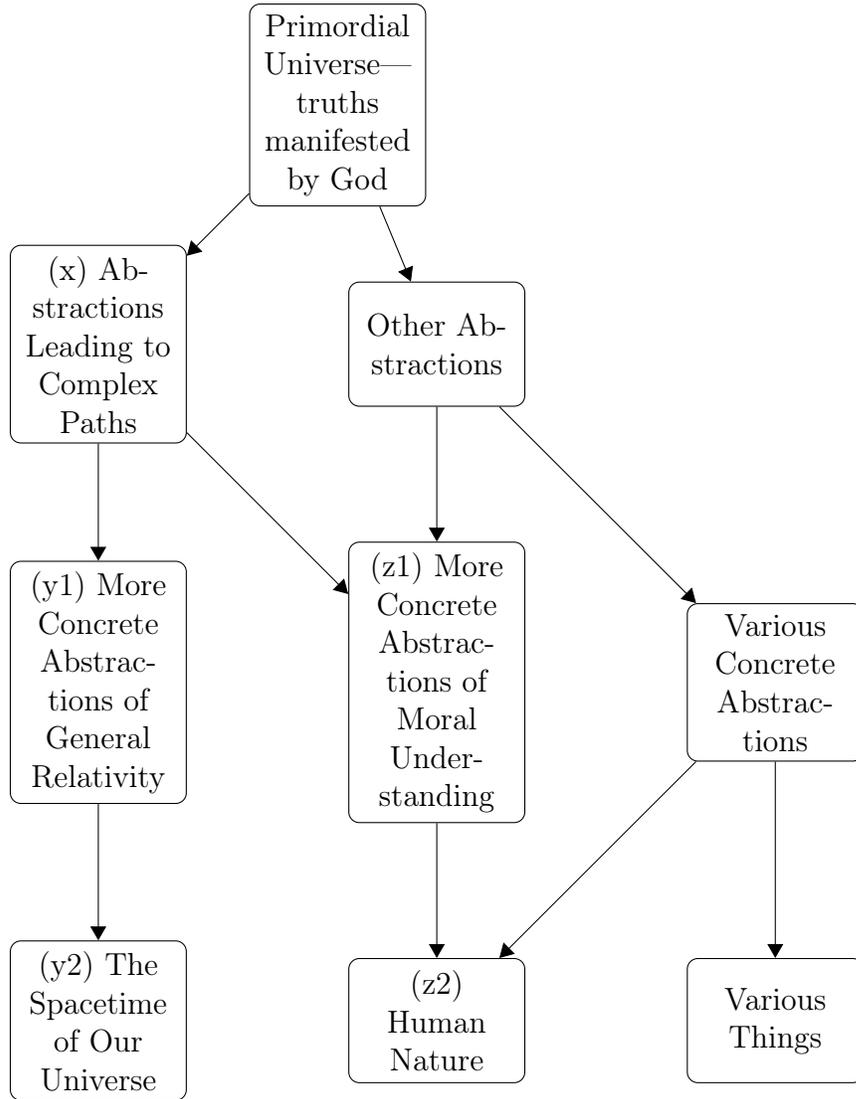

Figure 141.1: Simple Relationships of Abstract and Concrete Levels of Being

# 142 National Security Intelligence Analysis as Mind-shaping

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1818>. It was finished and uploaded on 2014/05/08.]

Col Pat Lang (ret), a Green Beret and military intelligence officer, has written another of many short and authoritative commentaries on the current messes which are the US civilian government and US military. Of the two, the military seems to be the far lesser mess, even to the point of being reformable so long as we can prevent our corrupt politicians and war-mongering corporations from further spreading their corruption into the uniformed services.

In this commentary, *Clapper's Edict* found at [http://turcopolier.typepad.com/sic\\_semper\\_tyrannis/2014/05/clappers-edict.html](http://turcopolier.typepad.com/sic_semper_tyrannis/2014/05/clappers-edict.html), we can read the specific idea I wish to discuss from my way of thinking.

As has been observed here, open source information is the bedrock of the information base from which analysts work. Contrary to the egotistical belief of many policy people who think themselves as capable of dealing with data, *the intelligence analysts' minds are the true weapons in the intelligence business*, not secret information. As I have said before, secret information is often useful but it is not the base of the data pool. [Emphasis is mine.]

I've made very similar claims before including the fundamental claim that our minds form as we shape our very complex and very flexible brains

in active response to what lies around us. At some point, we might be part of a large population of individuals who are members of a variety of communities also shaped as their members respond, as individuals and as communal beings, to what lies around them. An uncertain future lies ahead and those minds will need to respond to what is new or sometimes what is known but suddenly becomes new in a new context. Back in the late 1950s, Jacques Barzun claimed in *The House of Intellect* [7] that Americans were in pretty good shape so far as individual intelligence went, even perhaps using their individual intelligences when intellect (part of what I call “communal intelligence”) might better serve. Unfortunately, the individual intelligences of Americans entered a period of degradation shortly after Professor Barzun’s book was first published.

You should also be aware that where I wrote ‘mind(s)’ in the above paragraphs would be more complete if I had written ‘mind(s) and heart(s) and hand(s)’. I’ll stick to the simpler language because mind is the most important of the three in the context dealt with by Col Lang, but be advised you should also keep this more complete understanding of human being in the back of your mind.

I’ll expand on this idea of the importance of the intelligence analyst’s mind and the reasons I see behind Col Lang’s quite justifiable dismissal of the “many policy people who think themselves as capable of dealing with data.”

I stated above that “our minds form as we shape our very complex and very flexible brains in active response to what lies around us.” This is a claim consistent with what is known about the human brain by way of modern science, obviously neuroscientists lead the way in this research but evolutionary theorists and geneticists and mathematicians and engineers and various other sorts of scientists (or those from related fields) have played a role. It is also a claim first made by St Thomas Aquinas in the 13th century and implicitly made by many a literary man or woman of substance. Actually, the situation is more complex because Aquinas had a fully ‘modern’ theory of the development or shaping of moral character but he placed abstract reasoning in a ‘soul’ or ‘mind’ which was nonhuman and only accidentally attached to the human being—from at least the time of Aristotle philosophers and medical doctors knew of the importance of the brain in thinking and perception but they didn’t understand how dynamic matter is, and they thought the brain itself was largely inert. So it was that Aquinas didn’t think a mere hunk of even living stuff could be flexible

enough to engage in more abstract forms of reasoning, such as realizing—as an infant does—that the dachshund and the greyhound are members of the same species. I'll ignore this complication, as did the neuroscientist and philosopher Walter J Freeman in his insightful book, *How Brains Make Up Their Minds* [35] which explains this part of Thomistic thought far better than any other book I've yet seen, even those of Etienne Gilson who is generally the best at explaining Aquinas and his context.

I can only sigh at the mere mention of such matters as 'American mind' or 'American moral character' or 'American education' or the very basic 'American attitude toward reality'. It is that attitude which guides us in responding to reality, leading us Americans to respond to some fairy-tale version of reality; so it is that our minds and moral characters and our educational systems are deformed and serve something other than God's truths which are drawn from reality. I confess to having too readily accepted deformation, or perhaps lack of proper formation, in my moral character as well as in the shaping of my individual mind and my relationship to greater intellects, especially the somewhat general and even ghostly intellect of modern Western men. I attended a school system up through high school which encouraged all to move to some level of laziness and acceptance of a comfort-zone of mediocrity. I took the bait and didn't start recovering a stronger mind or moral character until nearly ten years after a disappointing career in college. Under the circumstances, I had little hope of fulfilling my desire for a successful career in physics because that is one of the fields where standards had been maintained at a properly high level. Help was available but I had gone into a bad spin of too much drinking and games-playing as a freshman and didn't take that help. By my junior year, I was getting good grades again but that isn't good enough for a field with high standards—a bit of interest and signs of a well-developing mind are more important. I was burned out and exited the academic life, perhaps wisely or perhaps just in a cowardly manner.

I look back and see myself as having exhibited a typical, but not universal, American trait. When caught in a bluff, I didn't take the correction from someone who knew more than I about a specific topic—I would advance and increase my error in an immoral effort to defend my poorly formed beliefs or my false facts as the real truths. This attitude is easily seen in American political leaders and leaders in many in other realms as well. Such an attitude now seems to be desirable for any academics or diplomats or intelligence analysts who wish to rise to policy-making posi-

tions. Similar comments seem appropriate with regards to nearly all realms of human endeavor in the United States and increasingly in all the other countries which have been poisoned by American thoughts and attitudes. A succinct summary: we have become a country which uses the wealth and power accumulated by our ancestors to shelter us in our desires to feel good about ourselves as we destroy out country in a remarkable display of incompetence in dealing with reality. This tendency was always present in the American character, at least in New England—see Chapter 408, *The Need for Abstractions in Moral Self-understanding* for my discussion of the stupidity and self-righteousness which lay behind the Puritan treatment of native Americans.

Physicists and other scientists and engineers are forced to be more honest and to be properly humble *when* their peer-review processes work well, sometimes public processes and sometimes private, but all fields of human endeavor should have a similar review process. In some fields, including literature and philosophy and theology where I spend most of my time and energy, the peer-review process can last over generations but there are some matters which can be settled quickly. Oddly enough, the process of writing serious novels or verse seems to enforce honesty even in men not so honest or morally courageous in most parts of their lives. The morally dissolute Flaubert portrayed a man much like himself with brutal honesty in *Madame Bovary* and the puritanical barbarian Tolstoy did the same in *Anna Karenina*.

Honesty of a certain sort, that is—honesty in perception of realities both internal and external and in the greater understanding of that reality—is necessary for higher achievement in nearly all fields of human endeavor, including politics and intelligence analysis. Note I speak of ‘achievement’ and not of ‘short-term success’, including that dangerous, blinding sort of success in American domestic politics. We Americans have benefited from such honesty in politics during the early decades of the United States when even the scoundrels were men of some moral intelligence and substance; there has been a notable lack of serious moral character from the time that noble generation left public life. There has been a scattering of presidents and senators and others of high and serious moral character, but that scattering seems to have further thinned in recent decades.

Let me mention a particular American agency which has been so dangerous just because there is a pretense of superhuman competence when the most basic levels of competence have been lacking. The CIA has been prob-

lematic from the beginning of its existence, despite the true OSS war-heroes who helped to found the CIA to fight the cold war where they had helped to fight the very hot war against the Japanese and the Germans. To be sure, my impression is that the OSS itself was an agency of mixed competency but always sliding too easily toward a state of playpen for adventure-seeking blue-bloods, disproportionately from Yale and from *Skull and Bones* and convinced the world corresponds to spy-novels and even the most ridiculous of spy movies. At the same time, we have living examples of CIA officers of high intelligence and high moral character in Philip Giraldi and Ray McGovern and Paul Pillar and a deceased example in Sam Adams. There are others including—I'm sure—many who never became known to the general public, but there are no indications that such men dominated the analysis or presidential advice-giving processes. Giraldi has said the CIA has the same distribution of human beings as other institutions: most put in an honest effort for their 40 hours each week, a very small minority are criminals of some sort, and a somewhat larger minority are men and women truly willing to sacrifice for their country and to simply achieve excellence in their work. I'll only mention there is some evidence the criminal element in the CIA has been disproportionately powerful and dangerous given their small numbers. See Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American* for a related discussion.

We Americans are prone to an “egotistical belief... [that we are born with minds fully] capable of dealing with data,” to somewhat rework one of Col Lang's statements. It's not just our recent presidents and senators and cabinet officials and even celebrity ‘policy-makers’ of the ilk of Condoleeza Rice or others in recent years who are supposedly competent academics but the mistakes they make seem to me to often be due not just to inexperience in the national security policy-making environment; they seem to be deeply ignorant in the fields in which they held prestigious academic posts.

Americans, and certainly many politicians and the academics who pander to them, seem to believe they had been gifted at birth with well-formed minds which only need some ‘data’ from any given field and then the humans possessing those minds can penetrate to truths as readily as any who spent years shaping their minds to information and well-stated knowledge about reality, not ‘data’ which lies about reality as often as it tells the truth. This reminds me of the story of President Truman hosting a meeting of intelligence analysts, military officers, scientists, and engineers who were struggling with the question: When will the Soviets have a fusion (hy-

drogen) bomb? All of a sudden, Truman triumphantly announced, “Never!” A deep silence fell upon the room as the most antagonistic proponents of various viewpoints realized as a group that a man of this mental and moral caliber was in command of the United States government and military, including the nuclear-weapons systems.

The fact was: the Soviets had a true hydrogen bomb before us—the monster set off by the US on Bikini Island was the size and weight of a railroad car filled with mostly industrial freezing equipment. It maybe could have been transported as a unit by a C-5 but not by the B-52 or any other bomber. Some, including perhaps Solzhenitsyn by hints have claimed the nuclear spy rings run by Stalin himself at times had the main purpose of corrupting American intellectual circles. After all, the Soviets had Sakharov and Landau and other scientists of that caliber, many of nearly that caliber. They were missing prototyping quality machine-shops and a population of well-trained production machinists to have easily kept up with the United States in most technological fields. But that was a heck of a lot to be missing and was but one result of their badly functioning system. We should even remember that Solzhenitsyn himself, when an inmate in the research lab portion of the Gulag before his rebellion, was doing good work with little resources on voice-recognition systems when such was an exotic project even at the well-funded Bell Labs.

I hope I’ve given a good flavor of my philosophical reasons and even hints of my theological reasons, for strongly supporting Col Lang’s claim that “the intelligence analysts’ minds are the true weapons in the intelligence business.” If we use the analogy of weapons, those minds have been shaped to penetrate deeply into the thoughts and feelings of the military or political or economic leaders of another country—leaders at various levels. (Keep adding realms such as culture and science and engineering and you can get to a more complete statement which would be quite clumsy.) I wouldn’t follow this particular line of reasoning too far just because we undoubtedly have, and should have, analysts who work on countries which are quite friendly to us, yet we would wish to have some deeper understanding of foreign political events or the decisions of foreign businessmen to develop, say, their computer industry in a certain way. Such information would always be of general use in understanding friendly or unfriendly powers when we anticipate responding to some problem or when we go about our normal peacetime activities.

We Americans, not just our political leaders, end up with malformed

minds largely because we don't recognize that the human mind is shaped by our active responses to reality. We think we are gifted at conception with some sort of a mind which only needs "data" to understand the world outside of us. We are forced to admit there is something different about the mind of a physicist or a geneticist but we, certainly our elected and appointed government officials, believe that our monolingual and historically innocent 'minds' can come to a complete understanding of Iranian or Russian politics if we but pour a little bit of 'data' into those minds which are truly pure only in the way of a whitewashed sepulcher. I've been in conversations with the pompous sort of fellow who was charitable to the Iranians though advocating a tough stance: "After all, they don't think in rational ways as we do." Two men I've mentioned, Col Lang and Philip Giraldi were experts on Iran during their careers as intelligence analysts, have claimed the Iranian leaders are more rational than our leaders. Those Americans who 'see' that many of our enemies are such because they aren't as rational as us have seemingly once had a thought flash across their minds and it seemed so good in its power to explain so much—let's go with it. Those Americans deserve the leaders they have, leaders so much like them.

The fundamental problem is moral: we who claim to be a Christian people, when it suits our purposes, pay little attention to God's Creation which is the totality of created being. We think we have minds which can reconstruct how things are and how they should be with just a little data as input.

As I noted before, this moral insanity, as Herman Melville labeled it, is an act of rebellion against God who failed to do as good a job as Creator as we would have wished. We deserve a better world to live in and we'll remake it to our standards as well as we can and make up the difference by 'knowing' what the world really is. Who needs to listen to those who have worked for years to learn the languages and histories and cultures of various peoples, who have worked just as long or even longer to develop their minds to specific tasks such as the understanding of specific countries or specific types of situations—including crises such as those in the Ukraine or Syria. We'll just wing it and eventually reality will come around to prove itself to be what we already believe it to be.

## 143 The Context of Thought and Language

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1842>. It was finished and uploaded on 2014/07/03.]

According to a couple of dictionaries, an ‘explanation’ is “Something that explains” or equivalent definitions of the sort which would gain a failing grade on a junior high school test back in the days when American schools were so tough we had to write essays explaining how it was possible to walk uphill going to and from school.

According to a highly respected textbook, *Theoretical Physics* [79] by George Joos with the collaboration of Ira M Freeman, an explanation provides “a reference back to simpler elements.” This is more solid but needs elaboration and more than a little expansion to cover fields beyond physics and similar sciences; in fact, a bit of expansion is needed to cover such ‘philosophical’ sub-fields of physics such as cosmology and also the truly fundamental sort of work done by Newton and Maxwell and Einstein and the founders of quantum physics. (I will return to the sub-topic of explanations in physics in a short while, without pretending to ‘solve’ longstanding problems but only the (Thomistic) intent of putting physics and other such fields of study in the context of more general human thought.)

Even within physics, such an explanation—“a reference back to simpler elements.”—relies on much conceptual, linguistic, methodological, and other apparatuses; there is much that could be labeled cultural capital in each of Newton’s simple laws. Without the entire history of ancient Greek philosophy and its battles to learn how to develop proper words and concepts and methods for abstract reasoning, without Euclid and Archimedes, without Ptolemy (whose ‘model’ of the Solar System was arguably the

first such large-scale mathematical-physical model), without a multitude of philosophical and literary thinkers from Christian and Jewish and Moslem cultures, without the empirical thinkers and doers of the Middle Ages, Newton's laws make no sense. Civilized thinkers realize this. Barbarian children who think the world is transparent to human thought and human language—many modern scientists and too many teachers and cultural leaders among others are such barbarian children—think that Newton's laws, the US Constitution, ancient Christian creeds, and other complex encapsulations of thought mean exactly what they 'seem' to mean. Such an understanding of understanding is thoroughly incoherent, but we'll gradually get to a better understanding.

When we explain something substantial, we're a bit like acrobats who support ourselves by standing upon our own heads, but mostly we, as individuals and as communal beings, stand upon our communal heads. We rely upon not so much our individual intelligences but our intellects as defined by Jacques Barzun in *The House of Intellect* [7]:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

There is much more to be said. I'm trying to understand understanding within the context of my worldview and doing so in a somewhat arbitrary way, but that is also the nature of human thought. We are blessed and sometimes cursed by the personal aspects of the thought left to us by Plato and Augustine and Dante and Shakespeare as well as Newton and Faraday and Einstein.

We are embedded in a world of particulars including particular men and women and other creatures; we are further embedded along with our world in a greater Creation of realms of abstract and particular or concrete being.

I'll be writing more about explanations and trying to write in such a way as to provide digestible pieces as part of a long-delayed effort to try

to make my worldview more accessible. As is often the case with me, it is a quite idiosyncratic way to move forward and a way decided upon by a seeming impulse after thinking hard about the problem for years. I'm bound to be idiosyncratic even when I'm working in a field seeming suited for systematic thinking—after all, I'm a philosopher and theologian who writes novels even when I'm writing philosophy and theology.

# 144 Adopting Mathematical Reasoning in Non-quantitative Fields of Thought

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1849>. It was finished and uploaded on 2014/07/18.]

I use the term ‘empirical science’ to include any field of disciplined study of Creation, physics and chemistry and engineering sciences but also including mathematics and history and literature.

The modern empirical sciences have advanced ahead of philosophy and very far ahead of Christian theology. Philosophers and theologians would be wise to start borrowing from those modern empirical sciences, not the particular mechanistic models but the true reasoning underlying those models. I’ll ignore for now the fact that fields such as history and sociology are in between, going through some successful and some far from successful efforts to use more advanced and abstract reasoning at least in principle similar to the powerful abstractions of those empirical sciences which had long ago adopted mathematics because of their need for quantitative analysis and then learned in the 1800s of the power of more flexible and more qualitative forms of geometric reasoning.

Yet, I’m only speaking of the arguments which, so to speak, end an analysis. It has always been true that the fundamental forms of human reasoning, including those of all modern empirical sciences, are qualitative and not quantitative. It takes a great deal of study and the development of sophisticated thinking processes to penetrate to those fundamental forms, though they are visible in the writings of Einstein in his early works and in many of the writings of the quantum theorists. They are also visible in

the writings of modern theorists of evolutionary biology, in the writings of modern neuroscientists and geneticists, perhaps even in the successful (perhaps a low percentage?) and the failed experiments of modern music and painting and sculpture. As will be clear soon, the idea that quantitative fields rest on qualitative foundations comes to the fore in the thoughts of some mathematicians including educators and famous (at least in small circles) men. There are also philosophers of science and mathematics working on this and related ideas.

Let me back away for a short while and put in my own two cents worth about the need to deal, at least ultimately, with issues of being and not to treat knowledge, thoughts, and truth, and other mental ‘entities’ as if they were separate from being and to be imposed upon being to establish a proper order. That order, in fact, comes from being and emerges in our own mind but only as we learn to encapsulate relatively more concrete forms of being and to move on to the more abstract forms of being from which the concrete, thing-like being is shaped.

In Chapter 156, *A Christian View of Einstein and Bohr’s Debate on the Meaning of Reality*, I addressed this general issue in terms of being and not knowledge, and in terms of an important debate which took place between Einstein, advocating what was really a ‘high’ pagan philosophy of worldly realism where things exist in themselves and can’t be inherently changed by external relationships, and Bohr who was advocating a radical view that relationships, such as those we can express in terms of the equations of quantum mechanics, are primary over stuff. Bohr’s position, as I point out in Chapter 157, *Quantum Mechanics and Moral Formation*, is pretty much the view advocated in the writings of St John the Evangelist and his followers and also anticipated in the Old Testament.

If we accept that relationships can be such, then we have accepted the reality of abstract being and should learn to speak in ways more appropriate to being, to reality.

I’ll move on to a few suggestive quotations on the subject of qualitative reasoning in modern mathematics and, hence, in modern scientific and engineering thought in general. For now, I’ll let the readers use their imagination to transfer these thoughts about mathematical knowledge to those aspects of being described so well by mathematics; from there we can see how this reasoning can be applied to all forms of created being, including human being.

In the article, *Symplectic Geometry* [146] by Alan Weinstein, we can

read on page 1:

[G]eometry has taken a new role in mechanics through the contributions of Poincare (1854-1912) and Birkhoff (1884-1944). Now, though, the geometry is the more flexible geometry of canonical (in particular, area preserving) transformations instead of the rigid geometry of Euclid; accordingly, the conclusions of the geometrical arguments are often qualitative rather than quantitative.

In that same article, we can learn that the highly regarded 20th century mathematicians, GD Birkhoff, expressed “the disturbing secret fear that geometry may ultimately turn out to be no more than the glittering institutional trappings of analysis,” while Poincaré (1777-1859), in Weinstein’s words, “suggests that calculations are merely a tool in the service of geometrical and mechanical reasoning.” (I decided to include Birkhoff’s statement, though I can’t currently wrap my mind around it, because Weinstein indicates that Birkhoff and Poincaré were expressing the same opinion.)

In a book of writings by Soviet mathematicians, *Mathematics: Its Content, Methods, and Meaning, Volume 2* [85], the truly great Russian mathematician, A N Kolmogorov, has this to say on Page 258 of the article, *The Theory of Probability*:

The proponents of mechanistic materialism assumed that such a formulation [of systems describable in terms of relatively simple differential equations, such as gravitational fall] is an exact and direct expression of the deterministic character of the actual phenomena, of the physical principles of causation. According to Laplace, the state of the world at a given instant is defined by an infinite number of parameters, subject to an infinite number of differential equations. If some "universal mind" could write down all these equations and integrate them, it could then predict with complete exactness, according to Laplace, the entire evolution of the world in the infinite future.

But in fact this quantitative mathematical infinity is extremely coarse in comparison with the qualitatively inexhaustible character of the real world. Neither the introduction of an infinite number of parameters nor the description of the

state of continuous media by functions of a point in space is adequate to represent the infinite complexity of actual events.

It's interesting and enlightening and refreshing to see determinism shot down, not by probabilistic arguments but by arguments pointing to the "qualitatively inexhaustible character of the real world."

Another volume of the same collection, *Mathematics: Its Content, Methods, and Meaning, Volume 3* [85], contains the article, *Non-Euclidean Geometries* by another highly-regarded Russian mathematicians, A D Alexandrov. On page 155, we can read

The real significance of this point of view is that it makes it possible to use the concepts and methods of abstract geometry for the investigation of diverse phenomena. The realm of applicability of geometric concepts and methods is extended immensely in this way. As a result of the concept of space the term 'space' assumes two meanings in science. On the one hand it is the ordinary real space (the universal form of existence of matter), on the other hand it is the 'abstract space,' a collection of homogeneous objects (events, states, etc.) in which spacelike relationships hold.

On page 158 of the same article, we can read a description of 'space' from an abstract viewpoint:

By a 'space' we understand in mathematics quite generally an arbitrary collection of homogeneous objects (events, states, functions, figures, values of variables, etc.) between which there are relationships similar to the usual spatial relations (continuity, distance, etc.). Moreover, in regarding a given collection of objects as a space we abstract from properties of these objects except those that are determined by these spacelike relationships in question. These relations determine what we can call the structure or 'geometry' of the space. The objects themselves play the role of 'points' of such a space; 'figures' are sets of its 'points'.

Abstract spaces might well be a 'graphing' of abstract forms of being in so far as they show up in properties or behaviors of concrete being, including human being.

Finally, we can read on page 1 of the book, *Topology and Geometry for Physicists* [96], by Charles Nash and Siddhartha Sen:

[T]opology produces theorems that are usually qualitative in nature—they may assert, for example, the existence or non-existence of an object. They will not in general, provide the means for its construction.

Some of my readers may have better knowledge and skills in these fields than do I, but, for the others: qualitative, topological reasoning is very important in modern physics, even in fields where the goal is to ultimately produce a quantitative result.

We have hints of a greater unity, one in which knowledge is not ‘of’ being, but rather an encapsulation of being in a way that makes it a sharing in being. Created being is manifested thoughts of God so that Creation is certain acts, acts-of-being, of the mind of God, acts-of-being become objects in which God is ever-present because that divine presence is God’s thought. God is unified in such a way that thoughts and acts and feelings aren’t really separate, as will also be true of that completed and perfected human being, the Body of Christ.

By exercising the human ability to encapsulate large chunks of the world and even of those realms of Creation invisible to the sense organs of our thing-like being, we share in those thoughts and acts and feelings of God in His freely-chosen role as the Creator. Being able to quantify, say, the effects of gravity under relativistic or non-relativistic conditions is a part of that sharing but it is more complete and more perfect when it becomes that greater understanding in a way similar to the greater, geometric understanding of spacetime which is the General Theory of Relativity, an understanding which can be made more specific so that it is the quantitative description of a particular universe or relativistic object such as a black-hole. Yet, the more general understanding, the more abstract description, doesn’t go away even when you tighten the constraints on the field equation of General Relativity so that a specific universe/object is described and the equations can be solved.

More importantly for my purposes, if we stay at the very abstract level for a while, we can begin to better understand the being of that abstract level, being from which this concrete, thing-like world is shaped. Using

abstract space and geometry, I can propose that we might be able to understand the cohesion of societies which have expanded far beyond kinship and proxy-kinship relationships in terms of a bending of the state space which brings citizens together.

There's much work to be done and all I can say at this point is that we won't come to better, even more exact, understandings of human communities by way of straightforward adoptions of quantitative methods from physics nor by way of more clever use of our current stock of words and concepts regarding the concrete, thing-like, directly perceptible properties of those communities.

# 145 Developing Human Minds, Individual and Communal

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1953>. It was finished and uploaded on 2015/01/15.]

Reality often messes up our formal models as well as our less rigid schemes of how reality should work. A good thinker takes such glitches not as a sign that we can't use models in a particular situation but rather as an invitation to think our way to a better model or perhaps to develop a more flexible understanding, perhaps a narrative structure in which some of the entities and events are describable by quantitative or qualitative mathematical models and much has to be described in a more purely qualitative way.

We need a general way of thinking this through and one of my goals has been to produce an understanding of created being which unites created being, and allows us to also see the true relationship of created being to its Maker. Specifically, I'm choosing to look at the 'boundary', which may be gradual or abrupt, between qualitative mathematical models and more purely qualitative understandings. This is roughly the domain of opened, non-deterministic narratives. This is also the domain which largely gives the setting for the more formal models and also points toward the greater story which is Creation, all the realms of created being.

I advocate the idea that relationships between and among creatures and other 'abstractions' are also a form of being. We can now abstract from matter and energy and fields to a level of reality already very abstract to us, though largely quantitative and deterministic to an extent that I'd further claim it can't be the entire source of this concrete world's being. That limited but extensive abstract level is described by the formalisms

of quantum mechanics. Even on strictly physical grounds, it can't be the entirety of the abstractions from which the thing-like being of this world is shaped. Spacetime comes from a different set of abstractions which may or may not be tightly linked at some highly abstract level to the abstractions of quantum mechanics. I'd go beyond what I've said in the previous few sentences: recognizing the dangers in consistency for its own sake, I would yet argue we get a more consistent and also more coherent description of created being if we simply consider those abstract levels (or realms) as created being. In this way of thought, I speak of concrete being as shaped from more abstract being. See Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality* for a more complete description of my ideas, including a discussion of this very simple, almost cartoonish chart:

Don't think of this chart in terms of knowledge of being but rather in terms of being which we can encapsulate in our minds so long as we respond properly to what lies outside of us, abstract being which is metaphysics and mathematics and some qualitative aspects of our concrete world and also concrete being which is chemical engineering and surgery and carpentry and child-rearing. Our vocations and avocations are created being as much as the tools and materials we use.

There is no absolute separation of abstract and concrete being. Concrete being is shaped from abstract being itself shaped from relatively more abstract being until we reach the truths God manifested as the raw stuff of this Creation, but abstract being remains yet in the lowest and most degraded things of this world.

This gives a new perspective on what a mathematical model is, including the most complex of scientific theories, say those of quantum physics or modern gravitational theory. It also gives us a way of speaking about my division of knowledge: revelation, speculation, scientific empirical knowledge, and practical empirical knowledge. (For more on this, see my freely downloadable book: *Four Kinds of Knowledge* [43].) Note also the problem I've created just by trying to break the bounds which were holding back human efforts to understand Creation, including human being, and to better order our own individual and communal selves: I'm forced at times to use a confusing, mixed language in which 'knowledge' seems to mean what I deny it means. But 'knowledge' had a meaning to ancient Hebrews and ancient Greeks far closer to that which I propose. For a man to know a woman was to become one with her in an act of sex and, at least to the

ancient Hebrews, this implied a respectful and loving act. We can recover such an understanding of ‘knowledge’ and purge our thoughts and feelings and acts of the modern dualism which fragments our world in a way less plausible than the ancient split between body and soul or matter and spirit.

I propose:

For a man to know this world is to have an encapsulation of that story being told by God in his own mind, so that it shapes his feelings and thoughts and actions. If such a story is morally well-ordered, it can be the stuff of a civilization.

For a simple and short introduction to my understanding of being, see two essays I wrote early in the process of developing that understanding: Chapter 156, *A Christian View of Einstein’s and Bohr’s Debate on Reality*, and Chapter 157, *Quantum Mechanics and Moral Formation*. In that second essay, I pointed out the similarity of Bohr’s ‘radical’ position to the teachings of the school of St John the Evangelist.

I’ve written of human being as a matter of heart and hands and mind—see Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*. Since we are images of God the Creator, this means we can speak, in the sense in which we already have something of a share of God’s life, of all created being as created by human mind and human heart and human hands at work along with our Father in Heaven. All three are necessary. All three acting together is truly God-like and when we share God’s life there will be no true distinction between the three. To feel is to act is to think. There will be one person even if the organs of brain and heart and hands yet exist.

I’ll quickly examine a case where some scientists applied the type of thinking associated with the study of complex dynamics (physics) to a linguistic problem. In the article, *Focus: Why Language Exceptions Remain the Rule* at <http://physics.aps.org/articles/v8/3>, Michael Schirber, a freelance science writer, discussed some work done by Christine Cuskley of the Institute for Scientific Interchange in Turin, Italy and her colleagues on an oddness which is particularly noticeable in English: Why do irregular verbs survive? Why “swept” instead of “sweeped?” Children try to apply the rules to every verb and will say “sweeped” until ‘corrected’ often enough that an eccentric verb form settles into their minds.

It turns out that it's the verbs less often used which remain irregular. The force of many users, including children learning English, will lead to the use of a regular verb form so long as those many users do truly use that verb often enough.

The last paragraph of the article is a summary sufficient for my current purposes:

“The strength of this paper is that it focuses on the essential ingredients of simplified models for the evolution of language,” says Eduardo Altmann of the Max Planck Institute for the Physics of Complex Systems in Dresden, Germany. Because the new model can be solved analytically, it provides more direct access to the conditions that produce the different language states, he says. In addition to irregular verbs, Altmann imagines the model could also work for instances where two languages (or ideas or beliefs) compete.

The initial model didn't work and the scientists complicated it, making it more accurate but at the cost of adding in a population of people with certain behaviors about adopting simpler rules or staying with the older rules—this population can't be identified. To match reality on a global level, they had to move away from reality on a local level.

This is all very interesting but my point will be a still more general one. Because we, as individuals, are very particular, we view being from a particular perspective at any time. On the other hand, we as communal human beings, view being—including this thing-like world—from a multitude of particular perspectives which an individual can somewhat assimilate and, in a weak sense, come to understand a great deal about Creation. Of course, what we understand about Creation is always timebound and spacebound, culturally constrained, subject to our particular role and skills, and so on.

When communal forces suppress an individual's inclination to do things more consistently and, at least arguably, better, we see the communal mind at work; this should be generalized to the conflict when any individual tries to think or feel or act in a creative way that conflicts with convention. Our communal minds are themselves far from mature, even for the simplest of communities with the simplest of roles in the life of the community which can be called mankind and is really the Body of Christ in formation. (This doesn't mean all men will be saved into the Body of Christ in Heaven, just

as it is well recognized that formal membership in the Church doesn't imply any automatic salvation.)

In Chapter 57, *Mathematical Models of Human Communities: Randomness*, I wrote:

From facts come—sometimes—patterns. We've become somewhat accustomed, by way of terribly vulgarized mathematics and biology and other sciences, to the idea that patterns come from 'randomness' or 'chaos'. Something of an overview can be communicated to those who have not heard of Poincare or Hadamard or Duhem, Ruelle or Smale or Prigogine and to those who don't know what a nonlinear equation is; we should wonder what sense these people make of it. We are at a more complex transition point than the one noted by Oystein Ore, prominent number theorist and teacher (see *Number Theory and Its History* republished by Dover Publications in 1988): in the 14th century or so, long division was coming into use and was considered to be a topic for mathematical geniuses, well beyond those even of more normal high intelligence. Nowadays, we start learning long division in mass education elementary schools, though many still have trouble with it and some can never master it even to the point of figuring how much per pound a roast costs if 4.5 pounds costs \$25.

In the struggle between consistency and established convention in verb forms, we see the communal mind reluctant to change certain fundamentals of language unless it has good reasons to do so. In the ongoing expansion of the human mind's capacity for learning what was once considered advanced mathematics in elementary school, we see the communal mind growing and maturing and individual minds somehow becoming capable of mastering skills well beyond the capacity of similar minds in earlier generations. Could the same happen with quantum mechanics and other hard theories some day? Could it happen with larger and more complex bodies of theories and concepts and narratives, such as the greater narrative of this world and the world of the resurrected set in the entirety of Creation?

We can see in the study of the irregular verbs that there is always the possibility of an imbalance between the individual mind or the communal mind. It's hard for a people to develop individual and communal minds

in a way such that both are strong and healthy, though—in principle—the strongest and most capable of individual and communal minds will develop together and co-exist. But not in peace, for we live in a world of struggle. It's almost a cliché that some of the best literature has been written by authors fighting the constraints of implicit or explicit censorship. I think of myself as fighting an implicit censorship which is the result of willful ignorance and the resultant stupidity of Americans and most other Westerners; this censorship takes the form of a sort of Gresham-like flooding of the bookstores and movies and television lineups with mindless crap which dulls the mind and stimulates our less noble emotions and will often lead to immoral acts.

My current opinion is that we're not in a situation where individual or communal minds have become too strong at the expense of the other. There are certainly some who think only the thoughts put into their heads by the wig-stands of the mainstream media or by the speeches of Presidents or Senators. There are also certainly those who think to break free of a morally disordered society, or perhaps to protect their own interests as they remain part of that society, by nurturing their own sense of individuality and denying what they inherited from their fellow-citizens or from men of distant times and places. This latter denial often takes the form of treating received human being as objective knowledge, that is, knowledge which can be treated as if it were x's to be combined in logical formulations. In any case, the West in 2015 has individual and communal minds which are both weak.

We Americans are morally unordered or disordered individuals who are ignorant and functionally stupid, yet we have some sort of strong attachment to the idea that we are well-formed individuals. Our communities, and communal minds, are equally disordered and yet express a strong self-regard, unlovable and criminal communities demanding our full and unqualified love. We Americans are poorly formed individuals moving in disordered herds and we think ourselves to be at the height of human accomplishment, downright exceptional we are. Similar states hold in most Western countries though the paths to those disordered states were different and some of those other Western peoples seem to at least suspect something is profoundly wrong inside of us and our various communities.

And, yet, there is much truth in claims that we've reached our disordered states at least partly because of those who sought to develop our communal natures at the expense of our individual natures, because of others who

sought to rip individuals from their communities or to seduce them to leave their families and other communities. Marxists and libertarians are equally committed to deformed understandings of human being.

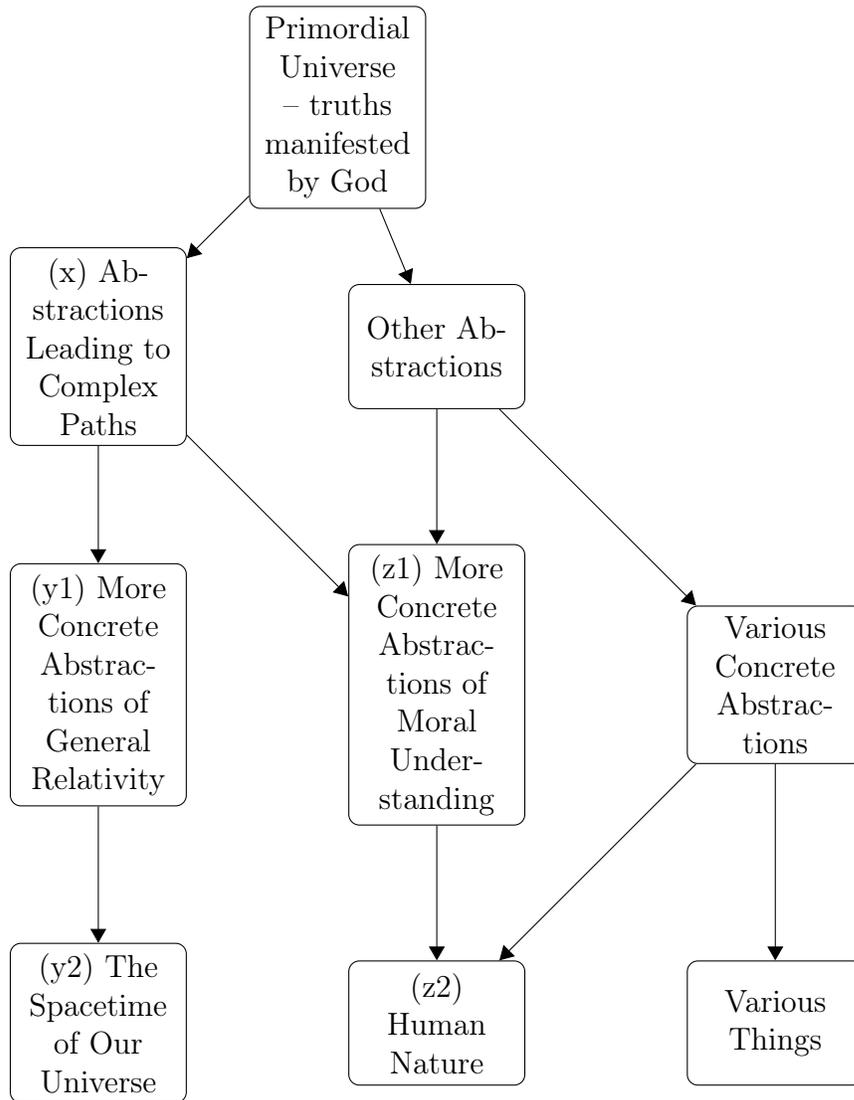

Figure 145.1: Simple Relationships of Abstract and Concrete Levels of Being

## 146 Elitism and Americans

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2001>. It was finished and uploaded on 2015/04/20.]

An article published in March of 2015 by Steven Wasserman, *In Defense of Difficulty* at <http://www.theamericanconservative.com/articles/in-defense-of-difficulty/>, is subtitled: *A phony populism is denying Americans the joys of serious thought*. The article begins:

It is a commonplace to bemoan the vanishing of serious criticism in our popular culture. The past, it is said, was a golden age. More than 25 years ago, Russell Jacoby put it sharply in *The Last Intellectuals*, when he decried the disappearance of the “public intellectual” since the heyday of the fevered debates over politics and literature that broke out among Depression-era students in the cafeteria at New York’s City College. Much had gone awry: “A public that once snapped up pamphlets by Thomas Paine or stood for hours listening to Abraham Lincoln debate Stephen Douglas hardly exists; its span of attention shrinks as its fondness for television increases.”

We should remember that public schools, as we know them, didn’t educate those colonists or the farmers of the Midwest. There were some schools set up and run by clergymen or parents or local political leaders, but much of the education took place in the home which would typically have a small library including some version of the Bible, some version (perhaps expurgated) of Shakespeare, and then perhaps a copy of *Pilgrim’s Progress* in some regions or some of the Latin or Greek classics in other regions or even both in some households in various regions. Lincoln was himself famous for lacking much in the way of formal education or even formally directed

self-education. In a similar way, I had relatives in my grandmother's generation who'd finished formal education in sixth grade but read serious novels and history books—I inherited copies of works by Flaubert and Balzac and Sterne from that earlier generation by way of an aunt who was a 1930 high school graduate with high tastes of that sort.

Take the prior description of American education before public school barbarism as an oversimplification which is meant to communicate the flavor of the situation. In any case, learning to read with the Bible as your text develops concentration in a way not possible with even the more rigorous schoolbooks (even McGuffey's and other collections of short works, etc) let alone the See-Spot-Run books and... It should send shivers up the spines of educated people, or anyone caring about the minds and moral characters of exploited children, to think about *Sesame Street* and other more recent innovations which blazed the path more fully developed during breaks from the violence during the Superbowl.

Not all aspects of a deep, deep problem can be discussed at once and Wasserman is speaking of of a specific phenomenon: the disappearance of those who once wrote essays for the middle-brow magazines as well as the higher literary magazines, of those who once wrote introductions to serious books. He is speaking of those such as Russell Kirk who added substance and intelligence and civility to the conservative side of discussions or arguments and of those such as Lionel Trilling who played a similar role for liberals of the modern sort. The efforts of these and other intellectuals, sometimes prestigious academics who put some substantial effort into writing and speaking to a wider audience, appealed to the types of Americans who once ran through decent and good quality novels and history books and biographies at their local libraries. And maybe those self-learners and the sometimes isolated readers of more demanding works wanted, even needed, some help in achieving a wider or deeper understanding. There were substantial thinkers of various beliefs and faiths who provided at least a structure for gaining that wider understanding; there were the conservatives (such as Kirk) or liberals (such as Trilling), the Christians (such as Flannery O'Connor) or the Jews (such as Chaim Potok). Yes, sometimes it seemed almost redundant for other public intellectuals to provide basic discussions of novelists because some, such as Miss O'Connor and Rabbi Potok provided powerful insights in the conversations and actions of their works of fiction and in their nonfiction writings.

This effort to provide for a developing American intellect was, in a man-

ner of speaking, followups or commentary to be read after or along with Charles Eliot's *Harvard Classics* (see [https://en.wikipedia.org/wiki/Harvard\\_Classics](https://en.wikipedia.org/wiki/Harvard_Classics)). In Chapter 127, *Intelligence vs. Intellect*, I discuss the issue of communal mind or intellect by responding to *The House of Intellect* [7] by Jacques Barzun, a very prominent public intellectual who expressed the opinion in that book that the effort to raise the level of intellect in the United States was a failure, leaving active individual minds, or "living intelligences," which are strong but also shallow since they're not part of a greater intellect. But the heroic effort was made by Eliot and by the likes of Kirk and Trilling and those of their quite separate groups and those of other groups, during the fifty years between Eliot's publication of those Classics and Barzun's pronouncement of failure. As Wasserman tells us:

In the postwar era, a vast project of cultural uplift sought to bring the best that had been thought and said to the wider public. Robert M. Hutchins of the University of Chicago and Mortimer J. Adler were among its more prominent avatars.

Those "great books" programs failed, as did the effort to nurture a middle ground, middlebrow literature—including histories and other nonfiction as well as many novels, some of which have held up well and most of which haven't. Even a more focused, though unorganized, group which comprised what can be labeled the "Catholic literary renaissance" failed to influence their major part of the mainstream though Flannery O'Connor's masterpiece, *A Good Man is Hard to Find* was produced in the heyday of the efforts of Rod Serling and others to use television for good cultural purposes. If creative storytelling of a higher sort was dying, if political and moral thinking was collapsing to policy-wonking, why would anyone expect any public demand for commentary upon past literary efforts? There is a demand for such commentary in certain Catholic and Calvinist circles and perhaps the circles of those—including some of those Catholic and Calvinist thinkers—who would revive respect for the works of the great pagan thinkers of Greece and Rome, but such demand is meaningless without some current efforts to produce serious creative efforts. Even serious efforts quickly seen as failures would allow some chance for survival of the West, even if only as a tributary into another civilization being born. As it is, even the most serious of Western thinkers are but traveling the same path

to irrelevance as the most mindless of mainstream American politicians or academics. After all, that path is along a river which can no longer be fed entirely by what lies far behind.

The end result of this process, under my description and understanding or those of Wasserman, is:

We inhabit a remarkably arid cultural landscape, especially when compared with the ambitions of postwar America, ambitions which, to be sure, were often mocked by some of the country's more prominent intellectuals.

But those ambitions, at their highest, concerned second-hand thought, commentary upon serious works in an age when serious works weren't being produced—outside of a lot of specialist works and an occasional worthwhile novel or narrative history. Samuel Johnson was part of the production of *The Decline and Fall of the Roman Empire* and of *The Wealth of Nations* as well as being a worthy commentator (if wrongheaded) upon Shakespeare. Russell Kirk and Lionel Trilling wrote a lot about dead white guys and a lot against living guys, white and from upcoming or reviving countries of various colors. Few of the writings or the battles are likely to be remembered by any but those who will one day study the strange detachment from reality by modern thinkers, where you can define reality as a Creation in the Christian sense or a Cosmos in the pagan sense. It is those 'cosmic' structures which are the most important and most necessary part of any tradition and, yet, the modern thinkers, even Kirk who was a devout Christian, worked on a piece—perhaps a wall or window of a once-great cathedral—and left alone the disturbing truth that the vandalism of a Rousseau or an Emerson, let alone the later vandalism of a Marx or a Dewey, was that of barbarians looting from the rubble of not just a decaying city but a decaying Creation or Cosmos. In the end, Kirk and Trilling didn't have the vision of Samuel Johnson, let alone the nearly God-like vision of Augustine of Hippo. But Augustine was looking at Creation, however imperfect and incomplete his worldview compared to what is possible nowadays—and is, I think, at least partly realized in my writings, fiction and nonfiction. Yet, no one is interested in the major and necessary effort to rebuild our understanding of Creation, that is, to reshape our own minds to better accord with reality and to make better sense of our religious beliefs. Policy-wonking is the work of our age, even for those who seem capable of far better.

As I've stated above and in other writings, this discussion of literature is largely beside the point. Good books are good because of the way they engage objective reality, if sometimes by way of concentrating upon the events occurring inside one particular, contemplative human being. It's a little unfair but also a little insightful to claim the modern literary elite of the sort discussed in this essay or in Wasserman's article were but barbarians who were trying to preserve some of the individual masterpieces but not noticing that the West was falling not because of the attacks of philosophical or literary radicals or mindless barbarians; the West was falling because its intellectual and other leaders had not properly addressed the good work of Columbus as well as that of Newton and Sterne—had not integrated that good work into an enriched and more complete understanding of a Creation or a Cosmos. I imagine some of them had an intuition that something was wrong at that higher level, but, outside of a small number of creative writers, Flannery O'Connor being my personal favorite, they failed to even explicate that greater problem. The best most Christian critics could do was advocate the thoughts of someone, perhaps Burke, who had—at least “sort of”—been a Christian in some past century. Pagans couldn't even do that much since it is hard to think the world will be saved if we adopt the political insights of a citizen of a Greek city-state, circa 350BC; to be sure, some advocates of Aristotle and others did write as if that were possible but that is the sort of belief only a highly (over-?) educated man could hold. More damagingly to all of us and not just to pagans, such an effort ignores the changes to human being which have taken place over the previous 2500 years, the enrichment and complexification seen very clearly in our communities and also in our individual selves if we look closely. These changes are seen more clearly by someone who has made the effort to re-understand Creation in light of modern knowledge about the empirical aspects of that Creation. And those changes affect everything, even affecting our understanding of revelation in a recursive sort of way, and certainly affecting our understanding of the literary and aesthetic aspects of human culture.

Yet, if I think Wasserman failed to penetrate to a deeper level of understanding, he does see the damage wreaked upon the modern, American mind and soul:

The ideal of serious enjoyment of what isn't instantly understood is rare in American life. It is under constant siege. It is the object of scorn from both the left and the right. The

pleasures of critical thinking ought not to be seen as belonging to the province of an elite. They are the birthright of every citizen. For such pleasures are at the very heart of literacy, without which democracy itself is dulled. More than ever, we need a defense of the Eros of difficulty.

Good commentary but I'm going to point out a problem in the midst of good stuff. By speaking of democracy in this way, Wasserman shows too clearly his limited viewpoint. There is nothing in the experiences of the past two centuries which would prove, even weakly, that democracy is even a viable moral option, let alone the clearly superior one. Wasserman's own words indicate the problem.

I'm not saying that democracy would work only if all men and women, boys and girls, devoured good novels or informative and reliable works of history. Yet, for democracy to work, we need such efforts to be distributed to the level of not just nationwide publications of various viewpoints; we need some way for those who do learn about Iraq, perhaps by reading books from local libraries or by reading on the Internet the writings of some of the many critical thinkers who are dissenting academics or retired military personnel or diplomats, to become known and respected, to be consulted by the voters in a smalltown or a city neighborhood or those gathered at one of the churches in a farm district before everyone signs on for a war desired by some politicians and armaments manufacturers. We would need this distribution of knowledge and reliable judgment for democracy to be a morally well-ordered form of government. Some would say that this isn't viable—if so, democracy isn't possible under conditions where the voters would be electing men more inclined to attack Iran while not knowing, in any meaningful sense, much about the reasons to attack or not to attack. To borrow Churchill's comment about journalists: American voters would be—in fact, are—like the courtesans (court whores) of the ages, desiring power without responsibility. Specifically, we Americans want to be able to 'support' a war without being required to find out about the real issues and without being required to think about those issues in light of knowledge and disciplined judgment. This allows us to hold parades during or after a war while feeling free to fight the war so long as it doesn't inconvenience us or to pull the plug if it does. In any case, knowing history, or knowing someone of moral sanity who knows history, is part of what we need to be moral citizens of a morally well-ordered democracy. But we also need to

have critical skills which can most readily come from the serious works, and commentary upon the serious works, which deal with such moral issues as war or a citizen's responsibilities.

I don't wish to reduce literature to a useful activity but rather to deny there is a true gap between utilitarian considerations and those of that triad of the good and the true and the beautiful. This claim itself can only be evaluated, provisionally, by an individual with some serious knowledge and disciplined skills in judgment or, more authoritatively, by a community with a number of individuals with overlapping but somewhat separate bodies of knowledge and skills of judgment.

And, to somewhat repeat myself, any sort of a living civilization or major part of a civilization requires the ongoing production of creative thought rather than just commentary upon existing works. If we miss either one, it would be like having a brain missing the region which puts together coherent sentences or the region which makes sense of sentences as they are being constructed in our brains. Those who can utter but can't evaluate their own utterances will produce streams of gibberish. Any evaluative capability without some ability of creative utterance would produce a silent critic. Take the previous two sentences as applying to individuals and to communities, both of which really mean individuals and communities as they respond to each other and cannot be truly separated from each other.

## 147 Elitism and Christians

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2039>. It was finished and uploaded on 2015/04/28.]

In Chapter 146, *Elitism and Americans*, I responded to an article by Steven Wasserman, *In Defense of Difficulty* at <http://www.theamericanconservative.com/articles/in-defense-of-difficulty/> (subtitled *A phony populism is denying Americans the joys of serious thought*). I largely agreed with Wasserman but went further in maintaining that higher literary pursuits make sense only in light of a greater understanding, one encapsulated perhaps in a Christian Creation or a pagan Cosmos. Let's call that higher understanding a 'worldview', however much that term has been misused. Moreover, I claimed that higher understanding in its full and communal form requires current and ongoing creative efforts of a high sort.

As Wasserman described matters—truly in my opinion, we have seen a specific decay process: public intellectuals writing for an audience of literate and intellectually curious high school teachers and insurance brokers and engineers and at least a few blue-collar craftsmen have disappeared. I'd say they disappeared as their existing audience put down their books and magazines and turned on the television and apparently Wasserman thinks something of the same. And, yet, this decay process was part of a network of decay processes, the highest of which is the decay of traditional Western worldview which is itself part of a decay of the processes which have educated and nurtured the creative thinkers who update worldviews or produce new ones.

We are talking about networks, correlations and complexes of causes-and-effects, typically at least nonlinear and perhaps even having recursive structures. There was no one worldview in the West and couldn't possibly

be any such unity in any complex civilization in this world of evolutionary and developmental processes; for convenience, I will sometimes write assuming that simplification and similar simplifications when necessary to avoid excessive verbiage. In fact, the term 'West' is problematic, especially when the reader isn't (yet?) well enough read in history to appreciate the complexity underlying any large human community, especially when there are so many different languages and ethnic histories, so many political and cultural and economic systems which don't quite correspond to even the ethnic populations.

It's certainly clear that literary elites and serious creative writers and thinkers aren't highly respected in the modern United States and perhaps not in much of the West. American public intellectuals were but one node in that complex network which is being destroyed by those various decay processes at work in the West. Without the guidance of an elite, politicians as well as the ordinary citizen are rapidly losing any clarity in the sorts of thinking processes used at more global levels and are also losing a respect for different viewpoints and for solid bodies of facts and knowledge as a foundation for opinions and attitudes, where I use knowledge as "facts at least partially and perhaps somewhat speculatively processed." As a general rule, creative scientists retain some public respect though applied science and engineering are more deeply a part of the thinking of even most highly literate men and women of the West; we are curious about Einstein and his successors but better understand the work of that nephew who is helping to develop a better carburetor. In some Western communities, such as the Western Catholic churches, scholars are respected; the underlying assumption, unconsciously held in nearly all cases, is that past creative thinkers told us everything God wants us to know and we just need to be reminded. If there is nothing new, there is no reason to have public intellectuals or even insightful novelists to help explore and evaluate this fascinating world. All the fascinating elements are either on the surface or supernatural mysteries. Against St Paul, most modern believers would leave themselves as slaves and not sons working with the Father, barbaric human animals watching God's acts of magic as if they were some sort of fireworks display.

Reality is confusing, complicated and complex, and this is one reason some of us see a need for those Wasserman calls "public intellectuals." However, the primary need is for creative thinkers to propose new thoughts and new ways of perceiving reality; then, the public intellectuals can get to work and so can the members of the general citizenry who are curious about re-

ality, from any viewpoint pagan or Christian or . . .

There is, in fact, much new in recent centuries and we have done little to make greater sense of all that new stuff. Some of the new is pre-existing, discovered by wider or deeper explorations of reality, including those of mathematicians who work in abstract levels of created being. Some of the new is truly new, most of that is the new forms of human communal being which have evolved and developed as the human race has grown in size and has discovered a need for new forms of relationships.

All of this affects even such matters as Christian beliefs. I'm an empirically oriented Christian. This means I think it to be of the utmost importance for us to listen to God, not just in Holy Scripture or the words of extra-Scriptural prophets and saints, but also in His acts as Creator. God isn't constrained by human ways of thought as they were as of 1800AD nor as they were as of 1300AD nor as they were during the lifetime of Jesus of Nazareth. Nor is God constrained by my provisional, but greatly updated and enriched, understanding of the human mind and of the reality which it deals with. Christian have been morally irresponsible in recent centuries—perhaps back to at least the time of Galileo; in particular, intellectuals and artists and other creative workers have retreated from their responsibility to make greater sense of all those facts and sets of knowledge gathered by modern explorers of this world and the abstract realms from which the world was shaped.

So it is that I expand Wasserman's analysis of the loss of public intellectuals to one covering also the need for a creative elite, specifically will I deal with the Christian need for an elite. In fact, there is not usually a way to clearly categorize a substantial thinker as purely 'creator' or 'commentator'. Despite his own occasional claims of limits to his work, Etienne Gilson creatively updated Thomistic philosophy in the very act of faithfully communicating what Aquinas said in the middle of the 13th century. Flannery O'Connor, and Walker Percy to a lesser extent, enriched Catholic philosophy and theology as they wrote fictions exploring traditional ideas in modern contexts.

We can learn from even public school textbooks that there was a time in the West when public men, politicians as well as any describable as 'public intellectuals', had minds formed by more disciplined study than has been common in recent generations. We can remember many, such as Alexander Hamilton and Thomas Jefferson, and even the greatly underestimated man of fewer hours of formal education—George Washington. Whatever your

opinions of the specific ideas and acts of these men, we can acknowledge that those old-timers had strong minds and those strong minds carried a wide and deep knowledge of classical literature, some more recent literature (such as Shakespeare), human history, some knowledge of then-current science and mathematics and technology, and even the non-believers knew a bit about the Bible and Christian creeds.

As surprising as it might seem in a world where so many men and women, boys and girls, of high intelligence have minds stocked with knowledge of pro sports and popular music and popular movies: in earlier times—as Wasserman points out, Colonial Americans gobbled up Paine’s pamphlets (and, a bit later, even *The Federalist Papers*—see [https://en.wikipedia.org/wiki/The\\_Federalist\\_Papers](https://en.wikipedia.org/wiki/The_Federalist_Papers) which were far more sophisticated) and farmers in the Midwest in the 1850s stood for hours to listen to very complex debates between Lincoln and Douglas. Another writer of more radical tendencies than Wasserman or me, Garry Wills, once wrote that those farmers weren’t just being polite—they responded with clapping or laughing at the right times, showing they understood the allusions and could at least follow the rudiments of the arguments raised by each of the speakers. And Lincoln hadn’t yet adopted his later (probably overly) simplified style and was also not speaking in the folksy style which he adopted with juries. He spoke sentences taking up multiple pages in printed form. Along the same lines, Jacques Barzun claimed in *From Dawn to Decadence* [9] that the 16th century French peasants who could read were devouring novels too complex for most late 20th century college professors.

The audience has decayed as much as the troupe of performers. While Washington as a young man was shaped by a near obsession with an idealized, but sophisticated and highly literate, play about the harsh but virtuous Roman, Cato, modern young men are more likely to be exposed to daily stories of rich young men who would be in jail if they weren’t NBA or NFL stars, movies such as *Rambo* or the more recent ones idealizing American operatives who are portrayed as sociopaths. Though it’s no longer a hobby of overly educated men of little understanding, those young men and the rest of us are still exposed on occasion to exercises in the debunking of legendary men, such as Washington, who had faults but were yet moral giants. Along similar lines, an American high school student is more likely to have the option of studying vampire literature than she is to have the option of studying Shakespeare or serious American novelists of the 19th century.

Again, this entire issue is of great importance to Christians and of

interest to some others, such as Razib Khan, a geneticist, who blogs at Ron Unz's website. Khan, raised a Muslim in Bangladesh and now an atheist, is very well-read in history and often produces intelligent analyses drawing upon both genetic and historical knowledge. In the article, *Cuius Regio, Eius Religio, in Anglo-Saxon England* at <http://www.unz.com/gnxp/cuius-regio-eius-religio-in-anglo-saxon-england/>, he blogged about British ancestry, an interesting and complex subject where historians and geneticists have cooperated in recent decades to produce a new understanding. A simple summary: the British, residents of Scotland and Wales as well as those of England, have a predominately ancient British ancestry; they share an ancestry from ancient farmers (described as "Spanish-like" in Khan's article) closely related to ancient farmers from southern Europe but are also descended partly from ancient Celts, largely those whose Brythonic culture and language developed some centuries before the Gaelic (Irish and Highland Scot) Celts arrived. In any case, the various pre-Roman residents of the British Isles seem to have had a predominately Celtic culture.

After the conquest by the Romans of part of what is now England, the native population was Latinized in culture, which meant that they were baptized into what is now known as the Roman Catholic Church—at a somewhat later time than the original conquest. From a very early stage, the Sacramental Christian churches, including the diocese in Rome which became the Roman Catholic Church, had rites and creeds which both symbolized and manifested a very complex understanding of this world and its relationship to its Creator. Moreover, they had a worldview which was rich and complex, though not plausible in its entirety to us in this post-Copernican and post-Darwinian era. That worldview drew upon the Bible, Judaism as practiced by the various groups in the Near East at the time of Christ's life on Earth, Greek philosophy, Roman law, Roman politics, and more; much of that worldview is foundational to my updated Christian worldview. The underground Church of the early years had an elite represented by St Paul and other men highly educated in Jewish or Greek knowledge or both. The Church became very visible even before Romans accepted it as their official religion and it was visible partly because of the accomplishments of St Paul and his many worthy successors. It became more visible when altars in underground grottoes were replaced by altars in magnificent basilicas in which buildings were celebrated the elaborate rites of Sacraments as well as many lesser rites. The very effort which these

noble and accomplished elites put into celebrating the Eucharistic Rite if they were priests, the pious attitudes of noble and accomplished elites as they knelt and bowed their heads and as they accepted Communion, the money and artistic talent which went into the buildings and vestments and altar vessels, would have been more than enough to awe the Catholics who could make no sense of Trinitarian doctrines or of the concept of a Creator.

In his article, Khan puts it this way:

[T]he Christian Church collapsed in eastern and southern Britain, only to reappear around the year 600 under both Brythonic and Continental missions. Despite the influence of the Celtic Church in the early decades, English Christianity was not an organic outgrowth of a religion which was submerged in the intervening century. Rather, it was a fresh planting of what had died. I have made an analogy before of what happened to Christianity in Britain to what happened to Christianity in the Balkans. While a regression occurred in post-Roman Gaul, what became Francia, it pales in comparison to the cultural devolution and atavism in Britain and the Latin-speaking world of the Balkans. It is fashionable in some quarters to declare that the Christian Church saved European civilization after the collapse of Rome, that the Church was the ghost of Rome. There is some truth in this, but, the example of Britain and the Balkans suggests to me that institutional and formal religion of the sort which we see in Christianity necessarily needs a minimal level of social and economic complexity, and concomitant “buy in” from the elites. Without the support of the powerful these sorts of institutional religions decay rapidly back toward primal animism and folk paganism. The old gods of the Celts and Romans were memories, but the new gods of the Germans were living and vital. It was a natural fit for the small scale economies which arose in the post-Roman landscape of proto-England.

Simple religion is folk religion, animistic paganism. It is likely many Christians could be described as animistic pagans, having a piety much like that of, as some have said, an Italian peasant from pre-modern times. Many devout Catholic Christians, in particular, can relate better to demons or Satan himself than they can to the Trinitarian God; something similar

could also be said of many Protestants. After all, Trinitarian doctrine is an ever provisional understanding of claims in the Bible. God can't be 'reproduced' by proper application of humanly derived axioms or other basic rules; God has to be understood on His own terms and some of us have faith that we can find enough of those in Creation as well as in the Bible that we can speak rationally of the Trinitarian God and it will make sense in terms of our own mortal lives and our hopes for salvation. Again, our knowledge is provisional and needs to be refreshed as we learn more about created being. We will never complete this process in this mortal realm.

Most of the more advanced levels of human knowledge and creative skills are a mystery to most human beings and so it is that they tend toward that simple faith of animistic paganism in which things move because there are unseen spirits moving them. After all, the internal power to move is something belonging to living creatures. A rock will simply sit there on the ground unless thrown by a young boy or tossed into the air by an earthquake which must surely be caused by some spirit or god or even the Father-God usually so distant from his pagan children. This goes deeper than a wrong or right understanding of the physics of projectiles. It is a matter of basic understanding of reality. Paganism, usually a variety of animistic paganism, is the natural state of mind for a human being; simple forms of pagan belief and seemingly most forms of higher pagan belief are brutally reductionistic in assuming direct cause-and-effect relationships, seemingly as a result of very basic human ways of perceiving and thinking. Even great physicists and philosophers have problems with quantum theory for exactly the same reason that the simple in heart will exercise their faith in cause-and-effect and look for spirits behind the events for which there is no simple or direct cause. See Chapter 90, *Shaping Our Minds to Reality*, for a discussion of the problems we have in doing that, shaping our minds to reality, which discussion was a response to an analysis by John Polkinghorne, an Anglican priest who'd had a first career as a highly-regarded theoretical physicist and professor of physics at Cambridge University.

Animistic pagans follow what seem to be inborn responses in conjecturing, or maybe just assuming, that the world is made of inert matter and living creatures, material or spiritual but there is always some spirit which moves an otherwise inert body. Modern non-believers tend to reduce reality to dynamic matter which forms relationships; the magic of cause-and-effect having been transferred to formal mathematical descriptions—often

by those of partial or no understanding of that underlying mathematics. I've argued in a number of places that Christians have to begin with relationships, rather than assuming stuff or entities come into being and then form relationships. The mathematics describing much of this world, including the formalisms of quantum mechanics, is one type of relationship. To a Christian, this idea of relationships having primacy over stuff comes from the Gospel of St John where the world came to exist because God first loved it; God didn't create the world and then choose to love.

I've explored this issue elsewhere; my current purpose is to point out the complexities of a Christian worldview as opposed to the simplicities of animistic paganism. If we really want simplicity then we should choose animistic paganism and I suspect many modern Christians will do that as their leaders fail to even move toward a worldview which makes sense of medical miracles and the *Apostles' Creed*—see [https://en.wikipedia.org/wiki/Apostles'\\_Creed](https://en.wikipedia.org/wiki/Apostles'_Creed).

Yet, some of those who hold a form of simple religion are Sacramental Christians who take seriously the celebration of the Sacraments. As an example, the Eucharist was subject in the past to very sophisticated analyses in efforts to understand the matter (bread and wine), the way in which God effects some sort of change in that matter, and the relationships between the human parties and the matter and God. A man such as St Thomas Aquinas didn't just sigh and say the Eucharist is such a mystery. He rolled up his sleeves and set to work to produce a way of speaking coherently about the Eucharist in the best terms he had. Six centuries before John Dalton (see [https://en.wikipedia.org/wiki/John\\_Dalton](https://en.wikipedia.org/wiki/John_Dalton)) the father of modern atomic theory, and another century before Niels Bohr (see [https://en.wikipedia.org/wiki/Niels\\_Bohr](https://en.wikipedia.org/wiki/Niels_Bohr)) and other quantum theorists of atomic structure, Aquinas worked with what he had: disciplined philosophical contemplations of the nature of material stuff, which contemplations were shaped by the philosophers' own experiences of the world and its stuff.

