I've noted before that the only recent book on Catholic just-war theory which I know of, *When War is Unjust: Being Honest in Just-war Thinking* [153], was written, very reluctantly, by a Mennonite scholar, John Howard Yoder, at the request of a ROTC commander at Notre Dame who'd decided that he didn't know any Catholics he could trust to do the job. (Maybe he should have looked outside the American-Catholic hierarchy and intellectual mainstream. . . But, I digress.) In the years since I first read that book, I've found not a shred of evidence that just-war theory is taught, at least for more than a few seconds, in the courses of either priests or deacons. I have no reason to believe it's taught to laity at Catholic schools, or other Christian schools. Or in Protestant seminaries. Catholic students, maybe other Christian students as well, are taught about our obligations to be nice to peasants who work for low-pay on coffee plantations. Apparently, those obligations go away if those peasants happen to live in the path of an invasion by the American military or the DEA. Then, they can be blown to Hell. And deserve it.

Even when the invasion of Iraq turned sour and lots of evidence showed up that the Bush administration had lied us into that war, even when more evidence turned up that the Clinton administration and the Israeli government had been preparing plans for a 're-make' of southeast Asia and north Africa as early as the mid-1990s, Catholic Christians, bishops and priests and laity, haven't stirred to carry out an examination of the justness of these acts which, when examined on the most casual basis, look an awful lot like mass-murder and willful destruction of advanced technological capabilities in these uppity countries.

I admit to feeling more than a little shame when I think about this entire mess. Bishops and other American-Catholics, indeed the vast majority of American Christians, accept the government's word that those million+ deaths in Iraq along with all the damage to social structures and infrastructure was justified. After all, Saddam Hussein was a bad man, as opposed

to the Clintons and Bushes and Mugsy Cheney, who start wars and kill lots of people because... Well, Saddam Hussein was a bad man, as opposed to Barack Obama who claims the right to kill anyone anywhere in the world if he thinks that anyone is a bad man or a bad child. And that American teenager in Yemen was clearly a bad young man—didn't we kill him?, as opposed to Lieberman and Kerry who own lots of stock in companies which make lots of money from all the wars that Lieberman and Kerry, Obama, the Clintons and the Bushes and Mugsy Cheney, start.

I've had conversations with people upset about the horrors of German mass-murder in World War II and told them about the millions of refugees rounded up by the Americans and British after that war who were turned over to the Soviets to be executed or used as slave labor. Typically, those compassionate Christians admit we can be bad also and then return quickly to talking about the evil of the Nazis or Communists or Jihadists. The rule, to a thinking Christian, is: you're damned for your own sins and there's no reason to believe God gives you credit for crying over the horrible crimes of the Nazis and the Soviets and the Maoists and Al-Qaeda. (See the article on *Operation Keelhaul* at [http://en.wikipedia.com/wiki/Operation\\_Keelhaul](http://en.wikipedia.com/wiki/Operation_Keelhaul) for a start on the literature of the U.S. forcing the repatriation of Soviet POWs and also people who'd fled the Stalinists.)

The American citizenry, including many self-righteous Christians, have a share of an awful lot of violations of the Fifth Commandment, mortal sins, and also a share of the sins in destroying the living standards of the Iraqis and others and even in destroying the moral characters of numerous Americans sent over to fight against, let's be honest, civilians who didn't want us there. 'There' includes all the regions where we fought sustained wars from 1945.

The Americans in general and their leaders including the American-Catholic bishops, let's be honest again, didn't think it worth the effort to even try to figure out if these wars were justified, before or after they were fought. I'm beginning to think there aren't any American Christian leaders, Protestant or Catholic or Orthodox, who know how to spell 'just' though they can do well with 'war', especially when they participate in those American national days of mourning which have been turned into joyous celebrations of how we killed all those bad guys in all those good wars. Morally healthy Christians, and most others, don't even celebrate killing guys who clearly and truly were bad. When the death toll includes

so many innocent human beings of all ages, then we should really feel a sense of shame, a need to examine the situation and the state of our own moral characters. Instead, we get another beer from the fridge and change the channel: see Chapter 465, *Dumber Every Day, With Beer in Hand and War on TV* for a related rant.

Americans, including their allegedly Christian leaders, might be raised from the grave and sent to a park where they can celebrate a joyous Memorial Day each and every day without end. A million years or so down the road, they might realize they aren't in Heaven and that big guy leading them in patriotic hymns isn't God.

# 474 Was the United States Ever a Christian Country?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1382>. It was finished and uploaded on 2012/08/23.]

I was fascinated by a claim Jacob Neusner quietly made in *Death and Birth of Judaism: The Impact of Christianity, Secularism, and the Holocaust on Jewish Faith* [99]. The assumption is found in this quote:

[M]y view is that when, in the late eighteenth century with the French and American revolutions, Christianity lost its status as self-evident truth to Christians in parts of the West, the Judaism framed centuries before in the encounter with that claim likewise lost its self-evidence to Jew in those same areas, and died. [page xii]

Is Neusner right that by the time the United States was founded “Christianity lost its status as self-evident truth to Christians”? I think he’s right, but it’s been a couple decades since I stopped believing the United States was ever a Christian country. Though the *Declaration of Independence* has never had any status as a true founding document of our government, its words regarding ‘self-evident’ truths should be taken seriously. A different set of truths than those in the Bible or the Creeds of Christianity had become self-evident. Jefferson, and most of the other Founding Fathers, had taken up a set of ‘self-evident’ truths proposed by lines of English thinkers dedicated to the idea that society could be at peace only if Christianity and other religions were stripped of their public status, purged completely from society or at least driven into the private realm. Most specifically, rights were no longer granted by God or even won by human effort in a Creation

which rewarded certain sorts of moral efforts. Rights were metaphysically grounded and truly belonged to human beings, though with a polite nod to a rather domesticated Creator. With rights stripped of giftedness Creation itself was no longer the work of a generous and Almighty Father; what exists had become our possession and God Himself had better not try to take it from us. (It's actually quite natural that we descended from that denial of Christian truths to a situation where we let our political leaders take our rights and property by frightening us with tales of the dangers in this botched Creation, but I'll let the reader imagine that story-line.)

Clearly, the main concern in Neusner's book is with Judaism, but I'm concentrating in this essay upon this denial of the self-evident status of Christian beliefs by the leaders, religious and cultural as well as political, of the emerging United States and revolutionary France. Leaders in greater regions of the West soon enough joined in. The Founding Fathers of the United States acted in a manner much more calm and much more rational than the anti-Christians to follow, to be sure, but the United States was founded as a non-Christian country with an optional Christian vocabulary to be used only to support ideas which had come from those efforts to remove religion from public life.

I repeat: the United States government formed under the Constitution was fundamentally a non-Christian government, not a Christian government tolerant of religious belief of others. A true Christian has no choice but to be such for the entirety of his life, for all hours of the day and for all the different roles he takes on. A Christian can't participate as a citizen in a country when such participation requires he leave his faith at home. The Constitution requires a Christian to shed his beliefs when he takes the oath of office as President or as an officer in the U.S. military.

Because of the non-Christian nature of the American state, Americans eventually—but American communities early on—took a strange form in which there was a radical separation of realms of human life. Some were clear-sighted and saw this process of fragmentation of individual and communal human life, saw the process and some of its horrible results. For example, the Norwegian-American professor and writer *O.E. Rolvaag* (see [http://en.wikipedia.com/wiki/Ole\\_Edvard\\_Rolvaag](http://en.wikipedia.com/wiki/Ole_Edvard_Rolvaag)) wrote a troubling middle book to his trilogy about Norwegian settlers in the Dakotas. In that second book, *Peder Victorious*, we see an honest vagueness, but clear attribution of motives and causes, about the way that the school teachers sent from the Eastern states took away the

Lutheran faith and much of the old-world culture of the children and grandchildren of Norwegian pioneer families. *Little House on the Prairie* with the school teachers singing the *Battle Hymn of the Republic* with all their might as they stared, stars in their eyes, at the statue of Abraham Lincoln in front of the school. I think Rolvaag got it right in that novel and I think what he was describing was a realization of the greater meaning of the Constitution. Any religious beliefs which might make it difficult for the United States to function as a secular nation must be left at home or, still better, purged.

Neusner is clear in his discussions that he believes, as do I, that religion is not only a very strong and basic part of human life but also the foundation of more complex human communal life, certainly the foundation of civilizations. I've met some atheists who, as individuals, would make better neighbors than most devout Christians and faith-filled Jews, but atheists don't found civilizations. Nor can they maintain or nurture them. As I've noted before, a civilization is inseparable from a people's understanding of the world, however broadly or narrowly they define that entity. An atheist who has such an understanding becomes, by definition, at least a pantheist or some other sort of pagan.

In Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*, I'd quoted from *Judaism in the Matrix of Christianity* [97]: "In the Western Protestant tradition of Edwards and Schleiermacher we take it for granted that emotions speak for the private individual, not the nation." I've never read any of Schleiermacher's works or even any books about his thought but I've read an allegedly complete collection of Edwards' writings and was impressed by the power of his mind but not by the lines of thought he chose to pursue. He saw the world as one not to have been made by a God who would have taken on human flesh. We're left alone in our terrible situation and a brutal sort of Calvinism, perhaps stated more honestly and with more insight by Edwards than by Calvin, is the logical result. Or else, perhaps a pagan incoherence is your pleasure. In any case, we aren't part of any Body of Christ, not even in terms of hope and faith and love. How could you have hope in a God who is infinitely distant from you? How could you have faith in a God who seems to have thrown you into a world in which the provision of human welfare comes through secular institutions? Why would you bother with a God who doesn't gift you with anything because it belongs to you in a self-evident way?

It's not just coincidence that Etienne Gilson identifies a general Catholic retreat into an intellectual ghetto as having occurred around 1800, pretty

*CHAPTER 474. WAS THE UNITED STATES EVER A CHRISTIAN  
COUNTRY?*  
2200

much the same time as the American adoption of a non-Christian Constitution which prepared the way for an eventual all-out anti-Christian assault upon the core beliefs, the very foundations, of Western Civilization. A Brave New World had been born. We've seen only some of the horrors which will occur before something new and good can be founded and the United States has been a major protagonist in those horrors of the past two centuries and is currently more active in waging war against God's Creation than is any other nation.

# 475 Physics, Politics, and Metaphysics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1399>. It was finished and uploaded on 2012/09/03.]

In a short essay recently published on the Web, the political thinker Ken Masugi tells us about political scientists needing to recognize the validity of philosophical modes of thought. They've drifted away from reality as a result of their efforts to become quantitative empirical scientists. In that essay, *Political Scientists Bow to the Laws of Nature* at <http://libertylawsite.org/2012/08/30/political-scientists-bow-to-the-laws-of-nature/>, we can read:

After some hesitation, the American Political Science Association (APSA) has cancelled its annual four-day, pre-Labor Day convention, with Hurricane Isaac bearing down on its New Orleans venue. Even proud contemporary political science must eventually submit to “the laws of nature and of nature’s God” in practice, while remaining resistant in theory.

Dr. Masugi gives us a highly summarized tale of American political scientists, through their professional societies, marginalizing and then even eliminating the study of those “laws of nature and of nature’s God”, eliminating philosophy from the study of politics. Perhaps his most interesting claim is that philosophical ways of thought are often closer to ‘nature’, empirical reality, than efforts to quantify, say, voting patterns and to turn elections into exercises in statistical analysis. The concluding paragraph of the essay tells us: “Following the lead of its Progressive founders, the

political science profession has indeed marginalized the study of political philosophy.”

I think that the author, Ken Masugi, is right that we need philosophy, the study of more abstract realms of created being in my telling, as part of our efforts to understand politics. He might even agree with my claim that we need a proper philosophy as part of our efforts to study any and all realms of created being, even the most mundane parts of the physical world. The most abstract realms of created being are present in those most mundane parts of this concrete realm of created being and we won't understand so much as a gnat, even in principle, if we don't have an understanding of the abstract geometry which describes shapes at this concrete level of being and if we don't have an understanding of the abstractions of relationships which allow us to describe complex environments in this same concrete level of being.

Mathematics and theoretical physical sciences (not just physics) are primarily about thinking; number-crunching should only start after some serious thinking is done. Sometimes, number-crunching isn't even possible except on a purely hypothetical basis, such as sometimes happens in the speculative exploration of exotic states of matter not (yet?) reachable in human laboratories or directly observable in nature. As one extreme example, the tensor equation which is the center-piece of general relativity is a qualitative description of possible equations of a more quantitative sort. If you're able to specify a few attributes, you might be able to turn this description into a solvable set of equations and discover, “Aha! I've found an equation for a simplified system with one dominant center of gravity in a perfectly symmetric sphere.” That discovery was the first explicit solution of Einstein's equation and was later seen to be the description of a particular type of black hole.

Tensors and other tools of modern mathematics can be like that, allowing scientists to describe a system even when they can't (yet?) produce equations which can give quantitative results. More generally, modern mathematics allows us to explore underlying concepts in a system, concepts about the very nature of the 'space' of interest and concepts having to do with relationships between entities in that space. By 'space', I mean a general concept which includes physical space but might also include, for example, a space which is a grid of possible states in a network of machines or human beings or both. Tensors, and the overlapping field of differential geometry, aren't used just to analyze and understand black holes or the en-

tire universe or other objects of interest to theoretical physicists; spinning machine parts are often designed with the help of tensor equations which are, often with much effort and ingenuity, particularized down to specific equations. It seems likely to me that there is a corresponding way to think of ‘purely non-quantitative’ problems, such as those of politics or moral relationships, so that we can qualitatively, abstractly, describe the nature of complex human communities or other created entities which are studied in the ‘soft’ sciences.

For example, we could maybe come up with concepts which are abstract descriptions of what can happen when relationships between members inside a community or between communities change. A moral creature embedded in a variety of communal relationships might suddenly find one or more of those communities is changing substantially so as to seem an entirely different sort of community. This might be a result of the community growing and becoming denser in relationships or as a result of a community losing moral structure.

I’m proposing that we use this sort of thinking, moving from the concrete realm of created being to a more abstract realm where we can reach a potentially more powerful conceptual understanding before returning to the more concrete and more particular realm. Physicists and others in the sciences, including engineering, have done this with remarkable success. In a field, such as politics, it would involve mostly conceptual relationships in the concrete realm of being rather than mostly quantitative relationships. I think this sort of thinking is done in the course of conceptual analyses of political systems or moral relationships, but I also think that it’s done on an ad-hoc basis so that it hasn’t had the desired change on metaphysical thinking, causing a lot of individual theorists to repeat the sort of effort which, as one example, Einstein and his friend Marcel Grossman carried out in learning how to use tensors and differential geometry to study gravity. That effort has been systematized and even clarified in a variety of books and articles and other instructional materials, but I know of no book which teaches thinkers in more ‘qualitative’ fields to abstract from a system being studied before trying to figure out how to particularize and analyze that system.

In my critique of our general inability to understand created being, not just human politics, I’ve pointed to one way of expanding those limited understandings and maybe correcting those understandings by borrowing from those fields such as quantum physics and gravitational theory which

have penetrated to some pretty abstract realms of created being from their particular viewpoints. Modern physics has shot past the limits on created being which traditional physics and traditional meta-physics had given us. We can expand our understanding of created being, including the possible sources of moral nature for a creature, and we can do that by trying to stand upon the foundations which physics and mathematics and other sciences have given to us and trying to see what lies beyond. What is the true nature of created being? Am I right when I say there is one spectrum of created being and that concrete being is shaped from relatively more abstract being itself shaped from still more abstract being and so on until we reach the truths God manifested as the raw stuff of Creation? That is, am I right that we can consider matter as being frozen soul, in a semi-traditional way of speaking?

In Chapter 468, *Christian Traditionalism: Moving With God's Story*, I discussed the issue of modernizing and 'upgrading' the ways in which we analyze and understand our own natures in their various aspects, political and moral and so on. I'll quote from that essay:

I'll refer to the following graph I've used before:

We can start at *Node y2*, which represents our current understanding of *The Spacetime of Our Universe*. This node is found on the bottom row. From that node, we work our way up through higher levels of abstraction until we reach a level which shows some promise for helping to understand, for example, human nature. So, by abstracting somewhat, we can reach *Node x* which is *Abstractions Leading to Complex Paths* and then travel down to *Node z2* which is *Human Nature* including our understanding of our moral pathways through this world. This understanding is also supplemented by other abstractions as shown by the arrow from the unlabeled node titled *Various Concrete Abstractions*. By *concrete abstractions*, I intend to convey the idea of a level of abstract being which is close to that of our concrete world.

In other words, I'm recommending that we construct richer and more complex metaphysical systems for Creation by using abstractions from mod-

ern physics and mathematics. We are ourselves part of this Creation, including those aspects of human nature studied by political scientists and political philosophers, by psychologists and moral philosophers. In recent centuries, we seem to have suffered various breakdowns in our human systems along with—not coincidentally—a failure to advance our moral and communal understandings; we can't understand how we can form coherent, morally well-organized communities from so many human beings with so many ways of organizing their moral and social activities. We have outgrown the metaphysics which is adequate to describe Greek city-states or human beings with a small number of communal relationships. Until we have a proper metaphysics, one which provides a proper description and allows for a proper understanding of the richness and complexity of fundamental created being as we now know it, matter and energy and fields and spacetime, we won't be able to properly describe or understand the complex entities of this concrete realm, not human beings nor human communities. After all, a modern country is probably even richer and more complex than a binary star system and lies within the same realm of created being as does that star system. Why are we assuming a simpler set of descriptions for relationships?

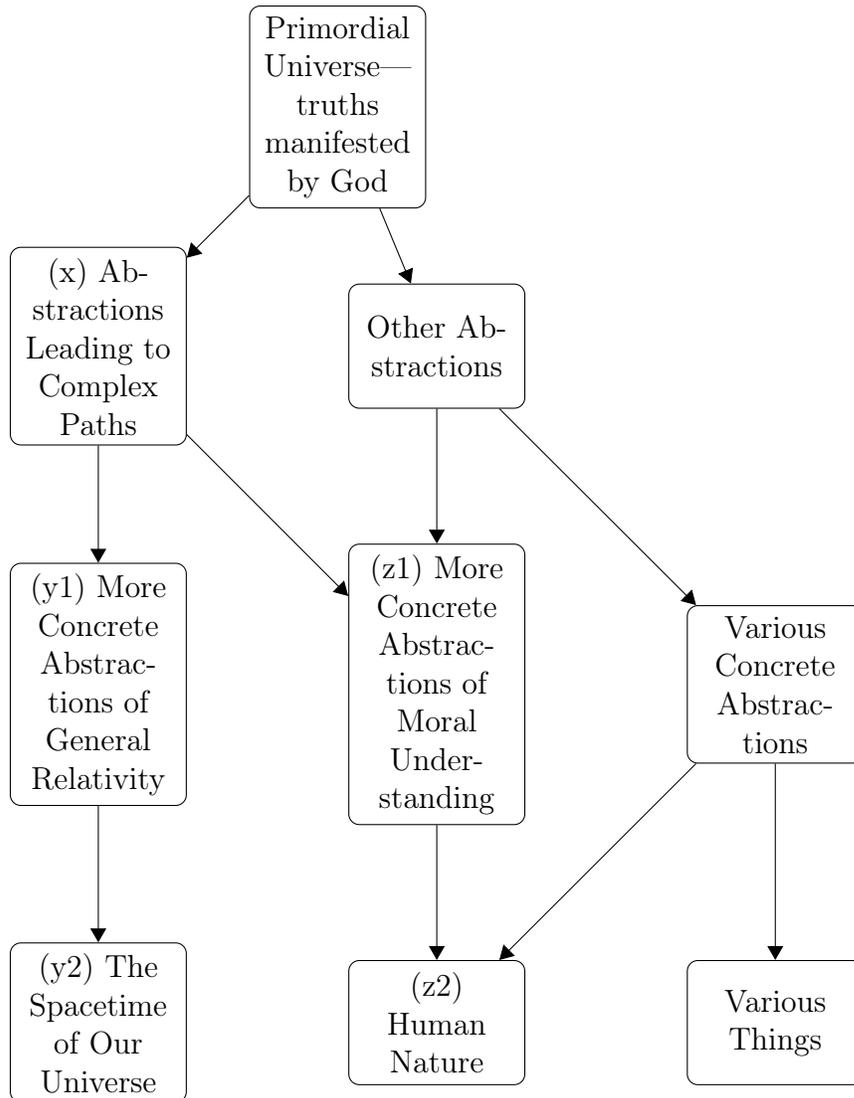

Figure 475.1: Simple Relationships of Abstract and Concrete Levels of Being

## 476 Is Skynet Being Born?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1452>. It was finished and uploaded on 2012/11/30.]

Those who have enough sense not to watch modern movies might not realize that:

Skynet is a fictional, self-aware artificial intelligence system which features centrally in the Terminator franchise and serves as the franchise's main antagonist. Scarcely depicted visually in any of the Terminator media, Skynet's operations are almost exclusively performed by war-machines, cyborgs (usually a Terminator), and other computer systems, with its ultimate goal the extinction of the human race.

See the Wikipedia article, *Skynet (Terminator)* at [https://en.wikipedia.org/wiki/Skynet\\_\(Terminator\)](https://en.wikipedia.org/wiki/Skynet_(Terminator)), or watch the movie *The Terminator* if you care to know more. There is also a Wikipedia article on the movie franchise at [https://en.wikipedia.org/wiki/The\\_Terminator](https://en.wikipedia.org/wiki/The_Terminator).

My belief is that something a little like Skynet is possible only because so many people watch this trash and take it seriously just as the criminal activities of gangsters inside the CIA and the Pentagon and the oil-companies and the investment banks and so forth became possible at high levels because people read, watched, and took seriously the James Bond trash as well as the whole genre of stuff out of the fevered imaginations of the likes of Robert Ludlum, Tom Clancey, and E. Howard Hunt—a man and author we should not want to be influencing our views of reality or those of the children of this world.

On to the serious science article to which I'm responding: *Simulated brain scores top test marks* found at <http://www.nature.com/news/>

`simulated-brain-scores-top-test-marks-1.11914`. This article was written by the reliable and often insightful journalist of science, Ed Yong. I always read at least the introductory paragraphs of his weblog, *Not Exactly Rocket Science* found at <http://blogs.discovermagazine.com/notrocketscience/>, but don't usually respond to them in my writings because he deals with general biological subjects of great interest to me but not bearing directly upon my work, though they do affect my general understanding of our world. This time, he did deal with such a subject: are we starting to create technological analogs of human minds?

In his article, Ed Yong tells us:

Spaun—the Semantic Pointer Architecture Unified Network—is the brainchild of Chris Eliasmith, a theoretical neuroscientist at the University of Waterloo in Canada, and his colleagues. It stands apart from other attempts to simulate a brain, such as the ambitious Blue Brain Project [. . .], because it produces complex behaviours with fewer neurons. “Throwing a lot of neurons together and hoping something interesting emerges doesn't seem like a plausible way of understanding something as sophisticated as the brain,” says Eliasmith.

“Until now, the race was who could get a human-sized brain simulation running, regardless of what behaviours and functions such simulation exhibits,” says Eugene Izhikevich, chairman of the Brain Corporation in San Diego, California, who helped to develop some of the first large-scale neuronal models—including one with 100 billion neurons. “From now on, the race is more [about] who can get the most biological functions and animal-like behaviours. So far, Spaun is the winner.”

Mr. Yong also tells us:

Spaun is almost as accurate at such simple tasks as the average human, and reproduces many quirks of human behaviour, such as the tendency to remember items at the start and end of a list better than those in the middle. “We weren't surprised that it could do tasks,” says Eliasmith, “but we were often surprised that subtle features like the time it took or the errors it made were the same as for humans”.

Don't worry that Skynet is literally on its way. This is a very limited model of only a few types of behavior on the part of a few regions of the brain. The underlying computer program which perceives and moves a simple robotic arm isn't capable of learning new tasks; it deals with only a few environmental signals presented in a somewhat artificial way. Yet, it's interesting and also scary because of our moral irresponsibility and our tendency to use, say, drone technology to kill children in Afghanistan and Yemen rather than to monitor forests in danger of fires.

Spaun is the type of limited 'thinking' technology which might work well in a drone with a particular mission, one which is to recognize signs of forest fires or one which will kill human beings wandering hillsides in Asian countries. Let's prepare ourselves for the likelihood that we're still in a decades-long, maybe centuries-long, period when technological advances, such as Spaun, will be used to advance the interests of those who are not only hungry for power and wealth but also ruthless when it comes to the lives and livelihoods of us common folk. Let's also consider the possibility that our technology may become part of us—we can pray only in a more benevolent form than killer drones: see Chapter 613, *Does the Body of Christ have non-human components?*, for a short discussion of the possibility that some technology might become truly part of us and our communities and thus part of the Body of Christ.

# 477 What is the Role of the Christian Church in the Public Square?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1465>. It was finished and uploaded on 2012/12/11.]

## 477.1 Man and Community

In recent years, I've been dealing a lot with the issue of man's true nature, as an individual and as a community member. There has been a lot of ground-work to do before I make an effort to provide a more 'scientific' or more 'exact' description of human moral narratives including those which form mere gatherings of human beings into communities; that effort has actually already begun but is so far no more than a first-year graduate student's knowledge of the relevant mathematics—which is probably sufficient—as well as some vague ideas which are starting to take on life in my mind to the extent that they are influencing my dreams. In any case, I'll give only a scattered sampling of this work of the preliminary work I've made public.

What are the parts which best and most completely describe a human being? I've endorsed the traditional Judaic view, not unknown in other traditions, of mind and heart and hands: see Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*. In Chapter 622, *Man, Society, and the Body of Christ*, I discussed how such a creature could become part of a community such as the Body of Christ. I also provide a way of talking intelligently and morally about that Body.

There are a number of other essays in my writings on this topic of human nature in its individual and communal aspects. My goal in this essay is limited to the presentation of preliminary, indeed—sketchy, ideas on the ways in which the Christian churches will have to change. When it's necessary to be more specific, I'll speak in terms, mostly, of the Roman Catholic Church in the United States. I certainly don't claim to know what that Church and those churches will have to become, only to have some serious speculations about what they can start to do and what they can no longer pretend to be. Mostly, I'm dealing with public issues, political and economic and moral aspects of our various communities.

I've speculated and now believe fairly strongly that all that is worthwhile in human civilization will be found in the Body of Christ rather than only what Christians do on Sundays or Jews on Saturdays. On the other hand, it's true that such human activities as musical composition in Heaven would be a form of worship. The point is that the Body of Christ doesn't include only what the Church is properly responsible for, not only what is supervised by bishops and carried out by priests with some assistance from the laity.

## 477.2 The Christian Church: Organ of the Body of Christ?

There is a question mark ending the title of this section, but I'll take the answer to be, "yes," without more discussion than can be found in the next paragraph about the nature of the Body of Christ or in more detailed statements to be found in various chapters in this collection of what were originally weblog writings. The Christian Church is the most important organ in that Body but not its entirety nor does it have the competence or authority to control that Body even in its pilgrim form in this mortal realm.

In what could be called the end of Medieval Era or the early phase of the Modern Era, the Church, the Catholic churches and all other Christian churches, started the painful process of backing down from Christendom's triumphalistic phase in the late Medieval period. She admitted that She has not the competence or the authority to govern nations or economies. Yet, the lesson hasn't truly been fully learned. Having taken up, at least

sporadically if not usually with any competence, their task of teaching the faith and guiding moral development, Christian churchmen repeatedly jump from general moral truths to specific policies as if the Church was only kidding in Her confession that She had not been given by God the power or the competence to run nations or economies.

I would recommend that the Catholic Church take seriously what was proclaimed by the Vatican II Fathers: the laity have their own competence and their own important roles. I would add that the bishops have neither the competence nor the authority to screen those laity, by coincidence—at this time—sharing the bishop’s ignorance on politics and history and economics and science, who will be sanctioned by the ecclesiastical hierarchy as being the true spokesmen of the Catholic (or other) Christian laity.

To be sure, there have been Catholic and Orthodox and Protestant clergymen who were not only competent in fields such as political theory and political practice; they were downright brilliant. This doesn’t justify the American Catholic bishops to dominate, or suppress, a process which should be a Christian witness to, for example, a nation supporting wars which have proven to be unjustified in retrospect. In general, while muttering some appropriately radical words about what might be called ‘the preference for peace’, the bishops and other Christian leaders generally go on to support the next war even as our country is bankrupt and is suffering the sort of collapse into moral disorder you’d expect in a country where the citizens are being trained to support a government resembling some weird combination of the Roman imperial bureaucracy and the Mafia. Even such strong and faithful Catholics, such as Pat Buchanan and Joe Sobran, were ignored when they tried to publicly discuss the moral problems in the American wars, especially in Asia and the Balkans, over the past two decades or so.

Similar critiques can be made in pro-life efforts, economic and political reform efforts, general moral reform efforts, and more. This isn’t the place to make those critiques but rather to make the claim that there is a great deal of expertise, of moral strength, of wisdom, to be found in Christians excluded from many of the processes of Christian witness and action on many important issues. Conservatives and libertarians, but also non-mainstream liberals and leftists, are the most likely to be excluded unless they play by the rules and within the constraints set by clerical and lay do-gooders of a herd-like cast of mind.

The Church has the responsibility and duty to teach the truths of the faith, theological doctrines which do have great implications for our polit-

ical and economic and technological decisions and moral doctrines which have more direct implications. She doesn't have the competence nor the authority to produce an understanding of the underlying subject matter, political or economic or social or other. She doesn't have the competence nor the authority to propose possible solutions to problems or to identify problems which might emerge or to even define the possible ways in which we can move toward a better political or economic system or how we can better raise children or how we should distribute ourselves over the earth's surface. It's most certainly the case they have just set out on the immigration issue with the goal of feeling good about themselves rather than learning about a very complex issue, without seeing the great damage they did to those already resident in this country and (often no longer) sitting in the pews. For one possible problem with the bishop's theory that we are morally required to admit all immigrants and treat them as if members of our communities, see Chapter 218, *Networks of Public Spaces Rather Than One Square*, which discusses the discovery of Robert Putnam, a Harvard professor of political science that:

[T]he greater the diversity in a community, the fewer people vote and the less they volunteer, the less they give to charity and work on community projects. In the most diverse communities, neighbors trust one another about half as much as they do in the most homogeneous settings. The study, the largest ever on civic engagement in America, found that virtually all measures of civic health are lower in more diverse settings. [From an article no longer on the website of *International Herald Tribune*.]

The point is that there is an awful lot which lies outside the experience or knowledge of Christian clergymen or mainstream Christian activists, though members of either of those groups could, in principle, be knowledgeable. At the same time, I'd guess that they wouldn't be invited to future meetings or elected to responsible positions in groups dealing with various issues if they were to offer opinions differing from the mainstream liberal views.

The bishops, and hosts of invincibly ignorant Catholics in general, have made the mistake described by Kenneth Minogue in *The Liberal Mind* [95]:

[I]t is characteristic of liberalism to make politicians of us all. . . Indeed, to be liberal *is* to accept an obligation to be concerned with matters beyond our direct responsibilities. [page

109. Those not acquainted with Professor Minogue's thought should be aware that, like many other historians and political-scientists and philosophers, he defines liberalism to include all ideologies which exaggerate our individualistic aspects. This includes classical liberals as well as collectivist liberals, Rush Limbaugh as well as Barack Obama.]

We like to stray "beyond our direct responsibilities" but we are also concerned with matters beyond our competence and we don't like to get anyone else involved unless they already believe what we believe, act as we act, feel as we feel, share our ways of discussing political and economic and moral problems. And we should be wary of expanding the public square in a society of diverse political, economic, and moral beliefs, as I discussed in Chapter 461, *Through the Looking-glass: Religious Liberty and Religious Toleration*, where I wrote "We shouldn't become dependent upon power-centers which might one day call upon us to act against our principles. In fact, I'll claim that religious neutrality on the part of governments is possible only if religious conflicts deal with issues not really important, at least not in our public life. In that case, religious freedom has no particular value and religion itself becomes the purely private affair advocated by extreme liberals of the modern era."

If they are to live up to their real responsibilities, rather than the false responsibilities of dictating the shape of various sorts of human systems, Christian leaders including Catholic bishops should learn how to live in a more open process of discussion of problems and possible solutions, of problems and opportunities which might arise some time in the future. As that discussion proceeds and as Christians or others begin to propose solutions or to form groups to implement some plan of Christian witness *perhaps* tied to specific policy proposals, Christian leaders should begin to provide moral guidance which will only be possible if those leaders manage to regain the respect they lost generations ago. Perhaps it's most important to note that this sort of a process would work best, and may have started somewhat spontaneously, if Christian leaders and educators had done their job of educating (do not read 'indoctrinating') those in their care and evangelizing others.

# 478 Something is Missing Even in the Best of Modern Political Thought

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1483>. It was finished and uploaded on 2013/01/07.]

This is a very good discussion of some important aspects of our national political mess in the United States: *Liberal Constitutionalism and Us* at <http://libertylawsite.org/2013/01/07/liberal-constitutionalism-and-us/>.

At the same time, something is missing and that something is a more general understanding of our world, in fact, of Creation as a whole. Until we have that understanding, one which encompasses Christian revelations along with—so to speak—the thoughts of Einstein and Darwin and also those of Lord Acton and Wallace Stevens, we are merely floundering with our efforts to understand and maybe reform specific realms of the world. God’s story, Creation in a general sense or this world in a particular sense, is the setting for all other stories; God’s story is the stuff from which the lesser stories are formed; God’s story, as best understood in modern terms, will give us our best ideas of the Almighty’s purposes as Creator.

The above paragraph is an effort to put my position in a short way which might appeal to Christians thinking in modern secular terms. I write this as a Christian thinker who has, I think with some substantial success, tried to produce an understanding of Creation, the abstract truths and the concrete things and the stories we live and the grander stories being told by God. From my viewpoint, Creation is a whole in a meaningful sense, this world is a lesser whole but itself has the important characteristics of unity

and coherence and completeness—as do those human animals who achieve the status of ‘personhood’.

The story God is telling is the birth and death of the Body of Christ beginning with the incarnation of the Son of God as Man. The Body of Christ contains as members those who will be raised to share the life of God through union with Jesus Christ, the head of the Body, but the Body is itself an entity not fully definable as a gathering of its individual members. Even our political and business activities have to be understood as activities directed towards the development of the Body of Christ, in a contemplative way and not in a way that provides direct practical guidance. Our current crises in Western Civilization, our various processes of decay which we so dimly perceive and so poorly understand, are caused by that root cause: we are the heirs of Christian peoples (more accurately—baptized and poorly assimilated pagan peoples) and we are trying to live within a Civilization which had a greatness coming directly from its Christian ways of thinking and feeling and acting. Again, we were never truly Christian peoples but that might not be possible in this mortal realm and, since this is the story being told by God, it seems to be His will that we develop towards our best states rather than somehow popping into those states by instant conversions of individuals or communities.

This is the big picture from the Christian viewpoint: this world is the story of the development of the Body of Christ and of the members, and failed members, of that Body in this mortal realm. We Christians need to set in this context all that is and all that God is bringing into existence by a pure creation or by shaping existing stuff.

I’ve claimed over the past few years in a number of writings on my main weblog, *Acts of Being* at <http://loydfueston.com/>, that the Body of Christ isn’t just the Church. Rather is the Church an organ of that Body, the organ of worship and spiritual and moral guidance. There are other organs in this entity, the Body of Christ, which is complex beyond our current descriptive capabilities. To move toward better capabilities, we need to draw upon the fullness of created being as currently understood. There is an understanding of created being which is slowly coming into view and it will, as one example, force us to use the more complex geometries of modern theories of spacetime in place of the Euclidean geometry found in such phrases as “the straight and narrow way.”

We also need to move toward developmental models in our moral and political and economic thought.

We need ways to describe, that is—understand in a narrative sense, those complex entities such as modern communities or the individuals formed within those communities. We and our communities, including our political communities, are far too rich and complex and dynamic to fit within the traditional concepts and languages of political and economic and moral philosophies and sciences of all sorts.

Even our more substantial poets and novelists haven't yet caught up. I write novels and have not yet finished a novel more than suggesting what can be done to heal our badly damaged individual and communal selves. My finished and downloadable novels, such as *A Man for Every Purpose* [37], have been efforts to describe the damage. Even *The Hermit of Turkey Hill* [36], set in the 1930s and with a protagonist based on a grandfather I never knew, was—from an abstract perspective—an effort to describe the stresses upon various levels of moral and social order at a time when the stresses had not yet caused major breakage, at least not in smalltown New England.

There is much to be done, much to shorten the coming periods of chaos as a new phase of Christian civilization forms. Describing broken political entities which are set in a Western civilization reduced to ruins populated by the barbarian children foreseen by José Ortega y Gasset is a good and useful task toward a greater understanding that will help the creative reformation to advance in a smoother way that might lead to better results. Yet, this part of our effort will work better if the analysts realize and explicitly consider that Western Civilization was a work of Christians and their God; our civilization will not survive if it has no Christian understanding of Creation to guide it. If I'm right, it's God who is forming the Body of Christ and, if we don't do our part right, God will continue rolling forward and crushing all who don't learn to be part of the Almighty's story—see the books of the prophets Isaiah and Jeremiah for details of the damage God inflicted on His own people when they refused to move properly with that story which is this world. (There are good insights in those books, although the views of even Isaiah and Jeremiah were necessarily local and simplistic compared to modern understandings of our world.)

In any case, God will eventually raise up those with a broader and deeper understanding of our world, including even our political entities. It's quite possible God is doing this now even as those in the mainstreams of human civilizations move along, sleepwalking?, with understandings of the world which correspond not to the richer and more complex understandings

of spacetime or physical matter nor to the increasingly rich and complex reality of modern human communities.

The main point to take away is that a Christian people need to understand the world according to their revealed truths. This might not have been so obvious even in some of the writings of Aquinas because he was a Christian fish living in a Christian ocean. The ocean is increasingly non-Christian or even anti-Christian and the Constitution itself and the more general political constitution of the United States were shaped by men who were on their way out of the Christian story. The United States, as it currently exists, will itself be seen one day as a nation formed as part of the process of decay in the West.

# 479 A Medicine Which Saved Lives and Destroyed Moral Order?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1518>. It was finished and uploaded on 2013/01/31.]

Some Christians think that God being all-good and all-powerful and all-knowing could have created a world without evil. Maybe. But it wouldn't be our world. It wouldn't be the story of the incarnate Son of God sacrificing Himself to the Father. From that main theme, we can consider salvation of the individual and salvation within the communal Body of Christ.

Those engaged in the strange enterprise of justifying the Creator tell us: "God can't have created all that is not Himself, else He would be the Creator of evil. Surely, we can say evil has another source. Maybe a great servant of God, call him the Angel of Light, was given a good substance but he chose to rebel and to oppose the all-good God, becoming evil in the process."

That sort of an explanation leaves us having to deal with the nature of the will which first chose to rebel against God. St. Augustine and others have tried to sneak by the issue by saying that evil isn't something that exists but rather a privation in being. Try telling that to those who've survived or even studied the horrors of the Nazi death-camps or the horrors of war or those of nasty diseases. Those few German scientists and assistants who survived Marburg Disease a few decades back had gone through such pain that they were insane, having extreme forms of schizophrenic symptoms. We can speak about children with incurable cancers or burn victims. Is HIV retrovirus a privation of being? In a sense, it is something of a re-

gression from a more complete form of life, but some more complete forms of life also inflict great suffering upon other creatures.

Maybe we have no right to question God's Creation in this way? Maybe we show ourselves to be the morally insane thinkers which Hermann Melville thought all Americans to be? Maybe we should accept Creation and try to learn about the story God is telling, the story which is this world? Try to learn about the story and try to play our parts well?

Evil remains, whether we truly believe in the God of Jesus Christ or not. This includes the sort of morally disordered behavior which harms others, including future generations, even if it allows us some sort of false sense of freedom. If we believe in that all-powerful God, we have to accept that He created a world in which evil can appear and sometimes grow into great monsters or sometimes remain in the shape of a man who drives home drunk most evenings or a mother who refuses to respond to her children's emotional needs. The Jewish scholar Martin Buber took the position, somewhat controversial amongst other Jewish thinkers and unthinkable amongst nearly all Christian theologians and philosophers, that the story of Adam and Eve was really a revelation by God that He could create a world with both good and evil without the evil touching His own Being. The story God is telling seems to not just allow for evil but to use processes which do lead to results we human beings consider evil. The Catholic novelist and Thomistic thinker Flannery O'Connor was particularly good at showing that the good under development can take on grotesque shapes, shapes of evil and suffering and great pain. There is every reason to believe this is a result of God's shaping of this particular concrete, thing-like world and not the result of some fall of man or cosmic fall.

Created being, at least the thing-like created being of this world, has the potential for good or evil. Volcanoes can wreak horrible suffering and death and so can power-hungry men as well as men who think they can bring the world to a radically better state of affairs.

Our Manichean ways of thought lead us to believe that evil has invaded the Creation of a God who is all-powerful except when He's not. Surely, says Mani and his followers, evil can't be a part of true being, however defined. It must be a result of some defective and false being or even an Augustinian privation of being. I suspect this is why Catholic theologians and ecclesiastical leaders assumed that the birth-control pills (and related technologies) were the source of the breakdown in sexual moral order in recent decades. Suppose instead, a single technology brought both great

good, the relief of suffering, and also the possibility of sexual moral disorder, a disorder which was realized the decade before the birth-control pill hit the pharmacies, a sexual moral disorder which plays a major role, at least in my opinion, in the general breakdown of Western Civilization, the destruction of political and economic order which can be seen as the destruction of vast amounts of material and immaterial capital.

There is an article, *Penicillin, Not the Pill, May Have Launched the Sexual Revolution* at <http://www.sciencedaily.com/releases/2013/01/130128082906.htm>, indicating that the more troubling scenario might well be true. In the referenced article, we can read:

The rise in risky, non-traditional sexual relations that marked the swinging '60s actually began as much as a decade earlier, during the conformist '50s, suggests an analysis recently published by the Archives of Sexual Behavior.

“It’s a common assumption that the sexual revolution began with the permissive attitudes of the 1960s and the development of contraceptives like the birth control pill,” notes Emory University economist Andrew Francis, who conducted the analysis. “The evidence, however, strongly indicates that the widespread use of penicillin, leading to a rapid decline in syphilis during the 1950s, is what launched the modern sexual era.”

A little later in the article, we can read:

A few physicians sounded moralistic warnings during the 1950s about the potential for penicillin to affect behavior. Spanish physician Eduardo Martinez Alonso referenced Romans 6:23, and the notion that God uses diseases to punish people, when he wrote: “The wages of sin are now negligible. One can almost sin with impunity, since the sting of sinning has been removed.”

Such moralistic approaches, equating disease with sin, are counterproductive, Francis says, stressing that interventions need to focus on how individuals may respond to the cost of disease.

Noble goal. Replace moralism with individualistic utilitarianism. Neither is very attractive. Neither passes any good sniff tests for what might

be vaguely labeled 'truth'. Both are extremes in a way of thought which can be seen as Manichean in a general sense, a rejection of concrete reality in favor of idealistic views of created being which isolate good and evil. These sorts of views, Catholic 'Jansenism' or Protestant 'Puritanism' or the original pagan 'Manichaeism', sometimes even extended to blasphemous ideas of the Being of God Himself.

I'll not write the dozens of pages it would take to repeat even a summary of my struggle, largely on the website, *Acts of Being* at <http://loydfueston.com/>, to produce a better view, one which considers modern empirical knowledge in light of the Christian revelations which are a major part of the foundation of Western Civilization.

An intelligent understanding of reality, including human reality, can't be based upon the imposition of so-called ideals, *a priori* schemes, upon a reality which won't obey orders from human thinkers. Nor can any intelligent understanding of reality be based upon a literalistic reading of alleged truths from facts. An intelligent understanding of reality recognizes that 'brute facts' themselves, even the most brutal of 'brute facts', cannot be understood directly. An attempt to do so will result in literalistic distortions of reality; some philosophers have labeled such distortions of reality, distortions of created being, as 'Gnostic'. In many cases, perhaps most, 'literalistic' and 'Gnostic' are pretty much the same.

Neither moralism nor cost-benefit analyses form a suitable or adequate basis for understanding man as a moral being. Neither leaves open the possibility of some sort of true nobility in our human natures. Neither could play a role in the formation of any form of human community which we could possibly consider desirable.

# 480 Remodeling the Caboose as the Train Wreck Progresses

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1554>. It was finished and uploaded on 2013/02/28.]

With a new pope to be elected soon, the Internet as well as print publications are filling once more with suggestions about radical or moderate reforms. “Let priests marry.” “Ordain women priests.” “Be more liberal allowing reception of the Sacraments.” “Allow divorce and remarriage.” “Allow artificial birth-control.” “Re-consider abortion, use of embryonic stem-cells, etc.”

Similar periods of frenzied proposals for reform come with greater or lesser reasons in various levels of American government, often when the results of a particular election disagree with the recommendations of some part of the pundit class. Often the suggested reform is the elimination of the Electoral College.

These observations could lead to the criticism of efforts to build a better world in the way we might build a better car or house. The point I wish to raise here is a little different, though related. We can’t even make a truly better car, at least for anyone but a hobbyist, if we simply set out with goals focused on the hypothetical car itself. For nearly all users of a car, it must be designed to consider a greater context, the roads and what is to be moved and the needs to park it securely or even the possibility that we don’t need so many cars. Over time, this context corresponds to some fairly substantial understanding of the existing economy and society and polity, the existence of proper mechanics and the property crime-rate and existing or likely restrictions on use.

The West, and probably most of the rest as well, is being destroyed

in various ways; it's a slowly progressing train wreck. Do we Catholic Christians have problems that can be fixed by letting priests marry? Can we fix our economic problems by selling houses more rapidly to each other? By nursing each other or teaching each other's children? By selling body parts from lab-grown embryos to each other that we might live a good, healthy 90 years after retirement? Let's assume you choose a consistent program of reforms. Do you think it will really fix anything or just start a new round of power plays so that the pros and cons fight for control of the government to enforce one set of reforms on all of us? Or to undo reforms they deem unwise? Are we more than a reform program away from an all-out breakdown in social order? A civil war?

Despite the efforts of thinkers such as Kenneth Minogue (see [http://en.wikipedia.com/wiki/Kenneth\\_Minogue](http://en.wikipedia.com/wiki/Kenneth_Minogue)) and Alasdair MacIntyre (see [http://en.wikipedia.com/wiki/Alasdair\\_MacIntyre](http://en.wikipedia.com/wiki/Alasdair_MacIntyre)), we act and usually think as if our problems are so shallow that they can be fixed by some reform program, putting down a new carpet in the caboose as the train continues to crunch up against a cliff wall. We in the West no longer have a largely shared moral or cultural vision; Christians and atheists and neo-pagans don't even truly share a physical universe, let alone a morally purposeful world. We can't even talk to each other in meaningful ways, as MacIntyre noted. We have such an exaggerated view of our individualistic natures that we can't form coherent communities, as Minogue gave us reason to fear.

There were deep divides amongst the east coast colonists in 1776 and perhaps deeper in 1787 as groups at the Constitutional Convention carried out various conspiratorial schemes or obstructive acts. Yet, the misnamed Federalists and badly misnamed anti-Federalists shared a more than substantial heritage from Western Civilization. That heritage even resulted in understandings of reality which were plausible given what was known, though less plausible after the discoveries of Darwin and Einstein and the events of the two wars in which Europe tried to commit continental suicide followed by a string of stupid and criminal wars by the American Empire. We are heirs of the idiots and scoundrels who thought to reshape the world by throwing huge armies of Englishmen and Frenchmen against huge armies of Germans or the equally great idiots and scoundrels who thought to reshape the world by sending large armies of American young men into jungles or deserts occupied by peoples who didn't want to be reshaped.

We no longer have a living and worthwhile tradition to defend, not in

the traditional European Christian churches nor in the major countries of the West. We're in a position more similar to that of the Christians around 400AD who were heirs of a Church tied to a Roman civilization which was no longer seen as having much to offer the world, a civilization falling apart so that it seemed to Augustine and others that it might bring the Church down as well. Those Christians, and their pagan neighbors, found themselves largely incapable of even speaking about hypothetical futures because they'd inherited the view that Rome, so corrupt and so vulnerable to barbarian invasions or conquest by the East, would always be the Rome of the Caesars.

I don't know many supposedly well-educated Christians who know much about the history of their beliefs, about the work of Augustine and Gregory and others that proved to be the building of the foundation of Western, Christian Civilization. I suspect those pioneers of Western Civilization might well be astonished as they look down upon what happened from their efforts to carry forward Christian traditions, knowledge of the Bible, and some major pieces of pagan, Mediterranean culture. From what I've read, Augustine and Gregory both were pessimistic about the future but they did God's work as it presented itself to them and that proved to be good enough. In any case, neither Augustine nor Gregory were under any illusions that the decaying Roman Empire, something of a house for the Christian Church for a couple of centuries, could be reformed or even kept alive in a weakened state.

Some of the suggested reforms for our various communities, Catholic Church or the United States or the NFL, might well be good or at least worth trying. But they won't help in this year of 2013 or for years to come. We're morally irresponsible, devoted to keeping ourselves comfortable and to maintaining our favorite human institutions as the train wreck goes on. We ignore the disaster we are part of or sometimes even admit it to pretend we can stop it and magically undo the damage. I think we can greatly shorten the period of hardship, and lessen the chances that Christianity will shrink to a small size, if we face up to the situation and respond bravely in light of a true Christian faith or at least a well-motivated pretense.

I'll leave behind the analogy of a train wreck to make my main point clearly. We modern human beings are out of synch with reality, Christians most of all. A family line of animals out of synch with their environment will not prosper and might well die off. A human community out of synch with the greater world of which it is part, however limited or expansive

a view it might have of the world, won't prosper and might well die off, leaving behind barbarian communities lacking the higher sort of view which is necessary for a civilization or even a smaller-scale culture of a higher sort. Barbarians are often surprisingly capable in technological fields, if only because of a need to produce high quality weapons and they can produce individual cultural works anticipating a more noble future, but a barbarian is not capable of even understanding the concept of civilization, let alone being capable of building or maintaining one. That is a necessarily circular definition. How do we know, how did Ortega y Gasset know, that we are barbarians? Because we show no appreciation for the heritage of the West, don't generally recognize something is seriously wrong, and show no capability of fixing even specific problems such as our inability to educate our children properly.

If we Christians, or any other people in one region of the world or another, were to move on to building a new civilization, or re-forming an old civilization, it will be necessary to first regain touch with empirical reality, that described by the great thinkers of Western Civilization, most dead but a few still above ground. If we are to claim to speak in the name of the Creator, in any meaningful sense, we should have a better understanding of the Creator's work, a better understanding of stuff and relationships and the complex, multi-layered story He is telling, the story which is this world. We should at least be able to give a plausible explanation for the Creator offering to share His life with a primate, cousin to chimpanzees and descendant of creatures not so much different from the fish we have for dinner. We should be able to give a plausible, if vague and highly qualified, answer to the question: Where is Heaven and what is it like?

Dantè was able to give such an answer within the context of the world as understood by some of the best minds of his age and, some centuries later, Copernicus and Galileo gave us good reasons to doubt that answer. Later researchers showed Dantè's answer was definitely wrong, though he expressed some other truths on his wrongfully described journey.

Nowadays? We mutter something about there being no conflict between science and religion while waving our hands about in a spastic manner. There truly is no such conflict if science and religion are well-matched in sophistication and in recognition of reality as best understood at the time. There definitely is a conflict between science and religion when we deal with a science which has advanced to a sophisticated understanding, in part, of created being as described by modern, disciplined research and a religion

which still talks and teaches as if created being is what it was understood to be before Darwin and Einstein.

# 481 Conservative Politics in light of Evolutionary and Developmental Processes

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1557>. It was finished and uploaded on 2013/03/06.]

Kenneth B. McIntyre's review of the book, *Oakeshott on Rome and America* by Gene Callahan, was published at the website of the magazine *The American Conservative*. I've not read that book but my comments deal with basic lines of thought found in Oakeshott's major writings. In McIntyre's review, *Oakeshott vs. America* at <http://www.theamericanconservative.com/articles/oakeshott-vs-america-112/>, we can read:

So what is rationalism, in the Oakeshottian sense of the term? First, it involves the claim that the only adequate type of knowledge is that which can be reduced to a series of rules, principles, or methods—and thus it is also a claim that “knowing how” to do something is nothing more than “knowing that” the rules are such and such. Second, because of this denigration of practical knowledge, it is a claim that rational action can only take place following the creation of a theoretical model. As Oakeshott once observed, modern rationalism is literally “preposterous” because theoretical reflection can only occur after a practice already has made itself distinct and more or less concrete.

Finally, as Callahan points out, since rationalism is a mistaken description of human knowledge and its relation to human

activity, it is also an impossible way of acting, politically or in any other sphere. Human action, including political action, is inherently an engagement of practical reason working within a particular tradition or and attempting to follow through on some of the inchoate suggestions that the vagueness of the practice offers. The opposite of rationalism for Oakeshott is not irrationalism but authentic practical reasonableness. Thus, and contrary to many of his reading-impaired critics, his critique of rationalism is not a critique of reason but a defense of it against a false modern conception of it.

To use one of Oakeshott's favorite examples, if one has no knowledge of cookery, a cookbook is useless. If, on the other hand, one is an experienced chef, a cookbook is superfluous. The cookbook is relevant only in a situation where either the great majority of cooks are relatively inexperienced and there is a dearth of connoisseurs or in a situation in which the traditions of cookery are in a state of confusion and a reminder is needed of some of the tradition's neglected resources.

Oakeshott used the term "ideology" to describe the attempted application of this rationalistic style to political activity. The rationalist's or ideologist's desire is to solve permanently the problems of political life and leave everything else to administration. Yet politics isn't concerned with the search for truth. Instead, as Oakeshott noted, "it is concerned with the cultivation of what from time to time are accepted as the peaceable decencies of conduct among men who do not suffer from the Puritan-Jacobin illusion that in practical affairs there is an attainable condition of things called *truth* or *perfection*."

In Chapter 448, *Predators, Producers, Sheep, and the Love of Liberty*, I wrote about the conflict in the fundamental understanding of liberty between the views of Oakeshott and the views of libertarians. I wrote, "Libertarian versions of liberty seem, by a naive analysis of historical timing, to be founded upon what I'd call a semi-metaphysical principle sufficient to ground their pessimistic attitude towards government, which attitude seems to be a reaction against the strange monsters which arose in early efforts of predators and idealists and realists and simple folk to develop governments suited to the needs of modern complex societies[.]" and concluded "

Obviously, I'm closer to the views of Michael Oakeshott than to those of Ludwig von Mises. Oakeshott was one of the very few true conservative intellectuals in the 20th century. Amongst his other peculiarities, he considered the claims of the *Declaration of Independence* to be mere silliness, the stuff of delusions. It wasn't the case that Oakeshott had no principles and no respect for rights of some substantial sort. It was the case that he grounded his beloved Englishman's freedoms in flesh-and-blood, dirt, and history."

In my terms, different from but overlapping Oakeshott's understanding, I claimed that, "man is an empirical being in an empirical world. Again I don't 'reduce' man and his world to a simple empiricist chaos, but there is much work needed to be done before we can have a modern Christian view with the contextual explanatory power of the view St. Augustine developed 1500 years ago, a view which largely held until the early modern period and a view I'll partly—and only partly—revive as part of my effort to contribute to a modern Christian understanding of Creation."

From this viewpoint, we can see how a proper form of abstract reasoning can help in concrete reasoning. In Chapter 408, *The Need for Abstractions in Moral Self-understanding*, I claim with respect to *King Phillip's War*—see [http://http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://http://en.wikipedia.com/wiki/King_Phillips_War), a war waged by some of the Indian tribes of New England against the European settlers and some Indian allies, that:

Instead of moving towards a proper abstraction that would have allowed a defense of their own culture but also an understanding of the human good in a different way of life, the European settlers raised their particular way of life to a self-righteous ideal. A conflict of cultures was seen as a war between God's servants, the White settlers, and Satan's slaves, the Indians. This stream, which may have been nascent in Puritan thought from the time they first stepped into that wilderness region of the New World, developed fully during the lead-up to the war as the Puritan leaders dealt with the growing resistance of the Indians to the expansion of settled ways of life.

Those European settlers in New England were guilty of the mistake of ideology discussed by Oakeshott, but the mistake was fixable not by a retreat from abstract thought but rather by a better abstract thought.

This better abstract thought would be generally invisible to politicians and others working in practical fields; it would be embedded in the ways of thought which are part of a better-formed civilization, one we can form if we have the will. Human life has become so complex that even practical thought has a lot of abstract thought buried in it.

In the realms of politics and history, Oakeshott takes the same common-sense position that I take: schematic knowledge is largely false knowledge. I've written against this idea that schematic knowledge is true knowledge. For example, we most certainly can't rebuild someone else's country: see Chapter 415, *Why We Can't Build or Rebuild the Countries of Other Peoples*, For pretty much the same reason, we can't really build a good country for our own selves. We can put up infrastructure, gradually and a little bit ahead of need is best. We can build education systems and hope, if we are wise, for a great deal of flexibility, to allow response to the needs of individual students and also to new needs of the entire body of students as the world changes around us. Those responses should be experiments at the level of concrete human beings, particular teachers interacting with specific students in the case of education. We don't need educational theorists with half-baked doctorates nor do we need new ideas in education from marketing people at electronics companies or even publishing firms. Similar comments can be made about our medical systems, factories, and many other components of our country including most especially the military.

We should avoid too much design. Most certainly should we avoid designs which tightly constrain the options of future generations as I pointed out in Chapter 459, *Progressives Kill Progress in Future Generations*. Development that even allows for outright evolution, and the necessary death to specific institutions which are no longer needed, is ideal though perhaps beyond our current capabilities.

In one of my early blog essays included as Chapter 405, *Ways of Thought in the Modern West*, I drew some insights from the historian Carroll Quigley. He had claimed that Western Civilization is founded on the principles of moderate realism. I made it more explicit that moderate realism includes "modern science, in which category I'd place all disciplined ways of thought which accept reality. In the words of Professor Quigley, moderate realism is the outlook defined (loosely) by: The truth unfolds in time through a communal process." A little later, I wrote, "Moderate realism is unique in its basic willingness to be shaped by responses to reality and Thomism reached a highpoint of sorts by the teachings of Aquinas on the importance of the

act-of-being, his existentialism, and by his teachings on the formation of the human mind and moral nature by way of responses to environments. Under Thomism, or even less complete systems of moderate realism, philosophers and even theologians to some extent pay at least as much attention to sensory perception, to empirical data, as does a farmer or a road-builder. Under Thomism, there is no clear divide between theologians and philosophers and physicists, not because theologians or philosophers can dictate to physicists, but because they each have important ways of dealing with empirical data and penetrating more deeply into being and into the meaning of Creation and its various phases and parts. In this unified way of approaching God's unified Creation, we can see the truth of one of the teachings of St. Thomas Aquinas: We know even God through His effects in Creation."

Practical politicians in a complex setting, such as the Founding Fathers when they were doing something rather than spewing forth the occasional metaphysical gibberish, hold some understanding of reality. In the countries of Western Civilization, politicians dealing with very complex settings will hold a more elaborate view of reality than, say, Genghis Khan, but the worldview of even Winston Churchill was largely held in a subconscious way. More recent politicians in the West don't act as if they even hold any coherent view of reality, but that's a complex situation not yet well-described by historians.

I'll now try to explain how we can start the process of rebuilding a Christian civilization in the West or perhaps on the Pacific Rim or some other place. We need first to have a plausible, in fact—powerful, understanding of Creation, of created being—stuff and relationships and narratives. We need to have some good understanding of the story God is telling. Most likely, the proper understanding of this story will be a revised and greatly expanded version of the Augustinian understanding of human history.

We need first of all to pay proper respect to created being. Placing knowledge first, modern thinkers also place mind ahead of created being, where mind is considered to be something with existence independent of created being. In my way of thinking, more plausible in Christian terms and also in terms of modern empirical knowledge, the mind is the immaterial aspects, relational aspects of that extremely complex and flexible organ, the brain <sup>1</sup> Those immaterial aspects come from two processes. First are the

---

<sup>1</sup>Yet, in a fuller sense, the 'mind' or 'soul' includes the immaterial parts of heart and hands.

evolutionary processes which shaped that brain and also inclined it toward developing, more or less naturally, some very basic ways of thinking and learning. That brain and mind are then shaped by responses to created being, that of our own bodies and also that which lies outside of us. The reader wishing to explore this issue in terms of modern science could read such books as:

- *How Brains Make Up Their Minds* by Walter J. Freeman who is both brain-scientist and philosopher and an admirer of St. Thomas Aquinas,
- *Bright Air, Brilliant Fire: On the Matter of the Mind* by Gerald M. Edelman, and
- *Adaptive Thinking: Rationality in the Real World* by Gerd Gigerenzer.

Under the illusion that we have some sort of ‘mind-stuff’ independent of reality, minds capable of evaluating sense impressions and turning them into knowledge, we tend toward the view that we have schematic knowledge we can use to filter those impressions and to enforce some sort of order upon created being. This schematic knowledge seemingly comes from transcendental regions of pure truths. There is no evidence that we have minds independent in any way of the stuff and relationships around us. The assumption that we have those sorts of minds came from the efforts of ancient and Medieval thinkers to deal with a mystery they couldn’t explore: the formation of the mind in an entity seeming no more than flesh and blood, including a brain which seemed too well-formed to, for example, learn how to turn concrete examples, often quite disparate in appearance, into abstract categories such as ‘dog’ or ‘cat’. In recent decades, scientists have developed instruments and techniques to explore the ways in which human minds form and we can see mind embodied in brain connections and activities. These modern empirical results tell us mind is the same sort of embodied entity as human moral nature as discussed by Aquinas—see the above referenced *How Brains Make Up Their Minds* for a very good discussion of the Thomistic theory of intention, that is, of the formation of human moral nature by way of a goal-directed growth process.

We can ascend to more abstract realms of being, we can receive revelations from God, but even this knowledge of abstract being and of revelations come through the stuff of our bodies or the stuff around us. We have

brains inclined to develop in certain ways which were shaped by evolutionary forces over millions of years and those 'preliminary minds', in a manner of speaking, are more fully shaped by our active responses to reality. Modern politicians and Christian leaders and men of the West in general prefer to believe they can shape reality to the minds they imagine themselves to have.

# 482 Are Rational Political Arguments Possible in the Modern West?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1560>. It was finished and uploaded on 2013/03/09.]

The *Library of Law and Liberty* website has another interesting article, this time dealing with some of the thoughts of the American Jesuit, John Courtney Murray. In this article, “*The True Sage of Woodstock*” at <http://www.libertylawsite.org/2013/02/26/reconsidering-the-true-sage-of-woodstock/>, Richard Reinsch writes:

How can reasonable men and women reclaim equality over and above egalitarianism? The first principled step is to get right with our compromised *Declaration of Independence*. This *Declaration* both affirms equality in self-government and reconciles our deeply contrasting Lockeanism and Calvinist Christianity as the basis of our liberty. This is an American Thomism of sorts, a reconciliation of seemingly opposed principles on the head of deliberative republicanism. It’s probably our best hope.

I have confessed to believe, along with Michael Oakeshott, that it’s misleading and can be dangerous to think a stable political system can be well-founded for a nation by documents such as the *Declaration of Independence* or the American *Constitution*—see Chapter 481, *Conservative Politics in light of Evolutionary and Developmental Processes*. The general view expressed in that title, that the thought of Oakeshott is still more powerful

after being merged with the thought of the sociobiologist E.O. Wilson, will play a role in the rest of this essay.

A nation, established as the United States is now or emerging as it was in the decades around 1800 and for a while after, needs some sort of rules for its political, justice, and economic systems. And more. But the argument Oakeshott made throughout his career as a political philosopher, and most certainly my Darwinistically and Christologically expanded version of the argument, claims we can't impose those sorts of rules upon, say, a cluster of human communities which reside in the same area. Even if those human communities seem to an outsider to have very similar cultures, as is true of Afghanistan to the western eyes, there might not even be any such rules acceptable to most of those communities, partly because they are communities and not just groupings of individuals but perhaps because the environments and the developed state of those communities aren't appropriate for stable, larger-scale political or justice or economic systems.

Reinsch's article is largely an appreciation of the political thought of the American Jesuit, John Courtney Murray who believed strongly in the formal political structures developed by the American Founding Fathers. Murray is quoted in the article as saying: "Civilization is formed by men locked together in argument."

What happens when those men locked in arguments about meaningful matters have a different view of what the world is? Christians believe in a Creation, a work of the God of Jesus Christ, a world with moral purpose in its workings and its goals. Pagans might believe in a world of eternal return, a world perhaps itself rational and perhaps not. Utilitarians, to be a bit simplistic, believe the world to be merely a place of things which might be useful to our efforts to attain pleasure rather than pain. Far worse are those in the Modern Age, indeed they are found in all ages of men, who seek a rather more vulgar form of pleasure than Bentham and his followers would have ever allowed.

Argument too easily becomes combat, at first in words and then maybe with guns and knives and bombs. This happened even between the supporters of the Stewart's ideas of royal government and the opposing, initially unorganized, ideas of the non-conformists. Eventually, those ideas came together in the Cromwellian Republic with its respect for some ideas similar to those of the American Founding Fathers, ideas which proved to be somehow consistent with brutal massacres of Irishmen and Highland Scots as those same ideas in our American heads have proved to be somehow con-

sistent with the dispatching of large armies to inflict high levels of collateral damage upon the world. In any case, the followers of the Stewarts and the followers of Cromwell would seem to have more in common in understanding of the world than do modern Christians and many of our opponents. How can we Christians have rational arguments with them? How can they have rational arguments with us?

There is a lack of common beliefs, and the possibilities of violence, in our arguments over such matters as abortion. Moreover, most Christians seem to think like modern secularists though they insist they can do so and come to traditional Christian doctrines, at which point we see their thinking is no more than assertions linked to ideas pushed into their heads perhaps in Sunday School or CCD. These Christians provide information-theoretic arguments to support a contention that a fertilized egg-cell is human. They appeal to squeamishness and sentimentality with grotesque images for those, including probably themselves, who can't hold a moral belief unless violations of that belief produce disgusting results and great pain for some creature we can sympathize with. We need a Kantian categorical imperative against abortion rather than the traditional Christian teachings that "what might be human should be treated as human" and "human creatures belong to God in a special way because He has claimed us in that special way and not because we're inherently God-like."

Let me go on, though the situation would seem hopeless to a man examining our current mess through Christian eyes if that man were bereft of Christian hope and a strong enough faith in the goodness of God to carry him through some nastiness in this concrete realm of Creation. Let's recover a reason for hope and a way of showing our faith in God to be consistent with the empirical reality which is this concrete realm of God's Creation. In other words, let us have confidence in God as Creator. More on that later.

Reinsch describes Murray's 'American Proposition' in these terms:

Its components are human dignity, constitutionalism, government limited by law as given to America by the common law tradition, self-government as faith in citizens to exercise the duties of moral judgment in basic political decisions, and the constitutional consensus that forms the Proposition and serves as the basis for rational argument and the compromises that it forges. This is the deep background that enables "the de-

liberate sense of the community” effectuated by our republican institutions to be reasonable.

One interesting aspect of Murray’s thoughts in this area is his insight that political associations differ “from associations like the employer-employee relationship, voluntary associations, or married family life where ‘the forces of life itself’ define the association more than reason. Rather, the essence of the political association ‘is its rational deliberative quality, its dependence for its permanent cohesiveness on argument among men.’”

I’d say he’s as wrong in this claim as is anyone who thinks human nature can be split into only one of its aspects, mind and heart and hands. We can’t believe those with bloated and undisciplined hearts by a misunderstanding of mind. What can be said about a man can be said about a human community which is each of its members in the large. Each of us, however non-political we might think to be, is the entire polity in the small and the polity is each of us in the large, our minds and our hearts and our hands.

Yet, there is a sense in which Murray is right in associating political systems to the mind in a special way. Traditional thinkers would have claimed he was positing an ideal. I would say he was foreseeing a future development of human political systems or, as I have been claiming recently, political organs in the Body of Christ.

Political systems in this mortal realm are, in a strong sense, more mind than heart or even hands, but are not such in their ultimate development nor in their original states. In Chapter 418, *As Go the Immune System and Neurological System*, I argued that, “[a]nalogies can be taken too far and too literally, yet I wonder if we can apply to the human social organism, ultimately the Body of Christ, the example of a long-ago and primitive immune system ‘spinning off’ a neurological system,” and went to note that “[s]omewhat, that effort to distinguish between ‘self’ and ‘non-self’ led to a central nervous system, ultimately thought, as well as to defenses against diseases.”

I also proposed this as an important question for Christians:

Government as we know it has grown out of systems to identify unfriendly or alien human beings (or sometimes to subjugate the other) or to protect against non-human dangers to the physical and moral aspects of our communities. As we mature towards the Body of Christ, is our government going to split into

a policing (immunological) system which operates with some independence but under conditions where it has only as many resources as it needs for the task at hand and a planning and thinking (neurological) system which plays a role in the ongoing functions of the parts of the Body but also plays a central role in understanding the environment of that Body and planning for the future?

I don't know the answer to that question and think that some future Christian thinker might propose an alternate and more meaningful question about the ultimate state of the political organs in the Body of Christ. In any case, it's time for Christians to relearn the art of Christian thinking, an art which can lead to a truly Christian understanding of Creation and to a refounding of a Christian civilization, whether it's based in the West or in Asia or on the Pacific Rim. We have to recover the confidence in God in His role of Creator which is expressed in the philosophical school of moderate realism whose true nature was expressed well by the historian Carroll Quigley as "Truth emerges in time through a communal process" and expanded by me to "The human mind develops in time through a communal process." Once, if imperfectly and incompletely, the Western mind, at least the minds of Aquinas and Shakespeare and Newton, were encapsulations of some understanding of this world, and more, and those encapsulations were images of some major part of Western Civilization as it developed. There's still more: I've claimed that Western Civilization is the most complete embryonic Body of Christ we've yet seen. It might be dying in the West and might come to life in some other region, perhaps Asia or the Pacific Rim, but the pilgrim Body of Christ will live and we will know it by its strongly Christian understanding of created being.

Developments which emerge in time can be expressed in written documents, but those words on paper can only provide a snapshot of the emerging and developing and evolving entities. Any efforts to stick with those documents as the Body of Christ matures, or as history moves forward—in non-Christian terms, will lead to a nation no longer holding a plausible understanding of itself, no longer having a plausible way to order its political activities. Yet, the origins of the political organs of the Body of Christ are still with us. Deflected from healthy development, those organs will yet recognize the alien, whether the European Jews of the 1930s or the Leftist radicals of the 1950s (even the anti-Stalinists) or the Islamists of the

21st century. Even domestic police might get into the act, waging war first against violent and brutally exploitive drug-lords and then against everyone who pops a pill or smokes a joint as they waged war against everyone who drank a beer or a martini not so many decades back. There remains yet the possibility that American Christians will get some of the treatment that some of them are advocating for those Islamists.

We're a long way from having the sort of political organs which can show mind-like attributes, at least on a consistent basis. For now those mind-like attributes seem almost like a strange dream in the midst of a West which is lost in the Cosmos as Walker Percy said. Until those mind-like attributes develop at the communal level, rational argument at the individual level will be sporadic and marginal, not even to be found at many universities from what I read and hear. The opposite is also true: until individuals are capable or and willing to engage in rational argument, the mind-like attributes will show sporadically and in marginal ways in our communities. We're not dealing with simple systems with easily stated cause-and-effect relationships but rather with the sorts of complex systems which mathematicians and biologists and political scientists and others have only recently begun to study.

And so I return to a more fundamental level to claim that rational argument doesn't bind together a civilization and certainly doesn't form it. A common story of what exists, of Creation in Christian terms, binds peoples together in a civilization, an embryonic Body of Christ, most of which have miscarried. Human beings, individual and communal, can adopt the story, learn to live by the story, and develop together. Rational argument can exist within that story and perhaps between those who hold differing stories.

Rational argument about meaningful matters between different groups isn't even possible unless those groups already share at least some version of the story and stories underlying a large-scale, 'multi-cultural' community. Even if multiple civilizations come to exist, they will inter-communicate on rational terms only to the extent that they produce men like the old-fashioned Jesuit missionaries, St. Francis Xavier and companions, who were able and willing to embed themselves in the ways of another civilization while holding on to their Christian faith.

Rather than trying to lead a return to the *Declaration of Independence* or the *Constitution* of the United States, rather than compromising their own faith in the interests of moralistic campaigns, American Christians

should get to work on figuring out how to live the Christian life, in their minds and their hearts and their hands, in this age decaying into barbarism. I'm doing my part by trying to produce what I call a worldview, an understanding of our world and of all of Creation in light of Christian revelations. My efforts will produce something good to the extent, and only to the extent, they are part of a greater communal effort, an effort of businessmen and musicians and artists, of scientists and poets and spiritual leaders, of engineers and house-builders and retailers.

# 483 The Foolishness of Overriding Development Processes

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1570>. It was finished and uploaded on 2013/03/22.]

I've argued repeatedly that we need to accept that we live in a world of evolutionary and developmental processes. This isn't just a matter of intellectual correction. Much of the suffering in recent centuries was caused by our prideful attempts to control dynamic entities, even our own children, as they go through maturing processes of various sorts. Many acts of mass-murder by revolutionaries, many imperialistic acts so damaging to other countries, were the result of efforts by self-defined elites to create a brave new world of some sort.

Most of the alleged beneficiaries of these acts of conscious or unconscious cruelty had, and have, enough self-respect to at least resent all that we could label as social-engineering, including the replacement of troubled neighborhoods by high-rise concrete crime zones. That resentment is only part of the reason for the failure of urban-planners to turn Harlem into a prosperous region of New York City, the failure of social-workers to rescue children by destroying what's left of family ties, the failure of Judge Garrity to raise the quality of education for African-American children in Boston by putting them on buses for hours each day, and the prior failures of Bolsheviks and Maoists and others to transform their countries into workers' paradises. The methods themselves, even if they had been implemented with the self-sacrifice of the Ukrainian Kulaks or that of the prosperous Iraqi middle-class, were grossly defective, out of touch with re-

ality. These grand projects of rebuilding Harlem or building a new nation in Iraq or rebuilding Haiti (see Chapter 415, *Why We Can't Build or Rebuild the Countries of Other Peoples*) are efforts to impose human schemes upon God's world. Don't try to fool Mother Nature and don't try to force the Creator's hand. The results can be ugly and painful. It's far better to work with Mother Nature and her Boss.

Jane Jacobs saw the problems in urban-planning schemes early on. Wikipedia's article about her, see [http://en.wikipedia.com/wiki/Jane\\_Jacobs](http://en.wikipedia.com/wiki/Jane_Jacobs), begins:

Jane Jacobs (May 4, 1916 – April 25, 2006) was an American–Canadian journalist, author, and activist best known for her influence on urban studies. Her influential book *The Death and Life of Great American Cities* (1961) argued that urban renewal did not respect the needs of most city-dwellers. The book also introduced sociology concepts such as "eyes on the street" and "social capital".

Jacobs is well known for organizing grassroots efforts to protect existing neighborhoods from "slum clearance" and particularly for her opposition to Robert Moses in his plans to overhaul her neighborhood of Greenwich Village. She was instrumental in the eventual cancellation of the Lower Manhattan Expressway, which would have passed directly through Washington Square Park, and was arrested in 1968 for inciting a crowd at a public hearing on the project. After moving to Canada in 1968 she joined the opposition to the Spadina Expressway and the associated network of expressways in Toronto planned and under construction.

Development and evolution aren't pain-free paths to perfection. There's plenty of pain and this world is mostly made up of ad-hoc entities which are good enough for now but might have to be far different next year, let alone a century from now. The world doesn't stay put long enough for it to even be desirable for us to attain a state of perfection. If we could attain such a state during our lifetime, it wouldn't be perfection by the time we attained it.

It's a fact in this world that evolution and development sometimes lead to deaths and other ends of something once good or potentially good, yet,

evolution and development are the ways of this world. Though change can often appear suddenly, as a result of external events or as a result of the buildup of stresses which unleash at once, this is mostly a world of gradual processes, at least in the macroscopic realm of things.

Yet, evolution and development are the ways of the world, the ways chosen by the Creator. To be complacent and not to try to make things better is a sin for a Christian; to try to enforce our desires and schemes upon the world is also a sin for a Christian. We are called to cooperate with God's world, the story He's telling, and to try to bring about as much good as possible. Not to try to ease all pain and suffering but to bring about as much good as possible. Those are different goals and conflict with each other.

What about American cities? Some of them were magnificent and livable at least into the World War II era at what now seems the end of a great expansion of prosperity for all American workers, from ditch-diggers through engineers and on to industrialists. By way of human beings living together, neighborhoods developed and no one cared that those neighborhoods were homogeneous, neighborhoods of Italian-Americans or Irish-Americans or African-Americans. Some cities dominated by conservative ethnic groups even had neighborhoods of artists and wannabe artists, true Bohemias. Those neighborhoods were mostly at peace with each other and shared many public squares.

By the 1950s, something had gone wrong, and urban renewal programs shifted into higher gear to rebuild neighborhoods such as those in Harlem for which the description 'troubled' is an understatement. The experts had arrived and were working as if guided by a sinister invisible hand to make things far worse, even threatening to modernize New York City by a highway project through the middle of Manhattan which would have destroyed much of the city, including Washington Square, where Jane Jacobs lived. She set to work. She was right. Now, truer experts, those who study reality and those who think about ways to make things better rather than thinking to make a new reality are still at work, as they will be so long as there are human communities in this mortal realm.

This is an interesting article about work done by one of those experts, Katherine King of Duke University: *Jane Jacobs Was Right: Gradual Redevelopment Does Promote Community* at <http://www.theatlanticcities.com/housing/2013/03/jane-jacobs-was-right-gradual-redevelopment-does-promote-community/>

4917/". She even found it conducive to good neighborhoods to have residences with their own direct door to the street, townhouses rather than flats or other sorts of multi-unit buildings. An interesting finding, one which makes some sense after being established as a fact but it wouldn't have likely been conjectured by someone working from some schematic representation of reality any more than Darwin himself could have anticipated the many strange and inconvenient facts he discovered.

I don't know if we Americans will ever learn better, but we'll soon be forced to act better as we realize we are no longer an extraordinarily wealthy nation.

## 484 The Fragmented States of America

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1586>. It was finished and uploaded on 2013/04/10.]

An article about the analysis of monetary flows in the continental states of the U.S. tells us, “By combining network theory with the travels of our dollar bills, the ‘real’ effective boundaries in a new USA are far simpler, reflecting where money ‘stays’ as opposed to more arbitrary state boundaries.” These mathematical analyses result in 8 such regions where “money stays.” The resulting map can be found in the article, *The 8 United States Of A New Monetary America* at [//www.zerohedge.com/news/2013-04-07/8-united-states-new-monetary-america](http://www.zerohedge.com/news/2013-04-07/8-united-states-new-monetary-america). There is also a link at an open-access science website to download the article summarizing the mathematical analysis. This study looked at the regions as replacements for the 50 states in a continuously existing United States, but I’ll shift to the idea that these regions might well define sovereign nations—at least until processes of federation produce a more coherent republic at a larger scale.

What I find interesting is that the regions correspond well to those proposed by a Russian academic, Igor Panarin, who proposed in the 1990s that the United States is politically incoherent and would collapse as a nation and form into regional nations—see *As if Things Weren’t Bad Enough, Russian Professor Predicts End of U.S.* at <http://online.wsj.com/article/SB123051100709638419.html>. It also corresponds to regions I’ve seen proposed, seriously and tongue-in-cheek at the same time, because of cultural differences within the United States. For a variety of reasons, I’ve also claimed that a similar breakup of the United States into such regions would produce more coherent political systems and also more coherent cultures.

Once able to live as independent political and economic and cultural communities, those regions would, in my opinion, be wise to move toward a smoother integration into a North American or even western hemisphere federation.

Powerful armies and predatory banks can both be used, and arguably are being used in Europe and the United States, to protect centralized powers which would be endangered by even the attempt to reorganize countries or institutions so that they are more coherent, in both structural ways and dynamic (narrative) ways.

I would emphasize that a federation still larger than the United States makes good sense and would seem a logical development in a world I believe to be the story of the formation of the Body of Christ, an all-inclusive human civilization in which the most important organ is the Catholic Church. Under this viewpoint, the end-point in this mortal realm would be a Christian civilization which includes the entirety of the human race as well as a bewildering network of networks of nations and worship communities not fully under the ecclesiastical hierarchy, of educational institutions and symphony orchestras, of businesses and nature clubs, of extended families and urban neighborhoods,

For a discussion of how I think human communities should develop, see Chapter 481, *Conservative Politics in light of Evolutionary and Developmental Processes*. Don't expect a description of desirable communities nor a recipe of how to build an allegedly good community. Human communities are more like organisms than machines, potentially like a world in the sense of a coherent narrative and not like an engineered building. Clearly, no one intended for these regions of more coherent cultures, regions which also are where the "money stays" to develop. No government agencies regulate them and their cultures or flows of money. In fact, government agencies try to encourage or even force the homogenization of culture and economy on the national level.

These regions developed despite the desires of the American central powers. They developed because of processes involving both individual human beings and small communities of human beings and the way they interact with others.

# 485 Getting Public Religious Issues Upside-down and Inside-out

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1601>. It was finished and uploaded on 2013/04/22.]

This article, *What Keeps the States United?* at <http://www.theamericanconservative.com/articles/what-keeps-the-states-united/>, is a well-written and clearly reasoned review by Joseph Baldacchino of a book, *Rethinking the American Union for the Twenty-First Century* edited by Donald Livingston. (I haven't read the book though I've read writings of some of the authors.) It deals with the general problems in American political and economic and cultural communities which I discussed in Chapter 484, *The Fragmented States of America*. The review comes to a conclusion similar to my claims, though I would have gone beyond words about 'Christian traditions' to write of communities actually shaped in response to the Creator and His work in a special way, a way at least hinting of what we will be in our individual and communal human beings if we are chosen to enter the completed and perfected Body of Christ. I also concluded that we're not capable of reforming the United States as it stands and would be wise to voluntarily separate into smaller republics which could then start the hard and multi-generational work of doing it better, even to rebuilding not just the United States but a larger scale North American or even Western hemispheric republic or "federation of republics."

It's clear there are very deep political and other problems in the United States in this year of 2013. The wrongful ideas and attitudes and ways of

acting which underly those problems probably originated in the West in general and—I think—were nurtured most tenderly in the United States. See Gore Vidal's novel *Empire* for a view of our corruption around 1900 from the viewpoint of the likes of Henry and Brookes Adams as well as men of political action such as John Hay. I've also read works by other thinkers of that time who came to a similar conclusion, such as the Irishman W.E.H. Lecky or Lord Acton who was worried about the damage Americans would do to themselves and their country if American leaders meddled in the complex affairs of Europe and Asia. Our leadership elite has been bad for a long time—Tocqueville found them to be scoundrels in the 1820s, as soon as the Founding Fathers' generation was gone. Yet, we can't blame them entirely. Better men, such as Ron Paul, arise sometimes and we're not interested. In the likes of George W. Bush and Barack Obama, we have the leaders we deserve, even the leaders we want in some sense of 'want'.

So things are bad and Mr. Baldacchino is here to tell us what I also tell my readers: very fundamental reforms are needed, not short-term, painless, technical fixes. Here are his concluding paragraphs:

Like many conservatives, the book's authors seem to think that the principles of the U.S. Constitution could be revived if only more people could be persuaded of its correct interpretation. But the original Constitution and its liberties presupposed Americans with certain character traits and cultural habits. The moral, religious, and social practices prevalent in America in the 1780s were grounded in a Christian and British tradition. Only a society with that kind of public ethos would pay more than lip service to a Constitution of checks and balances.

Returning to the Constitution of the Framers would require nothing less than a revival of the kind of civilization and character type from which it is indistinguishable. This cannot be accomplished quickly, through political speeches or decisions. It would require protracted moral-cultural regeneration of Americans, one person at a time.

My title doesn't refer to either the reviewer or the authors in the book getting public religious issues upside-down but rather to the lack of understanding on the parts of the leaders of American Christian communities, the

American Catholic bishops and other Catholic leaders as well as the Protestant leaders, ordained and lay. In their current battle in favor of religious freedom, they have gotten wrong the main point of the above paragraphs from Mr. Baldacchino's review: the Constitution is grounded upon Christian beliefs as manifested in a particular British cultural tradition. Our sorts of freedoms come from Christianity and whining as if the Constitution is what allowed Christians to be 'free' in a Western Civilization of mysterious origin shows ignorance, cowardice, and faithlessness.

The religious and other freedoms implicit or explicit in the Constitution weren't a result of the words or the political struggles at the Constitutional Convention but rather the background of those words, the background from which those various freedoms emerged after centuries of struggle by Christian peoples to overcome the temptations to misuse of power which seemed to overwhelm the Western Christians as soon as they came into power. The overcoming of these temptations involved, among other complex events, the renunciation of certain advantages of power and wealth by their holders, Popes as well as princes and kings and merchants and rentiers. The actual history is certainly ugly, perhaps at its worst when it is decent and morally well-ordered men who regress to an abuse of power, usually in an effort to reach a greater good.

The result was ugly even after some had learned lessons from the disedifying wars over the control of a people's religious communities, the persecution of a Galileo who wished to simply pay attention to the Creator's works, the burning of Servetus and Hus by Calvinists and Catholics respectively. Over the succeeding centuries, political theories which justified rights and freedoms matured and were sometimes enacted in governmental structures and definitions of power. Yet, we still look at matters in the way I phrased it in the previous sentence and that is wrong, dualistically wrong in the eyes of a Christian. In fact, theories were, as usual, the description of empirical realities however dimly seen, however imperfectly and incompletely realized as the theories were being formulated. Yet, we modern men, including nearly all practicing Christians, have swallowed the modern liberal story of Western freedoms being a matter of some sort of progressive recognition of some allegedly metaphysically grounded rights. (See my book, *Human Rights: An Evolutionary and Christian Perspective* [47], for a radically different take of these modern rights and the allied freedoms. My take is both Augustinian and Darwinian.)

These rights and the allied freedoms were earned by sweat and blood

and tears and are not to be found in some metaphysical realm of truths accessible to the mind of any human individual but are rather the result of evolutionary and developmental processes in mostly the communal human being of the Christian West. Those rights and freedoms were largely character traits of Christian communities from the Western traditions. The modern political theories, at their best, were descriptions of a well-ordered Christian's mind and heart and hands, where 'Christian' points toward communal human being even more than individual human being.

If the Western realms, including the United States, are losing their formal respect for freedom of religion, then it's a result of the losses on the part of Christian communities. Fewer Americans and Europeans are truly attached to Christian communities, and this lack of attachment covers many who still show up most Sundays to attend Mass or other worship services. Even those attached to Christian communities seem not to have a true Christian understanding of the rights of Anglo-American traditions, typically seeing those rights in the way advocated by secularists. The American Catholic bishops and intellectuals seem to have mostly accepted this secularist justification of freedoms and rights. (And this secularist justification is probably derived from unhappy branches of Christian natural-law thought; there is a vicious circle of sorts being traveled, most especially in various Christian ghettos of thought.)

Christian communities of the modern West are more often than not gatherings of individualistic Christians cut off from a living tradition or sometimes gatherings of Christians trying to be in communion with each other in ways which were part of earlier phases of God's story.

If we Americans would enjoy the benefits of Christian civilization, Christian rights and freedoms, Christian political structures, Christian culture, then we as a national community must be predominately Christian. What we have lost in our political and economic and cultural communities can be described as "ways of the West", including the more particular ways of the Anglo-American regions of the West. If we've lost some of our most important freedoms, we've done so because we've not properly cared for and loved our communities which have, as a consequence, decayed to states of weakness and relative disorder. As Mr. Baldacchino says in his review: "Returning to the Constitution of the Framers would require nothing less than a revival of the kind of [British and Christian] civilization and character type from which it is indistinguishable. This cannot be accomplished quickly, through political speeches or decisions. It would require protracted

moral-cultural regeneration of Americans, one person at a time.” I’d purge the term “one person at a time” and insert something like: “in an iterative and recursive process involving individual human beings and old or new communal human beings.” A creature in such a world as this can enjoy only limited freedom if trying to be a freestanding individual. True freedom can come only when we share the life of God and that comes only when we enter fully into a Biblical religious community, when we accept the communal human being of the Body of Christ (or the People of Israel) as our own and contribute all we have and are to that Body.

Over the past two centuries, American and the British peoples have passed on their Christian beliefs and the closely connected traditions of particular political and moral order in an increasingly weak, hollow-chested, form. By cutting the communal ties, we cut ourselves from the tradition, the links, that would tie us to the historical events in which God revealed Himself and His plans for us, however little the greatest of Christian thinkers have understood those revelations. The Constitution is merely a piece of paper without those Christian beliefs and British manifestations of certain Christian traditions. Logically enough, our politicians and judges treat the Constitution as a paper covered with words which mean what they wish them to mean at any instant, any point of fruitful crisis. Christian leaders, including American Catholic bishops, should be worried about their failure and the failure of their predecessors to nurture Christian beliefs in those under their care, the failure to pass on some manifestation of Christian traditions. It’s quite possible that much of this failure is due to forces beyond their control, but they have the duty to be honest with their own selves and with their fellow-Christians about this situation. We don’t need any Bishop Alfred E. Neumann: “What, me worry?”