If some, probably most, of the great Christian thinkers have considered it necessary to understand the Eucharist rather than just accept it as a mystery and if those great thinkers have found only provisional understandings, how is it possible for simple believers, often men and women of a robust earthiness and skepticism of a healthy common-sense variety, to believe and to receive communion so piously? Is it just coincidence that faith is weakening, outright dying in the younger generations of even some families of

great devotion, at a time when we have not even a weakly plausible understanding of the Eucharist in terms of modern knowledge of the world and its matter? There are some who, perhaps in good faith, recite the words of Medieval Scholastics as if the assumed Aristotelian understandings of matter and human being can be carried forward into this world of Einstein and Darwin. The simple often just receive the Lord's Body and Blood but more often in recent generations will lose their faith in the Real Presence of Christ in the consecrated bread and wine. After that loss of faith, one generation and maybe even two, will continue to practice their faith as if believing but the grandchildren have a sort of hardheaded common sense that sees the holes in what they are taught.

Christian communities haven't made it possible for even the more literate of members to retain a faith which makes sense in light of modern knowledge of this world. Children, young adults, and those of simple faith are vulnerable to the calls of a more or less pure secularism, or to some form of paganism, or perhaps to an unreasonably and unsustainably simple form of Christianity.

For the situation to change, Christians have to first understand they need to develop and support creative elites who can develop a Christian worldview and other elites who can teach the new understandings and make them accessible to still others. There might well be multiple levels such as: creative thinkers inspiring high-level scholars who begin to teach high school teachers and future artists and novelists.

Human understandings of reality, however limited or expansive we think reality to be, are what I call worldviews and we should always remember they are provisional but they are also real. In fact, they become the ways in which we perceive and understand reality and that is why they can endanger faith when we don't have elites to update or occasionally replace them with better ways of perceiving and understanding. Christian leaders are trying the impossible task of holding together or re-forming churches from human beings whose most fundamental beliefs about reality are non-Christian, inconsistent with the Bible and the Creeds and most Christian practices.

# 148 The Unbearable Lightness of the American Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2141>. It was finished and uploaded on 2016/01/05.]

[There are typos in the essay I'm responding to. I think they are probably due to the site's archiving since the *Scientific American* website is generally well-edited. I've kept the typos and avoided using the "(sic)" notation—the reader can make the corrections in his or her head.]

In this essay posted several years back, *Look East, Young Man* found at <http://blogs.scientificamerican.com/guest-blog/look-east-young-man/>, Tony Rothman of the Princeton physics faculty tells us that even supposedly elite American students can't compete against Asians or Eastern Europeans or first generation Asian-Americans in the hard field of physics. Near the end, Rothman writes:

People often ask me, Can this really be happening at Princeton? Arent your students the best of the best? Im telling you it can happen at Princeton and is. My chief worry about the ["super-deluxe track" of freshman physics] minoritywho take physics out of genuine interest and who, despite the fact that we regularly pulverize them with our exams, generously reconstitute themselves is that we are needlessly discouraging potentially excellent physicists. (Some of the...dropouts, Im told, remain bitter for life.)

I'll leave it to the reader to contemplate Rothman's qualification that it's "first generation Asian-Americans" who can compete with the students from Asia and from eastern Europe. As a freshman physics major in 1973,

I was struck by the fact that the Ashkenazi Jewish students (mostly from New York City) had covered much of the material in their high school years that was new to me as a college freshman, but most were little different from other Americans in work and socializing habits. The physics stars in my class, at least in the freshman year, were a group of a dozen or so ethnic Chinese from Malaysia. At the same time, I knew of a couple of Ashkenazi Jewish students who'd attended NYC's magnet schools and maybe had taken courses at Columbia or CCNY; those few students were taking mostly graduate school courses in math and chemistry from their freshmen years. What remains strongest in my memories is walking through science and engineering buildings and seeing a very high percentage of Asian graduate students and post-docs. American taxpayers were putting up good money to provide weak science and math educations in high school to their students talented in those areas and good money to brutalize those students in college as they watched foreign students and first-generation immigrant students perform well. In addition, lots of money was being spent to provide excellent graduate school educations to some substantial body of foreign and immigrant students. (I don't begrudge a good education to those students but I do begrudge the failure of the American educational system to prepare talented young Americans.)

A math professor told me something similar to one of Rothman's observations: I had poor writing skills, little ability to write coherent sentences to a firm purpose. Even my reading skills, once very advanced by age-group standards, had decayed over four years of watching TV, listening to many hours of pop-music, and reading sci-fi. To be sure, I was fighting boredom by heavy use of the town library which was almost across the street from my family's house, but I had little guidance and my reading tastes decayed, followed by my reading skills. And the peer-pressure was intense for one who had no reason to believe his interest in history and science was anything but weird. In American schools, at least in a blue-collar town in the Connecticut River Valley, you had to watch *The Monkees* and *Laugh-in* and *The Man from U.N.C.L.E.* and—of course—some Red Sox and Bruins games to be able to join the conversations at recess and lunchtime. This was crappy stuff even by the standards of mind-candy—a certain amount of which is necessary for the mental and emotional health of even the most serious of thinkers. Even in spectator sports, everyone, and all our local communities, would have been better off if we had followed local teams, little league or semi-pro. Yes, all of this stuff, high and low culture and

much else, is important in the formation of moral character and all that is made possible by good moral character. Even low culture shouldn't be stuff that leads to weakening of that moral character, to a decay in work-habits and the ability to concentrate.

Rothman wrote in the quote above: "(Some of the . . . dropouts, Im told, remain bitter for life.)"

I didn't go to Princeton but I'm one with those bitter dropouts from physics. I admit I perhaps had less excuse than the students Rothman refers to as I was a special scholarship student with an assigned mentor and was encouraged to believe that many American physics students went through a troubled undergraduate career and went on to success in the field. Help was even available from the physics department but I adopted a fatalistic attitude and dropped down to a relatively weak mathematics major. I was raised to be morally soft and was educated in the public schools of my town to be numbed down if not quite dumbed down, that is, I performed very well on IQ tests and standardized academic tests but had lost my once good attention span during my high school years and couldn't perform well in academic work of a more demanding sort. I was actually recovering and did fairly well in my latter years as an undergraduate as a math major but was thoroughly demoralized and went on to become an underachieving actuary—labeled as such by a manager at Fireman's Fund, a future CEO of three major companies. If not for the emotional damage, I would have been far better off in graduate school studying physics or math or engineering.

I have to admit that one of my high school math teachers warned me that he had watched me decay from an enthusiastic, hardworking student over my high school years—I should have had, and many talented students should have, enriched education, including supervision of developing work-habits, right from elementary school years; much of what was missing was actually the responsibility of my parents and of other adults, not just the teachers and administrators in the school system.

And so, I went to college with behaviors and attitudes corresponding to some belief I would magically do well in the same way I did in high school—in *Euclidean Geometry* (tenth grade), I had gotten perfect scores on the tests and quizzes up to Christmas vacation **without** doing a single homework assignment; I was threatened with an 'F' if I didn't make up all those assignments over that vacation. Something was seriously wrong and I have some reason to believe that there were discussions about the situation held behind my back, but nothing was said to me, no guidance was given to

me, no offer of enriched education was made until a ridiculous and useless effort to put me in contact with a local physics professor in the latter part of my senior year of high school.

I know my mother was afraid of disrupting my social development if my academic development was accelerated, but my most enjoyable and healthiest socializing came in my neighborhood, in pickup games and in card games and even tree-climbing; I could have enjoyed that healthier activity while going on to advanced courses in nearby colleges.

I, who grew up in a town of gentle and morally irresponsible citizens, the town itself embedded in a morally degenerate country, fit in with the students described by Rothman:

In [the freshman physics course for engineering majors and most science majors], the difference between the Asian students and the American students is so marked that they might well constitute distinct populations, and the reason can only be rooted in cultural attitudes: an American student may be failing the course and still think he is getting an A, while an Asian student may be getting an A+ and think she is failing the course. Asians are here to work; Americans are here to ensure that Princeton remains a Division 1 athletic powerhouse. The results are naturally evident, not only on test scores, but in work habits. Asian students exams, correct answers or not, tend to be models of clarity, each step written out clearly below the previous. Exams from Americans often more closely resemble Rorschach tests, ink blots left as exercises for interpretation.

Yes, I wrote out many a Rorschach test for the professors, though something came through to impress some of those professors who may or may not have known I was there under a special scholarship program named after, and perhaps funded by, Joseph Wilson who had retired from Xerox, a company he had co-founded and had set out to help further build up the University of Rochester—he died months before my freshman year began. On the whole, I fit in with those Rorschach students but I was supposed to be on deluxe, not super-deluxe, tracks for talented physics and mathematics majors. I couldn't do the work and needed to be put in a two-year program in which I would be doing college-level work under closer supervision. Doesn't happen in this country though the mathematician Raymond

Wilder was writing about this problem in the 1950s and claiming many talented American students could be rescued by the proper program and the right teachers—I don't know the details of his proposed 'rescue' program, if he ever gave such. As it is, the bureaucrats set schedules for everyone and many Americans, including my mother and my younger self—with much reluctance—followed those schedules with a fatalistic attitude. Perhaps physics professors, if they still have the power they had in the days when the Pentagon needed their work, could start a remedial, habit-formation program and require all American physics majors to enter it if they don't demonstrate the competence and mature attitude of those Asian students? Even an effort to start such a program would provide some needed embarrassment for the American educational system and for American culture in general.

I'll diverge somewhat to point out that, circa 1973 when I was entering college, Hannah Arendt's last work, *The Life of the Mind* [5] was published posthumously. In that book, she followed up on earlier works where she took the measure of American moral character and found it wanting—famously, she claimed that Americans were much like Adolf Eichmann, the logistical genius behind the Holocaust, who was nice but had no real moral character at all. Eichmann did his job, did what he was expected to do, though not a believing Nazi. In that last work, Professor Arendt claimed that Americans had set the United States on such a path that within a generation or so, we would be facing a difficult situation which would leave but two options: Americans could fall back into a relative state of poverty and powerlessness or could become an outright empire and steal what the United States could no longer make. (see [https://en.wikipedia.org/wiki/Hannah\\_Arendt](https://en.wikipedia.org/wiki/Hannah_Arendt))

In a sense, we can't make good science in the truly difficult fields and need to 'steal' brains from other countries, more or less as Rothman points out in his essay. One problem, even from the political and bureaucratic viewpoint, is that this isn't a matter under the control of the American power elite as is the decision to invade and destroy other countries or to use much of our wealth to produce high-tech weaponry. There aren't enough good-quality American scientists and engineers, and may soon not be enough foreign scientists and engineers, to keep up our infrastructure, to develop new energy technologies, to modernize our infrastructure, and so on.

The cultural and spiritual problems are even more fundamental than the political and economic problems. We have turned ourselves into creatures

who can't entertain or educate ourselves nor can we even guide ourselves or our children in proper use of public or private resources, such as libraries or sports fields—direct supervision of a crippling sort is the only option being exercised. The two, entertainment and education, are greatly overlapping activities in a true civilization. We have built an education system which teaches some rudimentary skills in literacy and then teaches the students to consider the novels of Charles Dickens as objects of an unpleasant activity called “studying”. This is a negative accomplishment of monumental proportion: we teach our students to hate reading even the greatly popular literary works of past but recent generations. And so it is that many of them who are inclined to literacy in some strong sense will ‘study’ Charles Dickens novels and then read Stephan King novels for pleasure.

Almost all modern human beings are capable of concrete thought of at least some minimal competence though there are some who seem socially competent yet can't be trusted to take care of their morning toiletries. Many human beings are capable of high levels of concrete thought and I've known some who were at best marginal students in formal classroom settings but have acquired some serious levels of abstract thinking skills after years of difficult machining tasks or the like. Some conquered trigonometry in the machine-shop though they would have likely failed in that subject in a classroom.

This is getting both long and depressing. Let me close with another quote from Rothman's essay found at <http://blogs.scientificamerican.com/guest-blog/look-east-young-man/>:

If the Asians are the most industrious, the best prepared are the Eastern-Europeans, who come equipped with the vestiges of old Soviet-style education. Those students, passing through a system largely influenced by the mathematician Andrei Kolmogorov, have often attended special math-science schools and have been fire-tested through Olympiads. Few Russian undergraduates are visible in Princeton physics, but our Bulgarians, Romanians and Serbs tend to be so well trained that not long ago I was forced to quip to a colleague, Anyone whose last name ends in ovich, adzich, or escu should be put in the honors course without discussion. No exaggeration. Each year a tiny handful of students four or five places out of freshman physics altogether via an in-house exam. Last year none of these were American.

The standard retort to such observations is that foreign education rewards discipline, while American education rewards creativity. Believe me, I'd settle for some Yankee discipline, and I've seen no lack of creativity on the part of the foreign students. Never forget that the Manhattan Project and the postwar science boom was largely the work of immigrants. The fact that American students have all taken AP physics is virtually irrelevant; they have clearly been taught to pass a standardized test and their knowledge of actual physics generally suffices for three weeks.

## 149 Making Peace with Plato

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2144>. It was finished and uploaded on 2016/01/13.]

Basic relationships and not complex things or ideas are the true Platonic Reals in the sense of being the basis of created being. So to write. So to speak, if I were discussing these matters with a like-interested friend over some good whiskey or stout or port. If we were to try to imagine a realm of Platonic Reals, we shouldn't try to imagine even the building blocks of concrete being, such as electrons and quarks. We should try to imagine relationships, or forces, that bind and that repel.

Something of this sort should have been proposed, often and perhaps in various forms, as a result of the work of Darwin and Einstein and their followers and productive opponents, but too many—including myself just ten years ago—reflexively opposed any sort of thinking that smelled of metaphysics. I'll assume metaphysics to be a legitimate way of building upon empirical knowledge, including that built by evolution into our brain operations, and move on.

I developed a worldview, including a metaphysics, or understanding of what-is, over a short period beginning about 2005. Some would be upset by the explicit Christian nature of my viewpoint, but I am a Sacramental Christian who was received into the Roman Catholic Church and receives Sacraments in that particular sacramental and Sacramental Church. Of course, my worldview is that of a Sacramental Christian. Perhaps the basic idea, relationships are primary and stuff secondary, comes from my sacramental religious beliefs, my belief not only in the Sacraments such as baptism and the eucharist but also my belief that God is present in all that He creates; if God were to absent Himself from me, I would cease to exist. The same could be said of the computer monitor in front of me and all

the earthworms outside which are probably retreating downward as a late winter arrives.

Even when it comes to the core of my own self-identity, encoded if vaguely by modern people of the West as ‘personhood’, I think in terms of relationships—we are born as human animals and begin to take on the characteristics of a person by way of our responses to God or at least to His Creation.

Relationships create stuff. Stuff doesn’t come into existence and then start forming relationships.

In Biblical terms, the world came into existence because God first loved it. God didn’t create the world and then choose to love it.

Put this together with the empirical discoveries that complex things don’t come directly into existence in this universe but rather evolve and develop from simpler things. Put it also together with the facts which led to my belief that relationships are primary: some empirical discoveries and some speculations tell us that there is a strange form of very abstract being (roughly: the wavefunction of quantum physics) from which the concrete stuff of this universe is shaped and continues to be shaped.

Behind evolutionary theories and quantum theories and modern mathematics and all of that, there are big piles of empirical facts, sometimes having been organized well enough to be labeled ‘facts’. There are many powerful and fruitful theories and less well-established speculative understandings of some crucial aspects of this concrete world. There is much to work with and somebody such as yours truly will be off to the races in trying to make greater sense of it all.

This is the sense I’ve made of created being in the greatest of possible contexts, all of Creation:

1. God manifested some truths as the fundamental form of being.
2. Under the guiding hand of God, those truths interacted so as to create more complex truths and other forms of abstract being.
3. Also under the guiding hand of God, these various complex truths, abstract being, relationships mainly, interacted to produce concrete being of the sort found in this universe and in our own bodies and environments.

Just a couple of comments on each of these three items.

I've claimed and argued for the idea that our modern empirical knowledge tells us that relationships are primary over (concrete) stuff. The truths manifested as the raw (abstract) stuff of Creation are relationships.

The evolutionary and developmental nature of complex things in this universe, galaxies as well as the surface of the earth as well as elephants, seems to be such a basic truth as to imply that complex forms of abstract being were the result of similar sorts of processes. Thinking in this way also seems, at least to me, to make it easier to form concepts and even images of being as it becomes richer and more complex.

Concepts of concepts, images of what is so abstract as to be beyond images even when we try to understand how the concrete being of this universe is related to the entirety of being, some of which is quite abstract and yet perceivable to some extent. We do the best we can and it be remarkable how much sense we can make of:

- intertwined space and time;
- matter seemingly forming as the result of the 'collapse' (a philosophically loaded term) of some form of abstract being which we 'perceive' as mathematical formulas and I think those formulas to be as close as we can come to a type of abstract being;
- moral and social creatures which evolve by way of truly nasty processes at least amoral and possible to perceive as immoral;
- abstract ideas about infinities far larger than the number of numbers and yet ideas which arise in minds generated by those complex things called "human brains";
- abstract mathematical ideas so intertwined with concrete, thing-like being; and
- and so on.

Go up to the first list and its first item: God manifested some truths as the fundamental form of being. Let me raise a claim from my book, *To See a World in a Grain of Sand* [41]. A world or a person (think of 'human person' as being analogical to the only true persons—Father, Son, and Holy Spirit) have three fundamental characteristics: unity, completeness, and coherence. I would conjecture that these three characteristics correspond

directly to truths manifested by God as part of the raw being from which all of Creation is shaped.

# 150 How Can Wrong Understandings Lead to True Insights?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2206>. It was finished and uploaded on 2016/04/12.]

I've pondered a problem for years. How is it that premodern thinkers, such as the 4 A's, Aristocles ('Plato' is a nickname which might mean 'Chubby') and Aristotle and Augustine and Aquinas, produced so many true insights into the nature of reality, the nature of contingent being and even of the empirical and concrete realms of being? How could useful and true insights have come from men who believed:

- Euclidean Geometry to be the one and only and true geometry,
- the universe to be centered upon the earth,
- men to be particular cases of Man who was an entity defined in ideal and absolute standards,
- the city-state and the experience of men as of circa 300BC to define all political and social and moral possibilities for men, and so on.

This isn't some sort of convergence problem. Aristotle didn't just hit the edges of some very big target with the small bulls-eye at the center, a small bulls-eye not to be hit until...? Until the age when we know the truth so well that we began to nail that bulls-eye with every shot? Of course, considering the states of disorder of nearly all realms of human endeavor in the West of the 21st century, I'd have to believe we aren't

even facing the target; we tend to mostly hit innocent victims such as the younger generations with their badly formed minds and disordered moral characters.

There is some truth in the idea that Aristotle hit the target but not often near the bulls-eye, but perhaps a better analogy would consider human being, individual and communal, in its entirety. We could examine our perceptions and cogitations which produces such mental entities as conceptions and those conceptions are the beginnings of a greater understanding which I call a 'worldview'.

We have our sense organs, our eyes and noses, our ears and tongues, our hands and the entirety of of our skins. We also have a vast array of instruments to extend our senses or to even 'sense' forms of being, such as quantum wavefunctions, which lie out of the reach of the sensory organs of the human body.

We have our brains which think well on concrete matters even without a lot of intellectual skills or abstract knowledge and we have the mind which can be considered as the relationships of that brain when it begins to know and think in abstract ways.

So, we have senses extended so that they can sense much that is in our environments but remained beyond the senses of premodern men and we have brains extended to minds that can perceive and conceive (perhaps) all that is in our environment, can indeed (perhaps) encapsulate all of this universe and other forms of being from beyond this universe. Maybe human beings of ever-growing sensory and mental abilities can be seen as analogous to a lens evolving and developing to allow clearer vision at near distances and far, of large objects and small, to make sense of all that is perceived and conceived. Then Aristotle could have perceived and conceived a multitude of objects of various sorts of being and could have seen them in their proper places and relationships, but those perceptions and conceptions were quite fuzzy.

Maybe.

I don't know, but I think the viewpoint explored very lightly in this essay might help to bring focus to various metaphysical and ontological explorations of this universe and beyond.

# 151 Disembodied Knowledge is the Root of Many Modern Evils

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2289>. It was finished and uploaded on 2016/11/15.]

I take knowledge seriously. I take seriously the problems we human beings have in gaining data, checking it, putting it into some sort of shape where it can be considered information and maybe even knowledge. After all, we human beings as individuals and communities are finite creatures biased to survival and reproduction; our individual and communal talents in measuring the movements of stars and then building models of the development of the observable universe seem to be something of a miracle from a Darwinian viewpoint. Serious knowledge should be taken seriously—respected and treasured. That statement covers even a lot of knowledge which proves eventually to be false knowledge, such as the Ptolemaic model of the solar system.

Knowledge is good. We should gain it. We should shape our minds to it, thus acquiring the skills and understanding of carpenter, music composer, or organic chemist. Most importantly, we should shape our minds to the Creator's work that we might come to share His thoughts, to think as He thinks. Yet, I have often denied epistemology as a valid part of metaphysical thinking, that is, thinking about created being or even (sort of) thinking about the (sort of purely) relational being of the Triune God, the God of Jesus Christ.

This is how the 1913 edition of Webster's dictionary defines epistemology:

The theory or science of the method or grounds of knowledge.  
[1913 Webster]

I don't object to the method business, though I consider that to be the primary domain of others than philosophers. Philosophers should be aware of what brain-scientists and other empirical investigators have discovered about our acquisition and use of facts, data, knowledge and so on. Philosophers can comment upon that good knowledge about knowledge and use it as they use the more direct results of physicists and historians and geneticists, but those philosophers should then move on to speculation about created being, using empirical knowledge which has been corrected and supplemented through the various efforts of various empirical researchers and doers.

As to "grounds of knowledge"? I object strongly. Our knowledge comes from created being through our perceptual organs or our conceptual organ (brain)—each of those organs being also created being. If we can't trust our senses, though admitting them to be limited and imperfect even in their range, then how could we ever know anything? The grounds of human knowledge are singular: being as it presents itself to us.

In other words, I take being far more seriously than knowledge. Being is primary and knowledge is certain effects of being upon our brains and—to a somewhat lesser extent—other bodily organs. Valid knowledge is some (typically imperfect and incomplete) encapsulation of true being—meaning not just actual being, but also possible being with some direct connection to what actually is. There is no Gnosis, that is, knowledge that comes to us "in the spirit" or as a pure revelation. We have no sensory organs to receive such (allegedly) pure knowledge. We have no minds but those which are formed by our embodied selves responding to what is inside and outside of those selves, minds which can handle facts and other thoughts which are reconcilable with our raw perceptions of this world.

Knowledge comes to us mortal creatures when created being presents itself and we properly respond to it. God created us so that He must come to us through His effects upon Creation—as Scholastics might put it. God must come to us through a more direct manifestation than 'hidden Creator', leading to human responses which bring about some of that knowledge.

Those who think of abstractions, of knowledge of species of trees and also the Pythagorean Theorem, as separate from created being are always in danger of losing themselves in the mazes of their own minds, or the minds of a misunderstood Plato or a more truly understood Spinoza or Kant or Heidegger.

St Thomas Aquinas and other moderate realists were right: we have

no choice but to accept what comes to our senses as true knowledge of created being. It might be defective or incomplete knowledge, but the correction of that knowledge isn't a proper task for philosophers but rather proper tasks for biologists and experts in use of instruments to extend or correct our perceptions and various other specialists in various aspects of empirical reality. Philosophers, those who study created being in its more fundamental aspects, can try to make sense of human beings and of Creation in light of the corrections to our perceived knowledge which come from the specialists in human visual and memory systems, from opticians, from physiologists, and from others. They might well find it useful to explore the details of those empirical investigations as philosophers of science often have explored quantum physics and evolutionary biology and the use of science in technology and so on.

Philosophers have no warrant to comment upon knowledge as being separate from created being; even theologians have to be careful to deal with divinity by way of God's effects in His Creation. To do otherwise is to separate one's thoughts from Creation, the work of God; to do otherwise is to wander into a humanly imagined world. To wander from God's Creation, in our thoughts about flesh-and-blood human beings or in our thoughts about the Creator, is to enter psychotic—nightmarish—realms, realms outside of what exists. And all forms of psychosis lead to nightmares, even if they start as sweetness and sunlight on a meadow of spring grasses and early wildflowers.

We set out on a wrong path, we imagine we have the ability to imagine a better world, when we begin to separate ourselves from what is around us, when we—motivated by religious or anti-religious beliefs—think that we are creatures somehow able to judge our knowledge of created being and then move on to judge created being and its Creator.

It's God who has the imagination healthy enough and powerful enough to see the way to a world which can be endlessly wonderful. We do well enough to learn about the results of God's chosen acts-of-being and to participate in the shaping of the forms of created being which are those results. Sometimes we even do well by straying away a little from empirical reality to produce variations upon what God has done—in our music and our poetry and our visual art.

## 152 The Knowledge Possessed by a Creature

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2337>. It was finished and uploaded on 2017/02/27.]

What is truth? Not so ridiculous a question as some would have it, certainly those who don't understand how difficult a struggle it has been to develop various plausible and implausible understandings of the abstract concepts of 'truth' and 'knowledge' over the past 10,000 years or so of rapid increase of human intelligence in certain Eurasian peoples—see the previously referenced *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending for an introduction to the genetic-historical study of the underlying events. If you wish to read of these events, or at least of snapshots of these events, from a philosophical or historical viewpoint, a viewpoint also more or less Eurocentric, you can see *The Origins of European Thought About the Body, the Mind, the Soul, the World, Time, and Fate* [106] by R B Onians, *Body, Soul, Spirit: A Survey of the Body-Mind Problem* [139] by C A van Peursen, and *The Discovery of the Mind in Greek Philosophy and Literature* [128] by Bruno Snell. General searches on the Internet or in your local library system on the *Axial Age* (see [https://en.wikipedia.org/wiki/Axial\\_Age](https://en.wikipedia.org/wiki/Axial_Age)) will lead you to to a variety of 'old-fashioned' and 'new-fangled' historical works on the strange and glorious transformation in human culture, including the intellect, which occurred from some time in the *Iron Age* (see [https://en.wikipedia.org/wiki/Iron\\_Age](https://en.wikipedia.org/wiki/Iron_Age)) and ended a few centuries or so before the birth of Jesus Christ. For a historical perspective which relies on particular mathematical and statistical analyses rather than starting at the level of abstract being as I'm doing, see Peter Turchin's website at

<http://peterturchin.com/> for an interesting, plausible, and powerful attempt at building applied mathematical models of events in human history; at the least, there are some good insights in the work of Turchin and allied thinkers. (At the same time, Turchin writes some good histories, such as *War and Peace and War: The Life Cycles of Imperial Nations* [136].)

The writings referenced in the above paragraph are but an entry into various sorts of literature dealing with the results of an important period of evolutionary and developmental changes in human being, changes which led to Archimedes and Augustine and Aquinas and Fra Angelico and Pascal and Newton and Mozart and on to Planck and Einstein and Picasso and Arnold Schoenberg and Eliot and Joyce and Sartre and others. A few minutes of serious thought will lead to the realization that any list of high achievers in recent centuries is remarkably short on great religious thinkers (John Henry Newman was at least a second-tier great thinker but few others reached anywhere near that) and writers or artists working in the traditionalist mode (Eliot was almost entirely modern in style though he advanced—did himself **adhere** to—important, central lines of traditionalist thought). Scientists and various mathematicians, including some great mathematicians discussed in earlier pages of this book, seem to be still more dominant, shockingly dominant, when we limit modern thinkers and writers and artists to those of undoubted greatness.

I'm not sure how many scientists or mathematicians would share my understanding of what-is, merely the universe to many of them and Creation to some of them and certainly to me. Only a few, mostly Platonists and mostly mathematicians, would even grasp the concept of abstractions as a form of being. Probably those Platonists would make the same understandable error as Plato—thinking of abstractions in terms of Reals which seem to be pure and ideal archetypes of complex entities such as human being; this idea seems implausible after Darwin and Einstein as seen through the eyes of the Reverend Monsignor Georges Lemaître (see [https://en.wikipedia.org/wiki/Georges\\_Lemaitre](https://en.wikipedia.org/wiki/Georges_Lemaitre)) and other founders of modern physical cosmology (in the 1920s).

After the work of evolutionary biology and quantum physics and history, we don't even currently know what are the basic components of being, human or otherwise—where 'know' can be taken as involving the actual truth or just the most plausible speculation of an age. We don't even know if there are basic components of the sort found in particle physics or nuclear physics. I suspect not, having found it easier to make sense of Creation in

terms of abstract being and concrete being—to be sure, I think of concrete being as shaped from abstract being so that abstract being is something like an elementary form of being but it’s a bit different and more consistent with quantum physics. In other words, the wavefunctions of quantum physics aren’t like the elementary entities of particle physics, though those entities correspond to quantum wavefunctions.

We have no coherent and morally well-ordered understandings of Creation in light of evolutionary biology or quantum physics. Our moral philosophers and moral theologians and various leaders don’t know how to view our communities and individuals in terms allowing even potential moral order of a sort which once seemed so clear to our minds and eyes. Our theologians in Christian traditions don’t know how to talk about man’s meeting with God, in prayer or worship or more specifically in the Sacraments; they babble on using terms which once meant something when the Greek philosophers and Medieval Scholastics seemed to have provided solid understandings of matter and mind and even God <sup>1</sup>. Modern thinkers sometimes just accept schemes of words and concepts of premodern times and sometimes try to build up their own—none of those modern schemes seeming at all plausible in light of what we now know about Creation.

We are creatures embedded in a Creation arising from raw stuff which is the truths manifested by God through His Son. To our minds and hearts and hands, this Creation is quite dynamic for at least three reasons:

- Creation is so because it is inherently so, evolving and developing as it moves from its original primordial state toward greater particularity and complexity.
- Creation is so because we learn about it through our own evolving and developing minds and hearts and hands.
- Creation is so because our very efforts to understand and to exploit this Creation brings about changes in the evolution and development

---

<sup>1</sup>The Protestant Reformers disagreed, sometimes radically so, with the specific, ‘higher-order’ Catholic schemes for understanding Sacraments and a sacramental world and man’s moral situation and so on, but accepted the words and concepts which existed at that time for discussing these things. Neither Martin Luther nor the Catholic Counter-reformer Cardinal Robert Bellarmine even pretended to engage in creative metaphysical thought.

of our own human being and in much of the being with which we can directly form relationships of any sort.

In my updated version of Thomism, creation is not a place containing entities but rather a set of relationships which are acts-of-being. Material stuff and even abstract stuff is the result of those relationships, most of which are highly dynamic. Human knowledge isn't settled from our viewpoint, human knowledge doesn't encapsulate the truth, until we can reach a better, more stable viewing place. But no such place can possibly exist so long as we're alive because we learn more about Creation and we also change what is by our active responses, as do all entities and lesser creatures, but only we humans can—in principle—encapsulate all that God has created in our own minds. Only we humans can—in principle—participate in God's greater acts-of-being, His thoughts and feelings and actions which take place in any realm or all realms of Creation. Only we humans can—in principle—share God's thoughts even as He creates from nothing.

Some principles can only be realized in the world of the resurrected where the friends of God share God's life by being part of the Body of Christ, by sharing directly in the human being of the Son of God. By so sharing we might even enjoy the dizzying sight of Creation from God's transcendental viewpoint. Then we will be able to understand.

## 153 Knowledge and Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2406>. It was finished and uploaded on 2017/05/30.]

Let's be philosophical: What is knowledge?

Under my metaphysics, knowledge is a misleading way to refer to an encapsulation of being in our own being. Words like 'know' and 'knowledge' are our ways of speaking about our active responses to what lies outside of us but also our active responses to our own human being. As we respond, we enter into a relationship. We begin to share in being which might be abstract or concrete but is always a manifestation of thoughts God freely chose. A similar process can result in something like participation in divine being, sharing in the life of God.

Even Christians in the modern world, and maybe most Christians throughout history, take a paganistic view of created being, formally acknowledging God as Creator of all and then ignoring Him when it comes to the hard and exciting work of making sense of what lies around us and inside us so that we can respond properly to that all which is the manifested thoughts of the Creator. We are pagans because we ignore God the Creator and think and feel and act as if this world were something separate from God, something over which God has great—maybe absolute—power, something He rules but something as separate from Him as Russia was from Peter the Great as he struggled to subordinate that country to his will.

We think and feel and act—quite wrongly—as if this stuff exists and then God begins to love it and to seek to control it. In terms of a more Christian metaphysics: What exists only exists because God has first loved it, has chosen to form an active relationship with it before it even existed; moreover, God's ultimate control over Creation is that which He exercises as a Creator, not as a King ruling someplace which exists independently of

His creative will. If the Almighty wishes to act as a King, imposing His will upon what He has done as Creator, then He is free to do so. We Christians shouldn't assume that is His only way of doing business or even His primary way of doing business.

Every bit of created being, including each and every human being, is a thought He manifested and has to continue manifesting for that bit of being to continue to exist. Thus it is that we have to think of God in terms of analogies from what He created. In some regards, we should think of God in terms often ridiculed as 'anthropomorphic'. Often the underlying criticism is proper if made in respectful ways, but often it is ridicule by those who aren't truly scientific. They aren't men and women who wish to 'clean up' our thinking about the Almighty; rather do they wish to stop us from thinking about any power, God or the natural world He created, which lies above human power.

God is mind and heart and hands, analogically and powerfully so. This is to say, He thinks and feels and acts in ways analogical to those of human beings. We rise above those analogies when we speak of God in terms of His true unity, a unity of mind and heart and hands which is true of divine nature and also of each of the three Persons, Father and Son and Holy Spirit. In such a unity of mind and heart and hands, we also see the future of the friends of God.

My metaphysics is a grand claim that there is no real knowledge which is separate from true divine being which is mind and heart and hands at once. God's thoughts manifested in Creation are one with His feelings and His acts. He thought of me before I was conceived, felt love for me, and acted to create me in my parents' act of conception. So I came to be, but it's misleading to think of the three phrases in the prior sentence, involving thought and feeling and acting, as truly three. They were one at my conception and they are one and they are the act-of-being which is me. My fragmentation is an ephemeral condition which will end when I join God on the other side of the grave or when I'm left in the permanent grave if I fail to respond properly to Creator and Creation.

It bears repeating: our human minds are encapsulations of what lies around us, whether it be concrete being or abstract being or even the revelation of divine Being. This encapsulation is itself an active response to being; even revelation isn't such until a creature responds honestly and openly to it. Biological evolution has prepared a complex human brain capable of and inclined toward that response and the ensuing encapsulation,

but it doesn't provide us with much in the way of specific beliefs in "the meaningfulness of life" or "the existence of an absolute being" or anything of that sort. Our worldview is the greater 'shape' of that encapsulation, is an active response to the totality of what lies around us, and is—because of that—always under revision in an active and living mind, even the mind of one such as I am: a believer in the traditions of sacramental Christianity, but I believe in a living body of traditions. And that worldview is mostly in the communal human being which is us rather than in the individual human being which is me or thee. (See my freely downloadable book, *The Shape of Reality* [56] for an explanation of the above use of the concept of shape.)

Even when we think about the most abstract forms of being, we are responding so that we participate or share in that being—along with the Creator. If we are honest and courageous, we will encapsulate reality to the best of our abilities—given our specific cultural and historical circumstances. Mostly our minds but also the entirety of our human being will encapsulate the being which we have responded to, whether it be a horse and riding gear, a tennis racket and a ball which can move in strange and rapid ways, revelations about God, 3-d printers and high-precision parts, historical and fictional retellings of the settling of New England in the 1600s, or other strange and wondrous forms of created being. Note that there are too many of those strange and wondrous things to be truly encapsulated by a single human mind or even by all the talented minds of all the universities on Earth. It takes a civilization to make a plausible worldview and that worldview is what really makes a civilization; in this case, you can dig to discover foundations and find yourself on the roof. I said above our worldviews are mostly the communal us and a true civilization has to have an appropriately rich and complex communal us; a Christian civilization, the pilgrim Body of Christ, has to have a very rich and complex communal us which is intertwined with God through the Lord Jesus Christ and through Christian communities of worship and service and belief.

Unlike us, God has control over what He thinks because what He thinks already truly is or has truly become at that instant. His will is fully effective while our wills must be disciplined to do what God left to us, always following His will—our only true guide. The Almighty is free and we are somewhat free, and can learn to be more free, by participating in His freedom. God can even create where there was once nothing, bringing an entire Creation into existence. We can only seek to know, to understand, the Cre-

ation in which we have our being, but this—as I said above—is to share in the being God has created. And this is to share the thoughts God manifested as this universe and in all of Creation. Consider it preparation for a more complete sharing of the life of God in the world of the resurrected.

The Satanic rebellion, the rebellion of modern men but also of many ancient men, is to refuse to share in the being of what-is as best we can perceive and conceive it. We modern men try to live in a Creation more to our liking. This deification of what we desire leads us into various sorts of hells, though we might have misguided forms of prosperity in those hells and might enjoy ourselves for some time; we gain the world though we lose truer forms of human being, those which would allow us to share God's life, to a small extent in this mortal realm and to a full extent in the world of the resurrected. We have no capacity to enjoy or even endure life without end; we can have that never-ending life and have it in joyful abundance only if we share the life of God.

We need to understand that we don't know, we participate in being. We aren't learning. By responding honestly and courageously to what lies around us, we encapsulate that being in our own being. Thus, it is more proper to say, "We are becoming," rather than, "We are learning."

Most of all, we need to understand we aren't in control. Knowledge, as typically imagined, is one human way to try to stand above being, pretending to control it if only by squeezing it into our various schemes. Until it squeezes back and crushes us.

[Many of these inadequate ways of thinking and speaking discussed above can become adequate if we re-orient our thinking towards being and toward God as a true Creator rather than a King. For now, I struggle with a language deformed to speak in false ways about Creation and its relationship to the Creator.]

# 154 Why Do I Write Such Complicated and Complex Prose?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2601>. It was finished and uploaded on 2019/02/12.]

The funny answer would be that I don't have enough time to write my essays so that they would be shorter and easier to understand. Ordinarily, there would be some serious truth in that—even so great a writer as Blaise Pascal could say:

I would have written a shorter letter, but I did not have the time. [See *Blaise Pascal* at [https://en.wikiquote.org/wiki/Blaise\\_Pascal](https://en.wikiquote.org/wiki/Blaise_Pascal).]

Some serious truth indeed, but Pascal wrote when Western Civilization was on an upward slope, likely because of increases in intelligence during the difficult periods which followed the High Middle Age. A high percentage of literate human beings of the West were more intelligent during the periods of history when, to put it bluntly: God, through the world He created, was applying brutal selection standards to men and women, young adults and children. Being more intelligent, they also—generally—took more ready advantage and better advantage of any opportunities for learning or for entering into more deeply interesting situations.

I've written on various aspects of this subject regularly, often starting with Jacques Barzun's claim that the West hit a peak, of sorts, in literacy around 1500. His book, *From Dawn to Decadence* [9] tells the story of

the West as it peaked and then entered a period of decline—with higher-level innovation (think of Einstein and Tolstoy and not even the best of ‘middle-brow’ thinkers) dropping off greatly after the generation at the peak of their creative activity in 1900 or so. (Barzun’s peak was actually for high-quality literacy among French peasants, a mere shot across the bow apparently ignored by the intellectual, cultural, religious, and other leaders of that country and of the entire West. Mostly, the ‘deep’ thinkers of later generations assumed peasants had always been homogeneously illiterate.)

The truth of the matter is simply stated but would lead to an essay as long and as complex as any I’ve written since I started my blogs:

- *Acts of Being* at <https://loydfueston.com/> [still active], and
- *To See a World in a Grain of Sand* at <https://loydf.wordpress.com/> [not active but accessible].

That simple truth? I write in the way I feel forced to write in order to prevent the sorts of deformations to the information and speculations I wish to communicate. More than that, I myself have to struggle for words and ways of phrasing which maintain the thoughts I have inside of myself. Often, my complex and complicated prose is the result of experiments in being true to those inner thoughts only partly expressed in words. A weak but indicative analogy: those painters who say they throw colors onto the canvas and then scrape away the excess. I want to control the process. I respect my readers and they can form their own ideas and viewpoints, but they should not pretend my writings are merely clay for reader participation of the sort we find in ‘deconstruction’ and some other major new phobosophies.

We live in a truly Orwellian world—in some ways and not so much in other ways. The world is Orwellian in that advanced technology is being used to push into our minds new words, new meanings for old words, simplifications for older ways of speaking which allowed for the sort of complex and nuanced thoughts and speech which are resistant to propaganda, new models of the world to replace the Christian models of the West. Likely it is that a more complete analysis by a new Orwell would identify the various working methods of political propagandists, marketeers, public relations specialists, and ideologically corrupt scholars and academics and public-school teachers.

The world is not Orwellian in that there is no tightly administered command and control center for these various processes of corruption of lan-

guage and, thus, of thought. The Invisible Hand guides morally well-ordered communities of somewhat ordered or well-ordered individuals to form complex economies and polities, communities of trust and requiring little in the way of policing beyond, so to speak, the issuing of citations. In a sense, the Invisible Hand is but a dim perception of the processes by which God is forming the Body of Christ. But that Hand, or its sinister counterpart, can also organize criminal communities, including those inside the American government and inside the banking industry and... Lots of places. As I've claimed before: there is no Deep State or overriding Conspiracy but rather has the modern world been turned into a battleground of criminal gangs of various sorts, with Latin American drug-lords and street-gangs and the partly mythical Mafia being weaker sorts. Sometimes those gangs form into larger and more complex entities. Sometimes they gain a highly leveraged position from which they can have a disproportionate effect on their society or even all of mankind.

It's all very complicated. So is my writing as I seek to say things which are so hard to say in a language stunted and twisted and deformed to the needs of marketing campaigns, including those ideological campaigns carried out in our intertwined entertainment and educational industries. There is also, quite clearly, an effort in our mainstream media to make it difficult to speak of certain things, such as the effort to paint 'national-security' as a prime directive so great as to exclude all discussions of privacy and personal freedom.

I'll end with another claim about my writing. I need to fight the deformations of our current ideological forms of English not just to truly say traditional truths but also to propose new truths in a way that I can control—partly and for now. If I'm truly pointing to new truths, then I'll have no long-term control over them; my own expressed thoughts sometimes surprise me and I'm sure that others will find new angles and new content and...

Where do these "new truths" come from? What are they?

They come from the Creator through His works, through His effects in this world and all the realms of Creation the human mind and spirit can see and understand much—however uncertainly and vaguely. For example, the story of the "origins" of mankind in the Bible makes no clear claims that humans were really a special creation outside of nature. Partly because of St Augustine's endorsement of that view, in *The City of God* and other writings, that speculative understanding of the Biblical narratives became

established as the “only possible understanding,” as the Truth. In fact, Augustine considered also the possibility that man rose from a lower species. It was the rejected option which has proven true and we Catholics and some other Christians ritually chant, “I believe in evolution,” before going back to discussions of human being which reject any intelligent understanding of evolution, which very strongly reject any integration of evolutionary thought in our understanding of human nature.

Stanley Jaki, OSB considered Augustine’s mistake to be the most important and most damaging act of intellectual cowardice in history. I’ve argued we need to correct this mistake in various ways; I’ll not make another such argument here. Rather will I point out that our efforts to hold on to something clearly not true have deformed the languages used by Christians to speak and think of our own beings, of our relationships to each other and to God; we have made that mistake so much a part of our mental furnishings that we can speak of our acceptance of evolution and then of a thoroughly inconsistent claim of a special creation in a state of grace followed by a fall into a state of sin.

If we accept biological evolution, that means we did not fall, rather are we rising from our knuckles. Heck, our backs are still more suited, in some ways, to crouching animals than to upright animals. Our various problems resulting from this rise from our knuckles, such as lower-back arthritis and sciatic nerve irritations, should convince us of this.

So it is that backs and hips mostly adapted, but not completely, to upright living can have a bearing on our understanding of the Bible, a bearing on our theological beliefs.

Yet, our languages—oh-so Modern and oh-so falsely twisted to deform both theological and scientific beliefs—don’t allow us to speak the truth in a greater and more consistent way. We see our spiritual and worldly mistakes and crimes as being the result of a fall from a state of grace rather than seeing them as an inherent part of the processes by which God has created and continues to create, has sustained and continues to sustain, friends for His Son—a double-good result according to Genesis. And those processes, perhaps more fundamentally and perhaps not, also create and sustain a world He has declared good.

So it is that we refuse to advance to a richer and more accurate understanding of God in His role as our Creator, as the Creator of all that exists that is not Him. Though, there is even a sense in which God creates Himself: He is his own Self-sustaining Act-of-being. But He doesn’t create

Himself from anything which is not Himself nor from anything which is more fundamental than Himself, as He creates this world from a seemingly strange and abstract form of being described by, and perhaps being, the formalisms of quantum physics. And then He creates living creatures from the inanimate thing-like being which is shaped from that strange 'quantum being'.

I'm doing my best to speak and think my speculative versions of greater and more consistent truths. And so it is that my thoughts and writings are more complex and more complicated than will be needed in a few generations to speak and think of such truths in simpler ways.

## Part IV

### Love and Stuff

## 155 Introduction: Love and Stuff

In this part, I've collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/>, in which I deal with the basic nature of concrete stuff and my conjecture that this stuff is secondary to relationships. By looking at modern science from a Christian viewpoint, we are surprised by naturally emerging parallels in a radical understanding of the findings of quantum theory with the theological stance of the school of St. John the Evangelist.

# 156 A Christian View of Einstein's and Bohr's Debate on Reality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=10>. It was finished and uploaded on 2006/07/19.]

Years ago, I read about this famous debate in which Bohr spoke of objects coming into existence as quantum waves 'collapsed' because of an observation. Einstein refused to believe this could be and spoke as if he were defending common sense.

Years ago, I also read *Critique of Scientific Reason* [75] by the philosopher Kurt Hubner. He talked about this debate but I'd forgotten a major claim he'd made about the debate:

Einstein was claiming that reality consists of substances which remain unaltered by their relationships with other substances while Bohr was claiming that it is the relationships which are primary and those relationships bring substances into existence.

Over the past year, I pulled this book out of storage several times to reread Hubner's discussion of this argument. It occurred to me that this argument puts Bohr's 'radical' interpretation of reality in line with Christian beliefs. Einstein's seeming common-sense is that of a hardheaded pagan who believes that matter exists eternally and independently of its relationships to other material entities and even independently of the will of God. God

may be in charge in this world, in Einstein's view, but He couldn't be the Creator in quite the way that Christians believe Him to be.<sup>1</sup>

How did God Create the world? How did the world and all of us come into existence?

Because God loved the world before it existed, loved us before we were conceived, we came to be.

The world as a whole and all that is in the world came to be as the result of God's free-will decision to love it even before it existed.

Pay attention to the line of argument but be aware that time-related language, such as 'before' should not be taken literally. That is, it can denote what philosophers would call an ontological relationship rather than a time relationship. The world could, in theory, be eternal when we consider whatever exists on the other side of the so-called Big Bang—more accurately, the beginning of the current expansionary phase of the universe. The question, "Eternal/infinite or mortal/limited?" isn't so important as some have taught to the issue of God as true Creator. The primary act-of-being by which contingent being, created being, came into existence doesn't have to be located in time.

---

<sup>1</sup>Einstein is, in fact, said to be an atheist by most who've studied his writings though many of his words seem to be those of a pious pantheist.

# 157 Quantum Mechanics and Moral Formation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=34>. It was finished and uploaded on 2006/08/02.]

In my blog entry on the debate between Einstein and Bohr on the meaning of reality, I spoke of relationships being primary. It is relationships which bring substance into being, as Bohr was arguing in an obscure way. In a seemingly separate line of arguments in my book *To See a World in a Grain of Sand* [41], I also argued that we're not born persons; we're born human animals and become human persons, or not, as a result of our responses to those around us, to our physical environments, and—most of all—to God.

In other words, I was already anticipating my more explicit claim that it is relationships which are primary in the viewpoint of a true and rational Christian Creationism. There are other arguments against Intelligent Design, but this is one of the strongest: Intelligent Design places substances ahead of relationships, static structures ahead of narratives. Good narratives, of course, show a strong appreciation of the importance of relationships. Let us hear the Biblical version of this:

Beloved, let us love one another; for love is of God, and he who loves is born of God and knows God. 1 John 4:7

And again:

We love because He first loved us. 1 John 4:19

We know God by way of His self-revelations and also through His effects in His Creation, through everything that exists. And both of those sets of

revelation speak to us of love. If we accept that love and struggle to live up to the demands of that love, we become persons, human beings who are being born of the Spirit, that is, being reshaped to become a God-centered and morally well-structured human person. And we are changed deeply by the relationships we take on. We can accept God's love and try to order our selves in response. We can order ourselves to the satisfaction of our creaturely desires for safety and comfort or perhaps for control of our world.

In responding to relationships, certainly in accepting certain relationships and refusing or slighting others, we are not autonomous, pre-formed persons who remain unaltered. We become different creatures than we would have been if we'd made other choices. And we change others by forming relationships with them, or even offering them relationships.

# 158 The Importance of Matter and Nature

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=48>. It was finished and uploaded on 2006/12/08.]

In an earlier entry, I advocated the view that relationships are primary and substance comes into existence as a result of one or more relationships. Now, I'll try to produce a more balanced view by saying why we Christians, perhaps others as well, should consider substance (or 'essence' in the usual philosophical talk) to be necessary for our very existence. In particular, I will be assuming that our substance is the physical matter of our bodies and the human natures impressed upon that matter.

We are brought into existence by God's acts-of-being, though I view that as a two stage process. In the first stage, God created what I call the Primordial Universe, manifested truths or being that is pure in some sense I can't yet define. In the second stage, the stage described in pagan myths and the first verses of Genesis, God shaped that pure being into a particular universe—the one we are part of.

We are brought into existence by God's acts-of-being and we have little control over our existence or non-existence. God can resurrect those who kill themselves thinking to end their existence for ever. He can leave dead those who think that they will go on to some Disneyland where they will continue to enjoy the sort of life to which they accustomed themselves. It is for God to decide who will be companions to His Son, though we can start out presuming He will select those who are trying to be such companions during their earthly lives.

Our substance is God's way of giving us some limited independence from Him. We can't know what that means since God is all-powerful and those

who thought it impossible for creatures to have any true freedom had some good arguments. Despite those arguments, we do experience something of a freedom but we do not exercise that freedom by way of anything deserving the name 'free-will'.

A human being should not even desire free-will because of the implications of the ability to act in a truly random way. For God the Creator, this ability to act in a truly random way means that He could bring into existence a Primordial Universe from nothingness and then shape that Primordial Universe into a particularized universe, the universe of which we are part. Our freedom consists, so far as I can tell, entirely in nudging ourselves towards an acceptance of God's wishes for us. This nudging process can be less painful and almost invisible when it begins in early childhood but few the Christian parents with the faith and courage and integrity to raise their children to be Christians in a world where non-Christian behavior seems to lead to much in the way of safety and comfort, in a word – prosperity.

To look at matters from a different point of view, the freedom we have as creatures is to help in shaping our selves, our stuff and our relationships to others including God. This gives us a very limited freedom, important in allowing us to accept God's offer to share in His life, but limited. The term 'free-will' is a term that is used predominately to speak of the ability of autonomous agents to choose from bundles of goods. We do not have that sort of freedom simply because we are not autonomous agents. We cannot choose freely nor does the liberal idea of bundles of goods mean anything. In fact, experience over the past few decades of rapid decay indicates this sort of view—when taken seriously—is most likely to lead to people being trapped in bad habits and immoral ways of life into which they were enticed as adolescents. In fact, the liberal view of freedom can trap us by the decisions we make in the very early stages of adult-hood. We see this in the teenaged rockers of the 50s and 60s who continue to make asses of themselves on the stage even when they are grandfathers and nearly great-grandfathers.

George Berkeley, a key thinker in the history of liberalism defined spirit—the human soul was one example—as the form of being which thinks, wills, and acts. It is this soul which is autonomous for its ties to the particularity of matter are accidental. It is this soul which could be happy in an age where men can choose to become women and women can choose to become anything but mothers. This modern age is most certainly not to the likings of a human being who is a particular physical being and satisfied

to be so. It is that particular physical being which has a particular moral nature. A being which is an immortal soul, a spirit as defined by Berkeley and the likes of Emerson and Thoreau, has no particular moral nature. This being is an 'agent' as Berkeley himself said, an autonomous agent in the thought of those who followed him on the path to modernity.

I don't know if God could have created such a spiritual creature as Berkeley or Emerson or Thoreau imagined themselves to be. I do know, the Bible tells me so, He created us that some of us could become companions for His Son, our Lord Jesus Christ. I also know that our physical nature with its needs and constraints do not allow us to choose freely even amongst the very limited range of 'bundles of goods' offered by nature. Even the unnatural bundles of goods we see offered to us in the modern world show a complete lack of the powerful imagination which would have to be part of a true free-will whether directed to good or bad ends.

We have some freedom, enough freedom to accept or reject salvation and even enough freedom to become good or bad men by the standards of our particular beliefs, but we have no freedom grand enough to deserve the term 'free-will'. Only God could have that sort of freedom. Mostly we have the freedom to move within the constraints and limitations of our human natures.

So far as I can tell, Berkeley put himself in an embarrassing position for a Christian—he defined the 'stuff' of God and the true 'soul-stuff' of man as being basically the same. Berkeley's God seems to have the one additional power to create and destroy other beings, but that seems pretty paltry for the God of Jesus Christ and not even the sort of 'difference' which would be appropriate to a God who established His power most securely as He allowed His Son to be tortured and crucified. God's power to create is one aspect of His true life, most especially of the love shared by Father, Son, and Holy Spirit.

When we think of God being made of divine substance, we're already in trouble. We limit Him rather than letting Him define Himself. One particular bit of trouble comes in when we begin to think of bodies of truths as somehow existing separately from God so that He becomes a thinker like us, a processor of truths which lie beyond His creative powers. Deism is implicit in such a view just as dualistic or polytheistic paganism is implicit in the oft-stated belief of many Christians that God intended this world to be different than it is. God is all-powerful and He created the world as He wished it to be. In this world are the creatures from whom He will choose

His Son's companions. In this world, such creatures come to be potential companions of the Son of God by reacting properly to the very forces of disorder which can even include those describable as evil.

I don't have any deep theories as to why God chose to create such a world or why He chose to Incarnate His Son as a member of a species of apes. In *To See a World in a Grain of Sand* [41], I merely told a story which is coherent in the way of a story. The sheer particularity of that story is a result of God's free-will decision as to which type of a world to create and then which specific world to create. That sheer particularity of God's decisions as a Creator also argues against us having anything describable by 'free-will', that term which has been taken over by liberal thought with its refusal to see a man as being bound, or even constrained, by his particular nature or his particular history. God created particular creatures and not creatures able to will freely from even a wide range of possibilities let alone an undefined but indefinitely large catalog of bundles of goods.

Whatever views Christians may have of free-will, it has been used in the modern world mostly to allow men to escape the Christian traditions of their forefathers. And now it has the practical role of allowing redefinition of a woman's very biological nature in societies which would collapse into poverty if their economies were not expanding explosively into new needs, the satisfaction of new desires manufactured to the profits of the ambitious and greedy.

A free-will is exactly what a true liberal wants to have because he would be what he desires to be and would rather cease to exist than to be forced to be what he was born to be. I'm not sure why a Christian would want a free-will or why he would imagine he has one.

Substance is what we have, where I consider substance to be both the underlying matter of our bodies and also our well-defined biological natures. More exactly, we have the substance which allows us to be formed into the sorts of companions God chose for His Son. Substance is what we need because we are particular beings. If we will to be other than our substance, we will an end to our existence. We cannot become gods or spirits or autonomous agents just because we are particular creatures with adrenal glands and sexual organs and pre-frontal lobes in our brains.

[More recently, I've decided the main reason God created such a world as this is the desire of the Son of God to sacrifice Himself in an act of love of the Father. Man was created in sin so that Christ could be crucified and this situation also leads to the possibility of resurrection into a life without

end as companion to the Lord Jesus Christ.]

# 159 Negative Theology in Physics and Metaphysics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=81>. It was finished and uploaded on 2007/03/09.]

I've argued that the human mind is shaped by its active responses to its immediate environments, including social relationships starting with that between infant and mother. From there, we expand out into larger sections of those immediate environments and may begin to interact with other environments. In this expansion into other environments, we're like other opportunistic animals—bears and wolves being my favorite examples. Those species are missing the brain structures, mostly in the prefrontal cortex, which interact with even ancient, 'reptilian' sections of our brains to allow us to plan ahead, keep in mind objects which aren't present, form abstract groupings from particular objects, and even to form concepts not clearly related to anything in our experience.

Any claim for human 'uniqueness'—only hinted at in the above paragraph—is clearly true in a substantial sense but it's also overly simplified. Chimpanzees have at least some raw abilities related to abstract thinking but don't display any signs of developing skills from those raw abilities—in general. Recently, scientists were a little surprised to observe chimps in the wild making spears and using them to kill monkeys. We should learn something from the very rarity of this sort of behavior, given that chimps do show abstract thinking readily when given specific incentives. But we also need to see that we are mostly citizens of our universe. The chimpanzees are our cousins.

Already, there are hints of thought patterns akin to those of negative theology, both the deliberate and conscious formation of analogies and also

the nay-saying that tries to claim, “No, God is not truly this,” or “No, men are not truly this.” This sort of reasoning is, in fact, natural to disciplined human thought, But remember that this sort of thought is not purely negative. The real method of negative theology, as practiced in Christianity, is based upon the realization that we creatures know our physical environments and must speak of even God in terms which are derived from our experiences and relationships. Analogies are formed and then an attempt is made to negate the most important errors which arise from applying creaturely analogies to God.

This way of thought, analogy and negation, is most applicable to our efforts to understand something that is not quite definable in explicit terms. I like to think in this way, forming analogies, sometimes drawing on knowledge far afield from the objects of my current thought. When I apply the analogy and I start seeing possible or realized problems, I start adding other analogical elements to counteract the original analogy. This can get complicated fast and all sorts of errors can eventually be hidden in a way of thought. Also, an abstract way of thought can sometimes come to be thought of as the truth rather than an attempt to deal with one part of reality or another. We should be faster to clean out our houses of thought, including those houses which contain accumulated thoughts about God Himself, the ultimate and only true reality.

Let me make a case study of sorts of some of my own thought processes behind the worldview I developed in my book, *To See a World in a Grain of Sand* [41]. This is rough because I didn’t keep any notes as I proceeded and my ways of thought tend to be too discursive to truly accord with a systematic presentation.

1. Where do the ideas of abstract mathematics and abstract metaphysics come from if we are physical creatures who learn from the physical things and relationships of this world?

We can become dualists at this point as most do, including most who consider themselves to be materialists. As some have pointed out, concepts of software have crept into the thoughts of the materialists. Soul or software are the same if it’s something that floats above the physical entity, only accidentally attached.

Another traditional form of dualism is the belief in a realm of Ideas which are pure, not corruptible or changeable in any other way. Some accuse Plato

of teaching this, but I read more nuanced and qualified views in the few dialogs I've read—in translation only. On the other hand, Neoplatonists did seem to teach this form of dualism and they had a great, and not always good, influence on thought in both Christian and non-Christian science, as well as other domains of knowledge.

Suppose we decide that empirical reality is sufficient for the natures of empirical entities. There is no magical extra added in, from soul-stuff or from software which can supposedly implement a 'mind' in the patterns of brain-cells or the patterns of insects or sunspots. There is also no realm of pure ideas which we can access.

We're now stuck with things and relationships of things to each other as the foundation of some extraordinarily complex mathematics. It's not clear how ideas of infinities larger than ordinary infinity can arise if all our mathematics has to arise in our physical brains formed in interactions with environments in this physical universe. There are many such abstractions in mathematics which raise such problems.

Those problems have to be considered in light of the empirical evidence that human mind-events are tied strictly to events in the brain. Since the brain is embedded in a body and that is embedded in complex environments, we're not really forced to find all mathematics in the brain as such. But it's not clear how we can use any of this to explain the power of the human mind if it is founded entirely in the physical brain.

We have ourselves a seeming conflict between scientific evidence that the brain is the foundation of our thinking activity and the fact that some human beings can imagine and analyze possibilities which seem unrealizable in this universe.

Let's move on.

2. Cosmological astrophysics and particle physics support a narrative of our universe which begins with the entire universe compressed to densities and states of being which can be described mathematically but not well-imagined by a human mind formed to deal with trees and rocks and hamsters.

As we reverse the narratives of the so-called Big Bang model of this phase of Creation—going backward in time from now until the beginning of that expansion, we find a general tendency for thing-like being to melt down and even to merge in fundamental ways with energy and fields. This

cosmological mush is a vaguer sort of being to us humans with our minds formed for thing-like environments.

If we extrapolate back through the Big Bang...

What might lie on the other side of that extremely dense state? Is it merely a point of oscillation and what we see is what truly exists? Is there some sort of quantum vacuum on the other side of that dense state? Does thing-like being truly melt away? That is, we might wonder if there is a different sort of being on the other side of that initial point of our universe, that point of extremely high-density.

The possibility of a different sort of being underlying the thing-like being of our universe raises a faint hope of letting us at least talk about the problem of abstract mathematics without falling into one form or another of dualism.

3. Modern physics defines space and time in terms of relationships to thing-like being, things and fields and some strange entities underlying them.

Do time and space as we know them exist on the other side of that initial time of our universe? I'm assuming here it was an initial point and not just an oscillation point where a previous, similar universe had collapsed. I'm also assuming our universe isn't just a fluctuation bubbling out of a quantum vacuum. So far as I can tell, a prior quantum vacuum would arise only in a state of thing-like being essentially the same as that of this universe.

Unlike thinkers like Kant who absolutized the nature of things in this universe, this phase of Creation as I would say, we've denied that the nature of things in this universe tells us what the underlying nature of things truly is. Not surprisingly, at least not to me, we've been led to speculate very tentatively that stuff that is not thing-like underlies thing-like being. That underlying stuff also, speculatively, doesn't have time-like or space-like aspects. But it would have to have aspects which would allow it to be shaped into this thing-like universe and to provide the stuff to make the things of this universe.

4. Having speculatively stripped thing-like being of many of the properties we associate with substantial being in general, I add in the claim of St. Thomas: "Things are true".

To a Christian, this should be almost trivially true because of the belief in a Creator God. If God creates from nothing, then the things He creates must be true because they're manifestations of some of His thoughts.

5. At this point, I'll return again to mathematics to point out that the line of thought which runs through Cantor and Gödel and Church and Tarski and Turing, arrived at an alien station in the mid-1960s when the great Russian mathematician Kolmogorov and an American high-school student named Gregory Chaitin speculated independently that randomness is a matter of coding efficiency. Most people seem to think that randomness is some sort of mystical and irrational concept.

By 1990 or so, Chaitin's work had culminated in a proof that all numbers are random. This is to say that a random number is an infinite stream which has no patterns at all which would allow it to be described in fewer characters than a straightforward listing of the number itself. Numbers which are clearly not random include integers and such numbers as  $0.3333\dots$  or  $1/3$ . These numbers have a measure which is 0 relative to the measure of random numbers. You can see [http://en.wikipedia.com/wiki/Measure\\_theory](http://en.wikipedia.com/wiki/Measure_theory) for a discussion good enough to understand what I said. Or you can just use this definition taken from that article:

**Measure theory** [A] measure on a set is a systematic way to assign to each suitable subset a number, intuitively interpreted as the size of the subset. In this sense, a measure is a generalization of the concepts of length, area, volume.

See Dr. Chaitin's homepage [20] to download a number of shorter papers and to obtain references to his books.

Randomness is factuality, as was pointed out by Professor Mark Kac of Cornell in the early 1970s based on the early work of Chaitin and Kolmogorov.

6. Now I ask: Is it possible that "Truths are thing-like?"

Now we're in a fine mess from having taken modern physics and ancient theology seriously. That is, we've taken the narrative of the so-called Big Bang model in reverse to find that, supported by particle physics, nature

herself has little respect for the opinions of man: some of the properties which many traditional metaphysicians have assumed as necessary seem to be quite contingent. They're add-ons to some sort of being which is very abstract and strange from the human viewpoint.

When we follow the narrative of the universe in reverse, when we see it melting down into a seemingly more homogeneous stuff than we could directly imagine, can we possibly say that we are seeing hints of the truths from which this universe was shaped? That is, did God create first some very strange and abstract stuff which is the manifestation of the truths we know and perhaps many others? For example, is gravity a particularized form of a metaphysical principle of unity which holds together those truths in the Primordial Universe and holds together matter and energy and fields in this particularized universe?

This extension of the Thomistic claim that "Things are true" is a very dangerous and potentially fruitful analogy which results in a rather direct claim that this analogy is literally true, that is, that abstract and concrete being are different forms of the same created being. In my book, and a few entries, I've already begun to use the techniques of negative theology to try to bring this analogy under control, but I like the idea because it brings all that is creaturely in any sense inside of God's Creation and leaves the Almighty, He who is His Own Act-of-being, free to be God. Unlike the Leibnizean God, one who's sneaked into Christian thought, the God of Jesus Christ isn't restricted to some humanly accessible set of absolute truths. This theological issue has great implications for mathematics and science, whichever way it's settled.

Should we strip away some of our common-sense assumptions to reach a better understanding of the 'stuff' which is the foundation of our universe? We have guidelines from physics which point towards more general forms of physical being, lacking many thing-like properties and perhaps not having time-like or space-like aspects. Maybe we should be as brave as the negative theologians of Christian history and dare to reason towards more fundamental forms of being? To be quite honest, my Christian beliefs guided me, especially in my willingness to conjecture that truths are thing-like. There are some deep theological and metaphysical possibilities to this line of thought but I'll not talk about those here.

This entire line of reasoning was displayed in my book, *To See a World in a Grain of Sand* [41] but obscured in some sense by my decision to use a discursive presentation and to repeat some key ideas in slightly different

forms. The bottom-line in my worldview is:

God created a Primordial Universe which is a manifestation of abstract truths, mathematical and logical and metaphysical. From this very abstract stuff, He shaped this universe which is a world when viewed in light of His purposes. That is, the moral order which only God can truly see is what makes this universe into a coherent narrative or a world.

The bottom-line on the 'techniques' used to develop this worldview is:

There is a complex weaving back and forth between fields of knowledge irrationally separated over the past five or six centuries. Those complex movements are coordinated by the traditional Catholic techniques of thought: analogy is disciplined by negations of undesirable aspects of the analogies which show up as the thought proceeds.

This is a more literary style of reasoning and is in conflicts with the most fundamental attitudes of modern liberal society which would bureaucratize all of Creation and would restrict all efforts to understand Creation to those which can be stated clearly in textbooks. The very stars themselves should obey the various bylaws and regulations of those who've been rendered incapable of the humbling wonder which should remind us of what Aquinas claimed centuries ago, that is, the human mind is, in principle, capable of comprehending all of this universe but any actual human mind is, in fact, incapable of comprehending so much as a flea.