In any case, we aren’t losing our religious and other freedoms because politicians or judges suddenly decided to take them from us. Rather is it the case that our ancestors long ago began a gradual process that we’ve continued: step by step, we’ve passed on progressively weaker versions of Christian belief and traditions until many decided it wasn’t even worth going to Mass or other services if, for example, God had gained the interesting trait of all-forgivingness. We tore ourselves from our communal human beings so that we could become modern, radical individualists. Gatherings of such individual human beings have nothing to do with the Biblical traditions of religious communities being shaped by God: the people of Israel in the Old Testament and the Body of Christ in the New Testament. We

modern American Christians, in fact—all Americans, are no longer peoples capable of being free nor are our Christian leaders capable of being the leaders of free peoples. We rely on the Constitution's illusory promises, once well-grounded to be sure, when we should be learning how to share the true freedom of God.

I'll invite the interested reader to explore my ideas about individual and communal human being in my blog writings at *Acts of Being* [38] or in my recently released, downloadable book, *A More Exact Understanding of Human Being* [53]. In part, this book develops an understanding of the Body of Christ in which the Church is the most important organ and not the entirety of that Body. I think that we've passed into a part of God's story which is so complex and rich as to overwhelm our priestly orders and the lay bureaucracies which are the institutional church. If I'm right, recovery will come as new Christian communities develop to deal with educational matters as well as to handle relationships with political and economic and cultural institutions. These new communities won't exclude ordained men, religious men and women, or lay employees of Church institutions, but these new communities will not be under the control of the official Christian institutions. For at least the beginning of an approaching reform and revival—which might be very painful, the new instruments of a greater Christian civilization will likely be dominated by the laity outside of Christian institutions.

## 486 Conspiracies Confirmed!?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1604>. It was finished and uploaded on 2013/04/29.]

This essay is written in response to an article which is highly rational and not ‘conspiracy-minded’ according to the current mind-set: *Everything Is Rigged: The Biggest Price-Fixing Scandal Ever* at <http://www.rollingstone.com/politics/news/everything-is-rigged-the-biggest-financial-scandal-yet-20130425>. This article deals with the price-fixing activities of money-center banks and allied financial institutions, activities which are proving to be wider ranging and larger in scale than even cynics, or even-even ‘conspiracy theorists’, had guessed. I’ll return to this article’s topic after dealing with some slightly more general issues.

Any coherent response to the title, *Conspiracies Confirmed!?*, depends upon the definition of ‘conspiracy’. There are those who see grand conspiracies, many of whom are good thinkers and are capable of honestly dealing with evidence of large-scale criminal acts on the part of political or military leaders, officers of criminal investigation agencies or national security agencies, bankers or executives in the petroleum industry. The list is somewhat open-ended though we can rapidly run out of potential criminal conspirators who are meaningful on a national scale or even the regional scale of a large country such as the United States. When we move down toward city streets, we’re speaking of the variety of neo-Nazi, African-American, Latin-American, and other gangs which fill—very roughly—the ecological niche once dominated in some cities by the Mafia and related gangs. Those who understand the nature of these street-level criminal conspiracies insist on thinking that there are no corresponding gangsters and criminal conspiracies at the level of the centralized governments. The great historian, Lord

Acton, writing in an age of far less moral decay, told us that the problem with powerful centralized governments is that they attract men with the moral characters of gangsters. (Along with a larger body of men willing to go above and beyond the call of duty and a much larger body of ordinary decent folk who just want to be paid for a day's work while accumulating benefits toward retirement.)

Criminals are many in all ages of men and in a morally disordered age will operate in a manner almost open. The United States is morally disordered for sure and so are the remainder of Western countries. After a couple centuries of destruction of their social order by colonizers (including American and British drug smugglers from as early as the 1700s) and then their own home-grown communists, China seems to be even more damaged than the United States.

Disorder reigns, despite the number of human beings who are at least decent when times are good and a fair number of human beings with deeper moral integrity. (The weaker and less discerning have shown surprising strength in community when they've had good leadership; as examples, consider the individual families or parishes or towns who risked their own lives to help Jews and other victims of the Nazis, but, so far as I know, only when leaders were strong and of good moral character.) At all levels of the West and China, of most African and Latin American countries, in all realms political and economic and judicial, there are pockets of gangsters who engage in various sorts of battles against each other and against the befuddled general citizenry as well as a scattering of would-be honest political and other leaders who are now in quite over their heads. The gangsters battle each other in the way of barbarian warriors who are fighting for the right to loot from the general citizenry.

Gangsters. Merely criminals and not wizards of great occult power. Some of these gangsters are pirates and some are failed and incompetent Alexanders. (See *Pirates and Emperors* at [https://en.wikipedia.org/wiki/Pirates\\_and\\_Emperors](https://en.wikipedia.org/wiki/Pirates_and_Emperors) if you've never heard the story.) These criminals leave behind tracks not so hard to see, if not so grand as those of Alexander, but we modern Americans, and others in the West to a lesser extent, insist on seeing our leaders in terms perhaps appropriate to the generation of leaders known at the Founding Fathers, men who were sinners like the rest of us but also more noble in many of their public activities. Even our two would-be Napoleons, Aaron Burr and Alexander Hamilton, were at least interesting men of moral substance,

not mere thugs as nearly all leaders of the modern West have been, including the ‘great’ presidents of the United States. We try hard to fit what happens into the narratives pushed into our heads during our public school days but it be impossible to fit *Operation Keelhaul* (see [https://en.wikipedia.org/wiki/Operation\\_Keelhaul](https://en.wikipedia.org/wiki/Operation_Keelhaul)) and related operations against civilian refugees, the War Against the Vietnamese Peoples, the Cold War as a whole, the take-down of the Twin Towers (impossible that the government’s story is true according to any firemen or engineers I’ve found willing to talk even ‘in secret’), the current and ongoing theft of the assets of ordinary Americans to keep money-center bankers, central-government politicians, and military contractors flush with cash. This is just a sampling of historically recent, large-scale criminal conspiracies for which we have detailed facts or at least strong evidence of the circumstantial sort.

This stuff simply doesn’t fit into the narrative most Americans and Europeans hold even when we add in some well-known aspects of the Gilded Age and its Robber Barons, most of whom seem to have at least been competent thieves who didn’t need to destroy a billion dollars of wealth to steal a few tens of millions. With these odd facts sticking out all over the place when anyone tries to fit them into the stories we were fed in American high schools—many weren’t bad stories for teenagers who need to have higher standards before learning about sinful men—then some will try to generate their own narratives, sometimes involving grand mystical conspiracies run by Illuminati or Freemasons or other wizards behind the screen or the *Comintern or Communist International* (see <http://en.wikipedia.com/wiki/Comintern>) which was created to “fight by all available means, including armed force, for the overthrow of the international bourgeoisie and for the creation of an international Soviet republic as a transition stage to the complete abolition of the State.”

So there are some gangsters, ideological or other, who admit to enough that the conspiracies aren’t even secret. Over time, the victims and others also come to know about many individual criminal conspiracies (projects), such as criminal exposure of workers in an industry to poisonous substances or bid-rigging for highway construction or laundering of drug-cartel money. We now learn from, Matt Taibbi, an honest and insightful investigative journalist, that *Everything Is Rigged: The Biggest Price-Fixing Scandal Ever*.

The money-center banks and some other well-placed financial big-boys

have been systematically colluding to set precious metal prices as well as a variety of loan and investment rates, in the process stealing from municipal governments, school districts, states, entire countries, the endowment funds of charities, pension funds, those who borrow to buy houses or cars or iPads; all of us. Anyone who's borrowed money or put money in the stock markets or bond markets in recent decades has had their pockets picked. So far, the American and other regulators have let them off with fines which were a fraction of executive bonus pools and, when some of the injured parties brought civil suit, a judge let the banks off after the lead attorney for the rate-collusion defendants argued that "while the banks may have lied to or cheated their customers, they weren't guilty of the particular crime of antitrust collusion." Taibbi adds, "This is like the old joke about the lawyer who gets up in court and claims his client had to be innocent, because his client was committing a crime in a different state at the time of the offense."

Essentially, they defended themselves by saying those who thought the banks were anything other than self-interested parties getting together to collude toward their own greater profits had deluded themselves and deserved what they'd gotten.

We still probably know only a part of the greater story—more of these schemes are coming to light, but what is known paints a picture of a vast conspiracy which is pretty much a bankers' version of a Viking invasion, probably complete with starving or enslaved masses before our economic problems are over. It's likely that these schemes have been the proximate cause of our current economic and political disasters. I say, "proximate," because much of the world was fragile after centuries of exploitation of various sorts and the countries of the West had been keeping open their self-inflicted wounds from World War I and other strange and stupid events. Since few are even talking about those problems, major collapses of our institutions, including entire countries, would have come at some point even if we and our leaders were honest in the more personal ways.

You can't solve the problems you refuse to acknowledge and to investigate whether those problems are criminal conspiracies or the problems of a civilization with eroded foundations. But this is odd. As I noted near the beginning of this essay, those who see street-level conspiracies (involving a few millions at their grandest) refuse to admit that larger opportunities, the wealth controlled by large countries or money-center banks or the power of the American military, will simply draw more ambitious gangsters. In a similar way, those who speak of moral decay in such matters as sexual

behavior or cultural standards refuse to see the decay is still more advanced in our political and economic behavior, in our government and business and religious institutions.

# 487 Does Expensive Weaponry Undo Western Traditions of Liberty?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1607>. It was finished and uploaded on 2013/05/02.]

Despite my—so to speak—metaphysical biases toward empirical knowledge, I carry with me a human respect for ‘ideals’, loosely defined, so that I don’t like the idea that liberty is gained and held by a balance of weaponry between the citizenry and their government. I do accept the arguments in the end, partly because the number of innocent human beings murdered by evil or psychotic private citizens is vanishingly small compared to the number murdered at the orders of the political leaders of centralized governments, including the United States as well as the British Empire, the German Reichs, the Tsarist Empire and Soviet Union, Communist China, and so on. For example, retired high-level CIA and U.S. military officers, as well as a handful of journalists with moral integrity, have supported the estimate of 176 children being killed by Obama-ordered drone strikes in Pakistan alone. Maybe if we were more worried about American government crimes, then we wouldn’t have such a problem with large-scale killings in the United States. Europeans should be able to make similar statements.

We Americans, and most Europeans, have been living for generations in an oasis, surrounded by the deserts our own leaders, business and cultural as well as political, were creating throughout many regions and realms of our own countries as well as the colonized or otherwise exploited countries of Latin America and Africa and Asia. We were protected by some sort of magical field that protected us from those who would enslave us in various

ways. And then the urbanized, middle-class and upper-class Russians found out what it was like to be a serf. The Jews of Germany and, in a lesser but significant way, the Christians and non-believers of Germany, discovered what it was like to be at the wrong end of the weapons of brutal rulers. Now, to their great surprise, Americans and others—including Germans once again, are learning a brutal truth of history—allow yourselves to become dependent upon centralized powers and those dependencies will eventually be used against you.

We are particularly vulnerable now, circa 2013, to be pushed back into serfdom. There are various reasons for this but one has to do with those guns and other weapons. In *Tragedy and Hope*, published in 1966 and available on the Internet as a pdf file, Carroll Quigley said that the modern ‘democratic’ forms of government as well as the various modern ‘rights’ of individuals are endangered because the governments of the world can now afford and can use weaponry more expensive and more powerful than that available to the ordinary citizenry. Under this way of thinking, which certainly carries some truth, the American colonists were able to successfully rebel against the British government in 1775 because the weapons available to the British army were, at best, as good as the hunting rifles owned and often used by many the colonists. The British cavalry were mounted on horses, at best, the equal of those ridden by the horsemen under the command of “Light-Horse Harry” Lee or Marion Francis. This is not to deny the general superiority of the British army and the unlikelihood of rebel victory, at that time, without intervention by the French. It is to say that, even if worse had come to worst, the American colonists would have put up a surprisingly good fight.

Nowadays, bands of heavily armed and heavily armored men and equipment can be quickly assembled and sent on missions through Boston, to choose one purely hypothetical event in a city once the center of a struggle between soldiers of a world-spanning empire and farmers and tradesmen with good muskets and knowledge of a landscape suited for partisan fighting.

Yet, a simplistic application of Quigley’s thesis doesn’t work. The Afghans and Iraqis, Hezbollah in Lebanon, have shown that even tank columns and soldiers with expensive, hi-tech weapons and armor are vulnerable to disciplined partisan fighters.

I’ll not go more deeply into the problems we’re facing as Western Civilization breaks down in fundamental ways, though our current economic

problems can provide enough material for contemplation of the problems we're facing and the likelihood that a corrupt power-elite will defend their own wealth and power by impoverishing many in the West who thought that good times had come for time without end. Even so sober a historian as Jacques Barzun speculated in *From Dawn to Decadence* [9], published in 2000, that we're entering a period when the public school systems will be shut down as impoverished children are sent back into factories or onto the farms. What will happen when we are told by militarized IRS agents to hand over more money to the government though our children are hungry, public schools are being shut down, and child-labor laws are being repealed?

We might be returning to the Age of Chivalry. That is, we, or our children, might find out what it's like to be a serf herded into the factories or mines of fields by warriors mounted on expensive transportation and wielding expensive weapons. Apparently, despite the speculations of modern liberals such as Francis Fukuyam, the reports of the end of history have been wildly exaggerated. See [https://en.wikipedia.org/wiki/Francis\\_Fukuyama](https://en.wikipedia.org/wiki/Francis_Fukuyama) for a short discussion of Francis Fukuyama and his work.

Believing that we have enough freedom of a creaturely sort to at least try to make tomorrow's world as decent as, or better than, the world we inherited, I'll claim that we are the problem. These problems were developing and began showing themselves as early as the American War Between the States or at least World War I, and we and our ancestors ignored them, preferring to accept any gifts offered by the gods of the marketplace. We didn't want to stop the rolling good times to contemplate the possible dangers of our growing dependencies upon various sorts of centralized institutions run by technocrats or the complementary dangers of the growing cost and complexity of modern weapons. Even with problems becoming obvious, many I know take, implicitly or even openly, the position that they'll keep their heads down and try to make it through the remainder of their own mortal life with as few problems as possible. Let the next generations eat moldy bread while working in hell-hole factories.

We have allowed those technocrats serving the central powers to gain nearly complete control over our ways of making livings, our ways of housing and feeding our selves and our children, the viability of our religious organizations so dependent upon tax exemptions and government grants, and so much else. And they have very powerful weapons. We have not, and cannot have, the weaponry to defend our selves and our children against

politicians, generals, policemen, bankers, and others in the power-elite. We also have not the toughness to fight in the way of those Asian tribesmen who've been willing to die by the dozens, and to see many children die, to kill one American or British soldier. This problem of unmatchable weaponry wielded by those serving centralized powers is a secondary problem, but it likely will play a role in the creation of the next phase of human civilization, complicating and endangering the building of a new Christian civilization.

# 488 We're All Barbarian Children on This Bus

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1621>. It was finished and uploaded on 2013/06/03.]

I've just finished reading Barbara Tuchman's *The March of Folly* and considered it a perversely entertaining read about a disedifying aspect of much of human history—the sheer stubborn stupidity of many political leaders. After quick discussions of Jeroboam, son and successor of King Solomon, and the legend of the Trojan Horse—which likely had some historical foundation, she discussed in some factual detail six Renaissance Popes who were taking care of their families' wealth and power while ignoring or aggravating the problems which led to the Protestant-Catholic schism, the British botch of their relationships with the North American colonies—all of them though Canada remained part of the Empire until helping to form the Commonwealth and Florida remained part of the British Empire for several more decades, and then the disaster many of us remember too well: the war of the American government against the Vietnamese peoples.

Tuchman seems, to this non-historian, to have carried out a good analysis of each of these disasters before coming to the wrong conclusion, though not a conclusion fully wrong to be sure. She concluded that Johnson and Nixon, for example, represented failures of reasoning, failures in the realm of individual thinking. They could have seen what needed to be done if they had simply engaged in more disciplined (individualistic) reasoning processes. There is a valid insight underlying this but her insight would have been far more valid if she had had a better and more complete abstraction of what it is to be a human being of a higher sort, a civilized sort, or—still better to a Christian—a human being responding to empirical reality in

such as way as to shape his own being to the thoughts of God as manifested in Creation.

It is a little surprising that she didn't come to a more coherent understanding of these follies of political leaders; she does seem to have been a proper admirer of Edmund Burke, a true man of Western Civilization and not a man to slight a well-disciplined human mind but a man with an appreciation of the other aspects of human being, starting with that aspect of the human mind which is formed over generations and cannot be brought into a well-ordered form by the will-full efforts of any one individual or even any one generation. This aspect of the human mind, intellect, was defined well by Jacques Barzun [7]:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand. [page 4]

I discussed this subject in Chapter 127, *Intelligence vs. Intellect*.

We have to deal not only with conscious reason but also with a ingrained practices and habits which correspond to reasoning processes acting over multiple generations. Some are aware of these reasoning processes, though that awareness can mess us up as much as thinking too much about that shot of the basketball or wondering, “Do I breath in as I begin my swing at the tennis ball?” In any case, many in a well-ordered human community will not be aware that many of their ‘prejudices’ are not given truths but rather capitalized experience which may or may not be valid now or in the future as we learn more or better about God's thoughts as manifested in Creation. Some may see this lack of full awareness of most human beings as good or bad; I see it as simply the way we are and see the need for each human being to somehow accept their own role and the roles of others, whether that human being is someone unconsciously embedded in a tradition or someone with conscious awareness of a tradition, to defend it or critique it.

Matters get more complicated, at least partly because we have no settled ways of speaking about human being which deal properly with all we know about that human being from our religious and other traditions, from literature and philosophy, from biology and the other sciences (perhaps especially mathematics) which tell us so much about the proper ways to think about the foundational stuff of our being and the being of our world or even all of Creation.

My thoughts about human being began to cohere into a framework which can properly organize our empirical and other knowledge in the spring and summer of 2012 as I was reading E.O. Wilson's *Sociobiology: The Abridged Edition* [151] and Jacob Neusner's *Judaism in the Matrix of Christianity* [97].

I'll lead with my conclusion as I can best state it for now: the human being can be usefully and morally described in terms of mind and heart and hands; all three have immediate and individual aspects but also longer-term and communal aspects. The immediate and the individual are not fully the same nor the longer-term and the communal.

As individuals, we can critique the communal beings in which we participate, though we should remember not to play around with explosives unless we know what we are doing. Most of us will not even be aware of the true nature of what I call a worldview; many of us don't realize that most of what we see as absolute truth and most of what we vaguely realize to be weaker truths are what we could call mediated truths—a worldview which is the capitalized experience of something like a civilization, spiritual experience as well as more strictly empirical experience. To complete this quick view of human knowledge of human being: a civilization is a mortal embodiment, quite imperfect and defective, of the Body of Christ as organisms on Earth have been in some sense mortal embodiments of that perfect man who was Christ after His resurrection. Whether I'm writing about the moral aspects of human being as individuals developing communal being or about the biological aspects of human being as individuals constrained to act in the interests of family-lines, I'm really writing of the evolutionary and developmental processes which lead to the formations of evermore complex individual and communal human beings, ultimately to the Body of Christ and all of His members in Christian belief.

Let me quote a brutally honest statement of Professor Wilson [151]:

Camus said that the only serious philosophical question is

suicide. That is wrong even in the strict sense intended. The biologist, who is concerned with questions of physiology and evolutionary history, realizes that self-knowledge is constrained and shaped by the emotional control centers in the hypothalamus and limbic system of the brain. These centers flood our consciousness with all the emotions – hate, love, guilt, fear, and others – that are consulted by ethical philosophers who wish to intuit the standards of good and evil. What, we are then compelled to ask, made the hypothalamus and limbic system? They evolved by natural selection. That simple biological statement must be pursued to explain ethics and ethical philosophers, if not epistemology and epistemologists, at all depths. [page 3]

Even this statement is wrong, though it's as correct as any such statement in the greater context of Wilson's thoughts about the social nature of human beings. We as individual human beings are ourselves and also the members of family-lines in an evolutionary sense, but also members of communities which have formed over time. This expanded view, well developed by Wilson and colleagues in a number of books and articles, adds the 'socio' part of 'socio-biology'.

The example I'll sometimes use to bring out the main point is reproduction, the center of evolutionary reasoning. Having babies and raising babies is expensive in the human species. Our raw biologically founded sexual desires and the pleasures which can result from fulfilling those desires are the ways in which nature encourages us towards ethical behavior in the context of biological organisms. We have babies to continue the family-line and perhaps help it to expand greatly. The value of human life rests first of all upon the animal foundation of natural selection: those family-lines containing members which reproduce successfully might survive into the future—pure luck also plays a role. I suspect natural selection has been misunderstood and feared by many who would protect moral order just because it developed in a period in which our individualistic beings were being aggrandized at the expense of our communal beings. If Darwin had grown up in a Civilization not undergoing a strange form of decay, he would have likely developed his theories in the direction taken since then by Wilson and other sociobiologists. (I believe there are hints of such developments in Darwin's writings.) If his Christian critics had not been decaying into a

state of radical individualism, they would have been able to tie Darwinian ideas into an appreciation of the communal aspects of human being.

Liberal individualism is little more than a secularized form of literalism of a general sort, including Biblical literalism: what is concrete and immediately perceptible is what is real and all else exists only in a nominal sense; moreover what concretely exists is transparent to human thought properly disciplined to the will. (In other essays, I've claimed this error has been growing in the West since Duns Scotus and William of Occam and other radical philosophers at Oxford in the 14th century first began their attack upon the traditional Christian understandings of mind and of human being as best refined to that time by St. Thomas Aquinas; those radical philosophers over-glorified the will and led too many to very bad states of thought and feeling and action.)

What we can perceive immediately is indeed a very concrete form of being and is only a starting point, from a metaphysical viewpoint, for analyses which penetrate being, heading deeper into ever more abstract regions of being ending in the level of abstract being which is the raw stuff of Creation, what all the rest is shaped from, the truths manifested by God as sufficient for this Creation including the story He wishes to tell in this concrete world, the story He will continue in the world of the resurrected.

Our individual intelligences operate over short spans, perhaps the length of our own lives though some families and other institutions have leaders who think over longer periods and there are human beings who have a bit of trouble with five minutes from now. Our intellects operate over the spans appropriate to our communities. Our biological urges are more limited in many ways but operate over spans appropriate to our genetic family-lines. We are driven to struggle to survive through famines and wars and horrible diseases, driven to reproduce even when it seems irrational to have children, by our genes in which are encoded, as Professor Wilson wrote, the foundations of not only the subject matter of ethics but also the very beings of ethical philosophers. And so we can see that our feelings and biological urges are less irrational and more in the nature of a sometimes harsh but rationally understandable ethics frozen into our DNA. Our passions are the most immediate part of us, hard for our reason to control even when we know our passions are inappropriately directed, but they serve needs evolved many years ago and are still being refined, as, for example, nerve-cells first evolved hundreds of millions of years ago but are still being reshaped to various purposes in the human brain and the brains of many species.

Life is good, not because it can always be said to be good by human standards but because we are the descendants of those who survived and did well enough to reproduce during good times and bad times. The claim that life is good is clearly only sometimes true but our family lines wouldn't exist if we didn't struggle through the bad times as if it be clearly true that life is good but for the current bad stretch. It would seem that God etches some harsh truths on stone tablets and encodes some other harsh truths in our DNA.

Harshness is part of life in this vale of tears, but only part. There are lines of Jewish thinkers and leaders who can see that the goodness of communal human life, family and synagogue and other communities, comes from a properly formed set of feelings and emotions. What evolution gave us for family-line survival can also work to the formation of morally good human communities, from marriages to nations and right to the Body of Christ.

The passion of man for woman, though it can go bad, is also the bond which ties husband to wife in a fruitful and wonderful marriage. (Most human relationships lie probably in a middling position on that spectrum from bad to wonderful; bad can dominate in periods when communities don't properly form their young men and young women.) This is a short statement of the traditional Jewish viewpoint [97]:

The doctrine of emotions in the view of the sages who created Judaism remained always the same. The reason derives from the social realities that give meaning to emotion and definition to the possibilities of feeling. If we begin with feeling, we end up in society. [page 51]

A little more discussion can be found in Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*.

See my freely downloadable book, *A More Exact Understanding of Human Being* [53], for more discussion and a proposed framework for understanding our individual and communal human beings.

Let me get back to Tuchman's criticism of the leaders in Troy, of Jeroboam, of George III and Lord Townshend and various others, of John Foster Dulles and John Kennedy and Lyndon Johnson and Richard Nixon and Henry Kissinger and many others. She speaks of their failure to use

their powers of reasoning properly without seeming to realize that communities are formed precisely by the strengthening of the communal aspects of our human being, by at least a partial submission of the individual aspects of our being. Only a thinker too well-formed to Enlightenment understandings of thought and human being would expect modern politicians, especially those who succeeded in American political machines, to be the rebellious thinkers who belong to the community and yet are willing and able to critique the mind and heart and hands of that community. Even the often courageous and intellectually substantial Winston Churchill had a career of disaster-causing errors redeemed by his bulldog courage, not brilliant policies, when facing the dangers of Nazi Germany. Then, after falling into a cleansing depression when he saw that he and the other leaders of the West had participated in intensifying the ongoing processes of barbarization of the Anglo-American countries in their efforts to fight the freshly barbarized nations of Germany and Russia, Churchill regained the wrong sort of courage and gave his famous iron-wall speech where he pointed into regions where militarists and national security thugs would shape the views of politicians rather than having a communal cleansing by way of return to free societies. Free societies are necessarily formed in morally well-ordered civilizations; at best, barbarian societies are struggling toward a true freedom, despite some silly glorification of ancient German tribal customs.

We still had the military power, the industrial productivity, the scientific knowledge, the political organization, of the most advanced civilization that the human race has yet seen, but we were becoming barbarians even before the process accelerated in the early 1900s as we Anglo-Americans raced the Germanic and Slavic and Japanese and Chinese peoples toward ever lower states of moral order.

The problem is not that Lyndon Johnson didn't use the full power of his political reasoning to see the nonviability of South Vietnam as an independent country. The problem is that the United States had become a country where the head of state was not in any true sense a citizen of Western Civilization nor even of the United States as defined by the traditions accepted by the Founding Fathers. Lyndon Johnson was a radical individualist who'd been herded together with many of his fellow American individualists and had acted according to his primeval communal instincts but those instincts had never been refined to accord to the better traditions of the West, the legend of King Arthur or the historical reality of the great-souled Charlemagne and the truly great Alfred and the admirable St.

Louis. Johnson had all the bad characteristics of Andrew Jackson without the virtues such as his battlefield toughness and willingness to take an unpopular stance. Johnson was the sort of modern American individualist and cynic who would have seen through all false legends and whitewashed biographies of George Washington and would have concluded Washington was simply another scoundrel who'd had better press than most. Johnson would not have had a clue why it was that Washington as a teenager had been so impressed with a stage play about an idealized Cato that he would have set his life's goal to be as devoted to public duty and public honor as Cato had been. (And Cato was a noble man though missing some of the benevolent virtues which are part of Judaism and Christianity.)

Thinkers of all sorts, including historical analysts, need to be able to step back far enough to see the ways in which the truly great leaders, Cincinnatus and Cato and Benedict and Alfred and George Washington, have shaped themselves in response to reality under the guidance of some noble tradition. Even Otto von Bismarck, that nationalist SOB was cool-headed in his political conspiracies, not vengeful or hateful, and he knew history well enough to know that large wars or constant wars of any size will destroy social order in a country; a war fought for motives of conserving some great good might still lead to revolution and loss of that great good along with much else. He was a man emerging from barbarism and possessed the warrior attitudes of his Germanic ancestors but the same can be said of Charlemagne and even of King St. Louis to some extent.

A society well-ordered to the demands of a noble tradition can produce, if all goes well or at least okay, a body of politicians and other leaders who will reflect some sort of strong order. The conclusion changes not at all when shifted to cover other complex human communities such as the Catholic Church or the various Jewish communities, even a military with a strong tradition of selfless service, such as the American or British or French armed forces. Nearly all of these communities, and many others, are in various stages of moral decay. We need to step back and see that this is the situation: we are barbarians in control of a modern city. Much that seems civilized about us is no more than our ability to somewhat use and crudely maintain complex infrastructure and to still make the clothing of civilized men and even put it on our own bodies without hurting ourselves. We've been stripped of that capitalized experience which shows itself yet in the *Rule of St. Benedict* or the writings of Shakespeare or the letters and speeches of George Washington, a man of more limited mental power

than Hamilton and Jefferson and Adams but all the more impressive for his absorption of so much of the political and moral wisdom of the Western tradition, British branch, as it existed in the late 18th century. If we could pause from our pedantic discussions of the Constitution long enough to read Washington's letters, written as he was holding the future of the rebelling colonies in his hands, we would probably understand much which is beyond the direct reach of our individual thinking powers.

Tuchman seems to have concluded that Dulles and Kennedy and Johnson were something like a George Washington gone wrong. They were nothing of the sort. If anything, the more intelligent of these individualistically best and individualistically brightest could be seen as Jeffersons or Hamiltons unleashed in a West collapsing into moral disorder.

As I already wrote: Johnson, and all the other recent American presidents and most other leaders, were men and women who wouldn't have had a clue why Washington so admired Cato. They certainly wouldn't have understood a man I mentioned earlier, one who did rise to a state of high literacy and the highest moral order during a period of barbarism: King Alfred the Great. Johnson and Nixon and all the others were outsiders to the traditions of Western Civilization, the traditions which are manifested in us as intellect defined so well by Barzun and also as feelings and emotions disciplined to higher moral purposes as discussed by Neusner. To the extent that Nixon's 'moral majority' existed, it was a mob of consumers who knew how to behave well in department stores and steak-houses, not a community bearing the traditions of the West.

It's been *Lord of the Flies* time in the West for a good number of generations. Barbarian children ruling over other barbarian children and often exploiting them in ways criminal and immoral.

## 489 Jefferson is Weeping but Jefferson is Somewhat Confused

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1644>. It was finished and uploaded on 2013/07/05.]

Most human beings alive in this year of our Lord 2013 freely and fully accept the evidence that the human race wasn't a special creation by God. Our ancestors were knuckle-draggers who rose from that position to one we consider, with some prejudice perhaps, to be more noble.

Remarkably, many who have accepted our biological situation continue to believe that human 'rights', political and other, did somehow come all at once, fully mature and fully belonging to our ancestors and most certainly to us. One question would be: which ancestors? Was it men born in the Enlightenment who had full possession of those Lockean rights to life, liberty, and property or perhaps the Jeffersonian rights to life, liberty, and the pursuit of happiness? Or was it men lucky enough to have been alive when Hobbes published *Leviathan* and political individualism of a modern sort came into existence? Or maybe we should look at periods of Roman order or Greek experiments with democracy? How about the age of the ancient Hebrew judges when we are told by the Biblical writers that there was true order but of a generally bottom-up sort favored by libertarians and anarcho-capitalists.

And so it is that we have one of the most interesting and most courageous legal and political commentators of this period, Andrew P. Napolitano, joining Jefferson in his noble confusion: *Jefferson Weeping* at <http://original.antiwar.com/andrew-p-napolitano/2013/07/03/jefferson-weeping/>. I'm in strong agreement with what might be called the 'feeling' side of the argument: freedom is a great good and one

all human beings with a Biblical faith should accept. Yet, I see serious confusion in some of Judge Napolitano's claims in this quotation:

When Thomas Jefferson wrote the *Declaration of Independence*, he used language that has become iconic. He wrote that we are endowed by our Creator with certain inalienable rights, and among them are life, liberty and the pursuit of happiness. Not only did he write those words, but the first Congress adopted them unanimously, and they are still the law of the land today. By acknowledging that our rights are inalienable, Jefferson's words and the first federal statute recognize that our rights come from our humanity—from within us—and not from the government.

The government the Framers gave us was not one that had the power and ability to decide how much freedom each of us should have, but rather one in which we individually and then collectively decided how much power the government should have. That, of course, is also recognized in the *Declaration*, wherein Jefferson wrote that the government derives its powers from the consent of the governed.

At the website *The Israel Koschitzky Virtual Beit Midrash*, found at "<http://vbm-torah.org/archive/intparsha68/18-68mishpatim.htm>", we can read in a commentary on the Talmud and ultimately on the Pentateuch: "The slave who rejects freedom believes that he has discovered an easier mode of service. However, static obedience is not what God desires. That person ultimately remains a slave." It's part of a discussion of the reason for mutilating the ears of a man who voluntarily takes on slavery, perhaps when offered freedom. There is good reason to believe the ancient Hebrews, and some modern Jews and Christians such as myself, would say that one who voluntarily takes on slavery, as opposed to a conquered and captured man, has placed himself outside the people of salvation, the People of Israel or the Body of Christ or both in some of my speculations. One who favors security over freedom "ultimately remains a slave," and cannot share the life of that only truly free Being, God. He has condemned himself.

So I'm a strong supporter of Judge Napolitano's advocacy of freedom, but I also can see clearly that much which is promised to us by God, and in

some way becomes an obligation upon us, isn't realized, at least not completely or perfectly, in this vale of tears, in this mortal realm. More exactly, we are born into a realm dominated by evolutionary and developmental processes, as was the point of the beginning paragraphs of this essay. If human beings evolved and if they can develop into different creatures as they respond within their personal capabilities to a complex and changing world, why would we think that the biologically mythical Adam and Eve become suddenly real when it comes to human rights? Where is the evidence that ancient communities were fallen versions of communities free by God-created nature?

Often, I repeat earlier claims and speculations, sometimes as part of a general effort to refine my own ways of understanding and stating them. In this context, it seems more appropriate to recommend that any interested readers download my recently released book about human nature, *A More Exact Understanding of Human Being* [53], or one of my earlier books which specifically addresses human rights in the context of a world dominated by evolutionary and development processes, *Human Rights: An Evolutionary and Christian Perspective* [47]. You may also wish to download a catalog of my writings, including my collection of essays from my blogs which is updated once a year: *Catalog of Major Writings by Loyd Fueston* [52].

## 490 Economics Allowing for Communal Relationships

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1674>. It was finished and uploaded on 2013/08/14.]

In the recent article, ‘*Networked Minds’ Require Fundamentally New Kind of Economics* at <http://www.sciencedaily.com/releases/2013/03/130320115105.htm>, we learn that scientists have discovered the existence of “networked minds”, a concept overlapping my concept of “communal minds.” Jacques Barzun covered some important regions of this territory in the 1950s with his book, *The House of Intellect* [7] and others were very tentatively exploring this territory at least as early as St Paul with his vague references to something he called “The Body of Christ,” the perfect man which is Christ and which is all of us. According to Jacob Neusner—see *Judaism in the Matrix of Christianity* [97], the sages who founded modern Judaism in the century or so after Christianity came to dominance in the Roman Empire were very concerned with the ways in which our feelings lead us into social ties, into communities. I discuss these matters in Chapter 127, *Intelligence vs. Intellect* and Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*, and in a greater context in my book which is available for free downloading: *A More Exact Understanding of Human Being* [53].

The first paragraph of the article, ‘*Networked Minds’ Require Fundamentally New Kind of Economics* at <http://www.sciencedaily.com/releases/2013/03/130320115105.htm>, is:

In their computer simulations of human evolution, scientists at ETH Zurich find the emergence of the “homo socialis” with

“other-regarding” preferences. The results explain some intriguing findings in experimental economics and call for a new economic theory of “networked minds”.

Later in the article, we can read about the core findings:

Prof. Dirk Helbing of ETH Zurich, who coordinated the study, adds: “Compared to conventional models for the evolution of social cooperation, we have distinguished between the actual behavior—cooperation or not—and an inherited character trait, describing the degree of other-regarding preferences, which we call the friendliness.” The actual behavior considers not only the own (sic) advantage (“payoff”), but also gives a weight to the payoff of the interaction partners depending on the individual friendliness. For the “homo economicus”, the weight is zero. The friendliness spreads from one generation to the next according to natural selection. This is merely based on the own payoff, but mutations happen.

For most parameter combinations, the model predicts the evolution of a payoff-maximizing “homo economicus” with selfish preferences, as assumed by a great share of the economic literature. Very surprisingly, however, biological selection may create a “homo socialis” with other-regarding preferences, namely if offsprings tend to stay close to their parents. In such a case, clusters of friendly people, who are “conditionally cooperative”, may evolve over time.

If an unconditionally cooperative individual is born by chance, it may be exploited by everyone and not leave any offspring. However, if born in a favorable, conditionally cooperative environment, it may trigger cascade-like transitions to cooperative behavior, such that other-regarding behavior pays off. Consequently, a “homo socialis” spreads.

As I understand matters, they reasoned that cooperative individuals could come to some sort of dominance in a society so long as selection allowed ‘other-regarding’ individuals to congregate in dense enough populations and one possible way for that to happen is for children to stay near parents. With strong families, a society can depend much upon the commons and can be something of a welfare society because of lessened danger

of being taken advantage of by free-riders. From strong families and the other-regarding behavior natural to genetically related creatures, networks of trust can be built to do business in efficient and friendly ways and to accomplish many other goods such as caring for the disabled without families and to help to educate all future citizens and not just your own children.

The viewpoint in the design and analysis of the research seems to me to start from the modern view of human beings as being autonomous and then to try to correct that view. Thus it is that their model of social man is a networked individual rather than a creature with both individual being and social being as is true in my ways of thinking as well as in the discourse of some others with some ties to the ages prior to modernity.

Yet, there is something of the nature of networks in our communal being and there is also much that is good in modernity though it tends to be, consistent with the modern view of human beings, clusters of good thought and good art and good actions connected by loose networks rather than by a coherent narrative of the meaning of it all. In any case, the networking of individuals gets at only part of human communal being but it's a true part just as genes are an important foundational part of human being and it's only when scientific thinkers use words, or even imply words, such as 'just' or 'only' that genetic thinking threatens our understanding of our human being and, in fact, all of created or contingent being. As Pope Benedict XVI said in 2008:

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.

It was this quote that inspired the title, and partly the spirit, of my book: *A More Exact Understanding of Human Being* [53]. Research done in genetics and sociobiology and biochemistry and social networks can help us to achieve this "more exact understanding of human being," but it needs to be brought into a coherent narrative which gives meaning to it all, which narrative would be the core of a civilization.

# 491 Is Detroit the Result of Slash-and-burn Politics and Economics?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1680>. It was finished and uploaded on 2013/08/26.]

In this essay, I'll sometimes write about the West as a whole and sometimes try to be more particular, especially in giving examples, by writing from the American viewpoint. In fact, it's at least arguable that the current moral and social disorders of the West began in the United States. Henry James is said to have claimed, circa 1900, that the United States would corrupt the entire world. I've claimed a number of times that Europe was a bit tired and in the process of fading by 1900 and the US, materially prosperous frontierland of the West, failed to take up the task of maintaining and advancing Western Civilization; Americans didn't seem to have realized, and don't yet seem to realize, that a civilization needs to be maintained or advanced. We assume the existence of Western Civilization and move on to drill oilwells and build amusement parks.

We Americans think ourselves to be sophisticated residents of a advanced and complex civilization. At a moment's notice, we can throw up more magnificent skyscrapers or factories in Detroit and Chicago and...

Maybe we've hit a roadbump or two, but we look back just a few decades and see that we were building cities on a scale beyond the dreams, or nightmares, of our ancestors. We now have smartphones and ebook readers which can carry large personal libraries on a tablet smaller than the keyboard I'm now using. We have remarkable space exploration technology and desktop computers which can hold more information than the largest libraries of the

ancient or Medieval ages. To be sure, we still seem capable of developing new and exotic technology though we are having more trouble, especially in the US, building and maintaining the workaday pieces of our civilization. I think that we are far worse than that when it comes to the 'soft' components of our civilization, especially the literary and other intellectual components which feed into our understandings of who we are and what our world is. We're still pretty good at hard sciences though some, such as the late Jacques Barzun, have claimed we're living off the creative advances of the decades around 1900; he was speaking of physics as well as pictorial art and literature and music.

Have our human beings developed as fast as our populations have grown and as our technology has developed? Even in science and engineering where we seem to know so much about the early periods of the expansion of our universe and are on solid ground for planning a colonization of Mars, have we come to better understandings of what our goals should be or do we just do what is possible and what strikes our fancy?

I've endorsed the claim of Ortega y Gasset that Western man has fallen back into a state of a barbarian child. Maybe the better claim is that, by the middle of the 19th century or so, Western man had matured to the level of a 12 year-old and then maybe fell back a couple of years of maturity over the next century and a half. We've continued to grow in many ways and haven't taken care of some of our basic hard and soft infrastructure and don't seem much interested, as a general rule, in developing new ways of organizing our communities or our individual lives. Even without our recent orgies of debt accumulation, many local ecological and moral and social problems were growing as we concentrated our efforts and resources upon the tasks of getting a new stadium for the regional NFL franchise or putting more computers in front of illiterate and innumerate and quite bored students.

The demands of our rapidly growing human communities, the need to feed and clothe and supply water and remove sewage and to develop proper political systems and to also develop private economic systems, maybe require more than even that 12 year-old man of the 1800s would have been able to deal with let alone man of the 21st century as he regresses toward infancy. The leaders of the West are acting as if they're as clueless as any Joe Six-pack who sits in front of the television, letting it numb him into a morally culpable state of ignorance and stupidity.

Our huge and dense populations as well as our rapidly advancing tech-

nology seem to be demanding of us a level of sophistication and complexity which we can't yet provide in the economic and political realms. A loose interpretation of the history of the 19th century, the golden years of classical liberalism, might indicate we had passed through a period in which individual human being had developed very rapidly in some ways but the development of communal human being was at best slower and maybe some important institutions had grown fast but into deformed, parasitic entities. Wealthy and highly centralized governments, had been hijacked by men I'll label, following Acton, as having the "moral character of gangsters."

A mature human community should be able to recognize those who serve their personal goals at the expense of the community and maybe some number of innocent individuals in particular. I believe it was GEM Anscombe who pointed out that a society is in deep trouble if it needs a formal resumé to tell if someone is a good man or woman. In fact, we use those formal resúmes for purposes other than judging character, but we are in a situation where we can't recognize those gangsters Acton warned us about. We put great wealth and power in the hands of such criminals, members of criminal networks if not quite gangs organized as tightly as the Mafia, and they get to work. This isn't to excuse us. If we can't distinguish between good moral character or bad, or—worse—prefer the ones with bad moral character so long as they promise us some good share of the loot, then we're almost certainly incapable of governing our complex communities.

Can it be true? Are we functionally primitives relative to our social and physical environments? Are we much like those rainforest natives who slash and burn to produce some open land which will be very fertile for a couple of years and decreasingly so after that? After that period of great fertility, the demands of the crops are too much for the soil and the tribe moves on.

Are our communities not fully such? Are they merely gatherings of selfish individuals? Do we seek short-term profits for our own benefit no matter the cost to our children or to our neighbors? Do we fail to make a proper effort to build the fertility of our country, the economic fertility and the political fertility and the cultural fertility?

Our publishing firms once had great potential, however much they failed spectacularly with Herman Melville and some others. True it is that junk books about buffalo hunters and tamers of the Wild West sold well while *Moby Dick* quietly died. The situation hasn't changed. Good books die while easily marketed low-quality books dominate our best-seller lists, though now receiving reviews which make them seem like real literature for

real, thinking readers. For a number of decades, the profits of the publishers were good and some good books were published; occasionally, an author of substance would even prosper. Then the publishers were sold to corporations with an eye on next week's bottom line. The slashing and burning began in earnest and soon literacy standards were falling. (In such a complex situation, there is no way to label the acts of the publishing companies, the American educational system, and the entertainment industry as being the real 'cause' or driver. They were all correlative and interactive factors, along with a number of others.)

I was told by a psychology graduate student that researchers had found that the average reading level of American newspapers had reached fourth-grade by the late 1990s—that is, fourth-grade standards from prior to 1965 or so. Soon enough those newspapers were going bankrupt. Why bother reading that stuff if you do have reading skills enough to handle even a decent mystery novel? Why bother reading if your reading skills have fallen with those of the average American?

Slash-and-burn business techniques had reduced the publishing industry to a farce of sorts and it was time to move on, to social websites or video-games or maybe televising the shocking and awful destruction of Baghdad or other foreign communities, that sort of destruction being something of an accelerated slash-and-burn process. The self-destruction of the publishing industry ran parallel to similar processes in education and other realms of culture.

We can't create much that's worthwhile and increasingly rely on Asians and others to produce the physical goods once so well made in Detroit and Hartford. All we can do is slash-and-burn, destroying human communities to break free the exploitable individuals, taking good advantage of their raw intelligence and making sure they never develop a proper intellect (communal form of intelligence). Literacy skills and general thinking skills were never so high in the general American public as some reactionary dreamers seem to imagine but they were developed well enough to hold up the profits during several decades in which there were grand profits from cookbooks and books of self-centered spirituality and novels written by untalented writers determined to prove their sixth-grade teacher was right: "You are such a creative boy." They sought to prove that writers were to write and not think; they did prove that many writers could publish without showing signs of having learned how to think.

Since I'm an author who's banged his head against the walls of the

publishing industry, I've concentrated on the destruction of the literary culture of the West by seekers of short-term profits. Heaven help any who would wish to be serious readers of serious new books; heaven help those who own shares of the publishing firms, perhaps in their pension funds; the party's almost over. The editors have slashed and the marketing executives have burned and the ground is now sterile. Time to move on. If only we had a place to go.