# 160 Randomness as a Sign of God's Presence

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=99>. It was finished and uploaded on 2007/09/22.]

One of the most important, if little noticed, intellectual events of modern times is the development of a rational understanding of randomness. Based on that rational understanding, I made the claim in my first published book, *To See a World in a Grain of Sand* [41], that only God could make a truly random number and only God could act in a truly random way. I'll try to discuss the reasons for these two tightly related claims and I'll try to make the discussion accessible to a larger body of readers.

Let me give a crash course on the new view of randomness which started to develop in the 1960s. In the middle of that decade, a prominent Russian mathematician, A. N. Kolmogorov, and an American high school student, Gregory Chaitin, both had the idea that randomness was more a matter of algorithmic complexity than of some sort of magic. To cut to the chase, a random number is one which has no patterns which allow it to be described more briefly than simply listing the digits. To be perfectly random, the number can have no patterns at all. It must have algorithmic complexity that is absolutely infinite.

Much of Chaitin's work deals with degrees of randomness more than with perfect randomness because we can't produce a random number. Nor do we have the slightest reason to believe that nature can produce a random number or any movement or change that corresponds to pure randomness—unless God interjects that randomness. Yet, Chaitin's major result in many ways was a surprisingly simple proof—by the standards of modern mathematics—that every number is random. No number has

a pattern. This doesn't mean that 1.22222... or 1.25 are random. Those numbers and any individual number, random or non-random, represents a vanishingly small point on the number line. It turns out that all numbers with patterns, all the numbers of our elegant and well-ordered mathematics, add up to a vanishingly small length on the number line. There are so many random numbers that the infinities of numbers with some patterns are overwhelmed. In the sense of what is called 'measure theory', there are essentially no numbers with patterns in comparison with true random numbers.

What does this mean? As the mathematician Marc Kac (pronounced 'cats') said in the early 1970s when the ideas of Chaitin and Kolmogorov were becoming known:

Now we know what a random number is. It's a fact.

I quote from memory.

In any case, this is the basic insight lying behind my claim that God created the truths of Creation, the truths from which our physical universe is shaped. The number line is a set of facts rather than a construction as Pythagoras and his successors have thought. Elegance in the Pythagorean sense, order in the sense of the theorist of Intelligent design plays no part in rational mathematics. Neither does randomness in the mystical sense of a typical Darwinist philosopher,

But elegant mathematics can arise from this pure factuality. In *To See a World in a Grain of Sand* [41], I compared this is the rising of islands of order from an absolutely infinite sea of chaos. Moreover, though I've not always been consistent, I've tended to at least imply that God created those facts as well, but I've also denied that God the Creator, He who is His own Act-of-being, works in a manner truly like that of a human workman.

Only God exists necessarily and He is a pure act of existence. Mathematics and other truths of Creation are the sorts of truths that have to do with substantial being. They would be irrelevant, though perhaps interesting in some sense, to an entity of pure existence. God created them as a side-effect of sorts of His free-will decision to love Creation. His decision to love Creation was the same as His act of creating Creation. To anticipate myself a little, this act was the only one we can know for sure to have been purely random. We should also remember that even the absolute truths revealed to us, those which deal with the necessary being of God and not with

His free-will acts as Creator, have to be conceived and expressed in creaturely terms. We see the true God through our incomplete and sometimes distorted view of God as Creator and shaper of this universe.

Once God created the basic factual truths of Creation, He could begin to shape it and raise islands of order out of that ocean. As part of those activities, He had created the number line and could move on to shape a universe in ways that raised those islands of order that we call Euclidean geometry, algebra, tensor calculus, and logic among many other more concrete laws of substantial being. As part of His acts of shaping this universe, He shaped time and space out of more abstract possibilities. We can imaginatively journey out on those oceans but we really couldn't live there. In fact, I don't think that sort of non-thing being could even register on our senses or our minds, though by the imaginative efforts of a disciplined mind, that non-thing being and even non-substantial forms of being can be thought about in a rational but indirect way.

Let's flip things inside out, to look at matters from inside this universe rather than speaking of truths in the greater Creation. Let's think in terms of constructing a random number, or executing a random act, inside this universe. To construct a single random number would require an absolutely infinite amount of computer power because each individual digit in the number would have to be checked against its neighbors to assure there are no runs which allow a shortening of the description of that number. Then neighboring groups would have to be checked against all other groups for the same purpose. All sizes of groups would have to be checked against all other groups. Then the differences between neighboring numbers would have to be checked because patterns in differences would allow a shortening of the description of that number. It gets more complicated from here. What's amazing is that Dr. Chaitin proved that all numbers, in a mathematical sense, pass these unimaginably demanding tests for randomness.

There's a simple summary of the situation:

Only God can make a truly random number.

And again:

Only God can act in a truly random way.

# 161 Keeping the Ultimate Goal in Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=175>. It was finished and uploaded on 2008/08/12.]

There's little new in this entry but I'm trying to restate some of my basic ideas in as simple and clear a form as possible as I move towards an enlargement—God willing—of my understanding of this world, this phase of Creation.

Sometimes I'll mention that I'm trying to show that Christian revelation and modern empirical knowledge can be reconciled in one worldview. While this is true, it's only a major sub-goal. My greater goal is:

To establish the primary importance of God's acts-of-being, that is —acts of bringing into existence. These acts of creation, necessary to the continued existence of contingent being are of primary importance relative to everything else, including all aspects of substantial being and also formal truths and the associated acts of reasoning. In my enlarged existentialism, even formal truths are the result of acts-of-being possible only to God.

This doesn't mean that I undervalue substance, but I do see substance as being secondary to what brings it to be: acts-of-being possible only to our Creator. Another way to put matters is: creaturely substance and particular entities made of substance are objects of God's love.

The existentialist insight has been obscured at the expense of some adolescent angst which allegedly lies at the heart of that insight. Both

Kierkegaard, from a somewhat liberalized and modernized Lutheran standpoint, and Sartre, from an atheistic standpoint, did produce angst-filled writings to be sure. This is passingly strange since neither man failed to enjoy the goodness of God's Creation. Sartre was certainly far more disordered than Kierkegaard but that seemingly dour Dane wasted a personal fortune in an impressively short time, even providing a sinfully extravagant birthday party for a young female relative. Before leaving this subject, I'll note that I read Sartre's *Nausea*, his greatest work of art even if it was what some claimed—a fragment of a great novel. In any case, I came away with the impression that Sartre was upset with the world just because of his existentialist insight. If Sartre could have accepted the more traditional belief in substance as being self-sustaining or even eternal, he would have been more intellectually accepting of the world he so enjoyed in sometimes very sinful ways. It was Sartre's understanding of some 'monstrous' act of creation, no—ongoing acts of creation, that made him understand so clearly that being was outside of his control. Substance was being created but not by any process under the control of Sartre. Yet, the Thomistic historian and philosopher, Etienne Gilson, made the claim that the atheistic Sartre was a better existentialist thinker than the devoutly Christian Kierkegaard, just because Gilson saw Sartre as having a better understanding of substance.

The existential act, the act-of-being, is primary but we'd never know a thing about it if it were not for the substance of our eyes and ears and brain. We'd never be if not for that substance nor would we know truth if not for the manifested truths from which the stuff of our world is shaped. Created being, abstract and concrete, has to be studied, but that's a complicated issue which I've discussed in many prior postings. Moreover, it's the sort of explanation best done by actually producing analyses drawing upon the specific sciences such as physics and mathematics and biology. Hard work of exploring empirical reality precedes the hard work of contemplation and philosophical analysis. That first level of hard work is necessary because higher truths manifested in Creation can be seen only through the substance and specific things which are shaped from those manifested truths which I call the 'Primordial Universe'.

I'm far from satisfied with the above discussion of my goal, but I'm perhaps edging closer to understanding what I'm up to. The process of understanding is itself the understanding, that is, it's a reshaping of my mind and my language. This is to say that I'm edging closer to an understanding of the general direction in which I'm headed, though I'll probably never

pass beyond an understanding more exact than the proverbial “generally westward.” I think I live too early in this process of building the foundations for the next phase of human civilization.

## 162 What Do I Mean When I Say, “God Creates Truths”?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=176>. It was finished and uploaded on 2008/08/20.]

In two earlier entries, Chapter 7, *God as the Creator of Truths*, and Chapter 71, *What is Mathematics?*, I argued that God creates truths, though not in the sense that He could have created contradictions or the ‘truth’ of  $1 + 1 = 3$ . My claim is that the fundamental stuff of Creation is what I call the Primordial Universe, the manifestation of the truths God chose for Creation. It is the Primordial Universe which the Almighty brought into existence from nothing and other phases of Creation, including particular and thing-like phases, are shaped from that Primordial Universe.

My goal is to develop a rational and consistent way of speaking about human nature, and the formation of the human mind, while recognizing that we are part of a particular universe which is part of a greater Creation. The human mind is not a ‘knower of truths’ as in most traditional philosophies but rather an entity shaped to deal first with practical needs of human life and then—perhaps—to deal with the desire some of us have to understand what lies around us. In my way of looking at things, to understand is to shape our minds in response to our environments, then to our universe if we can imagine such into existence. A still greater leap of imagination will open the possibility of shaping our minds to Creation in a larger sense.

It’s a mistake to believe human beings are born with minds, mental parts which come into existence automatically with our bodies. It’s also a mistake to think of knowledge, even knowledge of the most absolute of truths, as coming from any sort of realm outside of creaturely being. How could we really grab such knowledge or even receive it if it were somehow

streaming into Creation?

We're creatures with a certain type of being, though physics and mathematics indicate that our being has aspects that are only hinted at when we try to deal with quantum mechanics or transfinite set theory. We know that our being, and that of every creature in our universe and certainly the universe itself as an entity, has aspects which are quite strange and even abstract just because human beings have been struggling to shape their minds to deal with the being of quarks and stars and a spacetime seemingly shaped in ways describable by Riemannian geometry. In speaking of these matters, I mean to direct our thought in this context towards some abstract and conceptually difficult aspects of being that indicate our universe is part of a much greater Creation.

So this provides another way of looking at my claim that God is a Creator of truths. If the human mind is shaped by responses to its environments and its universe and its Creation, then any truths we can know are manifested in Creation. If we can respond to truths barely detected that we might begin to understand them, this must be a similar process to responding to the smiles and baby-talk of our mothers. The truths we can know are to be found in Creation. This is true of God's revelations as well. Having created us as physical creatures which build minds upon the substance of physical brains, the Almighty Himself reaches us through His effects in Creation.

The concrete things of this world, say quarks, are manifested in creation and we can respond to them or to different factual possibilities they imply. Abstract truths, such as those of group theory, are also manifested and we can respond to them or to different abstract possibilities they imply. That abstract truths are more difficult to see isn't a problem as such, at least no more a problem than Fred Astaire faced in learning how to move with such grace. After all it seems at first glance that there are concrete things, such as planets or comets or DNA, which are more difficult to understand than water in its simple attributes.

Water can only be better understood as we learn more of chemistry and quantum mechanics and the allied mathematical fields.

Concrete being comes from abstract being which remains intertwined with concrete being. Our understanding of the concrete and the abstract must advance in tandem or else we'll generate imbalanced or even false understandings.

So it is that I claim that it's proper to speak of God creating truths.

On the whole, it's perhaps better to say that God brings actual truths into being from nothing in that fundamental phase of Creation I call the Primordial Universe and He creates concrete being, such as this universe or the universe of the resurrected, by shaping it from the manifested truths of the Primordial Universe.

As a final point, I don't mean to deny the value of literature and history and biology in shaping a proper human mind. Nor do I mean to deny poets and novelists, spiritual leaders and political leaders, their importance in the human task of understanding God's Creation. In fact, the history of philosophy would indicate that much of my thought could be found in some pre-metaphysical form not only in modern science but also in the unmined treasures of Western Civilization—has anyone ever dealt adequately with Melville's struggle with the nature of created being in *Moby Dick*? I was obsessed with that book during the years immediately preceding my journey into metaphysical oceans. I only started to read philosophical works seriously after I'd begun that journey.

# 163 Not Monism and Not Dualism but Unity of Creation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=285>. It was finished and uploaded on 2008/11/04.]

In a number of writings, I deny the monism of matter and that of spirit or thought. I also deny the dualism of body/soul, brain/mind, etc. Yet, I use the terms 'soul' and 'mind' on a regular basis. What gives?

I think of being as richer than 'mere' matter, yet, I see no reason to speak of other substances being 'present' to us, such as 'mind-stuff' or 'soul-stuff'. Mind and soul exist but not as many would think. There are at least two ways to approach a proper way to think of such aspects of being.

1. Mind and soul describe relationships in which substance can participate.
2. Mind and soul refer to higher or more abstract levels of created being, levels closer to the manifested truths from which this universe is shaped: the Primordial Universe.

I think the second way of speaking will be more fruitful though I'm not sure that the two ways of speaking are truly separate. Still, the second way allows a richness of discourse which invites an acceptance of the ultimate unity of all Creation, not just this particular universe and not even just this particular universe and the abstract truths which play a direct role in it, but also all other 'universes' which God might have shaped from the Primordial Universe.

My language will upset some but I take 'universe' to be a phase of Creation which is self-contained in a meaningful sense I won't explore here.

There are some problems with this, or any, definition of ‘universe’ including the problem that physical cosmology tells us that there can be vast regions of this universe which we can’t observe, though parts of those regions come into observational ‘range’ each second. There is also the strange possibility that some parts of this universe might not have ever been in causal contact, though my personal prejudice is to discount that possibility.

More importantly, all of Creation is united in a very fundamental sense because the Primordial Universe, the first ‘creature’ so to speak, is the source of all created being. The more abstract levels of reality are closer to that Primordial Universe.

The richness of created being is due not to multiplicity but rather to depth.

Creatures, including human beings, are not ‘only’ their bodies but also those abstract truths about being which have been discovered about the stuff of our bodies by Maxwell and Planck and Dirac and Godel. We are, so to speak, made up of theorems from differential geometry and Dirac delta-functions as much as we’re made up of protons and electrons. In fact, those abstract truths are our current best understanding of more abstract levels of created being. Protons and electrons are more immediate levels of that same created being.

## 164 Some Problems with Substance/Form Dualism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=301>. It was finished and uploaded on 2008/11/11.]

This entry is a supplement to Chapter 163, *Not Monism and Not Dualism but Unity of Creation*.

One form of dualism is strongly supported by Aristotle: the idea that things come into being when form is impressed upon substance. What's wrong about this, and perhaps the real error underlying all dualisms, is the idea that stuff is out there in a thoroughly disorganized form and has to have order imposed upon it. This is perhaps one reason that many advocates of moral order are leery or even downright afraid of chaos and of evolutionary processes. They need to ask, "If form, order, isn't already impressed upon substance, then when and how will it be so impressed?"

So it is that many believe that man must be specifically ensouled, perhaps at conception in the view of some modern thinkers or at quickening in the view of some Medieval thinkers. So it is that it seems impossible an evolutionary process could seek any sort of true order by unpredictable routes. Note that rational (such as Pope Benedict) and irrational religious believers (such as the intelligent design theorists) agree on this. Those who don't seem to believe in the reality of order, including ideological Darwinists, agree as well. This is to say they agree that true order, certainly moral order, can't develop by processes not controlled in the way of a modern factory.

As for me, I think order can arise in this universe by bottom up development. After all, I claim that the stuff which is subject to evolutionary developments has been shaped from abstract truths which are ultimately

the truths God chose to manifest as the raw stuff of this very particular Creation.

Relationships are primary in Creation and bring substance into being as if abstractions could coalesce into concrete form by the focusing power of a relationship. Again, the language is clumsy, but the idea is similar to ideas found in some philosophical interpretations of quantum mechanics. Rationality in this universe is the explicit realization in mental form of some significant set of the relationships which shape the space-time structures and the matter-energy structures of this universe. A broader statement involving all of Creation is indicated when we speak of the human mind, but I'm content to speak of this universe in this context. In any case, we can draw from ourselves and the stuff and things around us no more than God used as His raw material in shaping this universe. We can never draw out as much manifested truth as God used. We struggle to draw out each bucketful from an ocean that seems infinite to us, but the principle remains clear: the human mind is the sort of entity which can encapsulate the world and perhaps all of Creation.

I'll turn to the concrete moral problems of those who feel themselves to be of a different sex than their bodies, soma and genes. There's an article, *Study In Transsexuals: Significant Genetic Link To Gender Identity* found at <http://www.sciencedaily.com/releases/2008/10/081030111005.htm>, which has been bothering me in the sense that I wasn't sure what to do with it, but it provides a somewhat extreme and controversial way to comment upon the general issue of this blog entry. First, I'll provide a short quote:

In the largest ever genetic study of male to female transsexuals Australian researchers have found a significant genetic link between gender identity and a gene involved in testosterone action.

We must always remember that even large and tightly peer-reviewed studies of genetic relationships to traits or behaviors have sometimes proven to be non-repeatable, but I'll take this study at face value because it's merely a, so to speak, sexier version of similar problems raised by genetic links to juvenile delinquency, to alcoholism or drug-addiction, and so forth. Remarkably, this study found a simple genetic link for what I would have suspected to be a complex condition. At the same time, I'm not surprised

that there's a genetic link. In fact, since I began to understand modern empirical knowledge in the context of Thomistic existentialism—including Thomistic theories of moral nature, I've believed there to be some less than fully determined but perhaps strong dependency of our moral natures upon genes, but genes in interaction with our bodily substance and also in interaction with our environments.

Developmental processes can be very effective in this universe but don't produce perfect results and sometimes produce some painfully botched results. This is true of the development, or evolution, of genetic lines over millions of years and is also true of the development of a particular individual. By using the word 'botched', I don't mean to morally condemn those tortured by the feelings and thoughts of having a body of one sex but the 'identity' of the other sex, nor do I mean to dismiss or relativize the wrongness of those who encourage or accept a mutilation of a human body, the temple of God. I do mean to point to the possibility, the likelihood in my opinion, that we don't understand what moral order really is. Nor do we have a clear idea of what human nature is, in its moral or other aspects, and we merely head towards a serious crisis of confidence by pretending we do and by speaking to our children and our neighbors as if we were ensouled in such a way that we were specific persons, male or female, from the instant of conception. It's nonsense for us traditionalists to claim we understand human nature when our understanding can be in serious contradiction to empirical facts. This doesn't mean that traditional moral conclusions are wrong. Science and mathematics are filled with examples of past generations which reached substantially correct conclusions on the basis of wrong or radically incomplete facts or tools of analysis.

Human moral nature is not a given form which is impressed upon the stuff of the human body, just as soul is not a given form which is impressed upon a fertilized egg-cell. Soul is a more general term for the form of a living creature, and it's a form which—at least to mortal view—develops rather than being fully determined at conception or at birth or even at the end of adolescence.

Form in this universe has more the nature of growth processes.  
In the case of living creatures, we can say: Form, soul or moral nature, is an organic growth process.

Though our sexual identity seems so fundamental to our more complete

self-identity, it's actually a matter of development and proper development is dependent upon a certain degree of correctness in the stuff of the body, in events in the womb, and in the developmental processes which occur in the human creature itself.

We're not born who we are. We become who we are and that process of becoming who we are can be disrupted in a variety of ways, sometimes as a result of our own actions or thoughts and sometimes as a result of factors beyond our control.

This is all very disturbing, not because of fears of a meltdown of moral order. The truth is that Creation is more a story in which the very landscape is forming and is not just a predetermined entity. Nor is Creation filled with other predetermined entities, which then simply act according to some nature impressed upon their physical stuff when they were conceived or otherwise created. Form is yet forming, even when it comes to such a basic question as: Who am I?

Moral order is present in God's world just as much as other abstract truths. We don't see all those truths, mathematical or moral, but the body of humanly perceived truths has tended to grow despite the convictions of those who feel human nature and the nature of this 'fallen' world isn't changing. The world is 'fallen' in the sense that it's filled with sin, with sinful creatures, but we Christians and other traditionalists have only mainstream stories which explain this sinfulness in ways that are in contradiction with modern empirical knowledge. We have a handful of raw facts and probably correct conclusions and no narrative to actually make sense of our existence or the way of the world.

Modern science should have taught us of the ultimate unity of what we call form and substance though in my way of viewing Creation, form comes first and God shaped concrete substance from manifested truths which remain present in matter and energy, in the structure of space-time, and in the particular narrative structure which is the story God is telling which we can know as a world. We explore the nature of matter and energy by way of mathematics which is very abstract and places great demands upon those who would participate in this exploration. We explore human evolution by gathering facts and then trying to make a story of all those bones and arrowheads and also telling a story about the development of

moral nature in non-human animals many millions of years before the first humanoids rose to a bipedal form.

For both the raw stuff of Creation and also for human beings, form and substance are but two aspects of a created being which is a unity and not anything like form impressed upon substance, nor is there anything like soul impressed upon the stuff of the human body.

# 165 Ways of Speaking and True Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=321>. It was finished and uploaded on 2008/11/22.]

Wikipedia tells us that *metaphor* (see <http://en.wikipedia.org/wiki/Metaphor>) is:

language that directly compares seemingly unrelated subjects. In the simplest case, this takes the form: “The [first subject] is a [second subject].” More generally, a metaphor is a rhetorical trope that describes a first subject as being or equal to a second object in some way. Thus, the first subject can be economically described because implicit and explicit attributes from the second subject are used to enhance the description of the first. This device is known for usage in literature, especially in poetry, where with few words, emotions and associations from one context are associated with objects and entities in a different context.

We should note that metaphor seems to operate at a phenomenological basis. We remain on a surface populated by thing-like being and relate one thing to another—to speak a little simplistically.

Wikipedia also tells us that *analogy* (see <http://en.wikipedia.org/wiki/Analogy>) is:

both the cognitive process of transferring information from a particular subject (the analogue or source) to another particular subject (the target), and a linguistic expression corresponding to

such a process. In a narrower sense, analogy is an inference or an argument from one particular to another particular, as opposed to deduction, induction, and abduction, where at least one of the premises or the conclusion is general. The word analogy can also refer to the relation between the source and the target themselves, which is often, though not necessarily, a similarity, as in the biological notion of analogy.

Analogy seems to hint a little more about penetrating to deeper layers of being. That is, it seems to allow us to think in terms of being which isn't immutable, a rock is a rock is a rock, but rather shaped from a rawer or more abstract stuff that could be something other than a rock and becomes a rock only by a process of development.

Our literary ways of speaking don't penetrate to that abstractness from which thing-like being is shaped in my way of updating Thomistic existentialism to account for modern empirical knowledge. They abstract by ways of generalizing across thing-like being, a good and necessary activity in the human struggle to understand our world and what may lay behind or under or over it but that's only a baby-step. I repeat: they don't penetrate to more abstract levels of being. As I implied, some thinkers have managed to use analogy to penetrate to more abstract levels of being, that is, levels of being shared across thing-hood. St. Thomas Aquinas, a master of analogy, is a clear example but so is the novelist Hermann Melville. But they had limited tools and limited knowledge to tell them how to do this.

Are we now in a better situation? I think so. Modern physics and modern mathematics have begun to teach us how to generalize in such a way as to reach more deeply into being rather than just looking for patterns on the level of perceivable phenomena. A particularly clear example is the work of Einstein which—somewhat to his surprise – reached to a level of abstraction at which matter and energy are made of the same stuff, an abstract level that was shown quite sadly at Hiroshima and Nagasaki to be reachable by concrete levels of technology. Still more surprisingly, general relativity reached an abstract level at which we can suddenly see that space and time are intertwined into one geometric structure. We still don't know the 'shape' of that structure, it it's 'flat' or 'curved inward' or 'curved outward'. Quantum theory and particle physics have told us far more about matter and energy and fields, probably even space-time, melting into more abstract and strange forms of being under certain conditions, such as the

high energy or, equivalently, the high density of the universe in the very early fractions of a second of its current expansionary phase.

In the more traditional ways of analyzing being, soul and body are side-by-side. In my view, it's legitimate to speak of soul but as more abstract aspects of that living entity which is embodied in front of us. It's not clear to me how to describe those abstract aspects in more accurate terms but I strongly suspect that we would do well to meditate upon the success of modern physicists in using very abstract mathematics to describe matter, energy, and even space-time. A while back, I spoke of this issue in Chapter 569, *Abstract Mathematics and the Real Presence of Jesus Christ*.

God is present in all levels and aspects of His Creation but the 'unseen God' can be more clearly unseen in the more abstract levels of that Creation. So to speak.

Another way to speak towards the greater possibilities I can vaguely see is to speak in terms of what I called the Primordial Universe, the manifestation of the truths God chose for Creation, the truths from which He shaped this world and will shape the world of the resurrected. I've spoken of the Primordial Universe as an absolutely infinite ocean, a seething ocean of seeming chaos, of randomness. Think of a random number as a fact. Think also of random events as facts.

Islands of organized being rise out of that seething ocean of pure created being, of manifested truths. Islands of things made of what we know as matter and moved about by energy. And then there are fields. So long as we move about only on the surfaces of those islands or view only the surface of that ocean, we remain in the realm of appearances. We don't account for modern science and what it has discovered of what lies underneath thing-like being. And nearly all metaphors and analogies work in that realm of phenomena, relating island to another island, palm tree to brush, land to ocean. They work horizontally. That was appropriate when the stuff from which things are made was seen as permanent in its nature. Even Christians who believed in a Creation from nothing and an end-of-times still thought of the stuff of water and rocks existing in that stable form from beginning to end. Water and rocks were immutable substances and not the results of developmental processes. It took an act of God to bring the stuff of things into existence or to destroy them to nothingness and God, of course, created water and rocks directly.

But I see all created being as the results of Thomistic acts-of-being and thus the creation of the stuff of things and the collapse of that same stuff

into nothingness is happening at each and every instant of time in all of Creation—or at least in phases of Creation where time as we know it exists. Things in this world, in this phase of God's Creation, and the stuff of which those things are made do have their horizontal relationships, but there is a fundamental 'vertical-ness' which goes right back to the most 'raw' stuff of Creation—the manifestation of the truths which God chose for Creation. I call that manifestation the 'Primordial Universe'.

Modern physics and mathematics force a movement of the sort I'm describing—towards abstraction. Neuroscience and other fields are experimenting with various ways of moving more deeply into being. In any case, my current interest is in that sort of a physics-like movement towards abstraction for the understanding of fundamental aspects of being which are of direct importance to the understanding in turn of human nature and especially of the human mind. For example, we need a better understanding of causation before we can understand moral freedom. What we don't need is an abstraction from concrete being but rather an abstraction which explores certain aspects of concrete being, such as the soul-like and mind-like aspects of a human being. In other words, an understanding of the possibilities of moral freedom isn't to be found in the phenomenological events that are the chemical events of our nervous systems. Those possibilities lie in the chain of relationships which tie the physical human being to the fundamental or abstract levels of created being. At the same time, we must realize we won't be able to deal with those relationships or even realize what they are unless we have good understandings of those chemical events in the human nervous system.

We should bear in mind that these more abstract aspects of being and of human being, though inherent in some sense, do not reach any maturity by necessary events. They develop in an organic way just as our brains and skeletal muscles do, a way that might not start at all and—if started—can go awry in various ways. Yet, it's remarkable that so many paths of development, such as that of St. Francis of Assisi or that of Albert Einstein, can result in a human being with mature 'abstract' aspects, soul-like or mind-like or whatever.

# 166 Social and Moral Truths Unfold

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=594>. It was finished and uploaded on 2009/09/12.]

Truth unfolds in time through communal processes.

I've realized there is possibly a very clear example of what this means in an area where I've perhaps misspoken a little. Maybe I've simply been in error. In any case, I'm also willing to claim that new truths might emerge in time through various processes, new truths not emerging from some mystical source but rather emerging as a result of the decisions God makes as He tells this story I call a world—the universe seen in light of God's purposes or, equivalently, in light of moral order.

The issue I'll consider now is human rights. See *Natural and Inalienable Rights* [47] for my position on this issue as of 2006. I've never felt good about denying we have some sort of absolute rights in this mortal life, though I've never been comfortable with those who treat those rights as if they were absolute in the sense of a metaphysical truth such as the law of non-contradiction. It would be nice in some sense to argue that we have all those supposedly inalienable rights declared by Jefferson (though the original Lockean trio of life, liberty, and property makes more sense).

In that earlier article, *Natural and Inalienable Rights* [47], I also spoke in somewhat apocalyptic terms. When the Son of God took on a human nature, being born as Jesus of Nazareth, we were adopted as His brethren, gaining some of His divine privileges, though men and their institutions remain what they are and don't have all that much respect for these privileges. Of course, this refusal of many to recognize the rights of others,

or better—their duties to others, isn't an argument against human rights of the Lockean sort any more than large-scale, modern disobedience of the Fifth Commandment is an argument against that prohibition of murder.

So, we go from apish men with inborn moral behaviors and attitudes to mannish apes with some awareness of themselves as...?

When and how do we become creatures with some sort of inalienable rights appropriate for the sort of morally responsible and self-aware creatures that few seem to be? Is there some magical moment when the human brain or perhaps human social relationships reached some threshold level of complexity? As a Christian, I'd certainly advocate the idea that something was sealed when the Son of God became man and adopted us as His brethren. In fact, I'd suggested that was the only solid basis for this inalienable rights business in my article, *Natural and Inalienable Rights* [47], and perhaps in other places. I now consider the divine privileges that Jesus Christ gave us when He adopted us as His brethren to be separate from human rights as defined by modern thinkers. Those human rights seem to involve empirical matters and can be discussed in the same way that formal political relationships have been discussed by Aristotle and Hobbes and others.

If human rights exist, they're something that first appeared at a perhaps vague or even "smeared-out" time during the evolution of the human species and the development of civilization. It's hard for creatures who live for such a small span of years to truly imagine new entities or even truly new aspects of existing entities arising in Creation, but we can at least move in the direction of imagining, for example, living cells arising out of a chemical soup or creatures with true abstract reasoning talents arising from clever apes. We can try to find a way to talk intelligently about the coming of new things or new aspects of thing-like beings. I view Creation as being made of stuff created, in a manner of speaking, before the so-called Big Bang (try to think in ontological or even logical terms rather than strict chronological terms) and I also view a world of things and thing-like beings which develop in the way of a story. God is telling a story in which He, with the help of creatures enjoying or suffering from a certain freedom, can move in unexpected ways or even bring into existence some truly new and creative possibility.

While officially accepting the evidence that man has evolved from a more primitive apish creature, most modern Christians have tended to prefer the pagan myth of a Golden Age which has decayed into the current Fallen

Age and they have also preferred to think as if the Creator has the same relationship with His Creation as would a pagan God or gods who use great power against recalcitrant matter which maybe has existed eternally along with them (and is maybe the same as those divine beings or divine Being). St. Thomas Aquinas taught an existentialist view of God—He is His own Act-of-being, the Supreme Act-of-being—but few have yet joined the effort to purge our Christian minds of the view of God as some sort of super-creature, acting upon matter as if literally a potter working clay. God is transcendent, for sure, but He is Creator and not Olympian King of the Gods. By creating, from nothing and in the way of a shaper and storyteller, God works more from inside. I've tended recently to speak of being in terms of levels, where thing-like being is a very particularized being which is shaped from more general forms of being. In this way of thinking, God works from the deepest and most abstract levels where He manifests truths out to the particular and thing-like levels of being such as our universe.

The very fact that human beings at some time could claim to have inalienable rights might well tell us that the claim has some validity, but what's of immediate interest is this idea, new to me, that something like inalienable rights could arise in history. Then again, how could it be otherwise? We can't posit our apish ancestors to have always had rights. Inalienable rights would be like the opposable thumb in that they appeared as the result of evolutionary development.

This seems a bit strange, but I've been struggling hard for nearly 20 years to reshape my mind to correspond to reality and I've perhaps had to deal with stranger and more radical ideas than this:

Can it be true that a human being of higher moral awareness and self-awareness might have those inalienable rights though a human creature from the Old Stone Age didn't have any such rights. After all, the two be almost genetically twins?

Let's see if we can apply a particular and plausible meaning to the allegory of Adam and Eve:

Did all human beings gain a supra-animal status when Buddha and Jeremiah and Socrates had first walked the earth?

Physicists like to explore extreme conditions of high-energy (or equivalently—high density) because they'd like to discover 'new physics'.

As they view matters, the universe is a boring place, frozen into a certain condition soon after the expansion had begun from an extremely dense state. A different realm of thing-like being had come into shape and it was very cool and stable and a story could begin, a story of galaxies and even huge clusters of galaxies coming to be from small concentrations in a remarkably homogeneous observable universe, a story of first generation stars which burned fast and exploded to produce waste products such as oxygen and iron and magnesium, a story of organic chemicals coming to exist in many regions and of life coming to exist on at least one planet made of many of those waste products of first-generation stars.

We live in that world of apparently stable physics—though we certainly don't have anything like a complete understanding of that physics. We have a tendency to see this world of rocks and flesh and blood as being “the way it has to be.” Over the period of years allotted to individual men or even to tightly bound generations of men, the world certainly seems pretty stable in some fundamental ways. Nothing new appears under the sun—during the periods of time easily handled by the human mind and imagination. Men are what they are, rocks are what they are, and ocean and sky are pretty much eternal.

In fact, things—including living creatures—have stories. They develop over time. The more thing-like, the more empirical, the entity or its aspects, the more we can assume it to be the result of a story. A story also introduces the possibility of new entities or new aspects of old entities appearing, perhaps as a result of new relationships between an old environment and an existing line of creatures or new relationships between existing entities when changes (such as the growth of technology and the consequent growth and interconnection of human communities) raise new possibilities.

God didn't create this universe all at once at the “time” of the so-called Big Bang. He still has the freedom to introduce new things under the sun. Moreover, we can participate in this ongoing creation, helping to raise at least the possibility of a better world.

# 167 Not Probabilistic Smudges but Relationships

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1000>. It was finished and uploaded on 2011/09/01.]

In James Gleick's biography of Richard Feynman, *Genius*, he refers to an early theory developed by Feynman and John Wheeler as "a classical theory, not a quantum one. It treated objects as objects, not as probabilistic smudges."

Mr. Gleick is speaking in terms of concepts of mainstream thinkers in physics and I'm not criticizing him, but I'd suggest that it's better to regard objects not as objects and also not as probabilistic smudges but rather as nodes of relationships. When certain relationships are complete at both ends, one node to another, the object acts much like an object of the common-sense world. When that object is dependent upon a pending relationship, it has a fuzziness which can be labeled a "probabilistic smudge," I guess, though the term seems little more than a meaningless placeholder.

It be far more rational, at least in my opinion, to describe such an object as being an incomplete concrete act-of-being. I stole the term 'act-of-being' from St. Thomas Aquinas so that I might use it in my worldview which I have described, with some good reasons, as an updating of Thomism to consider modern empirical knowledge. I'm learning how to use 'act-of-being', and other terms and concepts which are mostly under development or are still a bit ghostly, for richer and more complex discussions of created being, in its abstract and concrete forms. My willingness to speak of created being as a spectrum from abstract entities to concrete, thing-like entities adds the interesting complication that the smudgy object isn't yet a well-defined object but the abstract forms of being from which it is shaped are

still in existence, though it's not clear if they can be located in any particular place. At the same time, those abstract forms of being will continue on even in the most humble of concrete things in a way weakly analogous to clay continuing to exist in the hardened brick.

Concrete being is shaped from more abstract being by the sorts of relationships modern physicists have explored with so much success.

And that is a very simple synopsis of some important parts of my world-view.

## 168 Not Probabilistic Smears but Interactions

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1026>. It was finished and uploaded on 2011/09/16.]

In Chapter 167, *Not Probabilistic Smudges but Relationships*, I jumped the gun and said:

In James Gleick's biography of Richard Feynman, *Genius*, he refers to an early theory developed by Feynman and John Wheeler as "a classical theory, not a quantum one. It treated objects as objects, not as probabilistic smudges."

Mr. Gleick is speaking in terms of concepts of mainstream thinkers in physics and I'm not criticizing him, but I'd suggest that it's better to regard objects not as objects and also not as probabilistic smudges but rather as nodes of relationships. When certain relationships are complete at both ends, one node to another, the object acts much like an object of the common-sense world. When that object is dependent upon a pending relationship, it has a fuzziness which can be labeled a "probabilistic smudge," I guess, though the term seems little more than a meaningless placeholder.

Later in the book, he notes that Feynman came to speak of particles as being of the nature of interactions. Fair enough, though I'd prefer language which recognizes that relationships, or interactions, are primary and bring thing-like stuff into being. At the same time, thing-like stuff does exist and is truly such when it is shaped from that more abstract stuff which

Feynman considered to be interactions though I prefer to think of things as nodes in complex sets of relationships.

I'm trying to be sensitive to these little differences in foundational matters because they can be the difference between a solid foundation and a cracked foundation. There is an example in the writings of Etienne Gilson which is relevant: he said that there were at least two modern existentialists who were worth considering as rediscoverers of the Thomistic understanding of being: the Lutheran Kierkegaard and the atheist Sartre. Oddly enough, Gilson said that Kierkegaard saw the nature of what Aquinas called the act-of-being but he went too far and lost his respect for the stuff which can result from that act-of-being. On the other hand, he said that Sartre had seen the act-of-being but also retained his respect for the stuff around him.

We need to respect the act-of-being by which created being comes to exist and the acts-of-being by which abstract being is shaped to a more concrete level of being. We also need to retain a balanced view, respecting that more concrete being as a so-called 'thing in itself'. Most of the difficulty in seeing that 'thing in itself', noted by Heidegger and others, is due not to some imagined detachment from the thing-like being around us. Most of the difficulty is due to the very richness and depth, the levels of increasingly abstract levels of being, to be found in even the most humble thing. Seeing and understanding things in themselves takes a great effort; it is a work of the body and the mind in all its aspects, especially the imaginative aspects. At the end of our lives, probably at the end of human existence in this mortal realm, we'll have failed to complete our understanding of even the simplest aspect of created being if only because the simplest aspects melt away and reform with each new understanding of deeper levels of being, but this is a major part of being a human person. Even those who never pass beyond the state of human animal to that of morally well-ordered human person will likely have at least some curiosity about some parts of this world and will likely explore those parts even if they never so much as try to make greater sense of what lies around them.

It's part of our human nature to look at a rock and wonder, wonder as a philosopher interested in the nature of concrete being, as a painter interested in colors and shapes, as a chemist wishing to find all the different sorts of stuff in that rock, as a miner hoping to see signs of gold or iron, even as a child looking for a good projectile to hit that nearby tree.

# 169 From Abstract Being to Concrete Being and Narratives

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1050>. It was finished and uploaded on 2011/09/30.]

I stretch the truth when I sometimes talk as if I were the only one who sees being as a spectrum from the abstract to the concrete. Clearly, there is a sense in which Platonic and Neoplatonic Realists see being in two forms, abstract being (what they call the Real) and concrete being (the real thing, so to speak). Furthermore, modern physicists speak in terms which imply that entities exist which can only be described mathematically, some of those entities existing at ‘deep’ levels of our concrete world and some being part of some sort of precursor stuff to this concrete universe. There is some sort of interesting and potentially fertile confusion about whether that precursor stuff can be said to be still here. Unfortunately, the ‘fertility’ can only be realized if important questions about being are asked more directly and more openly in cosmology than is currently the case.

I’ll provide a few simple diagrams of some potential relationships between the different realms of being, but I’ll be simplifying matters greatly. See Chapter 438, *The Liberal Mind: The Essence of Liberalism* for a discussion of my view of the spectrum of being in the context of human politics.

## 169.1 Modern Cosmology

Let me start with a short discussion of the view implied by many modern theoretical physicists, and most of the popular interpreters working this field. In this model, abstract being becomes complex and relatively more concrete, more particular, by symmetry-breaking processes, a view which I

find congenial. More importantly, these models have a characteristic which I find disturbing, partly because of my Christian faith. This characteristic of the current cosmological models seems to isolate the universe, separating it from any precursor forms of created being at the moment when expansion of this universe begins. As abstract forms of being, describable in mathematical terms, flow through a bottleneck of sorts—the so-called Big Bang—they form a universe which is then apparently independent of the general realm of abstract being from which the universe came. The universe begins to evolve in time and never, so to speak, looks back at its source in more abstract forms of being.

Here's a simple diagram of the implied 'flow' of being in modern physics:

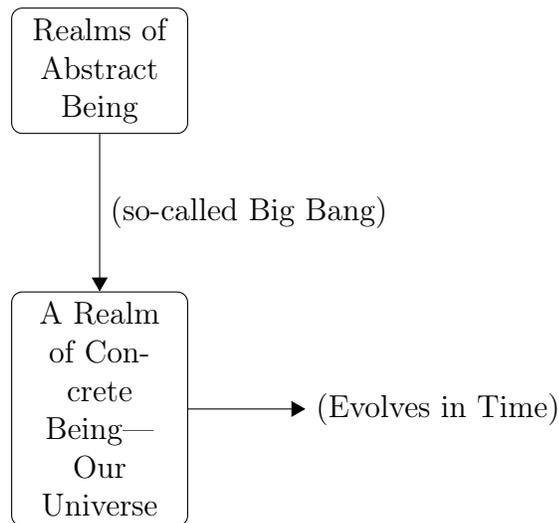

Figure 169.1: Naive Version of Modern Scientific View of Being

;

In this view of the concrete being of our universe, of how that concrete being came to exist, of what the universe is, and how the that universe came to exist, we find that something was pushed 'through' the small spigot that was the Big Bang and that something expanded to become our universe, the spacetime as well as the matter. Then the spigot was closed.

Does this leave in place a dualism of sorts? That is, are we left with the problem of explaining how we can access abstract knowledge, such as that

of transfinite numbers, without conjecturing some realm of thought-stuff? If our universe is an expansion of what cosmologists and particle physicists can plausibly conjecture to have spilled in the universe created by the act of spilling—in a manner of speaking—and if that spilling took place for only the early fractions of a second of that expansion, then where do the ‘immaterial’ aspects of our universe come from? It would seem that this standard way of thought implies that matter was separated even from the mathematically describable and very abstract being from which it came.

The above diagram gives a very good backdrop to the mainstream context in which we have to deal with the most basic issues of being. For now, that context gives some inclined strongly to empirical thought a pervasive if radically incomplete foundation for their metaphysical reasoning. A little reading in the accessible literature on modern cosmology will confirm that even those who showed great creativity in their scientific work will simply assume the metaphysical backdrop, which is what it is, that is, a largely unexamined understanding of reality which is read naively out of a literalistic application of the field equation of general relativity, or some similar equation. Most modern physicists would know that mathematics can only describe possibilities and not tell us that an object exists, abstract or concrete, but they assume that what is describable by the basic equations of modern physics is what ‘truly’ exists and other aspects of concrete entities, such as mental activity, have to be simply ignored while we’re slipping it in through the backdoor.

Some empirical thinkers who deal with cosmological issues are reductive materialists and some struggle to maintain a belief in metaphysical entities and qualitative aspects. There are even some who struggle to hold on to religious beliefs or at least vague spiritual beliefs. The non-reductionists, who seem to be greatly in the majority, try to admit other forms of being than what squeezed through the spigot of the Big Bang, but they show no willingness to deal with it directly, that is, by speaking of created being, rather than speaking of physical stuff and then all this other important non-stuff.

Other thinkers, and maybe some trying to escape their human inclination to think, will simply glide over the model of our world as described by modern science and will see the world as awash with whatever entities are needed to readily and comfortably deal with evil or with unlikely recoveries from cancer or with their own feelings that they aren’t ‘just’ flesh and bone.

We can do better in understanding the nature of created being, most

abstract to most concrete, without rejecting the understanding of the physical aspects of concrete being which has been given us by modern physics. To do better, we'll have to muster up the courage to talk in a rational and coherent way of the unity of being so that we don't have to sing fairy-tales or speak gibberish to describe, for example, men and human societies as they really are.

Before I re-present my proposed better way to understand created being, I'll provide a diagram and a short discussion of a very simple, maybe simplistic, form of Platonic Realism.

## 169.2 Platonic Realism or Idealism

I'm presenting this diagram only as background of sorts:

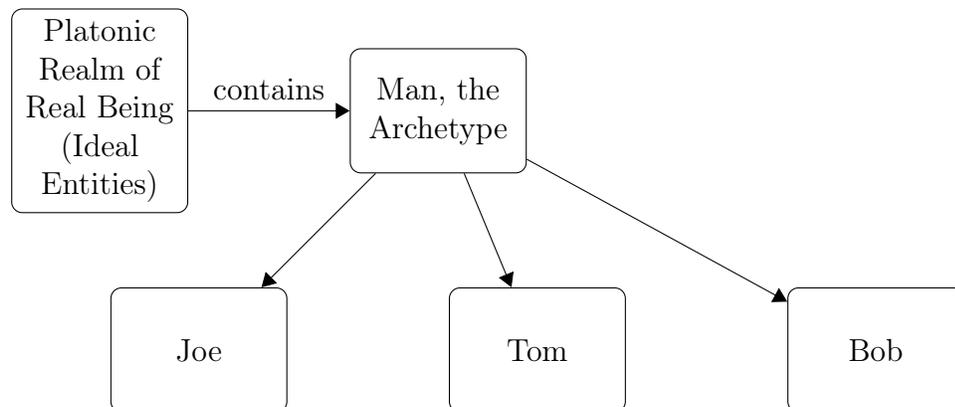

Figure 169.2: Platonist Particular Entities **Do** Come From a Single Archetype

In Plato's metaphysics, there are apparently a set number of types of entities each having an archetype in the world of the Ideals or the Reals. From the archetype Man, come specific men, such as Joe and Tom and Bob. One claim made by some scholars is that Plato's Ideals were the only immortals. For example, any reference to an immortal soul was a reference to the soul of Man. Joe and Tom and Bob were mortal creatures and could have part in immortality only through the species archetype of Man. There are no individual immortal souls in Platonic metaphysics, despite ongoing rumors to the contrary.

### 169.3 Loyd Fueston's Worldview: Concrete Entities Are Formed by Multiple Streams from Abstract Being

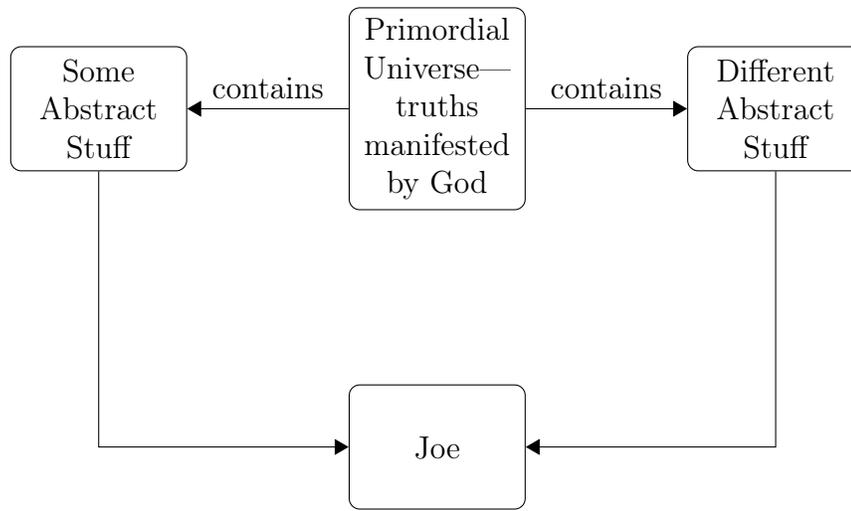

Figure 169.3: Particular Entities Don't Come From a Single Archetype

The main point of this is that there is an ongoing flow of being from abstract realms into this universe, this realm of concrete being. Each thing, no matter how mundane or seemingly simple, is the concrete level of a complex of different forms of being going deep into realms of abstract being.

At the same time, currently available empirical evidence and theoretical arguments tell us there was a special flow of certain fundamental forms related to the beginning of the current expansionary phase of this universe. Did this universe exist as such before it began to expand? If the physical stuff which we know as the matter, energy, and fields of this universe did exist before the so-called Big Bang, was it already embedded in relationships with the forms of abstract being which lead to what might be called the 'immaterial' aspects of this world?

The questions are badly phrased for now, but I think that it's clear what sorts of questions we should be asking to properly enrich the understanding of created being, the entire spectrum from abstract forms of being to the concretized being shaped from abstract forms.

## 169.4    Loyd Fueston's Worldview From One Step Back: A More Plausibly Complex Model

I'll republish the diagram from Chapter 438, *The Liberal Mind: The Essence of Liberalism* to demonstrate other aspects of my understanding of created being. This diagram was written to help me present my claims that our understanding of our own moral natures can be enriched by borrowing, in a special way, from general relativity. Specifically, I had noticed that we speak of our moral paths through life in Euclidean terms but those terms seem inadequate for human beings who live in societies grown tremendously complex and rich. I hope this makes my claim clearer and more plausible:

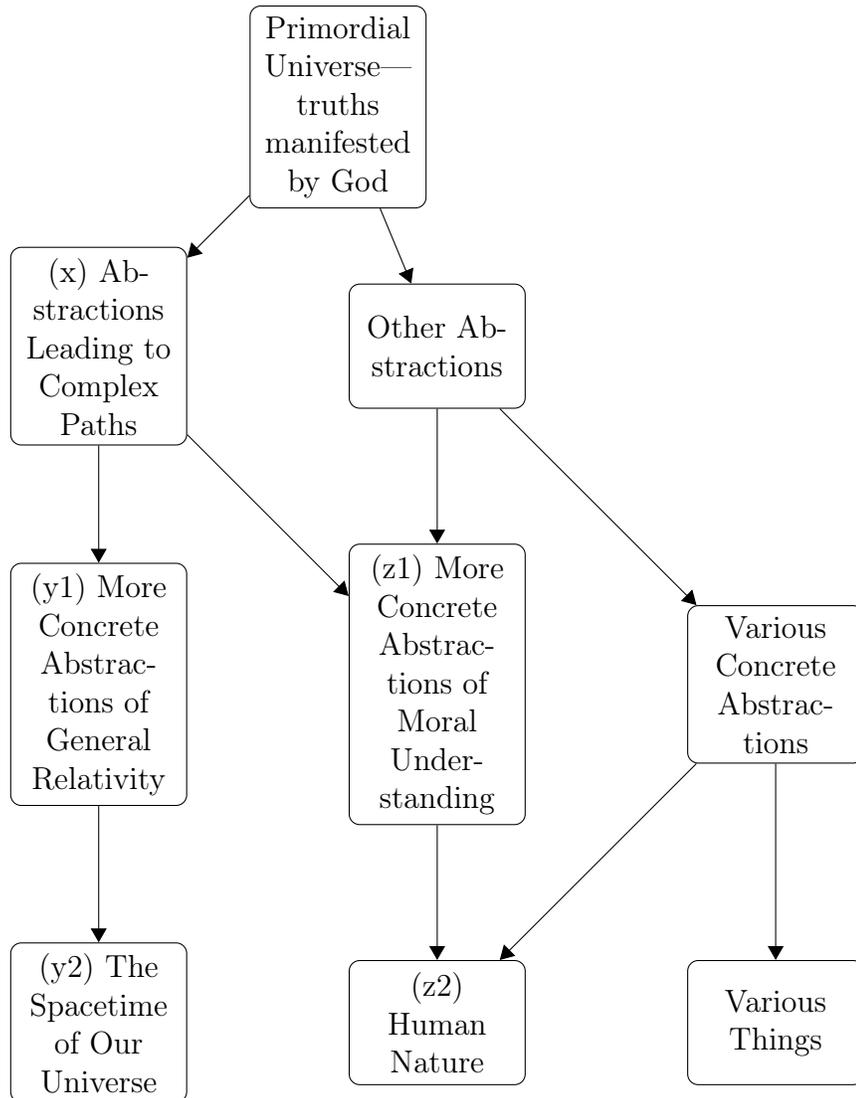

Figure 169.4: Simple Relationships of Abstract and Concrete Levels of Being

# 170 Being: Responding to Some Objections to the Reality of Abstractions

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1177>. It was finished and uploaded on 2012/02/08.]

In reading Richard Gregory's *Mind in Science* [65], I find that he raises a seemingly plausible objection to those thinkers who 'regress' to seeing abstractions, including knowledge, in the objective world. He states his objection in a short and loaded way:

[The psychologist Kenneth] Craik is suggesting that human inference has its validity and logical power because and only when it shares the structure of reality. This is pushing the concept of analogue computing to its limit. But how can thinking be like the objects of thought? Craik is surely slipping back here into a 'picture' account with all its attendant difficulties. . . . Craik is forced to say that abstractions such as numbers exist as other objects exist; for his brain states are non-representing objects. He thus goes back on Gauss's insights, which rescued us from the classical difficulties of mathematics, logic and language. This is surely a step backwards, which we should regard with extreme caution. [page 373]

I see various problems with Gregory's viewpoint, not from a traditional Platonist viewpoint which—at least allegedly—follows the ancient Athenian's view that there is an abstract realm which is more real than this concrete world. My starting point is a sophisticated-naive re-understanding of

modern understandings of space, time, matter, and energy—from cosmology and particle physics and abstract mathematics, but also history and poetry and music. With this sort of re-understanding, deliberately bereft of conventional epistemological filtering of real-world information, I have come to believe that concrete forms of created being are shaped from abstract forms of created being. This wasn't really something forced upon me, in any bad way, but ultimately a way of truly solving the problems Professor Gregory refers to. The problems weren't caused by Platonism as such but rather by any general attempts to separate thought and object. Recently, I read about such efforts in *The Meaning of Truth* [78], a collection of Williams James' articles on the real meaning of pragmatism. James knew quite well that man as we know him, the physical creature, doesn't have any special access to any sort of transcendental realm of truths or thoughts or whatever, but I know of no Jamesian pragmatist who has grabbed the bull by the horns and dealt directly with the discontinuities in being caused by this separation of concrete and abstract realms though such thinkers as Walter J. Freeman and Gerd Gigerenzer have helped to establish the human mind as a set of relationships centered upon a creature of concrete being.

But I deny man is fully a concrete being and I speak not of just the fact that all concrete beings in this universe have relationships which are immaterial. Concrete being is shaped from abstract being and that more abstract realm remains in our bodies and our relationships—including our minds—as clay remains in the bricks of our buildings, as carbon and hydrogen remain in the wood of the frames of those buildings. The modern feeling that it's wrong to conjecture a separate Ideal realm is valid but modern thinkers have not the guts or perhaps simply not the flexibility of mind to realize that if there is no Ideal realm but there are abstractions we can somehow access, that means those abstractions are here, in the very stuff of our bodies and in our relationships with other entities and with the entirety of various narratives.

We are still the clay as well as bricks, in a manner of speaking. Going beyond the clay, we're also carbon and oxygen and arsenic (a small amount only, please). Still further, we find ourselves to be protons and neutrons and electrons and—very rarely—some of the strange particles mostly produced in high-energy regions such as supernovas and the accelerators at physics labs. Beyond that? I'll skip a layer or so being actively explored by exotic empirical investigations and I'll claim we are yet those very strangely abstract entities in the investigations of theoretical physicists and mathemati-

cians. Or at least we're the ones which really exist. These investigations are in an early stage and the specific directions chosen by theoreticians might not correspond to the abstract forms of being from which this universe was shaped. But it seems true for now that our universe was shaped from some relatively more abstract form of being and I'm willing to conjecture that process, in one or more additional steps, takes us back to the truths manifested by God when He called Creation into existence.

I'm going to turn to a mathematics textbook, Morton Hamermesh's *Group Theory and its Application to Physical Problems* [68], where we read:

It must be stated at the outset that all our results [dealing with various physical problems] are obtainable without the formal methods of group theory. The alternative "simple" methods are, in fact, a physicist's rediscovery of some group-theoretical techniques. For simple problems, the formal treatment is also simple; in complex problems, the use of powerful tools can save considerable labor. We should not deprecate formalism as such—so long as the physical ideas are not lost from sight, the formalism is valuable. [page xiii]

Professor Hamermesh is far too modest on the behalf of mathematics and other fields of abstract thought. One clue that such is the case is the dependence, shown over the history of human thought and anticipated in a general understanding—however imperfect—in the thought of Aristotle and—even more so—St. Thomas Aquinas, that abstractions of the most ethereal type often end up being used in the physical sciences and engineering. Moreover, many abstractions in both mathematics and metaphysics have been generated over the centuries in the works of physics and other fields of empirical studies and contributed back to mathematics or metaphysics. In fact, Aquinas seemed to think the second process to be dominant, understanding abstract forms of being by studying concrete forms of being, but he lived before science and mathematics had become major, self-sustaining activities.

In their deeper and not directly observable levels, cosmological physics and particle physics—I'll ignore the overlap for now – conjecture entities which are quite abstract, that is, they have effects in the directly observable levels of concrete reality but they are radically different sorts of entities. This actually occurs even at all levels where there is a quantum effect.

The wave-function of quantum mechanics has a ‘dual’ nature of a sort only roughly similar to the dualistic natures some conjecture for body-soul or brain-mind. Interact with that wave-function thingie as if it were a particle and – abracadabra—it is a particle with particular location. Interact with that wave-function thingie as if it were a wave and – abracadabra—it is a wave with a particular momentum. It’s possible this is telling us something—maybe there is some substantial truth and not just an analogical truth in my claim that concrete flesh-and-blood human beings are frozen soul. That’s a matter not to be settled, so far as I can tell, until we have a vocabulary and a way of using it that we can test our ways of speaking about the full spectrum of being. I certainly don’t claim to have such a vocabulary nor such a way of using it and feel strongly this will result from a multi-generational effort by a good number of explorers and thinkers.

I’m moving fast and furious rather than carefully and so I’ll move on to discuss some comments made by William James in *The Meaning of Truth* [78]. First, he tells us:

Abstract concepts, such as elasticity, voluminousness, disconnectedness, are salient aspects of our concrete experiences which we find it useful to single out. Useful, because we are then reminded of other things that offer these same aspects; and, if the aspects carry consequences in those other things, we can return to our first things, expecting those same consequences to accrue. [page 246]

I have talked often about the mind’s movement from the concrete up to the abstract and back down to another, different but similar, concrete thing or relationship of concrete things. The difference is that I claim it corresponds to real being, that is, the things and the other things, as well as the relationships, at the concrete level aren’t just ‘thought about’ using the abstractions, they are shaped from abstract being which corresponds to those abstractions which are far from ‘merely’ mental. In our acts of ‘thinking about’, we are imitating the Creator’s acts of creating concrete things by shaping them from abstract being.

Again quoting William James from *The Meaning of Truth* [78]:

Without abstract concepts to handle our perceptual particulars by, we are like men hopping on one foot. Using concepts along with the particulars, we become bipedal. [page 246]

This is true but also sticks to the view that there is being, real stuff, and then there are magical incantations which help us describe and maybe control that real stuff, but those incantations are connected to the real stuff only through the human being, our bodies and especially our perceptual organs being in contact with the real stuff and our minds being able to grab hold of the magical words which allow us to generate human abstractions about the true reality, the reality of dirt and water and flesh and blood. No.

Again, no. As I've said before, James and his followers came to understand deeply and truly the bottom-up processes by which we can make sense of empirical reality. James seems to have rejected the possibility that we are, in a manner of speaking, building up into an existing world, however tentatively we perceive and conceive that world, when we engage in those bottom-up processes. Both the philosopher James and the mathematician Hamermesh above see the patterns of the abstract in the concrete thing but don't pursue the possibility that both are forms of being, different points on a spectrum of created being as I've claimed before. That spectrum of being is necessary for a world, a universe ordered to be a moral narrative. That spectrum is necessary for a human being to become a true person, and entity which shares the fundamental properties of a world: unity, coherence, and completeness.

Let me try to pull this line of thought together a little.

In the modern world, we've learned lessons such as these:

1. space and time can be one structure,
2. the very stuff of stars and rocks and human flesh were shaped from some strange stuff in the early seconds of the expansion of the universe and that strange stuff seems to be abstract in such a way as to be describable only in terms of what might be called 'demanding' mathematics,
3. the constituents of matter behave in ways that force us to give priority to relationships over stuff, and
4. there are numbers far greater than what we call 'infinity'.

In understanding this sort of exciting and disturbing knowledge, in understanding the narrative physicists have proposed for this universe, in understanding the evolution of life and of the human brain in particular, in

understanding the appearance of the human mind in history, I've come to believe that created being is created being is created being. I've come to believe we should take quantum physics and cosmological physics and particle physics seriously—concrete, thing-like being is shaped from some more abstract sort of being.

It's good to appreciate the ways of building knowledge of the empirical realms of being by bottom-up means. It's good to appreciate the value of applying abstractions to extend and deepen that knowledge. Yet, we achieve the widest and deepest understanding of this universe if we avoid the easy path of "understanding empirical things, by studying those things and applying abstract thought during that study." To be sure, there is much that can be accomplished by traveling that path, but there's a harder path by which we seek to understand what is the relationship between the abstract and the concrete rather than thinking the abstract to be no more than a tool useful in understanding the concrete. Is abstract thought, even mathematical thought, no more and no less than magical incantations by which we gain some sort of occult control over rocks and flesh and energy? Is the abstract no more and no less than wizardly wisdom? In opposition to such ways of thought, implicit or explicit, I claim that created being lies on a spectrum going from the fully abstract, the truths God manifested as the truly raw stuff of Creation, to the fully concrete, the rocks which are frost-heaved each year through the New England soil.

Let's have the courage and the faith to respond to created being in its deepest and widest form, the totality of created being.

# 171 What is? What Can Be Measured? Who Cares?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1215>. It was finished and uploaded on 2012/03/17.]

This article, *One Thing Is Certain: Heisenberg's Uncertainty Principle Is Not Dead* at <http://www.scientificamerican.com/article.cfm?id=heisenbergs-uncertainty-principle-is-not-dead>, gives an interesting summary of one important aspect of what is called Heisenberg's Uncertainty Principle.

[T]he uncertainty principle comes in two superficially similar formulations that even many practicing physicists tend to confuse. Werner Heisenberg's own version is that in observing the world, we inevitably disturb it. And that is wrong, as a research team at the Vienna University of Technology has now vividly demonstrated.

Led by Yuji Hasegawa, the team prepared a stream of neutrons and measured two spin components simultaneously for each, in direct violation of Heisenberg's version of the principle. Yet, the alternative variation continued to hold.

What is this other formulation of the Uncertainty Principle which is only superficially similar to Heisenberg's formulation?

The same year [as when Heisenberg proposed his Uncertainty Principle], Earle Kennard, a less-known physicist, derived a different formulation, which was later generalized by Howard Robertson:  $s(q)s(p) \geq h/4\pi$ . This inequality says that you

cannot suppress quantum fluctuations of both position  $s(q)$  and momentum  $s(p)$  lower than a certain limit simultaneously. The fluctuation exists regardless whether it is measured or not, and the inequality does not say anything about what happens when a measurement is performed.

I'm still in the process of learning some of the technical aspects of quantum theory. I think a serious understanding of those technical aspects will lead to more disciplined ways of writing and speaking about some particular aspects of the concrete forms of created being which, so to speak, came boiling out of the complex events simplistically labeled the Big Bang. I learned my basic views of quantum physics first as prejudices which were not well supported by serious knowledge, but I learned my prejudices from men who understood quantum physics, sometimes as physicists and sometimes as philosophers and sometimes as both. I can still recall Fr. Stanley Jaki, the Benedictine polymath who had a doctorate in physics in addition to the more traditional degrees of a Catholic priest, standing in front of a group in a large meeting-room at UMass Amherst and telling us that the Uncertainty Principle was unbeatable because it was a basic principle of being in this universe and not a problem of measurement inaccuracies due to disturbing the entity being measured. I can't remember him saying more than that to that gathering of scientifically literate non-physicists. I can't even testify that I remember his words accurately, but I remember the clear gist of what he said and Fr. Jaki was a man with an irritable manner when it came to matters of principle in theology and science alike. But my taste in 'popular' science also runs to books written by highly-regarded scientists writing for other scientists from other specialties as well as scientifically literate laymen.

So it is that I have understood for a couple of decades that there is an uncertainty principle which deals with more fundamental issues than the disturbance of an entity during a measurement process. This doesn't mean I was clear it was separate from Heisenberg's Uncertainty Principle, but I knew something substantial about the issue.

I'll state matters in my currently clumsy terms. A quantum entity, described in terms of a wavefunction, has a coherent set of aspects which we think of in terms of position and momentum. Position is a particle-type property, momentum is a wave-type property. By the very nature of a wave, its attributes are found over the entire region of what can simplistically be

called its region of vibration. This means that momentum can seemingly be understood as a wavefunction aspect and position as an aspect of a concrete thing and that means we don't really understand either aspect.

I'd hardly be original in claiming this tells us that the 'wavefunction' stuff is defined by groups of aspects which don't quite correspond to this concrete level of thing-like stuff, which is particle-like to our perceptions though we know of things such as vibrating drum-heads. That level described by wavefunctions is a more abstract level of being, in my way of speaking. This means that there are some more abstract properties in that more abstract realm of being in which wavefunctions can be found, so to speak, and when shaped to a more concrete form, these properties show up as the properties of mass-energy, fields, and—in some way not yet apparent from gravitational theories, spacetime. That is, those more abstract properties can be shaped to the more concrete properties described so well in classical physics. This points to some confusion—quantum physics first developed because what I'm calling "more abstract" realms of being have direct effects in this "more concrete" realm. Those abstract forms of being down just disappear in favor of more concrete forms of being, they continue to exist in the most thing-like of things.

The abstract realms of being, including even the realm of truths manifested by God as the basic stuff of created being, are present in this universe which seems to first perceptions to be so concrete. In fact, this universe seems so concrete that many thinkers, and many non-thinkers as well, have tried to explain the immaterial aspects of this universe by positing immaterial substances, explaining what I see as human relationships to the various entities and relationships of this universe by positing some mind-stuff or soul-stuff.

I've written often of this and will refer the reader to Chapter 169, *From Abstract Being to Concrete Being and Narratives*. This current chapter provides a very simplified overview of my view of being and a simple comparison to the view of being of Plato and the naive view held by working scientists during their 9-5 moments.

After a little contemplation, most thinkers with any scientific literacy will understand that I'm making obvious the way in which science works, moving up to the more abstract to develop more powerful concepts and skills and then moving down to apply what has been learned to the concrete world. At the same time, I'm recommending that this process can be used across fields, not to make political science a branch of physics but rather

to allow political scientists to acquire some potentially useful concepts and skills. Even more importantly, I'm claiming this process of movement from concrete to abstract levels and back again is a true reflection of the nature of created being and not just a human intellectual strategy.