If there's a lot of ruin in a country, there's more in a civilization, but it's still a finite amount of ruin. Eventually, the seeds don't germinate or perhaps they come up as sickly and malformed things.

We seem awfully close to that point of sterility in the West and many of our communities are there, cities and maybe entire countries and vast realms of Western culture.

The Western publishing industries are dying. Our newspapers and most mainstream magazines are no better off. Detroit is dead with many other American cities following. American infrastructure is said by many to be very low-quality relative to most other developed nations, but they'll follow us soon enough. Our military fights, destroys cities and the infrastructure needed for the care of millions of civilians, and can't seem to win wars, or maybe they and their political bosses do a bad job of picking wars to fight.

It would seem that the economic and political and military realms of the US are in trouble as deep as the cultural realms. I think the West as a whole is in it as deep as the US.

This is to be expected. We have slashed-and-burned and built cities on the cleared land. Most realms of Western life are increasingly sterile, growing from wretchedly impoverished soil. It turned out that we were living on inherited resources without contributing much, but I've suggested in the past that this has been true from the beginning in the US regarding many aspects of human civilization. We could dig mines and build factories with the best of them but it's beginning to look as if we never matured as a people in many ways, never learned how to build cities with staying power, never learned how to build the modern equivalent of the cathedral at Chartres, never learned how to build the narrative which would have made us truly a people. At some point, the Europeans seem to have decided to join the American party and joined us in our decay into deeper and deeper states of barbarism.

Our businessmen think of themselves as entrepreneurs on the march looking for the city which offers the best tax deal and already has a well-

educated body of workers and good infrastructure for the exploiting. Our Christian houses of worship, liturgies, intellectual works, literature, and music are bereft of imagination—I'm being kind. After a good start by Francis Parkman and Herman Melville, Americans seem to have lost interest in any effort to find a meaningful narrative of this country and acted as if determined to destroy any narratives in the minds and hearts of all Western peoples. In any case, we declared the United States to be a special place filled with special people and then went on our special way. We combine greed with soullessness and preciousness and put it in a narrative which is kind of a football game between the American cowboys and all the bad guys.

Football and cowboys have been very profitable for the American regions of the West. Complex histories which show the great potential still found in the West aren't any more profitable than discussions on the deck of a whaling ship about how it was we were failing to live up to that potential.

Is it any wonder that even the greatest of American cities seem little more than gold-rush cities only a few corporate relocations or unwise government fiscal decisions away from becoming ghost-towns?

Detroit and Chicago, and many other American communities, are more sterile than mules, intellectually and economically and politically and culturally, but we have no fresh regions of forest to start slashing and burning. This is despite the large expanses of physical lands available to Americans. We had already chosen the best of those lands, most especially the best with regard to water and some other key resources. More importantly, the forest was never really just the woods of Kentucky or the plains of Nebraska. The forest was also the civilization which came with the European settlers, even those with very rudimentary educations and only a bare grasp of the history of their own people. That civilization was in the minds and souls and customs of those settlers who were already giving themselves over to a booster mentality. We are no longer a people in touch with the Western Civilization which made it possible for the Founding Fathers to establish a country with some serious amount of respect for both individuals and groups, with a somewhat denatured Christian faith which at least made possible some degree of moral self-governance, which gave us both the common sense and the dreams which powered us on our slash-and-burn journeys across the continent and through our own minds and hearts and hands.

So, I ask, "Is Detroit the Result of Slash-and-burn Politics and Economics?"

## 492 Who Are the American Elites and Are They Conspirators?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1701>. It was finished and uploaded on 2013/10/01.]

Conspiracies. Don't underestimate the number and importance of conspiracies in human history, conspiracies political or economic or even cultural but usually criminal and often highly immoral. Don't overestimate their importance in the general scheme of things but don't forget their sheer abundance indicates they play a role in God's story—I'll pass over a discussion of what that role might be but I've proposed before that men of high ambition and great energy, even Alexander the Great and Genghis Khan and Caesar might sometimes be a yeast of sorts.

During periods of disorder, when human communities can't protect themselves and when the less corrupted leaders of those communities are often clueless, conspiracies of tightly connected insiders can be quite effective. Trust and openness are destroyed by various factors and those who keep secrets are in their domain, sometimes describable as a sewer or swamp. Greater community loyalties, even to communities of religious faith or to nation, are overwhelmed by those who hold a fanatical devotion to blood-relatives and brothers from fraternal organizations. New dependencies are forged for the disorganized masses, often using unsustainable promises by governments or corporations or religious institutions. The appearance of Obamacare, the culmination of 'research' done as early as the Nixon administration, is closely related to the previous six or so decades of a big Cold War, lots of little hot wars, political murders, invasions and destruc-

tions of countries powerless before the great powers, large-scale thievery of middle-class wealth by a coalition of politicians and bureaucrats and central bankers and others. [Obamacare is only one example. I've read that Bob Haldemann has written that a legalization of homosexual marriage was discussed during campaign strategy sessions of the Nixon insiders. This situation, as such, doesn't argue for the goodness or badness of government-sponsored healthcare or expanded definitions of marriage, only that any alleged reforms can be tools for the expansion of power by elites.]

There are rational thinkers out there who know some history and as much of current events as can be known by outsiders. Most can be found in the alternative press rather than the mainstream press, though some, such as Seymour Hersh, work in both realms; others get published at least occasionally in mainstream media. One of the more important websites in the alternative press realm, potentially very dangerous to current power-holders, has published a short article about the changing but somewhat stable 'dominant corporations': *These Are The Ten "People" Who Run The World (For The Last 20 Years)* at <http://www.zerohedge.com/news/2013-09-27/these-are-ten-people-who-run-world>.

I'd take the title for the above linked article as being a bit tongue-in-cheek, but it does point to a problem in the alternative news-media. Even the most rational thinkers in that alternative media know enough history and see current events clearly enough to detect criminal conspirators but they often overestimate the competence of the conspirators and greatly overestimate their cohesion and even assume a level of organization like unto that of the 3rd Army as it marched across Europe during WWII. We're dealing with a situation more like that of an extreme separation of classes, such as Roman Patrician clans versus plebeian communities. But worse. As I'll explain later, our elite is partially hidden, even when publicly known they act in many ways through their secret organizations whether fraternal organizations or government national security agencies. The entire system works to push our hidden elites toward outright criminal activities, worse in many ways than other abusive systems such as that of the Roman Republic.

Let me turn to a historian of a recent generation, Carroll Quigley. In *Tragedy and Hope*—available in larger libraries and also on the Internet as a pdf-file for free download, Quigley engaged in history verging on journalism. In the early sections, dealing with the period which happens to have been the time in which the American Empire was expanding out-

side of North America—the decades around 1900, Quigley claimed there to be three groups of elite power-holders, the bankers and the politicians and the monopolistic capitalists. In terms of the American turn to empire, three good examples are JP Morgan, William Howard Taft, and John D Rockefeller. (By ‘bankers’, Quigley meant not the mortgage officers at old-fashioned local banks; he meant investment or merchant bankers and the closely allied central bankers. And note that Rockefeller’s heirs were bankers, the result of a transition he began by moving from Cleveland to New York City where he began to control his largely industrial empire through banks.)

I don’t think Quigley’s scheme works for the world after 1950 or so and I think the power-holder groups were under transformative stresses for a couple decades or so before the breakdown. Yet, it is the only analysis of this sort I find fully convincing, as much as I respect the more recent analyses of those who write under the name of Tyler Durden at *Zero Hedge* found at <http://www.zerohedge.com/>, Sibel Edmonds, James Corbett, Peter Dale Scott, Alfred McCoy, and a surprisingly large number of others not writing at the *New York Times* or the *Washington Post* or their allegedly conservative little brothers. I find Scott’s general talk about the ‘deep state’ most convincing; basically, the deep-state is a sewer running under the governments and banks and other powerful institutions of the modern world; those sewers are inhabited by two-legged rats who move currency and arms and drugs for terrorists or for the ‘black operations’ guys at the CIA or the Mexican drug cartels or others of that ilk. Yet, even Scott’s analyses, as he himself acknowledges, don’t lead to a clear view of what’s driving the central institutions of our world; such a view likely might not be possible for a generation or more. And, maybe, the power-elites are currently as poorly organized and as ineffective as the above ground institutions such as the US Department of Justice or the MacArthur Foundation or Bank of America or Microsoft.

We need to gain some plausible view of the power-holders or power-elites if we are to protect our individual selves, our loved ones, our communities. If we set out to protect ourselves from falsely viewed power-holders, we’ll at best waste our energies and more or less consciously allow our attention to be wrongly directed. Even if our view is wrong but plausible, we can start to act in ways which might be effective as we will be re-forming our communities.

In any case, I find my analogy of modern gangsters of the state and

banking complex and so forth more apt—parasites and cancers inside the bodies we call human communities. This is partly because of my Christian orientation and my updating and enlargement of the human understanding of the Body of Christ. As a consequence of this line of thought, I've moved in my mission of trying to understand God's Creation toward an emphasis on human moral being—individual and communal. In a sense, my interest in these matters can be labeled as 'abstract' or 'academic', but that doesn't at all dull my concerns, my feelings, about the various victims of the seemingly stumbling and out-of-control power-holders of the 21st century. My concerns are still more personal in that I count myself, as writer and thinker, among these victims and think there to be many out there who could contribute to a richer and more sustainable civilization and those writers and thinkers, artists and dancers, tinkerers and farmers, are more or less deliberately excluded from access to cultural and economic resources as much as the better sort of political and social and religious leaders—this is my reason for thinking of the large foundations, MacArthur and Ford and so on, as part of the mechanisms of confusion, perhaps intended by the elite to be instruments of control.

I've dealt with the issue of conspiracies in various places but first came to my current understanding of what is truly happening when I set out to learn about a man who had held that the human race is split between producers and exploiters, with the producers often being unaware they are living on a battlefield of sorts. That was Thomas Jefferson. His friend, John Adams, had a different take as I discussed in Chapter 440, *I Have a Problem with Many Conspiracy Theorists*:

Something of a rational and more limited conspiracy is not only plausible but likely in a world where some would control the rest of us for their own purposes. In terms used by Thomas Jefferson: exploiters divide themselves out and try to form a class that dominates the producers. Jefferson seemed too willing to assume that some Providence or providence would protect American producers and keep the exploiters under control. His friend, then non-friend, then friend again, John Adams, agreed about the division between exploiters and producers but didn't think there was much chance the exploiters could be controlled unless the United States recognized an aristocratic class of some sort and put specific constraints upon them, even if only the

constraints of honor which have done a fair amount of good in channeling the exploiters in somewhat better directions. Of course, when Vikings are attacking there is an obvious role of honor for warlords. It's not clear what legitimate role there could be for our modern-day central banks and big-city banks. They seem to exist only for their own purposes.

Let me put this in more explicit terms. Americans decided in complicated ways, through political and other channels, that they wouldn't tolerate any class system, however restricted, however much the upper classes would then be subject to codes of honor and other customary restrictions—which sort of restrictions have typically been more effective in other countries than positive laws. As a consequence, wealthy and powerful men went partially underground to protect their family's wealth and power and to be able to pass it on more or less intact, which generally meant passing it on to a dominant son. More interesting in its dynamics was the way in which those sons and their brothers in blood or in class attitude formed conspiratorial fraternities at the great universities of the United States and somewhat similar institutions in New York City and other centers of wealth and power.

We ended up with such a strange entity as the Bush family, discussed in the book *Family of Secrets* by the journalist Russ Baker. Alongside, or perhaps behind, the Bushes are their Walker cousins and their allies such as the Dulles brothers (in the previous generation) and the Harrimans (also in the previous generation?) with their particular sub-house of the House of Rockefeller. Immense wealth and power held by men descended in part from those who'd made their fortunes as early as the 1700s in opium smuggling in Asia or capturing slaves on the western coast of Africa and transporting them (nasty business) to the slave-markets of the Americas. The natural and human resources of the northeastern states of the US, along with the Midwest and Great Lake regions and other regions such as Latin America, were developed partly by way of these criminal gains. It was hardly a break with their traditions when these families used the American Navy and Marine Corps to carry out labor negotiations in foreign lands and private armies as well as local police to shoot down strikers at American mines and factories.

Raised to honor a mixture of ordinary and noble and criminal ancestors, the young men of these families took to such activities as espionage

and counter-espionage work, drug-smuggling in the modern style (the CIA in Southeast Asia starting in the Cold War and maybe the preceding hot war), weapons and currency and drug smuggling to support efforts to overthrow Castro or to put into power a variety of thugs in Latin America or other easily victimized areas of the world. They continued to receive training in brotherly loyalty and keeping secrets in the fraternities and other societies of a secret nature, such as *Skull and Bones* at Yale—see [https://en.wikipedia.org/wiki/Skull\\_and\\_Bones](https://en.wikipedia.org/wiki/Skull_and_Bones) for background information.

There is a peculiar sort of brotherhood to be found in pirate bands and mercenary bands and such criminal groups as the Mafia; this brotherhood is a perversion in many ways and a strong image in other ways of the complete and perfected brotherhood to be found only in the Body of Christ on the other side of the grave. In its corrupted form in this world, a brotherhood can teach a fanatical secrecy and can demand a loyalty overlapping family ties but overriding even patriotic ties. As John Adams feared, eventually Thomas Jefferson came to share this fear, this attitude on the part of the American elite, driven by the desire to pass on wealth and power in an egalitarian country and also the desire of young men for adventure, leads to a form of criminality not to be found in officially recognized aristocracies in the West. Think of Tom Sawyer playing not at being Robin Hood but rather at being a CIA ops guy organizing psychopathic young Saudis to kill Russian and Afghan civilians in order to sucker the Soviets into an very unwise invasion. Search on the Internet for Zbigniew Brzezinski's interview in the 1990s where he admitted it was the US which started the trouble in Afghanistan for the purpose of giving the Soviets their own Vietnam. I think that if he confessed to this, then the whole story is probably even nastier and might involve, as one possibility, the movement of CIA drug manufacturing to Afghanistan as the Communist government of Vietnam drove them out of Southeast Asia.

We Americans have apparently corrupted much of the world by making it more or less obligatory for our allies and enemies to have this mish-mash of investment bankers and related lawyers, national security apparatchiks, allied or subservient politicians, subservient judges and law-enforcement officials and journalists, even subservient cultural and religious leaders. We also damaged Latin American and some other regions of the world by financing and training some ruthlessly stupid (stupidly ruthless?) colonels and police-chiefs and presidents or Shahs or Poobahs. Human communities

are never morally pure but we Americans seem to have set out to reduce the entire world to Caligula's palace, rooms devoted to exercising absolute power in the cruelest and more arbitrary manner and other rooms devoted to various sorts of moral degeneracy.

The United States has a solid streak of criminality running through its national character. It is hardly a coincidence that this particular criminal streak likely developed first in the elite of the New England Puritans and other Christian communities of related Manichaeistic outlook. See Chapter , *The Need for Abstractions in Moral Self-understanding* for my take on early signs of the moral blindness which I think to underly the corruption of the American intellect and then moral character. I use "intellect" as defined by Jacques Barzun in *House of Intellect* [7]: "the capitalized and communal form of live intelligence." I discussed this issue in Chapter 127, *Intelligence vs. Intellect*.

I don't think the American power-elite is a tightly organized hierarchy and it includes far more than those who have strong criminal inclinations, though many of those are willing to benefit from horrible crimes. It's more of a class separated from the rest of us. Yet, it's even more; they inhabit a different world even as they live among us. They fight against each other, Skull-and-Boner John Kerry against Skull-and-Boner George W Bush, but they unite when it counts—against the lower classes. And they occasionally admit new members, such as powerful, self-made industrialists or bankers or politicians, perhaps even one so truly lower-class as Bill Clinton.

So, I come around to asking: what are the powerful economic and political interest groups which correspond to the investment bankers, politicians, and monopolistic capitalists of 1900 or so? Do the traditional families who have summered at Newport or the Hamptons for generations still dominate? Does that pushy son of Italian immigrants with his Harvard MBA and his control of a major corporation enter automatically or does he sometimes remain outside the magic circles where men of rigid loyalties control voting rights in some of the secret decisions which determine the fate of industries or countries or rising politicians?

At the very least, we need to account for the national-security complex, with its especially strong links to the gangster undergrounds of our age, and also for the armaments-energy complex, if such is still one complex as it seemed to be for much of the Cold War era.

We would also need to account for what's happened in politics—the traditional machines, such as the ethnic (Irish and Italian and so on) machines

of Boston and New York City and Chicago, don't seem to be tied in to the power elites in the 21st century. Does anyone other than the bankers and lobbyists get to say which politicians are the peoples' favorites?

What about the strangeness of modern banking, especially at the money-creating central banks of various closely related types? Traditional bankers who make loans and collect payments of various sorts over years will favor deflation, as Quigley noted, but Morgan and allies created the Federal Reserve banking system which has always produced at least modest inflation. At times, in Germany and other countries during the 1920s and in many countries in the early part of the 21st century, central banks have created powerful inflationary forces, much of the actual damage not showing up fully as of 2013. But our economic systems seem to be a bit like tanks of highly pressurized gases which have not yet exploded and for which there is no known way to release the pressures. I think J P Morgan would be as confused by this situation as would be Nathan Rothschild or Lorenzo Medici. But I could be wrong as I clearly don't understand this situation now that the bankers have run out of middle-class money to steal.

On the whole, I don't feel confident that I could identify the groups which interact to form the power structures of the modern world though I'm sure that they are more than one and probably less than five.

American national-security complex? Almost certainly but they seem to be clownish in their own murderous and thieving ways and may lose power at any time.

Some power-hungry group masquerading as bankers? Almost certainly.

Armaments-energy complex? Likely.

Other corporate complexes? Maybe.

Something like a political machine? I don't know, but such an insightful thinker as Angelo Codevilla seems convinced politicians are the most powerful part of the ruling class, dominating the corporations and banks. Codevilla, I should note, has experience in the centers of power and wealth having been an official in the Reagan administration and having seen, in his opinion and mine, an honest effort to return government to the citizens being sabotaged by action of members of the power elite who had worked their way into Reagan's inner circle.

Military services? Not yet but our idiot politicians seem to be pushing them toward a coup with the formation of so many special operations groups verging on revivals of the SS.

Local police? Might be the regional warlords in a few decades if things get really bad, especially if they continue along the path of militarization.

Religious leaders? There is no one comparable to either the ruthless but devout Innocent III or the morally degenerate Alexander VI, no one who seeks to serve Christ by becoming Caesar—Augustus or Nero.

The question remains unanswered in my opinion: “Who Are the American Elites and Are They Conspirators?”

# 493 Christianity First Destroyed Rome and Now Has Barbarized Human Reason?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1706>. It was finished and uploaded on 2013/10/03.]

In a typically erudite book review, *The barbarism of reason: John Gray on the Notebooks of Leopardi* at <http://www.newstatesman.com/books/2013/09/barbarism-reason>, Gray tells us:

With astonishing prescience, [the Italian poet Giacomo Leopardi (1798-1837)] diagnosed the sickness of our time: a dangerous intoxication with the knowledge and power given by science, mixed with an inability to accept the humanly meaningless world that science has revealed. Faced with emptiness, modern humanity has taken refuge in schemes of world improvement, which all too often—as in the savage revolutions of the 20th century and the no less savage humanitarian warfare of the 21st—involve mass slaughter. The irrationalities of earlier times have been replaced by what Leopardi calls “the barbarism of reason”.

I detect a bit of the modern hubris in the words “an inability to accept the humanly meaningless world that science has revealed,” a now-centeredness and me-centeredness that—quite properly—rejects received understandings of the world. Having rejected what was received, there seems to be no will to try to find a new meaning; it could be argued that Leopardi and Nietzsche

and Gray are not honest men so much as they are the weak-minded and weak-souled descendants of better men.

Maybe they were justified in their display of self-proclaimed honesty? Maybe Leopardi and Nietzsche and Gray rejected what was received for a valid reason? After all, modern science had cast too many doubts upon a Christian understanding of this universe. Why? Because that Christian understanding was yoked to an understanding of physical reality which was pre-Galilean when the trouble started and had only barely made peace with pendulums and falling apples when Darwin came along and then Einstein and then Schrodinger. . . Let's not forget the geneticists and brain-scientists and all those mathematicians who found that Aristotle and his followers had misunderstood numbers, and certainly infinity, in a fundamental way that had deep implications for understanding the human mind as well as the nature of truths of various sorts. That Christian understanding which had outlived its plausibility was also tied to ancient metaphysical systems not fully compatible with modern science, though they could be enlarged and enriched in various interesting and promising ways.

None of this is an attack upon ancient or Medieval scientists and philosophers and theologians but only a recognition that they did their best with what they knew and they didn't know much that Galileo did know, let alone the scientists and other empirical investigators of succeeding centuries. In fact, it's at least arguable that the work of historians and literary exegetes did more harm to the general acceptance of the Christianity than did the work of physicists and biologists. Many men seem willing to live in a divided world where they accept one body of truths on Sunday morning and another when they watch specials on space exploration or modern medicine, but there seems to have been few Christians whose somewhat naive faith was unaffected by more sophisticated ways of reading the Bible or by the biographies on the "historical Jesus". (I'm under the impression that the generally more younger generation isn't so willing to believe different 'truths' in different contexts; they prefer a more consistent cynicism.)

To an extent, the Enlightenment—at least in its later stages—was something of a public recognition of a failure of Christian thinkers to deal with empirical knowledge that showed our prior understanding of created being was no longer plausible. Reality is reality is reality or created being is created being is created being. What comes to us, what forms our minds, comes from empirical reality and enters us through our senses. This seems to be a point as horrible to Leopardi and Nietzsche and Gray as it was to

the Inquisitors who would have tortured and executed Galileo if Bellarmine had not stopped them—though he was merciful rather than truly understanding what Galileo was saying. I have no particular problems with this basic fact of our perceived realms of reality and the other realms which are implied; in fact, I consider the effort to understand God’s work as Creator to be a bit intoxicating.

Ultimately, what we are seeing in Leopardi and Nietzsche and Gray is not a failure of understanding but rather a failure of a model of human being which came from Occam and the other radical philosophers at Oxford at the very end of the High Middle Ages. At that early time, those philosophers raised will, including that dangerously mythical entity of free-will, to such dominance that it gradually destroyed the Christian understanding of the balanced human being shaped by responses to God’s Creation, a creature of mind and heart and hands in which the mind played a special role of guiding that shaping process and of moving into the future in an orderly way. The “naive acceptance of reality” preached by Aquinas and some other Scholastics was replaced by a refusal to humbly accept what was not understandable in terms of our own private schemes of thought, what was not acceptable to our personal doctrines as to the nature of truth. (I’ve found the best descriptions of this balanced human nature in the explanations of Jacob Neusner of the views of the sages of post-Constantinian Judaism. See Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*,

To summarize a number of my analyses, what we are seeing isn’t anything which could be labeled “the barbarism of reason” but rather a crippling of the human mind by subjection to a mythical entity, the “will,” which could be nothing but our mysterious master or else a bad way of speaking of complex interactions of those aspects of human being which are mind and heart and hands. It is in those complex interactions that our freedom lies, including the freedom which can come into alignment with the story God is telling, the story which is this world. In that story lies meaning, if it can be found, “if it exists” as some would say.

Is modern reason barbaric? No, but reason (mind) separated from feelings (heart) and acts (hands) is but a pitiful fragment of human being. The same can be said of heart or hands; human being is mind and heart and hands—though ultimately one if we are to be true images of God on the other side of the grave. If reason seems to have dominated human being in the modern world, it’s because of an imbalanced and radically incom-

plete understanding and development of human being that was ongoing as European Christians found themselves near or in the explosion which was the modern exploration of empirical reality, an effort requiring high levels of development and use of mind and heart and hands.

I've stated some conclusions drawn from my extensive writings on this topic and I'll try to make a basic point more clearly: human being, mind and heart and hands, was torn apart first by those who had an excessive regard for heart in the form of will, just as it is still being damaged by those who have an excessive regard for heart in the form of compassion. This isn't an academic issue nor one of individuals simply messing up their personal development. We human beings have communal being as well as individual being; ultimately, those who are saved will share the being of the Body of Christ. Even in the more mundane terms of this world, we have intellect or "the capitalized and communal form of live intelligence"—see Chapter 127, *Intelligence vs. Intellect* for a discussion of this distinction of the two aspects of the human mind as made by Jacques Barzun in *The House of Intellect* [7]. The will as glorified by modern advocates of an excessive regard for individualism has especially damaged human intellect. Set free from the guiding wisdom of intellect, the individual with his live intelligence can be something of a monster or at least a barbarian. More importantly, the Body of Christ in His mortal manifestation is Himself in a defective form because of the willful misunderstandings we modern men nurture about human being and about created being in general.

## 494 When a Government Oversteps Its Proper Domain

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1710>. It was finished and uploaded on 2013/10/05.]

A number of those most consistently and honestly upset by Obamacare seem to be libertarians and I'll side with them on this issue though I consider myself to be what some have called Orestes Brownson—a radical conservative. I'll ignore the clueless conservatives and liberals who think moral order to be a gloss upon their favorite campaign slogans.

I would defend and nourish the inherited truths of Christian tradition but have been forced to see that those truths currently bear too heavy a load of human beliefs whose truth was contingent upon knowledge which was once plausible but no longer is. Those sorts of beliefs, we can even call them 'lesser truths', are necessary but we are bound to always update our understanding of Creation to reflect the best knowledge we have. In terms acceptable to those with a variety of beliefs: it's a simple matter of recognizing our concrete reality which doesn't contain all truth but can't be incompatible with any truth, however grand or abstract.

I dealt with some foundational issues of politics in Chapter 452: *How Much Health-care Do We Need?*, Chapter 457: *Moral Order vs. National Welfare Systems*, and Chapter 487: *Does Expensive Weaponry Undo Western Traditions of Liberty?*. See Chapter 424, *What is politics?* for a discussion of the fundamental nature of politics.

I've also written essays in which I've claimed the United States to be an incoherent collection of political entities held together by the wealth of the government in Washington coming from its power to collect lots of taxes. Our incoherent understanding of what a "political community" truly is, and

the bad policies we've adopted as a consequence, has damaged the United States, probably beyond repair. See Chapter 484, *The Fragmented States of America* for a bit of background on my views of our current political mess.

A nation held together by the force of arms and systems of bribery which are made possible by the tax-collection power of the central government isn't a real nation; to the extent it be coherent, it has the order of an ant-hill with a host of parasitic queens and has not the order proper to a human community. I'm greatly disturbed by the inclination of so many Christian leaders to see the gathered hoards of money and then to think of all the alleged good to be done with it, good done at the point of guns bought with money collected with earlier threats of violence.

I have an extremely low opinion of the government of the United States as it has developed after World War II and a merely low opinion of that government as it was between the time the Founding Fathers left public life and the beginning of the Cold War. The Founders were human but not merely human; they were men of substance, of moral character, though sometimes that character was infected with too much ambition or greed. Arguably, the Founding Fathers were as good as it can get at this stage of the evolution and development of human being, individual and communal. Americans accepted without protest the transition from those Fathers to the self-serving scoundrels Tocqueville found in political power by the 1820s. Tocqueville's head was full of images of great American leaders because of the stories of his father's friend, the Marquis de Lafayette, and that young Frenchman was horrified at what he found in that age just after the Founders' age. He was disturbed by what it might say about the public moral character of the United States, though he struggled to find good in this country. The future is here and I'm not frightened so much as I'm disgusted by the opportunities thrown away by Americans even as they pretended, and still pretend, to have made good on their opportunities.

We Americans have the government we deserve as numerous commentators have warned us, but we don't feel any need to examine our own slavish attitudes, figuring that we'll take any master who promises to ease the difficulties of life in this mortal realm. And, by way of an expansion into the most fundamental realms of human life, education and healthcare and regulation of a huge number of human relationships, the Federal government seems to have done well in providing for us, until you look at the longer-term, the years when future generations will be paying for our irresponsible and self-centered uses of power over the various assets of our

human communities. Government has become our means of stealing from our children and grandchildren, of stealing from our various communities.

I'm not opposed to government as a matter of principle, though I admire some libertarians who do take that stance. I can admire the courage and integrity of those who take positions I consider quite wrong, at least when they place some true moral goods, such as peace and freedom, at the center of their structures of belief. Currently, it seems as if there are ten morally courageous libertarians for every morally courageous conservative such as Pat Buchanan; the number of morally courageous collectivist liberals has grown vanishingly small since the passing of the generation of Lionel Trilling and Edward Shils.

I believe this world is the story of God forming the Body of Christ, a human community enlarged greatly but one like unto the community which formed around Jesus of Nazareth during His life on earth, a human community which is the mortal form of the true Body of Christ—the community of those sharing God's life on the other side of the grave. This is not a hierarchical community, as Christ Himself told us in His actions on earth and especially in His various commandments that all be servants of each other, including His special commandment at the Last Supper which was directed at those called to any sort of leadership. Even the Head of the Body is Himself a servant in a true way and not a servant whose entire duty is to give orders to the other members of that Body. Christ is not King so much as He is the Soul, the unity, of the Body of Christ because He is the divine stuff from which that Body and all of Creation was formed. For various reasons, including respect for all of God's creatures and also a respect for our lack of knowledge of the true status of a particular human being, we Christians are bound to act with some degree of charity to **all** human beings, sometimes that charity taking the form of only non-intervention in their affairs. In a proper and usually modest way, we serve all, but we clearly are bound strictly to always serve those close to us in a strong and primary way.

It's perhaps more useful in most analyses of practical matters to speak of our relationship to the Body of Christ in terms of dependencies, a relationship said by some in history and sociology to be the true cement of human communities. We are fully dependent upon our Maker and this is a tie which determines our loyalties in a radical way and forces us to be loyal first and foremost to the Almighty. See my article, *Justice: The First Step Towards God*, which can be freely downloaded at <http://loydfueston.com/downloads/justice.pdf> for a discussion of

this issue which builds upon a claim of St Thomas Aquinas.

We are loyal, if only grudgingly and as a matter of justice, to that upon which we are dependent, but we should be truly loyal to that upon which we are willingly or even enthusiastically dependent. If the governments of this world care for us, feed us, pay us, we are very much dependent upon them. In my way of thinking, we should have good governments which can provide certain sorts of protection: defending us against hostile foreign powers, keeping our streets safe, protecting us against—for example—rent-seeking classes or corporations, and perhaps providing some buffer-zones for the interaction of groups and communities which have incompatible ways of—for example—setting the price for the exchange of money for goods. I would willingly accept my dependence upon such a government and would willingly accept my duty to be loyal to that government; others accept their dependency upon a government claiming omnicompetence and thus making a claim upon our total human being and they offer up a total loyalty which subordinates their loyalties to family and local communities and ethnic groups and certainly God and Church. The problem for now is that the rent-seekers are strongly attracted to the power of central governments and are willing to promise the sheep an end to all ills.

Some who think the government to have overstepped its boundaries, place those boundaries more tightly than do I; some even advocate the elimination of all entities I'll just describe in naive terms as 'central governments'. There are many such thinkers in all age groups but a seemingly larger percentage in the younger groups; after all, it's the younger men and women who are looking at miserable working lives with poor pay and low benefits. Of course, those younger men and women won't be able to subsidize the Social Security and Medicare benefits of us in the older age groups, especially when the choices come down to schools for their children vs medical benefits for an older generation whose members believe the world owes them a prosperous retirement and expensive medical treatments for their sedentary, overweight bodies. The Boomers and members of the X-generation will soon enough learn why the Millennials are so cynical and apathetic; if disaster strikes at its earliest possible point, then even the parents of the Boomers will smash into reality in their last years.

In any case, with Obamacare, the rubber has truly met the road. If this is implemented, it will be another massive program to further cripple a badly limping economy with the fees for the breakers of kneecaps passed to future generations, bills which will not be paid because the only way to pay

them will be to sacrifice the needs of another and younger generation, closing schools or restricting them greatly, letting American infrastructure—already something of a joke in the developed world—deteriorate further, dipping into the already dwindling supplies of job-creation capital, and so forth.

Let me state a couple truths of human being:

1. The younger generations will be morally well-ordered only if Grandma and Grandpa put in a sustained effort during their Golden Years to pass on stories reflecting moral truths and the particular ways of living which embody those truths within particular family-lines or ethnic groups, however imperfectly those truths are embodied.
2. The younger generations will have good economic opportunities only if Grandma and Grandpa make the proper sacrifices from their accumulated surpluses.

What to do? The Catholic bishops have nobly offered their descendants for martyrdom while preferring to imagine that Obamacare can be baptized once it's magically stripped of 'prejudice' against Christians. As for me, I'm forced to anticipate some sort of martyr's future because I can't imagine a program, healthcare in this case, can be properly implemented if it involves moral issues upon which Christians differ in their own ranks and upon which Christians differ greatly with most pagans especially those of a post-Christian variety.

So it is that I a conservative Catholic will align myself with morally well-ordered libertarian thinkers such as Matthew May whose declaration of independence, *Guest Post: I Will Not Comply*, can be found at <http://www.zerohedge.com/news/2013-10-02/guest-post-i-will-not-comply>. In political terms, his statement climaxes in his statement: "I will not comply because I am a free citizen of the United States, not a subject of its government."

True enough, for a libertarian or for a Catholic trying to update traditional understandings of the Body of Christ: we would be free citizens of a true and morally well-ordered political entity, but we find ourselves as target subjects of a bloated government inhabited by rent-seekers of a variety which would amaze even Mark Twain and may well have amazed Gore Vidal during his last years. There are substantial differences between

my understanding of human being and that of libertarians: I consider our social natures to be true created being, communal human being, and not just some tendency for our individual selves to form external relationships. In other words, I consider the Body of Christ to be real and not just a way of speaking of a gathering of individuals bound by a particularly important contract. I find my belief in human being, individual and communal, to be more compatible with the findings of evolutionary biologists than are the beliefs of any version of modern liberalism, libertarian or collectivist.

Yet, there is a point where respect for reality, however understood, leads all men who would be morally well-ordered and who would live in a society morally well-ordered to stand up and say, “No,” when any part of the greater human community—ecclesiastical hierarchy or government, oversteps its realm of competence, its realm of moral operation. My difference with libertarians, including those who claim to be Christian, is my strong belief in the reality of human communities, the reality of human communal being, and ultimately the reality of the Body of Christ.

# 495 Quietly Charitable or Quietly Murderous But Always Quietly American

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1716>. It was finished and uploaded on 2013/10/14.]

Pepe Escobar is a world-traveling journalist who's worth more than the entire staff at *CNN*, *Fox*, *New York Times*, *Washington Post*, and most of the others in the American mainstream news-media. He seems to often be in the most dangerous regions of our planet and to have lots of solid information and to be able to provide insightful analyses based upon that information. In his essay, *Breaking American exceptionalism*, found at <http://www.atimes.com/atimes/World/WOR-03-011013.html>, he deals with a problem in the American moral character which has unleashed those dangers in many of those regions.

Much of his analysis takes a television show, *Breaking Bad*, as an allegory for what has happened to the United States: Walter White, a seemingly decent fellow who teaches high-school chemistry has developed a second life as Heisenberg, a drug-dealing gangster. As Escobar puts it:

Walt/Heisenberg is a scientist. His scientific genius was appropriated by unscrupulous partners in the past, who enriched themselves in a tech company. As Heisenberg, finally the scientific/mechanical genius comes to full fruition—from a wheelchair bomb to a raid based on magnets and even a remix of the 1963 Great Train Robbery in the UK, not to mention the perfectly cooked meth.

After making a few comments on various aspects of this double-existence, including a comment about Nietzschean nihilism, Escobar gets to the heart of the matter:

Walter White, once again, embodies “the myth of the essential white America. All the other stuff, the love, the democracy, the floundering into lust, is a sort of by-play. The essential American soul is hard, isolate, stoic, and a killer. It has never yet melted.”

Escobar’s analyses apparently come, at least partly, from his contemplations on *Studies in Classic American Literature*, a study of the American character by DH Lawrence and, in particular, of the Deerslayer character from James Fenimore Cooper’s novels.

I haven’t yet read Lawrence’s book, but this analysis seems close to that of Herman Melville regarding, first, the moral characters and thoughts of Ralph Waldo Emerson and Henry David Thoreau, and, secondly, his generalization of his fears from that analysis to the typical American. Melville thought the American character to have a strong streak of moral insanity and considered that to be of the form of a rebellion against a God who didn’t give us as good a Creation as we deserve. In *Moby Dick*, the actions centered around Ahab who was a courageous and more self-honest version of Emerson. In his next novel, *The Confidence Man*, Melville specifically dealt with the egocentric nature of Emerson (the philosopher who spoke gobbledy-gook) and Thoreau (the practical pupil) and then that of nearly all the passengers on a steam-ship (Americans in general with Cooper perhaps showing up)—the selfishness of these passengers, oddly enough, showed up as a hardheaded and seemingly proper refusal to accept any of the claims of the Confidence Man. Nathaniel Hawthorne had an understanding which was different in details from that of Melville’s but essentially the same. Tocqueville also thought Americans to have had an odd ability to ignore the most brutally obvious facts if they disagreed with mainstream American viewpoints. I’ve also read that Henry James, Sr had similar fears of the exceptional nature of the American character. Escobar didn’t raise this fear but I think this American moral disease to be spreading around the world with American popular culture, though few peoples have moved over to a dreamworld so completely as have the residents of the indispensable country.

In Christian terms, Americans are a people lacking in true charity—the love that binds us into communities as strongly as our dependencies do; Americans practice charity largely as a way of feeling good about themselves. Alternatively, they could feel good about themselves by killing off those “red savages” who were servants of Satan. Update to a people who send off collections of dollar bills to feed the children in one country, perhaps Haiti, even as they send in a firepowerful, if not so competent, military to demolish a city in another country. Don’t children live in such places as Baghdad?

In Graham Greene’s novel, *The Quiet American*, set in Vietnam in the early 1950s, we read about a clean-cut, young American man who is an undercover CIA agent. He spends his days helping Vietnamese to build businesses, improve their farms, and so on; he spends his evenings providing support to criminal warlords who commit terroristic atrocities against the civilian population of Saigon. Lest you think Greene was imagining this sort of activity, I’ll quote General William Odom—see [https://en.wikipedia.org/wiki/William\\_Odom](https://en.wikipedia.org/wiki/William_Odom), a prominent figure in the Carter and Reagan and Bush I regimes. In *American Hegemony: How to Use It, How to Lose It*, found at <http://www.middlebury.edu/media/view/214721/original/OdomPaper.pdf>, he tells us in ruthlessly honest words:

Because the United States itself has a long record of supporting terrorists and using terrorist tactics, the slogans of today’s war on terrorism merely make the United States look hypocritical to the rest of the world.

In other writings, Odom has put forth justification of the use of terrorism as a tool of American policy. American leaders, though not of the competent sort, aren’t so fully dumb as they might appear—they know quite well they use gangster methods to secure power and wealth around the world. They have souls which are “hard, isolate, stoic”; they are killers, though perhaps themselves too soft in body or too cowardly in physical ways to go forth into the action.

Life is more complex and more interesting than textbooks or newspapers can communicate, more interesting and less clear-cut than even the most complex of novels or history-books, let alone any movie or play or television

show. There are a variety of interesting angles for studying this problem of American “Exceptionalism”.

I’ve discussed this problem from various angles before, including one angle which I consider particularly interesting and insightful. In June of 2009, I published the essay, *The Need for Abstractions in Moral Self-understanding*, which is included as Chapter 408, in which I claimed:

Those who abstract only by idealizing their particular beliefs and ways of life will remain trapped by their prejudices, country yokels come to the big city and seeing no choices but to give up their ways of life fully or to react against the surrounding confusion by withdrawing into self-righteousness and maybe outright hatred. Only he who learns to abstract up to higher levels can truly see the viewpoint of others and see the goodness in multiple cultures which are in conflict even when he decides that he’s morally bound to side with one. For example, someone might see the goodness in the nomadic life of the New England Indians while deciding that a larger, more settled population is morally preferable to a nomadic society of the few.

Some of the Puritan leaders of New England during the period of King Phillip’s War were very well-read in Newton and all were well-read in the Bible and classical literature and Calvinist theology, yet they proved incapable or unwilling to ascend to a higher level of abstraction during the conflict with King Phillip and the tribes which followed him into war. Staying bound in their own concrete manifestation of Christianity and Western Civilization, they failed to see their position was not one of good and God-centered men fighting against a Satanic enemy but rather that of somewhat good and would-be God-centered men fighting to expand the domain of one manifestation of the Christian West. The enemy wasn’t Satanic but rather barbaric and nomadic. A suitable amount of competent abstract thought on the part of the European settlers of New England would have allowed them to see the true good they were defending but also the good the nomadic Indians were losing. A truer and more just peace might have been obtained even though I doubt the war could have been avoided.

Is it now possible for the West, as a civilization, to achieve greater competence in the abstract thought necessary to understand our complex selves and our complex civilization? We seem about to needlessly destroy our own civilization because of the same sort of self-righteous blindness which led the New England settlers to misunderstand their conflict with King Phillip and his followers. The New England founders dug a rut of sorts and we Americans seem to have traveled that rut in the ensuing three and a half centuries. We've even managed to idealize that rut into the path of truth and righteousness.

For now, I have nothing more to add to my public writings on this issue and probably won't be able to go beyond this sort of an analysis until I've made some progress in my project of expanding our stocks of words and concepts for moral, social, political, and other analyses. I've discussed this project in a few places and have also done some work in refining the implications of all of this for understanding human history.

As was true in the 1990s when I began writing novels about my disquieting suspicions that we modern men misunderstand the very nature of created being and of our place in the scheme of things, I have had vague, dream-like ideas and vague images about, in this more recent situation, moral spaces in which densities of human beings can pull individuals into increasingly vast populations or even into the equivalents of black-holes, moral spaces in which our imaginations travel strangely curved paths, moral spaces which we can reshape by proper efforts which are responses to the way things are now, and etc. I don't think we know how to balance our individual and communal selves in our brave, new world. See my freely downloadable book, *A More Exact Understanding of Human Being* [53], for a background discussion of human individual and communal being. And a little more.

In any case, my mind is often working—if only in subconscious regions—on this problem of how to describe and analyze human being and, especially, the moral aspects of our beings. As I discussed in Chapter 110, *Intentionality as the Guide to Philosophical Thinking*, I try to be as Newton was in this way:

I keep the subject of my inquiry constantly before me, and wait till the first dawning opens gradually, by little and little,

into a full and clear light. [Sir Isaac Newton]

Most Americans would prefer to avoid this by defaulting to an existing 'ideal' which is almost always a generalization which is actually little more than a restatement in abstract and idealistic terms of concrete American thoughts and behaviors and feelings, as I discussed above in the long quote from Chapter 408, *The Need for Abstractions in Moral Self-understanding*.

I'll give one warning about all of this. There are more good critics than good prophets pointing to a plausible future. Nietzsche was one of those good critics; I'm of the opinion that Nietzsche actually did try to return us to the path of virtuous paganism and failed for a variety of reasons that don't interest me enough to explore. I've tried always in my writings, novels and nonfiction works of various lengths, to point toward a better future, a Christian future which might not interest some in this day and age. In the midst of all this modern disorder, I've always held and preached a confidence that God is in charge and is telling a story in which the Body of Christ is forming even in this mortal realm, and I've done so by considering both Christian revelations and modern empirical knowledge. What I propose is a story in which the United States had a special role to play, as did many large communities in history, and failed to take up that role. Some see suffering in the future for the American people; I see great suffering just because I think it plausible that God will yet force us to take up the role He had given us in His story. Since we have already messed up in many ways, I think we'll share that role with other peoples, probably the various peoples of the Pacific Rim. We're not likely to be dominant in any meaningful way, but we'll see what happens.

# 496 Conspiratorial Gangsters Are the Leaders Americans Want and Deserve

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1721>. It was finished and uploaded on 2013/11/08.]

The center hasn't held and the pieces fly away. Without the most basic sorts of order, the sorts of order which are specifically labeled 'moral' aren't possible, at least not on a large-scale such as that of the United States or even that of the city of Springfield, MA less than a quarter mile away from me as I write. No one is foolish enough to deny that even street-gangs founded by teenagers have engaged and still engage in small-scale criminal conspiracies to control drugs and hookers and gambling. When the stakes rise high? Perhaps to control of the budget of the Department of Defense (DOD) with its Rumsfeld-announced missing money of about \$2 trillion? We could guess the harsh truth in Lord Acton's dictum that the problem (one at least) with powerful and centralized governments is that they attract men with the moral character of gangsters.

Let me diverge slightly on the subject of a corrupt DOD—which does not mean that the fighting men are necessarily corrupted though some would have to be to allow this level of thievery. David Walker was the government's internal auditor for much of the Clinton and Bush II administrations. He had the responsibility of putting the Federal government's accounts on a rational basis such as that used by businesses and he estimated missing DOD funds at about \$800-900 billion as I recall, still a large amount of money to have been embezzled, stolen, misused, or whatever. But remember that money spent as Congress had directed is still a source of power,

including that of paying for goods and services from businessmen friends and of giving jobs to specific individuals who support them politically or even types of individuals likely to support them.