Returning more strictly to the specific subject of this essay, I'm suggesting physicists have one foot in the concrete world of momentum-location of a classical sort, one foot in a more abstract world in which they formally use wave-like attributes such as momentum and particle-like attributes such as location and don't quite know how to translate these formalisms into an appropriate understanding of momentum-location in our concrete universe. In Chapter 90 written early in my career as a blogger, *Shaping Our Minds to Reality*, I addressed this issue. At the risk of bad authorial manners, I'll repeat the quote from a good and accessible book written by a man both theoretical physicist and Anglican priest:

The wavefunction is the vehicle of our understanding of the quantum world. Judged by the robust standards of classical physics it may seem a rather wraith-like entity. But it is certainly the object of quantum mechanical discourse and, for all the peculiarity of its collapse, its subtle essence may be the form that reality has to take on the atomic scale and below. Anyone who has had to teach a mathematically based subject will know the difficulties which students encounter in negotiating a new level of abstraction. They have met the idea of a vector as a crude arrow. You now explain to them that it is better thought of as an object with certain transformation properties under rotation. 'But what is it *really*?' they say. You implore them to believe that it is an object with certain transformation properties under rotation. They do not believe you; they think that you are holding back some secret clue that would make it all plain. Time and experience are great educators. A year later the student cannot conceive why he had such difficulty and suspicion about the nature of vectors. Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality. If we are indeed in such a digestive, living-with-it, period, it would explain something which is otherwise puzzling. A great many theoretical physicists would be prepared to express some unease about

the conceptual foundations of quantum mechanics—in particular, about Copenhagen orthodoxy—but only a tiny fraction of them ever direct serious attention to such questions. Perhaps the majority are right to submit themselves to a period of subliminal absorption. [117] [page 82]

I don't really have a lot to add except the suggestion that scientists might have headed off-track on dealing with this problem. They perhaps need to ascend to a higher level of abstraction than even that wavefunction of quantum mechanics. Arguably, they are doing so in string theory and superstring theory and awesome string theory or whatever, but there's little evidence so far that they've made progress in the basics—strings do allow some tentative understanding of the different masses of some particles otherwise the same. That's an important problem but string theory seems to be generating more fancy equations than insights.

Anyway, my goal is merely to raise the issue of proper abstraction when we encounter conundrums such as those faced by modern quantum theorists. I don't think much real progress will be made until a Newton or an Einstein arises, one who sets out accepting reality rather than trying to explain it away with too many well-formed, but ultimately questionable, assumptions about the nature of that reality. Then some of the conundrums might be restated as an acceptance of reality along with a statement of what truly needs to be dealt with by creative minds. The most powerfully creative mind will merely be idling at a high rate if it's trying to answer a question raised by the sudden emergence of a new level of being and trying to answer that question in terms of being as understood before this interesting surprise.

# 172 Frozen Soul and Other Delicacies

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1257>. It was finished and uploaded on 2012/05/03.]

What do you do with a frozen soul? You could lick it because, speaking in general terms, a Popsicle is as much a piece of frozen soul as a human being is. And so are rattlesnakes and monkeys and rocks hurtling through space. You can also saw frozen soul, beginning the process of making a house for sparrows. That leads to the insight that you can hammer a spike of frozen soul driving it straight so boards of frozen soul are held in place.

Some chunks of soul are less frozen than others. Some are described well by quantum mechanics as being some sort of strange vapor which might condense into a liquid or ice with any of a variety of properties and locations. Frozen soul also interacts with spacetime in ways that make the entire topic still stranger from the viewpoint of embodied creatures who detect something else in their own selves and, perhaps, a lesser something in other sorts of created beings. We're surrounded by vagueness and strangeness, abstractions and soul-stuff, when we try to understand the more fundamental stuff from which ordinary or concrete stuff was shaped. Stranger and stranger and stranger, surpassed only by outright weirdness.

When God chose to create, He manifested certain truths—perhaps an infinite number of truths—as the raw stuff of Creation. How do I know this? I don't. I'm speculating, working up a plausible story based upon the evolutionary and developmental nature of this universe as modern empirical knowledge would have it, history and Biblical exegesis as well as physics and biology. I don't wish to either greatly qualify or excessively constrain any view of the 'truth' value of these great mounds of empirical knowledge,

themselves not well-explored in true scientific, that is—systematic, ways. This body of knowledge, partly digested and occasionally plundered and wrongfully exploited by ideologists, is the best knowledge we have outside of a very small body of truths revealed to us—but even those truths were and are revealed through the eyes and ears and brains of the embodied creatures which we human beings are, and ultimately that process of revelation is describable in the terms I'm explaining in this essay.

The intellectual enemies of religious believers and also of some skeptics who believe in something more than this material stuff aren't those who acknowledge the importance and goodness of matter and physical energy but rather those who talk in such terms but litter their talk with reductionistic words such as 'just' or 'only', most especially when those words are implied rather than stated explicitly. We should remember that many who claimed to be believers in a Creator-God have also spoken in such reductionistic terms of matter while claiming to believe in some sort of a higher world. I'll leave that thought hanging and go on to deal with the totality of things and relationships and events in this universe. That totality implies a greater scope to created being than does any sort of reductionism. We start with what we can see and touch and explore, but soon enough realize that even the most vulgar entities in this universe show that evidence of something not reducible to pig-flesh nor granite nor ionized hydrogen gas. Something so simple as a journey to somewhere tells us the road, dirt and rock or asphalt, is more than 'just' a road made of one or more of those forms of matter. That journey also tells us the traveler is 'more' than a slave to his genes, more than a 'mere' product of evolutionary forces, biological and cultural, more than even a 'mere' product of his personal development. As the road is that road-stuff but more, so the traveler is his genetic-stuff and his soma-stuff but more. He is a product of various developmental and evolutionary processes. All that stuff and all those processes are more than 'mere', more than 'just'.

Extrapolating backward in time is nearly as foolish an endeavor as extrapolating forward in time, but some good can come from it, some ability to understand at least some aspects of Creation and to maybe anticipate potential opportunities or problems. This sort of foolishness can be great fun but it's also necessary for the founding of a civilization, an activity perhaps possible to conscious intention for the first time in history. We live in an age of not only heightened self-awareness but also an historical self-consciousness which renders some modern communities minded in the way

that individuals first became minded at some time during the development of the human race—I've conjectured this had happened about the half a millennium before the birth of Christ in some of my writings because of the sudden appearance, or at least sudden recording, of self-aware and abstract reasoning in several regions—Greece and India and Israel and China and perhaps others.

In any case, some modern men have minds allowing for an understanding of abstract forms of being and also events which must be seen as abstract such as the one we refer to as the Big Bang. I call this an abstract event for the simple reason that it left behind some concrete evidence of what happened, but the event itself occurred before mass and energy had settled down to a state where human observation, by way of sight or hearing or touch, could have happened even in principle. Electromagnetic energy was bound up with other sorts of entities in such a way as to exclude even a hypothetical vision of the events in the first few hundreds of thousands of years after that Big Bang.

If we imaginatively travel backward in time toward that Big Bang, we see mass and energy melt down towards strange states which I interpret as being more abstract versions of the various sorts of mass and energy. For example, weak nuclear energy and electromagnetic energy melt into a form of energy labeled 'electroweak'. This doesn't happen because of some approach to a mysterious creation-event but rather because of a compression into a tiny region or, more or less equivalently, because of an unimaginably high temperature. What compresses? What turns up the burner?

Let's first think of the process in temporal order, from the Big Bang forward. The 'stuff' of this universe expanded out of that very tiny region in an event which can be described as explosive though it was not like an explosion that shatters a seam of coal in a mine-tunnel. It was an explosion in which our spacetime were shaped into a particular form and then participated along with the more palpable stuff which are more particular or more concrete forms of being. That change of state was a great expansion or, equivalently, a cooling down. I often speak in terms of a freezing of more abstract forms of being. I'm only somewhat joking when I say instead: a freezing of soul or soul-stuff. I think this sort of abstract being was the intuited state of created being which was the point of discussions of 'soul' or even 'mind' by the more clearheaded thinkers of ancient and Medieval and modern times. We, and all the other entities of this universe, are shaped from this abstract being, this soul-stuff, but it's still with us, part of us, as

clay is still part of the bricks of our houses and walls.

In fact, we can view the Big Bang as a change of state at least analogically similar to the explosive weather events which occur when warm, moist air moves up the slope of a mountainside and water begins to cool so that the moisture condenses in the form of rain and/or snow.

As I see it, that change of state during the Big Bang was from a more abstract form of being, let's call it vapor in warm air, into a more concrete form of being, let's call it condensed water or even ice-crystals. So it is that I say that concrete stuff, water or ice-crystals, is frozen soul, vapor or water in a highly energized state of being. We human beings are frozen from the same soul-stuff as the most humble entities in this universe but we are in a form that makes us capable of exploring Creation, of struggling toward an understanding, even—in principle—of encapsulating in our own being the acts of our Maker in shaping the created being of our universe and of all Creation. Each human being, however humble, is born a potential image of his Maker and can become a better image by actively responding to the opportunities and problems which he encounters when living his humble life.

# 173 Studying Steam When All You Have is Ice

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1292>. It was finished and uploaded on 2012/06/03.]

I've often claimed that more particular, more concrete forms of being are shaped from more abstract forms of being, themselves tracing back after some number of stages to the truths God manifested as the raw stuff of Creation. In the spirit of meta-physics as properly conceived, in my opinion, by Aristotle and some of his predecessors, my claim is based upon an abstraction from the best physics of my day, supplemented by some general concepts from other fields, such as the understanding of this world as one of evolution and development which has come from Darwin and his successors.

The specific claim in this essay comes from my understanding of the discovery of modern cosmology and particle physics that forces and particles melt into more general forms at extremely high temperatures or, equivalently, extremely high densities. There's more to it than that, but I wanted to bring up the subject because I noticed two articles about states of matter which are difficult to reach, difficult but not impossible, to explore empirically.

First, there's an article about trying to explore a state of matter which exists at temperatures or densities whose existence would have been denied by Einstein, let alone Newton or Aristotle. In a very short review, *Synopsis: Deconstructing the Quark Gluon Plasma* found at <http://physics.aps.org/synopsis-for/10.1103/PhysRevLett.108.212301>, we can read:

Understanding steam would be really difficult if one only had access to cubes of ice, yet this is exactly the challenge con-

fronting researchers studying the quark-gluon plasma (QGP), a liquidlike state of matter obtained from colliding atomic nuclei at relativistic energies. The constituents of the plasma are quarks and gluons that are momentarily liberated from the colliding nucleons, but the strong nuclear force freezes these particles so rapidly into protons, neutrons, and other stable hadrons that it is difficult to measure them directly. To understand the microscopic constituents of the plasma (quarks and gluons), experimentalists need to know how to interpret what they can actually measure (the relic hadrons).

The article goes on to talk about a proposed theory which might be testable with current particle physics facilities.

The second article, *Exotic Particles, Chilled and Trapped, Form Giant Matter Wave* found at <http://www.sciencedaily.com/releases/2012/05/120524112511.htm>, tells us:

Physicists have trapped and cooled exotic particles called excitons so effectively that they condensed and cohered to form a giant matter wave.

...

Excitons are composite particles made up of an electron and a “hole” left by a missing electron in a semiconductor. Created by light, these coupled pairs exist in nature. The formation and dynamics of excitons play a critical role in photosynthesis, for example.

Like other matter, excitons have a dual nature of both particle and wave, in a quantum mechanical view. The waves are usually unsynchronized, but when particles are cooled enough to condense, their waves synchronize and combine to form a giant matter wave, a state that others have observed for atoms.

There are different sorts of steam in the physical world and the scientists doing the work discussed in the above article managed to separate an exotic sort of steam playing a major role in at least one important process, photosynthesis, and then they froze that steam to study further the properties of the colder, liquid form of the stuff.

The principle I’m claiming to be true is one of the most important in my worldview. It is not just an add-on but is necessary to my way of seeing the

world as unified, coherent, and complete, combining the revealed truths of Christianity as well as the empirical knowledge built up over the course of human history by various sorts of scientists, mathematicians, philosophers, theologians, poets, historians, and so forth. In a word, I seek to reunify human knowledge of our one Creation so we can understand it as such. Having a richer and unified understanding of being, which is the primary work of metaphysics, is a necessary part of this effort.

Again, the claim is:

Being lies on a spectrum going from the abstract (very hot) to the concrete (frozen). The more concrete forms of being are shaped from the more abstract.

# 174 Moon-dust Really is More Ethereal Than Earth-dust

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1307>. It was finished and uploaded on 2012/06/19.]

While examining samples of moon-dust, scientists discovered the stuff is a bit unusual, even by the standards of those who study ethereal stuff and relationships on a regular basis. Moon-dust, seemingly macroscopic stuff, shows quantum properties of the sort usually found only in such entities as individual atoms or subatomic particles. It seems that some dust on the surface of the moon is so thoroughly pulverized as to be small enough that it exhibits some quantum properties. Remember that quantum properties come from small energy transfers or related transitions—small is defined in terms of, as one example, the energy it takes for one electron to move to the next ‘orbit’ as it kind-of circles a nucleus. That’s a pretty small amount of energy but such wee bits of energy are apparently large enough to affect this moon-dust.

This was even a little surprising to me with my understanding of created being as a spectrum from the things of a concrete realm of being, such as ordinary dust, to abstractions, such as quantum wavefunctions. To be sure, quantum effects can be seen at the macroscopic level in at least a few cases under study, perhaps even in some parts of the human brain so finely balanced that an orbital transition of one electron can change the overall state of that macroscopic system. Recently, I’ve read that quantum effects play a role in photosynthesis. Chapter 366, *Creation and Freedom*, was originally written, in 2007, in response to a claim of Henri Bergson in *Creative Evolution* [10]. In that chapter, I wrote about scientists producing in a lab, in 1995, a “state of matter predicted decades ago by Albert Einstein

and Indian physicist Satyendra Nath Bose.” In this state of matter (close to a temperature of absolute 0), an assembly of atoms behave as one.

At that, few have expected to find a large mass of stable material which exhibits weird quantum effects on an ongoing basis. The article discussing this weirdness in some moon-dust is: *Nanoparticles Found in Moon Glass Bubbles Explain Weird Lunar Soil Behavior* at <http://www.sciencedaily.com/releases/2012/06/120613102442.htm>. The article speaks in a very general way of the reasons the pulverized dust can remain in its strange state. Under the conditions we know of on the earth, the dust wouldn't remain in such a state. The dust would recombine and become normal dust with macroscopic properties which don't allow quantum effects to show through.

What does this mean? If anything.

This moon-dust is thing-like being which exhibits some of the nature of more abstract forms of created being such as that we know as quantum wavefunction. I've claimed in my writings that the abstract being from which thing-like being is shaped remains in that thing-like being. We and the things around us are yet the truths manifested by God as the raw stuff of Creation, the stuff from which all created being is shaped. Moon-dust provides an interesting and unexpected support for the Thomistic claim that “Things are true” and also of my additional claim that “Truths are thing-like.” For one of my earliest, but still relevant discussions of this issue of abstract and concrete realms of created being, see Chapter 159, *Negative Theology in Physics and Metaphysics*. A somewhat more advanced viewpoint, with simple graphs, is developed in Chapter 169, *From Abstract Being to Concrete Being and Narratives*.

The abstract stuff from which we're shaped is still here and particularly here in moon-dust.

# 175 More on Matter as Frozen Soul

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1346>. It was finished and uploaded on 2012/07/17.]

There is likely a tendency for scientifically literate laymen, such as myself, to think of quantum effects in terms of the forces and particles of interaction, of potential, rather than in terms of what some might label 'brute matter'. Miracles of scientific measurement and experimentation are almost to be expected nowadays and, lo and behold, we learn in the article *Viewpoint: Matter Waves and Quantum Correlations* found at <http://physics.aps.org/articles/v5/70>:

[R]esearchers now have efficient tools in their hands to probe light fields for quantum signatures. Remarkably, these correlations have now been measured for matter waves too.

In other words, scientists now have reliable ways of showing that the seemingly inert stuff of rocks and flesh has wave-like, quantum properties. To be sure, this quantum nature of even rock-like substances showed up in the distributions of radioactive decay (think half-life) for all sorts of dense, heavy matter, but this expansion of experimental measurement emphasizes that matter is not what we naively think it to be, not what even so sophisticated thinkers as Newton and Boyle thought it to be, no, not even what more recent thinkers such as the Curies or Bohr thought it to be.

Most importantly, it emphasizes that matter also participates in a world of relations and of those metaphysical and concrete processes which are acts-of-being. In philosophical terms, the world is relationist and existentialist

and not essentialist. Matter is being reshaped as it interacts with other bits of matter, with the universe as a whole, and with itself.

See Chapter 156, *A Christian View of Einstein and Bohr's Debate on the Meaning of Reality* for an early discussion of this issue.

## 176 Are Entities Limited to Properties of Their Parts?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1440>. It was finished and uploaded on 2012/11/23.]

Can we derive the properties of complex entities from the particles or lesser entities from which they are built or from which they grow? The modern man tends to answer, “Yes,” even when he’s an accomplished thinker in a field which involves higher level analysis of empirical or abstract knowledge. This idea, underlying various sorts of reductionism, is an assumption, an unwarranted assumption so far as current knowledge of created being goes, though it is denied by a good number of scientists in fields such as neuroscience and cosmology and mathematics. Clearly, there are many thinkers in the humanities as well as various sorts of creative writers and artists who also deny reductionism is a valid way to approach being in general. I’m lumping theology and philosophy in with humanities for this discussion. Reductionism can be a very effective way to approach being constrained to one level of being. In Chapter 272, *Human Moral Nature: An Overview*, I provide an overview of created being lying on a spectrum of different levels ranging from very abstract to concrete, thing-like being.

Let me quickly discuss a couple of anti-reductionistic findings from physics, the first being a recent result.

The BaBar Collaboration conducts experiments and analyzes the results at the BaBar detector at *SLAC National Accelerator Laboratory*—see <http://www6.slac.stanford.edu/>. Some of the physicists in the BaBar Collaboration have recently found direct evidence of asymmetric time-reversal in decays of the B-meson. In the overview article, *Viewpoint: Particle Decays Point to an Arrow of Time* found at <http://physics.aps>.

[org/articles/v5/129](http://org/articles/v5/129), we can read:

Time moves irrevocably in one direction. Things get old, decay, and fall apart, but they rarely ever reassemble and grow young. But at the particle level, time's arrow is not so clearly defined. Most collisions and other particle interactions look the same whether run forwards or backwards. Physicists have, however, identified a few reactions that appear to change when time is reversed, but the reasoning has assumed certain relations between fundamental symmetries of particle physics. The BaBar collaboration has now observed time-reversal violation directly and unambiguously in decays of B mesons. The measured asymmetry, reported in *Physical Review Letters* [footnote elided] is statistically significant and consistent with indirect observations.

Why is it that we could have at least some asymmetric time-reversal at the particle level but no evidence of any such time-reversal at the macroscopic level? Indeed, we have no evidence of complex thing-like being, as such, engaging in any processes of time-reversal, though symmetric time-reversal is allowed by the mathematics. Why is it that things age but don't grow young, Humpty-Dumpty becomes a puddle of goo surrounded by egg-shell fragments without the process ever going in reverse? After all, in a local sense, many of the most important, and certainly most readily quantifiable, of the physical events of our universe are well-described by the equations and reasoning procedures of Newtonian physics under most conditions and special relativity under the remaining conditions. Newtonian physics and special relativity are both symmetric in time, indifferent—so to speak—between movement 'forward' or 'backward' in time.

We have to, and should, move forward optimistically, assuming that what we know to such extraordinary precision, such as particle interactions described as QED, is true, truly true, but we have to also realize that there are holes, complexities, and unknown regions beyond the frontier. Moreover, Newtonian and special relativity physics describe stuff subject to global interactions not so clearly subject to the laws, or more general rules, of the constituent stuff. Even QED describes the stuff of, say, semiconductors but doesn't tell us anything about the larger-scale events which occur when that stuff functions as the stuff of computers. When we general-

ize from our yet incomplete knowledge, we are making assumptions. When we do it well, we travel, we can hope with some sureness of foot, in that field of metaphysics considered at best a questionable human field of thought by advocates of some viewpoints such as ‘scientific materialism’. It’s disturbing when those advocates, including some very competent and insightful scientists, deny metaphysics by engaging unconsciously in a sloppy form of metaphysics.

Many scientists and philosophers speak and write as if the relentless movement of macroscopic entities and processes forward in time is a necessary consequence of the second law of thermodynamics. It’s probably not a law, though likely a ‘contingent law’, that is, a law given the way in which our universe is expanding as well as the initial conditions at the start of that expansion. Roger Penrose has presented pretty solid arguments that the second law of thermodynamics is actually a result of the accidental (in a philosophical sense) configuration of the stuff of this universe at the time it began to expand, the time of the so-called Big Bang. Yet, it does seem to be true that, at the macroscopic level, “Time moves irrevocably in one direction.” This is a level where the direction of time as we know it is established, though there might be a second establishment in the domain of the universe.

Let me address what might be happening in that domain with an analogy which I don’t think will work in the end, but it might guide us in the direction of finding better ways of thinking and speaking and writing about that arrow of time which we seem to be riding. I think the way in which the so-called Big Bang is presented has implicitly prejudiced the thinking of even serious scientists and philosophers. Rather than thinking of that Big Bang in terms of the spacetime which resulted from the ensuing expansion, think in terms of the abstract spaces which correspond to states of being. The universe is a strange sort of projectile which has been shot in a very particular direction into the spacetime which resulted as that strange projectile began to expand into that space of states of being, the space of configurations. In terms of concrete being, we could speak weirdly but usefully of that projectile being shot into nothingness in terms of concrete being, into a space of abstractions which can’t be directly perceived or explored. The path of that projectile, indeed the complex narrative occurring as the projectile hurtles away from its initial state of being, can’t be derived from the properties of the projectile and the various particles and other entities of which it is composed. The universe is projectile, itself passing

through various states of being—where ‘itself’ is defined by what can truly be studied by particle-based reductionistic ways of thought, and also the path which adds great complexity, and certain well-defined characteristics, to the totality.

I discussed the strong hints that conservation of energy isn’t a law for the universe as a whole in Chapter 193, *A Universe is More than it Contains*. My discussion played off a comment by P.J.E. Peebles in *Principles of Physical Cosmology* [109]:

We see that the faster decrease of [the radiation density of a relativistic universe modeled as a gas] compared to the mass density of a nonrelativistic gas is the result of the pressure work done by the expanding radiation. However, since the volume of the universe varies as [the third power of the expansion factor of the universe], the net radiation energy in a closed [and expanding] universe decreases as [the inverse of the expansion factor of the universe] as the universe expands. Where does the lost energy go? Since there is no pressure gradient in the homogeneously distributed radiation, the pressure does not act to accelerate the expansion of the universe. (The active gravitational mass due to the pressure has the opposite effect, slowing the rate of expansion. . .) The resolution of this apparent paradox is that while energy conservation is a good local concept. . . and can be defined more generally in the special case of an isolated system in asymptotically flat space, there is not a general global energy conservation law in general relativity theory. [page 139]

We live in a world where a building can be reduced to brick and timbers and copper wires and PVC pipes but the properties of those particles don’t sum up to the properties of a building. In the simplest possible terms, many of the properties of the building come from the directed activities of carpentry and plumbing and pavement construction as well as the use of the building. Other properties come from the context of the hidden or visible utility systems and roadways and the various surrounding social and economic and political systems. I don’t mean to return to any sort of design theology, only to point out there are a variety of realms and levels of created being not directly observable in the particle interactions as electromagnetic radiation separated from matter in the early millenia

of the universe's expansion nor in those of the sun's nuclear reactions and the resulting electromagnetic events. Some of those realms and levels of created being can only be known and explored by way of the abstractions of mathematics and by way of other abstract concepts corresponding to aspects and parts of our universe.

Is it unreasonable to assert that a human being can have some degree of true freedom even if he's made of substances and biochemical processes which are fully deterministic? It's interesting that physics itself doesn't support any reductionistic view of our universe or the entities which are part of it. There are more intuitive arguments and perhaps some fairly tight empirical-level arguments at the level of human nature which provide plausible space for the freedom of a creature of flesh and blood, some of those arguments being provided by neuroscientists or other scientists.

We have every reason to believe we have some small but significant freedom and it's a serious error to argue that the freedom we detect in our human lives must be illusory because our bodies are made of stuff which seems to be subject to a strong variety of determinism.

# 177 What is Created Being?

## Really, what is it?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1480>. It was finished and uploaded on 2013/01/04.]

We tend to think of created being as concrete stuff, matter and energy and fields. Neutrinos and quarks and protons. Rocks and hydrogen gas and bacteria. The energy of explosions of various sorts. Fields such as those of the magnet and of quantum interactions. A little knowledge of the history of philosophy and science and technology will let us see that this listing of stuff is somewhat problematic. Some of the most important items on this list of concrete stuff have been added since Newton although it's possible the changes really began in the Middle Ages as scholars debated the nature of infinity and tried to determine if Aristotelian physics could be true; that claim depends upon how some complex and complicated statements are to be understood.

As I've been developing a Christian understanding of being, I've combined the basic insights of the school of St. John the Evangelist and the insights of St. Thomas Aquinas with modern knowledge I generally describe symbolically but truly as being that of Einstein and Darwin.

I have written before of the primacy of relationships over stuff. In fact, fields have the air of relationships not yet settled down into concrete entities, settled down or collapsed in useful but problematic terms in quantum mechanics. In an essay from early in my blogging career, see Chapter 156—*Einstein and Bohr's debate on the meaning of reality*, I wrote about Einstein's refusal to accept quantum mechanics as anything but an incomplete view of reality. In the book, *Critique of Scientific Reason*, the philosopher Kurt Hubner talked about this debate, claiming:

Einstein was claiming that reality consists of substances which remain unaltered by their relationships with other substances while Bohr was claiming that it is the relationships which are primary and those relationships bring substances into existence.

In that chapter, I set out to, in a manner of speaking, discipline modern empirical knowledge to Christian truth which mostly means seeing Creation as being a story told by God for purposes partially, but perhaps substantially, revealed in the Gospels, the communal memories of the incarnate Son of God. So it is that I came to see that not only are we men creatures but so is everything which isn't God. Since things come from relationships, such as those described by quantum fields, we can see a modern justification for the claim of Aquinas: "Things are true," and also for my additional claim: "Truths are thing-like."

Created being, in all its forms and in all its realms even the most abstract, is the manifestation of thoughts God had; it is, so to speak, the setup for the telling of the story of the Son of God making of Himself a sacrifice to the Father. All of it is created because all of it must be manifested by God. None of it, not even such simple truths as " $1 + 1 = 2$ " exist outside of God unless He manifests it in such a way that it becomes an object of love to Him, a thing-like entity which shares, but only in certain ways, in the being of the Creator. Creatures can see abstract truths because we are shaped from such truths and those truths remain part of us and part of what lies around us. Human beings are those who have come to truly see these sorts of truths because we have brains and hormonal flows and so forth which naturally encourage totemic behavior: see Chapter 251, *Darwin, Einstein, and the Totemic Mind*.

We creatures have no part in being outside of what God created and then shaped in various sorts of acts-of-being. We can't shape our minds in response to other than what we can experience in or through the concrete, thing-like being of this universe. Through this thing-like being, we can see even the most abstract truths God has manifested as the raw stuff of all created being.

Created being is created being which is in turn: stuff and relationships and narratives. Stuff and love and stories in a manner of speaking.

So it was that one of the most famous and most important of scientific debates, that between Einstein and Bohr, was really a debate about the

nature of being. Eventually, it became clear that Bohr had the better argument, one equivalent to the metaphysical claim: “[I]t is the relationships which are primary and those relationships bring substances into existence.” Einstein’s argument was equivalent to the metaphysical claim: “[R]eality consists of substances which remain unaltered by their relationships with other substances.” What seems remarkable, or at least should seem remarkable, is that the physics community lined up behind Bohr, most physicists lining up within a few short years, because of the empirical evidence plus the specific theories and equations which were drawn from that evidence. Science had settled a metaphysical question, a fundamental question about being, and it had discovered an answer given a long time ago by St. John the Evangelist and then, set in the context of a philosophical system by Aquinas.

Relations are the primary acts-of-being; stuff comes into existence as a result of relations; and stuff begins to move, forming new relationships, and causing streams of events which evolve and develop into coherent narratives. All of this is created being. God’s love created all contingent being. We change the state of an atom by observing it because any observation is an interaction, the forming of a relationship. We can change others by loving them. We can all be changed by participating in a proper, morally well-ordered story. That is the purpose for which God has created this world and all the other realms of created being even the world of those raised to live with Jesus Christ for time without end.

# 178 Are Communities a Form of Created Being?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1505>. It was finished and uploaded on 2013/01/26.]

[I've found over the past two decades that many of my fundamental ideas can be seen in the novels I've finished and put on my website thus far. I think I can say that exploration of communities, what they used to be and what they now are, what they can or should be, was a major theme in all of my novels published to date and maybe more so in the conversion novel I'm working on, as of early 2013. It's interesting, at least to me, that I wasn't consciously aware of many of the ideas I was developing while I was writing novels, as well as a few short stories which seem to have disappeared from my computer's memory. I was unaware of the complexity of the moral conflicts in *The Hermit of Turkey Hill* [36] until a friend read the manuscript and told me it's a 'hard book'. That was years after I'd finished writing it.

See Section 2.2, *Novels*, for a list of my downloadable novels. Short descriptions can be found on page *Unpublished Novels* at [http://loydfueston.com/?page\\_id=18](http://loydfueston.com/?page_id=18). Some readers might better understand, or even enjoy, these ideas in the form of moral fictions which are decidedly non-didactic.

For the remainder of this essay, I'll be assuming an understanding of being as discussed in Chapter 169, *From Abstract Being to Concrete Being and Narratives*. The reader who wants to understand as much as possible might be advised to review that chapter.]

Philosophy begins with a sense of wonder at what is but only becomes true philosophy when coupled with an active exploration of being. That is,

in a formal sense, all philosophical schools and traditions—even such modern specialties as the philosophy of beer—are founded upon metaphysics, an understanding of being. In this sense, created being is understood in positive terms and God’s necessary Being is understood by way of what might be labeled ‘negative metaphysics’, metaphysics which can speak of God only by pointing out the ways in which His own Act-of-being is different from the lesser acts-of-being which we can study in one way or another. By His own Act-of-being, I refer to God’s very existence. The use of this term is indicative of the general scope of the term ‘act-of-being’. It’s not merely an act of creating a material universe nor of sustaining it; it’s the act of existence. And it’s a way of speaking which has annoyed many thinkers over the centuries. Etienne Gilson made the seemingly strange claim: out of all modern philosophers, it was the atheist Jean-Paul Sartre who best understood and accepted this Thomistic concept.

Being is at least what we can touch and point to and study by the methods of physics and chemistry and other empirical sciences. I’ve claimed, partly upon Biblical grounds and partly upon my experiences as a creature, that being is also what moves and interacts and forms relationships and various sorts of narrative streams including the morally ordered narratives which we can call stories. I’ve claimed that relationships are primary, not concrete and thing-like being and not even some general sort of stuff. Thing-like being comes into existence as a result of relationships and can be further shaped by relationships. See the Gospel of St. John or the letters attributed to him or his followers. See Chapter 156, *Einstein and Bohr’s Debate on the Meaning of Reality* for a debate on this important aspect of being from the viewpoints of two prominent physicists. Chapter 169, *From Abstract Being to Concrete Being and Narratives*, is a more extensive, more recent, more complete discussion of various aspects of being; perhaps it comes closer to a good understanding of created being. I write in a different and perhaps more accessible way of what I mean by ‘abstract being’ in three shorter essays found in:

- Chapter 172, *Frozen Soul and Other Delicacies*;
- Chapter 173, *Studying Steam When All You Have is Ice*; and
- Chapter 175, *More on Matter as Frozen Soul*.

I would claim that what we perceive, in a general understanding of perception, is some form of created being despite the possibilities of delusions and hallucinations and the misunderstandings of our own perceptions. We need to be careful, to properly analyze our perceptions of reality; nowadays, we have a great advantage in having so much information on this subject from the empirical research and disciplined analyses of human perceptions and processing of those perceptions. We know a lot about the weaknesses and tendencies to error in our seeing and hearing and so forth, but that isn't a matter to worry about. After all, if we can identify our weaknesses and errors in seeing and hearing, then we can make the appropriate corrections. If we can't see Jupiter's moons too clearly, then we can build telescopes and other instruments, even including flyby vehicles. If I know, and I do, that the floaters in my eyes start showing when I'm tired, then I adjust and consciously try to ignore the small objects or the insects coming from me out of the corners of my eyes. I then rest and my refreshed eyes will filter out those floaters.

Science, physics and chemistry and biology, can tell us much about being and, as I noted above, can help us to adjust for biases and other problems in human perception, more generally—in our minds and hearts and hands. I may create confusion by sometimes using science in the German sense: any disciplined and orderly field of study, but, here, I'll use science in the more limited sense though even in that limited sense there are fields of study, such as history, which straddle fields of study more strictly limited to the concrete realms of being and those fields which try to access, often the wrong way, more abstract realms of created being. (Some fields of science more narrowly understood also have to deal with the abstract, such as physical cosmology or evolutionary theory.) Of course, most literary scholars or historians would be surprised to hear their non-empirical ways of thought described in this way.

Increasingly, science in this narrower sense also tells us much about more abstract realms of being and even about the narrative forms of being in this concrete realm and in the more abstract realms as well. Complexity theory gives us some good examples of ways in which physicists and mathematicians and chemists and others are exploring the formation of complex entities of a sort which naturally participate in narratives, streams of physical events directed forward in time so that even moral purpose becomes possible. I'll state explicitly my claim that we should regard not only relationships but also the narrative aspects of our world as forms of being.

There is no chain of stuff-like created being, going from the higher ranks of angels down to living creatures and then things in the mortal realm. There are instead multiple networks of being which can be charted in this sort of way:

very abstract being => ... => relationships => ... => stuff

very abstract being => ... => relationships => ... => humans

very abstract being => ... => relationships => ... => narratives

stuff and humans and narratives => a world

Don't take the above too seriously yet. It's only indicative and a more realistic group of charts would be more like a plate of spaghetti than a neat schematic. If I don't produce that more realistic, richer and more complex, chart soon, I would hope someone else does.

We should question what physics and chemistry and biology and other sciences in the more limited sense tell us about being. I claim they tell us about some essential aspects of being, as well as a large number of contingent aspects, that is, aspects which could have been different. Again, the better image would bring in streams flowing from abstract regions, which streams are outside of the study matter and methods of those sciences so disciplined and so capable of helping us to understand concrete realms, the sciences which are, more or less, quantitative.

Now that I've confused matters a little, I'll draw some of the threads together to explain why communities are a form of true being, as much a form of being as the forms of being in the entities studied by astronomers and geneticists and chemical engineers. In other words, there isn't stuff, thing-like being, that God created and then relationships and other 'immaterial' non-thing-like forms of being. So far as we creatures are concerned, there is only what God created, that is, what He manifested in this particular Creation. If we perceive communities, if we perceive married couples, if we perceive the universe itself, as true entities, then they are formed from created being; they are not assemblages of things brought together as if business partners bound only by the contract laws of modern, liberal nations. There are no magical forces to be added to what God created so

that, “abracadabra!”, there is now a bride and a bride-groom, and a married couple where once there was a woman and a man.

We modern believers in a radical and incoherent individualism deny too easily our raw perceptions of communal entities. We ignore the underlying being which can't be explained to any significant extent by assembling our understanding of the constituent members and other parts. This is strange on the part of sacramental Christians; after all, some of the special bonds coming down to unite man and woman as a married couple, individuals as a Church, and mortal men as sharers of God's life are brought about by those acts we call Sacraments. The more general, less special bonds are still knowable as the glue of a sacramental world.

We perceive the abstractions of time and space without being able to fully justify either one. We take their existence as some sort of raw truth. In recent centuries, human beings of all sorts have developed high levels of skill and some rather fantastic instrumentation for exploring empirical reality. We humans have also developed the tools of mathematics and general reasoning to analyze at least some small parts of the mountains of empirical facts and to create some serious bodies of knowledge. Not only do communities exist as entities to study, entities with their own properties not definable by summing up the properties of their parts, but the very effort to explore and analyze and exploit, properly and improperly, our world has led to the formation of fantastically complex communities of a sort not seen before, such as those of science or those which formed by mostly peaceable means as explorers and pioneers from different cultures came together to form, say, Kansas City. Cities larger and more complex than Babylon grew up rapidly by the efforts of those who, not long before, hadn't known of the existence of the very sorts of human beings laboring by their side. When such efforts worked, the result was far more solid than a band of radical individuals working together for their own self-interest. This isn't always to the good. The political community named *United States* has grown into a morally disordered nation and the very reality of this community is what will make it hard to reform. It might well turn out that the path to reform, to moral re-ordering, will lead to a great loss of wealth and power and perhaps a (probably temporary) breakup into multiple countries more coherent and better organized than the current perversely adolescent giant.

This understanding isn't the result of an ideological commitment on my part. My emotional attitudes incline me to a very stable and traditional viewpoint, but my greater commitment is to be open to what is revealed as

God tells His story.

We all bring a story, adequate or not, to our explorations of the world around us, a circular activity since that world is a story being told by God. We bring a story and begin to fill in details and to fix some problems with that story. For the most part, men and women, boys and girls, inherit most of the story in which they find themselves. But...

Every so often, we find out something that should lead us to start revising our inherited stories, including the grand story which forms the communal mind of a civilization, the grand story which Jews and Christians consider to be the story truly being told by God. This doesn't mean that Jews and Christians think they accurately know or fully understand the story God is telling, but it does mean we each feel we understand some very important aspects of that story.

# 179 Why We (Mostly) Don't Need Categories in Metaphysics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1774>. It was finished and uploaded on 2014/02/06.]

In Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality*, I argued that Christians should respond confidently to what lies around us, to our concrete and thing-like realm of Creation and to all the other realms which remain yet in our universe which is our world when seen in light of God's purposes. I concluded that chapter by claiming:

Contingent being, that which is not God, is a coherent collection of manifested thoughts of God. The workings of evolution, natural selection and genetic processes, are among those manifested thoughts as are the quantum processes which bring matter into being and the processes which bring spacetime into being and shape it, the historical processes which have shaped human communities and the artistic processes which have shown us the beauty in Creation.

I'd like to elaborate on one aspect of traditional thought in general and traditional metaphysical thought in particular. In doing so, I'll be overlapping Chapter 53, *How a Christian Finds Metaphysical Truths in Empirical Reality*. Please bear with me.

Traditional metaphysics deals with abstract categories and I've argued against the use of categories and categorical reasoning: see Chapter 299, *Sex and Categorical Reasoning in a World of Evolution and Development*. I wouldn't really recommend a categorical rejection of categorical reasoning, only a realization that such reasoning and the related slotting of entities

and relationships and so on into categories are dangerous in the way of fast-setting concrete. They give us frozen images of a dynamic Creation, sometimes good and useful frozen images but frozen nonetheless.

But there are many who think well so long as they have a schema with nodes drawn from well-defined categories, some of those men can be truly considered great thinkers or doers.

For those who have studied at least lightly the field of modern dynamics: categories are like a relatively tight cluster of points on a Poincare section, the tight clustering would represent a temporarily stable or quasi-stable orbit through the state space of the underlying dynamic system. Any efforts to predict the state, or 'nature', of the entity being formed by and in response to that dynamic process will work until it doesn't, that is, until the orbit moves and a new point shows up on the Poincare section which, as you might guess, is a section through a space of states or phases of a dynamic process; the section is a plane through that abstract, mathematical space and shows where the orbits pass through. Conceptually, Europe moved to a new 'orbit' when the Middle Ages became the Renaissance and to another 'orbit' with the Enlightenment and so on. The analog of a cluster of points on a Poincare section is a snapshot of Medieval men and Medieval communities; we have trouble even seeing let alone making sense of other clusters from past cultures and few can even imagine the clusters which might be future cultures. In fact, the huge number of dimensions (each corresponding to a variable such as musical styles) which are involved in a state space of human possibilities would make it impossible for us to make sense of the corresponding Poincare section, **if** we could even construct it. I'll speak as if it were a simpler problem since I'm dealing with principles for now and for the foreseeable future.

We also create snapshot views of men and communities in our own age or—more plausibly—in our own culture in our own age. We idealize those views, thinking that men were ever like us. Surely, those Neolithic human beings must have been like us but without knowing so much. To which I respond that the human mind itself came into being as human beings responded to their environments in such a way that they began to generalize and eventually to think in truly abstract ways. I might be wrong in conjecturing a human mind with abstract reasoning powers appeared around 500BC, but, if so, it's an error in detail. In fact, it's doubtful that even most well-educated and intelligent thinkers have adopted abstract modes of reasoning, other than being able to recycle the thoughts

of great and long-dead thinkers: see Chapter 408, *The Need for Abstractions in Moral Self-understanding*, for my discussion of what was wrong in the thoughts of the very intelligent and well-educated Puritan leaders of New England during “the war known as *King Phillip’s War* [see [http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://en.wikipedia.com/wiki/King_Phillips_War)], a war waged by some of the Indian tribes against the European settlers and some Indian allies.” In that essay, I explain that the European colonists failed to intend (develop towards) “a proper abstraction that would have allowed a defense of their own culture but also an understanding of the human good in a different way of life, the European settlers raised their particular way of life to a self-righteous ideal. A conflict of cultures was seen as a war between God’s servants, the White settlers, and Satan’s slaves, the Indians.”

In many of those troubled times—including our deeply troubled age, human communities and the individuals which were formed by and in response to their environments were suddenly (on historical time-scales) moving through a different region of that space of the phases which are different human possibilities. A very complex space indeed.

Categories do seem to work during times of stability. Think of categorical reasoning as being cheat-sheets to the nature of a complex world ever revealing itself. I referred to these sorts of cheat-sheets from a slightly different angle in Chapter 641, *Enriching Our Moral World: Simple Is Digested Complexity*.

What we now know of reality, manifested thoughts of God, would lead us to language different from traditional metaphysical language; we need a language (and underlying concepts) of evolutionary and developmental processes rather than a language which implies that we in the midst of this grand story can see the ‘true’ structures underlying evolving life and developing social and moral structures and relationships. We need to be able to speak of that state space and the complex orbits we travel through it as individuals and as communities rather than speaking only of snapshots.

Engineers and physicists and other scientists long ago learned that their systems, a testable piece of machinery or the solar system, are dynamic and the current state of those systems are snapshots—useful in their own way but dangerous if taken as accurate descriptions of either past or future. They provide such descriptions only when seen as moving images: a snapshot of Neolithic men and communities followed by a snapshot of the period when agriculture seems to have been invented in what is now Turkey followed by a snapshot of one or another early civilization supplemented by

one of an area where civilization failed to develop and so on to the 21st century.

We should, of course, remember that this crude moving image has to be built up over various cultures as well as over time for, say, the eastern Mediterranean civilizations. These snapshots and the moving images they can help to generate must also include matters of individual intelligence and of communal intellect. As I said above, “A very complex space indeed.”

In other words, all human capacities for knowledge and understanding have evolved and developed and we can see those same capacities developing over time and across cultures if we apply our imaginations to our historical knowledge (wherein I include anthropological and archaeological knowledge).

We humans evolved in such a way that our brains can shape themselves to encapsulate reality as we actively respond to it with mind and heart and hands; that reality includes the human past or at least our best knowledge and understanding of that past; it even includes speculative knowledge and understandings of human possibilities for the future. Yet, we bring to these tasks of knowing and understanding specific ways of thinking, intuitions from our evolutionary past and also ways of thinking as individuals and as members of communities.

As a Christian trying to respond honestly to God's world, I believe that the necessary if not the sufficient rules of metaphysics can be drawn from the simple constraint that created being at all levels of most abstract to most concrete must not be in conflict with what we know of concrete being. In principle, we can only know of metaphysics what God has put into this particular Creation and, in fact, we can only know what has become known to men by a particular point in history.

The individual intelligences and communal intellects of Western, Christian Civilization have been driven forward for 1500 years or so partly by the battles between those most ready to learn from God's Creation and those most convinced that God's Creation is something we were called to bring to order. The first are convinced in one way or another that we are called to shape our minds in response to reality and the second think reality is to be ordered by transcendental ideas accessible to at least some human minds. This is clearly an oversimplification—many have mixed beliefs, part Plato and part Hume in a manner of speaking.

I'm clearly on the empirical side. After all: What reason do we have to believe that human beings, a species which arose in this concrete realm by

way of evolutionary and developmental processes, can access transcendental truths?

# 180 What is Life? A Possible Partial Answer

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1779>. It was finished and uploaded on 2014/02/17.]

There are various angles to be taken about the nature of life and how it came into existence. One question in open play right now with the discovery of so many planets throughout our own galaxy and even other galaxies is: Does life come into existence as a result of processes likely to occur often or is it something likely to come into existence very rarely? A related question is: Can we even determine if life exists out there before we find a way to get to other stars?

Some of the most important issues can be labeled as ‘physics’; if these prove dominant, a proposition argued against by many scientists and some engineers, then we’ll be able to decide pretty definitively if there is likely to be a lot of life out there in this universe; if not, then we may have to regard the question as a purely empirical matter to be settled only by finding evidence of life, or lots of life, out there.

In an overview article, *A New Physics Theory of Life* found at <http://www.scientificamerican.com/article/a-new-physics-theory-of-life/>, we can read:

Why does life exist?

Popular hypotheses credit a primordial soup, a bolt of lightning and a colossal stroke of luck. But if a provocative new theory is correct, luck may have little to do with it. Instead, according to the physicist proposing the idea, the origin and subsequent evolution of life follow from the fundamental laws of nature and "should be as unsurprising as rocks rolling downhill."

From the standpoint of physics, there is one essential difference between living things and inanimate clumps of carbon atoms: The former tend to be much better at capturing energy from their environment and dissipating that energy as heat. Jeremy England, a 31-year-old assistant professor at the Massachusetts Institute of Technology, has derived a mathematical formula that he believes explains this capacity. The formula, based on established physics, indicates that when a group of atoms is driven by an external source of energy (like the sun or chemical fuel) and surrounded by a heat bath (like the ocean or atmosphere), it will often gradually restructure itself in order to dissipate increasingly more energy. This could mean that under certain conditions, matter inexorably acquires the key physical attribute associated with life.

"You start with a random clump of atoms, and if you shine light on it for long enough, it should not be so surprising that you get a plant," England said.

Read the entire article for a very interesting perspective on life from a viewpoint which hints of reductionism but such viewpoints have often produced good results and have been folded into larger and richer understandings.

My opinion is that this is an empirical question, though certainly one with mathematical aspects subject to theoretical investigation.

In any case, The article is about a physicist who has proposed a profoundly clever answer I find too neat and straightforward for this world, but that's a matter of intuition which, as I've explained before, is a feeling for reality built into our brains by natural selection—it reflects some serious amount of truth of a utilitarian sort which is to say that it corresponds to some aspects of reality well enough to have allowed survival of family-lines. Intuition, even that of a Plato or an Einstein, is most certainly not guaranteed to be true. Our intuitions are correlated with truth. There is no strict linkage nor is there only an accidental relationship.

In any case, I find it quite plausible that Professor England's answer might be part of a more complex answer. He implies in his words as recorded in this article that is the case and the more profound answer lies in the relationships between physical entities in this universe. Though it be quite wrong to think of the universe as being an organism, it's equally wrong to

think of it as inert, a mere setting for things to happen leading to life and then to the evolution of a great variety of species and individuals. One part of the work of Professor England is the admission that the physical universe is active in ways that lead to organization of various sorts and at various scales of spacetime.

Near the end of the article, we can read a comment by Ard Louis, a biophysicist at Oxford University:

If England's approach stands up to more testing, it could further liberate biologists from seeking a Darwinian explanation for every adaptation and allow them to think more generally in terms of dissipation-driven organization. They might find, for example, that "the reason that an organism shows characteristic X rather than Y may not be because X is more fit than Y, but because physical constraints make it easier for X to evolve than for Y to evolve," Louis said.

And this seems to be part of what I'm claiming: life, like the human mind, is shaped by active responses to what lies around it; thus it is what lies around us which gives us, and bacteria, possibilities. I should also note that my relatively casual readings in evolutionary biology, including that strain of thought found in books about the brain, would lead me to claim that the serious thinkers in the field already know and advocate what Louis says in the above quote, though those other thinkers probably haven't stated their positions in quite the clean and potentially useful way that England has of dealing with the issue. When they are truly appropriate, well-defined mathematical models of processes or entities are truly useful.

# 181 The Basic Stuff of Created Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1860>. It was finished and uploaded on 2014/08/01.]

Very serious mathematicians of a philosophical bent of mind were trying in the late 1800s into the early 1900s to found mathematics upon logical bedrock, some of them intending to do so by first showing a few logical rules could generate the natural numbers. Those mathematicians set up proposed systems, the best of which developed elaborate machinery which included terms such as  $x(0)$ ,  $x(1)$ ,  $x(2)$ , etc. The idea was to start with nil or zero and declare a successor element to zero, “1”, and then to declare a successor element to 1, “2”, and so forth. The problem, and it was missed at first by even such brilliant thinkers as Bertrand Russell and Alfred North Whitehead, was that the natural numbers [0, 1, 2, 3...] were used as indices for symbols meant to build up the set of natural numbers from very simple thoughts of a logical sort. They had assumed the very ordering and counting processes they were trying to prove legitimate and so ended an effort to find an easy way to build at least natural numbers from the basic building blocks of nil and a successor operation. [A minor point—mathematicians don’t seem to agree as to whether or not ‘0’ belongs in the natural numbers.]

One brilliant mathematician from that time made a particularly interesting claim, used in recent years as the title of a book written by the physicist, Stephen Hawking—see [https://en.wikipedia.org/wiki/Stephen\\_Hawking](https://en.wikipedia.org/wiki/Stephen_Hawking). The original words of Leopold Kronecker, a 19th century mathematician of great accomplishment, were : “God made the natural numbers [or integers according to some translators, but negative

numbers add some complications to these efforts], all else is the work of man.” (See <http://www-history.mcs.st-andrews.ac.uk/Biographies/Kronecker.html>.) Kronecker “believed in the reduction of all mathematics to arguments involving only the integers and a finite number of steps.” Like the Pythagoreans, Kronecker didn’t even believe in the irrational numbers, let alone the likes of Cantor’s transfinite numbers.

Kronecker believed in the integers (or natural numbers) as the building blocks, along with well-defined finite operations, of all mathematics. I say that there are no building blocks as such—for what it’s worth, I’m much more open than Kronecker and his followers to non-finite operations in proofs and other mathematical activities. I even believe in Cantor’s transfinite numbers and other strange entities from abstract being.

Mathematics is the study of some types of abstract being, which types have increased greatly in the Modern Age. What is most important for this discussion is that mathematics concerns relationships and I’ll claim those relationships generate the number ‘9’ and those, perhaps with a few others, also generate the number  $\pi$  (3.14159...). So it is that I can claim that Russell and Whitehead and their colleagues in the decades around 1900 were on the right path except that they had too impoverished a sense of relationship as they tried to generate numbers from only a successor relationship. In fact, what is needed is the entirety of the sets of relationships which are dealt with in number theory and that implies the task misunderstood by those brilliant thinkers is ultimately no more and no less than the field of mathematics in its entirety. (Stated this way, my program seems to be similar to that of the researchers working on Category Theory, see [https://en.wikipedia.org/wiki/Category\\_theory](https://en.wikipedia.org/wiki/Category_theory), except that I’m considering mathematics and any possible abstractions covering multiple fields to be real, if very abstract, being. Essentially, I’m trying to understand mathematics as part of a program to understand all forms of created being. I’m a metaphysician and theologian rather than a technical mathematician. Or physicist. Or historian.)

How is mathematics to be understood? By doing it.

How is life to be understood? By living it.

How is the universe to be understood? By living in it, by exploring it, by thinking clearly and exactly about it.

How is the world to be understood? By seeing the universe in light of God’s purposes or perhaps the moral order seen by many including some atheists and pagans.

This points to an answer, at least currently plausible, to the question: How can we explain created being?

I've denied there are fundamental building-blocks as such and the task arises to develop a new program which will be part of a new civilization or perhaps a revived Western Civilization. This program will itself help define the the intellect or communal mind of the citizens of this new or revived civilization. Furthermore, as a Christian, I'll claim this intellect to be that of the pilgrim Body of Christ, an intellect to be completed and perfected in the world of the resurrected—as so much will be completed and perfected.

I'll take a stab at understanding this program and can promise I'll not yet be clear and exact. That will take years, and perhaps multiple generations, of effort.

Multiple streams of abstract created being have fed into this world:

1. some abstract being shaped into matter and energy and fields,
2. some remaining relatively abstract in the form of relationships which change over time and are called stories or narratives, and
3. some remaining relatively abstract in the form of relationships we ourselves detect, and use, as our minds or souls.

Our universe can be defined as being made of mostly, perhaps entirely, the concrete stuff in the first item above. But our universe becomes a world when we also consider the more abstract stuff which I sometimes simplify (or perhaps oversimplify) as being the manifestation of God's purposes or moral order or even rationality or reason to someone with beliefs similar to those of Einstein.

I certainly think the above list is incomplete but I have no intention of building lists which are likely to have arbitrary elements until I can develop some more powerful tools, or at least point others to more powerful tools, to bring all of this into a more clear and more exact focus.

For now...

We talk and scientists do their research as if there are building blocks of concrete entities, such as rattlesnakes and stars. And human beings and bricks. These concrete entities exist in spacetime, well described so far by Einstein's General Theory of Relativity. These concrete entities are made of layers of successively more particular, that is—more concrete, bits of matter. (Many physicists would advocate speaking of energy in the sense

of energy-matter— $E = MC^2$ —rather than matter; make the substitution if you wish.) So far as concrete forms of being go, we can actually describe and quantify the transition from the most concrete of abstract being to truer concrete being. This description and quantification is the work of quantum physicists and all others (such as computer chip designers) who use the field. (Unfortunately, the systems of equations are not generally solvable by known techniques, but some powerful results have come from even the so-far limited successes of applying quantum physics in the real world. And, from a fundamental viewpoint, experiments can be done which prove quantum physics works to an extreme level of accuracy.)

Stars are complex entities, swirling magnetic fields and plasma encircling matter dense enough to undergo nuclear fusion—and this is a rather grotesque oversimplification. Rattlesnakes are complex entities, DNA and RNA and mitochondria and other forms of flesh and blood—all interacting in a remarkably complex metabolism which is something like a self-regulating system so long as you consider the environment of the rattlesnake to be part of the system—but this is also an oversimplification. Human beings have all the complexity of rattlesnakes plus they form minds which are complex systems of concrete and abstract relationships—this is perhaps the greatest of these oversimplifications. All of these entities come together in stories and in one great story that is the world.

Relationships.

We assume that human communities form by way of relationships, though we often assume wrongly it's the softer and more sentimental relationships—love in various forms—which are crucial in forming strong human communities. In fact, it's something of a truism among modern sociologists that the strongest bonds in human communities are those of dependencies.

In any case, I already noted above that I consider relationships to be primary over stuff. Stuff is formed from relationships, as we are told both by the Bible and by quantum physics. (See Chapter 156, *A Christian View of Einstein's and Bohr's Debate on Reality* and Chapter 157, *Quantum Mechanics and Moral Formation*.)

I'd like to speculate further but I'm trying to be cautious for now as I am not confident yet that I know how to advance to the next level of understanding. More powerful tools are needed and I'm exploring in the fields of geometry and topology, especially as used by modern physicists. Maybe I'm choosing the wrong tools. If so, someone will come along to

show it can be done with some fancy group theory or just simple forms of category theory or whatever.

There is something that comes to mind which might help others to bring these claims of mine into better focus. We might be able to imagine, or at least think ourselves to imagine, particles as having the sort of existence as to be able to exist independent of a greater universe—other than perhaps some sort of spacetime. I think we fool ourselves into imagining an isolated particle, let alone an isolated human being, but I can certainly convince myself that I can do so, even when I don't really believe myself.

The most fundamental relationships of our concrete universe, those of spacetime as described by the General Theory of Relativity and those of matter-energy as described by quantum physics, had to pretty much come into existence in their current form and to remain in existence for our concrete universe to come into existence and remain in existence. Without that full package of relationships, there couldn't have been, couldn't be, a single electron or neutron or electromagnetic field.

If I'm right, our ability to imagine particles existing apart from the entire universe as we know it is delusionary, though understandable. This is to say we can look at a rock and seemingly strip away all that is around it so that only the rock exists, but this is an error, perhaps useful, in our imaginative thinking. Everything gets still messier when we consider the other forms of abstract being which shape concrete entities by way of relationships, and thus do show up in physical manifestations that are explorable and maybe even quantifiable—such as brain structures.

So what could it mean to 'explain' the concrete being of this universe in terms of 'elementary particles' or the like? For the most part, it's a good strategy for exploring the concrete stuff of this universe but it's ultimately misleading. Such thinkers as Wittgenstein were close to the truth in proposing the search for the smallest building blocks would lead to the universe in its totality. My enhancement of this claim is, for now—merely, to point to relationships as being definitive of this concrete universe and to take all that creates or shapes concrete being as true being.

This isn't entirely a new claim. Some scientists and philosophers and thinkers in other fields have proposed related ideas, though more than a bit cowardly in following up on the implications. The uniqueness of my claim lies in its context as part of a greater understanding of this concrete universe as a part of a Creation, the work of the God of Jesus Christ, a Creation which must be understood by hard work, investigation of empirical reality

by open-minded theologians as well as poets and novelists and historians and painters and music-composers as well as physicists and chemists and geometers and evolutionary biologists and engineers and politicians responsive to reality. And so on. To a Christian such as me, this must all be understood in light of Christian revelation, that is, this universe is part of a Creation which was intended, and is intending in the Thomistic sense, to be the place of birth and growth of the Body of Christ—including the Incarnate Son of God and there is another world which will be the home for time without end of that Body when it contains all those resurrected to share the life of the Son of God.

An explanation of the world, the universe seen in its greater order even ordered to God's purposes, can't rely just any ideas of elementary relationships or elementary particles. Elementary relationships exist early—as a complex body of relationships—and then elementary particles come to be. Both of these are an early part of a narrative in which higher-level relationships and particles and then complex, concrete entities come into existence and begin to shape matter into complex entities, including galaxies and gorillas.

For a very preliminary discussion of some of my efforts to find more powerful tools for a more clear and more exact understanding of created being, abstract and concrete, see Chapter 144, *Adopting Mathematical Reasoning in Non-quantitative Fields of Thought*.

# 182 Created Being is Created Being is Created Being. But...

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2271>. It was finished and uploaded on 2016/09/06.]

I've claimed that "Created Being is Created Being is Created Being" some number of times, but there it's a little more complicated than that. Those who've read some of my metaphysical writings might have some ideas on the topic. "Some ideas" is really all that I have.

The basic situation is this:

1. As a Christian, I believe God created what is not Him from nothingness, absolute nil and not empty space. In addition, and consistent with the Christian Testament and most of the great Christian thinkers, I believe Creation is some sort of embodiment of the Word, that is the Son of God. In my way of speaking and writing about this, I consider that God embodied some fundamental truths as the raw stuff of Creation. This raw stuff, embodied truths, is the source of all created being, abstract and concrete, qualitative and quantitative.
2. Our world of concrete things is actually a mixture of various sorts of created being, abstract and concrete, qualitative and quantitative, though dominated—in some ways—by thing-like being.

How does the raw stuff of creation, embodied truths, get to this concrete world? How does item #1 above get to item #2?

I don't really know. The first item is my way of stating the Christian belief that only God necessarily exists and that He is the Creator and Sustainer of contingent being, all that is not God. The second item is

a straightforward statement of the nature of this world in which we find ourselves, a world of pretty little girls and rattlesnakes and interstellar gas clouds and mathematical truths and love and honor and all sorts of concrete things, abstract relationships between concrete things and between a concrete thing and an abstract thing, and so on. I'm far from sure what the pathways are from #1 to #2.

It does seem clear that many modern thinkers, based upon an unreachable and undesirable goal of many physicists, think that there is only one sort of being in this world and that some single, quantitative theory of mathematics will cover everything. This is particle physics mutated into unconscious, superstitious metaphysics. It ignores all sorts of issues, including that of qualitative being vs quantitative being and abstract being vs concrete being. (It's conceivable that they are the same issue.)

This universe is such that it seems very implausible that there could be a complex soul-like entity entering this concrete (but not only) world. The Old Testament covenants of God seem to be better stated given modern knowledge as something like this: God in His freely chosen role of Creator has constrained Himself in that role to act according to His acts-of-being. In other words, He doesn't act in one way when He had determined the nature of created being and then take on the role of a magician to perform miracles. This doesn't deny miracles but rather redefines them as acts of the Creator within the rules He Himself set; those miracles might be highly unlikely but possible within the laws He set up to govern thing-like being and other forms of created being.

We can now say, with something approaching certainty, that thing-like being, matter, comes into this world by way of some process which shapes some more abstract form of being, quantum wavefunctions, into that more concrete form. Various sorts of particles combine to form ordinary matter along with the leptons, most famously the electron. There are also force carriers such as the gluons which hold together quarks in protons and neutrons, the photons which carry electromagnetic force, the graviton which carries gravitational force. There are also many strange beasts in this zoo of particles. In any case, all of this stuff forms the matter, the ordinary stuff, of our world of thing-like being.

It would be reasonable to think that qualitative being would have a similar, though not quantitatively expressible, system—truly elementary qualitative bits of being, probably mostly relationships, which combine to composite forms of qualitative being. At the same time that qualitative

being is not likely to be at all quantitatively expressible until events occur and, say, love leaves behind its tracks, it would seem to me that it's time for philosophers and theologians to move to use of what might be called qualitative tools of modern mathematics. These would add a large amount of disciplined analytic power to our efforts to understand, most importantly, human communities in their full-blown modern complexity. For some reason, social scientists and the occasional physicist who tries to analyze human political structures or the like are inclined to try quantitative modeling, which has a place in any overall understanding but can't provide the basic framework for analysis and understanding.

I've argued that moral order is built upon more fundamental forms of order, such as that of primitive colonies or herds of animals. Love itself might be a higher-level, non-quantitative relationship of a complex and sophisticated kind, but—again—even love leaves behind evidence at least somewhat quantifiable in its effects upon human events.

We need to address these issues to understand forms of created being other than physical stuff and its constituents. We need to begin exploring use of forms of mathematics which are used already for qualitative analyses of abstract spaces or abstract properties of geometric entities and the like—topology and category theory and various forms of exotic geometric studies and others.

This will result in a more profound understanding of being but might well leave the radical empiricists and quantitative analysts standing tall in one way—the past, what has happened and left a record of structures and relationships and events might well be subject to quantitative analysis. It might be only the slippery present and the future which holds qualitative being.

[As a very relevant side-comment, I'm working on a book which will present a very basic look at the use of qualitative mathematics to discuss human being, individual and communal. In effect, I'll be trying to provide a way of discussing communal human being as real, not just a nominal way of talking about a gathering of individual human beings.]

## Part V

### What is a Universe?

# 183 Introduction: What is a Universe?

In this part, I've collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/>, in which I deal with the nature of a universe. Mostly, these writing lay the groundwork for an explicit understanding of 'universe' and that understanding is still developing in my mind and will be so long as I live, God willing.

# 184 Symmetry-breaking, From Physics and Mathematics to Metaphysics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=47>. It was finished and uploaded on 2006/12/05.]

In my first book, *To See a World in a Grain of Sand* [41], I danced around an analogy that I can now see a little more clearly though I'm beginning to fear it's more than just an analogy. Matter, particular being, results from a broken symmetry of metaphysical truths. In this claim, I'm basically exploring an expansion of the symmetry breaking which underlies modern cosmology, particle physics, and quantum physics. I'll assume a lot on the part of the reader of this entry, but I will say that the intuitive idea of symmetry should be enough to understand what I'm saying. For example, a sphere is a symmetrical object in three-dimensional space under rotation because it's the same object no matter how you turn it. On the other hand, it changes in some sense when it is moved to the left or the right. In modern physics, mathematical descriptions of, say, electromagnetism and the weak nuclear force (responsible for the explosive power of nuclear fission) are such that they are broken or defective versions of a symmetry which is assumed to provide the mathematical description of a more general force labeled as 'electroweak'. This would be equivalent to breaking up a sphere into two pieces unlike each other and neither like a sphere.

In that book, I followed the standard cosmological model, the so-called Big Bang, back in time and projected that beginning of the expansionary phase of our universe was also a shaping by God of a more general sort of being, a shaping which was—at least in some ways – a breaking of the

symmetry, the sheer elegance, of metaphysical truths. The best and most important example is that the principle of unity became gravity. This is the best and most important example just because it is likely the only metaphysical principle that ‘decayed’ into something specific in this particularized universe. At the least, this would indicate the importance of gravity.

My main motive for pushing further in this direction has been stated in prior blog entries and partially in my book *To See a World in a Grain of Sand* [41]: I do not view God as a processor of knowledge and truths and ideas which somehow pre-exist Him but rather as the Creator of all, including truths. This doesn’t lessen their status as truths. It merely recognizes that the term ‘all-powerful Creator’ means just that. And I think that just that implies that truths are created thing-like. And this claim runs parallel, in my way of thought, to the Thomistic claim that things are truth.

Things are true.

Truths are thing-like.

But, though created, truths are not particular in the same way as things. Truths are more elegant, more smooth, more regular. We could say more symmetric. Things, including living creatures, come to be when truths are broken down in some way, when that elegance, smoothness, regularity, is shattered in some way; when the symmetry is broken.

We are formed at the margins of order and disorder. We are jagged creatures, forming by processes that often leave us rather grotesque in our intermediary stages. Our moral selves are diseased in some parts and robust in other parts, but we can often be the hosts to cancerous processes in those moral selves, in our souls and our minds.

If we were better ordered, we would not go through these particular life-processes, but it’s not clear in what sense we would be alive. We would be crystalline structures, mathematically elegant. Can we imagine the Son of God bothering to incarnate Himself in a world of entities resembling theorems of mathematics? I can’t, but I’m a creature of flesh-and-blood. That gives me some strong prejudices but I believe those prejudices to be at least partially confirmed by one rather obvious fact: God chose to make this world and not that more elegant and more symmetric world. Or rather, in terms of my worldview as expressed in *To See a World in a Grain of*

*Sand* [41], God first created that more symmetric world, a world describable as a manifestation of a metaphysical system, and then He created this world by breaking some of those symmetries and shaping this physical universe, a universe which becomes a world when seen in light of the Creator's purposes.

Now I'm stuck because I believe that we exist to be prepared for a truer life as God's companions. If we came from a breakdown of symmetry, then we might first think that our healing would lead to a restoration of that symmetry, but that can't be. At least I don't think so. Life is factual and personal, not symmetric. And now the reader aware of the history of human thought can see that I've restated, in terms of modern physics and mathematics, the age-old cartoonish dilemma between a version of 'to be' and 'to do'. In terms of this dilemma, shown most clearly in Herbert Read's fable in novel-form, *The Green Child*, the perfect being is (maybe) a crystal—frozen in its perfection and symmetry for time without end. Doing is seen as being made possible, and necessary, by the sorts of change that involve pain and decay.

Perhaps this is a false dilemma? Perhaps there is some state of dynamic being that surpasses the mixture of order and disorder we find in this life and also surpasses any human conception of the order hinted at by the concept of symmetry?

It's time to talk about God. Usually we ascend to some greater understanding of God by starting from His self-revelations, most perfectly the Son of God Himself. We try to come to some deeper, creaturely understanding of God by considering those revelations through analogies drawn from God's Creation, which is an image of God Himself, but really just an image of—in a manner of speaking—a few of God's thoughts. After proposing some analogies describing God and based upon aspects of His Creation, we begin the process of qualifying or even denying those analogies. This last process leads us into negative theology, where we begin to make strange statements of the sort:

God is perfectly simple.

Roughly speaking, the negative theologians of the Middle Ages made this particular statement to correct wrongful thoughts about God which might come from Aristotelian explanations of movement—movement was possible only to entities having parts and thus subject to creaturely change, including decay.

We are at a stage of human thought where many of our most basic metaphors have been overthrown by modern empirical research in history and literary studies as well as physics and biology. Our stock of revealed truths which came from God in a fairly direct way is small and now our stock of speculative truths of God the Creator is known to be wrong in some deep sense—as will always be ultimately true of any creaturely speculations. Take the above statement of negative theology: God is perfectly simple. This statement doesn't particularly impress me because I don't hold the Aristotelian concept of motion. On the other hand, it still points to a basic truth, ultimately the idea that God, unlike us, isn't embedded in durational time. But it doesn't work for me as a corrective because my metaphors, poorly formed as they are for now, don't seem to need such a corrective.

The correctives I need are for my preferred metaphors dealing with order and disorder. To be sure, I speak in these terms when discussing Creation and creatures, particularly the human aspects of Creation. And yet I believe, and have stated in various places, that we use our firm knowledge and our speculations about Creation to better understand God and what He expects from us. My metaphors, based on truths about empirical reality and speculations from those truths, should lead to new ways of understanding our treasure trove of revealed truths. For example, a more accurate understanding of human nature and how the human race came into existence will help us better understand what the Son of God did by His Incarnation, Crucifixion, and Resurrection.

## 184.1 More on Symmetry-breaking as of 2011/06/13

As of 2011/06/13, I would add three perhaps clarifying comments:

1. The concept of breaking symmetry seems to me to be a way of describing some ways, but not all, of moving from more abstract forms of being to more concrete forms of being. Breaking symmetry is to the movement from abstract forms to concrete forms as mathematics is to metaphysics. At least, sort of.
2. When I say God creates truths, I mostly intend to say He manifests some particular, probably absolutely infinite, set of truths as the raw

stuff of created being, the most abstract and fundamental level of created being, what I called the *Primordial Universe* in *To See a World in a Grain of Sand* [41]. I don't have a clue of how to speak about the truths to be found in the fullness of God, Father and Son and Holy Spirit, in His transcendent fullness.

3. In the years since I first wrote this posting, I have raised some possibilities about discussing not only abstract being but also the other world shaped from abstract being, the world of the resurrected or Heaven. See Chapter 191, *What are the Thermodynamic Properties of Heaven?* for a mere hint of how we can discuss Heaven in terms which make sense to modern men.

# 185 Why I Misuse the Term 'Universe'

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=59>. It was finished and uploaded on 2007/01/11.]

In my book *To See a World in a Grain of Sand* [41], I used the term 'universe' to mean pretty much the Einsteinian universe: all that is bound by the same gravitational field as each mortal man, the Sun, the other stars in the Milky Way, the other observable galaxies, and so forth. This is not quite the usual definition, at least for philosophers and students of the Greek language. The traditional definition of universe is:

**universe** All created things viewed as constituting one system or whole; the whole body of things, or of phenomena; the *to pan* of the Greeks, the *mundus* of the Latins; the world; creation. [140]

In this more typical definition, the universe is seen as being "All created things". Clearly, a Christian cannot accept this definition unless he's willing to say that the World of the Resurrected is in this universe or willing to speak of this universe as being something radically different and more inclusive than the term designates when used by modern thinkers. It seems to me that it makes sense to use the term 'universe' for the maximal gravitationally bound system. This definition captures what most modern thinkers are targeting with the term, certainly most physicists. And so there might be much outside of the universe which can be plausibly conjectured by disciplined speculation, but that much is not gravitationally bound to our particular thing-like realm of being, our concrete realm of being.

If we trace the development of the universe back in time, we approach the so-called Big Bang, often wrongly seen as an act of creation. From inside

the universe, we couldn't see a true act of creating a universe from nothing if only because we couldn't see nothing. What we see is a change of state and we can only speculate on the state of this universe before that event. In fact, we can only speculate as to whether we could even describe that state given what we know from inside this universe, this phase of Creation as I will call it at times.

My speculation is based on the story of this universe as reconstructed by physicists and astronomers. Following that story backward in time, we can see thing-like being melting away to those subatomic entities explored by particle physicists, but also including fields and energy. At some point accessible only to human imagination, these three types of entities, particles and fields and energy begin to melt down into...

What? Well, first of all, note that gravity is not part of this melting process. It remains intact so far as theorists currently know. They may or may not find a way to make gravity melt down in their theories, equivalently—to combine general relativity and quantum mechanics into one theory. I doubt if they will, so far as thing-like being is concerned, though there might well be a way to combine them on the other side of that so-called Big Bang. But I doubt that as well.

Actually, as I understand the views of Roger Penrose, he thinks gravity 'held' the degrees of freedom of this universe at the beginning of this phase of expansion—that is, that gravity held matter in the low-probability configuration that was a low-entropy state. This low-entropy at the beginning of the universe brings us the 'laws' of thermodynamics and the sorts of processes which underly life. This sort of a view might be analogical to my reason for conjecturing gravity doesn't melt down into a generic sort of stuff along with electrons, strong nuclear forces, quarks, electromagnetic fields, and so forth.

My conjecture is this:

God is the Creator of truths, including metaphysical truths, and not just the Creator of thing-like being. On the other side of that Big Bang, lies a form of abstract being which could be regarded as the manifestation of truths God chose for this Creation, all of it and not just this universe. Gravity is likely the particularized form of some metaphysical principle of unity.

In *To See a World in a Grain of Sand* [41], I referred to this prior state

of this universe as the Primordial Universe and conjectured it is the abstract and fundamental stuff of all Creation. The World of the Resurrected, not subject to the same processes of development and decay, is also shaped from that abstract stuff which is the Primordial Universe.

To be more exact, there might be other phases lying before the Big Bang but after the Primordial Universe, but that's not an important qualification for this discussion.

Before speaking further, I'll quickly address the question:

How did Christians speak before Einstein gave us a coherent definition of the universe as a single gravitational system?

Traditionally, Christians thought in terms of what I call the Aristotelian Cosmos, because that Greek thinker pulled together the ancient pagan ways of thought into a coherent system and not because he was the discoverer of that model which was the Heavens, the earth, and possibly Hades/Hell. This means pretty much what you might think. The Heavens were the realm of the blessed—those beyond the reach of forces of decay (and development). The higher the Heaven, the greater the bliss. Hades or Hell was the realm of the damned, those who had decayed to some state where they could feel naught but pain and anxiety. The earth was the realm of change and development and decay as we know it.

This traditional model, the Cosmos borrowed from the pagan philosophers, is essentially a static model. Change might be ongoing in the terrestrial realm, but even the earth is itself a setting which can change cyclically but always comes back to being what men have always experienced. The Cosmos was a setting for various stories, moral and otherwise but didn't really have a story of its own. This is perhaps the greatest difference between the Cosmos and the Einsteinian universe which can almost be described as being itself a story.

The universe is set into a greater context in the Christian view: Creation. So far as I can speculate, all of Creation, all created being, comes from the Primordial Universe, the manifestation of the truths, mathematical and other, which God chose. Chapter 186, *The Cosmos of Thinkers Prior to Einstein* will discuss what this really means, though those familiar with modern work on the foundations of mathematics might be able to guess.

# 186 The Cosmos of Thinkers Prior to Einstein

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=66>. It was finished and uploaded on 2007/02/06.]

There was no one Cosmos common to all thinkers prior to Einstein but there were some general beliefs held by all, or nearly all, thinkers in the West prior to Einstein—including most early modern scientists. This is not to say that there was no thinker who suspected reality to be richer, in some sense—deeper, than what could be directly seen. But those suspicions led nowhere. Heraclitus, the pre-Socratic philosopher, suspected that the apparent stability of things masked a deeper reality in which change was ongoing. In *The City of God*, St. Augustine noted the earth is clearly very old and he speculated that species can transform into other species—though he refused to back down on the special creation of human beings.

So, Augustine had a critique of natural knowledge that anticipated Darwin by 1400 years and it led nowhere. In fact, many thinkers over the centuries have read the *City of God* while not giving any evidence that they noticed some of the outbreaks of creativity. In a similar way, philosophers and theologians over those centuries made critiques of the mainstream views of infinity, time, space, and so forth; critiques that pointed towards the discoveries of Cantor and Einstein and Planck and perhaps Gödel. Those critiques just sank from view. Apparently, thinkers during those centuries had no hooks upon which to hang those ideas and readers of those critiques paid them little heed even if their eyes happened to pass over the proper page.

There was no magical transition point when all of a sudden men thought in a ‘modern, scientific’ way about their physical surroundings, no magical

point when an unexpected mutation produced creatures we can label as true Scientists. Early scientists held beliefs now considered superstitious, though those beliefs might well have been reasonable in the context of the totality of scientific, philosophical, and theological knowledge of those times. At that, new knowledge led to a critique of general views of reality, a critique which did not at the time lead to a new, coherent view, what I called a ‘worldview’ in my book *To See a World in a Grain of Sand* [41]. Over the intervening centuries, perhaps Kant produced something equivalent to a worldview but he made the very serious mistake of taking the laws, time-space structure, and perhaps the stuff of this universe as being necessary in their forms if not their particular configurations.

There were many problems in the ways that scientists and others viewed reality as they tried, and failed, to digest modern, empirical knowledge. For example, some of the greatest scientists and philosophers of modern times—those in the generation prior to Einstein, believed in an ether which filled space and was so rigid as to be able to vibrate trillions of times a second to transmit electromagnetism but also so light and flexible that the planets moved through with no measurable friction. It’s at least arguable that scientists prior to Planck should have long ago realized that continuous, non-discrete, energy levels are not consistent with stable atoms.

Man is a creature who moves through time with at least some self-awareness as well as a peculiar version of animal awareness of the surroundings. I’ve spoken elsewhere of man’s nature as a creature which seeks narratives as a means to morally order his surroundings. As background to those narratives, a serious thinker holds—however obscurely and implicitly—a view of reality as a whole, what I’ve called a ‘worldview’. You can’t help but to try to relate the stars to rattlesnakes if only to claim they are made of radically different sorts of stuff, one being eternal and unchanging and the other subject to earthly laws of death and development.

There have always been a multitude of worldviews, but I’ll be speaking only of one pre-Einsteinian worldview, a non-existent straw-man to be sure but one which makes it easier to speak of the totality of changes which Einstein has forced upon us.

Let me describe a few aspects of this Cosmos which seem particularly prominent in one or another body of thought which was not ‘Einsteinian’ in its empirical assumptions. I’m merely trying to describe the situation in general. A more thorough discussion would likely require years of study and careful thought.

1. All of Creation is to be found here, in what can be perceived, at least at a distance. The Heavens, perhaps even God Himself, lie beyond the moon, up where there is no change or decay, but it might be possible for a man to journey there in his mortal body and see the angels or perhaps the throne of God. If man has any component which is not bodily, then that component might belong naturally to that supra-lunar region when not tied to a body of clay. That immaterial component of man might even be inclined to visit that supra-lunar region if it is properly oriented.
2. All substances are found in a layered way, a great onion. Earthly things, mere matter—inert and lifeless in itself, are found between the ghostly existence of Hades and the ethereal realms where dwell the purer spirits, including perhaps human spirits released from their bodily prisons. It seems natural to believe that any given created substance can interact with all other created substances. Substance is seen in an oddly non-particularized way. Through the entire age of general awareness of empirical research, there are those who believe in a soul-stuff or mind-stuff that can interact with the human body but somehow remains invisible to scientific instruments.
3. Time and space are metaphysically necessary aspects of created being.
4. The type of substance we call ‘matter’ is inert and needs to be moved or shaped by immaterial beings or ‘energies’. The human body is inert but can be moved by a soul. Planets would have been inert if not inhabited by a god or other spirit in the way the soul inhabited the human body. Planet-moving spirits have been discarded more recently but the idea of a soul inhabiting the body retained by those who aren’t aware that the two ideas were part of a single, arguably consistent worldview.
5. Anything that exists, even the Almighty Himself, is made of some kind of substance. Since God is made of some sort of stuff radically different from the stuff of this physical universe, He is often pushed off to the distance, perhaps to sit on a throne in Heaven.

When this general set of worldviews began to unravel, few there were to even consider a general re-thinking of the situation. This is at least partly

because of the wrongheaded arguments that moral philosophy and physics and theology are completely separate ‘fields of knowledge’ that cannot be woven together to produce a coherent understanding of Creator and Creation. Men no longer even have a coherent understanding of human nature or human society, and that is hardly surprising.

We are lost in the Cosmos as Walker Percy said, but he didn’t help matters any. He was sometimes described as a Thomistic Catholic, but looking back to the years when I read several of Dr. Percy’s books, I fear he was probably reading Kierkegaard while thinking he was reading Aquinas. Kierkegaard re-discovered some of the insights of St. Thomas Aquinas but his attacks upon essentialist ways of thought were brutally unbalanced so that he showed no understanding of the importance of substance in this universe created by the God who is His own Act-of-being. Without an appreciation of substance, a thinker will lose sight of the goodness of Creation and will fall into the blackish moods common to Luther and Kierkegaard, Barth and Percy. But I digress, however usefully. . .

## 187 The Einsteinian Universe

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=78>. It was finished and uploaded on 2007/02/24.]

Einstein gave a great gift to rational thinkers, Christian and non-Christian. He gave us a universe, that is, a coherent definition of a universe. And the definition is proving to be quite a bit different from the traditional metaphysical definitions. In fact, the simplest way to think of Einsteinian Universes as a class is to think in terms of the gravitational field. That which can be found in the same gravitational field as the earth is part of the same universe as the earth.

The usual definitions for universe involve all created being or even all created and divine being. Some nowadays think in terms of causal relatedness, but there remains a good possibility that parts of the universe which emerged from the so-called Big Bang are not causally related to other parts. This would mean they are no longer causally related even so far as gravity goes but, by definition, all parts of the universe—this phase of Creation—would have been bound together; else they would be parts of different phases of Creation.

Clearly, I'm stretching language to the breaking point, but speculative thought can do that. Or, in Nietzsche's terms: speculative thought can involve dangerous balancing acts on a high-wire. Again, in Melville's terms, one who would find truth must leave the safe harbors and head out into the open seas, willing to brave the storms and the insanity induced by the inhuman vastness.

In any case, the known facts about the so-called Big Bang imply strongly we're in a specific phase of Creation and we can't do more than speculate on the form of general being from which this realm of galaxies and spiders expanded nor can we do more than speculate on the other forms of particular

being into which that general being can be shaped. But we do know that gravity plays a unique role in this universe: unifying. It would seem true almost by definition that the definition of this highly particularized phase of Creation would revolve around gravity.

At this point, it would become important to know what gravity really is and it may seem strange but modern physicists admit to not knowing what it is. Is it a force in the same sense as electromagnetism and the weak and strong nuclear forces? If so, could it be merely a particularized version of an abstract being which is the foundational stuff of all matter and all forms of energy and fields? In terms I proposed in my book, *To See a World in a Grain of Sand* [41], is it possible that gravity emerged from the Primordial Universe in the same way, and the same sense, as other forms of physical being? In those same terms—No.

In my worldview, gravity is a particularized version of a general metaphysical principle of unity while there is no such simple principle which seems to apply to the other forces of this universe. In some sense, gravity pre-existed this universe, this phase of Creation. I might well be wrong, but my story, that is—my explanation of reality, is consistent and coherent and presents this universe as being complete in some meaningful sense. This universe isn't complete in the sense of being all of Creation but it's complete in itself as a story. In theological terms, it will achieve the purposes for which God created it.

At this point, the reader who's read more of my entries, or my book, will be realizing that I'm serious about God creating truths in the very same act in which He created the stuff from which this universe, and the universe of the resurrected, are shaped. What I call the Primordial Universe is the mysterious stuff on the other side of the so-called Big Bang, the stuff that the thing-like stuff of this universe melts down into if we follow the development back in time and then speculate on a continuation of those processes.

Thing-like being developed as some strange stuff began to expand from the event first labeled the Big Bang by Fred Hoyle who wished to ridicule the model. Time and space as we know them also began during that process of expansion which was also a process of shaping. Yet, I should perhaps be a little more cautious. It remains still possible – though a bit unfashionable the last I knew—to speculate that the Big Bang was a rebound from a Small Slam and that the universe is in a state of oscillation though perhaps it can only collapse and expand a small number of times. Yet, this wouldn't

change the principle I'm expressing that the spacetime of this universe is part of this universe not a framework built from absolute truths.

The very nature of the Einsteinian Universe, as the largest possible gravitationally bound system of which we are part, tells us that it doesn't necessarily include everything. And we can't even necessarily see or otherwise interact with all of that gravitationally bound system. The journey backwards in time towards the beginning of this expansionary and factually-shaped universe points to greater and more general possibilities once the adventurer asks himself the question: What lies on the other side of the so-called Big Bang?

But let me state the matter in opposition to the five points I raised in Chapter 186, *The Cosmos of Thinkers Prior to Einstein*.

1. As I already discussed above, this universe is a highly particularized phase of Creation and not all of Creation.
2. The universe seems to be homogeneous. From the viewpoint of a physicist, the stuff in far-away galaxies is the same stuff as here on Earth, the physical laws in far-away galaxies are the same laws as here on Earth. This would be true even if some physical laws or constants have developed over time because physics as we know it would have to assume that the same meta-laws of development apply over the entirety of the universe. Or else, it would likely be the end of science as we know it. Regularity is the key to science, that is systematic investigation and thought. It doesn't matter – in principle—how many levels of parameters there are in the laws which express that regularity, although meta-laws would add immensely to the difficulty of exploring and understanding the universe.
3. Time and space seem to be dimensions in a highly particularized universe, arbitrary in both the details of their interrelationships and also—maybe—their very existence. The geometries which are used in theoretical physics are varied and there is no one geometry or other branch of mathematics that suffices for all work in that field. Kant and others, perhaps even Newton to some extent, were wrong in assuming that our world is necessarily a three dimensional Euclidean place moving through an absolute and uniform time. Some speculative work in physics and some modern work in the philosophy of science point to the same claim I've made that time and space are

creatures—as St. Paul simply assumed. We don't know what being is like on 'other side' of the Big Bang.

4. 'Matter' is not inert and not a pure object which is independent from minds or souls as they exist in this universe. Matter seems to be a partially frozen form of some sort of strange being which we can somewhat see, in a speculative way, by following the development of this universe back to that beginning of its expansion, the so-called Big Bang. Matter heats up as we go back in time in our imaginary journey, different sorts of basic particles beginning to melt into each other. Different forms of energy and fields also seem to melt into each other. In my book, *To See a World in a Grain of Sand* [41], I speculated that matter, energy, and fields all melt down into some strange sort of being which doesn't exist in any space or time as we understand space and time. In fact, in cosmological physics, that sort of extreme temperature and extreme compression are different terms for the same states. Soul-like and mind-like aspects of the human being are aspects of a dynamic form of being—partially frozen that creatures like us could exist.
5. The Creator of this sort of a universe would have to lie beyond or above or outside time and space and—in my opinion—could not have substance as the ground of His being. I've adopted the Thomistic existentialist view that God is a pure Act-of-being, His own Act-of-being, the Supreme Act-of-being. For reasons I won't go into here, St. Thomas compromised his existentialism by considering the possibility that some types of substance, soul-stuff, could be subsistent—that is, it could continue to exist indefinitely once God had brought it into being. I'm more consistent in claiming that all creaturely being, all substance exists on an ongoing basis only as a result of acts-of-being which are only possible to God Himself. In Chapter 156, *A Christian view of Einstein's and Bohr's debate on the meaning of reality*, I went even beyond this to speculate that relationships, inside of Creation as well as from God to Creation, are primary. Rather than saying that things exist and then have relationships, I am willing to follow radical quantum theorists, such as Niels Bohr, in claiming that—at some very basic level, relationships bring substance into existence. More than that, relationships continue to shape substances in very deep ways

so that a human being does become one of many possible entities depending upon his relationships to God, to other human beings, to his physical environments.

I've stated that my views are highly speculative but this is necessarily so. Neither facts nor theories can cohere by themselves. Speculative thought is the glue—obviously, 'grand' theories, such as the Theory of General Relativity, have important speculative components.

Without speculations, ultimately grand speculations on the meaning of all Creation, our knowledge remains fragmented. We can easily return to a state of intellectual barbarism without responsible worldviewing, and I know of few modern thinkers who are attempting to do what was done by Plato and Aristotle, Philo and Augustine, Aquinas and Kant. The problem is particularly noticeable in Christian thought where few have realized that, as Pope Benedict told us in his first encyclical, the teachings of the Church are made up of both revealed truths and speculations. Right now, the Church is teaching a body of thought which—in its entirety—makes no sense in light of modern empirical knowledge. Catholic and Protestant theologians and philosophers are all obscuring those revealed truths which they should be illuminating by honestly dealing with knowledge of this phase of God's Creation.

# 188 Defining Principalities, Powers, and Invisible Hands

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=80>. It was finished and uploaded on 2007/03/05.]

I've been thinking about Principalities, Powers, and Invisible Hands for a good decade or so, not every day but often. My academic background is in mathematics and I've read fairly broadly in 'chaos theory' and related specialties. For example, I've read some of the works of John Casti and Stuart Kaufmann, two experts in self-organizing systems. Along with the other pieces of my eclectic knowledge, this is feeding into something of an understanding of the issues involved. I'll be speaking entirely of human societies in a general sense.

Human beings are dependent, rational animals [91]—dependencies of this sort can be more generally labeled as 'social'. Our very dependencies upon each other make us very aware of each other's actions. We imitate very readily. We imitate unusual inflections or unusual use of words and often very quickly. We're not so different as we might imagine from schooling fish acting as one unit and it's somewhat surprising to learn from scientists that such coordinated action comes as each fish reacts only to its neighbor. There is no global control and yet there's global coordination.

We human beings also can form large-scale coordinated units just by imitative responses to our immediate neighbors. I don't have any problems imagining this, in analogy to schools of fish. Obviously, there will be some delay for more complicated individual behaviors and also some great uncertainty or confusion in the large-scale coordination if there are competing behaviors.

So far as I know, even mathematicians and other scientists who've stud-

ied this phenomenon, a type of self-organization, haven't come up with a good vocabulary for their quantitative purposes. And they may not, at least not for some future generation of thinkers who've more fully absorbed the discoveries of modern empirical science.

The development of modern science has been well-documented and it tells us that understanding comes only with the development of the vocabulary and concepts which can be generated by metaphors and analogies. Why do we need to speak as-if? Shouldn't it be possible to develop words and concepts that correspond directly to real-world entities and actions and relationships? Human experience to-date would indicate the answer to this latter question is, "No," a rather emphatic negative at that. I've discussed the often slow and sometimes funny ways we move towards better language for speaking of newly seen empirical facts and the new concepts they generate in Chapter 72, *Why Do We Need to Speak As-if?* and Chapter 90, *Shaping Our Minds to Reality*.

# 189 Henri Bergson: Almost Seeing a World

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=104>. It was finished and uploaded on 2007/08/22.]

The claim in the title of this entry is currently a vague idea, one based on a recent reading of *Time and Free Will* [11] and a currently ongoing reading of *Creative Evolution* [10]—I'm about halfway through. [Note: I did finish it not long after writing this weblog entry.] A little intellectual history:

1. Etienne Gilson studied under Henri Bergson.
2. At some point, perhaps after finishing his studies with Bergson, Gilson discovered St. Thomas Aquinas and had an ah-ha experience in which he realized that Aquinas was a radical existentialist, oriented towards strong reliance on empirical knowledge, who seemed to make more sense of the world than other philosophers.
3. In various writings, Gilson drew out what he thought to be the true thought of Aquinas and saw him as being far more consistent and coherent than the more modern existentialists, such as Kierkegaard and Sartre—though he did express some serious amount of respect for the philosophical thought of Sartre, a lesser amount for the thought of Kierkegaard.
4. During the 1960s through the 1990s, Alasdair MacIntyre constructed a narrative of a major line of moral and ethical thought in the West (roughly speaking, the line beginning with Aristotle and running through St. Thomas Aquinas). He ended up a Thomist and claimed

that the noisy incoherence in public moral conversations is due to traditionalists having a radically different vocabulary and set of concepts from the modernists (whom he separated into two groups of genealogists and encyclopedists in his Gifford lectures, published as *Three Rival Versions of Moral Enquiry* [90]). We moderns in different groups talk past each other, not having a clue at times what the other is really saying.

5. Starting around 1985, I was still crawling around on hands and knees in my efforts to develop a robust mind after years of American education and life in corporations. I started reading MacIntyre, first *After Virtue* [88] and then, upon publication, *Whose Justice? Which Rationality* [89]. In the meantime, during a business trip to a city which yet had civilized bookstores, Sydney, I obtained some of his earlier works in which he had started with the Greeks, trying to understand what was inadequate in Aristotle. He finally decided that Aristotle was close to seeing the truth but his ideal man was the proud gentleman of Athenian society, missing an appreciation of his own dependence upon others (see *Dependent Rational Animals*, a book version of Professor MacIntyre's Carus Lectures.)
6. Being monolingual, as Aquinas also was so far as scholarly languages go, I read *Summa Contra Gentiles* in English, a scattering of other translated works by Aquinas, MacIntyre's books in the order in which they tracked his movement towards Thomism, and a number of historical and interpretive books by Gilson. (MacIntyre moved towards the Catholic Church in parallel with his movement towards Thomism but he has insisted the two journeys were independent, a claim which seems implausible.)
7. As I was reading philosophical and theological works, I was also reading many of the more serious but accessible works on modern physics and biology, including not only some written for literate non-scientists but also those such as Weyl's *Space-Time-Matter* [147] (which is actually outside of the mainstream view of general relativity) and Dirac's *Principles of Quantum Mechanics* [28]. On first readings over the course of several years, I struggled to get anything at all out of these classics of science, but finally began to understand a bit. I was also starting to read some works in mathematics, the most important to

date of which proved to be some of Chaitin's articles and books on random numbers.

8. Starting out to write a simple book to let my fellow-Christians know they don't have to fear modern science, I found myself writing a book which created what I call a worldview. In my case, this was a very preliminary narrative of Creation, as a Creation with a Creator. The foundation is Christian revelation, most importantly that the Holy Trinity is one God, a Creator. The basic tools of narrative understanding were derived from Thomistic existentialism and applied to modern empirical knowledge. The universe, defined first in a coherent and dangerous way by Einstein, becomes a world when seen as created by the God of Jesus Christ for His pleasure and to meet certain ends such as producing companions for His Son.

Bergson had many profound insights into reality, which I'll discuss in later entries. Oddly enough, while seeing much that lay outside of the playing field of pragmatists, such as William James, he also didn't see even a universe let alone a world or the greater Creation of which this universe is only a phase. This is a little surprising only because Bergson anticipated so many other aspects of the more complete quantum theory and the more general theory of relativity that Einstein was working on when *Creative Evolution* [10] was published.

In *Creative Evolution* [10], Bergson saw that philosophers crippled themselves by accepting a division of labor that left them the job of cleaning up the statements of scientists. What is the job of philosophers? Well, the more serious philosophers will try to make sense of it all. That does involve some clean-up work. For example, back in the 1960s, Stephan Toulmin told theorists in evolutionary biology that they would do well to replace the concept of 'random' with the more complex and meaningful idea of 'unpredictability at points of interaction between two complex but well-determined systems'. The more important task for serious philosophers—in my opinion—would build upon work by mathematicians in the years following Professor Toulmin's critique: randomness is a form of factuality. (Gregory Chaitin has been generous in acknowledging the contributions of those who anticipated the insights into randomness which he and Kolmogorov proposed independently around 1965, but he doesn't seem to know about Toulmin's contribution.)

And what can we do with the insight that we can avoid an irrational understanding of ‘randomness’? First of all, we move on to try to understand ‘factuality’ and then try to understand the universe on that more basic understanding. What sort of a universe is factual in such a way that much is unpredictable? When we ask this question, we can see that many thinkers worked themselves, and continue to work themselves, into dead-ends.

A lack of emphasis on the concept of ‘universe’, redefined from ancient misunderstandings in the work of Einstein, will cripple a body of philosophical thought even when it contains serious and worthwhile insights. From ‘universe’, a Christian—and perhaps a thinker from another faith—can move on to develop a ‘worldview’ as I define it, that is, to see a ‘world’: a universe seen in light of moral order.

# 190 Seeing a Universe and Then a World

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=107>. It was finished and uploaded on 2007/08/31.]

I have read a lot of vague arguments that claim to shoot down scientific attacks upon Christianity. I have read a smaller number of very good arguments of that sort. From a certain viewpoint, those arguments—good or vague—are beside the point. We can divide human knowledge in various basic ways, and I've done so in *Four Kinds of Knowledge* which can be downloaded at <http://loydfueston.com/downloads/know.pdf>. This book speaks of revealed truths, empirical scientific knowledge, empirical practical knowledge, and the speculative knowledge that ties them together. Of these four, revealed truths deal with the only absolute truths, but it's quite true that speculative knowledge, philosophical and literary, is the glue that lets us see a world.

And that's the point. Pragmatists, such as William James in a clear way, but most modern thinkers to some extent, recognize only knowledge that arises directly from empirical data. This is a somewhat grotesque characterization of some bodies of thought both subtle and powerful, but useful for the purposes of this discussion which is about the problem faced by most philosophers and theologians and scientists: a universe can't be constructed from pieces. A universe, conceived as an entity as was done in the General Theory of Relativity, can be both itself—subject to scientific and philosophical analyses, and also home to a variety of entities—also subject to scientific and philosophical analyses.

As I often do, I've run roughshod over a great deal of complex history. Einstein himself only gradually came to understand he'd developed a theory

which could describe a single gravitationally bound system or the entire universe. And that points towards the question raised in the very title of Part V: *What is a Universe?*

To focus the point a little more: we're all pragmatists now. We all believe in environments fragmented and isolated from each other, sometimes by infinitely deep chasms. We Christians try to live on the Mount where Jesus spoke and we look across the various chasms to the interesting but contingent realms of cosmological physics or evolutionary biology or human history.

The incoherence in the Christian worldview in recent centuries is little different from the incoherence in scientific views until Einstein and his successors forced us to think in a more disciplined manner, to recognize that we need to define 'universe'—however tentatively—before we speak about it. Neither Christians nor scientists (yes, I know there is great overlap) had a clue what they were really talking about when they said the word 'universe' before Einstein provided a tentative technical definition and also an authoritative general definition: our universe is all that is bound by a common gravitational field. "A common gravitation field." Yep, that's the starting point for Christians to reconstruct their view of God's Creation and to make it consistent with empirical knowledge in its current state. You might say that gravity is a physical shaping in this world of the metaphysical principle of unity which was manifested by God in what I call the Primordial Universe, the underlying stuff of all Creation.

Start with a pile of the stuff of matter, energy, and fields. Add the most sophisticated form of Newtonian dynamics (some version of Hamiltonian or Lagrangian formulations of physics), toss in several tablespoons of statistical physics and chaos theory, and cook it all with the so-called laws of thermodynamics, and... You don't have a universe. You have a puddle of stuff. A universe exists as an entity and not just a container for the stuff inside of it. Nor can that stuff exist in the way of pragmatic speculation.

To make sense, a humanly conceived universe must correlate with our perceptible reality as built up from the pieces—but it's not reducible to those pieces. It's more than just the sum of those pieces. The history of human thought tells us prophets and poets and theologians had intuitions of a universe, or cosmos, before such could be defined. But a serious definition came only when science, studying the pieces, gave us the tools which Einstein used so well. Still, Einstein made a great leap of faith, faith that the cosmos was rational.

But this is still not enough. A universe is a very fragile entity if only because it has no reason to exist. ‘A reason to exist’ is a purpose which can’t be internally generated. It must be set from outside that universe. It is at this point that Christians can begin their work of making sense of the huge piles of modern empirical knowledge, not truly knowledge to be sure until it is part of a more coherent, more unified, more complete whole—a world which is ordered to the purposes of the Almighty.

# 191 What are the Thermodynamic Properties of Heaven?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=110>. It was finished and uploaded on 2007/09/23.]

A silly question in a way, but also a serious one. In fact, it's a question forced upon us by the importance of cosmological physics as popularized by the so-called Big Bang. Live in the Big Bang world, die in the Big Bang world. Even be resurrected in a world part of the same Creation as the world of the Big Bang.

God shaped this universe out of some very strange stuff that was not matter nor energy nor fields but became each of those by way of what physicists call the breaking of symmetries and by an expansion which led to a great cooling. I've written a number of entries on this and related topics and I'll not go into details here but I'll say that Roger Penrose, the British mathematician and physicist, has shown that that strange stuff had a huge number of possible initial states and God (yes, he used the G-word in this context though I don't know what his beliefs are) chose a very, very unlikely initial state. In a way, this is beside the point since any particular universe, even one beginning in a more 'likely' state, would be nearly impossible at that point of shaping and it was literally impossible from the creaturely viewpoint for anything to have existed in the first place. Substance is not self-creating nor self-sustaining.

Let's just move on to a fact explained by Professor Penrose in his wonderful but demanding book, *The Road to Reality* [113], but also discussed in his earlier books, *The Emperor's New Mind* [111] and *Shadows of the*

*Mind* [112]—also a bit demanding. Despite the name *Laws of Thermodynamics*, the ‘law’ that says entropy increases is not a law. Entropy tends to increase, rather relentlessly, in the universe as a whole, though life-forms exist by reversing that process locally. The reason for this tendency is that particular configuration of the universe at the time of the so-called Big Bang. Entropy was extremely low at that point God chose from the absolutely infinite sea of chaos I call the Primordial Universe.

It might seem surprising that this universe was at its lowest point of entropy, or its highest state of order, back in those early seconds when no things or thing-like matter had yet condensed out of that ball of fire which was far, far hotter than the sun. Yet, that’s the case. Entropy was very low. Disorder was very low. Order was very high. Very little energy was in the form of low-frequency and long-wavelength radiation that we know as heat or degraded, high-entropy energy.

Entropy had to increase and order decrease. This is the movement towards heat death that is sometimes discussed on documentaries on television. As it turns out, life on earth organizes itself as the physical environments take in the relatively ordered, relatively low-entropy, radiation of the sun and degrading it to heat. On the whole, entropy increases, but an amoeba or a gorilla or a sequoia tree is an island of order in the midst of this process of degradation of order. Life as we know it exists only because it can produce ‘heat pollution’ by degrading low-entropy energy. I might get back to this subject eventually. For now, I’ll again refer the interested reader to Professor Penrose’s *The Road to Reality* [113] where he discusses this seeming contradiction in the nature of life on earth.

I’ll speak about the problems this presents to Christian thinkers who consider Heaven to be a real place and a part of Creation. Other Christians who wave away concrete discussions of Heaven might wish to consider the possibility they’ve conjured Heaven away, turned it into a dreamland that’s not really part of Creation.

If we stick to the terms used by Professor Penrose and other modern physicists, it would seem we have to imagine Heaven as being a new world in which entropy is such that it doesn’t increase or decrease. It remains constant. Can such a world be a world of life? Would it be a frozen or crystalline world? I don’t know, but it doesn’t seem to endanger my faith to ask such questions. In fact, asking such questions leaves me more settled than avoiding questions or waving them away with vague suggestions that “such questions are beyond us.” I admit the value of a simple faith for many

believers but I think that history tells us that there are many, including the authors of the Torah and St. Paul, who are willing to deal with the difficult questions. My own experiences tell me that those with simple faiths aren't doing so good a job of raising their own children to be Christians, not in this world of National Geographic specials about human evolution or NOVA specials about the universe filled with stars and seemingly empty of angels.

Suppose we try to look for more general possibilities rather than assuming that God will fine-tune the recipe He used for this world when He shapes Heaven. Suppose the concept of entropy isn't necessary to describe a world in which human beings could exist, once formed by the processes of this universe. I don't know what sort of a world would have no entropy. I don't know if any world suited for humans, even perfected humans, could operate without entropic changes. It certainly seems that changes in entropy are part of the struggle between order and disorder in this universe in which we are being born and formed. In fact, as St. Paul tells us: "[T]he creation itself will be set free from its bondage to decay and obtain the glorious liberty of the children of God. We know that the whole creation has been groaning in travail together until now; and not only the creation but we ourselves who have the first fruits of the Spirit groan inwardly as we wait for adoption as sons, the redemption of our bodies." [Romans 8:20-21]

This is the problem with knowing more about this world. We now know enough to speculate on the nature of Heaven, but that's a good thing – once we Christians regain our faith and confidence. The ancient and Medieval Christians could also speculate on the nature of Heaven. After all, they'd learned from the great pagan thinkers that Heaven lay on the far side of the moon. What they knew of Heaven was largely wrong, but they didn't make the error of putting infinite chasms between Heaven and this world. We modern Christians tend to believe that knowledge of Heaven is impossible to men, that Heaven lies in a realm so different as to be pretty much non-existent. We should have faith that Heaven exists, as the Lord Jesus Christ told us, and we should realize that any Heaven suitable for human beings is a part of Creation and has to be subject to serious human speculation.

In ages of greater faith, Christian theologians and poets, such as Dante and Milton, didn't hesitate to speculate on the nature of Heaven while recognizing that the truth of the matter lies beyond any certainty on the part of mortal men.

## 192 One for the Empiricist Views of Mathematics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=160>. It was finished and uploaded on 2008/06/10.]

See *Astronomy study proves mathematics theorem* found at [http://space.newscientist.com/article/dn14064-astronomy-study-proves-mathematics-theorem.html?](http://space.newscientist.com/article/dn14064-astronomy-study-proves-mathematics-theorem.html?feedId=online-news_rss20)

for a case where astrophysical research helped to prove an extension to one of the most important theorems in mathematics (*The Fundamental Theorem of Algebra*—see [http://en.wikipedia.org/wiki/Fundamental\\_theorem\\_of\\_algebra](http://en.wikipedia.org/wiki/Fundamental_theorem_of_algebra)).

The title of the article is slightly askew because the work by an astrophysicist provided the missing half to a proof, where the other half had come out of work by algebraic theorists.

This is one more case where efforts to understand or explain a physical phenomenon led to some insights into seemingly very abstract regions of mathematics. Since at least the time of Archimedes, research in physics and mathematics has always at least overlapped and sometimes, as in the case of Archimedes himself and Newton, been inseparable.

In my way of looking at Creation in its totality, this sort of overlap between physics and abstract mathematics is an indication that there is no firm and absolute line to be drawn between the concrete and the abstract facts/truths of Creation. The proper physics of our universe is a particular instantiation of a metaphysics which is manifested in the more abstract phases of Creation. See Chapter 569, *Abstract Mathematics and the Real Presence of Jesus Christ* for a discussion of this issue from a slightly different perspective.

# 193 A Universe is More than it Contains

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=163>. It was finished and uploaded on 2008/06/18.]

In order to move on in my work, I've been studying advanced physics and mathematics when time is available. Recently, I finished reading *Principles of Physical Cosmology* [109] by P.J.E. Peebles, a distinguished authority in the field of general relativity. He has various interesting comments and insights, but one insight is particularly fascinating to me given my reasons for achieving a deeper understanding of modern physics so that I can better understand God's Creation. In the following quote, square brackets are used to include my explanatory insertions. As Professor P.J.E. Peebles tells us:

We see that the faster decrease of [the radiation density of a relativistic universe modeled as a gas] compared to the mass density of a nonrelativistic gas is the result of the pressure work done by the expanding radiation. However, since the volume of the universe varies as [the third power of the expansion factor of the universe], the net radiation energy in a closed [and expanding] universe decreases as [the inverse of the expansion factor of the universe] as the universe expands. Where does the lost energy go? Since there is no pressure gradient in the homogeneously distributed radiation, the pressure does not act to accelerate the expansion of the universe. (The active gravitational mass due to the pressure has the opposite effect, slowing the rate of expansion. . . ) The resolution of this apparent paradox is that while energy conservation is a good local concept . . . and can be defined more generally in the special case of an

isolated system in asymptotically flat space, there is not a general global energy conservation law in general relativity theory.  
[page 139]

Firstly, a disclaimer: we don't yet know the exact geometric properties of the universe, or rather—the region of the universe which is visible to us. It's not even certain we have a complete inventory of types of matter and forces in this universe. It might be that we do live in a universe that conserves energy at the 'global' level, but there's no 'law' mandating such and a good chance that we live in a universe where certain types of energy can go away at the level of the universe.

Given that disclaimer but remembering that there is no "general global energy conservation law in general relativity theory," we can see that a universe can be described in which all localities do have an energy conservation law while that universe doesn't. While those 'conserving' localities make up the universe in some strong sense, the universe as a totality can have properties different from what would be implied by an effort to construct the universe using only its localities. In other words, the universe as a totality is itself an entity and may have properties not found by assembling it, tinker-toy fashion, from its 'pieces'.

There is an element of weirdness here, a seeming violation of our understanding of the ways in which larger and more complex entities are 'built-up' from their components. It almost seems as if there's an analogy between the universe and a living creature, especially a social creature. We don't have any 'common-sense' intuition that a man or an elephant can simply be built out of its components but that's potentially dangerous because much of the individuality which is striking in man and elephant comes from the historical nature of such creatures, from their context or even embeddedness in a greater world. We human beings, along with at least social creatures, exist more as boundary phenomena where our organ-based physical selves interact with our environments and perhaps more. If that's true of the universe, what is its greater context? My worldview provides some ways of answering that since I speculate that the universe is only one phase of a far greater Creation, but those are vague possibilities and would require a major effort to develop—perhaps an effort beginning with years or even decades of study.

# 194 Finding the Foundations Supported by the Whole

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=171>. It was finished and uploaded on 2008/07/17.]

I've just finished reading Roberto Torretti's *Relativity and Geometry* [133], a philosophically oriented discussion of the foundational ideas of Einstein's two theories of relativity—geometrical and physical. Over the course of the book, as he discussed those foundational ideas of relativity, he builds up to a conclusion which is true enough, but does beg some questions. He points out that Einstein was able to avoid the philosophical assumptions of empiricism, axiomatic systems, and conventionalism.

So what did Einstein do, what sort of thinking did he engage in while being such a creative storm in theoretical science? More generally, what does it mean to think so that we're not unduly bound by empiricism, axiomatic systems, and conventionalism? Is there a more positive way to speak of such a way of thought?

Torretti gives one example of one mathematical physicist who was not able to escape the bonds of conventionalism circa 1900. Poincare was in a position to develop a full-blown special theory of relativity before Einstein did so, the great French scientist held a conventionalist viewpoint. In fact, he's one of the thinkers mentioned in a Wikipedia article, *Conventionalism* – <http://en.wikipedia.org/wiki/Conventionalism>, where we can read the definition:

Conventionalism is the philosophical attitude that fundamental principles of a certain kind are grounded on (explicit or implicit) agreements in society, rather than on external reality.

In an article on *Empiricism* – <http://en.wikipedia.org/wiki/Empiricism>, we can read:

In philosophy, empiricism is a theory of knowledge that is practical rather than abstract, and asserts that knowledge arises from experience rather than revelation.

Finally, in this article on the fundamental concept of *axiom* – <http://en.wikipedia.org/wiki/Axiom>, we can read:

In traditional logic, an axiom or postulate is a proposition that is not proved or demonstrated but considered to be either self-evident, or subject to necessary decision. Therefore, its truth is taken for granted, and serves as a starting point for deducing and inferring other (theory dependent) truths.

I should point out that our primary knowledge does arise from experience and that there are truths which are so self-evident as to be built into the very functioning of our physical bodies. There are also social aspects to the specific problems chosen by particular scientists, to the way they state even the most abstract of truths, and so on. However, we seem to be able to somehow access domains of knowledge of abstractions, generalizations from our experiential knowledge, that includes possibilities not known to be realized and even possibilities which can't be realized in our universe. I'll leave that issue undeveloped in this chapter. It's developed in various ways in the various chapters of this book, perhaps most intensely in Part III, *The Human Mind as a Re-creation of God's Creation*.

Einstein was pursuing a better formulation of the truth about the physical world and was first led on by the conflicts in the basic assumptions of reality between Newtonian mechanics and Maxwell's statement of electromagnetic theory—the impossibility of reconciling Galilean relativity with Maxwell's equations was perhaps the major problem. After the special theory of relativity was established, he wanted to reconcile inertial mass with gravitation mass (weight). Einstein achieved that second goal by developing the general theory of relativity and, perhaps to his surprise, found that he'd developed a theory that could be used to define and describe a universe as well as various strange objects inside the universe – such as black-holes.

We can think of gravity as that which unifies our universe and it will be no longer surprising that a reconciliation of inertial mass and gravitational

mass leads to Einstein's field equation giving a relationship between the shape of space-time and the distribution of matter-energy for an 'isolated' gravitationally bound system which can be merely a black-hole or it can be an entire universe or it can even be a more ordinary object in this universe which can be treated as gravitationally isolated. As Wittgenstein might have said: Einstein had penetrated to the foundations and found they were being supported by the entirety of the structure. Einstein himself has been quoted as defining a scientist as an unscrupulous opportunist, a way both humorous and dramatic to say that good science is often the result of seeing the importance of an unexpected result and exploring it in a fruitful manner. Some of the dramatic examples are in the experimental fields but the fruitful explorations of Einstein's field equation from the general theory of relativity provide another good example. While it was interesting and important that observers were able to see light being bent by the sun's strong gravitation field and most of the perihelion shift of Mercury was explained, the real action was along another line of development starting with Schwarzschild's early solution of the field equation which eventually was seen to be a description of a non-spinning black-hole. The ante was upped when Friedman found a solution which proved to be for an expanding universe with a bounded space-time. Other solutions were found, including that of Godel in which the entire universe rotated and could be detected as rotating and in which time could move in either direction.

Not only had 'universe' been defined in a scientific manner, but a small number of possible universes had been described, one of which – corresponding to Friedman's solution—is at least similar to our universe. Not only had general relativity given a way of defining a universe—at least one sort of universe, it had given a field equation, in fact—a way of thought, that allowed multiple universes to be defined. In a sense, Einstein had not only found a way back to the so-called Big Bang, he had found a way to pass through it and explore parts of what I call the Primordial Universe, the manifestation of truths that God had selected for Creation, from which truths He had shaped this particular universe.

# 195 Coherence and Truth

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=346>. It was finished and uploaded on 2008/12/11.]

There's a question which has bothered me for a while:

How could the ancient and Medieval thinkers have seen clearly so many truths about human nature and the rational nature of this universe (though they didn't have this modern concept in quite this form) when they had such an incomplete view of basic physical reality?

In fact, many of their specific views were wrong, even their most basic views of physical matter or forces, of the nature of the planets and stars, of life and of many basic aspects of the substance of human nature. Yet, great thinkers produced great insights, such as that of Aquinas that the human mind forms in an organic way in response to its environments.

Part of the answer is that coherence matters greatly even if the thinker has inadequate or even wrongful knowledge about his environments and what lies beyond those environments. Coherence of a theory or individual speculation would have to be defined in terms of substantial agreement with the body of empirical knowledge as known in that age and place.

There are obvious examples of coherent and surprisingly valid theories coming out of limited and sometimes defective factual knowledge of reality. The clearest example might be that of Newton's theory of gravity. Sometimes, popular science books will discuss Newton's theory of gravity as being an approximation to the more powerful and more 'exact' general theory of relativity. Not completely wrong but not the best way of viewing matters. Newton's theory is locally indistinguishable from Einstein's general theory of relativity. So long as we don't look too far in space-time

and don't look at objects of immense or highly concentrated mass, we see a universe in which gravity is described very well by Newton's theory.

The extraordinary success of modern physics and mathematics in describing our universe gives us hope that we can develop a more coherent general understanding of the universe. Most who discuss human knowledge look horizontally, so to speak, being impressed or not by the expansion in our ability to predict events in the heavens and by our amazing technology but often they remain convinced that the abstract truths drawn from Creation by traditional metaphysicians and theologians remain valid and complete. In fact, those truths remain valid in the limited sense that they are coherent in and of themselves though not able to describe the universe as understood in the light of modern physics and mathematics.

Coherent in an age that believed that matter had a stable existence, if only at the level of unseen atoms, traditional ideas of this universe are incoherent now that we know matter is held in existence by events and constraints understood very well in formal terms by quantum mechanics. Matter is not what Aristotle or Augustine or Kant thought it to be. For that matter, time and space are not what they thought them to be. A century after Einstein, it seems yet true that time and space are a single structure of space-time best described for now by those non-Euclidean geometries of gravitational theory. Most traditional 'proofs' for the existence of God rely on an understanding of infinity which is invalid in this age when even freshman college students might learn how to prove that there are infinities which are 'bigger' than the ordinary infinity of 1,2,3,... Yet, I think there are some deep truths in those proofs that might be recovered by a new generation of theologians and philosophers who are educated in transfinite set theory and other branches of modern mathematics and science.

Let me try to form a more explicit hypothesis of what's going on. The following is a description of the levels of created reality as found in my current views:

1. The most basic level of created reality is the **Primordial Universe** which is the abstract stuff which God created from nothingness. This abstract stuff is a manifestation of the truths God chose for Creation.
2. From that Primordial Universe, God shaped this **particular universe** as a totality in a more limited way. Seen in light of God's purposes for this universe, it becomes morally ordered and I then re-

fer to it as a ‘world’. With this terminology, our world isn’t necessarily unique. For example, God could have created a separate world for the resurrected.

3. The stuff of this universe is shaped into **things and living creatures** which also have existences separate from the universe. Alternatively, we could say the universe has a nature of its own and isn’t just a collection of things or a container for holding space-time and things.
4. **Living creatures** are interesting in their own regard as highly specialized thing-like beings but I’m mostly concerned with man, in fact, mostly with those aspects of the human organism labeled ‘mind’ or ‘moral nature’.

Levels 3 and 4 are at least partly reachable by our senses. Ancient thinkers and even some poets of prehistorical peoples had intuitions that something existed which is at least similar to Level 2, but it was Einstein who first defined the universe in rational terms—the Aristotelian cosmos was described by way of a sort of indefinite inclusiveness. Einstein expanded human reason so that it could better deal with that Level 2, this particular universe, and he did so by also expanding human reason more deeply and more broadly into Level 1, a level of being spoken about in dream-like or poetic terms by some like Plato and ignored by many others, even some known as metaphysicians. With quantum mechanics and many developments in mathematics, reason broadened still further and expanded more deeply into that Level 1, the realm of abstractions.

I repeat: We have the great opportunity of developing a more coherent understanding of the universe. But this is not a matter of simply trying to fit a new view of created reality into some sort of pre-existing, general-purpose human mind. We have to begin shaping our minds by responding properly to God’s Creation, to the vast piles of modern empirical knowledge and to those many piles of traditional knowledge which remain valid. It’s not modern empirical knowledge which is true or false according to whether we can fit it into the categories and relationships which we’ve inherited from earlier generations of thinkers. It’s our minds which are true or false according to whether we reshape them to the demands of modern empirical knowledge. Even the ultimate truths that the Transcendent God revealed to us will become false if our minds remain shaped to views of His Creation which are incoherent.

# 196 Modern Madness and Realms of Knowledge

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=359>. It was finished and uploaded on 2008/12/20.]

This article: *God Or Science? A Belief In One Weakens Positive Feelings For The Other* found at <http://www.sciencedaily.com/releases/2008/12/081215121559.htm>, ends with these paragraphs:

“What is really intriguing is that the larger effect happens on the opposite belief,” she said. “When God isn’t being used to explain much, people have a positive attitude toward science. But when God is being used to account for many events—especially the things that they list, which are life, the universe, free will, these big questions—then somehow science loses its value.”

“On the other hand, people may have a generally positive view of science until it fails to explain the important questions. Then belief in God may be boosted to fill in the gap,” she said.

The most obvious implication of the research is that “to be compatible, science and religion need to stick to their own territories, their own explanatory space,” Preston said. “However, religion and science have never been able to do that, so to me this suggests that the debate is going to go on. It’s never going to be settled.”

The study appears in the *Journal of Experimental Social Psychology*.

This sort of study supports a conclusion I arrived at years ago – that modern man has separated his understanding of his world into mutually

exclusive domains of knowledge. To separate knowledge in this way is to separate the world into mutually exclusive domains of being. Only one domain at a time can be real and other domains retreat into a dream-like existence. Some can manage to live in one domain at a time but those will usually do so by giving up the truthful aspects of the other domain. You can have atheistic curmudgeons and nutty Christians and those who think political or social claims trump science and religious traditions but few there are in these modern times who can live in one world that is reasonably complete in acknowledging the claims of empirical knowledge and religious revelations or insights, of esthetic instincts and practical knowledge whether of growing food or holding together communities.

Science and religion don't "need to stick to their own territories, their own explanatory space." That way lies cognitive dissonance. I've spoken of this problem in Chapter 577, *The Only Sane Christian in the Modern World*, and also in Chapter 91, *A Thomistic Take on Madness and Modernism*. Years ago, I also wrote a darkishly comic novel dealing with this issue, *A Man for Every Purpose* which can be downloaded at <http://loydfueston.com/downloads/aman.pdf>.

What is needed—ideally—is a single view of physical reality which men of good faith can agree upon. That single view can be the foundation of speculative knowledge in all those specialized fields we create because of human limitations. This website has been created by the belief that the best such single view is a Thomistic existentialism updated to account for modern empirical knowledge. St. Thomas pointed us towards a greater sort of sanity.

## 197 Being and Natural Law

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=364>. It was finished and uploaded on 2008/12/22.]

I've written of this universe and its stuff as shaped from the manifested truths of the primordial universe. Looking at this from another direction, the claim becomes: there are no natural laws but only properties of particular sorts of being including their forms of interaction. What we see as abstract laws, mathematical or metaphysical, are those manifested truths or at least some approximation to them. Those truths are not laws imposed upon inert matter but are rather the stuff from which God shaped this universe and its matter and space-time. If we think in terms of the concrete being of this universe, it's possible to think of those truths as deeper levels of created being.

This understanding of natural laws makes little practical difference to us as we go about our days trying avoiding the damage of gravity or the damage from an excess of energetic electrons. It also makes little difference to most scientists or engineers in their theorizing or experimenting or constructing of accelerators or bridges. Yet, when we try to make sense of it all, when we try to discover meanings, it's important to realize that being should be at the center of our attention and mostly the act-of-being which brings into existence.

We do not live in a universe where inert matter, energy, and space-time have specific laws enforced upon them as if the laws could have been different for that particular universe. We live in a universe where manifested truths have been shaped into specific forms of more concrete being. That being is matter and energy and space-time and also all the laws and facts which relate them. When we find that concrete being behaves according to 'laws', we're actually achieving deeper understandings of being. In a useful

manner of speaking we're penetrating to the levels of being which are those manifested truths from which it has been shaped. That is: natural laws are not external to things, natural laws as we know them are part of this universe and the created being within it. In this, they're not so much different from the behaviors and other aspects of concrete being which have more of a factual smell to them. That is, the law-like behavior encoded in the field equation of the theory of general relativity is not so much different from the gravitational constant as some would imagine.

# 198 As the Universe Ages, It Forgets What It Once Was

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1280>. It was finished and uploaded on 2012/05/25.]

Cosmologists study the universe at a level where records vanish, as we learn in this article: *Best Time to Study the Cosmos Was More Than 13 Billion Years Ago* found at <http://www.sciencedaily.com/releases/2012/05/120522180624.htm>. The physical world, with its stars and galaxies and background radiation fields, doesn't leave us some sort of permanent record to study at our leisure. Information can disappear in various ways.

New calculations by Harvard theorist Avi Loeb show that the ideal time to study the cosmos was more than 13 billion years ago, just about 500 million years after the Big Bang. The farther into the future you go from that time, the more information you lose about the early universe.

"I'm glad to be a cosmologist at a cosmic time when we can still recover some of the clues about how the universe started," Loeb said.

Two competing processes define the best time to observe the cosmos. In the young universe the cosmic horizon is closer to you, so you see less. As the universe ages, you can see more of it because there's been time for light from more distant regions to travel to you. However, in the older and more evolved universe, matter has collapsed to make gravitationally bound objects. This "muddies the waters" of the cosmic pond, because you lose memory of initial conditions on small scales. The two

effects counter each other—the first grows better as the second grows worse.

Loeb asked the question: When were viewing conditions optimal? He found that the best time to study cosmic perturbations was only 500 million years after the Big Bang.

This is also the era when the first stars and galaxies began to form. The timing is not coincidental. Since information about the early universe is lost when the first galaxies are made, the best time to view cosmic perturbations is right when stars began to form.

The information about the more raw levels of thing-like being disappear as it develops into larger and more complex structures. When gas clouds collapse to form stars and galaxies, the information about those clouds disappear.

As much as you might know about the entities and events at an advanced stage of a narrative, a story, you can't always form a good idea of the earlier stages of the story. Anyone who's read many biographies will know that there are those who pass through crisis points which don't allow predictions of where that character will be heading when he's past that cusp. If you start at the maturity of that character, you don't always have a clue what his childhood and young adulthood was like. This is true of a simple function which has an immediate change in direction, such as  $y = |x|$ , which has a discontinuity at 0, that is, there is no unique tangent. It's also true of those who pass through an important moral decision of certain sorts. For example, Adolf Hitler started life as a rather ordinary fellow and made a decision, or likely a series of decisions, which led him to a politics of hatred and exclusion. He headed off in a radically different direction from the prior trajectory of his life. There are entities, in the history of men and in the phystory of our universe, which have stable development paths. And there are periods where most entities have such paths. Take an ordinary American born in the period 1940-1970 or so and, with high probability, his general path through life, his political and business and charitable and religious activities, could be predicted. The general cluelessness of most such Americans in the event of dramatic changes in circumstances could have been predicted by those who knew history at a grander scale. What about those born into a society which had first stopped moving forward in significant ways, even in the physical prosperity so beloved by most men,

and then passed through various crisis periods? A flattening and then erratic movements in various directions.

Various structures, from the moral character of individuals to that of various levels of communities, have formed in ways and under conditions which couldn't have been predicted by following the trajectory of events in the 40s and 50s and even the 60s though there were strong hints of coming troubles in that latter decade and weaker hints for the more knowledgeable and more sensitive in the earlier two decades.

If you have no recorded information of structures and the circumstances and the states of individual entities before a crisis point—a discontinuity, it's hard, and sometimes impossible, to recover that information.

Discontinuities. Nonlinearities. Cusps.

There are many ideas explored by modern mathematicians and physicists which were well known under other terms by insightful historians and poets back when science was passing through its own Garden of Innocence when the universe seemed to behave in ways that seemed to be more rational. Functions describing physical reality were smooth, infinitely differentiable, well-behaved in most important ways. A scientist so clear-headed as Laplace could convince himself the future of the universe is fully predictable so long as you have a complete knowledge of the current state of that universe.

In fact, the world is chaotic in the scientific sense of being well-determined, though perhaps not fully determined, but having an unpredictable future. I've discussed this before from a slightly different viewpoint, but one closely related to that of the study discussed in the article I referred to above: *Best Time to Study the Cosmos Was More Than 13 Billion Years Ago* found at <http://www.sciencedaily.com/releases/2012/05/120522180624.htm>.

Though the universe is moving through some sort of, as yet poorly understood, space of states, there is a time-symmetry to many physical process that leads to the strange situation of the past being as 'unpredictable' as the future, in some ways and for certain ranges of time in the past.

As I noted in my first published book, *To See a World in a Grain of Sand* [41]:

There's a pretty good way to generate physical events which are chaotic by some realistic and practical standard. The measurements of those events will be a stream of numbers random

by some standard, sometimes quite high. You can simply put two independent systems in contact with each other and observe or measure what happens at the interface. That's all. It's a trick used in some of the simple experiments used to generate so-called chaotic motion. For example, take two pendulums with different periods of oscillation. Link the bobs of the pendulums and put one or both in motion. The two pendulums will clearly not be able to move as they would if each moved freely. In fact, the resulting motion will be chaotic, basically unpredictable. Equivalent experiments can be done with electronic components or even with simulations of the independent systems in software. There's nothing mystical involved in generating streams of physical events which are unpredictable or chaotic, generating numbers which are random by some low standard.

Chaotic motion can be visualized as an orbital path that never quite returns to the same point and is unpredictable beyond some length of time in the future or in the past. If you were to graph the orbits of such an object, and the orbiting earth is such an object, you would get a blur of orbits that lie close to each other and cross over often but no particular orbit is the same as any other. That sort of movement is patternless to human perception and measurement though usually staying within some tight boundaries. Physicists have shown by way of demanding computer simulations that "the orbital movement of planets in the solar system is chaotic. . . which makes practically impossible any precise prediction beyond a few tens of millions of years. . ."

The early results of Professor [Jacques] Laskar's research (his first simulations of the solar system [were carried out] in 1989) indicate that a mere 15 meter error in measurement of the earth's current position makes it impossible to say if the earth's orbit will be stable 100 million years from now. Because the equations of dynamics are symmetrical in time, this means it's also impossible to prove the earth's orbit was stable more than 100 million years in the past, with that range of ignorance moving with us so far as the future goes and also moving with us so far as the past goes. A few years later, Gerald Sussman

and Jack Wisdom of MIT showed that after only 4 million years it is not possible to predict the orbit of the earth, or any of the planets of the solar system, with any confidence.

Undoubtedly, results will have been tightened up in the technical literature to which I have no access. But the principle is what's important.

In a sense, knowledge is constantly coming into view ahead of us and constantly disappearing behind us. To be more explicit, this means that, despite common sense, we cannot prove by mathematical means that the earth stayed in its orbit 4 million years ago. So far as the equations go, with initial conditions provided by the current state of the solar system, the earth might have crashed into the sun or gone shooting past Mars 4 million years ago. Common sense sometimes tells us things that mathematics cannot.

You shouldn't imagine that this situation occurs only at the level of planets like the earth. The sun itself is traveling a chaotic orbit around the center of the galaxy. Our galaxy, the Milky Way, is dancing around various gravitational centers of local clusters of galaxies and larger-scale clusters of galaxies.

[In that book, I go on to a discussion that confuses predictability and determination, but the real issue is knowledge and predictability, chains of causality are sometimes unknown to us, whether well-determined or a bit looser than that.]

# 199 Theories, Meta-theories, and Meta-etc

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1403>. It was finished and uploaded on 2012/09/11.]

I've written of the desirability of using tensor-type thinking in qualitative fields where there is, even in principle, no way of particularizing the tensor equations to equations which could actually be used to calculate numbers. A reminder: by intelligent use of tensors (call it reasoning in more abstract spaces by way of differential geometry if you wish), Einstein was able to derive a description of theories of gravity (or of spacetime) which would satisfy his equivalence principle so that Maxwell's equations and other established laws of physics, even Newton's laws of motion and of gravity at the local level, would be satisfied in all frames of reference, even those which were accelerating. To be sure, the acceleration had to be accounted for in applying most laws, but that was hardly an obstacle to Einstein's work. At the same time, Einstein himself—so far as I know—never developed a specific set of equations describing a gravitationally bound system.

The first to do so? While at the front lines in World War I, the German astrophysicist Karl Schwarzschild particularized the field equation of general relativity into a set of equations describing a system which was spherically symmetrical and which could be quantitatively solved. Professor Schwarzschild died in an epidemic shortly after mailing his solution to a journal.

There is little in this discussion that should be of surprise to my regular readers but I find it valuable to restate in terms of my worldview truths already part of at least some of our accepted ways of thought. Subtle

differences, sometimes more than subtle, will emerge over time or perhaps will be obvious immediately.

Terminology of this sort, meta-this and meta-that, is used and abused and generally meaningless, but I'm claiming it can be used to say something meaningful about the knowledge of the spectrum of being from abstract to concrete. As we travel roads through this spectrum, we need to explore, map, experiment, to propose various sorts of theories and meta-theories, and test it all, subject it to the selective processes which can take place when an honest and reasonably well-formed mind uses reality as the first test, more complex worldviews as successively advanced tests as the explorer moves through life and through his small part of Creation. We actually don't have to bootstrap and may not be capable of it in any case. We start off in life with something akin to a worldview, such as a baby's strong belief in continuous existence of objects and also various levels of conscious and unconscious prejudices (in a neutral sense) of how to make sense of these confusing signals coming in through our eyes and ears. It's probably better to say, analogously, that we start off with a capability to learn symbols of various sorts and, culture permitting, we learn some system of hieroglyphics or a phonetic alphabet or whatever, and some will move on to develop higher skills of literacy and the sorts of conceptual skills related to literacy. There might still be only a few truly powerful and creative thinkers, but it becomes possible for good quality minds to explore the thoughts of a Plato or a Poincaré and to come to some serious understanding. In fact, there are many with good quality minds who can correct the creative thinkers or expand their results in many ways even though they might not be able to develop a new way of thinking from scratch.

Meta-theories play a role in all of this, the creative thinking and the proposal of new understandings and the teaching of any understandings which have legs. They play a role because human thinking and all that comes from it is an effort to shape a mind which corresponds to Creation or some part of it. Meta-theories are efforts to understand at relatively more abstract levels of created being and thus are a part of reality. Remember: abstract levels of created being are still real and aren't just imaginary efforts to understand some alleged 'true' reality of a concrete sort.

The human mind mostly enters abstract regions of created being on a speculative basis—after all we don't directly see the particles of modern physics nor the groups of modern mathematics nor even the patterns of history; we should think of those regions as places where we explore, map,

experiment as we try to achieve more profound understandings of created being. This isn't pure speculation as most would think of it because speculation as I conceive it is more a glue tying together different parts of concrete being, of abstract being, of concrete and abstract being. This is why I can see true freedom on the part of creative thinkers or doers or artists at the same time I propose they are doing 'no more' than trying to imitate the Creator in His acts-of-being. Our very creativity is within the constraints of reality.

I'm writing about speculation and speculation mixed with theory and both mixed with fact. The foundational idea remains as I've stated it often: created being is a spectrum ranging from the concrete stuff of this universe up to the abstract sort of stuff it was shaped from, some of that stuff being part of the story of the so-called Big Bang, and the more abstract stuff from which that was shaped right up to the primordial level of created being, the truths God manifested as the raw stuff of His Creation. Our minds, our ways of thinking and remembering should correspond to created being, to reality so long as one realizes reality includes some very abstract realms of created being. Thinking isn't something transcendental to created being, something which renders judgment upon Creation or any part of it. Thinking is, in a manner of speaking, the soulish aspect to created being. Moving forward from God's creation of the raw stuff of Creation to God's shaping of the concrete realm of flesh and blood and rocks, we can follow God with our minds and our hearts and our hands, imitating God as He goes about His work. We're children who pick up a stick and move it in ways analogous to our Father as He shapes stars and abstract realms of mathematics, making up our stories to explain what He does and what we try to do in imitation of Him. Over time, if the intellectually and pedagogically talented members of the Body of Christ do their jobs, we'll refine those stories and the underlying thoughts and feelings and acts so that they correspond ever better to God's own works of creating and shaping, His acts-of-being.

Our speculations, including the speculative levels of theories of even the most concrete matters, are always about levels of abstract being as well and, in some strong cultural and implicit sense if not in an explicit sense, also about the entirety, the whole ball of wax, all of Creation. We can have a theory which covers some part of being in a more abstract realm and that theory can be particularized to cover some part or aspect of the concrete realm of created being which is our universe.