I've read enough history to know that such observers as the Irish political scientist William Lecky noted that the American people were morally well-ordered but the American political class was the most corrupt in the world—circa 1890. This was the opinion of many observers even before that and of many more since that period. The United States has been an experimental dance along the edge of a cliff since at least the passing on of the generation of the Founding Fathers and it's quite possible that their Enlightenment ideas created the openings for such moral disorder at the leadership level, a disorder which eventually seeped into the most sedate of American smalltowns and city neighborhoods. We've fallen off that cliff and are yet to slam against the bottom.

Bertrand de Jouvenel, the French political scientist at his peak in the mid-20th century, noted that the United States political system was dominated by political machines operating behind the scenes, though everyone including the writers of *Miracle on 42nd Street* know of these machines which make money only by delivering the goods in terms of laws, judges, policemen, and so forth which are favorable to the paying customers. Intelligent politicians and judges and others are undesirable and those with moral character will make it impossible to guarantee the goods will be delivered. The reader can follow through to the disedifying conclusions which are, in fact, realized in American history.

Early on, the Tammany Society was formed—see the Wikipedia article at [https://en.wikipedia.org/wiki/Tammany\\_Hall](https://en.wikipedia.org/wiki/Tammany_Hall) where we can read these introductory words:

Tammany Hall, also known as the Society of St. Tammany, the Sons of St. Tammany, or the Columbian Order, was a New York City political organization founded in 1786 and incorporated on May 12, 1789, as the Tammany Society. It was the Democratic Party political machine that played a major role in controlling New York City and New York State politics and helping immigrants, most notably the Irish, rise up in American politics from the 1790s to the 1960s. It controlled Democratic Party nominations and political patronage in Manhattan from

the mayoral victory of Fernando Wood in 1854 through the election of John P. O'Brien in 1932.

So it is that the American political system from that early year had a means for political opportunists and crooks (Aaron Burr, an early member, was more a case of an odd mixture of talent, moral substance, and a moral willfulness resulting partly from a rebellion against his father, the Calvinist theologian who was the first president of what became Princeton, and his grandfather, the famous Calvinist preacher Jonathon Edwards.) Don't think things have changed that much. Two men of different political attitudes but similar regard for their country, Eugene McCarthy and James Buckley, formed an alliance in the 1970s to fight the so-called election reforms which they claimed, rightly as it has turned out, to be no more than a means of consolidating machine power in the national committees of the Republican and Democratic parties.

Put that political corruption alongside the joyful discovery of certain types of humanoids that there was much money to be made in modern wars and the 007 or comic book mentality inculcated in the CIA black-ops officers and agents by Allen Dulles and you have a ruling elite which helped the United States along in the final stages of moving from barbarism to decadence.

Far too many of the ordinary citizenry, though seeming moral in much of their activity, have adopted the personality structures of decadent barbarism—we never really stopped being barbarians but now consciously glory in our low moral and cultural state. How many, including allegedly devout Christians and Jews, have set their children in front of James Bond movies to absorb a worldview of absolute good and absolute evil, where the guy who represents absolute good kills ruthlessly when he wills to and also takes advantage of buxom young ladies, while generally living it up on the taxpayer dollar. Then, off to church on Sunday go devout Christian parents and children to commiserate with fellow church-goers about the tendencies of modern young men to take advantage of young women or to respond inadequately to young women not meeting James Bond standards of breast-shape and breast-size. As for young women taking on their fate as sex objects?

So... Is there any order, hierarchical or otherwise, in this devil's playground filled with morally perverse adolescents? Can we identify gangs in the ruling elites or at least classes with well-defined interests? I can't present any good analysis laying out any such gangs or classes as I noted in

Chapter 492, *Who Are the American Elites and Are They Conspirators?*. I don't know if it is even possible to make a clean separation of corporate marketing departments in Lockheed and General Dynamics and those others who deal in all sorts of illegal weaponry and drugs and human slaves. Those who understand supply and demand in the fast-food industry think there to be a clean separation between different supply sources of weapons and also that the 'evil' weapon suppliers will deal in drugs and slaves but not the 'good' American corporate or governmental weapons suppliers. Against that, I'll merely point out there is one international market for weapons and there are degrees of sliminess but overlapping ways of satisfying demands.

I do have a warning for those who think the money flows from Wall St tell us the investment bankers control the politicians. Those money flows might well be not the buying of those elected leaders and government workers but rather the payment of protection money. After all, few will hear that bar-owners and other businessmen men in a city are paying money to a gangster and then conclude those businessmen are buying the gangsters. In fact, the relationship is probably more complex than either simple bribes or protection money. There is no doubt that J P Morgan and John D Rockefeller owned the souls of a lot of politicians, regulators, and so forth but Teddy Roosevelt proved a headstrong politician who realized the nature of his own power could stand up even to such domineering figures. Of course, they did him in in his second effort to win the White House on his own, but it cost them a lot and it was far from certain they were going to win against the Rough-rider even when they used all the means at their disposal, short of assassination. Which they might well have considered—I have no illusions about men who devote themselves to gathering in power and wealth.

The other warning I have is: conspiracies are tools and not any sort of structure, political or social or so forth. Conspiracies might be ongoing projects with vague goals, such as those of the think-tanks and Bilderberg meetings, in which an effort is made to gain disciples or to spread the message. Think-tanks and other groups can and have engaged in specific conspiracies, such as the justification of the criminal invasion of Iraq in 2003. These softer sorts of groups more often have vaguer goals, more long-range and compatible with the objectives of differing groups in the ruling class or academic class or whatever; the Rhodes scholarship program was such a longer-range project and never, to my knowledge, associated directly with any criminal conspiracy but rather with the effort of Cecil Rhodes and his

followers to unite the English-speaking world to engulf all of mankind in Anglo-American culture.

We live in an age when historical awareness is very high and very much manifested in various scientific or pseudo-scientific forms. I would expand this general idea to include all sorts of rationality, good forms and defective forms, including engineering types of design. Elitism has become what it always tends to become: a project by powerful and wealthy families with some sort of communal self-awareness—though still necessarily operating within the context of possibilities and constraints we can somewhat guess at and understand by way of the newer and more exact understandings of human nature made possible by the results of modern historical investigations and analyses as well as by the results of sociobiology and other sciences. The self-awareness within the flow of history has become more intense than it ever was—aristocratic classes have tended to simply assume their own ways of grabbing and using power without having much awareness of its artificial or constructed nature.

# 497 The Christian West Continues to Destroy Itself and Other Christian Peoples

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1726>. It was finished and uploaded on 2013/11/09.]

I'll begin by saying that I believe God is at work even when morally disordered men are seemingly in command. It is God who is moving the story of the Body of Christ forward. We, all Christians in the most recent few centuries, have been following our own inclinations rather than paying attention to the Creator to understand what could be the meaning of all we're learning about Creation, including our own human natures. Yet, there is enough freedom of movement in God's way of telling this story that we, as individuals and communities, can damn ourselves by playing our roles wrongly. That God uses our cowardice and faithlessness to His own purpose doesn't lessen the seriousness of the crimes we commit to serve our own worldly purposes, even when those purposes are for the benefit of institutions originally founded to serve God and the Body of Christ.

As Dante's pilgrim found out at the very beginning of the *Inferno*, we can travel straight while God's path curves away from us. We should pay attention not to our own inner orientation but rather to that path or more generally to what is going on in the world God created, the world which is the story of the Body of Christ as it came to be and now develops. In particular, Christians of the modern West would be wise to distrust any good feelings which conveniently serve our individual or communal purposes, most especially the purposes of our political and economic communities, but also those of our ecclesiastical and educational and charitable

communities.

I've been listening to occasional ads on the radio station of the Hartford Archdiocese of the Catholic Church. These ads are a bit of a blur in my mind at the moment, but they are intended to direct listeners to one of the American government's retirement planning websites—I think that of the Department of Labor but I hardly care about that detail. These ads make a joke of anyone silly enough (or morally well-ordered enough?) to put their trust in their families or local communities rather than in the government in Washington, DC. I'll merely note the Biblical warning about not being able to serve two masters; the modern centralized powers, including the government of the United States, didn't become masters competing with God only when they began to more directly humiliate the bishops by using legislation and programs supported by those bishops.

Then, there is the ongoing horror of the destruction of ancient Christian peoples by the Western powers (rapidly becoming the comic non-powers) or their lovely allies such as Saudi Arabia or Qatar or the terrorist non-organization called Al-CIAda by knowledgeable observers. The most recent atrocity and cover-up I'm aware of is discussed by the reliable and insightful Srdja Trifkovic in his recent article, <http://www.chroniclesmagazine.org/2013/11/08/latest-massacre-of-syrian-christians-covered-up-in-the-west/> found at LatestMassacreofSyrianChristiansCoveredUpintheWest, where we can read:

When a false-flag atrocity occurs of which Muslims are the purported victims, the United States goes to war to save them—the January 1999 stage-managed “massacre” at Racak, in Kosovo, being a classic example. When all-too-real massacres of Christians by Muslims take place, they are unreported in the Western media and uncommented upon by Western politicians.

“Slaughter in Syria: 45 Christians Killed by Islamists in Sadad and Thrown into Mass Graves,” *CatholicOnline* reported on November 5 [at [http://www.catholic.org/international/international\\_story.php?id=53030](http://www.catholic.org/international/international_story.php?id=53030)]. The facts of the case are obvious from the rebels's own shockingly gruesome footage [at <https://www.youtube.com/watch?v=sxT6C6rJLSw> or with English subtitles at <https://www.youtube.com/watch?v=sxT6C6rJLSw>] and from the government

forces' initial video report after liberating the town. . . [Reader beware. The footage is gruesome as noted; for example, an insurgent kicks the bloody corpse of a Christian while calling him "Bashar's dog." These are the same rebels supported by the allies of the US government who buy lots of American weaponry and more from the US and at least weakly supported by the US government in more direct ways.]

We can read on to learn:

Forty-five innocent civilians were martyred for no reason, and among them several women and children, many thrown into mass graves. Other civilians were threatened and terrorized: thirty were wounded and ten are still missing. For one week, 1,500 families were held as hostages and human shields, among them children, the elderly, the young, men and women. . . All the houses of Sadad were robbed and property looted. The churches are damaged and desecrated, deprived of old books and precious furniture. Schools, government buildings, municipal buildings have been destroyed, along with the post office, the hospital and the clinic. What happened in Sadad is the largest massacre of Christians in Syria and the second in the Middle East, after the one in the Church of Our Lady of Salvation in Iraq, in 2010.

"We have shouted aid to the world but no one has listened to us," [Archbishop Selwanos Boutros Alneme, Syriac Orthodox Metropolitan of Homs and Hama] concluded. "Where is the Christian conscience? Where is human consciousness? Where are my brothers? I think of all those who are suffering today in mourning and discomfort. We ask everyone to pray for us."

Prayers they might get. In the same intercessionary prayers in which we American Catholics pray for the American soldiers who are being used to bring "peace" by overthrowing non-subservient governments in the oil-rich regions of the world. We might better pray for the souls of those young men and women (isn't it bad enough to send young men even when a just war is involved?) fighting in the service of a government recognized as evil only when it does something to impact the self-images or checkbooks of the American Catholic bishops or other American Christian leaders. I should

add that those who see some true good possibilities in the Islamic peoples should realize the American government and its allies do all they can to destroy any movements towards peace and tolerance in favor of the sorts of men who kill unarmed human beings in the name of serving Allah. All in all, those despicable figures are a bit like those Americans who knowingly kill unarmed human beings (such as the residents of Baghdad in 2003) in the name of serving the modern central powers such as the nation-state.

Western Christians aren't trying to serve God or to become part of the Body of Christ; they are trying to make the best deal possible, and to keep peace, with the devils which are the central powers of the Western world. And many who go to Christian churches on Sundays have integrated themselves into those devils.

# 498 Multiculturalism: Throwing Ourselves and Our Children into the Trash-bin of History

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1729>. It was finished and uploaded on 2013/11/15.]

In 1973, Jean Raspail wrote the novel, *The Camp of the Saints*. That novel was a controversial and very pessimistic take on immigration and multiculturalism; it depicted France decaying into a state of violent incoherence in a multicultural age.

Recently, Raspail gave an interview which is discussed by Srdja Trifkovic, see the article *Jean Raspail's New Warning* found at <http://www.chroniclesmagazine.org/2013/11/05/jean-raspails-new-warning/>. In that article, we can read:

Forty years after publishing his prophetic dystopia Jean Raspail is still with us, ever more resigned that our civilization is on the "road to disappearance." As he explained in an interview published in *Valeurs Actuelles* on October 25 (transl. by ST), he has no desire to join the big circle of intellectuals who spend their time debating immigration because, in his view, such talk is useless:

The people already intuitively know that France, as our ancestors shaped her over the centuries, is on the road to disappearance. The audience is being kept amused by endless talk about immigration, but the final truth is never stated. Furthermore, that truth

is unsayable, as my friend Jean Cau had noted, because whoever says it is immediately hounded, condemned, and then rejected. Richard Millet [a prominent figure in French literature who lost his job and was hounded out of public life because he claimed that Anders Breivik, the Norwegian mass killer, was a product of multiculturalism] came close to that truth, and just look what happened to him!

What can be done? Raspail tells us:

There are only two ways to deal with immigrants, Raspail says. “Either we accommodate them, and France—her culture, her civilization—will be eradicated without so much as a funeral. In my view, that is what is going to happen. Or we do not accommodate them at all, which means we stop sanctifying the Other and rediscover our neighbors.”

You can read the above quote with “the United States” or “Great Britain” or “Italy” substituted for “France” and the truth remains, though American culture is far less substantial, less of a loss to the West. At the same time, the United States, if we had chosen to grow up as a people, was the logical center for a newly reinvigorated Western Civilization. Likely it is that such an opportunity for greatness is lost, though I feel it likely that the American people will participate in some substantial way in any new civilization growing up in the next century or so. But it’s far from clear we’ll have the stuff to take a truly central role.

In any case, we in the West have a mess on our hands, a mess productive of high crime rates and revivals of political irrationalism. The US Army is said to have many soldiers proudly wearing the tattoos of various gangs from the Latin Kings to the Aryan Brotherhood; from the modern individualistic viewpoint, there would seem to be remarkably few large criminal gangs which aren’t ethnically or racially based. The crime rates for the core American population of European-descent are about the same as for the old countries, but American crime-rates, violent and otherwise, are relatively high because of other ethnic groups, such as African-Americans and Hispanics.

Bishops and ministers and rabbis and Senators and professors and others so charitably offer up the lives of their fellow-Americans and also their

money through programs to bring in more immigrants to a country which still hasn't figured out how to assimilate African-Americans who've been here for centuries. All this while job-creating capital is dwindling and infrastructure is decaying in the United States. Bishops and Senators alike show no capability of truly raising these more recent immigrant groups out of their primitive cultures, their illiteracy, their lack of the sociability needed to form or join higher-level cultures—unlike the British and French and Italians and Poles and other European peoples, Hispanic peoples show no inclination to form social clubs or to found schools. After all, any efforts to help these people to assimilate to a more complex and more civilized life would require that they first raise their children properly. It's much easier to cry as the dark-skinned teenagers kill each other in between gathering in barbarian mobs to loot convenience stores to the sounds of songs which glorify rape and the killing of cops.

Our leaders have presided over the decay and sometimes violent destruction of what was given to them in stewardship. Yet, these men who couldn't even maintain the institutions of a phenomenally wealthy and powerful country think to help others to... what? Assimilation isn't in the cards and hasn't been for a while. Those leaders seem not to have the faith in moral order or higher culture or even the God of Moses or Jesus Christ to impose any of the Western ways upon the troubled and disordered alien peoples in our midst; nor can we help them to form their own higher-level cultures—they must take the initiative.

It might not be possible to bring these immigrants to a state of moral order in any foreseeable time. Raspail might be right; we may have admitted and may be feeding and clothing those whose role is to kill the West and all that was good in it.

Politicians and Christian charity-workers look at these unassimilable peoples lovingly as potential dependents and corporate executives look at them with dollar signs in their eyes. It's hard to believe that American cultures, mostly as vulgar as European peasant cultures without the vitality and dedication to biologically healthy ways of life, can stand up as our exploitive masters further degrade their products, communication devices and movies and popular music and political speech and acts, to accord to new mass-markets whose most aggressive and opinionated consumers are at the cultural level of pre-urban tribesmen. A fair number of the children of European descent are headed toward that state. Others are just going to be befuddled little soft things in a world demanding a large degree of

toughness.

Things will get worse, will be magnified by our ongoing economic and political problems which seem be solvable only by a wholesale reform of Western ways of life—a set of tasks well beyond the doing of soft Americans or Frenchmen and unimaginable to our Sudanese or Hmong immigrants. Whatever happens, reform or decay into a state of utter barbarism, things are sure to be ugly and painful and we seem to determined to make things as ugly and as painful as possible for the next few generations.

Mixtures of peoples, for good and bad, prevent the sort of moral coherence which allows a nation or smaller community to respond to problems. In fact, a mixture of cultures, even of morally well-ordered peoples, makes it difficult to even engage in the ordinary transactions of life. When we go to a store, we British-Americans, and likely others, wish to buy goods or services in the way to which we are accustomed, such as set prices, rather than find ourselves involved in a Middle Eastern negotiation for the price of oranges and beef roasts. I'm sure immigrants from the Middle East mistrust store-owners who refuse to bargain. We would like to assume our family doctors understand their role in the way of, say, a smalltown New England doctor rather than in the way of a corporate or government bureaucrat. Modern men of the West are restless and dissatisfied partly because we've gone multicultural in a willy-nilly manner that takes away one of the great advantages of human culture: we don't know what to expect of neighbors, merchants, providers of professional services, or public servants. We have lost our human cultures which were shaped to our customs and habits. Our leaders have given us only illusions of a kinder and gentler world, one whose best attribute is the impossibility of bringing it into existence.

We should not underestimate the importance, for good and bad, of the large-scale migrations of history; nor should we forget their relationship to periods of war and other forms of upheaval. We should not court the disasters attendant upon those large-scale movements of peoples into alien lands, disasters often leading to future goods of lesser or greater sorts, but only after generations of suffering and then hard work. In the cases of the United States and Europe, I fail to see much good coming from large-scale immigration from Asia and Africa and Latin America, especially at a time when our own troubles are maturing and are likely to result in reduced living-standards for the next few generations as well as being likely to result in a very shabby inheritance for our descendants in the political and cultural realms.

Yet, there are many out there, morally well-meaning in a juvenile and irresponsible way, who think that we—especially we Christians—can solve the problems of the poor by direct and simpleminded actions, though they would more likely claim the phrase, "direct and simplehearted," to be closer to the truth. Given my understanding of human being [53], there isn't so much difference between simpleminded and simplehearted. If you think it good to be comfortably dumb, you should also think it good to be simple of heart, undisciplined and spewing forth sentiments upon all who don't get away fast enough.

As I have noted repeatedly, we modern Christians tend to claim the world is simple when we set out to worship or understand or serve our Maker though we are awfully willing to recognize the complexity of the world when seeking to save our own lives by way of modern diagnostic machinery or surgical techniques, let alone the technological wonders of cable television or smartphones. See Chapter 582, *Taking the Fresh Fruits and Giving God the Leftovers*, for a very short discussion of this issue.

I'd like to point back to some of the chapters where I've discussed the moral disorder (lack of participation as worshipers or voters and uncivil responses to strangers and even those in one's own communities—sound familiar?) which comes to multicultural communities: see Chapter 218, *Networks of Public Spaces Rather Than One Square*, and Chapter 275, *We Prefer to Cooperate With Those Like Ourselves*.

I've also tried to address in a short essay the frustrations of watching well-meaning and intelligent men and women who seem not to see problems until they've run us over and passed by: see Chapter , *Reality Bites Back but Maybe It Started Nibbling Many Years Ago*; as some of us would have feared, they are now aware there are problems and are waging war against the symptoms. After generations of many Christians, including the domineering leaders of both the American Catholics and American Protestants, pushing for government programs which would make the ordinary citizens dependent upon centralized political and economic powers, Christians—including many leaders—are surprised, surprised that gambling is taking place in Rick's nightclub (see the movie *Casablanca* or just the short clips of that scene available on the Internet). This is to say, they were surprised that the sorts of men and women who seek political power would misuse the dependencies of the citizens upon the central government (and centralized medical industry corporations). Maybe it's unwise to expand the central government's power to cover all important areas of human life?

But, and this is a big BUT, would it matter in the long-run to a Christian if Western Civilization were to utterly collapse? If God is in charge, the story of the development of the Body of Christ in this mortal realm will continue, even if we find that Body suddenly centered on the Pacific Rim (one possibility and the one I think most likely). It will matter in the sense that we men of the West will have to admit to our failures of nerve, of faith, of the sheer guts that leads **good** men to live or die for God, family, Church, civilization, and nation—in approximately that order though clergymen and others with peculiar vocations might have a slightly different ordering to meet their peculiar duties.

Moral order, even when embodied in warrior societies or exploitive societies, is the raw stuff of the Body of Christ. When it is embodied in such a society as the United States has become, not the society Adam Smith lauded but the one he feared might arise? Yes, rather than full-chested Christian men setting to the task of being more active stewards of the world's natural resources, including human talents, we have become the genial men lacking the tougher moral characteristics—as Adam Smith feared for just a sentence or two before returning to his sometimes irrational optimism. Maybe we are invited to destroy ourselves and Western Civilization because Western men hollowed out their own chests—with more than a little bit of assistance from our mothers and our mostly female teachers.

It's a bit disturbing to think we are falling from the heights of wealth and power, of cultural accomplishment, because we have become fat, dumb, and lazy, but that might well be the best way to understand our current problems. If we were to recognize the real enemy is the Western man who looks back at us from the mirror, could we rescue the West, at least so that we can participate in the birth and development of a greater Christian Civilization? A somewhat more complete, if not yet a more mature, Body of Christ? I don't think there is much possibility for a large-scale revival of Western Civilization because I don't think Western men are honest enough, courageous enough, to face up to the fact that they lack balls, no matter how much muscle mass they develop in trips to the gym and no matter how many hours they put in viewing brutal sports events or the far more brutal assaults of the American military upon civilian targets in countries not able to defend themselves.

## 499 Creating Our Own Realities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1732>. It was finished and uploaded on 2013/11/18.]

I've written on this general topic before: see Chapter 408, *The Need for Abstractions in Moral Self-understanding* as one example.

Americans seem to love sloppy idealizations drawn from shallow and literalistic understandings of reality. We love witch-hunts of all sorts; we love to justify ourselves in the way of Emerson and Thoreau and Parker and other New England Transcendentalists and Unitarians who seem to have had a respect for common sense and reality only because they truly and deeply believed that common sense and reality were those wraiths which flickered across the stages in their own minds. Most of all, we love that strangely profound and profoundly strange thinker named Abraham Lincoln, though we like the folksy man of the people as he's depicted in movies and in public school textbooks—among other errors in our 'knowledge' about Lincoln: he started as a poor lawyer but quickly became a wealthy lawyer skilled in defending railroads and other corporations fighting against efforts of local communities to rein them in. The reality is more interesting but the American dreamworld is so comforting, I guess, though I'm not particularly comforted.

It's hardly surprising that a people convinced that every shadow passing across their minds is the hard stuff of reality would soon enough decay to a point where we can no longer produce heretics with stuff in their chests. At least Lincoln had stuff, but even Emerson, most of all Emerson, was always questionable so far as stuff goes—Melville had to dress up his character with a rebellious courage before Captain Ahab was born. I guess Emerson was an English country parson trying to present himself as a self-made frontiersman. If Melville had known, he could have waited until Lincoln

came along as a model for Captain Ahab. But maybe Captain Ahab was truer to Lincoln than to Emerson.

Garry Wills, in his honestly admiring book about what Lincoln actually did—*Lincoln at Gettysburg: The Words that Remade America*, told us that Lincoln had little respect for the Founding Fathers or their *Constitution*, though he found *The Declaration of Independence* to be at least useful to his arguments. I don't know from what I've read, including the book by Wills, if Lincoln was aware that decontextualization is a form of abstraction more conducive to distortions than to truths. I suspect he simply wouldn't have conceded that such was an issue because he would have thought his dreamworld to be a greater and better reality. Then again, I'm simply not sure how Lincoln would have justified his all-too American style of abstracting from concrete reality in an effort to derive. . .

Not ultimate truths. Lincoln was too insightful in his glacial way not to see that his ways were incompatible with any recognition of truly objective or absolute truth. Yet, Lincoln was willing to engage in actions he knew to be enforcing his particular dreamworld, not nearly as trite as the current American dreamworld, upon the dreamworlds of other Americans as if convinced his dreamworld to be the true Gospel.

My criticisms of American transcendental ways of thought aren't consistent, at least not fully so, but I think this to be a result of trying to describe a rapidly mutating mind-infection of sorts. It's easier to produce coherent critiques of the American tendencies toward a strange sort of well-meaning antinomianism, closely associated with our Transcendentalism to be sure; I provided a very sketchy critique of those tendencies, the desire to sin without being guilty of sin, in Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*. It's all part of one disordered American Mind.

In any case, I'd recommend a reading of the essay by Richard Gamble, *Gettysburg Gospel: How Lincoln forged a civil religion of American nationalism* found at <http://www.theamericanconservative.com/articles/gettysburg-gospel/>. Gamble seems to be a thinker conservative in the true way of trying to preserve what was and might still be good in our heritage. He recognizes the true insights in Garry Wills' book but presents an analysis not only critical of the acidic effect of Lincoln's way of thought but also open to something which might be called "moral order." In fact, it be dangerous to present a firm view of moral order in an age such as ours; openness to objective truth is needed and parts of truth are revealed in the

Bible and in our traditions and in empirical knowledge.

I'd also recommend some time contemplating this question: is it knowledge of some external reality that is of interest or rather a knowledge which is participation in a being which is us as well as those rocks and rattlesnakes out there. I've dealt with this general issue in many and sundry essays and a few books; the freely available book, *Four Kinds of Knowledge*[43], is particularly important in this context.

# 500 Radical Individualism and the Misunderstanding of Modern History

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1768>. It was finished and uploaded on 2014/01/20.]

In the back of my mind, I've been pondering a strange blind spot in mainstream modern historians and political commentators since reading Barbara Tuchman's *March of Folly* in May of 2013. It seems to me that she saw clearly the somewhat complex and fluid balance of forces between individuals and families or other tightly knit communities when she wrote the chapter about the Renaissance popes, but then turned to a narrative ignoring those sorts of family and class ties when discussing the American disaster in Vietnam. Were there no powerful families influencing events in the American follies in the 1960s and 1970s? Was David Halberstram wrong in *The Best and the Brightest* when he discussed a depressingly long list of New England blue-bloods who brought to bear the patronizing views of their class, attitudes covered with scraps of facts and phrases of reasoning and enshrined as truth in the halls of Harvard and Yale? Yet, it could be said that much of that odd mixture was imbibed with mother's milk in the prosperous and not-so prosperous households of those belonging to what was once called the Eastern Establishment. It was reinforced not just at Harvard and Yale (and a multitude of prep-schools before that) but also in the boardrooms of Wall Street and Boston law-firms and Wall Street investment firms.

In Chapter 408, *The Need for Abstractions in Moral Self-understanding*, I discussed an early display of this Puritan belief that reality had to conform

to their worldview during *King Phillip's War*—see [http://en.wikipedia.com/wiki/King\\_Phillips\\_War](http://en.wikipedia.com/wiki/King_Phillips_War).

During the war of the American government upon the Vietnamese peoples, were the profiteering oil-companies and engineering companies, armament-companies and aerospace companies, not involved with Neil Mallon and Prescott Bush (and his son, George H W) and other New England blue-bloods sent to form ties with the newly rising barbarians of Texas (and California and Florida and so on)? Were not the investment banks of Wall Street heavily in the business of financing profligate governments such as that of the United States as it fought the war against communists who probably wished they were as powerful as portrayed in the *New York Times* and against poverty—an absurdity almost beyond ridicule, and a failed absurdity in the end.

Many know these powerful families and classes and institutions exist and are willing to sacrifice the wealth and lives of common citizens to gain their goals, yet it remains hard to speak of such things as applying to American history because we are taught a strange history of a non-Darwinian people, one perhaps acceptable to the preachers of colonial Boston but strangely at odds with what we know of the histories of Chinese and Russian peoples, of ancient peoples of the Bible or those of Athens or Rome.

Extreme individualism, including that found in American herd-life, is a denial of some of the strongest of human characteristics—not all attractive—and would put the human race on the path to extinction for reasons given by the sociobiologist, E O Wilson, in countering Camus' claim that suicide is the act at the center of modern life:

Self-existence, or the suicide that terminates it, is not the central question of philosophy. They hypothalamus-limbic complex automatically denies such logical reduction by countering it with feelings of guilt and altruism. In this one way the philosopher's own emotional centers are wiser than his solipsist consciousness, "knowing" that in evolutionary time the individual organism counts for almost nothing. In a Darwinist sense, the organism does not live for itself. Its primary function is not even to reproduce other organisms; it reproduces genes, and it serves as their temporary carrier. [page 3 of *Sociobiology, The Abridged Edition* [151]]

From a slightly different but compatible viewpoint, the “central question of philosophy” is how to live moral individual lives and how to form morally well-ordered communities given the type of creatures we are and the type of world we inhabit. Our genes aren’t our slave-masters but they determine our basic characteristics. From a Christian viewpoint, the problem is how to form the Body of Christ from the available human material and not from some strange creature found in the imagination of utopian or dystopian thinkers of the left or the right. Extreme views of man as an individual (often combined with an advocacy of something like totalitarian governments) can be either utopian or dystopian in this sense. Whether seen as depraved sinners alone in front of an angry God or as creatures inclined to do good if not corrupted by traditional institutions, men are seen by too many modern thinkers as only accidentally attached to families or other human communities, only voluntarily attached to families or other human communities if the Puritanical or modern liberal reformers can do their work. Men are seen in those terms even when they are obviously different.

We know that individual men and their communities are the result of complex evolutionary processes which also produced wolves and the wolf-pack. That is, evolutionary processes produced specific forms of individual being and, in some species, also communal being. Evolutionary processes produced the parental loves which are the primal bonds of families of various sorts in at least the social mammals. It produced human families which grew into tribes and clans bound tightly in a hostile world so that those human animals outside the tribe or the clan were often seen as lesser sorts of human beings and sometimes as non-humans.

Yet, families and classes—true families arising from our deepest selves—have disappeared from most of the modern efforts to understand the modern world—the noble acts and crimes alike. Why? Are the oh-so scientific academics and commentators of the modern West afraid to deal with such blunt expositions of the importance of blood-ties as Wilson’s works on sociobiology or the book of *Genesis*? Are they blind or are they afraid to stray from the mainstream?

I think many modern thinkers in the fields of history and politics imagine, if only implicitly and unconsciously, that we’ve outgrown families and classes and other groupings with ties of blood or marriage. The sociobiologists, such as E O Wilson, are reminding our oh-so modern selves that we still are moved by the same primitive emotions or desires as those to be

found in particularly clear form in the early books of the Bible.

In the sometimes noble and sometimes criminal or exploitive acts of families and fraternal societies or religious groups or others, we are seeing a part of the maturing processes of the Body of Christ or sometimes a rebellion against those maturing processes.

# 501 Political Philosophies Are Bound to Be Bad When Creation is Poorly Understood

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1789>. It was finished and uploaded on 2014/03/12.]

In a short essay recently published under the byline of the staff of *The American Conservative*, *Higher Culture, Better Politics* found at <http://www.theamericanconservative.com/articles/higher-culture-better-politics/>, an argument is made which is in the right direction but steps into the water as the boat is pulling away from the dock:

When a movement neglects culture and philosophy, one can be sure it’s dying. High ideas, art, and literature seem remote from the concerns of political professionals and grassroots activists. But the movements that succeed—or that acquire power, at any rate—tend to be steeped in theory.

In Chapter 594, *What Can We Say About the Body of Christ?*, I wrote about Joseph Ratzinger’s claim that “that Christians of the West hadn’t properly maintained their home.” I went on to explain that “Western Civilization isn’t in trouble because of invasions by pagans or Satanic agents but rather because Western Christians were morally irresponsible in their duties towards their own civilization. Pagans and others didn’t invade the West. They wandered into vacated public spaces.” I went on to argue that the Christian Church Herself is an organ in the Body of Christ and not the entirety of that Body; She is the central organ—moral and spiritual and

liturgical guide from which the entire Body grew. The entire Body has the fullness of human life in it and, as such, looks more like a civilization and looks more attractive in that it promises a full human life in the world of the resurrected and not a sentence of eternity in a church choir. In fact, there is very little evidence in the Gospels that Jesus of Nazareth would have been interested in choir life everlasting as singer or conductor.

Western civilization is in a state of decay because of the moral irresponsibility of Christians over the previous two centuries or more. In my opinion, this moral irresponsibility developed into a schism between our worship of the God of Jesus Christ and our concerns, practical and theoretical, with the world created by that God, a world which is the physical universe of the scientists seen in its completeness as a morally purposeful story being told by God. As implied above, this schism shows up in the restriction of the Body of Christ to the Church and an attitude which ranges from condescension toward Creation to condemnation of Creation as if it were truly the kingdom of demonic forces. Christian teachings broadly understood to include the political teachings in Western (Christian) civilization are out of synch internally and more out of synch with the teachings of our current deformed and decaying civilization.

In Chapter 600, *The Promise and Comedy of Modernity*, I stated the basic problem in this way:

[T]he modern phase of the Christian comedy has become a farce, played out by those who strive to remain Christians by remaining true to traditional human encapsulations of “the book of nature, the book of sacred Scripture and the book of the liturgy” as Pope Benedict termed these forms of human knowledge of God’s Creation. These Christians live behind ghetto walls refusing to look at the huge amount of material our age has added to that “book of nature” and to our understanding of at least the history of “the book of sacred Scripture” and the history of the “book of liturgy.”

Somewhere in his many writings, Etienne Gilson said that, around 1800, Catholic intellectuals failed to deal properly with the questions raised by modernity and led the Church into an intellectual ghetto from which She has not emerged. They sinned greatly in doing so—their responsibility was to educate their students to surpass the weaknesses of their teachers, but

men will often fall into self-righteous defense of the ideas to which their minds were shaped and will fail to respond properly to a Creation which is not only dynamic but also constantly revealing itself in depth and breadth to a properly curious mankind.

On the 7th of June, 2008, Pope Benedict spoke to a gathering of scholars, where he said, “Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.” I wrote not only a variety of essays published on my blog, *Acts of Being* [38], but also an entire book in response to this quote. The book is freely available for download: *A More Exact Understanding of Human Being* [53].

Before I wrote about human being, I had done a lot of work on the basic nature of being, of spacetime and matter and the nature and facts of human history, of creative fictions and other narratives, which provided the foundation of my work to date on human being. I have done some reading of popular science works which appear on bestseller lists and some of those are by serious thinkers writing intelligently about the empirical knowledge of modern science and about what it might mean to human beings. I have also read less accessible, quite serious works by Darwin and Einstein and their successors as well as works by intelligent commentators on modern scientific work. I’ve read John Henry Newman’s comment in which he accepted the truth of Darwin’s work and very wrongly denied its importance to our understanding of Christian truths. I’ve read commentaries on science by the good historical and literary thinkers, Butterfield and Barzun and others. So far as non-scientists go, I was most impressed by a comment Flannery O’Connor made in one of her letters as published in the Library of America’s collection of her writings [33] (page 953):

To see Christ as God and man is probably no more difficult today than it has always been, even if today there seem to be more reasons to doubt. For you it may be a matter of not being able to accept what you call a suspension of the laws of the flesh and the physical, but for my part I think that when I know what the laws of the flesh and the physical really are, then I will know what God is. We know them as we see them, not as God sees them. For me it is the virgin birth, the Incarnation, the resurrection which are the true laws of the flesh and the physical. Death, decay, destruction are the suspension of those

laws. I am always astonished at the emphasis the Church puts on the body. It is not the soul she says that will rise but the body, glorified. I have always thought that purity was the most mysterious of the virtues, but it occurs to me that it would never have entered the human consciousness to conceive of purity if we were not to look forward to a resurrection of the body, which will be flesh and spirit united in peace, in the way they were in Christ. The resurrection of Christ seems the high point in the law of nature.

Miss O'Connor was mostly certainly not among the morally irresponsible majority of modern Christians. She was trying to re-understand Creation in terms of what men currently know and not by just putting a new coat of paint on a ramshackle structure. Unfortunately, she somewhat missed the target as I noted in Chapter 599, *Flannery O'Connor Was a Pretty Good Thomistic Philosopher*, but she came closer to the bulls-eye than any modern Christian thinker I'm aware of.

Good works of creative fiction, history, philosophy, literary analysis, Biblical studies, the Bible itself, have also played a role in my efforts to revive my mind. Such works as well as observations of living human beings and a lot of contemplation also play an important role. (I like to do my deepest, and often back-of-the-mind, thinking as I walk or run the sidewalks of my hometown to which I returned some 20 years ago.)

This is the point of this essay: political philosophy is a room in an upper floor of the structure of a complete Christian understanding of Creation, or any other reasonably complete understanding of this world and more. To speak of better political philosophy in an age of man when our ancestors discovered centuries ago that the Christian story no longer makes sense is to speak gibberish, it is to recommend remodeling a room on an upper floor of a decaying structure which could collapse at any time. In fact, to speak of culture as if there is much worth engaging with in the new productions is to speak gibberish. To speak of culture as if it is inherited antiques is to simply misunderstand matters.

I addressed this problem in Chapter 307, *Modern Ideologies as Misunderstandings of Human Communities* though limiting my comments to human being and the general lack of understanding, even among Christians who supposedly believe in the Body of Christ, that human communal being is real being. If it isn't real being, our hopes in salvation are in vain as both

Christians and Jews were warned by Jacob Neusner—see Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?* for my discussion of Neusner's views as well as some relevant ideas of Hans Reichenbach and E O Wilson.

At the end of Chapter 307, *Modern Ideologies as Misunderstandings of Human Communities*, I refer to some of my earliest blog writings where I discuss the debate between Einstein and Bohr over the nature of reality. Einstein is generally seen as the defender of common-sense. I discuss, very briefly, why this isn't so and why it is that Bohr's radical view of the nature of reality is similar to the understanding of the school of St John the Evangelist who taught that relationships (starting with love) are primary over substantial being and, in fact, bring substantial being into existence and continue to shape it.

# 502 We Need All Sorts of Mavericks in This Dynamic Creation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1792>. It was finished and uploaded on 2014/03/26.]

Judith Curry is Professor and Chair of the School of Earth and Atmospheric Sciences at the Georgia Institute of Technology. Curry's blog is well worth reading for reliable commentary on climate science and more general matters of science practice and of public policy in its relationship to science. One of her recent articles, *More scientific mavericks needed* found at <http://judithcurry.com/2014/03/23/more-scientific-mavericks-needed/>, is a short discussion of three articles or essays on the need for mavericks in science in the modern limited sense and also in economics. Professor Curry's article, begins with a quote from one of those articles, *We need more scientific mavericks* found at <http://www.theguardian.com/science/2014/mar/18/we-need-more-scientific-mavericks>:

Agencies claiming to support blue-skies research use peer review, of course, discouraging open-ended inquiries and serious challenges to prevailing orthodoxies. Mavericks once played an essential role in research. Indeed, their work defined the 20th century. We must relearn how to support them, and provide new options for an unforeseeable future, both social and economic.

Curry is right to endorse this view which is presented in that article as a consensus view of highly-regarded British scientists including some

Nobel laureates. She has written before about the need for dissenters to keep the scientific processes working properly, reasoning from the general principles of those processes. She herself is now considered by some to be a dissenter on the matter of human-caused and disaster-laden global warming because she has pointed out the need to understand the 16 years or so (1998-2013 and running) when the actual temperature increase in atmospheric temperature (or possibly flattening of that temperature) has been at or below the extreme low-end of the plausible increase patterns as the major climate models have forecast them.

God's Creation is dynamic in two ways:

1. It is dynamic in itself, and
2. It seems still more dynamic because of the various ways in which our knowledge of this dynamic Creation has grown and deepened and become more sophisticated—at a very rapid pace in recent centuries.

At some gut-level and often at a fully conscious and rational level, men have known of the first, the dynamic nature of reality itself, but the second source of dynamics has come into view only by an increase in historical experience. We can learn much from the writings of Aristotle and from the Bible but only when we understand their total context including the purposes of their authors. Something similar can be said about the writings of Einstein and Arrhenius and Chaitin.

In my writings, I've presented the second source of dynamic activity as the formation of the human mind which, updating Aquinas' claim a little, develops by various processes as the underlying brain shapes its neural connections and develops systems of neurons to better encapsulate the world around us, including not only the concrete realms of created being which we can sense and study directly but also the abstract realms of created being (think of the underlying abstract 'stuff' described by quantum mechanics or even pure mathematics).

It takes a flexible mind, one which can shape itself to empirical knowledge, to understand Creation by the best standards of any age. In fact, there are few with minds flexible enough to work across a variety of fields of knowledge and they don't seem much welcome in established institutions. See Chapter 405, *Ways of Thought in the Modern West*, based upon one of my essays from 2008, for a discussion of some insights which the historian

Carroll Quigley expressed in *The Evolution of Civilizations* [119] (reprinted by *Liberty Fund*—see <http://www.libertyfund.org>. In Quigley's view, instruments grow up in new civilizations to serve various needs, including pure and applied science in recent centuries. Over time, these instruments tend to rigidify into self-serving institutions which exclude those who can solve the serious problems which will rise eventually. There is now no reason, nor was there ever a reason, to believe that the physical sciences would be immune from this process, this rigidification into institutions which defend themselves rather than seeking truth or serving a greater cause or an entity such as a civilization or the Christian Church.

The problem is showing itself in science in the modern sense of physics and chemistry and biology and a few others, but it's been a major reason for civilizations or more local cultures collapsing when their problems were solvable. It affects all fields of human thought and action, theology and philosophy and literature and such areas as national security agencies. In the article *Why Dianne Feinstein Can't Control the CIA* found at <http://www.theamericanconservative.com/articles/why-dianne-feinstein-cant-control-the-cia/>, Phillip Giraldi, himself a former CIA officer, tells us:

Government bureaucracies, like many private sector businesses, are initially created in response to a perceived need either to do something or provide a service. The Department of Defense in its current incarnation rose out of the developing Cold War in the post-Second World War environment, while the CIA was created to prevent a second Pearl Harbor. But as bureaucracies mature they become less and less connected to their founding principles as circumstances change and they fail to adapt. They then go into a self-defense mode that makes maintaining jobs, budgets, and political turf in Washington their top priority. This compulsion to protect equities is the reason we are currently hearing of alleged CIA spying on a largely disengaged Senate committee in an attempt to forestall any accountability for torture and rendition policies that many believe to be war crimes.

Mostly lost in translation is the fact that the Senate's Select Committee on Intelligence, like CIA, is also a stale bureaucracy, one largely inhabited by senators who have been in

place for many years. Committee staffers reflect their sense of entitlement, believing themselves untouchable as they bask in their celebrity since 9/11. In short, they too are prone to go into self-defense mode about what they have and have not done, making Sen. Dianne Feinstein no hero for opportunistically attacking the CIA for spying on her committee. Her attempts to shift the blame for now-discredited and abhorrent activities in which her committee was almost certainly complicit are obvious, though this in no way exonerates the Agency.

There is a very large-scale problem, especially at times in history when contradictions and stresses have built up because new knowledge of our world hasn't been properly integrated into a good and plausible—albeit ultimately time-bound and culture-bound—understanding of our world. The empirical knowledge gathered in recent centuries didn't fit into any traditional understandings of our world. Heroic efforts were made to put huge volumes of new wine into small and old wineskins. The containers tore apart and yet many in such fields as theology and philosophy still insist on the goodness of those wineskins. Great physicists, even Poincare, tried to deal with the discoveries and theories of Planck and Einstein in such a way but physics as a whole was strong enough and youthful enough to move forward. I don't see reason to believe that contemporary physics, or other fields of science, could deal so well with truly revolutionary understandings of our physical world.

And there is no unified understanding of our world, certainly not one which sets it in the context of a greater Creation—unless my understanding proves to be good enough to found a new Christian Civilization or revive the decrepit West.

Even the limited understandings of disciplined scientific thinkers seem like shards of glass and not like pieces of an intact window or a coherent mosaic. See my book on knowledge, *Four Kinds of Knowledge* [43], for my take on the nature of human knowledge, and the truer nature of knowledge which underlies it.

As matters stand, the institutions of Western Civilization have constructed various ghettos of thought and attitude and, as discussed above, there are signs that physicists and chemists and biologists are now doing the same—though those ghettos are not so well populated as those of theology and philosophy and literature. To mention national security issues again,

we can examine the past 20 years of American treachery toward a Russia struggling out of the mess the Bolsheviks had made and it's pretty reasonable to conjecture this has happened at least partly because so many have made careers out of opposing and hating Russians. (This is most certainly not an original speculation; some who work in the field, including some who have personal or national reasons to dislike Russia, put it forth as a definite factor in the way things are.)