In the relatively distant past, I've dealt with the idea of a more gener-

alized selection theory of which Darwin's would be a particular family of theories, not a particular theory. This is where my thoughts had turned several days back. 'Natural selection' can be stated, somewhat tongue-in-cheek, in this way: those organisms which survive to reach the age of reproduction have a chance to reproduce, may the luck be with them. It needs to be particularized to make total sense—as Darwin did himself in an exploratory way, crippled by lack of knowledge about DNA and by the lack of perspective which comes with time when we can accustom ourselves to a way of thought.

Let me present a list showing some examples of selection processes organized according to some basic attributes of such processes:

1. Selection processes with goals
  - a) Brain development
  - b) Most scientific research projects
  - c) Writing serious novels
  - d) Growth of a human community—short-term
2. Selection processes without identifiable goals
  - a) Darwinian 'evolution'
    - i. Natural selection (for survival)
    - ii. Sexual selection (for specific reproductive opportunities)
  - b) Growth of a human community—long-term

Here's the same scheme in a rough:

At least I think it's understandable. Note that I didn't place the development of a worldview in this scheme, despite the fact that I've described the process in this essay in terms of selection. I'm uncertain about the correct scheme for understanding selection processes and uncertain about some of the examples I've used above, but I'm very uncertain about how to classify the development of a worldview.

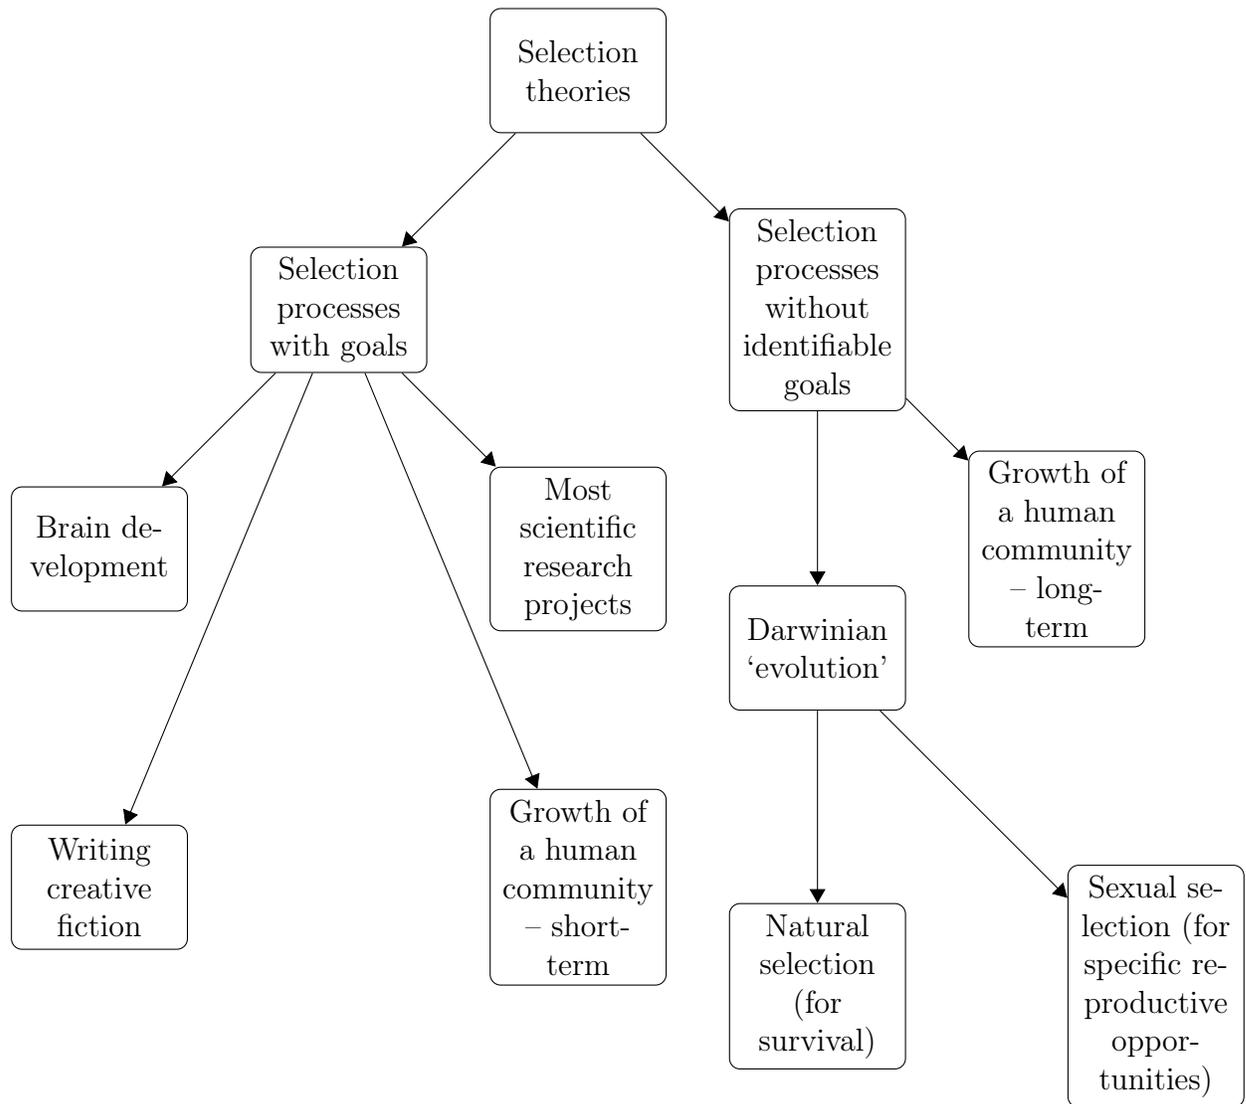

Figure 199.1: Darwinism as a Partially Concrete Selection Theory

;

# 200 More Evidence of Higher Organization in the Universe

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1490>. It was finished and uploaded on 2013/01/14.]

There is a good possibility for interesting science in the field of astrophysics and the closely related field of physical cosmology. It seems that something exists that couldn't possibly exist under current theories: a structure of quasars that extends to distances which seem far greater than possible under current understandings of the expansion of this universe along with the abstract nature of spacetime as well as mass-energy-fields. (I assume the distances stretch beyond those of cause-and-effect relationships under current models of the expanding universe.)

The article, *Biggest Thing in Universe Found—Defies Scientific Theory* at <http://news.nationalgeographic.com/news/2013/01/130111-quasar-biggest-thing-universe-science-space-evolution/>, discusses this finding which is potentially fruitful if it be as disturbing to our understandings as it first seems.

Talk about a whopper—astronomers have discovered a structure in the universe so large that modern cosmological theory says it should not exist, a new study says.

...

Astronomers have known for years that quasars can form immense clusters that stretch to more than 700 million light-years across, said Clowes. But the epic size of this group of 73 quasars, sitting about 9 billion light-years away, has left them scratching their heads.

That's because current astrophysical models appear to show that the upper size limit for cosmic structures should be no more than 1.2 billion light years.

"So this represents a challenge to our current understanding and now creates a mystery—rather than solves one," Clowes said. . . .

The titanic structure, known simply as the Large Quasar Group (LQG), also appears to break the rules of a widely accepted cosmological principle, which says that the universe would look pretty much uniform when observed at the largest scales.

"It could mean that our mathematical description of the universe has been oversimplified—and that would represent a serious difficulty and a serious increase in complexity," Clowes said.

[Quotes attributed to "study leader Roger Clowes, an astronomer at University of Central Lancashire in England."]

There are two major qualifications which any reader should bear in mind. First, these interesting results might disappear with further research or analysis. The seeming anomaly might prove to be easily explainable with a relatively modest modification to current understandings. Probably not but, in any case, I'm hoping that these researchers have discovered something interesting because that leads to fruitful periods of struggling to re-understand the universe or what it contains.

Secondly, I am most certainly not implying even the possibility of mystical or magical forces but am speculating these researchers might have found pointers to some higher-level, 'abstract' principle of physics which can lead to more profound understandings of the universe itself, not just the universe as an ensemble of what it contains.

In Chapter 193, *A Universe is More than it Contains*, I put forth the claim that the universe is itself an entity and not just the sum of its contents. My claim and discussion were based upon a discussion by P.J.E. Peebles in *Principles of Physical Cosmology* [109] in which that prominent cosmologist summarized a discussion of some equations modeling the expansion of the universe: "[W]hile energy conservation is a good local concept. . . and can be defined more generally in the special case of an isolated system in asymptotically flat space, there is not a general global energy conservation law in general relativity theory."

I'm not proposing answers and I'd say that even the most solid answers we now have will be shown as doubtful before long. The first and second clauses of the prior sentence are closely related.

What we need, what we no longer have from Christianity and can't possibly have from a properly disciplined physics, or any other strictly empirical science, is an overall understanding of Creation, as we Christians would say. That greater understanding, whether Christian or other, comes from acts of imagination as much as acts of analytical understanding of empirical knowledge. It's the authoring of a story which corresponds as well as possible to the true story which is this world, the universe seen in a purposeful light, whether the light of the God of Moses or the Triune God of Jesus Christ or the principle of rationality which was Einstein's Old One. Still more wondrously, Christians or others who see God as a true Creator can see Creation in all its realms from this realm of concrete, thing-like being through various realms of abstraction right on to the raw stuff of Creation which corresponds to the truths God manifested as sufficient and proper for the stories He tells.

To a Christian, physics and evolutionary biology and all other 'purely' empirical sciences should be used, must be used, in this effort to achieve a greater understanding but those empirical sciences can't by themselves produce anything corresponding to a greater understanding. At the very least, a faith in the all-powerfulness of rationality or some other idea of necessary order is required, a faith I think to be beyond the capabilities of even the greatest of modern pagan thinkers (such as Nietzsche and Sartre and Einstein).

The goal for a modern philosophical or theological thinker is to find a narrative line, one which presents us with interesting and meaningful questions as much as, perhaps more than, answers. For now, with all the decay of the West largely attributable to the decay of the Christian intellect, empirical scientists and others have inherited enough of an overall understanding of that which they might not call Creation but with which they can work half-blinded, guiding themselves through the process of exploring created being and putting it into some sort of a meaningful context and asking good questions when new discoveries are in conflict with existing understandings.

## Part VI

# Freedom and Structure in Human Life

## 201 Introduction: Freedom and Structure in Human Life

In this part, I've collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/>, I deal with human nature, especially in the physical foundations and the ways in which we have a limited but true freedom in this mortal realm.

# 202 Darwinism is More Sexual Than Natural

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=21>. It was finished and uploaded on 2006/07/28.]

No, I don't claim Darwinism is sexy, only that Darwinism is sexual. And it's more accurate to say evolution is more sexual than natural, since Darwinism—as many use the term—is at least arguably an ideology only accidentally connected to a valid field of study. Perhaps it's more fair to say that most human beings with some knowledge, but perhaps not much, of Darwinism will think of it as being natural selection, however defined in more rigorous, 'scientific' terms. The problem is. . .

When you put our thoughts and words about evolutionary processes in the context of a society with a high proportion of superstitious, irrational Christians and another high proportion of superstitious, irrational anti-Christians, then you end up with a difficult situation, one where it's hard for the unbiased experts to speak a properly qualified truth and just as hard for the unbiased laymen to hear any such words. There is a corollary to Gresham's Law which tells us the unintelligent drives the intelligent out of the public sphere when discussions draw much interest and many participants, at least when those many participants have more enthusiasm than knowledge or thinking skills.

Let's take a more modest and reasonable approach to this quick discussion of Darwinism. Good evolutionary thinkers will let their readers know that natural selection, as people usually think of it, is not the dominant type of selection even in the original, pre-genetic, form of Darwinist thought. That is, Darwin was an excellent naturalist and a wonderful writer on natural sciences if not so good an abstract thinker. He knew the argu-

ments for some form of inheritance mechanism in the body, from his own perspective and that of the breeders he dealt with. The so-called ‘modern synthesis’ was the effort to integrate modern knowledge of genetics with Darwin’s theory of evolution, which really wasn’t so well-formed. Again, Darwin was not a competent abstract thinker, as he himself realized, but he was a good naturalist and assembled arguments which eventually made up the pieces of a more coherent theory of evolution, though it’s perhaps more accurate to speak of a family of theories of evolution, some of which are merging into a complex, rich mess which includes two sorts of processes. There are very specific processes with at least something of a physics-like cause-and-effect structure. There are also chains of events which must be understood by way of developing narratives.

But what was the main ‘driving force’ of that Darwinian theory of evolution. It wasn’t natural selection but rather sexual selection. Nature, in an analogical manner of speaking, doesn’t really care if you survive past the ages of optimal reproductive activity. It is the ability to reproduce and not the ability to survive which is at issue. Moreover, in that same analogical manner of speaking, nature doesn’t care about the individual and evolution works with groups, with breeding populations.

At this point, a social and moral conservative of Catholic beliefs, and I am one of those, might be inclined to point towards the traditional Catholic family. That family had lots of children and a few would become priests or monks or nuns. Despite having some members who took on vows of celibacy, those families tended to grow over time, to produce many children from one generation to the next. That traditional family was certainly more successful in the most brutal Darwinist terms than the modern sorts of families advocated in liberalism. It is a sign of a deep, deep dishonesty on the part of so many modern evolutionary thinkers, such as Stephen Jay Gould, that they could advocate a death-culture liberalism while so strongly advocating a view of life as being a struggle for successful reproduction.

In any case, I wish to expand the viewpoint a little. It is not just the traditional family in modern terms, the so-called nuclear family, that is central to this issue. The breeding population in which that nuclear family was embedded is the true subject of a rational, non-ideological theory of evolution. That true breeding population is not defined in the same way throughout history, not even throughout modern Christian history. One of the problems which has led to the short-term attractiveness and very short-term viability of our culture of death is the loss of any well-structured

breeding population, extended family or religious community or tribe. The so-easily condemned and potentially jingoistic or bigoted understandings of breeding populations, no intermarriages between Blacks and Whites as one example, at least allowed the development of coherent social relationships of the sort which lead to children. However morally undesirable bigotry might be, it doesn't seem much of an improvement, if any at all, to move towards a breakdown in all the relationships which define true breeding populations. A nation or ethnic group or any other well-defined human population most certainly is not acting morally, by any rational standard, if they don't produce children. They're acting in an irrational manner by pure biological standards which would tell us morally well-ordered populations have to survive to remain such. You have to exist before you can be moral.

I should make one additional point. I am not arguing here for a return to a traditional Christian moral viewpoint. I'm simply making an appeal for evolutionary thinkers and so-called Creation Scientists alike to try to purge themselves of their ideological delusions. After all, any way of thought which produces biologically implausible views of human social life is clearly an ideology with delusionary components, even if that view also contains some great truths, from empirical science or from the revelations of the Creator.

Creation Scientists forget that even direct revelations from our Creator must be perceived by way of human physical senses, if only the eyes that see the words of the Bible, and then understood by human thought processes which seem to involve mostly, and perhaps only, physical brain processes and relationships to other created things where those relationships might be in the present or the past. Many evolutionary thinkers have adopted an overly harsh view of the origin of species while ignoring the reality of the evolution of morality itself; morality develops naturally as creatures develop into social groups. I wouldn't claim that morality is a necessary result of biological evolution, but I am claiming it to be, by definition, a necessary component of social living whether we are speaking of rats or wolves or human beings. Many evolutionary thinkers hold both that harsh, and supposedly realistic view of life alongside a liberal, individualistic view of human life that ignores the need for viable breeding populations in human society.

Reproductive fitness for human beings has a large social component which has been largely destroyed in many modern societies, including American society.

## 203 What is Original Sin?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=43>. It was finished and uploaded on 2006/10/09.]

As I noted in my book, *To See a World in a Grain of Sand* [41], the term ‘original sin’ points to a fundamental truth about the human condition, but it seems to miss the target by enough to mislead a good number of Christians. Maybe human beings have always had trouble distinguishing between revelation, empirical knowledge, and human speculation. Or maybe we have far greater problems because of our deep illiteracy as a culture. In either case, ‘original sin’, mostly a doctrine about the condition of a creature—man, has become a matter of revelation in the views of many who consider themselves to be defenders of traditional Christian thought. This is strange. While revelation is necessary to tell us our exact relationship to God, we come to understand our own natures by observing those natures and gaining some substantial knowledge of how those natures came to be.

And yet, as I noted, the term ‘original sin’ speaks of a profound truth about the basic condition of man. It speaks of a deep sort of disorder that leads us often to act against our own best instincts and sometimes leads us to act in self-destructive ways or in evil ways towards even those we love. But the fully elaborated concept of ‘original sin’ as we have inherited it adds a variety of claims that are only one possible interpretation of the creation stories in the book of Genesis and those claims are in serious conflict with much of our empirical knowledge about man and about this universe.

That fully elaborated concept of ‘original sin’, found in the last chapters of *The City of God* by St. Augustine of Hippo, was developed using concepts borrowed from ancient myths—I might even say ‘pagan’ myths—of man’s fall from a god-like state. The Golden Age decayed to a Bronze Age and

then further to an Iron Age. In many of those myths, the entire process would start again when human beings had decayed to a primitive, pre-civilized condition.

Christian thinkers borrowed those myths but eliminated the cyclical nature. Even so brilliant a thinker as Nietzsche was not able to much damage the secularized revelation from Christ's story that the history of this world is linear. There was a one-time creation event, which we cannot see, and there will be a one-time end-of-times, which we cannot anticipate.

The linear nature of history proved a dangerous insight when combined with 2 other ideas:

1. The idea that God acts as if He is a human lawyer; and
2. The idea, already discussed, that the linear flow of history began at some high point, a Golden or Edenic Age, where human beings were in a prior state of grace, of perfection of a creaturely sort.

So far as the first idea goes: God is primarily a Creator. He is no more a Lawyer than He is a Designer. He is also a story-teller before He is either Lawyer or Designer. At least the Bible seems to tell us the Almighty tells a mighty good story, but so does our current best understandings of the nature of empirical reality.

So far as the second idea goes: our ancestors were knuckle-dragging apes and we haven't advanced so far as some people think. But we are certainly not in a steady state of decay, however much we often decay for centuries at a time. It would even seem that there is some large amount of truth in a modest theory of progress, never proposed in schematic form so far as I know but often showing up in the narratives of good historians.

I emphasize that the concept of 'original sin' is not found in revelation directly. It is a human speculation which comes from reading the Bible in light of both the true insight that man is in a radical state of disorder and two other beliefs related to the two wrong ideas above:

1. Man could not be in such a state of disorder, often including various sorts of pains and sufferings, unless it is punishment for something he did wrong. This comes from viewing God as a Transcendental Lawyer operating according to a human scale of justice. We cannot understand, limit, or expand God's justice. A human system of justice is a weak metaphor for God's justice in the same way that human

systems of thought or action are no more than weak metaphors for God's acts of creation.

2. Man was created as 'Higher Man' and is inherently a creature capable of hearing and accepting God's offer of companionship.

In fact, the developmental aspects of the worldview I developed in *To See a World in a Grain of Sand* [41] take care of both problems. The first problem is eliminated by the simple realization that God is a Creator of being and a shaper of particular universes. In future books and blog-entries, I will discuss the difference between God as Creator and God as Designer or Judge. For now, I'll just note that there is a difference and we do not need to assume that God would, or could, give us our just deserts in this world—whatever that might mean. We would probably be better to wonder if God is telling this particular story with all its misery and pain and unfairness just because it is His chosen way of producing the saints He wishes as His companions.

The second problem is eliminated by simply realizing our ancestors, being also the ancestors of chimpanzees, were not inherently rational nor inherently God-centered in a conscious manner. Not only are we dependent upon God reaching out to us, we are dependent upon the Almighty Lord teaching us that He is there and is reaching out to us.

My way of understanding our human selves, more importantly—of understanding our relationship to God, is very complex and is not a task to be completed in one life. Yet, I can see hints of what is involved and those hints once again come through modern empirical knowledge. By way of our disciplined exploration of this phase of Creation we call the universe, we're learning to think the thoughts God feels appropriate to us. We may well conjecture these are thoughts we will be thinking when we are companions of God in another, more peaceful phase of Creation. In any case, it's quantum mechanics that's teaching us to view relationships as being primary, though that is probably a lesson we should have learned from the Gospel of St. John as well as his letters.

Once we see our very beings as the result of God choosing to have a relationship of love with us before we even existed, once we see the universe and all other phases of Creation as existing just because they are objects of God's love, we can give up our attempts to make our own what is an ongoing gift. We do not even possess our own existence let alone any attributes that

make us suited for life as God's companions. We can realize that our beings and our various attributes, good and bad, are a result of God's chosen relationships with us. And that forces us to realize that we, as individuals and as a species, are living out a story which pleases God. Our way to God, even that lesser way to a state of virtuous paganism, leads through various environments in which order is built from the stuff of disorder.

Whatever might be possible to God, He has certainly not chosen to create a universe in which men are, or ever could have been, living in a state of grace. This is not to deny that we all receive God's gifts, His grace. This is to say that neither we nor our apish ancestors could have been the sorts of creatures capable of responding in full faith and confidence to God's offers of companionship. God might have created such beings but they wouldn't have been us.

The traditional doctrine of 'original sin' points to a great truth but it is not a very good explanation of the human condition. It is far better to retreat to St. Augustine's earlier insight. We do not sin, we are sin. We are not autonomous agents with free-wills who can chose to be sinful creatures or to be angelic creatures who reject sin once and for all. We are sin to the depths of our beings.

Only God can change this condition. We are living in a story God is telling, not one which we—or any conceivable demons—can change in any fundamental way. Even the greatest possible use of our limited freedom can accomplish little unless God chooses to leverage it as He did, over a period of centuries, the noble but humble efforts of St. Benedict and his companions. All they wanted to do was to live a Christian life in small communities and God used them not only to develop and spread the Gospel but also to salvage much of Roman technology and then to start developing it in innovative ways. Even when our actions have great effects in this world, we can't predict what those effects will be. God's ways are not our ways and yet it is our task to try to make them our ways.

It is this mismatch between what God calls us to be and what we can be by our inherent powers that can be misunderstood as 'original sin'. It is a sinful state since our Creator has called us to a better state and we are responsible for that sinful state. But we are not responsible by the criteria of human systems of justice because we did not will to be what we are and could not have been different and still have been us. We are responsible by more general criteria and yet we have no good way to say why we are responsible for what we are when we were made by Another.

We would be better off if we looked at our real situation and developed stories to explain it rather than trying to defend a view of human nature which can be readily seen to be partially right but also seriously wrong. We have a duty to move towards a new view which will retain what is right about the concept of 'original sin' while correcting what is known to be wrong. True, that view will eventually be seen to be also partly wrong but we have to recognize our creaturely limitations and work within them.

## 204 Visual Technology and the Deformation of Human Intelligence

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=11>. It was finished and uploaded on 2006/12/14.]

The recently released movie *The Nativity* has raised some questions in my mind, starting with a matter of doctrine but that's not what I come to discuss. Those unconcerned with the finer points of Catholic doctrine should bear with me for a paragraph or two as I set up a discussion about the dangers of visual technology.

*The Nativity* is said to be a reverent and well-produced movie. I have no intention of seeing it for reasons which will become obvious, but I'll take that assessment at face-value. The first problem that presents itself to a Catholic is that it apparently shows a normal birth for Jesus and the Catholic Church has strongly tended to teach that Mary remained a virgin through her entire life on Earth – not only in regard to sexual acts but also in regard to birth processes. This teaching can be found in catechisms and summaries of the faith as well as in the teachings of some of the most important Fathers. While not speaking in medical terms, those various writings were certainly saying that Jesus didn't break His mother's hymen in the way He left her holy womb. The current *Catechism of the Catholic Church* written under the guidance of John Paul II continues to teach this traditional doctrine, using a quote from St. Augustine to summarize the 'official' position.

In various writings, I've claimed that the Church's teachings include both revealed truths and well-grounded human speculations—Pope Bene-

dict XVI made the same claim in his first encyclical. Disagreement in good-faith is possible when it concerns doctrines that seem to be human additions to the faith.

In my book, *To See a World in a Grain of Sand* [41], I disagreed with the general belief that we have souls which can survive the death of our bodies—bodily resurrection is the teaching of the Bible. Before I went public with such a belief, I did a substantial amount of research on the issue, reading some serious books on the history of Christian doctrines, books written by the prominent Fathers, philosophy books dealing with mind or soul, science books dealing with the same topics, and even some books of philosophical archeology on the very foundations and evolutions of the words we've inherited—psyche, anima, and so forth. And I spent much time fretting over the contradiction between the Church's general condemnations of dualism and the belief of many that the Church of the Apostles tells us we have souls made of some stuff different from matter.

But all of this is leading to a seemingly different line of thought. Consider this as some sort of transition from prologomena to the main line of argument. . .

The association of specific images with an idea or even a physical event uncertain in some way leads to a change in our thoughts, a change corresponding to literalization in many human beings. Metaphors and appropriately fuzzy images take on a specific form, hard edges and all. Anything that associates a hard-edged image with an idea will shut down the imagination which is the bridge to our deeper thoughts as we try to understand the vague or the inscrutable.

What you take in, food or images, will help to form your very being. Uncritically view a pious movie about the birth of Christ, one which shows a normal, bloody human birth and you will think in those terms – at least most will. View a movie emphasizing the brutal treatment of the Christ and that may well shape the way you think of His redemptive work. That is, it may well limit the way you think of His redemptive work and it may well encourage you in the modern heresy that we carry our crosses by merely enduring physical suffering. In any case, the brutal suffering will come to seem the point of it all.

Those more interested in literary or historical issues can easily think of the problem in those terms. Think of the movies about Abe Lincoln and then read a serious biography and you find out he was. . . A wealthy lawyer who helped NYC investors to cheat Cyrus McCormick out of his royalties

for the reaper? A willing tool of the railroads who helped establish the precedent that state-chartered corporations could exercise the powers of the state against local communities trying to protect their ways of life? But there is that one image of Lincoln walking up the hill as a surprisingly jingoistic Unitarian hymn comes on to blur the very distinction between God and Abraham Lincoln.

The true and more imaginative knowledge that comes from reading and thinking will not always puncture legends. You may read some worthwhile books and end up with a still higher opinion of George Washington and Henry Knox, of the Indian leaders Pontiac and Chief Joseph and the wrongly maligned Geronimo. You may even have to purge images from the movie *Patton* and numerous images of Alan Alda's smirking face as you discover evidence that Patton and MacArthur were moral giants compared to the civilian leaders they served under – despite the fact that their egos were just as bloated as the egos of Churchill and Roosevelt and Truman.

Visual imagery can easily prevent the exploration of new meanings which can only be expressed by way of analogies and metaphors and other softer-edged literary devices. Visual imagery can distort our views of history and—as one example—leave us Americans puzzled after every murderously unsuccessful adventure in some foreign region we don't understand. For that matter, we no longer have the knowledge or the thinking skills to understand our own country. We are incapable of purging ourselves of the jingoistic images implanted in our brains by the journalists and movie-producers who are the harlots of those who hold the reins of power. Even as we, and our children, are being skinned by the corporate and political leaders of this country, we smile and sing “His truth goes marching on” as images fill our heads of our Deity marching up that hill.

## 205 Lowering Standards Outside of the Superbowl

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=14>. It was finished and uploaded on 2006/12/28.]

In sports, we know that young people will achieve more by aiming high, by pushing themselves into zones of discomfort and even pain. No one would advocate that even a high school football player should just settle down at a performance level that's comfortable to him.

It's certainly not bad, within the appropriate limits, to encourage high accomplishments in sports (forget the steroids and the financial corruption for a minute). On the other hand, the typical American won't even try to appreciate performances by those supreme athletes of vocal performances—opera singers. We prefer juvenile performances by emotive actors to disciplined performances by adults who can project their voices without screaming. We prefer politicians and journalists who flatter us rather than honest men of moral integrity who will speak honestly. We prefer entertainers who exploit our passive couch-potato selves rather than maintaining the skills of reading substantial books or those of making our own music. When we grow white of hair, we prefer condos in Florida to the joys, and frustrations, of being full-time grandparents.

Dare I even mention that such quaint hobbies as playing the piano or dulcimer, writing verse, writing serious and substantial sermons or homilies, are rarely pursued? Crafts that demand human skills but not much in the way of human intellectual or spiritual development seem to be often practiced—I'll leave it to others to say if they are well-practiced. But it's on the sports field that we demand excellence, often far beyond the levels possible to us or to any human beings we know.

We enjoy high standards in sports because they provide us with a good show we can appreciate from our amateurish pasts as sand-lot ball-players, from our hot summer evenings of tossing basketballs in the general direction of the hoop. Why do we not appreciate a truly good singer from our weak efforts to hit the notes in our church's children's choir? Why do we not appreciate a truly good writer from the garbled one-page essays we struggled with in ninth-grade? Maybe because there is some brain-power involved in either writing or making music and we are intellectually and spiritually lazy? True, we're also physically lazy but you don't have to push your bodies through walls of pain to watch a marathon and you don't have to jump even 12 inches to watch a wide-receiver go straight up 30 inches in a crowd of 250-pounders ready to slam his defenseless body into the ground.

It takes mental effort to appreciate a substantial novel. This is true of a Dickens novel, straightforward in some senses but containing its substance at least partly in the character development that is brought about by complex plots. This is also true of a Melville novel that is far from straightforward, in most cases, and develops a complex view of some part of the world by way of unusual characters, insertions of essays or encyclopedia articles, philosophical dialogs or monologues. It also takes more effort to appreciate a Mozart piano sonata or even a Beethoven setting of a poem by Walter Scott or Lord Byron.

But I don't think it's fully a matter of laziness. In fact, a certain amount of disciplined laziness leads us into the leisure which allows us to appreciate substantial elements of human culture. The interested reader can check out Josef Pieper's *Leisure: The Basis of Culture* [114]. A certain amount of disciplined laziness is also necessary for creative writing or musical composition and also for the contemplative life, religious or philosophical.

In Chapter 349, *Morality and the Modern Novel*, I made the claim that modern human beings don't like to read true novels, substantial works of moral exploration, just because they shy away from any examination of their moral insides. We are so many Dr. Jekylls, suppressing our unconverted selves and pretending to be what we are not. The modern novel in its classic form played a role as a helper to the Bible, pointing towards the need for moral self-examination even when specific novels or Biblical passages seem to be glorifying sinful activities. Laziness played a part in the loss of our ability to read the Bible and *Don Quixote* in an intelligent way, a way that allows a living response. But I suspect that we, and our ancestors, began shying away from any moral self-examination from a feeling of self-

righteousness—we're a genial folk, surely that means we have a true moral integrity.

A writer with moral integrity, that is, a author who is truly an author and not just a writer can't back off. I'm certainly not claiming that all great writers have been morally good human beings, nor am I claiming that all novels teach moral lessons in the simplistic way. It's surprising how few of those immoral works are recognized as being great and those which are recognized as non-ephemeral works run parallel to the poetry of Baudelaire dealing with lesbians, cats, and other creatures of moral disorder. Baudelaire set out to explore the alleged beauty of evil and then marched all his lesbians to hell. Cats, being of low levels of social order by the standards of higher mammals, are not always willfully evil but they are. . . Not so well-ordered in moral behavior by the standards of men, dogs, elephants, and whales.

Cats are the most predatory of higher mammals, mammals which tend to high levels of social and moral order.

Modern men have tried to shift the balance of their natures towards cat-hood. I'll explore this more elsewhere. In fact, I've explored this somewhat in my various writings, including my book, *To See a World in a Grain of Sand* [41]. We've tried to be individuals to a greater extent than is healthy, or even possible in the long-term, for human beings.

This sort of prying into our moral natures is what's involved in serious writing, not techniques allied with the willful refusal to write "with a message". Since I'm allergic to modern educational systems and techniques, I've no intention of going near a writing school, but I'm under the strong impression that they try to relieve any true writer of that desire of true writers to tell true narratives. Despite what writing-school professors and publishers of writer's manuals preach, true narratives are—by definition – morally ordered.

Narratives have purpose and direction and those attributes are supplied by some recognition of moral order, though it might be a moral order which is decaying or never quite came into form. It might also be a moral order which the author despises. A narrative without purpose, without moral order, will cease to be meaningfully to human beings, but we modern human beings prefer purposelessness to moral self-examination. In each of our heart of hearts, we fear we are Dr. Jekyll or—if you prefer—Adolf Eichmann. We fear, if only deep inside ourselves, that we're capable of stomping a young child for the sheer pleasure of it and we know we're capable of putting our

noses to the grindstone and pursuing our careers in the interests of an evil government.

Whether an author writes history or theology or novels, he's a 'serious' author precisely when he deals with the big issues in the context of his own times. And modern human beings don't like that stuff. They gravitate towards writing which is allegedly pure, it tries not to teach messages. Modern human beings are as allergic to serious writing as I am to modern institutions. It's not just coincidence that I try to write serious books. I despise our modern school systems, academic attitudes, and moral frivolity. Our modern schools systems, nearly all of our modern institutions, are fascist – that is, they have authority structures imposed from above. Human beings are healthiest when authority structures grow naturally starting from the extended family. Despite what many people think, that is what the history of the ancient Christian churches show – they pass through periods of corruption which are also periods of bureaucracy and wrongful sorts of authority.

Human beings who adapt well to such forms of organization were described by our Lord Jesus Christ. They are the white sepulchers, pure-white on the outside and full of death and rot inside. They are also the ones who honor the prophets murdered by their fathers—even as they prepare to murder the prophets of their own age. In the modern age, human beings are squeamish and they first use weapons of silence against anyone, including any serious novelist or historian, who takes a properly prophetic stance.

As for me...

I may or may not write books which will prove to be of lasting interest, but I most certainly have the same attitudes as all those great writers who despise the modern world. I aim for high standards and those have nothing to do with the brain-dead techniques of modern fiction-writing. High standards for writers are the same as for all those who have vocations involving mind and spirit—honesty comes first, insight is valued more than flattery.

This is the problem. Higher standards are denigrated in all fields where they would be associated with moral self-examination. Great literature, especially the modern novel, explores moral order. Politics, economics, history, science, engineering, and even games also are dynamic efforts to explore moral order and to find some sort of useful and noble stability. But sports is interesting in that higher standards of a sort can still be pursued when moral order or even moral relevance are denied. American politics and

business are the same. We explicitly deny that moral order is a necessary precondition before we pursue our short-term goals.

There was some truth in the English claim that their empire was built upon the sports fields of Eton. And it's clearly true that the British Empire, even at its most evil, was built by men of little moral vision but much moral discipline.

Our political and our business worlds have decayed into battlegrounds of incompetent, greedy men, but our sports worlds have become battlegrounds of highly competent, greedy men. Now we can see a conclusion coming into form, and it's not one I had in mind in such a sharp form when I began writing this entry:

We can maintain high standards in sports while our standards are dropping rapidly in literature and history and politics and economics just because competence in sports can be appreciated by the citizens of a morally disordered society. In that sort of a morally disordered society, competence in literature and most other fields of human endeavor is mostly ignored but sometimes despised or even actively destroyed.

## 206 Social Security: It Seemed Like a Good Idea

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=55>. It was finished and uploaded on 2006/12/29.]

In my various writings, I've not had a good thing to say about the welfare systems and social security systems of our modern age. I only want to write a short entry explaining the basic principle behind my opposition to welfare systems and social security systems.

We are physical creatures, creatures who need food and shelter and physical companionship amongst various and many needs. We are not even so individualistic as are cats, perhaps the most individualistic of social or higher mammals. We have bonds of dependency, first of all those bonds formed between mothers and children. A child's love for his mother begins with his dependence upon her breasts and arms and legs. He is dependent upon her for food and for shelter and for the companionship which first shows as cuddling and cooing, not as some sort of spiritual communion.

Such bonds are the foundations of all human ties. Even our Lord Jesus Christ formed such bonds with His blessed mother during His infancy.

Our loves are not some sort of magical or 'spiritual' bonds that come to us from... Where? We are physical creatures and our social bonds, our deepest emotional ties, come first of all from our bonds of dependency. Our bonds to God Himself come through His acts as Creator of our physical selves and of the physical environments that are our homes during our mortal lives. We are dependent upon our Maker and we owe Him everything.

What are our modern bonds of dependency? Certainly, they are not bonds tying us to local political communities or communities of worship. Certainly they don't tie us to the extended family. We have even weakened

our still-existing bonds to the so-called nuclear family.

Our strongest bonds are to those Principalities and Powers which I called ‘the gods of the marketplaces’ in my book, *To See a World in a Grain of Sand* [41]. We are more dependent upon Toyota and the Social Security Administration than we are upon our siblings or local merchants or local churches or synagogues. Our souls are formed by the moral midgets of the entertainment industry and not by our priests or ministers or rabbis.

Social security and welfare systems as they exist in modern nation-states are evil because they replace our local bonds of dependencies with bonds to central powers, the Principalities and Powers in the Hellenistic language of St. Paul. For those who care about history: the first national welfare and social security systems in the modern world were built by the Iron Duke, Otto von Bismarck, as he militarized and centralized Prussia. He despised people who needed to be taken care of, but he became convinced that welfare and social security were necessary to bond Prussians to their increasingly powerful central government.

The Roman politicians who presided over the decay of the Republic into the Empire acted as if this were true, though I don’t know if they had any conscious plans to build the welfare bureaucracy that existed before Rome had a professional army. As time goes on, it seems that those early victims of the modern age—the Anabaptists, understood it better than the rest of us. The central powers are not to be trusted. Christians and Jews are very unwise to make alliances with those embryonic Principalities and Powers. But there are many in the pro-life movement as well as those fighting to retain traditional regulation of marriage who would do all over again, thinking: This time when we regain control over those Principalities and Powers, we’ll do it right and not lose control. No. Once power is sufficiently centralized, it takes on a life of its own and becomes the evil side of the Invisible Hand of Adam Smith. Centralized power will serve its own purposes, as mindless and lifeless and destructive as those purposes might be.

But that centralization of power can always be started up with a simple appeal to people’s needs. Let some politicians gain general taxation powers in a morally well-structured society and soon they’ll be saying, “We’ll set up a safety net to help only those without family or community bonds.” And soon, most will be forsaking their family and community bonds to enter the always exciting marketplaces.

[As a corrective: I’m not opposed to large-scale governments in principle

but I don't think we've yet learned how to form such governments so that they serve the needs and goals of the smaller human communities coming together to form a nation. This claim is independent of the states rights issue. If we ever get proper centralized governments, mortal manifestations of some legitimate organs of the Body of Christ, they will develop by organic processes and not by the efforts of human designers or as a matter of financial or military/police power being used to impose order from the top-down. The problem of dependencies remains and my advice is to be careful who or what you become dependent upon if you would wish to be a moral and free human being.]

## 207 The Christian in the Universe of Darwin

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=58>. It was finished and uploaded on 2007/01/08.]

Darwin is no problem to Christian thought. The facts gathered by biologists—including sociobiologists and other evolutionary biologists, geneticists, and brain-scientists—are themselves no problem. Certain thinkers, evolutionary biologists and so-called philosophers, have interpreted those facts in terms of a skepticism of a sort charitably described as reductionistic materialism.

Such thinkers, as well as more pious and more intelligent materialists, are forced to become dualists just because they have no way of conceiving a coherent physical ‘place’ which might be the setting for what I have called a world—a physical universe, or Aristotelian Cosmos, seen as being morally ordered. That moral order cannot be seen in a mere collection of environments, which is what you get with pragmatic philosophies and other semi-empirical modern forms of thought which try to construct a body of knowledge from catalogs of randomly assembled facts. Even when the existence of a universe is grudgingly—and inconsistently—acknowledged, the problem doesn’t go away. You can’t force moral order upon an amoral universe or Cosmos. That order must be inherent to the universe or Cosmos. Without a coherent physical setting, you have two choices in any effort to retain some sort of morality:

1. Invent moral rules: that forces a subjectivism, likely a dualistic plurality where each human being has his own ‘truths’. The more damaging aspect is the dualistic separation of the universe from moral truths.

2. Invent a transcendent realm of truths: that forces a more direct dualism often labeled Platonic though it's not clear that Plato himself was advocating such a view.

It's true that most modern Christians and Jews have become dualists in that same sense—they see us as being individuals passing through physical 'places' which are not morally ordered as such. Consequently, they have to draw moral truths from a Transcendent realm. On their part, this strategy is superficially more plausible since the Bible seems, to modern literalistic minds, to be a set of revelations from such a realm.

Creation is morally ordered and is not just a neutral setting for human beings to engage in moral or immoral dramas. More to the point, we have moral natures because we evolved in a morally ordered universe. The facts of evolutionary biology can be brought into a coherent form so far as their moral implications go. All of those facts about rodents acting in the interests of their genetically close relatives, the fact that wolves have stronger instincts than men against killing members of their own species, the general behavior of animal mothers and especially those from the species of birds or social mammals, tell us that the moral aspects of animal natures have evolved as much as the other aspects of animal natures. The evidence strongly indicates that the universe is highly conducive to the development of moral natures.

Unlike the ideological Darwinists, including Richard Dawkins and Daniel Dennet, I can legitimately engage in speculations about morality just because I work from an understanding of the physically well-ordered universe of Einstein. That Einsteinian universe can then be seen as a world, a morally well-ordered universe, in light of my Christian faith.

Without this perception of a physically well-ordered place, Aristotelian Cosmos or Einsteinian universe, any moral thinker is forced to be a dualist of some sort. A proper understanding of this physical universe, this phase of God's Creation, allows us to understand that we are moral creatures because the true Creator, the God of Jesus Christ, has created us as members of a social species living in a morally well-ordered universe.

## 208 What is a Human Being and Why Should Novelists Care?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=19>. It was finished and uploaded on 2007/01/16.]

A human being is not an individual animal in the way that modern liberals imagine. A human being is an individual in a meaningful sense but he's bound into various relationships, with his fellow human beings, with other creatures, with the non-living world. He is not much a solitary comet shooting through space so that most contact with other entities will usually be at a distance or will be catastrophic. He is more a tree with his roots entangled with the roots of the other nearby trees, which entanglement takes in the entire forest.

I've spoken in my book, *To See a World in a Grain of Sand* [41], of Hermann Melville's dislike of the ideas of Ralph Waldo Emerson. Along with at least Nathaniel Hawthorne and Henry James, Sr., he considered Emerson and his side-kick, Henry David Thoreau, to be morally insane. I use this example repeatedly just because it speaks to a deep problem that affects American societies, in their political and economic aspects as well as their literary and artistic aspects.

Melville considered Emerson's philosophy to be a spiritualized materialism that came from an excessive concern for comfort and safety. Moreover, he thought it masked pure selfishness, a profound lack of charity, of concern for others. To top it all, he feared that Emerson was a more typical American than we would like.

In fact, we have become so enwrapped in a certain type of mindless prosperity, directed towards maximizing marketplace activity and not directed towards human or humane goals, that we have lost sight of the need

to make sacrifices at time. The sacrifices we generally need to make are those which integrate us in human communities of various types: family and local political community and community of worship.

From the viewpoint of a true writer, one aiming to be an author (think ‘authority’), a human being is a character in a complex set of interlocking moral narratives. There is a narrative that can be called his life and there is a narrative of his family and one of his local community and a number of other narratives, some of which have only an indirect effect on an individual, though they might have helped to form the earth or the human race or Europe or France.

There are a seeming infinity of views of this complex set of interlocking moral narratives. Different authors choose different views. Jane Austen concentrated on the concrete details of what might be called ordinary lives. Nathaniel Hawthorne wrote allegories which came across as also being concrete stories but were actually loaded with symbols of various sort which manifested aspects of those other narratives in the concrete tales.

Writers play a part in forming those narratives and not just in relating them to the public. Good writers, that is—authors (think ‘authority’), can change the meaning of words and phrases, can introduce new metaphors and analogies, can even change the grammar that constrains or empowers us.

We live in an age where a genial mediocrity passes for morality and that also says something about the lack of courage and integrity of the writers we prefer to read. It’s hard to divide responsibility. A true author (whether ‘great’ or destined for the ash-bin of history) won’t compromise though he may seem to be doing that. It took a couple decades or more for critics to realize the novels of Charles Dickens were profoundly moral—and then it was too late. He was as well-established as the type of hack who flatters the public and panders to their worst tendencies rather than challenging their better selves. One difference which emerged over time was the fact that the books of Dickens were read and studied over time. Of course, his stature was helped immensely by the fact that some of his stories made good movies and musicals, even great movies and musicals in a few cases.

Narratives are necessarily ordered and the proper order for human stories is a moral order. Those of us who believe in a personal Creator believe, or should believe, that the entire universe is also morally ordered though that order might be invisible so that we know only what God has revealed to men. That moral order turns the evolving partial differential equations

of cosmological physicists into a story. That moral order also turns the brute facts of anthropologists and geologists and paleontologists and the theories of evolutionary biologists into a story of life on earth. But I speak mostly of more limited works of the imagination, ones dealing with human lives in a specific age and a particular place. Yet, that greater context flows through the most ordinary tale if it be morally well-ordered.

Modern readers have lost most of their skill, especially for reading a book in a greater context than what is on the currently open page. Without that greater context, the moral structure of the greatest of novels remains invisible. But novels written to pander to those who seek comfort and security first, and then make their moral decisions, will have a defective moral structure, quite often a moralistic or sentimental structure. And they won't be able to help the readers to change and to try to put some purpose, some truer and more demanding moral structure, in their lives.

## 209 Moving with the Grain of the Universe: Parasites and All

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=61>. It was finished and uploaded on 2007/01/18.]

The website of *New Scientist* has an interesting article, *Parasites may reduce relapse in MS patients* at <http://www.newscientist.com/article/dn10964-parasites-may-reduce-relapse-in-ms-patients.html>, which tells us that investigations of third-world children with auto-immune diseases, such as multiple sclerosis, have indicated that they sometimes do better against their diseases if they are infected with parasites.

As I understand the best efforts so far to explain this:

1. We evolved as parasite-ridden creatures.
2. Parasites have ways of suppressing our immune systems so that they can survive longer.
3. Our immune systems have adjusted to this by being set at higher levels than if we were some sort of organism which was created in a pure environment.
4. Consequently, when we are too free of parasites and other infections, our immune systems will be too active and too sensitive. Auto-immune diseases such as MS or rheumatoid arthritis will become more common.

There is a social message and also a theological/anthropological message in this. The social message, stated simply, is that we should beware of any efforts to isolate human beings from the dirt and reality of the natural world.

I'm not advocating we abolish all sanitary efforts—not by a long-shot, but we should be wiser in choosing our means and also our goals. There is a lot to be said about this complex issue, but I'll leave that task to others for now.

The theological/anthropological message can also be stated simply, though I've tried to develop it in detail in my various writings, especially my book: *To See a World in a Grain of Sand* [41]. We are not fallen creatures so much as we are creatures integrated into a world which is a struggle between forces of order and disorder.

The paragraph above still leads too easily to a misinterpretation that portrays us as being at war with our own world. Speaking as a Christian, I feel my task is not to war against God's Creation, nor do I see Creation as being filled with evil spirits who war against us. Our task as God-centered human beings is to figure out our role in Creation, having faith that finding this role and fulfilling it as well as possible will put us in the proper relationship to our Creator and prepare us for life in the world of the Resurrected.

## 210 Are We Born With Self-awareness?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=72>. It was finished and uploaded on 2007/02/19.]

I don't know where consciousness begins in the animal kingdom though most animals we pay attention to are certainly conscious in the intuitive sense of being aware of their immediate environment and not just responding to simple chemical cues. So far as I know, only human beings are self-aware in a deep sense so that it is truly a part of human nature. Chimpanzees can show self-awareness under certain circumstances but don't seem to be at high levels of self-awareness as a natural matter. When I speak of a 'human self', I mean a human being in which this self-awareness is developed to a relatively high level. As I'll discuss, we have little reason to believe that we come into this world with a well-developed self-awareness any more than we come into this world with well-developed intellectual skills.

In Chapter 211, *Can a Corrupted Language Lead to Heresy?*, I speak of the dangers to Christian belief of the modern understanding of person and I make reference to complex arguments that we can become persons, in the Christian sense, only by letting Christ infuse us and turn us into Christ-like human beings. It's best to keep those arguments in mind when reading this entry.

In Chapter 8, *Staking Your Faith on Gaps in Empirical Knowledge*, I spoke about an article in the newsletter *BrainWork* which discussed evidence that out-of-body experiences and near-death experiences seem to be the result of serious disruption of certain brain systems that regulate our awareness of ourselves as selves. There is a very interesting implication of

the very existence of these brain systems, one which is more disturbing than the likelihood that there is no human soul separable from the body—our personhood develops during our life along with underlying brain structures rather than being something which exists at our birth, let alone our conception.

I'll leave it to the interested reader to explore the scientific literature if he cares much about the details of these brain systems. Neuroscience is blessed with some top-level scientists who write books which are accessible to a literate non-expert. If you need a start, here are some names: Michael Gazzaniga, Gerald Edelman, Walter Freeman, Semir Zeki, William Calvin, and Antonio Damasio.

Those who doubt the tentative and fragile nature of our self-hood can think about any human beings they knew who suffered from Alzheimer's or Huntington's. Amongst the other problems in such disorders, we can observe a frightening loss of self-hood even when the victims are quite recognizable in their behavior and speech as human beings, although they'll be limited in both those areas by the time that loss becomes noticeable. It's possible they'll lose all human behaviors and will stop giving indications of a human intelligence being present.

The human self truly is a construction resulting from interactions of the physical human being with the environments around it and also from internal interactions of various components of that body. The brain is very important but other components and aspects of the human being are involved. Think of the human self as an onion—the brain is at the center but there are layers going out, some of those layers being closer (not necessarily in terms of physical distance) to the core regions of the brain and others being farther out and seemingly having more the role of 'taking abuse' from the external environments to protect the inner regions.

'Construction' is a bad word for the development of one of the most complex aspects of the human organism, but it makes the point. It's a little better to say that we're not characters passing through the stories that are our lives—we're formed by those stories even as we shape those stories by our own actions and thoughts, including our imaginative interpretations by which we struggle to see the moral meanings of those stories which are our lives, stories which are part of the great story God is telling, the story which is the world. We don't come into this world as pre-formed characters; our genetic and somatic heritage provide important possibilities and constraints but there is a lot of room for variation. Identical twins might be very alike

but they are far from being just two copies of the same being. Each of those twins has had somewhat different experiences, inside his body and outside, even when they were closely bonded.

There is no self which is magically attached to a body, no self which exists at the moment of birth or even at the age of 50, let alone at the moment of conception. Saul of Tarsus was not an autonomous agent as in modern liberal theories of politics and economics; the change to Paul was different from a mere selection of a different basket of life-style goods and choices. The change was deep inside of his very being.

A human being, at 70 as well as at birth, has a very complex body which provides some basic processes and some very complex processes by which a self can be shaped. Many of those processes don't work in isolation but only in response to environmental cues, including those from the mother and other human beings. We're constrained by our bodies and our environments but we're shaped within those constraints by our particular responses to the world and by the response of others to us.

Perhaps it's best, in the sense of accuracy, to regard most human beings as being immature selves with a low-level of self-awareness. This might partially explain the difficulty that most human beings seem to have in taking moral responsibility for, or even interest in, the large organizations and general movements of which they're part. Too easily, human beings merge into a herd of human animals responding to material needs or to the general movement of the herd. We need more self-awareness before we can be unselfish at the larger scale. We at least need to recognize that we are part of a herd, or several herds at different times of our day or our lives. Otherwise, we will simply act, with blinders on, to take care of our mortgages and our retirement funds, because that's what the modern herd considers to be the highest duties. Self-awareness would seem to be necessary for higher moral consciousness, but it doesn't seem to be inborn. The possibility is inborn but modern ways of living, modern ways of forming societies and educating our children, don't seem to develop the sort of self-awareness necessary to that higher moral consciousness.

## 211 Can a Corruption of Language Lead to Heresy?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=74>. It was finished and uploaded on 2007/02/19.]

The answer would seem to be, “Yes”. We’ve lost our ability to say that Christ was man and God in one divine Person just because we use the word ‘person’ to refer to each instantiation of a human being. One of these two possibilities is true:

1. Jesus of Nazareth was born a human person. If united with God in some way, there was a confusion of persons or else a mutilation of the human being of Jesus of Nazareth by loss of the properties of human person-hood.
2. Jesus was born as a human body united with a divine Person but in that case He was different from other human beings who are born as human persons and are inherently persons from beginning to end of their mortal lives. He would have only been a puppet, missing this human person-hood which so many of us claim to exist from conception or birth or somewhere between.

By sheer sloppiness and lack of concern for the importance of words, we’ve lost the ability to speak in an orthodox manner. We’ve put ourselves into the position of the ancient Monophysites, as some historians tell the story. Those heretical Christians were not willfully heretical but they spoke a language which didn’t properly differentiate between nature and person. The traditional Christian formula, “Jesus had a divine and human nature in one divine Person” would translate as either “Jesus had a divine and human

nature in one divine nature” or else “Jesus had a divine and human person in one divine person”.

We modern Christians seem to be in a similar position. Using our day-to-day language, we are forced to think of Jesus Christ as not being truly man because He wasn't a human person or else to think of Jesus Christ as being a confused mixture of human person and divine Person. In such a case, the divine Person would be so overwhelming that the human person would disappear.

## 212 Alzheimer's as a Cost of Passivity and Laziness

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=71>. It was finished and uploaded on 2007/04/04.]

Every time someone looks at the state of the modern mind, the news gets worse. A recent large-scale study by the American Library Association tells us that nearly all recent college graduates are illiterate at a very basic level. Epidemiological studies tell us the number of modern human beings with serious Alzheimer's symptoms is increasing rapidly. Some of us fear the situation is going to be far worse than current projections. See the website of *Alzheimer's Association* at <http://www.alz.org> for news on current and projected prevalence rates. You can also see the website *Alzheimer's information at National Institute of Aging* at <http://www.nia.nih.gov/Alzheimers/Publications/adfact.htm> for background information.

I think there is a strong connection between the decrease in literacy and the increase in Alzheimer's. Most modern human beings don't use their brains actively in the way of farmers or skilled pre-industrial workers. They pretend to a literate style of brain use, but the reality is that most of us use our brains the way a couch-potato uses his lungs and skeletal muscles.

Undoubtedly, there are some who are genetically more prone to this disease but many of the causative agents are believed to be environmental. All the factors that affect heart and lung disease, smoking and high-cholesterol and so forth, seem also to play roles in bringing on Alzheimers. In addition, many scientists think a passive life-style, especially one lived in front of the television set, puts a human being at great risk of dementia. BBC provides a nice summary discussion of a major report which showed a strong correlation between Alzheimers and TV-viewing. A correlation

might indicate a casual relationship in either direction and might also be a coincidence (unlikely in this case). The discussion by the BBC is found at <http://news.bbc.co.uk/1/hi/health/1204894.stm>.

I'll speak in practical terms. We have a very serious situation on our hands. We can't even take care of our current population of Alzheimers patients and that population will be rising just because the Baby-boomers are reaching the age where they show the symptoms of Alzheimers. The rise might be even greater than many will think because the generation of video-games and cable-TV and dumbed-down books is reaching middle-age and beyond. We need to address this problem, one more likely to bring our society crashing down around us than the heroin problem or even international terrorism. Still more importantly, there is a deep moral problem if we're living in ways that lead to brain decay. We're not leading proper lives and the lives we're leading will threaten the quality of lives of future generations.

In this and a few entries to follow, I'm going to speculate a little freely about what's really going on and what might happen in the future—maybe the near future. But my speculations are compatible with the results of investigations into the nature of Alzheimer's and also the historical trends which are summarized brilliantly in Jacques Barzun's *From Dawn to Decadence: 1500 to the Present* [9], a history of the Modern West written around the theme of a steadily dropping literacy. A dropping literacy is part and parcel of a drop in the sort of abstract intelligence we would associate with either St. Augustine or Shakespeare or Einstein. In fact, there is reason to believe that high-level geniuses have disappeared from American society and some scientists have speculated that this might be due to leaded gasoline having caused marginal brain-damage sufficient to prevent the development of an Einstein-level of intelligence. I'm speculating that some of the causes might be cultural—the drop in quality of literacy due to our life-styles and our passive forms of entertainment.

The brain doesn't seem so much different from other organs in that it must be used, even properly stressed, to develop properly and to maintain its health after development. Use it or lose it, preceded by: Develop it at the proper time or never have it. Interested readers can refer to the works of Gerald Edelman for discussions of his very important work on the development of the human brain. Use his bibliographies as springboards to other authors. Alternatively, look up one or more of these writers: Larry Wolpert, Antonio Damasio, William Calvin, Michael Gazzaniga, or Jerome

Kagan. There are other brain-scientists who write prose accessible to a literate reader with some very basic understanding of biology, but these are writers whose books I happen to own. There is also a lot of good information and pointers to other sources of information at the website of the *Dana Foundation*, <http://dana.org>.

At about the age of three (I wrongly put this age at three months before birth in my first published book), the human being has more brain-cells than she will ever again have. If all goes well, development proceeds rapidly in response to environmental events, especially mother-child interactions—I'll explain later what happens to the 'excess' brain-cells. The language abilities and basic moral character of a child are formed in the first six or seven years of her life, a time she now spends watching various educational shows that teach her to pay attention to a single stream of thought for about 15 seconds. She also begins her life of being rushed from one activity or child-care center to another. It's also likely she'll be in the living room while the adults are watching a variety of violent sports and movies which show human bodies being mutilated and also often teach young men how to exploit young women and young women how to enjoy being exploited.

The abstract thinking abilities of the human being develop mostly in adolescence, a time when our young people are watching lots of television, listening to primitive sorts of music played electronically, sitting bored in classrooms that are one station or another of an assembly-line, rushing about from sports practice to various clubs, and otherwise exhausting themselves in activities that don't stimulate the higher regions of the brain. Imagination atrophies even before other cognitive abilities. A hectic life isn't necessarily a rich life and may well prevent the development of a rich inner-life.

One of the first symptoms of Alzheimer's in many people is the inability to set schedules or to follow remembered 'scripts'. But that inability is almost a given with young human beings in our society. We teach children to respond to adult coaches and other supervisors, not to organize their own schedules or thoughts. Socialized in this way that could be labeled 'fascist', they can be more readily processed in the public-schools and so that they can be easily exploited by our entertainment industry. I'll go out on a limb by suggesting our government and academic brain-scientists might be downplaying some of the entertainment issues because of fear of the lawyers of the entertainment industry, the computer industry, and probably the various unions and companies which profit from an increasingly

dysfunctional educational system.

There's a good book which discusses the moral and medical issues: *Endangered Minds* by Jane Healy. Pay attention to her discussions and soon you may be noticing that learning to like TV is a bit like learning to like smoking. Children will draw back and show all the signs of an animal in fear and not sure if it should flee or freeze in the hope the enemy will pass by. In the interesting and important book, *On Killing*, Lt. Col. Dave Grossman noted that tests have shown that most adolescent boys will try to shy away from the sight of violence or blood on the movie-screen. They watch because of peer-pressure from the small percentage of boys who like that stuff. It's likely that peer-pressure can also be exerted by parents and older siblings who are already accustomed to this sort of horrible and trashy entertainment. If a man is sitting beside his ten year-old son as a Terminator movie is playing on TV, then that boy will likely conclude that real men watch that sort of moral trash.

Col. Grossman expressed an opinion I've heard to be common among military trainers: young Americans have very little moral structure. As Adam Smith feared might be true in the type of society he glorified, modern Americans are raised to be no more than genial and have little real moral integrity. We shouldn't consider moral and cognitive problems to be separate. While history tells us of saints who aren't too bright and evil creatures who are brilliant, moral reasoning in a complex society requires high levels of abstract reasoning power as well as the strong character which should be built during the first seven or eight years of a human being's life. And we shouldn't ignore the fact that we pump up our GNP, providing our salaries and benefits and government programs, partially by exploiting our own children, even stunting their brain development and deforming their moral natures.

I remember reading a speculation by a brain-scientist that Alzheimers isn't an aging disease but rather a form of brain-damage caused by misuse or underuse of the brain during crucial developmental phases. The human brain is a dynamic organism in which cells and groups of cells are always trying to form connections in response to any serious stimulus. The cells and groups of cells which fail to form a lot of connections, or fail to be active at a reasonably high level, will die. If too many cells die, the brain is damaged.

The good news is that there is some serious evidence that a weak brain can strengthen by these developmental processes even during later decades.

You'll never recover fully what was lost in those early years of passivity and exploitation but you might recover a bit of brain-power. But that sort of recovery can be as painful as the process of turning yourself from a couch-potato into a physically fit human being.

## 213 Overprotected Children: Developmental Issues

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=73>. It was finished and uploaded on 2007/04/12.]

I was happy to see a column by Jane Brody in the Springfield Republican on Good Friday of 2007. That column hit upon some of the same mental and emotional health issues that are disturbing me and which I discussed in Chapter 212, *Alzheimer's as a Cost of Passivity and Laziness*.

Children need free playtime, unsupervised by adults for their brains and bodies to develop properly. At the level of our animal natures, with our embodied love for children and also our concern that we ourselves be taken care of properly as we age, we should be more concerned with raising our children to be healthy, creative men and women. There are many issues here but I'll post three entries. At that I'll only cover a few of the most important aspects of this problem. To give the conclusion first: We adults need to step back and let children play in the ways that are natural to them, which means we have to let them take true risks, normal risks.

I'll start by reminding the reader of the blunt fact that our children are not ours—they belong to their Creator just as we do. Our duty is to help them grow into healthy men and women well-adjusted to the world as it exists. The world has dangers in it. For example, it has a huge and hugely varied population of microbes which cause disease. Overprotected children are known to have weak immune systems. During the next plague, bird-flu or otherwise, they might be among the first to die. Specific predictions are, of course, impossible since a particular disease organism can more readily attack those with specific gaps in their immune systems—most of which are genetic. (See *The Coming Plague* by Laurie Garrett for good discussions

of the underlying issues.) In that book, she tells us that disease experts say that the children who've died in well-publicized E. Coli outbreaks have been overprotected children with weak immune systems.

What is our response when a handful of children die, children who've been raised by parents who are more squeamish than rational? We change rules of food-handling to eliminate all microbes from the food of all our children—lessening the development of immune systems for nearly all children in our society. We act as if to turn them into men and women fit for life only under a plastic bubble.

I'm going to present a claim for which I have no evidence from scientific studies:

Exposure to real dangers, of the sorts normal children have sought as long as human beings have existed, will help to form a child's mind and body, including their reflexive and conscious attitudes towards more serious and unavoidable forms of risk.

I was a middling child so far as risk-seeking goes. That was true of my climbing and my general attitudes towards situations where falls were possible and potentially crippling or fatal. In my 20s, on a camping trip with some co-workers, I surprised some of them by walking across a fairly narrow log which was a bridge over a gully perhaps 10 or 15 feet deep. I didn't even slow down since I saw right away the log was stable and worn a little flat on top.

I'm not fully immune to vertigo when I look down from a height—and more prone to vertigo as I age. On a trip with the same co-workers the prior year, I'd not been able to walk right to the edge of the cliff overlooking the campground and restaurant area of Yosemite – we'd chosen to do more serious camping in the forests above the valley. I had to go to the edge on my hands and knees.

Yet, I had somewhat conquered my fear of height and my vertigo. I had been a real tree-climber. I wasn't as fearless as some. I went to the next branch up only if I were very sure I could get back down without too much of a risk.

I'm pretty confident that my particular level of risk-seeking and risk-aversion, when climbing or height was involved, was shaped by a couple of incidents when I was very young and not capable of judging dangers. But I was only a few years old and was never more than a quick run or a room

away from responsible adults. During one of those incidents, I'd managed to climb the shelves in my parent's old-fashioned pantry. I got to the top, looked down and saw there was no safe way down, and I screamed. It must have been traumatic because I have ghostly memories of the incident though I was pretty young and don't generally have memories from that time. So far as I can tell, I learned the lesson: don't climb up unless you have a good plan for getting back down.

You can probably teach that lesson to children wearing safety helmets and wrapped up in harnesses while they scale plastic rocks at an indoor playground. But my gut feeling is that it's not really the same lesson. It won't be burned in quite so deeply and won't lead to the same sort of a combination of confidence and caution. But note that I didn't learn to fear climbing, only that I had certain limits.

If we shape our minds and our souls, including our moral characters, by responding to real-world situations, the results will be different from the shaping which comes from responses to situations simulated by the use of technology. This isn't to say that there's no value in controlled training—there can be lots of value. But it's reality we should respond to. That reality will eventually invade our best-planned efforts to insulate ourselves from the dangers of life in this universe, and we do our children no favors by overprotecting them during their most crucial years of development.

## 214 Overprotected Children: Faith Issues

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=74>. It was finished and uploaded on 2007/04/16.]

My original purpose in writing on this issue was to speak about overprotected children as being a sign that the responsible adults don't have a true faith in God. Faith certainly doesn't mandate a careless attitude towards children but it does mandate a certain confidence that God's world is good. Children are in danger when they climb trees and swim in natural bodies of water. Left to their own devices, children will make dangerous swings and unstable tree-forts. Those young boys destined to be Nobel Laureates in Physics or Chemistry might well build explosives that blow off a few of their finger-tips. This is how children develop into confident adults.

We all belong to God and this is His world, the world He shaped for shaping us in turn—among many other purposes. A strong faith in the God of Jesus Christ doesn't mean we don't learn how to control dangers, but we have to recognize that He Himself doesn't seem to place a maximum priority on our safety and comfort. And the Bible itself, Old Testament and New alike, indicate He has a liking for earthy men and women, those hardened by difficult lives where they're exposed to storms and wild animals. That liking might indicate that a proper attitude towards danger, including that which children confront during their play, is not only a sign of faith but also a way of disciplining the self so that a stronger faith is possible.

American parents have a tendency to over-protect their children and then, at major transition points, throw them out on their unprepared own. As one example, American parents do their best to protect their children from drug and alcohol abuse and then blithely send them off to American

colleges and universities, nearly all of which offer the possibilities of truly disordered lives to their freshmen. I certainly wasn't prepared for the peer-pressure and could have easily been classified as an alcoholic for my first two years of college and off and on again during my travels around the corporate cultures of Boston and San Francisco, New York City and Atlanta, ending in Stamford.

I was born in 1955, the heart of the baby-boom birthing era. The way in which my generation was raised, and the generations since, trains the youth to respond to peer-pressure and also to respond to the pressure of exploiters in the entertainment and educational industries alike. We were left vulnerable to those who serve the gods of the marketplaces, political and commercial. This feeds back into the theme of overprotected children, in fact, into a more general theme of a serious moral error we made on our own behalf as well as that of children.

Americans, and most modern human beings in the West, reshaped their societies—hence, their moral beliefs and actions—under the illusion that we can achieve safety and comfort in this world with a certainty unknown to past generations.

We assume that we can make our decisions to satisfy our desires for safety and comfort—for ourselves and our children—and we'll be able to settle the other moral issues afterward. Faith in God would indicate that we should first serve Him and then take care of our obligations to raise children to serve Him. Instead of raising God-centered children, we raise children who think that life can not only be ever safe and comfortable but also ever prosperous. It was the illusion that this was a good environment for children that led us to turn those children over to be formed by public-schools and the entertainment industry. Public administrators and corporate executives promised us all our heart's desires in return for our patronage.

Around the time of World War I, Santayana had already observed that American parents felt they had neither the right nor the responsibility to form their children's beliefs. From my observations since my entry into the Catholic Church, I'd say that's just as true of Catholics as it is of others. There are responsible Catholic parents to be sure, and also responsible parents who are Protestant or Unitarian or pagan in some sense. Even those responsible parents have to send their children out into a society of children who've been raised to be lambs to be sheared by those who so faithfully serve the gods of the marketplaces. But they're pampered lambs for sure. At least they have been up to now.

Often, it's useful to simplify complex, factual messes. Sometimes, it's necessary for us to get a handle on those messes. In that vein:

We've created our current mess, overprotecting ourselves and our children, by the illusion that we gain not only safety and comfort but also some sort of freedom by shifting our dependencies from relatives and neighbors and fellow-worshippers to large centralized powers.

Those centralized powers gain our loyalties by promises of safety and comfort. They'll educate us and cure our diseases. They'll care for us in our old age and protect us from criminals. Some of those promises have been kept, others were kept for a while, but we shouldn't have been interested in any of them. In apocalyptic language:

The gods of the marketplaces are more anxious to promise us safety and comfort while the God of Jesus Christ seems content to let us suffer at times.

We have to have enough faith in God to start the process of separating ourselves and our children from a civilization gone bad. Maybe the modern nations of the West can sustain prosperity and continue providing a bit of safety and comfort to many citizens, We shouldn't be interested. It's become hard for us to even conceive of local economies which can provide the basics of food and shelter and clothing without international corporations. We don't want to take the risks and we don't want to raise children to take such risks. We're soft. We're morally flabby. We care about God only to the extent that we get warm and fuzzy feelings from the occasional worship service. And we raise our children to be just like us – overprotecting them and teaching them to worship those gods which promise to continue providing the good life.

God or the gods of the marketplaces? The rough way that leads to salvation or the wide and smooth way that leads to a final death? If we turn to God, we can have faith that He'll toughen us up as He did long ago to that city-dweller Abraham.

# 215 Overprotected Children: Moral Issues

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=75>. It was finished and uploaded on 2007/04/25.]

The issue of overprotected children overlaps with another issue that currently worries me—in fact, I think it might be the major moral issue of the modern world where many activities are organized through large-scale institutions. We have not learned how to control such institutions. We have not learned how to live as moral beings in this sort of a society. In fact, we generally cede our moral responsibility to power-hungry politicians and greedy corporate executives.

Our moral natures are adapted to the small-group living, in tribes and families, of the Neolithic Era while we modern human beings inhabit nations which are huge and may contain many parts which are larger than any nations of past eras. In these modern nations, much of the children's time is spent in activities run by those inhumanly large organizations. It's remarkable that American parents trust these organizations given what we know of the leadership of modern nations. Without so much as blinking, modern leaders can move from dropping bombs on other people's children to conducting dangerous experiments on the sexual natures of their own children. At the same time, they'll make sure the children under their care wear helmets and knee-pads every time they go out to play. They'll mandate changes to the handling of food for all children after some irresponsibly overprotected children die from relatively mild strains of E. Coli.

Unfortunately, a skeptic could plausibly argue that modern parents cede control over their children for a reason that I've discussed in other postings: we readily cede many of our moral responsibilities to the large institutions

to which we owe our loyalties, that is, the institutions upon which we are dependent. We aren't about to protect our children against the exploitations of those who provide our medical care and who promise us social security checks one day.

Those in the younger generations have been trained to move in herds rather than to find their place in a human community, though we baby-boomers suffer to a somewhat lesser extent from that same distortion of our moral characters. I'm not going to claim to know how children should be raised. I do claim there are various reasons, moral and practical, for parents and extended families or local communities to shape children to the traditions and needs of those local communities rather than letting them be shaped to the needs of the modern nations.

There is no one way to raise children, no one way for communities to organize themselves, but the moral natures of children should be nurtured. Their confidence should be nurtured and some reasonable skills should be nurtured to find new ways to live in a changing world. Some parents might well feel their children should be given technical educations and others might raise their children to be free-spirited poets or musicians. We should be flexible and creative in raising children so that they are flexible and creative enough to survive under changing conditions and to do so free of governmental or private enslavement.

We have to remember that we are a particular type of creature and our optimal character development occurs when we interact with our fathers and mothers, grandfathers and uncles, grandmothers and aunts. We need to interact with our environment to understand our role in nature. We need free-play time, rather than non-stop little-league, so that we can learn how to exercise our imaginations and to organize our own time, individually and within informal peer-groups. Even those inclined to book-learning need to learn how to learn, not how to sit passively while crap is pushed into their brains.

We've chosen to train American children to gather in groups so that they can be told what to do by adults who may be parents of some in the group but are truly representatives of the institutions which sponsor their activities. Those children have been trained to be passive, waiting for some teacher or character on the television set to draw forth a specific response. Our playgrounds are empty but for those times when children gather in uniform to play under adult supervision.

If we and our children are able to successfully deal with our mounting

problems, it will be despite the way we raise them. We have left the younger generations with the daunting task of learning how to nurture their creativity and courage, to start again the growth processes which were halted by the wrongful ways in which we Boomers were raised, the still more wrongful ways in which later generations were raised. History indicates that the children of irresponsible and selfish parents are rarely able to recover from poor upbringings. And then it takes generations to rebuild a civilization, if the underlying cultures survive at all.

## 216 What Can We Do to Maximize Brain Health?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=81>. It was finished and uploaded on 2007/07/05.]

How do we get a healthy brain? Do we all have to sit around and think about the difference between the philosophy of Spinoza and that of Pascal? Do we all have to learn how to play Beethoven piano sonatas?

No. In fact, a farmer who rarely reads—except maybe his Bible – can live a moral life and keep his brain healthy by managing his farm well. Learning the lay of the land and how each parcel should be used. Getting a feel for the seasonal variations in the various parts of his property. Developing a long term strategy for harvesting trees and replanting trees, for managing water resources, and for improving his livestock, will all be profitable activities in their moral results and cognitive results as well as in his ability to make his honest living.

One of the worst positions to be in is to be falsely intellectual, a position in which many people are in. Think of all the hours our youngsters spend in school doing dumbed-down intellectual work—bad for those who should be doing real intellectual work and just as bad for those who would be better off learning basic intellectual skills while also learning the skills of a trade. Our modern schools exploit these children for the benefit of those employed by the schools and those who sell to the schools and this modern exploitation might well be more damaging than the earlier exploitation by the mills. Some of my maternal relatives in my grandparents' generation went no further than sixth-grade and nearly all of those learned to read difficult books and to think clearly in their own living-rooms—blessedly free of television sets. The men were mostly skilled metal-workers. In those

days, that meant they did electrical work, plumbing work, made parts for machines when the manufacturers couldn't deliver quickly, repaired metal roofs, and fixed appliances. Their tools and materials were more primitive but they probably used their brains more than modern workers. And some of the men with little formal education taught themselves a bit of trigonometry and some metallurgy and probably much else.

I don't wish to be mindlessly nostalgic, but I do wish to emphasize that we have many possibilities for improving our lives and we've mostly abused those to develop lives which are simultaneously hectic and passive. A young man using a simple lathe to learn how to make table legs is using his mind, learning much about the qualities of different sorts of woods and the importance of efficient set-up of work-areas and much else. A young man sitting in front of a desktop computer is learning how to download pre-recorded music or movies using programs with mindless interfaces all developed by some gnomes in Redmond or some such place. True, there are some natural programmers out there, but few and most of those aren't encouraged to develop those natural skills.

Primitive lathes and desktop computers loaded with overly visual software are not our only options, but we won't be able to find better options if we continue the destruction of our own imaginations and abstract reasoning skills, our ties to the physical world and our practical reasoning skills. If we were properly skeptical, we would notice and question the way in which the more important aspects of productive knowledge and skills are being concentrated in corporate entities.

What's most important in maximizing brain-health is what's also most important in maximizing cardiovascular fitness or woodworking skills or musical skills: use it so you don't lose it. More than that: use it intensely enough to give yourself a good workout. Use your brain so that it becomes the foundation for the mind you want. If you sit back, perhaps waiting for some magic drug that will cure a poorly used brain, then you better realize you'll have a brain which belongs to the various bureaucracies which have proven they can reshape it, to restore it to health or to be more useful to the gods of the marketplaces which they so well serve. It's amazing that so many who might be afraid of giving control of their bodies and minds over to possibly hostile entities will do so quite readily when those entities smile benignly and speak of drugs and surgery. Cures!!

Take control of your own body and mind if you would have any pretense to be free. Learn to be healthy and not just curable. If possible, find an

old-fashioned doctor who's not just a specialist in one or two pounds of your flesh or a generalist who refers you to an expert. Flee from any doctor who shows signs of having taken seriously the literature of the drug companies or the medical electronics companies.

We need to learn to live and to die in a manner appropriate to mortal human beings. It's not an easy task and it will require a lot of experiments, most of which will end in failure.

# 217 Why are Human Beings of Greater Worth than Chimpanzees or Rattlesnakes?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=88>. It was finished and uploaded on 2007/08/17.]

In Chapter 564, *Christian Misuse of the Term 'Person'*, I spoke of the need for Christians to give higher priority to revealed truths even at the cost of eliminating some arguments which seem of practical value in protecting human life. That leaves open the question given in the title of this entry. Why, indeed, is human life of greater worth than the lives of other sorts of biological creatures?

Let me seemingly divert to a question which turns out to be the same:

Why did Jesus Christ, the Son of God, accept baptism?

Surely, He didn't need to be baptized. He bore our sins but was Himself free of all sin. The second antiphon for the Morning Prayer, (Liturgy of the Hours—modern Roman Catholic version) on the Solemnity of the Baptism of the Lord tells us what occurred when the sinless Lord of Creation entered those waters to be baptized by one of His own creatures:

Springs of water were made holy as Christ revealed his glory to the world. Draw water from the fountain of the Savior, for Christ our God has hallowed all creation.

Water is good in its natural qualities. It refreshes and cleans. It's all-important to life on earth because it irrigates so effectively, bringing in nutrients and carrying away wastes.

It's fitting that the Lord chose such a substance to play a role in baptism, a rite in which we're cleansed as we move towards salvation. But we must remember that water as a natural substance isn't the source of the grace which can lead us to salvation. That grace is in the waters of baptism, when united with the proper words—I baptize you in the name of the Father and the Son and the Holy Spirit – because that grace flows **out** of the Lord Jesus Christ and **into** the waters of the world and that flow of grace began when the Son of God let His human body be baptized with water.

Human beings, in and of themselves, are a particular species of physical animal. In a moral sense, we're not so high above our fellow-animals as some would think. For example, we have our instincts which make us reluctant to kill other human beings but wolves have stronger instincts against killing members of their own species. See *On Killing* by Lt. Col. Dave Grossman for a fascinating discussion of this entire issue.

We men are morally superior to other animals in our ability to abstract from our moral instincts and to produce moral systems of thought and behavior. This general ability to think abstractly and the consequent ability to raise ourselves above our environments, vaguely seeing the possibilities of a Creation and a Creator, is probably the reason we can please God as companions, here and in the world of the resurrected. This is a fascinating, important, and terribly complex issue which arises in many efforts to make sense of Christian revelations and empirical knowledge as part of the same story. It's important that we Christians learn how to deal with this issue if we are to spread the Good News in this third millennium after the birth of our Lord, but that larger issue is the work of a number of lifetimes and beyond the scope of this posting.

Our Creator decided to offer us that chance to be His companions on the other side of our graves and that offer was made in the incarnation of our Lord Jesus Christ. Human life became qualitatively different from other forms of life when the Son of God took on human flesh, being born as the defenseless human baby who was named Jesus by His mother, Mary, and His foster father, Joseph.

The Incarnation didn't happen because human flesh was already divinized and somehow worthy of providing the stuff of a creaturely nature for Christ. It was Christ who made human nature holy in some sense by becoming one of us, just as He made the waters of the earth holy and suitable for our baptisms.

Getting back to the value of human life, this is the situation of men

without Christ:

Men tend to place a high value, but far from any absolute value  
on the lives of other human beings.

The Romans of the Republic had a harsh moral and legal code, though they tended to follow those codes far more faithfully than modern Christians follow their professed beliefs. Historians have written that those Romans knew that abortion was murder but those hardheaded and virtuous pagans could handle hard cases without feeling the need to justify themselves. They were willing to break their own laws or moral beliefs if there seemed to be a strong practical reason to kill a baby in the womb or to kill a misbehaving adult who was a threat to the clan, but they didn't feel a need to turn a crime into a social good in order to justify themselves. I repeat:

Men tend to place a high value, but far from any absolute value  
on the lives of other human beings.

That is about as good as it gets on the basis of our natural instincts and our natural reasoning. Unfortunately, we have to understand that the non-Christians of our society aren't being deliberately thickheaded or evil when they deny that all human life, all that might be human life when we don't know for sure, has absolute value. For centuries, we of the West have fooled ourselves. We collaborated with the modern Deists and other sorts of pagans in trying to keep what was good in the Christian West by deriving revealed truths through processes of natural reasoning. We continued to worship as Christians on Sunday while paganizing our political and social systems, even our basic moral codes, on the other six days of the week.

We in the modern West aren't a mixture of Christians and pagans as so many believe. We're a mixture of Christians and pagans and paganized Christians. Those paganized Christians deal poorly with the hard case morality which arises naturally in pagan societies and they feel the need to feel justified and saved in the way of their Christian ancestors. They can't just murder human babies in cases where there is some true hardship. They have to turn the murder of human babies into a social and moral good just because of the moral attitudes they inherited from their Christian ancestors, attitudes now severed from Christian belief. Now, we have some more honest sorts of pagans, not necessarily of the virtuous sort, who bluntly

deny any absolute moral rules and claim the right to use one human being as means to meet the ends or needs of another human being.

We got to this point because so many well-intentioned Christians joined in the efforts modern pagan thinkers to retain the moral beliefs of Christianity while getting rid of the Person of Christ. The absoluteness of Christian morality which comes from the Incarnation was dangerously and weakly justified on purely natural grounds.

The inevitable has happened. Nature herself doesn't give us any reason to believe human beings are so much different from other animals as we imagine. The fraudulent effort to turn some of the revealed truths of Christianity into products of natural human reasoning failed and those who see absolute value in human life now engage in ridiculous and childish arguments with those who are willing to see other human beings as means to their ends.

Human life has absolute value right from conception.

Does not.

Does.

Does not.

It's time to start with the core of revealed truths and the huge unorganized piles of modern empirical knowledge and first learn how to tell the story of Christ and His brethren in a way that makes sense of both. Once we have a plausible version of the story being told by God, the story which is our world, we can begin to live once more as Christians no matter the cost we have to pay to be true to our Savior. Then maybe we can return to the Christian vocation of spreading the Good News of Christ.

## 218 Networks of Public Spaces Rather Than One Square

There's been a buzz of sorts on parts of the Internet because of a major study written by a pro-diversity liberal, Professor Robert Putnam of Harvard. That study indicates there are some serious problems with diversity. He thinks, or maybe hopes, those problems to be of a short-term nature. There might be other ways than a simple choice between a return to tribalism and a cosmopolitanism that melts down local communities or at least renders them ineffective.

There's an overview article, *The Downside of Diversity*, on Putnam's study at <http://www.iht.com/articles/2007/08/05/news/diversity.php>. The article begins:

It has become increasingly popular to speak of racial and ethnic diversity as a civic strength. From multicultural festivals to pronouncements from political leaders, the message is the same: our differences make us stronger.

But a massive new study, based on detailed interviews of nearly 30,000 people across America, has concluded just the opposite. Harvard political scientist Robert Putnam—famous for *Bowling Alone*, his 2000 book on declining civic engagement – has found that the greater the diversity in a community, the fewer people vote and the less they volunteer, the less they give to charity and work on community projects. In the most diverse communities, neighbors trust one another about half as much as they do in the most homogeneous settings. The study, the largest ever on civic engagement in America, found that virtually all measures of civic health are lower in more diverse settings.

“The extent of the effect is shocking,” says Scott Page, a University of Michigan political scientist.

[Michael Jonas, Boston Globe, as published in International Herald Tribune on August 5, 2007]

You can get a more complete view of Professor Putnam’s work at a blog he runs, *Social Capital Blog* at <http://socialcapital.wordpress.com>. You can also find a link to the website of the journal that published the study.

I would suggest that everyone thinking about these matters consider the desirability of a social model corresponding to both the traditional ways that the insurance industry handled risk and also the Catholic principle of distributivism in economic and political systems. The general principle is that everything is localized as much as possible. Acting on such a principle would protect local customs where ‘local’ covers ethnic and cultural and religious communities and minimizes various sorts of transaction costs, only some of which can be quantified in financial terms. It would protect these more local or more focused communities so that the members may reasonably expect certain customary responses and ways of behavior during casual meetings in the store or during negotiations for the sale of a house or during dating or during the public debates in which more voices should be heard.

It would seem to me that feelings of distrust are increased when you have to expend energy and invest attention in a high percentage of your social interactions of various types. Once you start developing habits of closely examining body movements and facial expressions, vocal inflections and choice of words, you’re going to be keyed up to enter most of your social interactions as if facing a possible predator.

Let me choose a concrete example. We enter a retail store with expectations about the behavior of the clerks and cashiers. When I was growing up, prices were pretty much set in most retail stores in the U.S., most certainly in my hometown. The local grocer, a neighbor, set prices so he could support his family at a decent level. Every one knew that grocer worked long hours and was not making a killing off their trade. They did business with that grocer rather than running from store to store or town to town in an effort to save money.

Coming from a set-price culture, I found it exciting the first time I went to Tijuana where the natives or the ‘with-it’ Americans ignored price

tags or took them as the starting point for downward negotiations. When merchants and customers have different attitudes about price negotiations, there is plenty of room for one to think the other is trying to cheat, even when all participants are honest. Our fellow human beings see our habits and customs and not the underlying virtues or vices. To be seen immediately as honest, we must show the signs of honesty which a particular man or woman expects and those signs are specific to a culture.

We should maybe give up our all-or-nothing attitude towards the public square and realize that it can be hard to interact fully even with members of morally well-ordered communities to the extent that their ways of doing business and socializing are different from ours. We should maybe have networks of public squares with each ethnic or cultural or religious community having their own squares. Most of human life could then be lived in those local squares where values and behaviors and even conventions of dress and food are shared. Younger children and perhaps timid teenagers or even adults would not stray past those public squares in which there is a valid expectation that a particular set of conventions would be obeyed rigorously. In addition to those local public areas, there could be some common political and commercial public squares connecting the more particular public spaces. Few would have a need or desire to enter those most common squares, mostly the leaders of the various communities and perhaps assistants and apprentices to those leaders.

We need to feel free to experiment with our forms of community and that would require a re-localization of human life that would be dangerous to our current crop of politicians and businessmen and lawyers. The guiding principle of such a system would be: the interests and needs represented in public squares shared by multiple communities would be common to the communities and wouldn't include the more particular interests and needs of the various communities. Local communities of various sorts would feel more free to nurture their own beliefs and cultures and to protect the innocent and timid from disturbing sorts of interactions.

Could such a system exist without falling into tribalism or moving once again towards the sort of cosmopolitanism that destroys social bonds of all sorts? I don't know, but it might be worth a try to start re-building local communities and see how those various communities interact.

## 219 What is Freedom?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=98>. It was finished and uploaded on 2007/09/17.]

In the modern world, we tend to think of freedom in terms of satisfying desires. To be sure, even many who live for that false sort of freedom seem to realize that we then become no more than our desires or, more horribly, the thwarting of those desires—a terrible and humiliating state in either case. Hannibal the Cannibal is the most free of all modern men because he has become his desires and he has gained the power to satisfy them. Hannibal the Cannibal is the role-model for our politicians and our lawyers, our investment bankers and our corporate executives, our athletes and our entertainers. He may even be a role-model for many clergymen.

Let me move in a different direction with a quote from *Time and Free Will* [11] by Henri Bergson:

[W]e are free when our acts spring from our whole personality, when they express it, when they have that indefinable resemblance to it which one sometimes finds between the artist and his work. [page 172]

Let me provide another quote, this one from Walter J. Freeman's *How Brains Make Up Their Minds* [35]:

An intent is the directing of an action toward some future goal that is defined and chosen by the actor. [page 8]

In Thomistic moral philosophy, 'intent' defines human morality and freedom. We don't freely will to be a good man or a good woman, we choose to struggle towards that state of goodness. We don't freely will to cut down

on our drinking or stop smoking, we choose to move towards a state where we don't continue our bad habits or bad thoughts because our brains and our bodies and our relationships to others and to our environments have all changed. We should realize that the very process of forming intents can be a bit vague if only because we don't see the goal clearly until we're well along the path. I've certainly deluded myself often about the goal of becoming a Christ-like man and I've also deluded myself about the nature of the path I have to travel. The forming of our moral intentions is an ongoing process and not an action taken once and for all time.

The modern concept of free-will is useful to entrepreneurs, political or commercial, as they go about their task of destroying local community life to draw us all into the gigantic marketplaces of a land where natural cultural and physical boundaries have been dismantled. That concept of free-will leaves most human beings stripped of their defenses against those entrepreneurs and other predators and parasites of a cosmopolitanism and imperialism rendered all the more damaging to human beings by the pretense that we remain dedicated to traditional human values.

[W]e are free when our acts spring from our whole personality. . .

So said Bergson but I'm not sure if he realized the full meaning of his own words. He was caught in the modern, liberal understanding of the human animal as being naturally a person, even a person from conception—a trivialization of the concept of 'person' and a useless concept alongside that of 'human being' or 'human animal'. We're not born persons and there is good reason for a sensitive observer to fear that that most of us remain human animals to the grave and never become persons. Mark Twain, an insightful critic of Americans and their culture, noted that many Americans claim they want to go to Heaven and live with God for time without end but few willingly engage in activities that would prepare them for life in any Heaven conceivable under Christian beliefs. My belief is that we can become human persons by preparing ourselves to live in Heaven. Even then, we're persons by sharing in Christ's own Being rather than being freestanding persons.

There are only Three Who are truly persons, Who are truly unified and coherent and complete in their single Being—to use criteria for personhood I've proposed elsewhere. There are virtuous pagans who show strong signs of personhood, Cato the Younger and Geronimo to name but two, but the

greatest of human animals is still constrained by his circumstances and his inborn characteristics. We're seemingly stuck if my instinct is true that freedom and personhood are tied together. Our very being and the choices offered us by our environments are tightly constrained. Any personhood we can develop will be tightly constrained. How can we be free? How can we become true persons, or at least truer persons?

How could even Jesus of Nazareth have been truly free? After all, He was a true man. Doesn't mean that He was also constrained in the ways in which even the best of us are constrained? Yes, but there's one major difference that makes all the difference:

The Son of God freely chose to become Jesus of Nazareth, to be born a helpless baby in the care of Mary and Joseph, to live as the adopted son of a carpenter, to become a carpenter Himself. He freely chose to be born a son of David and of Abraham. He freely chose to be Jewish, to follow the law of Moses and to worship His own Father each Sabbath. He freely chose to preach a mission of salvation, to save some and to cure some of their bodily ills. He freely chose to suffer, to be crucified, to die, to be resurrected.

Jesus of Nazareth was the only truly free man in history. His freedom was necessary for His perfect sinlessness. His freedom was necessary to allow union of man with God. His sinlessness would not have been perfect if Jesus Christ had been less than the Creator of His own world and His own human body, if He hadn't freely chosen to live that humble life. His divine personality would have been somehow cramped.

What about the rest of us?

We can choose the false freedom of a Hannibal the Cannibal by seeking to satisfy our desires rather than setting intentions to move towards moral goals. Or we can intend to reach the noble though constrained freedom of virtuous pagans. Or we can intend to reach the perfect freedom of a Christ-like person. This is the difference between the path to virtuous paganism and the path to a Christ-like virtue:

The pagan disciplines himself to become a truly good man while the Christian disciplines himself to learn how to stay out of God's way while the good Lord does His work.

When we stay out of God's way, He'll pick us up and put us on His shoulder. After we ride for a while, we'll learn the rhythms and direction of God's movement. He'll set us down and we'll find ourselves moving with God as if part of Him. But we'll be us. We'll be free because we'll be moving along with Him in His perfect freedom. We'll be thinking along with Him in His perfect freedom. We'll be speaking along with Him in His perfect freedom. We'll be acting along with Him in His perfect freedom.

## 220 Could Adam and Eve Have Made Christ Unnecessary?

Could Adam and Eve Have Made Christ Unnecessary?

No. Christ's self-sacrifice was necessary to save us, to make us true companions of God. No action by any human being could have changed that fact. No action by any human being could have reduced our dependence upon the work of Jesus Christ. In the sense of needing salvation in Heaven, no possible creature could be saved by some sort of natural grace because God has to act to make that creature suited for life in a radically different phase of Creation. The Almighty has to act to purify and raise that creature to be able to share His life. And the Almighty has to actually bring that creature to new and true life in the world of the resurrected.

There are many who would claim to believe that we need Christ to save us and then they go on to claim the Bible tells us that Adam and Eve were created in a state of grace the same as the state of the saved who belong to Jesus Christ. Then, as the story goes, the snake seduced grace-filled Eve into an act of disobedience to God and she, in turn, brought grace-filled Adam into that state of disobedience. A careful reading of the third chapter of the book of Genesis might lead to the suspicion that we're reading the story of Adam and Eve through interpretive lenses and not simply accessing a clear and obvious understanding of that strange story.

The story of Adam and Even is presented in a mythical form and apparently borrows much of its content from the heritage the Hebrews shared with the various pagan traditions of the Near East. To treat it as if it were presented as historical fact is, among other errors, to do great injustice to the treatment of the story of Jesus Christ in the four Gospels. Some might think that the entire Bible should be raised to the level of the Gospels in the sense of historical reliability and truth-bearing capacity, but the real effect

is likely to drag the Gospels down to the level of the books of the Bible which are intended as myths or allegories which teach a lesson of some sort rather than relating historical facts which carry their own direct truth.

That story of our mythical ancestors also has an edge to it. God Himself isn't presented in the best possible light. The all-knowing Creator is presented as being surprised by actions of His creatures. He seems to be defeated, at least in the short-term, by the snake and can do no more than promise a decisive counter-attack at some vague time in the future. Moreover, God seems unreasonable in punishing Adam and Eve for not meeting expectations that might well have been beyond human capabilities.

Something is wrong with that story of Adam and Eve or perhaps something is wrong with our interpretations of that story.

Let's consider a little bit of modern empirical knowledge.

There is serious reason to believe there was no human man and woman who were the common ancestors of the human race in the way of Adam and Eve in the book of Genesis. It seems almost certain that any common ancestors of the entire human race existed well before human beings came to full moral self-awareness. The genealogies of Cain and Seth indicate the authors of Genesis believed, as I do, that that awakening was tied to the development of technology, including true agriculture, and the growth of the early cities. So far as I know, the earliest evidence of craftsmen gathering in community—perhaps seasonal at first—shows in layers of soil about 10,000 years old in the vicinity of Jericho. Perhaps that indicates the reason for the inordinate importance attached to that city in the Bible. Specialists have done genetic sampling of human beings from across the globe and think that our last common ancestor lived about 70,000 years ago in the vicinity of Nigeria. And he was Adam. Even lived tens of thousands of years before that.

The immediate descendants of Adam and Eve were forming civilizations, indicating the very important conflicts and revelations which underly their story and those of their sons occurred more than 50,000 years after any possible common ancestor of all humans. A specific and concrete act of rebellion by a particular human couple doesn't seem to be a plausible explanation of the sinful nature of human beings or the disorder which often arises in the world. As St. Augustine told us: we do not sin, we are sin. Yet, the particular forms of sinfulness which bother the Biblical authors involve forms of human social life which appeared with cities. The disorder in the physical world, more accurately—the struggle between order and disorder,

have existed since the so-called Big Bang about 15 billion years ago, a bit before human beings appeared.

The positive element in all of this is that the hint that the true meaning of the story of Adam, Eve, and their sons has to do with human moral problems which somehow involved technology and the greater gatherings we call cities. I think it's even better to say that these important moral problems were magnified when technology and cities appeared. In a potentially dangerous way, I'll speculate that those authors of Genesis knew that human uniqueness, the reason we have the potential to be companions to God, is tied up with our ability to abstract ourselves—so to speak—out of the concrete environments in which our species evolved. As our ancestors developed technology and the ability to live in cities, they abstracted themselves out of the grasslands and a tribal foraging life. They had the problem of reshaping to some extent their own moral natures to match the new possibilities and dangers which arise faster than we can adapt.

It's still true that we develop technology and ways of life that reshape ourselves and our children in important ways. This reshaping is not just on the skin. As we learned at Hiroshima, as we learn when children are corrupted by modern entertainment, we can reshape ourselves to serve evil and sometimes, as Hannah Arendt told us after her studies of the Holocaust, evil is served most effectively by nice human beings who are well-adjusted to modern bureaucratic life.

What does this have to do with human sin and human salvation? In adapting ourselves so effectively to serve good or evil, we show we're capable of reshaping ourselves to the higher demands of God, demands which exceed natural morality, demands which culminate in the command: "Be perfect". Be Christ-like. Cooperate with God as He reshapes you to share His life.

The problem the authors of Genesis seemed to be dealing with was this:

The all-loving God was the same as the Creator who made a world which placed impossibly difficult burdens upon morally self-aware human beings. The human race seemed to be condemned by God the Creator for the crime of using the unique abilities He'd given to men and women. If a St. Francis is possible, then so is an Adolf Hitler. Does the possibility of St. Francis justify the sufferings of so many at the hands of Hitler?

Adam and Eve didn't rebel against God so much as they recognized

the burdens of God's demands upon human moral nature. As the great Southern writer Andrew Lytle realized, man had to leave paradise to fulfill his God-given role. (See the under-appreciated novel, *The Velvet Horn*, for a rich display of Lytle's views on this issue.) But paradise wasn't what most think it to have been. It wasn't Heaven. It was the same earth Adam and Eve later lived in. The difference was that Adam and Eve awoke and left behind their animal state of innocence. Go back and read the third chapter of Genesis and see if this makes sense. Adam and Eve took up their yokes, but those yokes were yet hard and those burdens were heavy. Our ancestors were called by God to be His companions but that task is well beyond human capacity.

The traditional interpretation of the story of Adam and Eve is inconsistent with the Christian belief that we can be saved only by Christ. That traditional interpretation makes the claim our ancestors were born in a state of grace, a state of salvation, and would have remained in that state if not for an act of rebellion. Even if God had created a world and a human race better suited to perfect creaturely virtue, we would still not be suited to be the companions of God.

Only Christ can save us. Only Christ can make us Christ-like, God-like, so that we can share God's life. Life with God for time without end would be hellish for a creature not suited to share God's life.

I think that the empirical knowledge of evolutionary biology, viewed properly, is a message from God, a wake-up call. God is driving His story along in a particular way at this particular time. I also think the human authors of Genesis were smarter than us and certainly had a stronger and more pure faith than we modern Christians have. Those authors were sensitive to God's call and they realized that God had placed contradictory burdens upon us, had given us demands which were impossible for human beings to meet. They didn't try to justify God by waving away His omnipotence with irrelevant and possibly blasphemous theodicies, claims that our moral freedom excuses an all-powerful and all-knowing Creator.

The problem isn't with the violence of Creation, the moral disorder which has arisen in social mammals. The problem is that we found fault with the work of God and had to look for those excuses for the Almighty's failure to live up to our standards.

Evolutionary biology leads me to the speculation that we human beings have natures that allow us to be reshaped to share God's life. We're not born in in a God-like shape and we don't have long-ago ancestors who were

in that shape before some fall from grace. Nor do we have the capacity to reason towards absolute truths which are binding upon God Himself. God shaped us to be reshapable as His companions and He must do the reshaping, He must tell us the greater moral truths which are the perfect and complete versions of the moral truths which have arisen in the course of evolution. He must help us to live up to those truths, though that's where we can start sharing His life—in reshaping our own selves to be images of God.

The moral truths of Christianity are consistent with natural moral truths, those which can be derived by the methods of evolutionary biology, but they go far beyond into regions which human beings couldn't have reached on their own. We can see this in the way that Jesus Christ astonished or shocked His followers with the *Sermon on the Mount* and with His claims that they were to eat His Flesh and drink His Blood. Many, including many who claim to be Christians, still discount the commandments to be perfect even as many refuse to accept Christ's words in instituting the Eucharistic Rite or in saying that only those who eat His body and drink His blood will be saved (Matthew26:26-28, Mark14:22-23, Luke22:19-20, and especially John6:53-58). There are many Christians who swallow camels and then strain at gnats, finding literal truth in an ancient Hebrew allegory and then denying or diluting the words of Him who they acknowledge as Lord and God.

My speculation about the meaning of the story of Adam and Eve moves in the opposite direction, taking Christ's words as absolute truths impossible for us to reach on our own and speculating about human stories and their meanings. Oddly enough, taking Christ seriously rather than trying to dilute His words or to impose heavy philosophical loads on Him has let me accept modern empirical knowledge on its own and has also let me speculate freely about Creation and about forms of metaphysics that can allow a deeper understanding of that Creation. I can let God be God and then go about my creaturely task of trying to understand Creation.

I think my particular speculations about the story of Adam and Eve render justice to the Gospels in recognizing our inability to save ourselves, to make ourselves Christ-like or God-like, even by the most virtuous behavior. It also does justice to modern empirical knowledge as well as to the book of Genesis. My speculation leads to a recognition of our dependence upon Christ, not because our mythical ancestors rebelled but because we're creatures and can't transcend our own natures. The traditional interpreta-

tion claims man was in charge, conjecturing that Adam and Eve could have saved themselves—and us—by simple obedience in a natural human state. In that traditional interpretation, God's plans were at the mercy of human decisions and the rebellion of Adam and Even forced the Son of God to accept crucifixion to save us from our own willfulness.

I see man as a product of evolution, the crown of Creation in the sense that man can be reshaped while remaining man. We human beings can abstract ourselves from our natural environments to live, imaginatively or concretely, in environments for which we seem unsuited at first glance. God can even reshape us to be suited to life in Heaven. It's largely our minds—so poorly developed in modern times—that make us so shapable, that allow us to abstract our own characters from a particular environment and to live in imaginative realms or in new environments such as those of the Industrial Age.

Adam and Eve weren't rebels who removed themselves from God's direct Presence. They were apish animals who heard God's invitation to be His companions and realized they weren't suited to such a life. There were contradictions in the human situation and those contradictions are prominently displayed in the story of Adam and Eve. The tree of knowledge was set in front of them and to eat from it was natural to human beings—it had to be done for them to realize their own natures. Having eaten that fruit, they gained self-awareness, awareness of their own nakedness, and knew sin. Sin had already been with them. They, in fact, had already been sin, but suddenly they knew that they were sin. But good or bad behavior, only a small part of the Biblical understanding of sin, is still not the point and the story is confused when it should be confused—the authors of Genesis admit their confusion and ignorance to anyone who reads with any sensitivity. The story of Adam and Eve seems to be almost a scream of frustration:

What do you want from us, Lord?

How were Adam and Eve to live forever? How were they to share the life of God? God Himself seemed unwilling to help them. God seemed to have booby-trapped His world, leading men and women to realize the potential of human nature, and then hinting at a transcendence of that nature. But He left men and women with no way to transcend their animal natures. God seemed to have played the nastiest possible joke on human beings, calling them to a life which could be seen only at a distance as well

as through a glass darkly. The authors of Genesis were inspired to look at a tiny image that God was holding miles away from them—behind a smoky hunk of glass.

Only Christ could save human beings and He was free to do so or not. He was free to come when He chose.

## 221 The Complacent Ape

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=101>. It was finished and uploaded on 2007/10/03.]

Why Are We Complacent to the Point of Self-destruction?

More exactly, why did God create us to be such creatures? There is little doubt that we are such creatures and that this is one major cause of the problem pointed to by St. Paul in 1 Thessalonians 5:3:

When people say, "There is peace and security," then sudden destruction will come upon them as travail comes upon a woman with child and there will be no escape. [141]

Our environments can switch rapidly from, say, a benign climate to conditions which cause famine, starving some and weakening the sick so that minor diseases become fatal. New disease organisms can sweep through large regions of the earth, killing many. Human predators can gain an upper hand on peaceful communities, enslaving many and impoverishing prosperous communities. Why do such changes occur?

One of the true lessons coming from modern empirical knowledge, mathematics and physics and biology and history, is that complex and unpredictable events occur whenever two independent systems interact. This occurs even if the two systems are themselves simple and fully determined. The standard example is two pendulums of different length (different periods of movement) which are tied together. The resulting motion will be fully determined (by assumptions based upon physics and mathematics as we know them) and yet unpredictable.

When we consider living creatures, the two independent systems which interact are the living creature (sometimes assumed falsely to be defined fully by its genes) and its environment. That living creature can be a

human being trying to feed his children in a world suddenly short of work or a virus seeking to survive and prosper in its way. To reduce living creatures and their contexts to a simple creature/environment interaction is clearly a great oversimplification of the sort which is necessary for making basic points. After all, I'm currently interacting with my own body and its damaged tendons as I type. In the past few minutes, I conversed with my sister and used her coffee-maker and microwave oven. I inspected her yard with its grass in some parts that is already dormant and the grass in other parts that needs at least one mowing before it enters winter sleep, and I made tentative plans to mow and clean up in a couple of days. I'll be interacting with various human social and economic systems over the course of the day and also with the system I could call New England weather—unpredictable largely because this region sits at the point of interaction of so many continental and oceanic systems.

I'm trying to figure out how to do some important reading and some equally important writing while meeting a commitment for several looming projects at my parish. My schedule for the next month is getting worse at least partly because there is a shortage of workers on these projects and those who are willing have uncertainties in their schedules. In addition, New England's weather can force me to mow the lawn and rake leaves at a time not convenient for me. There are also some logistical and supply problems on the parish projects and some odd jobs I'll be doing for friends. Each of these interacting 'systems' is pretty simple but we all know how complex a situation gets when such 'simple' systems interact. One change to a seemingly settled part of my schedule and I'll be rethinking my priorities and maybe scrambling to meet my most important commitments. Our everyday, boring schedule problems are often caused by interactions of independent systems. The concept is pretty easy but the details can be very complex at the level of organizing supply lines for an army or forecasting the path of a storm moving towards colliding fronts.

The interesting and important problems of evolutionary biology, including many that affect us directly, come mostly from the results of interacting systems. Our character traits and our body structures are sometimes the result of compromises or bad results forced by the interaction of our ancestors with their environments, including other human beings. For example, many of us have sinuses that don't drain properly or sciatic hips because of the 're-use' of the body parts of crouching apes to shape the erect human body.

When we deal with human personality traits, we're better off taking the Bible as a source of 'wisdom' and evolutionary biology, history, and other empirical disciplines as a source of 'explanations'. The Bible can provide purposes and guide our direction while empirical knowledge can help us to develop strategies for dealing with, say, that small percentage of impulsively violent young men who are little problem in a well-disciplined society but are a great problem when they grow up without strong male guidance. One example of such a young man is Genghis Khan whose father and grandfather were strong leaders seeking to form a peaceful confederation of the Mongol tribes. A paranoid Chinese government instigated tribal war that resulted in the deaths of nearly all the leaders of the Mongol tribes including the mature men in the family of Genghis Khan.

So, let's consider the complacency that can be called a form of laziness that kills our children and enslaves our grandchildren. Attaining security and comfort require a lot of energy—high-energy expenditures in bursts and the slow drain of energy which comes from constant vigilance. In many ways, we don't exist either inside our own bodies or outside of them in our environments but rather on the boundaries of these systems. It's tiring to be always pushed this way by our desire to soar over the trees and then pulled back by gravity – that Superman cape around our shoulders isn't so much a help as we would like.

Even when we mature, if we mature, our moral desires—to serve God and country and to care for our families—can be frustrated by economic factors or by stupidity or criminality of the leaders of our country. We discover we're on different paths from those of our loved ones and we fight through brush to meet only to bang heads. Our dreams often exceed our capacities or our financial resources. And we try to relax from this constant effort as much as possible. Our social and physical environments often seem no more than struggles between order and disorder. Sometimes disorder dominates and sometimes order. We're finding now that disorder may be upon us some day soon in public health issues—our technological tricks are being matched by fungi that eat our crops and by retroviruses that chew up our immune systems. We seem to be running full speed to stay ahead of the approaching famine or plague and we only need to slow down for a second or to stumble and disorder will catch us and overwhelm us.

Because of the bursts of high levels of energy expenditure and the constant drain due to the need for vigilance, we have strong tendencies to relax when possible. In recent decades, we Americans took our chances

for soft jobs with corporate or governmental benefits. Many of us left our neighborhoods and worship communities, entering the public marketplaces for most of our needs and pleasures and jobs. We allowed the banks and stock-brokers to turn our family assets and local businesses into fungible assets which were soon enough sold to corporations. We encouraged our government to enslave us by various sorts of benefits, leaving us vulnerable to impoverishment of various sorts when that government and those outside interests no longer share goals with us—our government is increasingly interested in overseas adventures and our corporations find cheaper labor in Asia and also find they can profit from morally corrupt goods and services. In my area, western Massachusetts, and probably in most of the United States, banks are now opening as fast as manufacturing operations were moving overseas in the 1980s and 1990s and as fast as family farms were disappearing before that. And we reacted by turning on the TV after getting home from our jobs at the local branch of a nationwide retailer or the marketing office of a computer manufacturer that has all its factories in Taiwan. We also take in stride this strange proliferation of banks in a troubled economy.

We took it easy, we still take it easy, because the world seems so peaceful and orderly to us living in the United States, so ready to offer us comfort and security. What we were really doing was emptying out the bank accounts created by the hard, smart work of our ancestors and now we're taking reverse mortgages on all that we own. The next generations will pay the bills, either by living in relative poverty as other countries stop selling us hard goods on credit or by giving up their moral integrity if the United States uses its military power to become a full-fledged empire, stealing what its citizens can no longer produce or grow.

Again, St. Paul told us:

When people say, "There is peace and security," then sudden destruction will come upon them as travail comes upon a woman with child and there will be no escape. [141]

The disorder of this world can overwhelm even a morally well-ordered society, and wisdom recognizes this. Wisdom also recognizes that prosperous human societies will often destroy themselves by complacency. Peace and security leads to a softening of moral and intellectual fibers, and woe to the generations that live when disorder dominates, when peace and se-

curity are mere memories. We are told in Psalms 49:12 which is repeated as Psalms 49:20:

Man cannot abide in his pomp,  
he is like the beasts that perish.

In his prosperity, man becomes as stupid as a beast, no longer making the effort to anticipate the future and to prepare for it, no longer even seeing the need to make that effort when his favorite NFL team is coming on the tube or when her favorite store is having a sale down at a nearby mall, no longer making any effort to serve God or the children of God—not even his own children and her own grandchildren.

St. Paul provides the wisdom to put this human tendency in perspective for Christians anticipating our salvation, our rescue from our own frailties and from the struggle between order and disorder which is so much a part of God's story in this mortal existence. Empirical knowledge, including the historical sections of the Bible, gives us some understanding of why we are like this, that is, why such creatures as human beings would have emerged in God's story. The story of Jacob is that of a devious man who survived and prospered and left children who multiplied rapidly over the succeeding generations. This is pretty much the same story told by the more rational and hardheaded of sociobiologists. I sometimes wonder about the blindness and rigidity of those Christians who are conversant with the Biblical view of human beings and then get upset when sociobiologists provide a very similar view in different language and a different intellectual context. We should be able to separate the serious scientific content of Richard Dawkins' work even as we filter out the philosophical and atheological babble.

Both the Bible and empirical knowledge can tell us what we need to do to play our role in this story, forming ourselves and our children into God-centered and morally well-ordered human beings who respond to our natural moral duties and to God's commands rather than responding to our environments in the way of stupid and lazy beasts. The number of hours we Americans work and the number of hours we spend in school are meaningless—we train ourselves and our children to 'learn' and to 'work' at the command of the gods of the marketplace, political and economic, and to the needs of those idols. Hardworking men and women can be the most complacent of all.

We need to find ways to remain constantly aware of possible futures. We need to find ways of recognizing those who make good watchmen and those who can lead us wisely according to the reports of those watchmen.

## 222 Through the Body Comes Sin, Through the Body Salvation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=139>. It was finished and uploaded on 2008/03/26.]

In the December, 2007 edition of *Brain in the News* published by *Dana Foundation* (see their website at <http://www.dana.org/>), there is a reprint of an article *I Feel Your Pain*, from <http://Salon.com/>. It seems that specific brain-cells have been found which respond to distress on the part of a nearby creature. True pain is felt.

What is empathy? It's the response of certain brain-cells to certain sorts of stimuli. But...

Is that really empathy? Is that what ties us together during times of distress and trouble? Is that what motivates some to take in orphans and others to go off to serve in regions just hit by natural disasters? Is that what leads me to feel sorry for a man who just lost his beloved wife even when he's the jerk who cheated me out of a promotion? We seem to have a need for some sort of higher explanation, something that would raise our emotions—loves and hates—into a realm more pure than our world of flesh and blood, dirt and rocks.

I had set out to write a nuanced and properly qualified discussion of this issue but changed my mind at Mass on Tuesday as I was bowing my head and praying while the priest consecrated the bread and wine that it might become the Body and Blood of our Lord Jesus Christ. It came to me that any Christian believing that the Son of God is truly present in the earthly form of bread and wine should be able to believe that a human being is truly present in his own flesh and blood.

So, I return to the question:

When those specific cells in the human brain respond to distress on the part of a nearby creature, is that empathy?

Yes.

And I'll go beyond that to speculate that the basic brain mechanisms that produce our sense of 'self' and maybe can develop into a true sense of 'personhood' are very much like those which underly empathy. We become self-aware as certain parts of ourselves (a complex system of various groups of specific brain-cells) establish some sort of empathy with our entire self, not just our flesh and our blood but also our relationships with others, those we love and even the inanimate entities which are parts of God's Creation.

I've argued for the view that our only stuff is flesh and blood, that stuff is the basic substance of our full beings. I've also argued that stuff exists as an object of divine love. Beyond that, that stuff—our flesh and blood—exists to participate in relationships.

There are nuances as well as unexplored deep issues which are important. A full description of our relationships to the external world would be very complex. For now, I'll end by referring the interested reader to Chapter 8, *Staking Your Faith on Gaps in Empirical Knowledge*, and Chapter 569, *Abstract Mathematics and the Real Presence of Jesus Christ*.

## 223 Do We Survive the Major Transformations of Our Lives?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=148>. It was finished and uploaded on 2008/05/03.]

Here is a summary of an article published by *American Scientist*, the full article being available only to subscribers:

Larvae, the immature forms of many animals, are distinct from adult forms by definition. In many life histories—caterpillars and the trochophore larvae of clams and sea snails are examples—larvae and adults bear no resemblance to each other. Biologist Donald I. Williamson has proposed that larvae are juvenile forms acquired through hybridization—the fusing of two genomes, one of which is now expressed early in an animal’s life, the other late. This hypothesis, which goes against traditional thinking that branches on the evolutionary tree cannot fuse to form chimeric species, is one of several possible solutions to open questions about the evolution of larvae. Although an experiment did not yield convincing DNA evidence, the hypothesis is consistent with certain patterns seen in the distribution of genes across species. Along with other evidence of cross-species hybridization, it implies a pattern of evolution that looks more like a network than like Darwin’s tree of life. Until he retired in 1997, Williamson was a Reader in Marine Biology at the University of Liverpool. He is the author of two books on the origins of larvae. His coauthor for this article is Sonya E. Vickers, a teacher and naturalist. [See *The*

*Origins of Larvae* found at <http://www.americanscientist.org/issues/feature/the-origins-of-larvae>.

The different species are not so well-separated as even evolutionary biologists would have thought a few decades ago. Even if this particular hypothesis of chimeric hybridization between species is wrong, there's still clearly something going on here that doesn't fit with our simple ideas of what a species is. Our cell-membranes and skins don't do as good a job as we might hope at keeping us in and them out. It's even plausible that different species can merge to share the same soma or body-mass. This is a conceptual problem at various levels, including our concern for understanding what sorts of entities we human beings are. We can say at least this much: whatever our fate on the other side of our graves, we are fully a part of this universe, this phase of Creation, so long as we remain alive as mortal human beings.

Biologists discovered long ago that our DNA includes such junk-code as genes for making proteins for our apish ancestors. It also includes junk-code inserted by viruses or retroviruses, even the reverse-transcribed DNA or RNA for some of those microorganisms. There's no empirical evidence that we are inherently transcendent to this world of blood and mud, no empirical evidence that we are anything but peculiar members of the animal kingdom. In some sense, we're still part ape or even part reptile or—still more radically – part bacteria.

Yet, it's surprising that someone could even speculate plausibly that two creatures can share a body, one living for part of the total lifetime and melting away inside a cocoon to provide the gunk from which the other creature is shaped. In a sense we already knew this about creatures, such as butterflies, which pass through a larval stage, but now we can speculate in a plausible though unsettled way beyond our verified empirical knowledge. We know that there may be two separate sets of genes involved, that is, sets of genes originally from separate complex species. But are they really two creatures or different phases of one?

After all, our cells and the cells of all known bacteria and plants and animals are powered by mitochondria which were once separate creatures before being absorbed by an ancient, single-celled ancestor of ours. Are mitochondria still separate creatures in some sense, perhaps slaves of our cells? I doubt if anyone would seriously support that idea. Why would we think the larva and the caterpillar to be separate creatures? One reason

might be the belief held by many that a human person is defined by his genes and that person comes into existence as soon as a complete set of viable genes exist in a fertilized egg. Suppose that the larva has one complete set of genes that are shut down as it enters its pupal stage. As that transitional stage progresses, another complete set of genes is activated and another creature comes to life, so to speak. Again, it's far from certain this is the best description of the situation, but it's currently plausible and that alone should raise some questions. If that larva and that butterfly can be coherently described as separate individuals, our own individuality may not be what we think it to be.

This speculation is another nugget of knowledge in conflict with many of the theories about human nature, especially when those theories have been drawn, however unconsciously, from modern liberalism's teaching that we're some sort of autonomous human person from birth to death. My Thomistic beliefs that the human mind forms by responding to its environment and also to its own body imply that we can change in very fundamental ways throughout our lives. A conversion, spiritual or moral or intellectual, may lead you down a path where you have a radically different mind than you would have otherwise had. Are you then a different person?

Suppose our bodies are changed in a significant way? How deep do those purely physical changes go? Are you truly a different human being if a virus invades and changes your genes in some way? How about changes induced by some sort of radical gene therapy or by psychiatric drugs? How many of your organs can be transplanted or mechanical before you becoming a different human being? Or do you always remain the same human being so long as changes are gradual enough?

In *Rewriting the Soul* [67], the philosopher Ian Hacking had speculated that the multiple personality phenomenon is a largely learned strategy of segregating painful memories. Is our sense of a particular individuality tied that strictly to specific memories? But our memories would not seem so separate from a specific physical body, with a specific set of organs and a specific set of genes that are activated or de-activated as needed by that body.

It's established to a high degree of certainty that we don't have conscious control over many of our actions that we experience as being consciously willed. (See Chapter 385, *Is This Evidence Against Free-will?*.) Our bodies move and act apart from our conscious parts to a greater extent than we realize. Our nerves and our muscles, our hearts and lungs, are parts of our

moral selves and not just stage-props. Questions about our bodily nature have moral implications as well as practical implications which probably are far more important than our moral worries with our conscious selves. Our conscious selves probably are most important in their ability to shape our future unconscious selves. That is, we can change our human beings, the 'wiring' of our nerves and the development of our muscles and our cardiovascular systems, and those changes become part of our moral selves.

When we talk about human beings, we're now in a position where we literally don't know what we're talking about. We're at a transitional point where we've learned a lot about human nature at the species level but we haven't absorbed that knowledge into our everyday languages, Christian and non-Christian languages alike. In fact, our words and concepts about our individuality, our ways of making decisions or forming relationships, is in very bad condition. Many of our philosophical and theological words and concepts are from once plausible but now outmoded ways of looking at the empirical reality of human nature, but our views of our individual selves, and our social selves, have been downright deformed by a lagged adoption of the radical individualism of modern liberalism. That is, today's Christian who thinks he's a moral traditionalist has ideas which come from Hobbes and Locke and Jefferson as well as from truly Christian lines of thought.

I'm not the only one who sees these problems though I might have a unique perspective. Others, scientists and poets, philosophers and theologians, musicians and historians, have been working on this problem of re-aligning our thoughts and speech with the reality of human nature and the greater realities of our universe, but thinkers who work specifically from inside the Christian faith don't seem willing to deal with this explosion of modern empirical knowledge. I'm trying to grapple with this new knowledge with an open-minded attitude similar to that of St. Augustine of Hippo or St. Thomas Aquinas. That open-minded attitude towards God's Creation isn't to be found in many recent Christian thinkers. This is a serious problem that implies that even the best of Christian thought has been corrupted for centuries by a Manichean lack of respect for God's Creation. Until Christian thinkers purge themselves of this lack of respect, until they nurture an open-minded attitude towards this universe, Christian thought will be marginalized and mainstream cultures will be lacking in a proper Christian element. In fact, with a distorted view of physical reality, Christians won't be able to see this world created by God because that world is the physical universe seen in light of God's purposes.

## 224 Rats feel peer pressure too

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=142>. It was finished and uploaded on 2008/05/13.]

This news article, *Rats feel peer pressure too*, at <http://www.newscientist.com/channel/life/mg19826554.500-rats-feel-peer-pressure-too.html>, tells us:

It's not just humans who succumb to peer pressure - rats do too. Brown rats have a tendency to disregard personal experiences and copy the behaviour of their peers. What's more, the urge to conform appears to be so strong that they will choose to eat food they know to be unpalatable when interacting with other rats that have done the same.

The article ends with this interesting question:

The big question now, he says, is why they conform. "It's not immediately obvious why a rat or chimp or human would cast aside what it knows from its own experience and adopt an inferior course of action just because everybody else is doing it."

At the risk of straying into a sort of story labeled as 'just-so' by the very important mental sanitary engineers of evolutionary biology (such as George Williams), I'll speculate. Social bonds provide a huge advantage under the conditions which have prevailed during the recent evolutionary eons. Social mammals often have intricate habits to help the entire community to find and share food, to set up watches for that leopard slinking through the shadows, to help raise the young in the communities, and so forth.

Acting in concert would have generally provided advantages far outweighing the risk of the community following a member who was a little nutty or just mistaken so that he had picked up a dangerous habit.

A strong-willed madman or idiot would provide a great danger for the human race so long as he was attractive enough, in some sense (but Hitler?), that he is able to gain some initial attention while going about his lunatic ways. He might even provide a way of behavior in which seeming normality would cover up moral insanity, allowing the vast majority of members of his society to carry out evil projects while going about their ordinary affairs, taking care of their children and paying taxes and other bills and so on. This is exactly what happened in Nazi Germany, colonizing European powers, and even the Soviet Union according to the historical researches and analyzes of Hannah Arendt. (I say even the Soviet Union because the usual view is that the Communist Party wiped-out the developing middle-class rather than co-opting it into the Soviet state as bureaucrats and engineers and so forth.) Robert McNamara has made a similar claim about the Washington functionaries who managed the Vietnam War.

With great power comes great responsibility.

A modern technological society has great power to feed great masses of human beings or to blast them to kingdom come. A mass society, and modern technological societies are such, can provide for a constant onslaught of peer pressure. Raise children in front of the television. Raise them on brand names and tales of celebrities. Send them to schools organized in age-group cohorts just to make sure they don't get the mistaken idea that their job is to learn—no, it's to socialize and to learn how to like what everyone else likes. Thus it is that bureaucratic institutions and corporate products are always with us, allowing each worker to keep his nose to the grindstone and ignore the results of his efforts, allowing each consumer to simply transact as often as possible in his favorite marketplace. Hitlers have only a few years to do their work but the nice middle-class bureaucrats will always be with us.

Let me be personal for a minute. When I was young, I liked some television, but very little. A John Wayne movie on Saturday night was great. The *Flintstones* were okay on Friday and I tried to watch *Bullwinkle and Rocky* on Sunday mornings and *Bugs Bunny* cartoons whenever they were on. The last two cartoon shows demanded much higher levels of cultural knowledge and reasoning from their viewers than any current adult shows. At any rate, I was far from allergic to television but I didn't see the point of

watching *Leave it to Beaver* when there were so many good books to read and so many jigsaw puzzles to solve or even re-solve. Then I learned in fifth grade and sixth grade that I wasn't going to be part of the American conversation if I didn't watch *The Monkees* and then *Laugh-in* and then *ad nauseum*. Soon enough, I began to offer myself up, allowing myself to become more digestable to the gods of the marketplaces.

At the same time, I was being trained in school to sit in class as the teacher went over and over material I'd already known before the first time. I'd been taught to read at the age of 3 by my Aunt Minnie who'd grown up in Montrose, Scotland. I didn't slow down in my learning until informal peer pressure pushed me towards time-wasting trash like *The Monkees* and also trained me to be lazy. I've always had a problem with peer pressure—I failed to resist heavy drinking in college and in the corporate nomadic world. Apparently, I was born with a weak moral spine. But I sure didn't get any help in exercising my moral integrity from the schools or my church or even my family. To be sure, I had my hardworking parents and some other beloved adults as good examples but I learned some lessons from those examples and many from the public schools and many from the anti-intellectual trends in American entertainment. In fact, not seeing my parents actually working at the machine-shop and the hospital, I had little idea for years that they were working any harder than I was, snoozing in my classrooms.

Through lack of an inborn toughness and lack of proper formation, I had become just another head of cattle following the ass in front of me, so to speak. I wasn't happy about the situation and wasn't enjoying myself but I'd try a little harder every so often because those around me seemed to enjoy movies as they declined in quality and creativity, television as it remained television, sports as it became central to the American consciousness, constant movement through stores and malls. I tried. I honestly tried, wasting my opportunity to develop my mind and become a theoretical physicist as I'd wanted to become since I could recognize Einstein's face in pictures. I honestly tried, giving up my own pleasures and my own preferred ways of spending my time, even giving up my dead-time. That last was dangerous and had to be unlearned. Somewhere, Jacques Barzun points out that the achievers among creative thinkers are those who know how to loaf. In modern society, we're only to give the illusion of loafing as we sit in front of the television or stereo, or perhaps in Yankee Stadium, letting someone fill our eyes and our heads with profitable trash.

Because of human intelligence, human societies can be terribly dangerous organisms, to the point of evil. Because of higher possibilities of human intelligence, many of the worst dangers can be averted or at least moderated. Those higher possibilities allow us to do what rats or chimpanzees can't do: to evaluate the dangers to our own moral integrity or that of our children and to properly educate and train ourselves and our children to deal with the dangers.

The first step in overcoming inappropriate peer pressure which can deform our moral natures is actually something simple and something very Thomistic, if I may say so. We first need to pay attention rather than always acting reflexively or acting to move with the flow. If we pay attention, we can think about how to change our behaviors and our ways of seeing and thinking. If we pay attention, we can move towards true human personhood, achieving some sort of self-aware moral integrity. How do we do this?

The second step in overcoming inappropriate peer pressure is simply to decide to do what you think is right, one step at a time, and worry about the practical consequences afterward. This is the big issue from a more general level. If you wish to be a moral creature, then you act morally, by effort when training yourself and as a natural matter once you've done that. You do what is right. If you think first of the practical consequences and order your options accordingly, then you're not a moral creature but rather a utilitarian creature. This is not to say it's morally proper to ignore practical considerations, especially the damage our moral actions might have on others. It is to say that we have to first order our possible behaviors by moral criteria and then consider whether, for example, our children might suffer greatly if we accept martyrdom even if the price we pay ends up to be no more than the loss of public respectability or prosperity or both.

Pay attention and put moral concerns first, concentrate on your next step. Make your long-term goals but realize you have to move towards them one step at a time. By the time you reach a goal, you might find it to be different than you had imagined, different from what you'd planned upon. And you might find yourself frighteningly alone. You might find that some of those decent folk who are far better behaved than you have redefined morality in the terms used by those nice, middle-class German bureaucrats of Nazi Germany or their spiritual brothers in Washington, DC during the 60s and 70s. Moral behavior has become that which secures prosperity and protects our property rights. Thus it is that we're upset with street crime

but okay with dropping bombs on civilians in Hiroshima or Munich or in the villages on the borders of Cambodia and Vietnam. Why bother mentioning Baghdad or aspirin factories in Africa?

But this entire process of gaining the proper sort of moral independence is short-circuited too easily by peer pressure and we Christians should be insightful enough to realize that modern societies feed our worst sorts of social instincts. I was very lucky in some ways when I was young. Among those ways was my attraction to the idealized biographies of famous men and women which my local library had on the shelves on the children's floor. To be sure, a schmaltzy story of Thomas Jefferson bringing ham and bread to a slave who'd run away from the family plantation wasn't the last word on his complex and confused relationship to slaves and slavery but it's still the best introduction to an important man. A skeptic might point out that it's a narrow view compared to what we'd read in a more complete life of Jefferson, but what's wrong with that? Those stories glorifying some sort of moral integrity sat in the back of my mind all those years I was trying so hard to be a mainstream American.

## 225 Sin and Survival

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=143>. It was finished and uploaded on 2008/05/17.]

In reading a short article on the web about bears rubbing against trees (it's marking by both males and females and not scratching a different itch), I saw a comment about females marking partly to protect their young: a male bear will sometimes kill a female's young to bring a mother back into heat and mate with her.

Behavior of that sort is truly 'sometimes' even for bears which are typically one of the less social of social mammals—especially the males and most especially the big males who need lots of food and wander over large territories. Still, I've read articles by wildlife biologists who have observed males socializing with cubs while the mother looks on without objecting.

Yet, brutal behavior remains a factor, behavior that I would call immoral even for non-human social mammals. This leads towards a very difficult problem, one not handled well by any view of evolution that I'm aware of:

Some of our less desirable instincts and tendencies were necessary for the survival of our ancestors.

This is a real problem for mainstream Christian interpretations of the story of Adam and Eve and, in general, for mainstream Christian understandings of human nature. Put a bit simplistically:

If our ancestors had been sinless, they wouldn't have survived.

Most modern Christians claim to accept some version of evolutionary theory and accept we share common ancestor with the chimpanzee, a creature capable of as much nastiness as a man. Presumably, that ancestor was

as nasty as his two major descendants. At what point in the evolution of humanity would we expect a 'sinless' Adam and Eve to have arisen? From nasty animal to sinless ancestors of all men to fallen man? Not plausible.

A real problem for those who think our ancestors were some sort of sinless Platonic archetypes who fell into a state of sin by their own (culpable) fault. In fact, the evidence is growing that we were born into a world, a phase of Creation, which is a battleground between order and disorder.

Is this evidence in conflict with the story of Adam and Eve, with the Bible as a whole? As most Christians understand that story and that book, yes. However, my reading of the story of Adam and Eve would lead me to believe it wasn't a fall into a state of sin but rather an awakening of man into an awareness of his state. Try reading those chapters in the book of Genesis and the following chapters giving the 'genealogy' of human technology—the founding of cities and crafts and so forth. Keep your mind open and see if you really find anything supporting those many sermons and homilies and books of theology about the fall of Adam and Eve.

# 226 If Only They were Athletes, Part 1

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=144>. It was finished and uploaded on 2008/05/19.]

See *Images of maths 'geeks' stop people from studying mathematics or using it in later life...* at <http://www.sciencedaily.com/releases/2008/05/080512094435.htm> for more depressing evidence of modern priorities. As human societies grow ever more dependent upon advanced technology, we Americans continue to positively discourage the development of mathematical talent. This particular article deals with a general cultural prejudice against 'geeks', that is, smart boys (mostly) who can do the sorts of mathematics which is necessary for creative work in engineering, scientific research, as well as in mathematics as defined by college organizational charts.

We tease mathematically gifted students with the possibilities of learning when they're young and then place them in classrooms with teaching methods oriented towards those who don't want to learn or those who have to struggle to learn mathematics. Sometimes it's a simple matter of level of maturity in abstract thinking, a problem which would be solved by the logical solution of going to an achievement level system of education instead of an age-cohort system which allows brainwashing by peer-pressure processes and also is good for the sports programs.

This lack of concern about the nurturing of creative talent in general isn't a new problem in these United States of America. I was diverted from my goal of studying theoretical physics when I found I couldn't compete in my first two years of college because I had been trained to be lazy in high school. My high school course-work had been ridiculously easy. But I also

didn't pursue enriched studies on my own in high school as many successful mathematicians and scientists had done in similar situations. This was partly because I grew up in a sports-centered neighborhood in a sports-crazy town and partly because I'd taught myself how to watch TV and read undemanding books so I could participate in conversations with my friends and schoolmates and so I wouldn't seem too strange.

The simple fact is: Americans like good athletes and don't like smart young men and women. They don't strongly dislike those smarty-pants much so long as they stick to the rules of conversation—talk about sports and television shows. Let someone interested in a subject, be it local animals or American history start talking about species of bears or the courage of John Adams in (reluctantly) agreeing to defend the British soldiers who did the shooting in the so-called Boston Massacre and the yawns begin even as the eyes glaze over. As for any interest in mathematics? Something to wonder at but mostly just an eccentricity that's okay, but: "Lord, please, none of my children."

A town or city would be in uproar against a public school system that didn't take good care of talented athletes but few there are who think that maybe other sorts of gifts should also be nurtured. Little it matters if those gifts are directed towards the core subjects of education because the schools exist for social reasons and to indoctrinate children into the mainstream of American society.

## 227 If Only They were Athletes, Part 2

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=145>. It was finished and uploaded on 2008/05/27.]

Recently, I read a volume which collected various works on the philosophy of mathematics—*New Directions in the Philosophy of Mathematics* [138]. This volume includes an article from the 1950 Proceedings of the International Congress of Mathematicians, pp. 258 -271, in which the mathematician Raymond Wilder talks about:

... drill type of teaching [Which he labels ‘symbolic reflex’ teaching] which may enable stupid John to get a required credit in mathematics but bores the creative minded William to the extent that he comes to loathe the subject! What is the difference between teaching a human animal to take the square root of 2 and teaching a pigeon to punch certain combinations of colored buttons? Undoubtedly the symbolic reflex type of teaching is justified when the pupil is very young—closer to the so-called ‘animal’ state of his development, as we say. But as he approaches maturity, more emphasis should be placed on his symbolic initiative.

Let me put this in a different but largely equivalent way. The modern mind is one which likes to settle in well-worn ruts. A human being with such a mind can see nothing outside of his ruts and he’ll consider education to be a matter of training other minds to travel those same ruts. This is a good way to deform and cripple the minds of those who can think more freely.

We need to nurture curiosity and a healthy imagination in those who show a willingness to move outside of set ruts. There might be a few who carve new ruts—the Einsteins or Beethovens. There will be many more who will climb out of their ruts and find a variety of pre-existing ruts to explore. They might end up as the serious thinkers who explore the details of the theories of an Einstein or the composers who explore the possibilities raised in the works of Beethoven.