In any case, many resources are controlled by ghettoized communities of knowledge and thought and creative art. Mavericks are on the outside, sometimes struggling to survive. We mavericks can console ourselves with the thought that we are living in reality while the ghetto-dwellers hold on to often magnificent but no longer valid understandings of reality from prior centuries, but we can also grow bitter in our poverty of income and resources. The time-scales in the prior sentence can be adjusted to describe the situations of maverick scientists in the maturing generation if no one manages to find a way to support them.

It's the way of the world.

We can conjecture, without too much abuse of just-so reasoning, that there are advantages to creatures conforming to established ways of thought and behavior during the relatively stable periods, good or bad, which dominate the timescape of this world. It's likely that the human race has evolved so that most men and women will try to minimize risk and energy expenditure. In any case, most human beings tend to settle into habits which can become so strong as to doom those creatures when surrounding conditions change.

I am not saying, nor is Professor Curry saying nor the British scientists, that it would be desirable or even possible for every scientist or every poet or every composer to be a maverick in the way of Einstein or Eliot or Stravinsky. We need a mixture of human types where all legitimate types respect each other, where all valid ways of being scientists or literary men or philosophers or government intelligence analysts are provided for. That is how evolution shaped us as a race, a mixture of risk-adverse and risk-seeking creatures, conforming and dissenting creatures. We should assume this is a good thing in this world and we should take care of all those who serve the survival and advancement of the human race.

# 503 The Moral Superiority of the Modern Military Over Modern Civilian Society

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1801>. It was finished and uploaded on 2014/04/09.]

Military men, even the warriors or “rough boys”, hold a variety of opinions on political issues, including how to use the military. My readings in history and in the news and blogging sites of the Web have led me to believe their opinions tend to be better founded and better reasoned, in terms of basic moral instincts and reason, than those of any recent President of the United States and the vast majority of American public leaders in general—including cultural and religious leaders. The opinions of those military men who blog or write articles on the Internet or for paper publication (exclude those who move into highly-paid jobs in the military-industrial-political complex) are most certainly better founded than those of American citizens in general or those who teach in prestigious universities or advise American Presidents, but those military men tend to come from the intelligence operations or to have moved from combat roles into academic roles during their careers.

I think many of even the most clear-sighted of military men tend to put what might be called “national greatness” too high on the scale of values, especially in the United States which has a people who are not generally warriors and are also quite immature **as a people**. As Patton noted, Americans do make tough citizen-soldiers and we should be content with that and get on with our true callings in life. I think that Americans, no matter how well-educated, tend to ignore the importance of community and this might

be one reason so many convince themselves they are warriors or potential warriors—their lives are separated from communal critique and their dreams become blurred with reality, especially if reinforced by television and other forms of entertainment. Military professionals, especially those with intelligence or academic backgrounds, are far less likely to make this error because they have a truer community if one with a limited purpose from the viewpoint of a total human life. Certainly, military professionals assume the reality of military communities and the reality of their own selves as shown in the communal mirror.

True military men, and even the dedicated short-termers who are citizen-soldiers, enter into a real form of being which is most directly perceived in their loyalty to their unit. If they serve on the battlefield during wartime, it's a common claim they will fight for their comrades in that unit rather than for the greater communities of family and nation and all those in between. This makes sense because our foundational being remains flesh and blood no matter how many abstract loyalties we form and no matter how much a particular man or woman might come to understand the nature of those abstract loyalties. Apparently, even a wife and children are a little abstract on the battlefield when the bullets and missiles start flying. The guy lying out in a no-man's zone with a bad wound to a thigh is of more immediate concern and so is the guy a few feet away. When the command comes to move into the gunfire—will he hesitate or move out like another Audie Murphy? Often, according to combat veterans, courage is at the group level at that point.

I'm comfortable claiming that communal being in the American military is better formed than is nearly any other communal being in the United States. For reasons I can only partly intuit, the US military matured in this way far faster than other communities in this country still so young though I can put forward one likely reason. As I'll discuss in another context, military communities are different in having more limited but better defined moral natures.

At the same time that there is a far greater moral order in American military communities than in nearly any other American community, I'm under the impression that our political class has succeeded in partially corrupting the men in uniform, partly because the Department of Defense as a whole, including all the civilian bureaucrats, and the military-industrial complex as a greater whole, seem to be one of the most corrupt of major segments of the United States, public and private. When he was Comptroller

General of the United States (from about 1998 to 2005), David Walker had estimated there was a cumulative total approaching \$1 trillion dollars of money and supplies in the Department of Defense which couldn't be accounted for. I've read that the estimates for cumulative money missing in the US government as a whole now total to something like \$4 trillion. And now we're witnessing the spectacle of an increasing number of officers, including generals and admirals, going to jail for simple thievery or for crimes worse than that.

Yet, there remains something to the discipline necessary to military life and operations which is not just conducive to moral order but is actually at least a limited but substantial form of a higher moral order and which does reach a much higher level in men such as Robert E Lee and arguably a number of military leaders in the American Revolution—I write 'arguably' only because most of those men were citizen-soldiers. If we strip away our idealistic and self-righteous illusions about the nature of morality in the real world, we can add even two of the Indian-fighting generals, George Crook and Nelson Miles, to the list of those who fought hard but tried to treat enemies, at least when defeated, in a just and sometimes merciful manner. Ulysses Grant and John Pershing and George Patton and Matthew Ridgeway would also be on that list of men who fought hard and with great competence but within the the moral limits of war as they understood those limits. I'm no military historian and I'm certainly missing American warriors of great moral integrity from my list. I'll move on with that disclaimer.

Now we get to the heart of the matter. First of all, I'll once again refer to one of my pivotal essays included at Chapter 127, *Intelligence vs Intellect*, where I responded to two related insights of Jacques Barzun in his important book, *The House of Intellect* [7]. First, he pointed out:

We [in the United States] have in fact intelligence in plenty and we use it perhaps more widely than other nations, for we apply it with praiseworthy innocence to parts of life elsewhere ruled by custom or routine. [page 4]

At the bottom of that same page, he claimed:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of

discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

Institutions which rely on discipline, such as militaries, are heavier on intellect than individual intelligence. This isn't to say there aren't highly intelligent men and women in the military—there most certainly are such men and women. It is to say that a highly disciplined community will emphasize the communal mind or intellect. Judging by the books and essays on the Web written by retired, or sometimes active, military officers, I'd say the American military might well be better than the Catholic Church at bringing members' minds in line with the communal mind without crippling the individual minds. This is perhaps due to the extreme reaction against modern empirical knowledge by Catholic intellectuals in recent centuries, rooted in a mindset seen as early as the persecution of Galileo but showing itself in full bloom during the retreat from modern thought at the end of the Enlightenment, a period which gave us a lot of potential good—not yet well developed.

Because Christian thinkers and leaders have refused to properly respond to the Enlightenment (actually a complex of different enlightenments) which defined the Modern Age, the ordinary Christian has had to deal with a fragmented world on his own. He lives in a real world and then goes to church once a week or perhaps more often to hear of claims which seem increasingly dream-like, having less and less to do with any Creation this universe could be part of, less and less to do with any promises of salvation which make sense or are even attractive to flesh-and-blood human beings. See one of my relatively early essays included as Chapter 577, *The Only Sane Christian in the Modern World*, where I discussed our modern inability to say anything intelligent or even sensible about Heaven.

The ugly result of this fragmentation of perceived and conceived being is typically a fragmentation of the human being of Christians or else an effort to maintain integrity of human being by leaving Christianity or else dropping belief in the creedal claims of Christianity and then bracketing

Christian practices as simply something done out of habit or for the sake of celebrating the fun Holy Days such as Christmas and Easter.

The intellect of the Christian churches is in bad shape. Children are provided with an understanding of God and Creation which makes little sense in light of modern empirical knowledge. At the same time, the formation of individual intelligence in the more talented children is ignored. Christian children aren't provided with much to help them to deal with the forces of fragmentation and any later education they might seek about Christianity usually relies on books which, however loose and 'liberal, simply build upon that earlier indoctrination.

The intellect of the modern American military is limited in scope and is troubled but is in far better shape than that of the Christian churches or other communities in the United States—except for **some** scientific communities but those are made of the Americans who somehow make it through the educational system with enthusiasm intact and at least some self-discipline. Young men and women entering military service are indoctrinated more than educated, though often real education is offered to those who can benefit and wish to do so. It seems possible to make a good career in the American military without doing much to develop your individual intelligence, but you'll at least have to become part of a communal intelligence, or intellect, in decent shape though ragged at the edges. You'll think in ways learned by the hard experiences of the battlefield or the sustained campaign.

To a certain extent, education or training similar to that of the military can be justified to indoctrinate young Christians even at the expense of nurturing a deeper understanding—especially given our egalitarian refusal to differently educate those who might be able to develop more creative or more powerful minds which might find pleasure in dealing with such understandings. In fact, my experiences and what I notice in others leads me to conclude our modern educational systems, public and private, teach us to consider study and even the pleasurable reading of good literature to be a grind, something to be done only when you're trying to attain your diploma, your credentials for the real world. Even a pretense of learning largely stops at graduation, certainly any learning related to such matters as history or literature or the sciences. In healthier times, even some working men and women would read serious works in those fields, for sheer pleasure of using their minds. As our general educations teach us to hate reading even serious literature which was very popular in past generations, such as the novels

and essays of Mark Twain or the political writings of Thomas Jefferson, so do our Christian Sunday Schools and CCD classes teach us to avoid reading the Bible or other great works from various religious traditions.

I suspect the military indoctrination as well as its more profound sorts of education are more effective than Christian indoctrination and leave the minds of soldiers open to learning just because it teaches a way of life but not a commitment to an understanding of reality which is a poor encapsulation of that reality.

The military is in the job of understanding a more limited aspect of Creation: defending country and all it contains against those who have attacked us or preparing to defend country against potential attackers. (For the purpose of this part of the discussion, I'll ignore the misuse and perhaps corruption of the American military by the political class of the United States or—more generally—the military-industrial-political complex.)

At its best, military life is built around the principles so many honor in the breach:

- we must be willing to pay any price to do what is right and important;
- we must be willing to pay lesser prices for what is right and less important; and
- we must not willingly do positive evil though sometimes forced to act with incomplete knowledge or forced to act when there is a complex balance of good and evil revolving around our various options.

I'll ignore the problem that the last 'principle' is a catch-all which allows weasels to get to any point they wish—and their points will be accepted by a conveniently ignorant citizenry with manipulable minds—see Chapter 308, *Unreliable Memories, Minds Like Silly Putty*.

It is quite possible that military men will find themselves called to fight certain wars against dangerous enemies even if they know those wars came about, or came about in a more serious form, because of immoral or unwise decisions made by the civilian leaders of the government, American or otherwise. There are other, similar problems which military men might have to ignore in waging war against those who may not have truly been our enemies before we engaged them in battle. At a different level, combat officers, including the commanding officers in the field and their staff, are bound to beat that enemy for various reasons including the protection of

soldiers under their command even if they know we shouldn't be in that country, perhaps in the backyards of proud men who have to carry weapons because of violent men who would dominate others against their will.

Order is good, order which respects the basic moral instincts built into our genes and order which respects the best (not most self-righteous or self-serving or . . .) thoughts and feelings which come from our philosophers and theologians, our politicians (real ones) and business leaders, our social and cultural leaders including artists and musicians.

Much of this order is gone in the Modern West and never existed in a strong form in the United States, largely because generations of Christians have practiced a sort of ghetto-thought allied with a feel-good philosophy toward our emotions. The American military, and some other militaries have a better defined, and necessarily more limited, understanding of moral order, an understanding in the context of their roles as soldiers.

I would maintain that, even in the deeply corrupt United States, the military is still a community with a good percentage of men with true moral character and moral courage. You don't have to agree with them on all matters—even the non-interventionists in American military uniforms, or formerly in those uniforms, tend to be a bit more aggressive than I would recommend in international matters. Yet, some have looked at the damage we've wreaked throughout the world and inside the minds and hearts of young American men and women, as well as having looked at all those who have died or been crippled—American and otherwise. Some of those are at least considering a fairly strict position of “defend our own borders and don't get involved in faraway lands unless absolutely necessary to defend American lives or property.” (I think there are some adopting a stance which is more to the non-interventionist side than they would prefer because of their perception of that lack of moral order in the American political class and general citizenry—they don't trust us or our elected representatives to even bother to learn where a country is before bellowing to attack because those evil people, whoever or wherever they are, “hate us for our freedom”; maybe they'll love us when they understand we are descending toward a relative material poverty to match our moral and cognitive poverty.)

I would also maintain that we Christians, warriors or citizen-soldiers or pure civilians, can learn much from that more limited but firm moral code still honored by many individual American military men and, to a lesser extent, by many American military institutions—though often honored in the breach because of the corrupting influence of the American political

class or the military-industrial-political complex as a whole. I'll mention two lessons similar to principles held by the military. We should form children to the principal that they, and we, should always be living for the greater good of God and our family and our country and our other communities, including those of medical professionals or anthropologists; when necessary, we should be willing to die for God and our human communities. We should also recover a respect for habit-formation, not in a totally mindless way but in a firm and authoritative way.

# 504 Can We Be Willfully Criminal and Immoral While Retaining Moral Integrity?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1810>. It was finished and uploaded on 2014/04/29.]

In the article, *The Cognitive Dissonance of Spying* found at <http://www.unz.com/article/the-cognitive-dissonance-of-spying/>, subtitled *It's Always Illegal and Often Immoral*, Philip Giraldi, who has served as an officer of the CIA and also of the DIA (military intelligence), tells us:

It is being reported that the attempt by Director of Central Intelligence John Brennan to steer the CIA away from paramilitary action and back towards conventional spying and analysis is not going well. Media coverage of the problem is depicting it as being partly driven by bureaucratic obstacles associated with budgeting and allocation of personnel, but the truth is that cultural change that has taken place over the past thirteen years is the real culprit and one must conclude that it will be even harder to shift than if it were simply a question of who gets the money and the promotions.

Giraldi then provides a short and interesting description of the process of recruiting foreign agents and the old-fashioned emotional ties between an intelligence officer and the agents he recruits, He has written of this before and of his own experiences of feeling true sorrow when something bad happens to one of the agents he recruited and managed, even if the

agent was a scoundrel who was purely and simply selling his country's secrets for money.

Giraldi goes on to speak of the changes in the CIA since 2001/11/9:

Then there arrived the drones. Killing machines pure and simple with everyone inside the process knowing that lots of civilians were paying the price for poor intelligence. And the world learned about renditions, targeted assassinations and torture, all endorsed at the highest levels of CIA, which is still attempting to justify what it did. To continue to work in such an environment required a complete suspension of conventional morality. The whole world became a gaggle of enemies clustered in a free fire zone. Spot, assess, develop, recruit? Become a friend. No time. No way.

So Brennan is confronted by a problem more pervasive than resource allocation in his effort to revive the old intelligence skills. No one any longer thinks the way they did pre-9/11. Apart from regular nervous assertions of "we are the good guys," there is not a whole lot of soul searching about what is happening and why and you either have to accept the reality or move on. Which makes it hard to go back to what was, as John Brennan is discovering.

This is a sad situation. The American 'skill' of committing the same evils as other powerful imperialistic peoples and then walking away, oblivious to our own evil and forgetting even the basic facts of what we had done, is the reason behind Solzhenitsyn's claim that we are a "uniquely evil people." Giraldi is different just because he can remember his actions as a CIA operative as being illegal, possibly immoral, and justified only if the Cold War was so serious a situation as the mainstream in the United States was preaching.

The problem is deeper and goes to the nature of a country which was a melting pot of individuals from various cultures and different understandings of reality from mostly the British Isles. There was no true community even during the excitement of fighting for and gaining independence from the English government. The United States had no communal moral character and still has none to brag about. Many of us are proud of being ignorant adolescents and the entire country is such: an ignorant adolescent

composed of individuals with active intelligence but possessing no communal intelligence, no intellect. (See Chapter 127, *Intelligence vs Intellect*.)

Though our evil was far less at the time, Tocqueville saw the same fluid memories in our national ancestors in the 1820s, the same ability to ignore the most obvious fact if it conflicted with the mainstream understanding. It has something to do with the horrible possibility that Adam Smith foresaw: that men in the commercialized, prosperous societies he was foreseeing might be genial with no real moral character, no moral courage. It also has something to do with our immaturity as a people, and we are a people—however ill-formed, however little intelligence we have as the American national community. That is to say, being a Christian true to Biblical and other historical traditions, I recognize the reality of human communal being which reaches its perfection and completeness in the true Body of Christ in the world of the resurrected.

I've written a number of times about the weak moral character and poor moral order to be found in Americans, as individuals and as a community. For example, see Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*, Chapter 499, *Creating Our Own Realities*, and Chapter 641, *Enriching Our Moral World: Simple Is Digested Complexity*. Another important essay is one where I discuss the ways in which weak-minded modern men, most especially Americans, have allowed their understanding of reality to be controlled by those who show signs of being enemies of God: see Chapter 308, *Unreliable Memories, Minds Like Silly Putty*.

I was once criticized, lightly, by a man I respect—he said my (longer?) writings were repetitious. He made it light by noting it was a valid strategy for someone trying to teach something truly new, but there's more going on. I'm trying to bend language and human thoughts to better shape them to reality. I'm digging deeper into reality, a small distance at a time. I'm refining my efforts to better shape human thoughts and language to reality one phrase at a time, one unspeakable and unthinkable insight at a time.

I'm trying to properly expand my critique of the weak moral character and self-delusions of modern men of the West, men who have been labeled “genial without true moral character,” “hollow-chested,” or simply “nice in the way of Adolf Eichmann, the architect of the Holocaust logistics.” (Respectively, and not exact quotes: Adam Smith, C S Lewis, and Hannah Arendt.) But Girdi in his article, *The Cognitive Dissonance of Spying* found at <http://www.unz.com/article/>

the-cognitive-dissonance-of-spying/", as well as Pablo Escobar in the article, *Breaking American exceptionalism* found at <http://www.atimes.com/atimes/World/WOR-03-011013.html>, which I discussed in Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*, have presented evidence and analyses that we have gone beyond willful ignorance and self-righteousness to a state that can be described as an actual celebration of crimes when committed by Americans against the others in order to advance some American goal whether seemingly well-defined or clearly vague—so to speak. Escobar quotes D H Lawrence's description of Deerslayer (the main character of a number of novels by James Fenimore Cooper):

A man who turns his back on white society. A man who keeps his moral integrity hard and intact. An isolate, almost selfless, stoic, enduring man, who lives by death, by killing, but who is pure white.

This is the very intrinsic - most American. He is at the core of all the other flux and fluff. And when this man breaks from his static isolation, and makes a new move, then look out, something will be happening.

Those Americans, formerly found in the imaginations of many including too many morally ill-formed young men, can now be found all around us. In his book, *On Killing*, Lt Col Dave Grossman (ret) wrote of the very small percentage of men who truly enjoy killing other human beings and the larger but still small percentage of those who can kill with detachment when they think it morally right. When the rest of us kill, we pay a price. Some in that largest group, those with strong body-based instincts against killing other members of the human race, have been war heroes but suffered decades of nightmares (lessening over time to be sure) in which they might see the face or at least form of the enemy soldier they killed.

Unfortunately, there seem to be many in the United States who are developing bad attitudes in response to all sorts of twisted words and images in the public speech of politicians and others, in entertainment products, and—as time goes on—in the reinforcing speech and acts of peers. Many are literally twisting themselves into sociopaths of one variety or another; with some it might be largely a show, but...

In the book I referenced above, *On Killing*, Grossman said the part of the My Lai massacre story which most disturbed him was the way in which some soldiers knew it was wrong and were trying to stop the cold-blooded murder of unarmed and innocent civilians until the blood-lust caught them and they joined in as well. Do you think there will be so much as hesitation on the part of those who have been worked, with their own cooperation, into the state of sociopathic attitudes? It won't matter how superficial the attitudes might be in some. The self-disgust will come later but **mostly** if those who are neither psychopathic nor capable of detachment when killing see the results of their particular actions. (Those capable of detachment will usually not succumb to those sorts of rages which overwhelm moral inhibitions—according to Grossman and also to Col Pat Lang, retired Green Beret and military intelligence officer.) There are stories suggesting some drone-operators are feeling remorse for their actions as they can see the person disintegrating as the missile hits and, even if they are willing to kill 'bad guys' however defined, as they occasionally see the stray child or other innocent or even a Good Samaritan get a piece of the murderous pseudo-justice intended for one of those 'bad guys'.

I have somewhat mixed feelings about the question of individual moral order in American history. We have our strengths in moral order, largely in the context of our domestic lives; we have little knowledge or experience of the sort which might prepare us for even the friendliest of meetings with those from radically different cultures or those who feel they have a legitimate gripe against the United States. We are soft and don't know how to respond properly under the stress of battle, as I noted above in the case of the massacre at My Lai. I strongly feel that we have been almost entirely unordered as a people, but we have the same instincts as others to act as a community. So it is that we usually behave well for practical reasons and also behave well toward our friends and relatives and those we recognize as neighbors but we are frighteningly willing to commit horrible crimes as a people, at least when we could get away with it. Free and unordered though we might be in some ways, we remain tied to each other so that we move up or down in moral order as members of various communities—a complex movement often involving churches or synagogues, neighborhoods or social clubs of seemingly decent and even gentle human beings, as well as involving national or military communities. Or peer-groups of young men trying to adjust to the blood-lust so often glorified in our political speech and in our movies and thriller novels; few young men are willing to be the advocates

of peace and justice or even hardheaded reason in a group cheering on the Hellfire missiles as they strike deep into the heart of a city so far away.

Philip Giraldi has written before of the horrible weaponry our corporations have developed, of men who tortured and later showed no moral regret no matter how horrible the torture, of public officials who misuse intelligence information or the powers they hold in trust to start wars of less than questionable legality and morality. At least one military intelligence officer not impressed by CIA personnel in general, Col Pat Lang (ret), holds Giraldi in high regard. I say this to emphasize the message he brings us from one who was inside, who has risked his life for his country, who has spoken boldly and bravely of crimes and self-serving acts on the parts of American politicians, intelligence officers, and military personnel. We should take his message seriously: spying is almost always a criminal operation, though arguably moral if we were trying to find out the Nazi plans for defending Europe against allied invasion. There are probably some lesser justifications for many types of spying, though I see little good as having come from non-military spying—it seems to me we would be better informed if we had a think-tank group of highly educated and eccentric men and women studying other countries or specific situations based mostly on publicly available information. Torturing and killing from the air without a hint of judicial process are evil. We have become a people capable of doing or at least accepting acts we once damned without qualification when done by Soviets or Red Chinese or North Koreans or others.

As a Christian, it frightens me that many ruthless and disordered men, at least in the military and apparently in the CIA, are practicing Christians, seemingly devout. Yet, they commit, without a quibble, acts which are gross violations of the Fifth Commandment, mortal sins, damning sins, even if you've gone down on your knees to accept Jesus as your Lord before leaving for combat in some country your friends and parents can't even locate on a map. "Mine eyes have seen the glory of butchering those who hate us for our freedom and our purity."

Even when spying and engaging in some other covert operations might be justifiable, we Americans take to glorifying James Bond with an unseemly relish which indicates to me that we had found a focus for our immoral desires that appealed even more than the frontier legends, from Deerslayer to the Earp brothers—men who could kill other human beings and walk away without suffering the psychiatric problems which tortured the men studied by Col Grossman (see his book *On Killing*.) As I said,

there are men who are well-ordered and capable of killing with detachment when they think it morally proper. Those aren't the ones we Americans desire to emulate nor is there any reason for such a desire—they are different from us and, probably, we have enough “rough boys” (a term used by Col Lang for himself and other born warriors) to protect the rest of us under ordinary circumstances and to form the core of an army fleshed out with citizen-soldiers when we need to fight a major war. Why long for warrior virtues rather than developing the virtues God gave you?

We admire not the rough boys because they kill only when they think it proper and keep themselves under control even when provoked greatly. We admire the ones who seek opportunities to kill, the ones who can make killing their lives, the ones with itchy trigger fingers. Nor do we honor those not made so they can kill with detachment, even under just conditions. I get the impression from Grossman's book, *On Killing*, as well as my own acquaintance with men who served in Korea or Vietnam or Iraq, that Americans are quite uncomfortable with those men who damaged their own insides so badly for the sake of their country or for the sake of the other men in their units. It's as if we think it shameful to feel guilty for having killed other human beings—morally or otherwise, to be incapable of killing at will, to be under partial control of a communal moral character of the sort we Americans have failed to develop very well, though it be built into us by Darwinian processes and is very strong in some.

We want to will as we would. We would be total masters of our own human selves. We are upset by, even ashamed of, the moral instincts which are part of something greater than our individual selves. We think it noble to be able to kill at random, or according to random needs and desires we generate in response to opportunities. We would choose not to kill only if doing so in some state we imagine to be absolute freedom. We think it degrading and enslaving to be bound by moral instincts or even by rules given by others.

We Americans, like all human beings, are products of evolutionary processes and we are, like it or not, creatures of moral traits rather than creatures of free-will who can ‘freely’ choose to kill or not, to steal or not, to conquer other countries or not. We nurture the moral qualities we possess or we become immoral wretches. What a sad state to be in: to be morally ordered creatures, however imperfect our order, and to be constantly nurturing our desires to trade in our moral characters for free-wills which would allow us to kill or steal or conquer other individuals or countries when we

would, doing all of this ruthlessly and with a grin, partying on the way—each arm around the slender waist of a pretty young thing, a daughter of another man.

Now, women are also joining in the fun and an inclusive essay would have to allow for whatever perverse dreams they have when joining the army to kill people or the CIA to engage in adventures where they kill ruthlessly while risking civilization's existence in order to save the world. Or something like that.

# 505 Can a Modern Individualist Understand Who Owns America?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1825>. It was finished and uploaded on 2014/06/06.]

A short while back Ralph Nader published an article, *Who Owns America?* at <http://www.theamericanconservative.com/articles/who-owns-america/>, which begins:

There was a time in the Depression of the 1930s when conservative thought sprang from the dire concrete reality of that terrible era, not from abstractions.

They did not use the word “conservative” very often, preferring to call themselves “decentralists” or “agrarians.” Eclectic in background, they were columnists, poets, historians, literary figures, economists, theologians, and civic advocates. In 1936, Herbert Agar, a prominent author, foreign correspondent, and columnist for the Louisville Courier-Journal and Alan [sic—Allen] Tate, poet and social commentator, brought a selection of their writings together in a now nearly forgotten book: *Who Owns America? A New Declaration of Independence*.

They believed, in simple terms, that the monopoly capitalists owned America. This analysis could be, and often should be, expanded to a more complete answer. In September of 2013, I read an article, *These Are The Ten "People" Who Run The World (For The Last 20 Years)* at <http://www.zerohedge.com/news/2013-09-27/these-are-ten-people-who-run-world>, about the ten dominant corpo-

rations in the world. In Chapter 492, *Who Are the American Elites and Are They Conspirators?*, I wrote as part of my response to this article:

Let me turn to a historian of a recent generation, Carroll Quigley. In *Tragedy and Hope*<sup>q</sup>—available in larger libraries and also on the Internet as a pdf-file for free download, Quigley engaged in history verging on journalism. In the early sections, dealing with the period which happens to have been the time in which the American Empire was expanding outside of North America—the decades around 1900, Quigley claimed there to be three groups of elite power-holders, the bankers and the politicians and the monopolistic capitalists. In terms of the American turn to empire, three good examples are JP Morgan, William Howard Taft, and John D Rockefeller. (By ‘bankers’, Quigley meant not the mortgage officers at old-fashioned local banks; he meant investment or merchant bankers and the closely allied central bankers. And note that Rockefeller’s heirs were bankers, the result of a transition he began by moving from Cleveland to New York City where he began to control his largely industrial empire through banks.)

I don’t think Quigley’s scheme works for the world after 1950 or so and I think the power-holder groups were under transformative stresses for a couple decades or so before the breakdown. Yet, it is the only analysis of this sort I find fully convincing. . .

What did Tate and the other Agrarians or decentralists think of the idea of government coming to our rescue by regulating the corporations and bringing them under control? Nader tells us:

Nor did they believe that a federal government with sufficient political authority to modestly tame the plutocracy and what they called “monopoly capitalism” could work because its struggle would end either in surrender or with the replacing of one set of autocrats with another. As Shapiro wrote in the foreword, “while the plutocrats wanted to shift control over property to themselves, the Marxists wanted to shift this control to government bureaucrats. Liberty would be sacrificed in either case. Only the restoration of the widespread ownership of property,

Tate said, could ‘create a decent society in terms of American history.’”

Although the decentralists were dismissed by their critics as being impractical, as fighting against the inevitable wave of ever-larger industrial and financial companies empowered by modern technology, their views have a remarkable contemporary resonance given today’s globalized gigantism, absentee control, and intricate corporate statism, which are undermining both economies and workers.

I think we can see the issue more clearly if we define it as did Quigley, realizing that few—if any—are the times in history when one group of power-holders was in absolute control. In my essay I referenced and quoted from above, I expressed doubt that we have any good understanding of the current power-elite comparable to Quigley’s proposal that the American power-elites fell (from some time in the late 1800s to about 1930) into the three groups: investment bankers, monopoly capitalists, and politicians. Yet, there must be some way of cutting across these ways of exploiting others to find the ties that bind all the investment bankers and monopoly capitalists and politicians who summered together at Newport back in the good ol’ days. There are more dimensions to this problem than we account for with our modern theories of economics and politics and society in general; more than we can account for with our the theories of human nature underlying so many theories and practical studies in the departments of our academic institutions. Hold this thought in suspense for a few paragraphs.

Those groups, investment bankers and monopoly capitalists and politicians, remain powerful but now there is some serious confusion caused partly by the underground, ‘top-secret’, nature of some of the power-elite families, a nature which allowed them to move into the OSS/CIA and into various groups that carried out criminal conspiracies on a regular basis, as a ‘normal’ means of exercising power rather than as a readily-deployed but extraordinary means. Even J P Morgan who conspired so successfully to create the Federal Reserve Bank system generally worked by more normal means of bribes and intimidation. (For those who always doubt the existence of criminal conspiracies on the part of powerful figures in the United States—see the article posted at the website of the Federal Reserve Bank, *A Return to Jekyll Island: The Origins, History, and Future of the Federal Reserve* at [http://www.frbatlanta.org/news/conferences/10jekyll\\_](http://www.frbatlanta.org/news/conferences/10jekyll_)

history2.cfm and remember this article is posted by one of the organizations created by a Morgan-selected group which gathered, secretly after being transported from New York City in a sealed train-car with blackened windows, to write legislation and propose central banks which would restructure the American economy. The article is right though that the meeting was only part of the process but fails to note that some historians think Morgan deliberately aggravated the panic and near-collapse of the American economy in 1907 at least partly because of the increasing influence of local and regional banks. I think it likely that Morgan and the other founders of the Federal Reserve Bank system were helping his fellow Americans the way that George W Bush helped the peoples of Iraq.)

Some of the agencies of the modern world might serve the groups of power-elites and some might have ascended to some sort of gathering of, say, 'deep-state' criminals embedded inside the most 'respectable' of modern governments. There are, of course, the military-industrial complex and the national security complex. Both of those complexes overlap each other greatly and also overlap the complexes run by investment bankers, monopoly capitalists, and politicians. But how do they really operate and what do the overlaps mean? And—which are servant agencies and which are actually gatherings of powerful men who have a role in calling the shots? I don't know and we don't seem to have a Quigley to propose a plausible structure to the exercise of power in the modern world.

In Chapter 500, *Radical Individualism and the Misunderstanding of Modern History*, I had claimed there to be a blindness of sorts on the part of modern historians and I specifically discussed Barbara Tuchman's *March of Folly* as a clear example. In the chapter on a string of Renaissance popes, some morally irresponsible in their duties as popes and some downright morally degenerate, she clearly noted the way in which family duties and family ties overrode their duties and ties to the Catholic Church. The intelligent or generally competent men were as busy as the nitwits in securing or increasing family wealth and power while the problems festered which led to Luther's revolt and the damaging of the unity of Christian Europe. In the earlier chapter on Vietnam, all was presented in terms of institutional and individual failures. Blood-ties and their proxies had disappeared and the freestanding individuals were organizing themselves into groups of the sort studied in courses in the business school and political science department. A large book devoted to the American problems in Vietnam, *The Best and the Brightest* by David Halberstram didn't have this problem; Halberstram

saw clearly that the mistakes we made in Vietnam and in other regions of the world at the time were due to the beliefs and behaviors and self-images of the power-elite partially describable as blue-bloods and the technocrats recruited into the worldview of that power-elite. But even Halberstram didn't "follow the money" as the modern simplification would have it. He noted class biases but not class profit-seeking.

On the whole, mainstream histories and mainstream news-media seem to assume that we defeated Karl Marx by causing the disappearance of classes and families and religious communities as he knew them and replacing those communities by metrosexual and multicultural clubs of various sorts, some to do charitable work and some to organize trips to the baseball games and some to sing hymns. And meanwhile, there are others who are building highways to take us to the malls and office complexes, military bases in central Asia to protect us, government buildings to provide good working environments for the politicians we elect from small lists—also provided by those kind and largely invisible men and women—as well as the various professional murderers and instigators of revolution and those who educate our children and provide us with health-care and so on. We have a full-blown welfare, warfare state with some profiting and many accepting, but with increasing doubts, the claim that the United States is a country of patriotic, freestanding individuals. Send your sons, and now daughters (the horror increases), to fight wars in all those oil-rich countries where the evil inhabitants hate us for our freedoms. Public policy is made by those processes described in your freshman political science course rather than the conspiratorial way of past centuries or those benighted countries such as Iran and Russia and China. Gangsters are perhaps intermingled with politicians and industrialists and bankers in Turkey but never the United States or other advanced countries where people know how to dress and talk like real human beings.

In Chapter 488, *We're All Barbarian Children on This Bus*, also written in response to Tuchman's *The March of Folly*, I discussed some of the foundational ideas and facts which argue rather strongly against understandings of human nature, and human history, in terms of freestanding individuals who only form communities by voluntary contract.

There are two major errors of omission in the mainstream view of human nature. The mainstream view forgets:

- Human nature has both individual and communal 'components'.

- We are tied to family lines by emotions and feelings at the deepest levels of our bodies, thoughts and acts as well but not quite as obviously.

These two factors overlap. Our first communities, the primary part of our communal natures, come from our ties to family lines, though we can be fooled, for good and bad, into treating some as being more or less related to us than they really are. We can, in fact, use our minds to ‘fool’ ourselves by way of proxy relationships and, thus, form ever more complex and larger communities, culminating in that most complete and perfect of all human communities—the Body of Christ.

For more discussion and a proposed framework for understanding our individual and communal human beings, download my book: *A More Exact Understanding of Human Being* [53].

So...Who owns America? Easy. The rich people, some of whom are parts of multi-generational streams of power and wealth, families and classes, and some of whom are flashes in the pan. Few there are among historians and amateur seekers of historical answers who consider families when they analyze the major events of modern times, not even those who understand the importance of families in past ages. We know how important family was for the ‘true’ Caesars (actually Julius Caesar was a member of the gens or family Julia, Augustus Caesar and his descendants were members of the plebeian family of Octavii though Augustus was adopted by Julius Caesar, his maternal great-uncle, into the gens Julia), for the Merovingian and Carolingian royal families, the family (loosely defined) of Mohamed and other Islamic ruling families, the large number of Chinese dynastic families, the de Medicis, the Rothschilds of Europe and the Sasoons of Asia, the descendants of Napoleon, the Morgans and other banking and robber baron families from before World War II, and others. Some of these families destroyed themselves; some great warrior families seem to have carried a brutal form of bipolar disease leading to homicidal rages, sometimes directed against their own families. Genes carry dangerous traits from one generation to the next as well as neutral or advantageous traits, but even self-destructive families might hold wealth and exercise power for a number of years.

We should expand our understanding from families to classes which are formed by acknowledgment of even distant blood-relationship or by proxy relationships which come from living together intensely, perhaps starting

early at private resident schools. By such means, sibling-like friendships and loyalties are forged as well as possible marriages to the sibling of a close friend. Then we can conjecture the United States is owned by families in a way not so different from the situation a century ago described in *Empire* and the succeeding novels in Gore Vidal's American Empire series—the earlier volumes partially describe how we got to that point. In any case, there were the Morgans and the Rockefellers and the Paynes and the Whitneys—the latter two families being perhaps the most powerful because of their intermarriages into other great families. Common folk, such as the children of John Hay, would marry into those great families—some of which families were well-known because of flamboyant individuals and some were quiet and hardly known to be so powerful and wealthy. I would suggest the blood-ties and proxy blood-ties to have been more important than the tools of corporations or central-banks. Tools can be invented, but human nature is what it is, for the founders of secretive dynasties or the founders of open Christian communities.

The rich who hold on to their wealth and power over generations are different from the rest of us because they don't believe the crap common American folk do about this freestanding individual business. John D Rockefeller may have seemed to play that part of a rugged individualist but he was a rugged dynasty-founder and not a man who placed any 'idealistic' interests ahead of those of his children nor did he raise his sons and daughters to be different in that regard. John D Rockefeller would have shaken his head over those many middle-class parents who brag openly about planning to spend all their money before they die because their children are doing well enough. Americans of Jewish or Chinese descent seem to act differently—somehow the disease of individual selfishness and biologically implausible denial of blood-ties infects mostly Americans of European Christian descent. This is the disease we must fight because it makes us ready and willing victims of those centralized powers which, once in place, are to be rightly feared. It also makes it impossible for us to form stable and greater communities which build upon our biological natures rather than building self-destructive communities of the modern 'liberal' sort which deny our biological natures or even fight against them.

You cannot build good communities as if human beings were bloodless sorts of creatures who submit themselves to roles imagined by those sorts of abstract thinkers who would impose nice, neat schemas which look so good in the organization charts which can be formatted on nearly any computer

or many smart-phones, nor can you properly understand human communities now or in past generations by assuming human beings to be what they clearly are not. Whether used for analysis or to reshape existing human communities, the tools of modern management sciences are inadequate and distorting. And so it is that our minds are deformed. After all, tools shape the thoughts of their users to some extent and can greatly shape the thoughts of weak or poorly developed minds and this is one major reason for the likely impending collapse of the great families of the United States and Europe—they've come to depend upon tools which deform human nature and sap the strength and energy of the West. Likely it is that some members of secretive dynasties actually do believe in the myths of freestanding individuals and maybe even share the bloodthirsty jingoism nearly as common among American youth as the cynicism so well-founded but so destructively dispiriting. Likely it also is that some of those semi-underground families are struggling to protect their children from these factually and morally wrong ideas so well-accepted in our days.

How do we get to an understanding which can help us to build a better country? After mostly talking about concrete matters, such as blood-ties, I'll now claim we need good-quality abstract thought (see Chapter 408, *The Need for Abstractions in Moral Self-understanding*). Good abstract thought isn't drawn from some Neo-Platonic realm by acts of mental magic; good abstract thought draws first upon reality and then can be subjected to various processes which produce understandings of a wide variety of phenomena and entities in this concrete world of things. Good abstract thought, whether it deals with possible relationships between entities of a human type or with the far more abstract relationships between formal and mathematically describable entities (group theory and the like), can then be applied to understandings of history or of nuclear particles, as appropriate. I suspect there to be a very high layer of abstract thought where relationships of the objects physicists study and the entities historians study will be the same but I know we are a long ways from being able to comfortably and sanely produce a description of such a layer of abstract thought. To impose improper and inadequate categories upon our efforts to understand human history and human communal relationships—including those of economics and politics—is to guarantee at best a shallow understanding which falls apart with the slightest change of circumstances. It is to deal with images from a hall of distorted mirrors as if they were accurate images of the flesh-and-blood human beings walking through that hall.

We need first to accept reality, to describe human beings as they are and then to try to understand the sorts of communities they have formed and can form. This doesn't mean I deny that human political communities have their own natures nor that I deny that human beings are changed by their relationships to various sorts of human communities as they develop to ever greater levels of richness and complexity. Quite the contrary, we are creatures of complex minds and complex feelings and complex behaviors and those are formed by processes of acts-of-being, of shaping, which are the result of back-and-forth movements between abstract relationships and the concrete entities and relationships they create or shape. In our proper understanding of this formation of human beings, we encapsulate in our minds the reality of movements and changes in created being. I do deny that 'groups' of human beings which reproduce successfully will act as if they are radical individuals in a capitalist-democracy or a Marxist society or any other society shaped to wrongful understandings of human nature. We remain killer apes when we gather to try to form secure societies and we remain sex-crazed when we try to bring those societies to a state of moral order. See Chapter 643, *Repeat After Me: The Church Has Accepted Evolution and Our Ancestors Were Sex-Crazed, Killer Apes*, which begins with:

I distort for the sake of modern men who have trouble focusing upon reality. Apes are our cousins, not our ancestors; the terms used for the common ancestors of men and apes seem to change every few years or so. And those ancestors were only killers part of the time, perhaps less often than modern Americans would desire for themselves—see Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*. The sex-crazed business is perhaps less of an exaggeration for us and for our ancestors.

We should try to nurture societies proper to our natures in the way that good parents help to nurture a child according to its own talents and inclinations so that he becomes a healthy adult and not a twisted creature superficially corresponding to some false dreams of the not-so-good parents.

We remain creatures who have certain traits even while subjected to civilizing processes just because those are the traits which allow for survival and reproduction in this world so well-described by Darwin and his successors.

We carry these traits because they allowed our ancestors to survive and reproduce successfully and these traits include some which lead us to accept, even to strongly desire, the bonds and dependencies of complex human social life. It is that total human creature—individual and communal—who forms polities and economies, who is recorded in the pages of history. And he is a creature who can be deformed in the short-term so that these desires are turned to the advantage of the Nazi Party or the Comintern or an imperialistic free-market, but as someone once said (I think Eric Voegelin): the problem with human material is that it refuses to be treated as material. In most cases and at least eventually. Those groups of human beings who subject themselves to the demands of abstract forms of human polity or economy or religion not true to empirical reality will disappear. In terms used by some: their genes will disappear from the human gene pool—an oversimplification and seen as such by those who realize the gene pools are defined in terms of family-lines and successful family-lines can include individuals who act in biologically implausible ways.

Put that total human creature into a society with political systems and economic systems, educational systems and even church ‘systems’ (the horror of it all), which are the result of willful misunderstandings of human nature or idealistic efforts to impose dreams upon mankind and you’ll have a society and a population doomed to collapse and perhaps disappearance. In terms of a civilization once reaching out toward the farthest regions of Earth: you’ll have a dysfunctional West in which the core populations are so demoralized as to be unconcerned with reproducing and building up families and concrete communities and greatly concerned with various fads and passing fancies of a quickly unsatisfying sort.

In the long run, the West has doomed itself by adoption of the centralized forms of organization spotlighted by Tate and his associates and by Nader. We can’t even understand our own selves at the most basic and concrete levels because we’ve been trained to view ourselves as freestanding individuals and our most important communities as voluntary associations culminating in the Hobbesian centralized state which allegedly makes possible a large-scale community of freestanding individuals while protecting them from each other.

We forget our human communal natures as readily as we forget our ties to our kin and to those we have come to accept as if kin, both of these characteristics being regulated by specific and now identified brain structures and hormonal flows. If we are to have expanded ideas and feelings and

habits of brotherhood, we have to expand from our true flesh-and-blood selves but not by forming some ideally imagined communities pretending we're something other than sex-crazed, killer apes—again, see Chapter 643, *Repeat After Me: The Church Has Accepted Evolution and Our Ancestors Were Sex-Crazed, Killer Apes*. We must enrich and complexify our individual and communal natures, especially in those aspects we label as 'moral', but we also can't forget the basic structures of our brain and the complex behaviors which lead us to strong ties with kin and to generally form human communities.

The West is collapsing, largely because of the corruption of the tremendously powerful United States; we Americans, other than the private organizations of the dynastic families and the communities of some family-centered ethnic groups, have tried to organize our various political and economic communities in ways that make no sense given the biological creature called man. We Americans never accepted the reality of a class forming of wealthy and powerful families and we in the middle-class and working-class taught ourselves that we are individuals forming voluntary associations such as that of the entire nation of the United States viewed as a political community of freestanding individuals born under some sort of strong duty to this community which is bound by voluntary ties despite the fact we are tied in at birth and. . . Don't ask, just be a freestanding American individual ready to die at the command of the government which keeps secret it's actions and justifications for those actions, a government poorly understood by way of the false abstractions of modern political science and economics.

The wealthy and powerful families serve their own needs and we also serve them in strange ways because we convince ourselves that there are no elites who profit from wars or from the construction of, say, the Federal Reserve Banking system. Meanwhile, most Americans are busily acting the part of freestanding, selfish individuals and we dissolve our families and our other "little platoons" as we pursue our selfish goals. (For the meaning of "little platoons", see the quote from *Edmund Burke* at <http://www.bartleby.com/24/3/4.html>.)

The end result of Americans seeking to be what men can never be is a nation of deformed human beings, deformed in our individual and communal natures. We Americans are a mixed population of submissive sheep and exploitive wolves in shepherd's clothing. This general situation is far more important than the fact that the exploiters use certain specific forms of economic organization (corporations or central banks) or political orga-

nization (the political machines controlled by two national committees of men and women but imagined to be describable as ‘democracy’). We can’t just fight corporations or banks or the national committees of the Republican and Democratic parties—we play into their hand when we accept their ‘game’ as real. We have to start working toward better ways of forming communities and we need to start by paying greater respect to and nurturing our concrete communities of families and neighborhoods and churches or synagogues. I think this was what Tate and the agrarians had in mind based upon their understanding of their own concrete communities in the South.

# 506 Deep States and the Modern American Citizen

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1831>. It was finished and uploaded on 2014/06/17.]

The issue of ‘deep states’ had drawn the attention of at least some mainstream journalists for an instant or so around February of 2014 because of a very interesting article by Mike Lofgren, a former Senate staffer; I’ll get to that article in a short while. The attention seems to have been a flash in the pan though, if deep states truly exist and if the United States has become one, it’s arguably the most important of public issues, politics and economics and even culture to a surprising extent. A deep state is a thoroughly corrupt state sure to be dangerously exploitive of its own citizenry and, if that deep state is a superpower, of many in other lands.

Since I tend to be interested in the true nature of human beings, individual and communal and in the story God is telling—the story which is this world, I don’t always respond to journalistic fads in the way of the shallow journalists or the bulk of blog commentators. Thus it is that a still inadequate stewing time of a few months has returned me to a subject of great importance in the modern world—criminal conspiracies carried out by members or servants of the power-elites, which criminal conspiracies are made possible by standing-gangs within governments or in close alliance with governments. It’s not the spectacular crimes, as such, which interest me but rather the importance of the types of men who engage in criminal conspiracies when they are holding positions of public responsibility or are part of the general power-elite; those servants, often feudalistic in their personal loyalty, are also willing to put that loyalty above any duties to God or country or their personal families. (E Howard Hunt, CIA operative deeply

involved in conspiracies against Castro, Watergate burglar, possibly—by his own macabre deathbed confession—a participant in the ‘project’ to murder JFK, and successful writer of thriller novels, is one of those and I’ll be discussing his odd life in Chapter 507, *The Soft Power of Corrupted Culture*, which follows.)

We modern Americans have denied that we have a power-elite or ruling class of any sort and this has made it impossible to keep that power-elite under control. This is of great importance in our time. Criminal conspiracies have often been an important tool for those who exercise power to their own interests. Political enemies, in one’s own country or in other countries, can be murdered if they refuse to do as one gangster or another expects them to do. Careers of honest men can be destroyed in various ways. Men or women who’ve made one or many mistakes in the past can be blackmailed into doing the wishes of one or more gangs inside what I’ll call the ‘power-elite’, the ruling class.

Criminal conspiracies need be no more exotic than the mafia involvement in labor unions and in certain industries that allowed the laundering of criminal profits—restaurants and trash-collecting were said to have been popular in past decades. The mafia was also said to have been involved with certain political powers, as seems to have been true in the case of Jimmy Hoffa. There are also Japanese gangsters said to control some labor markets and some industries; there are some journalists claiming Japanese gangsters are deeply involved in what seems to be a very corrupt Japanese nuclear-power industry which also seems incompetent in a very non-Japanese way. Crimes are crimes and criminals are criminals and power-elites of even the most publicly respectable sorts have engaged in professional murder and drug-smuggling and human trafficking. We know this is true in other countries and in other centuries; why would we think that the power-elites have suddenly developed consciences limiting what they will do in the interests of their individual selves, of their families, of their close associates, and occasionally of the entire class of the power-elite? Besides the Mafia in Sicily and mainland Italy and the US and the Japanese gangs, we can also think of the now-weakened Colombian drug-cartels, the now-strengthened Mexican drug-cartels, the Turkish organized crime syndicates which are very much in the loop in politics and business in that country, the Russian mafia—especially those driven out of Russia by Putin and said to be very close to the Israeli political class. China, India. Wherever there is wealth or power to be grabbed or large numbers of human beings to be exploited, there

will be gangsters, perhaps young men just controlling the drug-dealers and prostitutes on individual blocks in an inner-city and perhaps even young men engaging in profitable crime to finance a future revolution. Perhaps young men setting up guns-smuggling operations for the sheer excitement of it all.

I'll anticipate a later part of this essay by saying that the drug-smuggling by the CIA was motivated initially by the perceived need to fight communist insurgents around the world even if the money (maybe for the CIA operatives but certainly for their regional allies) were to come from illegal drugs. The divertable cash-flows from drug-smuggling, arms-smuggling, currency-smuggling, and perhaps professional murder operations, are immense for most purposes.

There is another complication to the issue of power-elites, one which was initially peculiar to the United States at its founding. John Adams saw that the United States was structured to assume that each generation of men was starting out fresh and as a mass of equals and knew this couldn't work—he claimed in his correspondence with Thomas Jefferson that wealthy and powerful men would find ways to get around the various restrictions and attitudes so that they could pass on the wealth and power to their sons. In the opinion of Adams, we needed some sort of public recognition, and imposed code of public honor, to bind men of wealth and power and the sons who would inherit that great wealth. He was right and, in my opinion, the general situation in the United States has encouraged the development of an underground serving the power-elite and, at least in the 1800s through the Cold War, largely run by adventurous sons from the power-elite families, with some families serving the greater families and some families entering the ranks of the power-elite. (And, as Smedley Butler told us, the US Marines were openly used as a sort of labor negotiating team by Wall St investors in Latin America. See [https://en.wikipedia.org/wiki/Smedley\\_Butler](https://en.wikipedia.org/wiki/Smedley_Butler) for the background on the only man to win more than one Medal of Honor and for a link to his freely available book, *War is a Racket*.) In fact, some of the wealthy and powerful families have been surprisingly unknown by the standards of aristocrats in most societies, certainly in the honor-hungry societies of Europe. In his American Empire series of novels, Gore Vidal, a good historian as well as something of an insider to the power-elite (he seems to have despised most of them), mentions the Paynes and Whitneys as having been perhaps the most powerful of families in the early decades of the 20th

century because of intermarriages with a number of power-elite families.

True to the American experience, the class of the power-elite and the sub-class of their servants has been remarkably dynamic with such great families as the Rockefellers and Fords joining the ranks of blue-bloods. More recently, Prescott Bush became a 'patriarch', a founder of a servant family entering the ranks of the power-elite, by marrying a daughter of the wealthy and powerful financial genius George Herbert Walker. Bush, along with his blue-blood friend Neil Mallon, helped to integrate the newly rich families of the Texas oil industry into what was no longer just the 'Eastern Establishment'. Mallon was interesting in that he had broken with Northeast blue-blood tradition of going into investment banking, financially oriented law-firms, the clergy of (mostly) the Congregationalist Church or the Episcopal Church, or sometimes academia or the adventurous life which too often led into the slave-trade or opium-smuggling in Asia. He entered the corporate life, eventually becoming President of Dresser Industries, an oil industry manufacturing and service company which became the core of Halliburton. Someone or a group of someones, perhaps led by Prescott Bush, brought the newly rich oilmen and water barons of California into the class of the power-elite. A reliable history of these events hasn't really been written and the crude summary I just gave is very tentative but quite plausible—something of the sort happened. In any case, I'm not interested in the details nor in accuracy at the level of academic historians—I'm interested in the patterns which tell us about the evolution and development of human communities and especially in regards to that ultimate human community: the Body of Christ. I'm also interested personally and on behalf of those I care about because I think something went wrong and the US, indeed the West as a whole, is being destroyed in ways that aren't even to the advantage of the main power-elite families. They've lost control and all the brutal forces they thought to control have been unleashed in the form of stupid wars and the use of despicable forms of torture and, generally, crimes being committed seemingly for the sake of the immediate profit and not for some focused goal, whether that goal is seemingly good or evil. Politicians drive their countries into bankruptcy and bankers steal money which will be worthless before long.

Perhaps the best business in a decade or two will be guillotine manufacturing.

We in the modern world have an irrational idea, usually implicit, that family ties are no longer important but when we need some cuddling af-

ter a failed romance; we think to inhabit a world structured according to the ideal rationality of modern, Techno-Enlightenment theories, some of which—particularly in politics—are descended from truly ancient ideas. In fact, this ideal rationality, even when heavily moderated by a recognition of empirical knowledge as was the case when the Fathers founded the United States, is opposed to reality and cannot, in the end, be reconciled with the reality of human nature or of the reality of our context as described by historians and physical scientists and novelists.

In Chapter 505, *Can a Modern Individualist Understand Who Owns America?*, I wrote about the modern (usually implicit) denial that blood-ties are strong to the point of often being the dominant human relationship in political and economical and even ecclesiastical realms. (Sometimes, the relationships are proxy relationships formed to consciously or unconsciously mimic the formation of ties between siblings by, perhaps, sending children to resident schools with children from other families of the right sort.) We falsely see politics and economics in terms of organizations which individuals voluntarily join, perhaps only as a result of invitation. In fact, human nature hasn't changed so much from those dark centuries when de Medicis used the Papacy or any other tools (including murder or criminal warfare) to gain or protect family wealth and power. When wealthy, powerful men are fighting for "what belongs to them and their children" (especially the oldest son but sometimes nephews, as was true of some popes observant of their vowed celibacy), they don't just fight within the law or within the range of crimes acceptable to squeamish middle-class Americans. Kings have murdered powerful enemies and stolen all their property, perhaps killing all the close relatives of the original victims to cement the transfer of wealth. Popes have done much the same, though perhaps not nearly so often as some might imagine. Republics and monarchies and oligarchies alike have waged bloody, criminal wars to steal the wealth of another people or to enslave them but usually all participated in the sins and crimes while the few collected the profits. Part of Queen Victoria's royal income came from the opium-smuggling profits of the East India Company of which she was the largest stockholder.

Brotherhoods of various sorts, shared financial interests, shared religious beliefs, and all the other human ties can provide the glue for secretive human societies, but blood-ties or class-ties of blood and marital and brotherhood relationships almost certainly will remain the most central and usually the strongest human ties in secretive human societies and other human com-

munities. Strong blood-ties make it easier to maintain power and wealth over the generations, even to the point of most family members not using inheritance laws to break non-legal primogeniture and entailment arrangements. The many offer up their children to secure power and wealth for the children of the few, though there are periods, such the years 1800-1970 or so in the United States, when there are substantial benefits for even the least in a region or multiple regions. That is, in fact, how good societies are built—by customs and habits which allow much to the wealthy and powerful but protect the common folk.

I'm not so pessimistic as many of my writings might indicate, including this essay. I don't think history to be merely a record of crimes and of exploitation of the poor and the powerless, but crimes and exploitation are with us always in this mortal realm and might even become dominant factors in the best of communities if the common men don't keep watch and aren't prepared to stand up for the rights of their children and grandchildren.

Crimes we've had even in the best days of the American Republic, though our public-school textbooks tell fairy-tales of a morally well-ordered, freedom loving American citizenry. As a side-comment: I can't understand how Americans can claim to be Christians who consider the Bible to be a source of truth and then accept the view of the United States as being a better country than the Bible would indicate to be possible, the American people to be a morally superior people to any in the Bible or foretold by the prophets or Jesus Christ Himself.

Admittedly, there is a strain of American thought, very strong right now in our public schools and all colleges, which brutally depicts the crimes (and sins by at least implications) of the Southern slaveholders, but it's pretty well established that the North tried slavery and it didn't work up north except for household slaves and in some small-scale crafts shops. Moreover, as I have noted a few times in past writings, New Englanders from the Colonial period were selling native Americans as slaves throughout the world; Americans including some from prestigious families were smuggling opium into China in the late 1700s and the first half or so of the 1800s and a good number were working the slave trade on the West Coast of Africa throughout the 1700s and 1800s. The latter fact is one of the reasons Lincoln didn't want to punish the South unduly after the War Between the States. So far as I can tell, this blue-blood (and more generally, Northeastern American) entry into profitable lives of crime and sin was first motivated by a desire

for adventure on the part of those not equipped, emotionally or mentally or physically (restlessness), for the mundane life as a farmer or storekeeper or even that of investment banker or Wall St lawyer. But, whatever the original motivation, the profits flowed back to a prosperous region largely lacking in the sort of liquid wealth needed to fuel the sort of development that the Northeast and the Midwest would see from about 1800 into the 1900s.

Some of the mansions in Boston and New Haven and New York and Philadelphia were built with profits from the slave-trade or the Asian drug-trade. In fact, John Jacob Astor bought a strip of land heading north from the physically small village of Manhattan and developed that strip into Fifth Avenue; Astor's money to that point had come partly from legal trading with the Indians of upper New York state and partly from selling them whiskey and guns even while they were at war with the white settlers and then those profits were increased greatly in the opium smuggling business in Asia. Criminal profits flowed also into the investment pools used to build railroads and mines and manufacturing corporations throughout the United States, though the power-elite families predominately deployed and controlled their wealth and power through investment banking and Wall St law-firms. We can exaggerate the meaning of all of this if we think that all blue-blood families or other families of distinction owned seats on a major stock exchange or held a partnership in a major Wall St or Boston law-firm, if we think all the wealth of the Eastern Establishment came from criminal activities or high-powered investment or legal careers; there were many who had quite ordinary occupations or were distinguished authors or scholars or missionaries, though David Halberstram tried to teach us in *The Best and the Brightest* that some of those blue-bloods with moral integrity did as much damage to the United States as any of their criminal cousins. My point is that these criminal activities, however marginal at times and however important at other times, show a Mafia-like loyalty to one's own family, gang, and class that turns outsiders into some sort of class of subhumans to be exploited. That was also true, in Halberstram's book, of those crews of privileged Harvard professors become advisors to John Kennedy and Lyndon Johnson and who brought us the wonders of Vietnam and nearly those of nuclear war.

I'll soon be noting the work of a respected and honored historian who paints the situation in very dark terms—the power-elite of the United States operates at times in ways not all different from those of a Latin American

drug-cartel, at least in the way of a drug-cartel being able to draw upon the resources of Wall St and the American government. First, I'll turn to a man who speaks harsh truths, but has a view a bit different from and perhaps more 'moderate' than mine. In February of 2014, Bill Moyers published an article, *Essay: Anatomy of the Deep State* at <http://billmoyers.com/2014/02/21/anatomy-of-the-deep-state/>, which was written by Mike Lofgren, "a former congressional staff member who served on both the House and Senate budget committees," an insider of at least the American political system.

What is the 'deep state'? Lofgren provides a definition in a footnote which I'll quote in its entirety:

The term "Deep State" was coined in Turkey and is said to be a system composed of high-level elements within the intelligence services, military, security, judiciary and organized crime. In British author John le Carr's latest novel, *A Delicate Truth*, a character describes the Deep State as "...the ever-expanding circle of non-governmental insiders from banking, industry and commerce who were cleared for highly classified information denied to large swathes of Whitehall and Westminster." I use the term to mean a hybrid association of elements of government and parts of top-level finance and industry that is effectively able to govern the United States without reference to the consent of the governed as expressed through the formal political process.

Lofgren's view is sufficient to puncture illusions of the average American who believes he can go about his roles as a fan of the Chargers and the Rolling Stones and also as a town and church volunteer while trusting those slightly crooked but most all-right politicians to govern the country in the best interests of all, though no one could possibly define 'all' and most especially not in the demographically dynamic and culturally chaotic United States. We are a country and a people made for moral disorder, and this is undoubtedly one of the factors contributing to the development of a criminal underground which operates as part of the power-elite and isn't just a marginal bunch of gravely-voiced Sicilians and flamboyantly dressed African-Americans from the inner-city. In fact, as I'll note later, there is good reason to believe that even those street criminals don't have to launder

money through the cash-registers of restaurants nowadays—they have their own special contacts at the best, or at least largest, of American banks.

In any case, I would suspect the Turkish definition to be more accurate in all modern states—organized crime in the sense of arms-smugglers, drug-smugglers, and professional murderers are embedded in the modern state and are sometimes receiving paychecks from the CIA or US AID or the private foundations and ‘charities’ which consciously or unconsciously work to destroy foreign cultures or political entities to some presumed (and usually imaginary) benefit of the American government. Moreover, my admittedly sparse knowledge of such matters as drug-smuggling and arms-trafficking lead me to doubt if Boeing and other major arms-merchants could possibly be free from the taint of not only arms-smuggling but also drug-smuggling and currency-smuggling. Similar comments could be made about a multitude of financial services companies and manufacturers even outside of the weapons industry. We live in a truly corrupt age, though some are inclined to see clearly only when sexual crimes or street crimes are involved.

One reason for considering the possibility that true gangsters are integral parts of the deep state, in its political and economic realms, is the reported dependence of the American economy on the liquidity supplied through the bank deposits of Mexican drug-cartels (said by some to have saved the US from a far worse collapse in 2008). In fact, Lofgren notes the importance of cash-flows to the deep state: “If there is anything the Deep State requires it is silent, uninterrupted cash flow and the confidence that things will go on as they have in the past.” Lofgren is speaking mostly of cash-flows from Wall St but even that is sometimes quite tainted beyond even their possession of vast amounts of free money from the Federal Reserve Bank and other government handouts paid for by the American taxpayer.

In an article, *Global banks are the financial services wing of the drug cartels* at <http://www.theguardian.com/world/2012/jul/21/drug-cartels-banks-hsbc-money-laundering>, which must be rather depressing to those holding ‘mainstream’ views about the modern world, we can read about the involvement of the British bank HSBC and the American bank Wachovia (now part of Wells-Fargo) in laundering money for drug-cartels. The HSBC executives lined up to apologize to the US Senate for crimes far worse than those which put street dealers in prison for years, even decades. “Wachovia was fined \$50m and made to surrender \$110m in proven drug profits, but was shown to have inadequately monitored a staggering \$376bn through the casa de cambio [‘a currency exchange house

operated in Mexico on behalf of the largest criminal syndicate in the world and one of the most savage'] over four years, of which \$10bn was in cash." We also learn: "No one from Wachovia went to jail." The same was true of HSBC.

I'll just list three more stories on the subject and let the reader follow up:

- *Money Laundering and The Drug Trade: The Role of the Banks* at <http://globalresearch.ca/money-laundering-and-the-drug-trade-the-role-of-the-banks/5334205>,
- *Wells Fargo: Your Neighborhood Mega-Money Laundering, Drug War Profiteering, Prison-Industry Enlarging Bank* at <http://www.alternet.org/economy/whats-wrong-wells-fargo>, and
- *How A Major U.S. Bank Laundered Billions In Mexican Drug Money* at <http://www.businessinsider.com/how-wachovia-laundered-billions-in-mexican-drug-money-2011-4>.

There are lots of strange, individual stories originally mostly from mainstream journalists about the various crimes related to the Iran-Contra conspiracy, ties between the CIA, Oliver North, the Saudi Arabian royal family, the Bin Laden family, Bill Clinton, the Bushes, and various smugglers and professional murderers. One bank involved in financing the Iran-Contra smuggling, Bank of Credit and Commerce International (see [https://en.wikipedia.org/wiki/Bank\\_of\\_Credit\\_and\\_Commerce\\_International](https://en.wikipedia.org/wiki/Bank_of_Credit_and_Commerce_International)), "handled money for Saddam Hussein, Manuel Noriega, Hussain Mohammad Ershad and Samuel Doe. Other account holders included Medellin Cartel and Abu Nidal." "The U.S. Central Intelligence Agency held numerous accounts at BCCI, according to William von Raab, former U.S. Commissioner of Customs. Oliver North also used and held multiple accounts at BCCI. These bank accounts were used for a variety of illegal covert operations, including transfers of money and weapons related to the Iran-Contra scandal, according to Time Magazine. The CIA also worked with BCCI in arming and financing the Afghan mujahideen during the Afghan War against the Soviet Union, using BCCI to launder proceeds from trafficking heroin grown in the Pakistan-Afghanistan borderlands, boosting the flow of narcotics to European and U.S. markets."

Even the venerable Clark Clifford (see [https://en.wikipedia.org/wiki/Clark\\_Clifford](https://en.wikipedia.org/wiki/Clark_Clifford)) was indicted for involvement with BCCI. [See the original Wikipedia article about BCCI for the footnotes referencing original sources.]

The US Customs was allowed to infiltrate BCCI and take it down *after* the Soviet Union fell and this gangster bank was no longer needed for fighting the Soviets in Afghanistan.

Even if casual research is done and even if you only accept what is said in original sources from the mainstream press, you will soon see that drug-cartels come and go (and might disappear in Columbia to grow anew in Mexico) as do arms-smugglers and other gangsters as most think of the term but the corrupt Western banks and the Western national security agencies, especially the CIA, have been constant presences in these large-scale, international criminal enterprises since at least the beginning of the Cold War.

There is an academic who can tell us how this came to be: Alfred W McCoy, the JRW Smail Professor of History at the University of Wisconsin and a specialist in Southeast Asia. The first paragraph of his bio sketch, <http://history.wisc.edu/people/faculty/mccoy.htm>, reads:

After earning a Ph.D. in Southeast Asian history at Yale, my writing on this region has focused on two topics—Philippine political history and global opium trafficking. My first book, *The Politics of Heroin in Southeast Asia* (New York, 1972), sparked controversy when the CIA tried to block publication. But after three English editions and translation into nine foreign languages, this study is now regarded as the “classic” work on the global drug traffic.

Imagine that. A book about, though not only about, CIA heroin manufacturing and smuggling is “regarded as the ‘classic’ work on the global drug traffic.” Perhaps Lofgren should become a bit more skeptical about the power-elites of the modern world, including the ones in the United States? (We should be careful about using ‘power-elite’ in the singular unless we specifically recognize that it is a class made up of different groups often doing battle against each other, united only when their ‘right’ to exploit the naive and the weak is endangered. Otherwise it is best to use plural forms, recognizing the conflicts inside the class of ‘power-elite’, for

example the conflict some, including me, see between the powerful, established families and some of the servants grown powerful—especially those in the national-security industries or the oil or weapons industries.)

The last paragraph of Professor McCoy's bio sketch reads:

My current work explores the role of the “covert netherworld”—an invisible social interstice inhabited by criminal syndicates and secret services—in shaping the politics of modern states and their world order. My first publication from this project, exploring the domestic dimension of this covert realm, is titled *Beer of Broadway Fame: The Piel Family, Their Brewery, and a Changing America*, and will be published in 2015.

We live in a world different from and not so much different from the morally corrupt political and ecclesiastical world of the Renaissance, in Italy and a few other regions of Europe. We live in a world with a “covert netherworld”, with “an invisible social interstice inhabited by criminal syndicates and secret services.” Those who inhabit or travel through this interstice shape “the politics of modern states and their world order.”

Nasty stuff and often American nasty stuff—though there is a common sewer underlying the modern world which includes regions perhaps even nastier than the American sewers.

Was it horrible what happened to American cities beginning in the 1950s, when heroin and other illegal drugs piled on top of other factors leading to social and moral decay? Yes, but the timing and other facts point to the likelihood that much of that heroin came from operations originally started by the CIA and perhaps turned over to their allies such as two divisions of the Nationalist Chinese Army driven into Burma and turning to drug-manufacturing and drug-smuggling to finance an ongoing war against communism. Why would good American boys, likely even noble to the point of having been varsity football or baseball players, have started heroin production and smuggling operations? McCoy was told by a highly regarded OSS (predecessor of the CIA) officer that, during the years after WWII, the US Congress wanted the newly-formed CIA to engage in an extensive covert worldwide war against communism but wasn't willing to pay the full costs. The CIA started a variety of businesses, some largely

legitimate, to finance some of their operations or to help their allies finance their operations.

Lofgren seems to hold a softer view than I hold. He claims in his article, *Essay: Anatomy of the Deep State* at <http://billmoyers.com/2014/02/21/anatomy-of-the-deep-state/>:

My analysis of this phenomenon is not an exposé of a secret, conspiratorial cabal; the state within a state is hiding mostly in plain sight, and its operators mainly act in the light of day. Nor can this other government be accurately termed an “establishment.” All complex societies have an establishment, a social network committed to its own enrichment and perpetuation. In terms of its scope, financial resources and sheer global reach, the American hybrid state, the Deep State, is in a class by itself. That said, it is neither omniscient nor invincible. The institution is not so much sinister (although it has highly sinister aspects) as it is relentlessly well entrenched. Far from being invincible, its failures, such as those in Iraq, Afghanistan and Libya, are routine enough that it is only the Deep State’s protectiveness towards its higher-ranking personnel that allows them to escape the consequences of their frequent ineptitude.

I certainly know the American deep state isn’t omniscient or invincible. In fact, in recent decades it seems to have screwed up and destroyed American wealth and power more than it has added to American wealth and power. The question I raise is: how integral is that sewer (the “highly sinister aspects” as Lofgren has it) to the overall operations of the American state, underground and above ground? That is a question that can be answered only by an analysis of the structure of the power-elite class I’m certainly not qualified to make, and I’ll never be so qualified because my ultimate interests are in a more general understanding of human being allowing for both the revealed truths of Christianity and modern empirical knowledge. This business about power-elites and deep states is just a small part of that empirical knowledge.

There’s a spectrum of possibilities and I think Lofgren isn’t so far from where I sit, and McCoy and others, that is, not so far as I thought when I first read this article. I think the criminal underground of the American deep state is really integral to the entire system and it can’t

be cleaned up at this point without taking down many American institutions and bringing chaos into our political and economic systems. (For those who prefer audio, see *CIA complicity in the global drug trade* at <http://www.radio4all.net/index.php/program/54741&75267> for a discussion between McCoy and Peter Dale Scott who speaks of some interesting connections between CIA drug operations and the wars in Vietnam and Afghanistan. I don't recall he drew a strong conclusion, but it seems a possible case of the tail, CIA drug operations, wagging the dog of American war. The US Marines were once used to shoot Latin American peasants demanding better pay, why would it not be possible the entire US military was used to protect drug-cartels?)

Lofgren is right that it's not a cabal; there is no wizard behind the screen but rather gangsters battling it out in the sewers and emerging to murder and smuggle drugs or weapons, for their own needs or those of the above ground bankers and politicians and corporate bosses who have some control over some of the criminals. There may even be, or have been, some who lived in both worlds, underground and above ground.

The important concept is that of power-elite, a class intertwined not only with powerful investment operations, Wall St law-firms, the political parties, corporations and especially in the arms-manufacturing and oil industries, and money-center banks, but also intertwined with criminal organizations which serve the powerful and wealthy and with criminal organizations which are independent profit-centers. Any cabals are parts of smaller and tighter entities inside the deep state, or the class of power-elite, sometimes really families or extended families and sometimes temporary groups such as those which came together to try to overthrow Castro. I've dealt with some of these these issues in various chapters of this book, including:

- Chapter 420, *What is a Conspiracy?*,
- Chapter 430, *Are Conspiracies Self-organizing?*,
- Chapter 440, *I Have a Problem with Many Conspiracy Theorists*,
- Chapter 445, *Are Serious Historians Conspiracy Nuts?*,
- Chapter 486, *Conspiracies Confirmed!?*,
- Chapter 492, *Who Are the American Elites and Are They Conspirators?*, and

- Chapter 496, *Conspiratorial Gangsters Are the Leaders Americans Want and Deserve.*

My general view on conspiracies and deep states and the like is that they are very similar to the good forms of organizations which Adam Smith saw developing by way of the useful myth of the Invisible Hand. Behind the myth is the cooperative nature of a social animal of great complexity. It's of greater interest (at least to me) and of greater importance to deal with the underlying human being which can lead to various sorts of human communities organized by conscious and unconscious means; some of those communities might be good and some evil and many of mixed character. Human beings of some substantial moral order, such as the Christians of Scotland and England in the second half of the 18th century, will work by those conscious and unconscious means to build communities of moral order. Human beings of defective moral order, such as the barbarian children of the United States, will work by those conscious and unconscious means to build communities of moral disorder or, at best, a defective moral order working to the benefit of the few.

## 507 The Soft Power of Corrupted Culture

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1838>. It was finished and uploaded on 2014/06/26.]

In Chapter 506, *Deep States and the Modern American Citizen*, I addressed the ways in which members and gangs of members of the ruling class of the modern world, and many other ages of man, use crimes—even brutal and murderous crimes—as tools to gain control over other human beings or human communities.

In the United States, soft power, mostly the shaping of minds and attitudes along with some substantial sharing of wealth (perhaps now being reversed to some extent), has kept the ordinary citizens of past generations quiet, maybe unconsciously distracted by circuses and maybe consciously compliant with a sometimes criminal ruling class, while the power-holders committed various sorts of crimes in the political or economic realms. More recently, morally corrupt cultural products, such as James Bond books and movies and *Rambo* and *Star Wars* with its perversely adolescent depiction of good and evil, have gotten the masses off their seats at times, lining them up along the streets to cheer the troops going to or returning from another war against those who hate us for our freedoms including apparently hundreds of thousands of hateful children.

Soft power has been remarkably effective in turning the American mind into something like silly putty—see Chapter 308, *Unreliable Memories, Minds Like Silly Putty*. Several of the most prominent aspects of American life have been spotlighted as factors contributing to this problem of the dumbing down of Americans. There is the hectic pace of life even when we're neither having fun nor accomplishing much of anything. There is the

related problem of constant communication and other sorts of electronic distractions. There are cars and lawns we care for as if fairways at the country club. There is a confusion of excessive information that some deal with by adopting unreasonable simplifications—such as the one about those Iranians and Iraqis and Syrians not being able to think as rationally as we Americans do.

All of this contributes to the major problem: we don't fill our heads with good stuff. We don't realize we shape our minds in response to what we perceive in physical terms (including our own bodily activities) and what we conceive in mental terms (including imagination). We think to watch *Rambo*, avoid the *Bible*, and somehow go to our deathbeds suited to life in Heaven.

We should put our energies into putting the good stuff into our heads and into our hearts and into our hands and feet. We should have thoughts which are drawn from those God revealed in the Bible and the thoughts He manifested in this world and its things and relationships and in all the abstractions from which this world was shaped. We should fill our heads with the stories of great men, good men, strong men, by reading serious, narrative histories and biographies or good historical novels or by recalling and retelling the story of our grandfather the fireman who entered burning buildings to save lives or our grandmother who went with a church group for part of each summer to work as a nurse's assistant in a burnt-out coal district in West Virginia.

In Chapter 506, *Deep States and the Modern American Citizen*, I wrote something about E Howard Hunt, noting that he was a "CIA operative deeply involved in conspiracies against Castro, Watergate burglar, possibly—by his own macabre deathbed confession—a participant in the 'project' to murder JFK, and successful writer of thriller novels." I was planning on writing in response to an essay posted on the Internet about a "shallow state", but wasn't impressed with that essay on a more careful reading. My thoughts and words turned instead to cultural soft power and how it helps to reinforce the deep-state. Rather than just sidelining the ordinary citizen with bread and circuses, soft cultural power has been used to recruit the ordinary citizen to the various programs, often criminal, of the ruling class, or classes, of the United States. The cultural angle is, in fact, more interesting, especially with the fascination of Americans over the previous 50 years with that elegant criminal and exploiter of young women, James Bond. And his ilk.

So, what about E Howard Hunt, most famous for being a seemingly incompetent burglar in the Watergate mess? It's certainly interesting that Hunt was a prolific and, so far as I can tell, financially successful writer of spy novels. Even my smalltown library, missing all works of some major literary figures, has three of his novels on the shelves. At [https://en.wikipedia.org/wiki/E.\\_Howard\\_Hunt](https://en.wikipedia.org/wiki/E._Howard_Hunt), we can read this about Hunt the novelist:

Hunt was a prolific author, primarily of spy novels. During and after the war, he wrote several novels under his own name—*East of Farewell* (1942), *Limit of Darkness* (1944), *Stranger in Town* (1947), *Bimini Run* (1949), and *The Violent Ones* (1950)—and, more famously, several spy and hardboiled novels under an array of pseudonyms, including Robert Dietrich, Gordon Davis and David St. John. Hunt won a Guggenheim Fellowship for his writing in 1946. [See article referenced above for footnotes.]

My very general impression is that the article, in its entirety, is very questionable based upon reading the works of serious, non-mainstream journalists such as Russ Baker who puts up some serious investigative research at the website *Who What Why*—<http://whowhatwhy.com/>. I've written of Baker's work in Chapter 445, *Are Serious Historians Conspiracy Nuts?*, and in Chapter 492, *Who Are the American Elites and Are They Conspirators?*. Baker has also published a readily available book about the dynasty founded by Prescott Bush, father of a president and grandfather of another president: *Family of Secrets*. Hunt's path through life at least veered near the path of George H W Bush and maybe that of Prescott Bush as well. Hunt also seems to have been involved in at least that one project (overthrowing Castro) near and dear to the hearts of Allen Dulles and his business partner George Herbert Walker, Jr (uncle to George H W Bush.)

Hunt seems an interesting case of a man who provided part of the cultural foundations for the positive attitudes modern Americans have toward spies, assassins, and other criminals as well as having himself been a spy and involved in assassination conspiracies against Castro. Hunt wrote about the life and then lived it and continued to write about the life. Something of the sort can be said of Ian Fleming, see [https://en.wikipedia.org/wiki/Ian\\_Fleming](https://en.wikipedia.org/wiki/Ian_Fleming) for biographical information, and

of David John Moore Cornwell who wrote under the pen name of John le Carré, see [https://en.wikipedia.org/wiki/John\\_le\\_Carre](https://en.wikipedia.org/wiki/John_le_Carre)" for biographical information. A host of others have written about life in the intelligence or covert operations communities with less direct experience or perhaps none at all.

The sorts of books we read, and the sorts of movies we watch, have little to do with reality. Those books and movies of the thriller genres do have a lot to do with the actions of the leaders of the United States since the beginning of the Cold War and a lot to do with the American failures to deal with realities on the ground as opposed to inside of our heads—inside our heads, we're still on top of some world if not the one created by God. We have strayed from God's reality, trying to build a world with an excess of covert actions and a deficit of diplomatic or other peaceful actions. By default, we bribe officials in other governments and steal secrets through them or by other means. By default, we destroy entire countries which don't bow to our every American whim—even when those countries are, in some clear sense, rising in social order and in prosperity and are at least moving toward the sorts of values Americans claim to hold dear.

We Americans know that goodness is to be defended and maybe even spread into evil regions by use of the same criminal methods and attitudes which were advocated by Nazis and Bolsheviks and Maoists. The Bolsheviks and Maoists (many anyway) targeted some true badness, such as ignorance and poverty. They used rifles and bombs and concentration camps where education and modern farming techniques and modern medicine would have been more appropriate. Those evil Bolsheviks and evil Maoists. If only they had been good enough to spread democracy and fight evil by the methods used by the United States in Vietnam and Afghanistan and Iraq and Somalia and Libya.

Whatever is true of the American elite, so wealthy and so powerful, the ordinary American has been convinced the negative wisdom of the Stalinists and Maoists is the appropriate way to defend our country and the values we claim to hold, but we have a strange blindness that leads us to think that what we did to Iraq was morally good and not at all similar to what the Maoists did to Tibet. In fact, we adopted many of the methods of Hitler and Stalin and Mao; in our efforts to defeat them, we became their disciples. (I believe it was C S Lewis who first expressed this insight but I don't have a reference.)

But maybe I have it wrong. Maybe Lenin and Trotsky and Stalin and

Mao and his followers learned from our grandparents the brutal and amoral ways described by Winston Churchill in a quote I provided in Chapter 433, *The Final Frontier of Our Modern Moral Journey*:

All the horrors of all the ages were brought together, and not only armies but whole populations were thrust into the midst of them. . . Neither peoples nor rulers drew the line at any deed which they thought would help them to win. Germany, having let Hell loose, kept well in the van of terror; but she was followed step by step by the desperate and ultimately avenging nations she had assailed. Every outrage against humanity or international law was repaid by reprisals – often of a greater scale and of longer duration. No truce or parley mitigated the strife of the armies. The wounded died between the lines: the dead mouldered in the soil. Merchant ships and neutral ships and hospital ships were sunk on the seas and all on board left to their fate or killed as they swam. Every effort was made to starve whole nations into submission without regard to age or sex. Cities and monuments were smashed by artillery. Bombs from the air were cast down indiscriminately. Poison gas in many forms stifled or seared their bodies. Liquid fire was projected upon their bodies. Men fell from the air in flames, or were smothered, often slowly, in the dark recesses of the sea. The fighting strength of armies was limited only by the manhood of their countries. Europe and large parts of Asia and Africa became one vast battlefield on which after years of struggle not armies but nations broke and ran. When all was over, Torture and Cannibalism were the only two expedients that the civilized, scientific, Christian States had been able to deny themselves, and they were of doubtful utility.

We Americans have added (often poorly) targeted murder by way of drones or special forces. We Americans have used, at least intermittently, torture which for all its “doubtful utility” seems to be a way for the righteous to inflict pain upon those evil creatures who hate us for our freedoms and for our goodness and probably for our golf courses.

To a large extent, this has been made possible by the crap we absorb from our trashy books and trashy movies and trashy songs. Disorder is us,

it is in us, and we love it. So long as we feel good about ourselves, we must be doing what is right.

A Medieval theological joke:

Who will be saved?

Anyone who can enjoy Heaven.

We American Christians spurn the Bible and good poetry and we read books and watch movies about ‘heroic’ criminals of the elegant James Bond sort or the rather crude Rambo sort. We gather in front of the television to cheer as the missiles and bombs hit a heavily populated city, such as Baghdad.

Why would anyone think they would be happy in Heaven if they enjoy watching or even imagining the killing of any human being, no matter if he is an enemy? Why would they be happy in Heaven if they prefer *Rambo* to the *Gospel of St John*? Why would anyone who claims to be a Christian prefer the professional murderer and exploiter of young women, James Bond, to George Washington, that man who was a sinner but one who struggled his entire life to behave according to a strict code of public honor. I have to ask: was it just coincidence that the James Bond era corresponds to a period of a very public denigration of George Washington? We honor a fictional character who was a coldblooded and hardhearted criminal and then spit upon the Father of our country.

In *Washington: The Indispensable Man*, the shorter biography by James Thomas Flexner, we can learn that Washington looked at the dead and horribly injured men being brought off the battlefields of the American Revolution and concluded that even just war isn’t glorious and is to be avoided unless absolutely necessary—though to be fought to the last ounce if necessary. He also showed in his refusal to allow reprisals against civilian populations who aided the British or the Royalists that he thought the best way to win hearts and pull together a country (or a world by extrapolation) is to treat human beings decently and maybe even better than they deserve from our viewpoint.

Perhaps we should spend more time with the Bible and with respectful biographies of men like George Washington and less time watching James Bond movies or—Lord, have mercy—Rambo movies.

# 508 Crowds Are Morally Disordered Communities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1857>. It was finished and uploaded on 2014/07/29.]

Richard Sale has written an intelligent essay upon the diseased state of the public mind of Americans: *The Menace of the Crowd* at [http://turcopolier.typepad.com/sic\\_semper\\_tyrannis/2014/07/the-menace-of-the-crowd-.html](http://turcopolier.typepad.com/sic_semper_tyrannis/2014/07/the-menace-of-the-crowd-.html). Wikipedia has a stub article about Sale at [https://en.wikipedia.org/wiki/Richard\\_Sale\\_\(journalist\)](https://en.wikipedia.org/wiki/Richard_Sale_(journalist)).

Sale is looking for the more general truths behind the morally irresponsible attitudes of Americans toward Russia and its leader Vladimir Putin, those attitudes being stirred up into a nasty froth most recently after the civilian airliner MH-17 was shot down from the skies over a war-zone in eastern Ukraine. We know little though the American government has made accusations against Russia and Putin without supplying evidence. We have to remember that this is the same government which lied on important matters in Syria, that is, lied in a criminal manner. Both the President and his Secretary of State, as well as some junior members of this administration, have also shot off their mouths or acted in an irresponsible and juvenile manner on numerous occasions on important matters and when dealing with adults from countries which were once willing to be friendly toward us.

This moral irresponsibility and immaturity on the part of American leaders wouldn't be possible if the American people were themselves morally responsible and mature. If we were better people, we would have better leaders or would call bad leaders to account if we made mistakes in the voting booths. What gives? Sale tells us:

So what you see happening today is the transformation of individual convictions that become overwhelming in force because they are repeated endlessly by those in authority. The cautious restrictions of what once was called, “Iron objectivity” had been discarded as too ineffectual and cumbersome. Few in the media have the intellectual or moral strength to resist what is told them by their leaders. The collectivities have the habit of drowning anything that is private and not collective.

To put it differently, the first causality of a crowd is the loss of its reason, the loss of its ability to weigh and estimate events. One of their greatest fears of a crowd, of people who think in unison, is to be seen as being moderate and sensible. It used to be that moral contagion acted slowly, moving cautiously, but now thanks to social media, the public’s worst instincts are not only let loose, they are praised and glorified.

So a crowd, as Sale uses the term, is what some call a mob and that is a gathering of individual human beings who may possess at least modest levels of individual intelligence but, as a group or a ‘crowd’, they have a very low quality of intellect—communal mind (see Chapter 127, *Intelligence vs. Intellect*.) The mob-thoughts or crowd-thoughts are hardly rational and often lead to harm to the members of the crowd itself as well as to its intended victims.

A human community can take the form of a marauding band of sports fans or a lynch mob or a mass of those with minds like silly putty (see Chapter 308, *Unreliable Memories, Minds Like Silly Putty*. Sale refers to the silly-putty crowd. A truer community can be seen in a company of Green Berets or the history faculty of a small liberal-arts college or a society of medical specialists or a collective of pottery craftsmen or a church community or the workforce of a small machine shop or any of a variety of human beings who gather into a community in an adult manner for a legitimate reason, even if only to play cribbage once a week. These better sorts of community have a part of the greater intellect which is the true core of a civilization and, thus, a share in the ultimate, complete and perfect, intellect which is that of the Body of Christ. I’m early in the process of developing adequate ways to discuss matters such as this: why is it that sometimes human communities, even temporary gatherings, develop in a healthy and morally well-ordered form and sometimes they become lynch

mobs. In the past, such matters were just discussed as if being a “way of the world,” but I’m trying to follow through on the modern program recommended by Pope Benedict XVI (Joseph Ratzinger):

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.

[Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: “Broadening the Horizons of Reason. Prospects for Philosophy”.]

The American people don’t have much of an intellect at all, not the intellect or communal mind of any civilization which could be labeled ‘Christian’ nor even one much like that of a virtuous pagan civilization. We are, as a people, primitive and morally unordered; we pretend to be freestanding individuals even as evolutionary biologists and neurobiologists have joined historians, sociologists, and the better sort of Christian philosophers and theologians in seeing that men are bound in communal life. I prefer to avoid half-hearted words and just claim we human beings have both individual and communal being—as do probably most animals but certainly all social animals. (This expansion in the definition of created being should be plausible in light of the expansion of being by modern scientists to include relationships; some of the Old Testament authors and St John the Evangelist were there first—see Chapter 156, *A Christian View of Einstein and Bohr’s Debate on the Meaning of Reality*, and Chapter 157, *Quantum Mechanics and Moral Formation*.)

My view of human being is richer and more complex than the view Sale seems to assume. My view allows better ways to state the problems we face and far better ways to analyze and understand those problems. I’m going to push hard on an expansion of our understanding of created being, so that we begin to acknowledge that relationships are primary over stuff and that there is both individual and communal human being. I’ve developed this worldview in numerous books described in Part I, *Overview*, and in numerous weblog essays included in this book. Ultimately, our social beings, forming and participating in all our social groupings in this mortal realm, reach their completeness and perfection when we become truly Christ, that

is, when each of the human beings saved by Christ becomes the Body of Christ while remaining his or her individual self. This is analogous to God Himself: three Persons who remain fully three individual Persons while also being fully one God.

Therefore, I think Sale's comments are valid but he uses a set of words and concepts which leave him writing as if a crowd is inherently bad rather than a disordered, or at least poorly ordered, form of something good—a true community. I would suggest we can better understand the underlying problems caused by defective or immature human communities when we recognize the reality of communal human being as well as individual human being. As we recognize a street thug as a stunted and deformed human being, a pietistic peasant as an immature Christian, a schizophrenic as a human being with a damaged mind, we can see a crowd as human communal being which is defective or incomplete or immature in some significant sense.

# 509 Mathematical Models of Human History: Are They Plausible?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1864>. It was finished and uploaded on 2014/08/11.]

I'm not an unqualified supporter of quantitative modeling in the social sciences, most certainly do I have my doubts about modeling in history. It's a dangerous business and the results have been spotty at best. Yet, it could work for some sorts of analyses and doing it in a disciplined way would allow rejection or modification of the model. We can read about a seemingly successful application of quantitative modeling technique as applied to the spread of large-scale societies, proto-states and states, in Europe and Asia and Africa. That successful application is discussed in an article by a geneticist, Razib Khan, who blogs at Ron Unz's website, *The Unz Review: An Alternative Media Selection* and subtitled *A Collection of Interesting, Important, and Controversial Perspectives Largely Excluded from the American Mainstream Media*.