Why don't schools nurture curiosity and a healthy imagination? Why do they suppress giftedness or even lesser talents? The proximate cause seems clear to me. Those who run the vast majority of public elementary and high schools aren't particularly interested in any academic subjects. Most of my teachers (I graduated from high school in 1973) would have greatly preferred a quiet evening of television to a quiet evening with a good book. Teachers kept up with the pennant-race but didn't pay much attention to developments in modern physics or mathematics, didn't even know what was revealed in the glossy pages of *National Geographic Magazine*.

The obvious exceptions were notable for being so obvious. And I should acknowledge that the older teachers were more likely to be interested in their subjects and seemingly competent.

In their favor, many of those teachers I observed were interested in the students as human beings. A good percentage of those many could work effectively with students in the middle, raising them to some modest level of literacy and perhaps general knowledge. Some could work wonders with at least the occasional troubled or disabled student. From what I could see, the teachers in the music department were truly interested in nurturing talented students and also helping the other students to develop some level of competence. Of course, many teachers and not just the coaches were concerned that athletes got the proper opportunities to develop their talents. I also have strong memories of the football coach, Chick Patullo, getting very upset that athletes no longer sang in the chorus or participated in the drama club. He was a good man and, though a little obsessed with football, interested in helping young men and women to become good men and good women, having some foundation of liberal learning and a bit of moral integrity.

Moreover, we have to consider the age of the student and the material he needs to learn as Professor Wilder noted in the quote at the beginning of this entry. At the elementary level, which should probably end at age 8 or so for talented students, it's probably appropriate for teachers to be

student-centered in order to nurture very general abilities.

What about teachers who were interested in their subjects? There were few at my high school. And it's such teachers that are needed to guide the students with some academic talent and an inborn curiosity. Such a student can be encouraged to develop a good work ethic—math is hard, but hard work can be fun in academic fields and not just on the playing field.

But the talented, those who can be our future physicists or the inventors of new computer technology, those who can make sense of our recent history and those who can plumb the depths of the modern soul in poetic forms, also need freedom of a sort not to be found in the modern American classroom. Such talented students, often bad students by many standard measures, need to be given some basic instruction and then encouraged to seek their own way, finding what interests them and learning to ask for guidance. This is a situation which would strike fear deeply into the heart of a bureaucratic school administrator trained to process young human beings as they were raw material and the schools were factories.

In math and physics classes, a talented student would be better off with only an occasional conventional classroom session to set the stage or provide general guidance. Then he should be given a list of problems culminating in some difficult ones. Let him find a comfortable place to sit with a small pile of books on the subject, a pad or two, several pencils, and a wastebasket. Provide him with a tutor and hold problem-solving sessions with several students where the leader could even be the most advanced student or one from a higher level. In history or literature, a talented student would be better off let loose in the library with some easy questions to answer, then with some harder questions, then with some for which there's no certain answer. All of this is preceded and interspersed with large amounts of reading of real books and not text-books.

Why do we have a school system in which talented and enthusiastic students are taught to hate even the fields in which they have talent? Because we have a school system populated by teachers and administrators who do not themselves like to work hard at the core subjects of a high school education, history and writing and mathematics and the sciences. They don't seem to even truly understand that there are some amongst the young under their care who actually can like math or history or disciplined creative writing (based on lots of reading) or lab sciences.

If only those students were athletes, we'd have noticed long ago and done our best to nurture their talents.

## 228 Cleanliness is Next to Cannibalism

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=147>. It was finished and uploaded on 2008/06/01.]

Why in the world would *lab rats turn cannibal in cleaner cages*? The article at <http://www.newscientist.com/channel/life/mg19826576.200-lab-rats-turn-cannibal-in-cleaner-cages.html> tells us that rats are heavily dependent upon sense of smell to recognize other rats and even their own young as such. Keep their cages clean and they start to eat their own young.

As the evidence piles up relentlessly that we are wrong to think of ourselves as inherently separated from the animal kingdom, we should wonder if some of our problems with sexual and other social/psychological disorders might be due to our modern crusades to wipe out natural smells or to cover them up with perfumes.

This is not to say that the sense of smell is as important to human beings as it is to rats. Visual systems are dominant in most ways in human perception. But, apparently Proust (*Remembrance of Things Past*) was right that the sense of smell is very important in bringing back memories and painting them with emotional colors. Likely it is that the sense of smell plays other important roles, almost certainly helping to bond baby to mother and maybe helping to form stronger bonds between man and woman. It might be that we're disrupting a variety of human interactions by suppressing natural smells and covering them up with the smells of detergents or perfumes. Has any historian or anthropologist or sociologist ever done a study on the correlation and possible causal relationship of moral disorder and the use of perfumes?

## 229 Reality is Still Knocking: Human Uniqueness

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=158>. It was finished and uploaded on 2008/06/03.]

This article, *Six 'uniquely' human traits now found in animals* found at <http://www.newscientist.com/article/dn13860-six-uniquely-human-traits-now-found-in-animals.html>, will be worrisome to those who think to secure the moral worth of the human being by appealing to some claim to uniqueness of the human race amongst biological species. Some of us aren't bothered much at all by such articles because we see human beings as raised above the animal kingdom only by adoption by Jesus Christ as His brothers and sisters.

In fact, there's been substantial evidence for a while that human natural morality is not so much different from that of other social mammals. That famous anthropologist from Mars wouldn't be able to so easily distinguish between the moral nature of a human being and that of a wolf, though wolves are more reluctant than human beings to kill other members of their own species.

Yet, as the old saying goes:

Only man brews beer.

More importantly:

Only man explores differential geometries or writes metaphysical poetry.

Human beings share the ability to think abstractly with at least chimpanzees. Unlike chimpanzees, human beings are aggressive in using their

abstract thinking talents. Those human talents for abstract thought are also much greater than the talents found in chimpanzees. Human beings are capable of being companions of God just because of the capabilities of the human mind. Firstly, we can become aware of at least the possibility of a personal God. It's hard to have a relationship if you're not aware of at least the possible existence of the other entity. Secondly, we can become aware that we inhabit some 'place' that might be called a cosmos or a universe. Once we see the possibility of a cosmos or universe, we can realize that such an entity would have to be rational and well-ordered by some standard that we may or may not wish to discover. We are creatures who, with minds properly developed, can hear God's offer of friendship and can respond to such an offer.

If the Son of God were to become a creature in an act of submission and obedience to the Father, the Son would've had to become a creature capable of that higher level understanding so that He could understand, you might even say remember, that most important of all creaturely knowledge: our humble relationship to the Father and our duty to render Him all that we have and all that we are—see <http://loydfueston.com/downloads/justice.pdf> to download my article *Justice: The First Step Toward God*. The human nature of Jesus Christ was in deep communion with the Father and with all that He had created with Father and Holy Spirit. This means that such a state is—in principle—possible for an ordinary human being just because Jesus Christ was a man like us and also the Son of God. He was true man and true God. This means that with the proper relationship to Creation and to the Creator, we can be just like Him. Human uniqueness lies in that possibility of imitating our Brother, the Lord Jesus Christ, in our adoption as His brethren.

## 230 We are Also Outside of Us

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=151>. It was finished and uploaded on 2008/06/10.]

Changing the colors of a bird in the most superficial and artificial way can change its hormone levels and make it a more aggressive breeder. (See *Feather Colors Affect Bird Physiology, Barn Swallows Show* at <http://www.sciencedaily.com/releases/2008/06/080602121302.htm>.)

When John Henry Newman entered the Catholic Church, he gave up his comfortable living as an Anglican priest and accepted poverty. He moved to Birmingham to, among other accomplishments, found a school for poor children. One of his first acts was to spend most of his small stock of funds to buy new dresses for the girls who would be attending the school. Undoubtedly, he anticipated good results in self-esteem when those girls received, in most cases, the first pretty, new dress of their lives. How deep do such changes go? We don't yet know but we should be very careful to work for the best and to fear the worst when we raise children or even when we set our own ways of living and thinking.

When I was young, most Americans still had the traditional middle-class habit of ensuring that each child had decent clothes for school (maybe a couple pairs of khakis and a couple sports-shirts for boys) and also a set of Sunday 'church-going' clothes (if only a modest blue blazer and pair of gray slacks from Sears for a boy).

Let me zag a little now that I've zigged. When I was reading about grizzly bears years ago, in preparation for an important scene in a novel, I learned that wildlife biologists had verified that Rocky Mountain grizzlies, especially the males, had been so big in the 19th century as to seem a different species from their 20th century descendants. Their speculation was: mother grizzlies could manipulate the genes of the young in their

womb (not consciously of course), sending the message, “Grow big, son, we’re the dominant species” or maybe, “Be more modest in your growth, son, because there’s a dangerous species taking our territory and food.”

I’m simplifying in a somewhat grotesque manner to make a point, which is: we, that is—our bodies, can’t be something which isn’t a possibility in our genes, but our genes give ranges of possibilities rather than locking us into one set pattern of development. Our genes aren’t just a set response to our ancestors’ environment but rather a set of responses to some finite but perhaps wide-ranging set of possible environments.

## 231 A Moral Animal Rather than a Selfish Animal?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=152>. It was finished and uploaded on 2008/06/23.]

I find this article, *Virginity Pledges May Help Postpone Intercourse Among Youth* at <http://www.sciencedaily.com/releases/2008/06/080610105945.htm> to be somewhat interesting given the evidence that human beings don't always change their current or their future behavior in response to horror stories of lung cancer told to smokers or lingering death by AIDS told to nearly all American children, even when relatively few were at high risk of 'risky' behavior. Apparently, some youth will be more likely to avoid premarital sex if they simply give their word to do so.

A creature that values its word more than the avoidance of future suffering may be different from the creature assumed in much of our teaching institutions, inside churches as well as inside the secular schools. Such a creature might even carry the possibilities of nobility, of willingness to sacrifice for future generations rather than maximizing their consumption of present pleasures. If only we were wise enough to nurture these better possibilities in our own selves and in our children.

## 232 A Truer and More Honest Natural Law

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=166>. It was finished and uploaded on 2008/06/25.]

There's a short but interesting summary of a survey about the effects of knowledge on the opinions that men and women hold about the moral legitimacy of some controversial medical/scientific procedures such as the use of various sorts of stem-cells. See *Scientific Information Largely Ignored When Forming Opinions About Stem Cell Research* found at <http://www.sciencedaily.com/releases/2008/06/080606112831.htm>.

In a nutshell, those who hold prior moral beliefs about such matters, usually because of more basic religious beliefs, don't change their opinions about, say, embryonic stem-cell usage if new research results indicate embryonic stem-cells can be used to cure some terrible disease. It's hardly surprising, at least to me, that those who think the *Ten Commandments* and the *Sermon on the Mount* are binding will not change their opinions on allowable human actions because of individual fragments of empirical knowledge, even when those fragments speak of cures for cancers or neuro-muscular diseases. After all, we don't look at the evidence of success for the relatively homogeneous population of Japan and decide that maybe ethnic cleansing of alien populations can be a good thing. If something is morally wrong, alleged practical benefits have no effect on its moral status. But some don't put such activities as harvesting of cells from aborted fetuses or from eggs fertilized in the laboratory in the same category of moral wrongdoing as genocide. And I don't really wish to start out assuming that those modern medical techniques are in that same category. I just wished to make the point that a belief that something is absolutely wrong isn't going to be

subject to any change from most sorts of empirical evidence. And I say that as a radical empiricist of a Thomistic existentialist sort.

I'd also like to make the point that even natural moral reasoning not allied to some sort of absolute beliefs should still have a core of beliefs which don't change readily. This is true even when we speak of reasoning in the empirical sciences. In physics, for example, as evidence piled up against some of the problems of so-called Newtonian physics, physicists kept patching up an increasingly baroque structure of thought rather than throwing aside increasingly implausible basic beliefs in response to the mounting piles of inconvenient empirical facts. A discussion as to whether they should have changed before Einstein forced the issue is beyond the scope of this posting, and probably beyond my knowledge of the situation, but the point is that you don't dynamite the foundation when you realize the plumbing to the bathroom is bad. When you realize all the plumbing is bad and the electrical system is in bad shape and then you discover cracks in the foundation, you start buying the dynamite and also begin to think through a better design for a new structure.

In many of my writings, I've criticized my fellow Christians for not seeing that many of their moral beliefs and all of their ways of expressing moral beliefs should reflect the nature of a human animal and also the nature of our universe which is the only phase of Creation which we can experience and the only phase we can explore in our mortal lives. Most human beings throughout history have reasoned according to their understanding of their own nature and also their understanding of their own environments and any other environments of which they're aware. Human beings in all ages start out with a great deal of knowledge about appropriate behavior as understood in our families and neighborhoods and places of worship. In the modern world, even casual viewers of television documentaries often have acquired lots of more or less organized facts about bones dug out of the sands of Africa and the customs of tribes in Australia and oil-rich princes in the Near East. It doesn't matter if a modern human being tries to consciously form his moral beliefs or if they come to him during his dreams after watching a television documentary about the evolution of the human race or about the development of human civilization. Unless that man is a new Socrates, he won't be capable of the sustained attention to reality and the sustained lines of thought that can lead to the development of a set of rational moral beliefs. But someone needs to do this and to provide a way for others to understand this world, as a world—that is, in terms of unity,

completeness, and coherence. Such a rational system of beliefs would be stable enough that it would take a lot of new empirical knowledge and a large speculative effort to bring about significant changes.

The idea of forming a moral system which accounts for the actual nature of evolved human beings and their world is hardly new nor is it alien to Christian thought. In the 13th century, St. Thomas Aquinas taught us that we're 'mostly' physical creatures. He felt forced to conjecture a strange and non-human 'soul' that would survive the death of the human body but it was no more than an entity which does abstract thinking. Teaching we have souls separable from our bodies was his biggest mistake in matters of human moral nature, but his views on human moral nature were otherwise so solid by the high standards of modern empirical knowledge that one of the most highly regarded brain scientists of our era has endorsed those Thomistic teachings. See Chapter 73, *What is Mind: Part 1. The Imagination that Can be All* and succeeding parts in that series for my review of Walter J. Freedman's *How Brains Make Up Their Minds* [35]. Professor Freeman gives a remarkably clear and concise description of Thomistic teaching on the 'intentionality' of human moral nature. (A warning, 'intentionality' in the Thomistic sense has nothing to do with motivation or setting goals and all to do with your movement along a certain path. If you drink excessively and get behind the wheel of a car, you're acting as if to kill another human being. In terms of Thomistic moral teachings, you intend to kill though your head might be filled with the best of wishes for all your fellowmen.)

Human reason and knowledge of human nature, along also with knowledge of other creatures, tells us that human beings are a rather unique species of ape, but such true natural-law reasoning doesn't justify the belief in the absolute value of even obviously human creatures let alone masses of cells in a petri dish or young embryonic growths in the womb. Reasoning from the facts of nature also tells us that it's appropriate, pretty much by definition, for the members of a social species to place high value on the lives of others in their species, but not absolute value. In fact, wolves seem to be far more reluctant than human beings to kill members of their own species but few would see any possibilities of absolute truths coming from a deeper understanding of the moral nature of wolves.

It was the adoption of human beings as the brethren of Christ which gave human life some sort of absolute value. See Chapter 217, *Why are Human Beings of Greater Worth than Chimpanzees or Rattlesnakes* for a discussion of this view of matters. I'll speculate that this is the insight underlying the

denial of the concept of natural moral law by John Howard Yoder and some other theologians. They're right to this extent: it's impossible to derive the fullness of Christian moral beliefs from the natural world because that fullness is based upon a freely made decision of God to incarnate His Son and the freely made decision of the Son to adopt all men as His brothers. Yet, the impossibility of deriving a free-will decision of God from nature doesn't invalidate natural law which comes from human thinking and human common-sense reasoning.

In terms of any natural-law reasoning having much to do with nature as we know it, there's no rational reason to believe human life to have absolute value in any meaningful sense. Christians have to realize they have no right to expect others to recognize truths which depend upon the revelation Who is Jesus Christ. Christians should also work a little harder to clarify their own beliefs and to recognize that they do have two sources for their system of moral beliefs: nature and Holy Scripture. We should respect those who haven't accepted the Good News and the light yokes of Christ. If we wish others to accept the fullness of Christian morality, we should evangelize, should spread the Good News of Christ.

It's also well within our duties as Christians to respectfully critique the moral positions which others might hold in good faith. We can and should also point out to our contemporaries that many of the 'rights' of ordinary human beings in recent centuries, much of the dignity we of the non-elite can claim, can't really be justified without the belief that the Son of God became our brother, adopting us into His divinity. Even this development of a respect for human beings has to be seen and understood in light of specific historical developments in particular societies which were at least Christ-soaked if not quite Christ-centered.

## 233 Excluding the Hyperactive Amongst Us

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=153>. It was finished and uploaded on 2008/06/26.]

See *Did hyperactivity evolve as a survival aid for nomads?* at <http://www.newscientist.com/channel/being-human/dn14100-did-hyperactivity-evolve-as-a-survival-aid-for-nomads.html> for another example of a human attribute that can be good or bad depending upon the context. I'll provide a few quotes from the article:

The nomads' active and unpredictable life centred on herding might benefit from spontaneity, says Ben Campbell, an evolutionary anthropologist at the University of Wisconsin at Milwaukee, US, who was involved in the new study.

"If you are a nomad then you ought to be little more impulsive than if you are settled," he says. "You should be a little quicker on the trigger."

...

Why the mutation isn't more common is a mystery, says Eisenberg. Another study found the impulsive variation in about 60% of native South Americans, but only 16% of Caucasian Americans. "It might be that there is a niche for a few people with more impulsive behaviour, but when there are too many of them those niches are filled," he says.

...

The mutation “predisposes you to be more active, more demanding, and not such a pleasant person,” says Henry Harpending, an anthropologist at the University of Utah in Salt Lake City, also in the US. “You probably do better in a context of aggressive competition.” In other words, in lean times, violent men may feast while passive men starve.

A number of years ago, I remember pondering the situation of some hyperactive boys and young men that I knew. I came to a conclusion similar to that of these scientists, but different. These young men were prone to misbehave in schools which expected of them an alien behavior, passive and quiet. Those young men also exhibited impulsive courage that made me realize that, if taught a proper discipline, they would be the ones who would, without hesitation, place themselves in danger to protect women or children or puppies. Not that men without hyperactive traits are incapable of courageous acts, but there’s at least a hesitation in the responses of most men, a period of evaluation and calculation—often, but not always, that period of delay is appropriate. In addition, some of those boys and young men with hyperactive characteristics proved themselves more than willing to accept a certain sort of harsh discipline, that of the Marine Corps or martial arts. Though we manage to turn hyperactive boys and young men into sociopaths of a sort, they might actually serve the needs of communities by being willing to move without thinking.

Modern society, at least in Europe and North America, has been dominated by a middle-class with rather gentle manners, well-behaved in face of any authority and not just an authority which shows itself deserving of respect (such as Marine drill sergeants). We seem to assume that the ideal human being is one of these creatures who so obligingly fills slots in the workplaces of the modern world and then goes to buy what is offered in the well-organized, sanitary marketplaces. We don’t know how to deal with those human beings who can’t or won’t fit into their allowed slots and behave as expected. We don’t know how to use the full range of human attributes and seem to be blind to the advantages of having impulsively courageous men who might have, for example, stepped between his Jewish neighbors and a Gestapo agent. Of course, the Gestapo foot-soldiers were likely drawn from the population of men with impulsive tendencies developed in a sadistic direction, but that just points to the need for ways to

accept those with characteristics outside the mainstream and to teach them the proper discipline to serve society in their own way.

Perhaps we simply need more manly fathers and clergymen and teachers. Perhaps we need tough religious orders and demanding vocation schools.

## 234 The Tie that Binds

# Evolutionary Theory and Biblical Christianity

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=167>. It was finished and uploaded on 2008/06/30.]

John Hawks is an evolutionary thinker who seems to think clearly and to speak honestly. I'd recommend his weblog, <http://johnhawks.net/weblog/>, for anyone wanting an intelligent take on evolutionary biology from the viewpoint of an anthropologist who has done highly regarded work on the genetics aspects of his field.

In a recent entry about a conference of scholars gathered to discuss the question, "What makes us human?"—see the article, *Don't ask the experts if they can't agree on the question*, at <http://johnhawks.net/weblog/2008/06/18#what-it-means-to-be-human-2008>, he had this to say about what ties us together into the human race:

One thing is shared by all humans, and cannot be taken away: our evolutionary history. Each of us bears some—but none has all – of the marks of this history.

It is our history that connects us to our distant relatives, not our genes. Even with a close relative like a twentieth cousin, there is a decent likelihood that you will share no genes at all because of your shared kinship from your most recent common ancestor. By the fiftieth generation, it is a virtual certainty. You are a genetic stranger to your ancestors.

Modern science in general has been forced to speak in terms of stories. Astrophysics discusses the development of galaxies as a reality and not just as part of the unpacking of a pre-fab universe. Darwin himself seems to have realized the importance of movement through time in a geological context (the Patagonian highlands) before ever he arrived at the Galapagos Islands. Within human history, those who produce better-quality thought in my opinion recognize that the various aspects of human civilizations—such as political freedom in the West or absolute respect for human life in Christian cultures – are the result of specific sub-plots in the human story.

The Bible also is a story and many stories. Like the universe, the Bible is more than it contains. (See Chapter 193, *A Universe is More than it Contains.*) Like the Bible, the universe is a story being told by God. When we see the universe as a story being told by God, that is – morally ordered as a narrative, I call it a world. The story that is the world has a chapter yet unfinished which is the evolution of man.

After years of contemplating the mystery, I still can't quite understand why so many Christians refuse to see that evolutionary thinking, a narrative based understanding of human nature is easily reconcilable with our understanding of the Bible.

## 235 What is Stem Cell Research Really About?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=84>. It was finished and uploaded on 2007/07/30.]

In the April, 2007 issue of *Brain in the News* published by Dana Press, there's an article titled *Stem Cell Research Opens New Doors*, written by Carl T. Hall and originally published in *The San Francisco Chronicle*. I would recommend regular visits to Dana's website, <http://www.dana.org>, to anyone interested in modern medical sciences, especially the study of the brain or immune system, and also those interested in the ethics of medicine and medical research.

In his article, Mr. Hall tells us:

One argument for stem cell research is that it might generate fresh replacement cells for those destroyed by such horrific diseases as ALS, the paralyzing nervous system disorder popularly known as Lou Gehrig's disease.

The latest research suggest those predictions might be unrealistic: Replacing cells that die off in a disease still leaves open the question of why the cells died in the first place, which is the critical issue in any autoimmune disease, or degenerative diseases such as Alzheimer's or Parkinson's.

The findings may be the most dramatic example yet of the idea that stem cells are valuable as a "disease model—used to study disease—rather than a simple source of replacement parts."

Stem cell colonies were used in experiments which discovered that nervous system damage in ALS (Lou Gehrig's disease) was not due to problems with the nerve cells; it was a result of poisons coming from diseased cells surrounding those nerve cells.

As a next step, some scientists plan to, roughly speaking, transfer DNA from diseased cells in ALS patients into stem cells and watch as the disease progresses, presumably in the neighborhood of stem cells grown into the type of nerve cells which die to give the terrible symptoms of ALS.

As someone who is opposed to the use of any human being, or possible human being, as the means to the ends of another, I wonder what sorts of stem cells were used in these experiments. I've also read enough of the accessible scientific literature in this field to know that the pro-life leaders live in la-la land. The four or so types of stem cells have different properties and morally obtained stem cells don't have the right properties for all types of medical uses, research or therapeutic. Even when adult stem cells can be altered to be somewhat like embryonic stem cells, a careful observer will note the alterations depend upon technology that will possibly allow the elites of the moder world to create customized human beings, perhaps dumb and physically tough or perhaps capable of sexual feats beyond the desires of most of us.

My first general comment is:

We are a in a state of moral decay where all powerful technologies are potentially evil. Some of the technologies which are potentially of good moral use are at least as dangerous as the technologies which are evil from the get-go.

Our problem isn't one to be solved by the sorts of policy wonks we've all become, even those with honest and noble intentions to protect traditional moral values. We need to recognize that our society has removed many of our moral constraints. As the novelist Flannery O'Connor pointed out a half-century ago: we Americans are not a moral or compassionate people, we are merely squeamish. Our moral limits melt away a little more when we realize we might be able to increase our prosperity or safety or comfort by going just a little further. The nations of the West support medical research, technological exploitation, entertainment, and social experiments of a sort which would have horrified our grandparents. Our general decay, our tendency to create problems and to destroy moral and political traditions

rapidly, would indicate that we shouldn't assume that we're the ones who know better than our grandparents. At 52, I'm old enough to remember the attitudes of those days which were, to be sure, the true parents of our days. If someone had described a society like ours to my grandmother in, say, 1965, she would have gasped and labeled that society as being evil.

As numerous commentators have conjectured, Hitler and Stalin won the battle for the hearts of modern human beings. In fact, the neo-Marxist Horkheimer once claimed that radicals owed a lot to American businessmen who proved they could destroy families better than the toughest and most competent of modern dictators. I would add that the moral giants of our corporate world dissolve traditional moral institutions of all sorts but otherwise Horkheimer was mostly right on target, though he missed the important role played by the American government in all of this. Modern human beings have been bribed to walk away from the institutions which once embodied the moral traditions of the Christian West. The result is a gentler and kinder Reich, a more efficient version of the Bolshevik Empire. Every entity on earth, every bit of flesh, has become a means to the end of increasing the prosperity of society which defines prosperity not in terms of human and humane goals but rather in terms of material wealth, of safety, of comfort. We value long lives and have forgotten about good lives.

We haven't seen the worst of it yet. If it now seems necessary to study ALS by observing multiple types of human cells grown in the laboratory, what will we do when we discover that ALS or some other horrible disease is really a complex disease of multiple parts of the human body? So far as I can predict the future, we'll begin to grow human babies in the laboratory and not just any human babies but babies customized to have particular forms of those horrible diseases so that the progression of those diseases can be studied under controlled conditions. Our public morality is such that we'll have no good arguments against doing this.

## 236 Are All Scientists Evil?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=85>. It was finished and uploaded on 2007/07/31.]

After publishing Chapter 235, *What is Stem Cell Research Really About?*, as an article on one of my weblogs, I got some feedback that indicated that I didn't make my point clearly. One reader claimed I implied that all scientists are evil. While I think my writing was not nearly that bad, I do think it worthwhile to address this issue from that angle, that is, to ask, "Are all scientists evil?" There is some scientific research that is inherently evil but most is morally neutral depending on how it's used. I did eliminate one good example from that prior entry at the last minute: Alfred Nobel invented dynamite to save the lives of miners and was horrified that it was so readily used in warfare. He funded the Nobel prizes to try to encourage moral and peaceful uses of science. Plenty of other scientists have done as much evil as Nobel did by accident, but some—maybe many—have intended to do that evil if that was necessary to gather money or power.

It wasn't businessmen and politicians who invented all the evil technology that rips apart human bodies or destroys our social and physical environments, though some of the scientists and engineers who did invent that technology moved on to become businessmen or politicians. And some of those were in the same position as Alfred Nobel—the evil results of their work weren't intended and might have deeply bothered them to the point where they did some sort of penance.

The problem we have in our age, and I've tried to make this clear in many entries and also in my only published book, *To See a World in a Grain of Sand* [41], is that scientists are no different from the rest of us and the rest of us are morally disordered (or perhaps unordered) creatures living in a society which has liberated its citizens from traditional moral

relationships that they might produce and consume more freely in the public marketplaces.

There is another source of confusion about moral issues which I've tried to clear up in other writings but it takes some honest contemplation and maybe some reading of substantial history books to fully eliminate this confusion:

There is good reason to believe that most of the evil in the modern world was actually carried out by nice, middle-class people because the nuts like Hitler weren't capable of carrying out their own schemes.

The most frightening books I ever read were *Eichmann in Jerusalem* and *The Origins of Totalitarianism* by Hannah Arendt, the Jewish historian and philosopher who took the long way out of Europe when she had to flee her native Austria after the Nazi takeover—she stopped in Paris and helped others to escape, leaving only when the Gestapo was almost upon her. Eichmann, the bureaucrat who supervised the roundup and transpiration of the Jews in Nazi-controlled lands, was captured in South America by Israeli agents in the early 1960s and transported secretly to Israel. Hannah Arendt was sent by one of the major American magazines to cover the trial and was allowed to interview Eichmann after the shocked prosecutors had completed their interrogations. She was soon as badly shocked as they had been: Eichmann was a very, very nice man. It turned out that he had sympathized with the Jews and had helped many to escape, refusing bribes, when it had been possible for them to make it out of Nazi-controlled territory. He had simply been doing his job when he carried out orders and managed the logistics of the Holocaust. Adolf Eichmann was a nice man without any moral integrity.

It was Hannah Arendt who concluded that most of the evil in the modern world was actually, and necessarily, carried out by nice, middle-class human beings who were simply trying to make a good living. She didn't say anything about scientists being a special group who had refused to go along with the commission of evil. In fact, much of the evil in modern times was carried out with the help of advanced technology. The collaboration of scientists and engineers was necessary to the Holocaust though Stalin in Ukraine and Mao throughout China murdered a lot of human beings with more primitive methods.

In *The Wealth of Nations*, Adam Smith stopped deceiving himself and his readers just long enough to wonder if the type of commercial society he was advocating might produce citizens who were genial without having any real moral integrity. His fears were valid. He was foreseeing us, the citizens of the modern West, and perhaps the citizens of China and India and Southeast Asia before long. The scientists are drawn from us. And we are like Adolf Eichmann, not wishing at all to do evil but doing it in pursuit of the goods we've been taught to value:

1. economic prosperity,
2. a good credit record,
3. a clean record with the tax authorities, and
4. children we've successfully raised to be just like us.

Our desire to meet those goals will lead us to all sorts of moral shortcuts. Mostly, we lull ourselves into a state of moral unconsciousness. And, no, I see no reason to believe that scientists are immune from these processes by which we put on blinders and delude ourselves.

Are we free and morally well-formed human beings who take responsibility for our own acts and for the acts of our elected leaders? No, not most of us.

Are scientists such human beings, free and morally well-formed? No, not most of them.

We, including the scientists amongst us, would prefer not to do evil. We'd prefer a world in which we can all become prosperous and there are no victims, but we do place our prosperity, our safety and comfort and long lives high on our list of priorities and rarely are we taught the practical skills of moral living and moral reasoning. There are some of us who do evil, in a fully conscious way, perhaps even enjoying the evil as much as the profits. Most of us just do our jobs and go about our peaceful way, working in a plant while caring—but not excessively so—what it produces. Napalm? Antibiotics? In the end, we just do our jobs, pay our taxes, and protest if anyone claims we aren't morally responsible human beings.

## 237 Corporate Laws: Not in Our Genes and Not in the Bible

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=183>. It was finished and uploaded on 2008/08/06.]

There is no verse in the Bible that says:

Thou shalt extend human political and economic rights to corporate entities with abstract ownership that freedom and prosperity might spread through the land.

Nor do we have any reasons from genetics or evolutionary biology to believe that human beings function well as cogs in large corporate entities, either private or public. The nice middle-class Germans who actually did the work for the Nazis (building railroads and running military manufacturing and logistics and so forth) were not forthrightly evil as were Hitler and Himmler, but they ignored the larger effects of their work and kept busy in pursuing their modest career goals that they might be respectable citizens paying their taxes and adding to their children's college funds. See *Eichmann in Jerusalem: A Report on the Banality of Evil* by Hannah Arendt for an accessible analysis of the situation in light of Eichmann's trial and her efforts to deal with the 'niceness' of the man who was horrified by the Nazi programs but did his job of managing the logistics of the death-camps.

For every exploiter who made his billions by selling American productive assets and jobs overseas, for every exploitive employer pushing the 'liberal' cause of open immigration programs which has been justly labeled as 'quasi-slavery' by some commentators, there were not only armies of naive and well-intentioned activists for the global economy but also armies of well-behaved widgets who handled the details of those programs even to the

point, in many cases, of selling their own jobs overseas or training their own cheaply-paid immigrant replacements.

The marketplaces of the modern world are morally unstructured because those vast places can only be inhabited by mobs of human beings, not human beings organized into local communities that reflect, poorly or badly, the needs of concrete family- and community-centered creatures. A mob of human beings moves as such. Not generally rebellious, these marketplace mobs are docile, moving to build the railway lines to carry their Jewish neighbors towards the east, staffing the planning and operations departments of corporations which provide huge bonuses for executives and illicit dividends for retirement funds by selling American productive assets and jobs overseas. But what are those people to do?

Capitalism can take many forms, including forms which allow families and local communities a large role, but as for corporate capitalism. . .

Can no one see that huge, centralized structures don't meet the moral needs nor the moral capabilities of those very specific creatures – human beings? The economic man assumed by the theoreticians and practitioners of corporate capitalism doesn't exist and never did exist. He bears no resemblance to the concrete man described by evolutionary science, genetics, psychology, and the better-quality novels. Try to justify our current economic system on the basis of any of the writings of Jane Austen or Feodor Dostoevsky or Hermann Melville or Henry James or V. S. Naipaul. It would be the same problem as trying to justify our current economic system on the results of sociobiology or neurobiology, both of which paint an image of man not so different than those of our better novelists as well as the Bible. And this is an image of man not suited for life in the modern marketplaces, not capable of living a morally well-structured life in these marketplaces.

# 238 Stem-cell Research: Some Good News But I'm Still a Skeptic

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=189>. It was finished and uploaded on 2008/08/12.]

First, the good news. From this article, *Stem cells created from ALS patient and used to make neurons* at [http://scienceblogs.com/notrocketscience/2008/08/stem\\_cells\\_created\\_from\\_als\\_patient\\_and\\_used\\_to\\_make\\_neurons.php](http://scienceblogs.com/notrocketscience/2008/08/stem_cells_created_from_als_patient_and_used_to_make_neurons.php), we learn:

It's a good time to be a stem cell researcher. Legal and political wrangling aside, the discoveries are starting to come thick and fast now and new breakthroughs seem constantly around the corner. Last November, I was writing about two groups of scientists who had managed to turn adult human cells into embryonic stem cells for the first time. Now, after less than a year, John Dimos and Kit Rodolfa from the Harvard Stem Cell Institute have given us two more surpassed milestones for the price of one.

As before, they have transformed adult skin cells have been into embryonic stem cells but this time, there are two important differences. Firstly, the cells that came not from a young, healthy individual, but from an 82-year old woman with amyotrophic lateral sclerosis (ALS), the same condition that has paralysed Stephen Hawking. Even after a lifetime of chronic disease, the adult cells could still be reverted to a stem-like state.

I remain skeptical about the uses modern societies will make of this technology. For various reasons which have taken books to explore on even a tentative basis, the modern West no longer has the moral and social structures which forced even scoundrels to discipline at least their public behavior to some reasonably demanding standards. This was part of the reason for the ‘spontaneous’ formation of morally well-ordered marketplaces which so impressed Adam Smith: he was observing societies where scoundrels were forced to behave in their public activities, including commerce, or they would have been ostracized. You could label this as the ‘good’ hypocrisy that pays tribute to morality. But mostly, those Scottish and English marketplaces self-organized into morally well-structured forms because the vast majority of citizens of those countries were Christians at least in their moral beliefs and behavior. In this context, I’ll make no arguments that Christianity is morally superior to other human sets of beliefs, only that such a homogeneous society allowed free human beings to organize their activities from the bottom-up because they shared their basic beliefs and behaviors.

In any case, our modern societies have unleashed their morally challenged members to the greater task of enriching themselves even at the expense of others. For the sake of argument, I’ll assume that the current researchers and administrators and investors in the stem-cell industry are all morally well-formed men and women. If true, it won’t be true for long just because of the vast potential of this industry, potential for profitable good or evil. Those seeking wealth and power will soon be flowing towards this industry, as trained scientists or administrators, as fund-raisers and bankers. The potential for abuse and exploitation of vulnerable human beings is perhaps beyond any horrors yet seen in the brutal history of our race. Even in the United States, the most middle-class of any major country in history, there is a growing separation between rich and poor and the middle-class is pushed downwards. This is but a hint of what we might see if we build an industry capable of turning some human beings into walking spare-parts bins, in general—capable of turning some human beings into the means for reaching the ends of others. More so than in any period of that brutal history of our race.

I remain skeptical that we can control the potential evil of various forms of biotechnology. Our societies have not the moral structures adequate to control such dangerous technologies. After all, we managed to destroy our farming communities and many other human communities by the way in which we deployed our modern knowledge of growing food.

## 239 What's the Point of It All?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=211>. It was finished and uploaded on 2008/08/21.]

Some more good news on stem-cell research, but all is not well. An honest researcher points out a fact which is inconvenient for those of us who have trouble thinking one human being should never be used as the means to the end of another human being.

In *Twenty Disease-specific Stem Cell Lines Created* at <http://www.sciencedaily.com/releases/2008/08/080807130834.htm>, we read:

Harvard Stem Cell Institute researcher George Q. Daley, MD, PhD, also associate director of the Stem Cell Program at Children's Hospital Boston, and HSCI colleagues Konrad Hochedlinger and Chad Cowan have produced a robust new collection of disease-specific stem cell lines, all of which were developed using the new induced pluripotent stem cell (iPS) technique.

The new iPS lines, developed from the cells of patients ranging in age from one month to 57-years-old and suffering from a range of conditions from Down Syndrome to Parkinson's disease, will be deposited in a new HSCI "core" facility being established at Massachusetts General Hospital (MGH), HSCI co-director Doug Melton announced yesterday. The operations of the iPS Core will be overseen by a faculty committee, which Daley will chair.

Later in the article, we read:

While Daley, President of the International Society for Stem Cell Research, is enthusiastic about the promise of reprogram-

ming studies, he is far from ready to abandon experiments with embryonic stem cells. Daley believes that reprogramming and ESC research must advance in tandem to bring cell therapy to the clinic as quickly as possible.

Christians have fallen over each other in the recent past to justify good and moral uses of stem-cell technology so long as we might have our medical problems solved and might be relieved of the responsibility for moral witness. In this article, I'll not discuss the moral error in using any human being (including babies murdered years ago) as the means to the ends of other human beings. (See Chapter 235, *What is Stem Cell Research Really About?*, and Chapter 236, *Are All Scientists Evil?* for such arguments.)

We can't live forever. We can't solve all medical problems anymore than we can stop earthquakes or volcanoes. We do what we can to help ourselves and others, especially the children, but we do no good by sacrificing our moral integrity, by growing or making things which might well be evil and putting them in our bodies or the bodies of children.

We Christians proclaim a belief in a resurrection into life without end as the companions to our Lord Jesus Christ and yet we make no serious protests against a society that sets its goals to maximize life-span and comfort and material prosperity, considering moral preferences—truths would be too strong a word for our views—only as secondary matters. True Christians would decide to live in recognition of moral truths, to live in such a way that we would nurture our love of God and our human moral integrity first and try to lengthen our lives or ease our sufferings as a secondary matter.

## 240 Causality and Moral Freedom: Heading in a New Direction?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=178>. It was finished and uploaded on 2008/08/28.]

A while ago I'd read that some wildlife biologists had speculated that there's a regulatory gene for size in grizzly bears and that the mother could change the setting on that gene, setting it to BIG when there was plenty of food and grizzlies were dominant and to a lesser setting when the conditions were less ideal for those humpbacked bears. There have been other speculations as well as factual hints that an organism doesn't develop under the strict control of its genes, that genes are part of an organism and not sort of all-powerful dictator beyond the reach of its slaves. The strongest evidence that the gene-as-dictator model is defective was the discovery by the Human Genome Project that human beings have about the same number of active genes as the average worm. I'll leave it to the reader to think about that or to research the thoughts of geneticists and others who've tried to make sense of that result.

Now we have evidence for the complication of inheritance in the form of data from reproducible studies of the inheritance of diabetes: *Diabetes Transmitted From Parents To Children, New Research Suggests* found at <http://www.sciencedaily.com/releases/2008/08/080820163239.htm>.

DNA is the primary mechanism of inheritance; kids get half their genes from mom and half from dad. However, scientists are just starting to understand additional kinds of inheritance like

metabolic programming, which occurs when an insult during a critical period of development, either in the womb or soon after birth, triggers permanent changes in metabolism.

In this study, the researchers looked at the effects of a diet high in saturated fat on mice and their offspring. As expected, they found that a high-fat diet induced type 2 diabetes in the adult mice and that this effect was reversed by stopping the diet.

However, if female mice continued a high-fat diet during pregnancy and/or suckling, their offspring also had a greater frequency of diabetes development, even though the offspring were given a moderate-fat diet. These mice were then mated with healthy mice, and the next generation offspring (grandchildren of the original high-fat fed generation) could develop diabetes as well.

In effect, exposing a fetal mouse to high levels of saturated fats can cause it and its offspring to acquire diabetes, even if the mouse goes off the high-fat diet and its young are never directly exposed.

The study used mice so it's not time to warn women to eat differently during pregnancy and breastfeeding but earlier research has shown that this kind of inheritance is at work in humans. For example, there is an increased risk of hypertension and cardiovascular disease in children born of malnourished mothers.

Changes from metabolic programming can pass on through multiple generations even though there's no changes to DNA. Though we don't yet know how important this is in human beings, there is reason to suspect it could be very important. In any case, it greatly complicates our understanding of our particular human natures and how we fit into a family line. In theory, though not yet proven for our species, we could inherit the effects of bad habits of our grandmothers by way of our mothers or fathers.

While this can seem unfair, most of us can accept this for physical problems such as hypertension and diabetes. What about inheritable traits or dispositions that have a more direct bearing on moral matters? Many accept that a man might have too strong a taste for whiskey and yet draw back from considering the possibility that our moral freedom is constrained

by factors inherited from prior generations. This sort of constraint on our moral freedom seems all the more unfair if it's a matter of our mother's or grandmother's habits rather than the DNA they carried through no fault of their own, though I'm not sure about the use of the word 'fault' when talking about who we are. To say that it is or isn't my fault that I'm me, that I possess certain strengths and certain weaknesses, might be a little strange. That we talk this way might be a sign of the confusion that leads us to think constraints remove our moral freedom though constraints are necessary for a well-formed human nature. To be sure, constraints can strangle us or choke off some vulnerable part of us, but we shouldn't speak as if freedom were some sort of formlessness. And usually we don't.

We get close to our fears about being morally misshaped when we consider the results of another study as summarized in this article, *Nature or nurture—Are you who your brain chemistry says you are?* found at [http://www.eurekalert.org/pub\\_releases/2008-08/sonm-non081208.php](http://www.eurekalert.org/pub_releases/2008-08/sonm-non081208.php), we read:

“Our main finding was that reward dependence is the only personality dimension correlated with opiate receptor binding, and that positive correlation was restricted to the ventral striatum, which is considered the key area of the human reward system and of the development of addictive behavior,” said Peter Bartenstein, M.D., professor of nuclear medicine, Ludwig Maximilians-University, Munich, Germany. “This correlation means that people with high reward dependence have a high concentration of opiate receptors available in that area, while people with low dependence have fewer opiate receptors.”

In other words, be born with too many of those opiate receptors and you're in relatively greater risk of becoming a junkie. This returns us to the harsher mysteries of that phrase domesticated by gentle Christians of a prosperous age: There, but for the grace of God, go I. But I have no interest in developing that line of thought.

To me, this is more evidence of the truth of Thomistic intentional morality. We're creatures, organisms, and our moral natures grow as part of our overall growth. We're not rational agents, nor are we autonomous agents. I don't say we aren't rational and autonomous because such words do describe certain aspects of our human beings. I do say we're primarily organisms and

our stomachs do have substantial impact upon our moral decision-making, especially when we're truly hungry. Our sex organs and brains interact in complicated ways. We inhabit environments where the meaning and impact of a habitual behavior or a single action vary according to context. We're organisms in specific contexts, most especially social contexts.

I'm not trying to introduce any sort of 'holistic' mysticism. Organisms act as such but they can be usefully studied by proper use of reductionistic methods of research. Human beings are the 'rational animal' only as a way of qualifying certain differences between us and even the most intelligent of other animals. Our human natures aren't rational in a complete sense but they can be understood in scientific terms, in terms of rationality. The mind can study that which isn't mind or isn't only mind. That's tautologically true because even the human mind takes its form in response to its environments, the universe if all goes well, the world—or universe seen in light of God's purposes—if all goes still better. Moreover, our minds really respond even to our own bodies. As a consequence, even in its 'immaterial' aspects, the mind is a process of response to Creation, in part or whole. The human mind is a fairly well-defined subset of those organic development processes which are human nature, but there is substantial overlap between our intellectual natures and our moral natures.

We become moral beings—and mindful, self-aware beings—by processes which are spread over time and over our own bodies and our environments. It's those development processes, part of more general development processes of human organisms, which are our moral natures or our intellectual natures. Each and every act we make is part of the movement of the whole of the organisms which are us. As a consequence, each and every act we make with any moral import, even the decision whether to pick up a hobby and cut back on watching television, is a part of our moral development.

What interests me for now is that the organic foundation of human nature, including its moral aspects, argues for ways of speaking of cause and effect as being, shall we say, more diffuse than the well-defined ways of speaking of agents and decisions in spacetime terms reminiscent of billiard-ball physics. I have read that the logician and philosopher Quine has spoken of the possibility of causation which is non-local.

The interested reader can follow up on the basics of Thomistic moral nature as I understand it by turning to Chapter 385, *Is This Evidence Against Free-will?* for a discussion of one set of experiments showing we make at least some simple decisions without our any prior activity in the regions

of our brain which are associated with higher levels of consciousness. The problem is that this sort of a result does argue against models of free-will as developed by modern philosophers in the various schools of liberalism, but not against models of moral freedom which recognize the organic nature of the human being.

Thomistic moral philosophy is far better than competing schools of thought if we wish to develop a plausible model of human freedom. For a discussion of intentional morality as advocated by the neuroscientist Walter J. Freeman, see Chapter 83, *Is Christian Morality a Natural Morality?*, Chapter 84, *Pragmatism and Thomistic Existentialism*, and Chapter 84, *More on Pragmatism and Thomistic Existentialism*.

As a first step, I think we should study causation in the realm of physics proper because that can provide us with an understanding of the possibilities in terms of the fundamental being of this universe. I'm particularly interested in non-locality, which occurs in general relativity and quantum mechanics but also in other physical realms such as those of self-organizing systems. Hurricanes are one example of a self-organizing system where there are lots of local processes but no one local process dominates the overall activity as a tropical storm develops from hot ocean water and disturbed air masses. Getting a handle on this issue of locality vs. non-locality which is fairly well-defined might well lead to a breakdown of much of the language and the conceptual apparatus we use to try and understand causation in the moral and non-moral realms.

## 241 Didn't Their Lack of Muscle Tone Give a Clue?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=223>. It was finished and uploaded on 2008/09/12.]

Here is an article about parents overestimating the time their children spend on vigorous exercise: *UK Children's Physical Activity Levels Hugely Overestimated* at <http://www.sciencedaily.com/releases/2008/09/080908215935.htm>. We learn:

Parents said their children were moderately to vigorously physically active for an average of 146 minutes a day.

But the accelerometer readings showed that this figure was actually 24 minutes a day, with boys managing 26 minutes and girls 22.

According to the survey data, 83% of boys and 56% of girls complied with the recommended daily amounts of moderate to vigorous physical activity.

But the accelerometer showed that only 3% of boys and 2% of girls actually did so.

I'm bothered by the parents' lack of awareness of their children's physical activity but I'm not really advocating a crusade for parents to be leading exercise sessions for five year-olds nor am I advocating still more T-ball for pre-schoolers or little league for pre-teens. I think most children are naturally active and that leads to the fear that we've deformed our human societies so that they somehow lure children away from their inborn inclinations to run around and climb everything accessible, to organize themselves

into groups playing games and get themselves into healthy sorts of trouble. We've turned too many children into sluggish creatures who only move in herds, generally under the direction of an adult coach or at the beckoning of some corporate marketing scheme.

# 242 Heading Towards a More Exact Understanding of Human Nature

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=226>. It was finished and uploaded on 2008/09/13.]

Sometimes I've written entries which point to various scientific evidence that our soul-like characteristics are actually founded on matter and arise first of all, but not only, from such physical processes as hormonal flows or brain-cell activity. Soul-like characteristics seem to be matters of relationships rather than strictly of physical activity or physical states, so the hormonal flows that restructure a new mother's behavior and very perceptions work towards the benefit of her child. The hormonal flows and brain changes work to generate and strengthen maternal love.

It doesn't bother me at all to think my stuff is 'just' the stuff of my body. It's stuff that God made for His purposes. And, in its perfected form (think of the risen Christ), it's sufficient for life without end as a companion to the Lord Jesus Christ. St. Thomas Aquinas had this to say about the relationship between a human being, his body, and his soul [5]:

My soul [in Thomas the organ for thought] is not I; and if only souls are saved, I am not saved, nor is any man. [page 43]

Aquinas' major mistake in regards to understanding human nature was thinking an immaterial entity was necessary for human (mostly abstract) thought, but he never made the mistake of placing core human attributes, which we share to some extent with other animals, in the soul. It is the

physical man who loves, has faith, and has hope even if Aquinas thought those to be refined by association with the higher thoughts of the 'soul'.

We're creatures, objects of God's love and our being has to have some sort of substance to allow us some appropriately independent existence from God who is His own Act-of-being, the supreme Act-of-being, in terms of Thomistic existentialism. We exist because of lesser acts-of-being possible only to God but these lesser acts-of-being result in bodily life.

It bothers me not at all, surprises me not at all, to see growing empirical evidence indicating that our substance is that of our body and that, unlike even Aquinas' moderate views, we probably are not some sort of pasting together of two substances. It seems to me better to be this stuff that sits and types rather than some mysterious stuff with radically different properties than anything the biological me can even detect. Who would I be if I were not this flesh-and-blood me? My soul is not me. In substantial terms, my soul is even less than St. Thomas thought, in fact, nothing at all. The soul is a set of aspects of this biological me, aspects coming from my relationships to God and my fellow-men and to this world created by God. And so, I retract my claim—my soul is part of me but it comes into being when the flesh-and-blood me responds actively to God and God's Creation.

We shouldn't be overly disturbed by the various scientific findings that tie us ever more tightly to this flesh-and-blood which is us. So, I'll continue to make note of some of those findings, noting also that we do possess those aspects and characteristics which are considered by man to belong to the soul. In fact, we are heirs to a profound understanding of important aspects of human nature that was developed in the Bible, in the writings of Virgil and Shakespeare, in the music of Bach and Beethoven. What we did was to fool ourselves into thinking that we have an invisible and undetectable substance that somehow controlled our flesh-and-blood substance. This was a dangerous understanding. Errors of such magnitude will always cause loss of faith in our human selves and even in our Creator when they're seen as errors. Errors of this sort have likely played a role in the loss of faith in this age where we have good reason to know that science gives us certain kinds of truths and those truths which must be accepted on faith are presented by most Christians as being tied to ideas in conflict to those lesser but verifiable truths of science.

Let me discuss a couple of recent empirical findings about human nature, starting with the article *The right side of fair play* at [http://scienceblogs.com/notrocketscience/2008/09/the\\_right\\_](http://scienceblogs.com/notrocketscience/2008/09/the_right_)

side\_of\_fair\_play.php:

Now, Daria Knoch and colleagues at the University of Zurich have discovered that this desire for justice is influenced by a small part of the brain - the dorsolateral prefrontal cortex or DLPFC - which constantly suppresses our more selfish urges.

Note that word ‘influenced’. Think also back to those poor sons or daughters of alcoholics who also had an overly strong taste for the elixir of life. In a social context, one of concern for another human being, we freely admit there is something to this inheritance of traits which have a bearing upon our behavior and characters. At the same time, we must remember We do have a substantial amount of moral freedom. It takes effort and patience and often a humble willingness to seek help for us to exercise proper moral control over our tendencies, but we can do much even when we lose the battle. With conscious awareness, we can sometimes overcome our selfishness, probably even when our DLPFC isn’t doing its job. Some believe that they are in a war of sorts against a fallen soul when we’re actually in a struggle to discipline the different parts and aspects of our organic selves to higher moral standards. The explanations of evolutionary biology and the books of Moses are different but they both point to the same—sometimes harsh—reality, even when it concerns male promiscuity as in this article: *Of voles and men: exploring the genetics of commitment* at [http://scienceblogs.com/notrocketscience/2008/09/of\\_voles\\_and\\_men\\_exploring\\_the\\_genetics\\_of\\_commitment.php](http://scienceblogs.com/notrocketscience/2008/09/of_voles_and_men_exploring_the_genetics_of_commitment.php), we read:

Love is all around us and love is in the air, and if I know my mainstream science reporters, today they will have you believe that love is in our genes too. A new report suggests that variation in a gene called AVPR1A has a small but evident influence on the strength of a relationship, the likelihood of tying the knot and the risk of divorce. It’s news for humans, but it’s well-known that the gene’s rodent counterpart affects the bonds between pairs of voles.

and

Humans have our own version of the vasopresin receptor, with its very own unmemorable acronym - AVPR1A. Like its vole

counterpart, it's preceded by an important stretch of DNA that is rife with repetitive sequences. These are known as "repeat polymorphisms"; they are short genetic leitmotifs that vary in number from person to person. According to earlier research, these variations in this sequence can affect human behaviour and are linked to altruistic tendencies, the risk of autism and the age at which people first have sex.

We can now add the strength of relationships to that list.

But, we are warned:

Vasopresin is far [from] the only molecule involved in forming relationships, even in voles and there is still much we don't know about the other players involved.

On the morning of June 7, 2008, Pope Benedict XVI "received participants in the sixth European Symposium of University Professors, which is being held in Rome from June 4-7 on the theme: *Broadening the Horizons of Reason. Prospects for Philosophy.*" I discussed this address in Chapter 25, *Broadening the Horizons of Reason*. In that address, Pope Benedict said:

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.

What we are seeing in all these scientific research results is the empirical foundations of that more exact understanding of man. What we modern men need to do is to take these mountains of empirical knowledge, some of it so raw as to be facts or data and not yet knowledge, and make sense of it in light of our higher-level understandings of human nature. In an age where too many men are able to use modern empirical knowledge to more brutally exploit others or to simply kill them in large numbers, we have a chance to use this "more exact understanding of the nature of man" to do some good, to help us shape our own moral characters and those of our children. We have a chance to help us shape ourselves and our children to better serve God and to even prepare ourselves to be His companions in the world of the resurrected.

# 243 Dualism is Dying a Slow Death

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=194>. It was finished and uploaded on 2008/10/02.]

There was once a strange tint to the philosophizing of some modern biologists and philosophers working in that field. They set up unidirectional structures of control from DNA to soma and from brain to physical limbs while also setting up one way flows of perception, including that of pain, from physical limbs to brain. The result was a dualism in which some forms of matter became embodiments of what might be called 'software' or 'soul' or 'spirit' as you will. That is, matter organized in the way of mere mortal life could send out detailed commands while remaining surprisingly unaffected by that which is controlled. All matter is equal but some matter is more equal than other matter. This universe is one entity, homogeneous and isotropic, but some entities within it are radically isolated in their homogeneity and isotropy.

When the Human Genome Project was completed, the researchers found that the number of active genes in the human body is about the same as the number in the body of a worm. Clearly, there was something activating and deactivating the huge number of genes in the human genome. Suddenly, DNA was a part of an organism which interacted with that genetic stuff, calling upon it to provide, say, directions for producing the hormones to prepare the placenta of a woman for possible pregnancy. In fact, many clearheaded scientists had realized DNA and the brain are parts of very complex organisms. For example, see Simon LeVay's *The Sexual Brain* [86] for a discussion of the role the brain plays in sexuality, focusing upon that all important part of human sexuality: the menstrual cycle. The brain is

the dominant organ as Professor LeVay tells the story but even the brain is most certainly not a Master dictating to powerless slaves.

So far as I can tell, popular writers and followers of science are more aware of the importance of the organism as a whole. This study, *Pain Is Not A Symptom Of Arthritis, Pain Causes Arthritis, Study Shows* found at <http://www.sciencedaily.com/releases/2008/09/080929123935.htm>, tells us:

Pain is more than a symptom of osteoarthritis, it is an inherent and damaging part of the disease itself, according to a study just published in journal *Arthritis and Rheumatism*. More specifically, the study revealed that pain signals originating in arthritic joints, and the biochemical processing of those signals as they reach the spinal cord, worsen and expand arthritis.

The imaginary barriers which divide the human organism are falling. The most important lesson we can learn is that the human being is an organism which has properties not to be found by simply assembling each of its parts seen as separate entities. A second lesson we can learn is that those parts are separate in only a very qualified way or, still better, the entire human organism is more than it contains. See Chapter 193, *A Universe is More than it Contains* for a short discussion of the universe itself in the same spirit.

## 244 What's Wrong with Books and Writing Pads?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=271>. It was finished and uploaded on 2008/10/10.]

In this short article, *Smart Desks Make Sci-fi A Reality In The Classroom* at <http://www.sciencedaily.com/releases/2008/09/080916215203.htm>, we are told that:

Researchers at the Technology-Enhanced Learning Research Group (TEL) are designing new learning environments using interactive multi-touch desks that look and act like a large version of an Apple iPhone.

Children with any academic talent need to develop good reading and writing skills as a prior condition to learning science and math and well as literature or history. Children with lesser or little academic talent need to acquire at least the reading skills to deal with newspapers and basic contracts. In any case, the development of a child's literary skills, high or middling or low, requires great effort by both teacher and student. This means lots of hours reading books, along with the teacher or alone. This means lots of hours writing out at least simple sentences. And there is also the basic arithmetic skills, important to future chefs and machinists as well as future engineers.

The situation gets more complicated at higher grade levels when the various opportunities and problems of students at the higher and lower levels of academic talent are ignored as our bureaucratic educationalists try to force all students onto standard paths of development which, at best, might be appropriate for many of the students of middling academic talents.

And why are all students put in so many hours of academic classes in any case? Is it somehow better to be a failed algebra student than to be a good student of sewing or carpentry?

If smart desks are an answer to a problem, it's not any of the real problems of educating human beings. Then again, few school systems are going to be able to afford these desks or much other new equipment with our economic problems still increasing.

## 245 The Invasion of the Body-changers

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=246>. It was finished and uploaded on 2008/10/11.]

Nearly ten years ago, I wrote the first version of a dark comedy in which the protagonist, a formerly respectable professor of philosophy, seems to be in a rather confused state of mind. (The novel *A Man for Every Purpose* can be downloaded from <http://loydfueston.com/downloads/aman.pdf>.) I'll ruin part of the surprise by saying that much of the confusion of the protagonist's thought comes from alien genes introduced into his body by a virus that nearly killed him. Since I wrote that book, partly a matter of pure speculation on my part, scientists have gathered information that indicates the possibility that an invading organism can alter us, our genes or at least the expression of those genes. For example, our personalities or manifested intelligence levels can be changed. Read on for some details...

There is no magic that will exclude from our bodies chemicals from our environment or genes from another species. Our environments leak into us and we leak out into our environments. We often alter our own chemical balances on purposes, using alcohol or far more dangerous drugs. Sometimes, we can cause permanent changes by excessive use of various substances or by exposure to workplace chemicals or whatever.

I'm hardly surprised to read this entry, *Toxoplasma - the brain parasite that influences human culture* found at [http://scienceblogs.com/notrocketscience/2008/10/toxoplasma\\_the\\_brain\\_parasite\\_that\\_influences\\_human\\_culture.php](http://scienceblogs.com/notrocketscience/2008/10/toxoplasma_the_brain_parasite_that_influences_human_culture.php), on Ed Yong's fine science education blog. (His blog, now named *Not Exactly Rocket Science*, has moved to <http://blogs.discovermagazine.com/notrocketscience/>. We learn

from this science writer that:

In rare cases, *T.gondii* infection causes a disease called toxoplasmosis that produces mild flu-like symptoms and only really threatens fetuses and those with weak immune systems. But in most instances, the parasite acts more subtly.

Carriers tend to show long-term personality changes that are small but statistically significant. Women tend to be more intelligent, affectionate, social and more likely to stick to rules. Men on the other hand tend to be less intelligent, but are more loyal, frugal and mild-tempered. The one trait that carriers of both genders share is a higher level of neuroticism - they are more prone to guilt, self-doubt and insecurity.

The entire article is worth reading if only for its intelligent discussion of the problems with too simple or literal an interpretation of these results or results of similar sorts of studies.

Yet, it's likely that we are altered, for good or bad by various living entities or non-living substances that enter our body uninvited. Parasites, in particular, can spew out various products, some of which change the metabolism or behavior of its host. This particular parasite reduces fear in its host for one cycle of its life, rodents, so that they're more likely to be captured and eaten by the host for the next cycle of its life, cats. As Yong explains, human beings are a dead-end in the reproductive cycle of *T.gondii*, but the various chemicals it spews out to change the brains or hormonal flows of rodents are likely to have some effect upon us, just as viruses can influence us or our descendants by planting copies of their genes inside our DNA, which genes might contain random fragments of genes from the most unlikely of species. Notice that men infected by this parasite tend to be mild-tempered. This may be a sign of a lowering of fear levels which is the effect upon rodents—tests of different breeds of dogs have shown the gentler breeds, such as Golden Retrievers, have far lower levels of fear in many circumstances than the aggressive breeds, such as Rottweilers.

I don't know how matters have turned out but, back when I was learning a little about these areas in the 1990s, some scientists were claiming the gene for feline leukemia was a fragment of a gene for a growth hormone in an ancestor of the baboon. It's most likely it was transported from one species to another by a virus or retrovirus. And that's how I made matters

work in that novel I referred to above. Poor Milt emerged from a blood-fever disease with some mental peculiarities including an occasional desire to enter stagnant bodies of water and feast on pond-scum. Somehow, he had acquired genes from some species of aquatic worm. Maybe. Or maybe he had a vivid imagination affected by his learning in the fields of genetics and evolutionary biology.

I'm not surprised that *Toxoplasma* might change the personalities of those human beings it infects. If so, it would have an effect upon cultures. Since *Toxoplasma* infections are far more common in tropical regions, then we might have cultural differences which come not from human DNA or from human interaction with physical environments but rather from a difference in infections by region and maybe by level of economic development. The chemicals in the products we handle in the developed West, the heavy metals found in the dust on our roads (such as platinum from catalytic converters), the various hormones in our meats and dairy products, and certainly the constant flow of certain hormones in response to hectic lives, are likely to have some effects upon us.

This is a bothersome matter to those who define the human self in terms that imply it is, or ever could be, sealed off from what's around it. To me, it's just another complicating aspect of our world and one which is amusing in a somewhat darkish way. And I don't necessarily think there to be any deeper meaning, other than the impossibility of truly walling ourselves off from Creation or even much walling ourselves off from this universe during our mortal existence.

Once upon a time, a transcendentalist princess announced with the most generous of motives, "I accept the world," only to be asked by Sir Thomas, a champion of a certain hard-headedness, "Ye gads, what choice have you?" [My memories of a reported exchange involving Margaret Fuller, as a young woman, and Thomas Carlyle as a middle-aged and somewhat wise skeptic.]

## 246 Aiming to be Half-sane

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=275>. It was finished and uploaded on 2008/10/14.]

In a recent essay, *Liquidate the Empire* at <http://www.amconmag.com/blog/2008/10/13/liquidate-the-empire/>, Patrick Buchanan continues his recent tendency to move in the general direction of reality while not wanting to stray too far from the path of political orthodoxy. To be sure, reality can be harsh and we see why by noting Buchanan's half-heartedness in these words from that essay:

Uncle Sam's VISA card is about to be stamped "Canceled."

The budget is going to have to go under the knife. But what gets cut?

Social Security and Medicare are surely exempt. Seniors have already taken a huge hit in their 401(k)s. And as the Democrats are crafting another \$150 billion stimulus package for the working poor and middle class, Medicaid and food stamps are untouchable. Interest on the debt cannot be cut. It is going up. Will a Democratic Congress slash unemployment benefits, welfare, education, student loans, veterans benefits—in a recession?

No way. Yet that is almost the entire U.S. budget—except for defense, the wars in Afghanistan and Iraq, and foreign aid. And this is where the axe will eventually fall.

It is the American Empire that is going to be liquidated.

Why does it matter that "seniors have already taken a huge hit in their 401(k)s." I've taken a hit in recent years in not being able to afford a car or a lot of new clothes because I've chosen to continue writing while not

making any money at it. Do I have some sort of right to what I can't afford? Maybe it'd be a better world if serious writers could make a living right now. Maybe it'd be a better world if American seniors and Chinese seniors and African seniors could have hip-replacements when needed, if they could have generous pensions that allow them to live without being dependent upon their children or local communities. The real question is: can we Americans or those Chinese or African afford such ways of life? There's also the very important question as to what binds together human communities, including multiple generations. Some sociologists and historians say it is exactly dependencies which bind human beings together.

The fact is that we can't afford Social Security and Medicare as currently structured, though the pension plan—Social Security – can likely be saved by increases in taxes combined with cutbacks in benefits. Various economists and accountants and actuaries have calculated the deficit in those plans if the books were kept in the way that the government and investors and societies of Certified Public Accountants require of private businesses and most nonprofits. The range of deficit estimates that I've seen is \$50 trillion (from the GAO, the Federal government's own auditing unit) to \$100 trillion (from an economist at the Dallas Federal Reserve Bank). Both of those numbers are for 2007 or so and likely have gotten worse because of our current financial problems. I've seen estimates of the value of everything that American citizens own throughout the earth—around \$40 trillion.

The bulk of the deficit is in Medicare. If we really want to continue trusting those in Washington and New York City, we could rescue Social Security. In fact, that gives us some time and room to move to a better system without putting undue burdens upon those who are currently retired or will be retired soon. But sacrifices are necessary. Our choice is between an impending collapse or a planned transition to a more modest medical-care systems and more modest private plans—perhaps fully privatized. Until recently, economists and actuaries have thought that the system needed repair by at least 2020, but I'd guess that collapse is truly imminent because of the current economic collapse.

Medicare seems to be a good example of a system which is the worst of all worlds in the way it combines market mechanisms with regulation and government deficit-financing. The government pays much of the charges to individual consumers (though more direct grants to researchers and others involve very large sums as well) but the institutions compete. This

has resulted in hospitals with an excess of expensive diagnostic equipment and hi-tech operating theaters and probably a severe lack of hospital bed-capacity which provides affordable nursing care including simple hospice care for those in their last months of life and without possible home-care. Medicare has been used to corrupt our once wonderful medical systems in the same way that the general system of deficit funding through the Federal Reserve system has been used to corrupt our financial systems. In fact, we shouldn't pretend that Medicare and Social Security are viable systems without deficit funding.

Just as we're seeing with our imploding financial system, the Federal widgets will do their best to save the bloated and dysfunctional parts of the system. They may well drag down the regional and local banks with their Wall Street bailout programs and they will likely try to save our far too numerous research hospitals and the bloated radiology departments in every hospital and make it more difficult for us to return to a better system of primary medical care and basic nursing care supplemented by far fewer specialists than we have now.

Because of the bloating of our medical system, private health-care plans are no healthier than Medicare. We've got one hell of a lot of MRI machines to pay for and doctors are forced by standards of care to use them when needed or not. Furthermore, as many are finding out on their statements for their 401K plans, private pension plans are also being dragged down by our general economic problems and there is no return to prosperity in sight.