Khan's article, *Modeling World History in Math Is Possible* at <http://www.unz.com/gnxp/modeling-world-history-in-math-is-possible/>, is a commentary upon an article summarizing results of a research project: see *War, space, and the evolution of Old World complex societies* at <http://www.pnas.org/content/early/2013/09/20/1308825110>".

Khan displays six graphs in his article which he says show "the major result: a model with only a few simple parameters was incredibly good at fitting the genuine growth and evolution of complex societies over 3,000 years." (Actually, both Khan's article and that by Peter Turchin and the

other researchers make it clear they are interested in the spread of sophisticated military technology and centralized political systems of the sort we would call ‘states’.)

This model of an important part of human history is essentially a model covering external environments, such as proximity to the types of grasslands which nurture nomadic and semi-nomadic horsemen who have developed much of the military technology and fighting methods of Eurasia and northern Africa and have forced the development of other military technologies and fighting methods.

The model was used to predict “the historical distribution of large-scale societies in Afroeurasia during 1,500 BCE-1,500 CE” and to also develop maps “indicating the frequency and distribution of large-scale societies.” The authors were interested in such matters because of their concern with the large size which can support rational bureaucracies and sophisticated educational systems. Again, the model produced the right results based upon the assumptions about the importance of nomadic horsemen from the great grassland regions in initiating the movement toward advanced military technology and large societies with centralized political, bureaucratic systems. Apparently, their model was successful in regions such as south China and Europe which were not directly contiguous to such grasslands because the model allowed for the diffusion of military technology into, say, most of Europe from the Near Eastern and northern African regions which were contiguous to such regions and were sometimes conquered and were sometimes able to adopt the horsemen’s military technology or perhaps to develop their own superior military technology which allowed, along with the political controls which are part of what we know as ‘states’, successful defense against the horsemen such as the Mongols and Turkmen and Berber peoples.

Neither the authors nor Khan are making a claim that human history is deterministic in a simpleminded way. They are simply claiming that such models can allow a more exact understanding and an objective way of testing claims about human history. (In another article, *Human History Is Both Contingent and Inevitable* at <http://www.unz.com/gnxp/human-history-is-both-contingent-and-inevitable/>, Khan argues for a far more sophisticated view in which the world is contingent in some ways and fully determined in other ways. Still other articles on his blog take up similar issues.)

I endorse the development of well-formed quantitative models, though I

feel they will only be useful, and only avoid misleading the naive, for very well-formed ideas which can be tested and clearly rejected or modified or accepted. The problem, and it's related to the more general form of the problem the researchers dealt with, is that no one has the sort of overview available in gravitational theory (the theory of general relativity) or other fields of physics where very successful quantitative models are made possible by criteria the models should meet. Without a greater understanding, it can be dangerous to rely too heavily on models because they produce 'accurate' answers to specific questions or to questions under particular conditions. I've read a couple introductory works on mathematical modeling and found the practitioners who develop models over a variety of domains to be more skeptical than would be true of other mathematicians or scientists. Models which are built by rigorous application of physical laws should work but those which are built upon empirical results often break when different facts are considered or when the future simply proves different from the past or present.

Yet, the model of the growth of large-scale societies under consideration seems to deal well with the initialization of one very important process: the formation of centralized states with sophisticated military technology.

But, again, we have to be wary of answers to questions about human history which merely preserve the known phenomena. We moderns tend to misunderstand the history of human science and human thought and to think there was some reason the ancient and Medieval thinkers could have realized it was 'wrong' to place the Earth at the center of the Cosmos as they knew it. (There were speculative developments of alternative models but no clear arguments why they might be superior.) The models of the Cosmos overthrown by Kepler and Galileo and Newton were quite successful, especially the mathematically rigorous model originally developed by the Macedonian-Egyptian mathematician Ptolemy. Those pre-Galilean models preserved the known phenomena and, in fact, were quite successful in predicting the movements of planets and could have been extended, in principle, to planetary moons and comets and the like at the cost of greater complexity. Ultimately, modern physics overthrew Ptolemaic models of the relative movements of the Sun and planets because it had far greater power than was necessary to merely provide a more economical model of the Solar system. Modern physics, beginning in a systematic way with Newton's dynamics, has proven itself to be both a qualitative and quantitative understanding of certain very important aspects of concrete being. It was not any

gains in model accuracy of planetary movements that forced the adoption of Newtonian dynamics but rather the fact that Newton's physics worked as well with cannon balls as it did with predicting the movements of the moon.

This was the modern re-adoption and rational modification of the ancient program of understanding all that exists by a single system of thought.

Arguably, and I tend to think this way, physics as we know it is—or can, in principle, be corrected and expanded to be—a complete understanding of aspects of concrete being, including at least the quantitative aspects. That doesn't mean physics is a 'complete' understanding of concrete or thing-like being, nor will any human science be a complete understanding of any specific realm of concrete being. In fact, the abstract being from which thing-like being was shaped is still here with us and continues to interact with the more abstract sorts of being from which it was shaped. This concrete realm of concrete being is not yet complete and is being made richer and more complex even by the very acts of human exploration of Creation and by all other relationships which continue to bring concrete being into existence and to shape it.

Let me end with a few comments about what I think will be involved in providing a wider understanding for human nature as part of a greater Creation; such a wider understanding will give us not magical answers to every question about human history or human moral problems but rather a general context in which our human being is set as well as ways of properly phrasing our questions and properly developing our proposed answers.

I think we have to keep in mind that there are deterministic forms of relationships and contingent forms of relationships. There is a different balance of such relationships, and differing relationships in their details, for each of: individual human being, communal human being, and external environments. In addition, human being both individual and communal have a peculiar and very important type of contingency—that which is part of moral freedom.

I discussed the quest to gain a "more exact understanding" of man in a book I published in 2013, *A More Exact Understanding of Human Being* [53], which is available for free downloading. The title is from Pope Benedict XVI (Joseph Ratzinger):

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact under-

standing of the nature of man. [Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: “Broadening the Horizons of Reason. Prospects for Philosophy”.]

I would recommend a review or first-time reading of Chapter 144, *Adopting Mathematical Reasoning in Non-quantitative Fields of Thought*.

# 510 A Different Model of the Growth of Centralized States in History

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1867>. It was finished and uploaded on 2014/08/18.]

Stephanie Pappas wrote an article, , *Origins of Hierarchy: How Egyptian Pharaohs Rose to Power* at <http://www.livescience.com/47284-how-stone-age-despots-evolved.html>, summarizing some results of work done by Simon Powers, “a postdoctoral researcher in ecology and evolution at the University of Lausanne in Switzerland.” Powers is working on the initial concentration of power in a despotic hierarchy and will next be moving on to try to deal with the next stage in which a large-scale state arises, but the results of his initial work point to the possibility of producing a different understanding from that found in the article discussed in the prior Chapter 509, *Mathematical Models of Human History: Are They Plausible?*, by Razib.

Pappas’ article about Powers’ work points to the possibility that:

[V]oluntary leadership arises when leaders give enough benefits to their followers at the outset, Powers said. If leaders give their people an advantage in producing food, the people will follow them, he added.

Moreover:

[L]eadership turns to despotism when two factors arise. The first is the growth of population density and size, which follows

naturally from an organized, agricultural society.

“It basically becomes hard for individuals to stop following the leader,” Powers said. “As the density of the population grows, there is less free land available.”

If we consider this analysis and the analysis I discussed in Chapter 509, *Mathematical Models of Human History: Are They Plausible?*, we are getting into some potential useful confusion. Powers is developing an explanation based upon internal factors (advantages coming from strong leaders and then maybe the difficulties of escaping control by those leaders) while Turchin and colleagues were concerned with external factors (starting with the conquest by or reaction against nomadic horsemen of the grasslands of central Asia).

There are going to be no clean, sharply defined answers to the questions of human community-formation or, more in line with my worldview, questions of the creation and shaping of human communal being. This means there will be no answers corresponding to, say, the thermodynamics of gas in a piston which can compress or relax. There likely will be many quantitative models which will help us deal with specific aspects of human social or political or economic behavior but those will work only if they are part of a more general framework of what might be labeled qualitative models, though subject to the disciplined analyses to be found in certain fields of mathematics—see Chapter 509, *Mathematical Models of Human History: Are They Plausible?*. For some very general discussion in light of quotations from some highly regarded mathematicians, see Chapter 144, *Adopting Mathematical Reasoning in Non-quantitative Fields of Thought*.

I’m reluctant to speculate too much on what might eventually work to produce a deeper and more exact understanding of human nature both individual and communal but I have a very vague image on the edge of my mind of a single entity which is like a manifold—that is subject to well-defined analyses in each ‘small region’, ‘locally’, where the proper analyses might be quantitative or qualitative. An odd chimera indeed, but that is what we seem to be—as individual human beings or as communal human beings.

And we must remember that we are human beings, entities which are unified and coherent and complete—no matter how imperfectly so. Our knowledge of our own being should be knowledge of such an entity and not

just a handwaving explanation which points toward a quantitative model here and a qualitative explanation there.

# 511 American Soldiers Who Enjoy Killing

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1909>. It was finished and uploaded on 2014/11/24.]

William R Polk has an impressive resume, summed up in the short bio published with his articles at *Consortiumnews.com* at <http://consortiumnews.com/>:

William R. Polk was a member of the Policy Planning Council, responsible for North Africa, the Middle East and West Asia, for four years under Presidents Kennedy and Johnson. He was a member of the three-men Crisis Management Committee during the Cuban Missile Crisis. During those years he wrote two proposed peace treaties for the American government and negotiated one major ceasefire between Israel and Egypt. Later he was Professor of History at the University of Chicago, founding director of the Middle Eastern Studies Center and President of the Adlai Stevenson Institute of International Affairs. He is the author of some 17 books on world affairs, including *The United States and the Arab World*; *The Elusive Peace, the Middle East in the Twentieth Century*; *Understanding Iraq*; *Understanding Iran*; *Violent Politics: A History of Insurgency and Terrorism*; *Neighbors and Strangers: The Fundamentals of Foreign Affairs* and numerous articles in *Foreign Affairs*, *The Atlantic*, *Harpers*, *The Bulletin of the Atomic Scientists* and *Le Monde Diplomatique*. He has lectured at many universities and at the Council on Foreign Relations, Chatham House, Sciences Po, the Soviet Academy of Sciences and has appeared frequently on NPR, the

BBC, CBS and other networks. His most recent books, both available on Amazon, are *Humpty Dumpty: The Fate of Regime Change* and *Blind Man's Buff*, a Novel.

A serious man, indeed. Polk is a highly-respected historian who falls into that small category of mainstream thinkers who can be highly critical of those in the mainstream, business leaders and cultural leaders as well as political leaders and intelligence or foreign service personnel. He writes in speaks in polite but straightforward terms about the incompetence and irresponsibility of the leaders of the West in a recent essay: *Standing in an Adversary's Shoes* at <http://consortiumnews.com/2014/11/10/standing-in-an-adversarys-shoes/>. This essay ends with these short and powerful paragraphs:

So it is not surprising that today we are moving away from coherent, well-reasoned and effective strategy and indulging in scattered, short-sighted and unsuccessful tactics. We jump from one crisis to the next with little thought on how we keep repeating our mistakes.

There is truth in the old saying that when one is in a hole, his first step ought to be to stop digging. We need to pause and take our bearings. We need to do this for our sakes as much as for "theirs."

I end on a very personal demonstration of a proof for what I have written: when many years ago I was first visiting such Asian and African lands as Afghanistan, Iraq, Syria, Yemen, both Sudans, Libya and Algeria, I was welcomed – as an American – with open arms. Today, I would be in danger of being shot.

Remember, many of those American responses to crises, often created by our leaders or allies, resulted in devastated countries with piles of bodies, hospitals and schools in rubble, and poisoned soils resulting in high rates of birth defects. If our leaders, and most of our citizens, fail to see that we Americans wreak death and general havoc wherever we go in recent decades, then it is ignorance and blindness which is a form of evil.

I'll leave it to the reader to explore Polk's essay and maybe find other works by Polk on the Internet, in an accessible library, or in a bookstore. For now, I'm going to respond to one of his specific comments:

The Special Forces or Green Beret soldier apparently, in the words I have heard them say, positively delight in their power to inflict pain and death. What is the long-term effect of such experiences on our own society and culture? Surely, they cannot be beneficial.

Back in April of this year of 2014, I published an essay included in this book as Chapter 503, *The Moral Superiority of the Modern Military Over Modern Civilian Society*, where I claimed “that communal being in the American military is better formed than is nearly any other communal being in the United States.” It could be said that this is a low standard and it has to be said that military communal being isn’t independent from the greater communal being of the societies or nations or empires in which those military men and military units serve. See Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*, for a discussion of American moral character in light of the trigger-happy self-righteousness which shows in both our preferred entertainment and our foreign policy adventures.

Some have spoken differently, based upon experience that might not be fully relevant to current American conditions, cultural and military. W. Patrick Lang, who is “a commentator on the Middle East, a retired US Army officer [Colonel] and private intelligence analyst, and an author[,]” has spoken of an earlier generation of Green Berets as being men who could kill when they had to but were inclined to try and understand those in other cultures and to treat them with respect. Another retired Green Beret who blogs on Lang’s site under the user-name of “The Twisted Genius” refers to himself as a hard-hearted empath. See [https://en.wikipedia.org/wiki/W.\\_Patrick\\_Lang](https://en.wikipedia.org/wiki/W._Patrick_Lang) for a short biography of Colonel Lang and go to his blog at <http://turcopolier.typepad.com/>, a ‘clubhouse’ frequented by others with experience in the military or in intelligence services, civilian as well as military.

Let’s consider such men, able to kill with detachment of their feelings—in a manner of speaking, but under the overall control of . . . What?

Under my way of understanding, men have both individual and communal nature. We human beings are images of the one God who is three Persons; we human beings are each individuals but will be saved as one perfect man (in St Paul’s terms) and yet will remain our individual selves. I also have a more complex view of that one perfect man, the Body of

Christ, than can be derived directly from St Paul's letters. We are imperfect versions in this world of what we can be if we are resurrected to share Christ's life. We do not live as individual, freestanding creatures even in this world as is the dominant belief in the modern world, especially in the United States. We are members of a variety of communities and share being in each of those communities with all the other members. This is all quite consistent with modern understandings of man from genetics and from evolutionary biology, especially sociobiology. See Chapter 281, *Social and Biological: Being Honest About the Basics of Human Nature* for some background.

Americans, even in the Colonial period, have shown a streak of self-righteousness which borders on, or crosses into, moral insanity. I discussed this with respect to a brutal war waged on New England Amerinds in Chapter 408, *The Need for Abstractions in Moral Self-understanding*. Note that men capable of moral detachment might well be more capable of this sort of higher moral reasoning than the most of us—particularly if they are raised in a morally well-ordered society.

I'm going to assume those Green Berets discussed by Polk were from a younger generation than Colonel Lang or The Twisted Genius, though my discussion linked to in the above paragraph covers Americans from earlier generations. Parents and other adults in recent decades thought it proper to sit children in front of violent cartoons and then *Rambo* and *The Terminator* and a lot of movies and TV shows about drug gangsters and undercover cops shooting up Miami or Los Angeles. A few decades ago, I remember reading about less elegant gangsters in New Haven who held their gun battles in the hallways of the projects. The walls and doors weren't built to stop bullets and a few children and other innocent people stopped those bullets instead.

These youngsters, even some just a few years younger than me—I was in the last Vietnam era draft in 1973, also grew up with war-mongering governments and news media who had learned not to televise images of frightened young girls running down the road trying to escape the napalm burning into their backs. They grew up watching Baghdad being destroyed by terrible air assaults and it all seemed so clean and so righteous. And they grew up hearing about American Exceptionalism. They grew up seeing gangsters glorified on television and George Washington debunked at school.

In short, anyone born after 1965 or so grew up in an age of serious moral disorder which had even penetrated to the small towns and farmlands by way of television and the movies. Even most of those who were guided

by wise parents and clergymen and neighbors still grew up in an age of malformed moral nature in their larger-scale communities, including the malformed moral nature of the American state and its citizens as a body. We are a morally disordered people and even our seemingly good individuals have a share of that disorder. It takes a positive effort and a willingness to be ‘un-American’ to retain a clear vision, a willingness to just leave when it’s not possible to correct errors. There are some who will listen if you try to tell them it’s the United States and its vassals who are causing the trouble in Ukraine and are among the ultimate sources of trouble in the Near East and Middle East. There are some who simply stare at them if you try to argue that Putin might well be a bastard, but he’s the sort of bastard that good Christian men sometimes have to be to protect their country.

I’ll repeat the quotation from Polk’s essay:

The Special Forces or Green Beret soldier apparently, in the words I have heard them say, positively delight in their power to inflict pain and death. What is the long-term effect of such experiences on our own society and culture? Surely, they cannot be beneficial.

What I said is, “They went there with disordered communal moral natures and often with disordered individual moral natures.” And I could add, “Polk is right that their experiences further damage their moral natures, individual and communal. Even the ones who partly or largely pull out of it do so by way of dealing with horrible memories of the evil they found themselves able and willing to do—if only willing during the period of blood-lust or fear.”

# 512 Traditional Morality is Dead, Long Live Traditional Morality: A World of Evolution and Development

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1922>. It was finished and uploaded on 2014/12/10.]

I was inspired and frustrated by a discussion by Claes G Ryn of the traditional Western views of human moral nature: see *The Moral Path to Peace* at <http://www.theamericanconservative.com/articles/the-moral-path-to-peace/>. I was inspired by such statements as: “In the end, only moral character, supported by general culture, can fortify the self in man that wants openness to argument and respect for others.” I was frustrated by still another effort to counter the wrongheaded teachings which have arisen and spread in the modern world by way of arguing against those wrongheaded teachings (Ryn concentrates upon Rousseau) instead of making the far more important effort to deal with the knowledge gained by modern men as they explored empirical reality; the failure to take on a task not so different from that of Augustine of Hippo: to build a new understanding of God’s Creation by dealing with knowledge both wondrous and dangerous.

In upcoming essays, I’ll deal a little more with some specifics of what is good and what is lacking in the efforts of serious and learned conservative thinkers such as Claes Ryn. In this essay, I’ll deal with some foundational matters about Creation as it can be understood in light of modern empirical knowledge. In particular, I’ll be dealing with some general aspects of

man, individual and communal, as results of evolutionary and development processes rather than as properties of some Man who came to be at one time with a stable and well-determined nature. I'll be dealing with men as creatures whose substance and characteristics and aspects arise from relationships rather than creature born with well-formed substance and characteristics and aspects and which then enter into relationships. I don't know enough of intellectual history to understand how it might have happened, but modern conservatives have an understanding of being not so much different from that which underlies the false teaching of libertarians that we are freestanding creatures who enter into relationships on a voluntary, or even 'contractual', basis. Unlike libertarians, those who label themselves 'conservatives' choose to acknowledge the goodness and propriety of communal relationships but haven't learned or won't learn to speak in terms of men having both individual and communal human nature.

Modern conservatives tend to avoid certain problems by assuming that men are born with well-determined moral and other social characteristics but somehow those characteristics allow the same man to be a villager in a tribal society or a citizen of a great civilization such as the one we're destroying in the West. Man is seen as an all-purpose social creature, having appeared on the earth in a final state, whereas the evidence is growing that man has actually been evolving and developing rapidly over the past 50,000 years or so, evolving and developing so that he has the brain regions proper to develop minds capable of the abstract reasoning processes needed to live in a modern university community which is part of the United States, itself a somewhat reluctant part of Western, Christian Civilization. That this Civilization has at least one foot in the grave doesn't matter in one sense—it lives in the minds of those such as Ryn who wish to keep alive what is good from the traditions and those such as I who wish that but also wish to rebuild Christian Civilization, the Body of Christ in this mortal realm, so that it corresponds more faithfully to God's Creation as we can now understand it. And I contend that Civilization is fundamentally a great understanding of man and Creation, an understanding provisional in this mortal realm, but one which seems to have included some important core truths from its beginning thousands of years ago and seems to be adding more core truths as well as refining those we inherited.

The traditions of Western Civilization were magnificent. With a simplistic—but largely true—view, we can see Western Civilization as a grand synthesis of Jerusalem and Athens/Rome. There is also much truth

in the related simplification by which we see Western Civilization as beginning with Augustine of Hippo, Pope Gregory the Great, and Benedict of Nursia and developing as Europe was invaded by barbarian peoples from mostly Indo-European stock—peoples closely related to the Latins and others already in Europe. Those Goths and Franks and Gaels and Britons joined the Latins and other Italians, the various peoples of the Middle East and the Near East—including North Africa, in an initially chaotic and always unplanned effort to make something of Hammurabi and Moses, Plato and Archimedes, Augustus Caesar and Virgil, as brought into the Christian cosmology constructed by Augustine of Hippo and many others. It is this effort I'm encouraging, an effort mounted with barbarian energies, to make the tradition as new as Augustine did.

Western Civilization looms larger if one accepts the view of Joseph Ratzinger (Pope Benedict XVI) that Western Civilization was the house built for the Church by generations of Christians.

It looms still larger with my major extrapolation of that view: Christian Civilization, encompassing many cultures and a huge number of individuals, is the true Body of Christ with the Church being the central organ of the Body. Western Civilization is that Body in its most advanced stage to date.

The Body of Christ as I envision, in light of modern empirical knowledge—history as well as sociobiology, literature as well physics—is a bit different from Western Civilization as understood by Joseph Ratzinger; that Body of Christ as I envision it is a living dynamic being rather than structures built by individual dynamic beings and that Body develops in response to environments of contingent circumstances and random, or factual, events. As such, that Body is more than a bit different from Western Civilization as understood by modern academicians in general—even those of Christian beliefs; that Body of Christ as I envision it is headed by Jesus Christ and Christian Civilization, most recently of the West but perhaps not for long, is the mortal manifestation of the true Body which exists in a completed and perfected form in the world of the resurrected.

Remember always that individual human being is also evolving and developing as well as communal human being.

Empirical knowledge, in the sense of structures built from facts, can't get us to anything like my understanding of Creation, nor to the lesser cosmologies which have been the foundations of Western Civilization as well as the cosmologies of the Semitic and Greek and Roman civilizations, and others, from which Western Civilization has descended. On top of that sort

of factual empirical knowledge, scientific and practical, we need speculative knowledge—often metaphysical reasoning disciplined by and abstracted from the best of mathematical reasoning in any given age.

Yet, we Christians are still not done, for all of this empirical knowledge and speculative knowledge has yet to be disciplined to the truths revealed to Moses and Isaiah and by Jesus Christ, true God born as the man Jesus of Nazareth.

This structure of human knowledge is developed in more detail in my freely downloadable book, *Four Kinds of Knowledge* [43].

Let me move on to discuss a matter of some sensitivity. Western Civilization has been starved to a state approaching death. As matters stand, Western Civilization is not likely to survive as the dominant part of Christian Civilization—if it survives at all. Yet, there is a certain magnificence to the frightening old boy. After all, he trekked through the Sinai with Moses, sailed the Mediterranean with Odysseus, watched Christ die alongside the Virgin Mother and St John the Apostle and not many others; he rode alongside the literate and noble St Alfred in the war to drive Vikings from England, traveled through Hell and Purgatory and Heaven with Dante and Virgil, and fought alongside Galileo to re-establish a respect for God's Creation in light of what might be called a neo-Augustinian theology and reading of the Bible.

Grand old boy that Western Civilization, but he was never for real but rather a human understanding of the real Body of Christ as he develops in the story being told by God, a telling and a story in which men participate in such a way as to help shape that Body and, thus, their own future lives as shared with the Son of God in the world of the resurrected. The real Body of Christ, as he is in this mortal realm contains a lot more than Western Civilization, a lot more than the Christian churches and realms traditionally in union of some sort with Rome. And that Body is certainly a bit different than would appear to mortal eyes.

We can't predict the future development of the Body of Christ with any confidence because it is a living entity, having its own communal being apart from the individual human being which exists inside the Body in a multitude. (This communal being isn't really apart from individual human being but the converse is also true.) As is true of any living creature, it will grow and develop and even evolve in response to the contingencies it encounters; those contingencies include at least the events of the physical world. The individual human beings in this Body of Christ will also be

growing and developing and, as a species, evolving. This is a view which can't be handled by currently existing ways of understanding man as an individual or as community. New forms of thought are needed and I claim that at least a beginning in thinking afresh can be drawn from abstractions of modern knowledge of created being in its material form—including that form of knowledge we call mathematics.

We've traveled into realms where sophisticated thought is needed. Despite what determinists might think, 'randomness' (or unpredictable facts emerging) occurs at the interfaces where two or more systems interact even if those systems are fully deterministic in their internal events. The current environments of man, social and also 'natural', are made of some very complex systems indeed and there are very complex, 'fact-ridden', interactions at the interfaces of these systems.

Human being has changed and is currently changing rapidly. Geneticists and paleoanthropologists say that anatomically modern man came into existence more than 100,000 years ago, but cognitively and socially modern man seems to have come into existence more recently in processes starting during some period during the past 40,000-60,000 years—we see more complex societies and technology developing slowly by the standards of a man's life but showing clearly by 10,000 years ago or so. [Take the exact years with a small grain of salt; they might well change but a shift of decades of millenia wouldn't affect my arguments.]

What happened? Why was it that there were human beings 100,000 years ago little different from us in matters such as bone structure and perhaps soft flesh but not forming complex human communities nor even developing more sophisticated tools than those of primitive hominids from a million years ago or more?

There are some emerging answers, and good reason to believe these will cause deep problems in modern societies increasingly committed to the proposition that there are no significant differences between the races or the smaller ethnic groups. Those anatomically modern human beings seem to have reached their final brain development at the beginning of adolescence—this because the genes for brain development during adolescence can be traced back to the populations which left Africa 40,000-60,000 years ago though some of those development genes flowed back into Africa and some might prove to have developed independently in Africa. In my terms—to which some scientists might object, abstract reasoning tends to develop during adolescence and those earlier creatures (say 100,000 years

ago) which looked so much like us were practical-minded creatures able to handle small-group life and primitive technology but not capable of understanding even high school physics nor capable of reading a complex novel. They couldn't develop, probably couldn't have dealt with, the complexities of the relationships we think so natural—social, political, economic, and so forth.

Much happened after the human brain began to develop regions adapted for, or adaptable for, abstract reasoning. Human beings had lived for hundreds of thousands of years in relatively small groups, extended families to a large extent but not exclusively; so far as I understand matters, those groups were semi-nomadic and lived by both hunting and foraging. By 10,000 years ago or so, they seem to have formed larger communities which mostly made their living by agriculture including animal husbandry and supplemented by manufacturing of tools for internal use and perhaps external trading.

Over the next six or seven thousand years, progress continued and probably accelerated so that larger-scale manufacturing and truly dense communities developed, first in the Middle and Near East and then elsewhere. These people achieved high levels of accomplishment in such areas as architecture and organization of complex endeavors such as building and operating large-scale irrigation systems.

As I've noted in prior writings, we see signs that of truly abstract reasoning, and not just high levels of practical reasoning working its way out through trial and error, by the sixth century or so before the birth of Jesus Christ. This is the age of the Pre-Socratic philosophers, the later prophets of Israel and likely those who put the more ancient works of the Bible in more or less final form, and the founders of Hinduism.

I would contend that history, that of human thought as well as that of politics and that of technology, gives us no reason to think these processes of evolution and development have slowed down; in fact, it's likely that human sociobiological evolution has accelerated. History speaks of the increased and increasing rate of interesting events and we can all see the ongoing emergence of more complex relationships and tools in our various communities right up to the global level.

To look into matters more deeply or to try to see the world more clearly leads to dangers to our personal selves and our communal selves.

That is where I'll pick up in the next essay in this series.

# 513 Traditional Morality is Dead, Long Live Traditional Morality: The Dangers of Understanding God's Acts-of-being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1927>. It was finished and uploaded on 2014/12/15.]

I'm writing this essay to set up my responses to Claes Ryn's essay describing how the moral teachings and traditions of the West could re-establish some sort of peace in our world: *The Moral Path to Peace* at <http://www.theamericanconservative.com/articles/the-moral-path-to-peace/>.

I'm planning for now to finish the set-up in this essay, following up on what I wrote in the first essay, Chapter 512, *Traditional Morality is Dead, Long Live Traditional Morality: A World of Evolution and Development*. The theme of that first essay is what the title claims and I'm now going to try to discuss, very briefly, the difficult situation of those of us who believe we need a good understanding of the past and a deep respect for the knowledge and the wisdom of the past to guide us into the future.

We do live in a world of evolutionary and developmental processes. We human animals came to exist, as a species, by way of Darwinian evolution (understood in the modern sense to include Darwin's solid achievements plus much he guessed at and much he didn't even guess at), and, as individuals, by way of developmental processes. We are changed and become differently shaped, in emotional and cognitive and neuromuscular ways, by our responses to what lies inside and outside of us; this truth was taught by

St Thomas Aquinas and rediscovered by modern neuroscientists as discussed in the book *How Brains Make Up Their Minds* [35] by the neuroscientist and philosopher Walter J Freeman. A factual truth gained by honest observation and hard thought by a Dominican friar in the 13th century has withstood the test of time and scientific research.

There are other truths which are trickier to evaluate in light of new knowledge of the processes and structures and entities of Creation which is, after all, a manifestation of specific thoughts of God. It's a little surprising to me, but only a little surprising, that viruses and bacteria and even fungi can manipulate us, changing some fundamental aspects of our feelings and our thinking processes—see Chapter 316, *The Demonology of Sexual Behaviors and Preferences*. It adds a certain richness to modern understanding of what was once seen as demonic possession. Does it change at all our understanding that homosexuality and cross-sex behavior is disordered? It certainly should make us more tolerant of those who don't meet traditional standards, but I've found that, at least in recent years, even clergymen and orthodox Christians who hold traditional views on sexuality are tolerant of those whose behaviors or desires are condemned by the Bible. I don't think we've yet found the right balance between tolerance and charitable 'condemnation', and the very fact I had to use scare quotes on the word 'condemnation' tells its own story. It's also perhaps the case that some have an intuition for that balancing point but have trouble expressing it in words and actions and prayers in this historical context.

So, I think it fair to say that new knowledge that, for example, there is a fungal infection which seems to turn women into obligatory Lesbians by way of even one experience, doesn't force us to change our views on the moral rules of sexual behavior. But it does complicate the story of the human race and should make the self-righteous stop and wonder. If you believe, as I do, that this world is a work of God and then discover there are infections which can make you slower on some cognitive tasks, infections which can make you friendlier and more prone to serious schizophrenia, and others which can change your sexual desires, then we have to ponder the simpler understandings of good and evil and even of God's relationships to us.

So there are ways in which modern empirical knowledge can be quite disturbing. It greatly damages our established understandings of the world and more—or rather, it forces those who see the world as composed of well-defined regions of light and dark to see something different from that, or

forces them to blind themselves. All of Creation can be disturbing when we start to learn things which force us to confront the inadequacy of our existing understandings. Modern mathematicians have found that the old truths hold but the full truth is much greater and includes ways of thought, corresponding well to our physical world in many ways, which don't obey Euclidean geometry. Infinity has proven to be a multi-headed beast rather than one unapproachable 'point'. Randomness is an irreducible fact rather than a matter of magical chance.

The human race has been through changes so deep or extensive, or both, as to destroy the plausibility of the teachings of conservatives (in the true and not Trotskyite/Neocon sense) and traditionalists of other sorts. Augustine was forced to develop a historical viewpoint in which Christianity was separated from its historical environment of the Roman Empire; Rome was seen as yet another ephemeral work of men. In a more restricted domain of politics (and somewhat of economics), Edmund Burke was forced to both defend the political traditions of the British peoples and to reformulate them: the political situation of those British peoples was changing dramatically and the truths gained by hard experience could be saved only by transforming them. Something similar could be said of John Henry Newman's transformed understanding of Christian thought as something which did change with the times. I make more general claims than Newman, considering changes in our knowledge of Creation or any part or aspect of Creation or, more radically, with the realization that we have seen emergence of new forms of created being. These latter events would be most likely to occur with human communal being though we now know that human individual being is changing rapidly, down to mundane physical matters encoded in simple and easily readable ways in our genes. In fact, anthropologists and geneticists claim we human beings are changing more rapidly than ever before.

It is most certainly true that none of this new empirical knowledge, nor even the new forms of human communal being, argue that the "old truths" are no longer such, but they do argue that we need new ways to live according to even the most absolute and lasting of truths, new ways to understand human nature and this world and even the nature of salvation, and new ways to understand our failures and our sins. Over the past few years, I've been working on a project to better describe and discuss the Body of Christ, each of the saved remains an individual and yet is fully the perfect and complete man which is Christ; I'm trying to derive appropriate

concepts and words by abstracting from the (largely qualitative) forms of geometry used in the General Theory of Relativity but also in some fields such as the design of machinery.

This is disturbing, though also exciting in that it points to the need for creative thinkers and doers and even feelers and the corresponding possibilities to reach the greatness of Augustine of Hippo, Francis of Assisi, and others who responded—if reluctantly at times—to great change by producing new thought or behavior or institutions to meet the needs of human beings. They used their inherited tradition, added to it, and passed on an enriched and complexified tradition to us.

We need to face up to modern empirical knowledge and stop claiming that it has no effect whatsoever on moral or political or cultural issues. We need to admit the strangeness and dangers in the knowledge that bacterial or viral infections can change the functioning of our brains or other parts of our metabolisms or the realization, at least on my part, that none of the existing ideas on how governments and other centralized institutions can be formed work very well in our huge and hugely complex societies. The Ten Commandments and the Sermon on the Mount remain as absolute truths but the political philosophies of Aristotle and the political forms in the American Constitution seem quite inadequate to our truly new world, not yet a brave world because we men of the West in particular haven't shown the courage to deal honestly with God's Creation. I begin to see a large number of contingently true ways of thought which no longer correspond to our particular contingencies in the 21st century.

As a final comment: I most strongly propose we should study even thought and behavior and institutions inadequate to our needs but once adequate to some group of human beings. There is much political and moral wisdom even in the parts of the Old Testament which advocate a sort of tribal localism (see 1 Samuel) and probably more wisdom of a political nature in the writings of Aristotle and Plato and Augustine and Dante and so on.

# 514 The Long War of the American Ruling Class Against All That Exists

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1930>. It was finished and uploaded on 2014/12/17.]

That Brazilian globetrotter, Pepe Escobar, has summarized the New Cold War in a recent article, *The new European “arc of instability”* at [http://www.opednews.com/articles/2/The-new-European-arc-of-i-by-Pepe-Escobar-Chaos\\_Debt\\_European-Union\\_Gold-141213-163.html](http://www.opednews.com/articles/2/The-new-European-arc-of-i-by-Pepe-Escobar-Chaos_Debt_European-Union_Gold-141213-163.html). In that article, he published a paragraph from an email he received from the Saker, a former military intelligence analyst who lives outside his homeland of Russia but defends her strongly and intelligently in his comments on the Internet. Saker tells us:

Putin is telling both the West and the Russian people that there is a long war in progress and that the Russian people have to morally be prepared to accept sacrifices for the survival of Russia. This is one more step in the ‘coming-out’ of what I call the ‘Eurasian Sovereignists’ in which the US [has] now openly declared as a Russophobic (Russia-hating and Russia-fearing) enemy, and the Europeans as a powerless colony. Military power is not directly a factor in this, the internal power balance between the pro-Western ‘Atlantic Integrationists’ and the ‘Eurasian Sovereignists’ is.

(You can find more writings of the Saker by going to his blog-site, *The*

*Vineyard of the Saker* at <http://vineyardsaker.blogspot.com/> or the news aggregation site *Russia Insider* at <http://russia-insider.com/en.>)

Escobar's entire discussion, including the inset discussion by the Saker, is interesting and extremely important but I'm going to deal with this specific idea of a "long war" and in a terrible insight into the moral degeneracy of the American ruling class but a degeneracy being endorsed by even those Americans who live local lives of moral integrity: the United States is waging a demonic war against all that exists to the extent it won't bow to the American ruling class. Captain Ahab, he of utilitarian competence and moral insanity, is the normal American, as Melville feared back in the 1850s. (The results of recent American adventures in Asia and Africa and even in Detroit and Ferguson raise questions as to our competence in 2014, but that merely turns a moral tragedy into a greater farce.)

As I see matters, the American ruling class is waging a long war against nearly every entity and region on the face of the earth. I don't exclude the American people or peoples or individual citizens nor do I exclude the various regions and cities of the United States. So far as I can tell, the American ruling class is comfortable only with gangster and bankster behavior, enforcing their desires upon others. I almost think they would be disappointed if everyone on earth were suddenly to obey Washington or Wall St. A great period of boredom would set in. There would be no reason for ambitious young Americans to go to Harvard or Stanford to learn how to play with the world as if it were a risk board and its men, women, and children were plastic pieces.

This moral sickness on the part of Americans, foreseen by the likes of Melville and Hawthorne in the 1850s and others since, is what doomed the peace dividend when the Soviet Union fell: we Americans, along with some of our allies in Europe and other regions, had built up bloated militaries and national security agencies which had no way to justify their existence unless they continued waging war upon... anyone and everyone. From the beginning there were Dr Strangeloves and bomb-crazy generals and politicians combining ignorance with an egocentric understanding of the world. Nearly all American leaders, including those religious leaders betraying God and flocks, came to enjoy this idea that we Americans know how human beings should live. All Americans are ever horrified to discover some peoples hate us for our DisneyWorlds and our McDonalds and our military bases in their backyards. Those who fear such a morally trashy culture and nation for the sake of their own children are as jingoistic as those who treat wars against

largely defenseless countries as another spectator sport—see Chapter 465, *Dumber Every Day, With Beer in Hand and War on TV*.

In a fit of paranoia, we Americans fell in behind our profiteering leaders to threaten war against the entire world and to actually wage it upon various countries, including two countries, Iraq and Libya, which were suffering under brutal leadership but were also advancing in many ways toward a stable and prosperous situation. And, all the time, our leaders were using some American citizens to wage war upon the entirety of the American citizenry.

I've covered much of this ground before and have little to add. I prefer to get back to my goal of developing ways of thought which can help us, or our descendants, to better shape our multitude of overlapping communities, including those of a political and military nature. Above, I gave some links to relevant essays I've written. In Chapter 506, *Deep States and the Modern American Citizen* for one of my efforts to make larger-scale sense of this bad situation. That chapter points to some of my other efforts to deal with conspiracies in the sense of deep-states or predatory classes. (A little warning: I prefer to speak in terms of classes or institutions and to reserve the word 'conspiracy' for specific criminal projects.)

In Chapter 408, *The Need for Abstractions in Moral Self-understanding*, I discuss the moral insanity which was already well-developed in the New Englanders of the 17th century as they waged war against native Americans, even those who had become Christians, because they hadn't become English middle-class Christians of the Puritan sort. In Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*, I discuss American moral character in a more recent setting.

# 515 Traditional Morality is Dead, Long Live Traditional Morality: Reformulating Traditional Morality

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1934>. It was finished and uploaded on 2014/12/24.]

This chapter is the third and last of a series. The earlier two were Chapter 512, *Traditional Morality is Dead, Long Live Traditional Morality: A World of Evolution and Development* and Chapter 513, *Traditional Morality is Dead, Long Live Traditional Morality: The Dangers of Understanding God's Acts-of-being*.

Now I will write about the greater meaning of this line of thought.

I'm writing in response to Claes Ryn's essay describing how the moral teachings and traditions of the West could re-establish some sort of peace in our world: *The Moral Path to Peace* at <http://www.theamericanconservative.com/articles/the-moral-path-to-peace/>. Some who traveled part of their intellectual journey as I did might ask, "How can you criticize an essay summarizing a clearly articulated and morally well-ordered knowledge of reality, a speculative wisdom with which you claim to largely agree?" I criticize in the same spirit in which I criticize even that Founding Father of the West, St Augustine of Hippo. He was human and made some mistakes but still more importantly: he was a man of the 4th and 5th centuries and we've learned much more than was known to the entirety of the human race in 400AD. Unfortunately, modern conservatives have learned little from modern empirical knowledge (except

perhaps in history and sociology and literature) and have actually helped to enforce the Enlightenment separation of knowledge into inherently separate realms and, thus, fragmenting Creation itself.

But what did he do in his effort to save something of Roman Civilization and all of Christianity as he knew it? At the time of Augustine, the best of pagan thinkers were claiming the fall of Rome and the collapse into barbarism was due to Christian influences which weakened the Roman character. Rather than trying to restore all that had been lost, Augustine met the challenge with courage and honesty. He presented the world with a Christian understanding of history as a linear series of passing entities and events and periods in which the Roman Empire itself was only one of those passing entities. In doing this, he preserved the Christian faith for the West and also preserved much of what was good in Roman and Greek culture in a way that disciplined those noble pagan cultures to future Christian purposes. Christ became the Lord of History and Augustus Caesar was pushed into the background; Virgil eventually served the Christian poet Dante.

In terms of our knowledge and understanding of Creation, the task for Christian thinkers in the modern world is similar but still broader and deeper than that of Augustine of Hippo. Christian understandings of Creation have been devastated, left in ruins, not so much by willful vandalism, though there was some of that, as by true advances in human knowledge in those realms of Creation we can directly explore (biology, physics, history, Biblical exegesis, etc.) and human knowledge of realms of Creation in which we must speculate (metaphysics, mathematics, logic, etc.). As Etienne Gilson claimed: Catholic intellectuals (I'd say all Christian intellectuals) have failed since 1800 to answer the questions raised in the modern world. As Joseph Ratzinger put it: modern Christians have been morally irresponsible in not properly caring for Christian civilization. I have my own ways of discussing this problem and the reader should know beforehand that I speculate that the Church Herself is the primary and central organ of the Body of Christ which is, in this mortal realm and in its ultimate form in Heaven, a completed and perfect human community which is a civilization containing a Church at worship but also much else which is validly human. I also believe the problems started before 1800, showing at least in the persecution of Galileo.

Men, individuals and also the entire species—however defined, are creatures, empirical inhabitants of a world of concrete being though not only concrete being. Still, we as a species have an evolutionary history which is

a bit disturbing in some ways; murder and deceit and thievery are part of human behavior as are self-sacrifice and those random, little acts of charity which smooth our way in a sometime harsh world. We as individuals are sinners, as well as sometimes saints and often potential saints. But there are important details in any answer to such questions as: Why do we murder and steal and break trust in various ways? Is it because we inherited some sort of spiritual blemish due to a fall from grace by the ancestral couple Adam and Eve? Evolutionary theorists and geneticists tell us our last common male ancestor and last common female ancestress probably lived thousands and maybe tens of thousands of years apart. Is it because we're descended from creatures who survived and reproduced with some success in a world with some nasty aspects? We can see our moral and spiritual failings and our corresponding strengths as the result of some complex mixture of traits and instincts and desires rather than as the result of a battle between a little angel and a little demon.

This entire line of thought I've been pursuing has raised questions as to the legitimacy of 'schemas' of understanding as used by Plato and Aristotle and Kant. Can the moral states of men be best, or even competently, understood in terms of virtues or any other such well-defined categories of moral traits? What I've said above would imply a rather strong, "No."

This matters greatly in politics for various reasons, some having to do with observable and measurable differences in ethnic groups which have great implications for political and social and cultural issues. For me, those differences point also to a more complex Body of Christ than has been conjectured before.

In fact, it would seem doubtful there is a homogeneous or uniform 'man' to be described in terms of the tradition. Plato was speaking mostly of Greeks and not so much of Chinese or Africans; something similar can be said of Locke and Kant and most other philosophers who were part of what might simplistically called the schematic tradition. There is actually so much commonality and also so much clear thought of their situations that the best of these philosophers can play a role in understanding a world, indeed an entire Creation, though that world and that Creation must be seen in terms largely alien to most of the great philosophers, from Athens to the modern-day Cambridges.

Man not only has changed over time but man is also really the multitude of men whose characteristics vary over sometimes wide spectrums. There are some ethnic groups where shame holds (at least some Asiatics)

and some where guilt holds (at least Northwestern Europeans). Some behave well when they know their kinsmen, at least, are observing and some struggle to behave well when isolated in the jungle. The first can more easily form great and stable communities and the second tend to such activities as aggressive exploration of the earth's surface. We've seen some of the dangers of the first realized in the extreme conventionalism of China when the Confucian bureaucracy controlled that land in the name of the emperors. We're seeing some of the dangers of the second being realized in the moral and social disintegration of the liberal West. Since we know of no peoples perfectly balanced between individualistic and communal tendencies, we need to accept the historical fact—even if matters could have been different—that we need to work toward the formation of the Body of Christ and the formation of ourselves as members of that Body by way of a messy process involving a spectrum of possibilities in which extremes are sometimes dominant.

See the writings of Peter Frost at <http://www.unz.com/pfrost/> for an accessible entry into the anthropological and genetic work which has been done on these fields. These analyses indicate rather strongly that there are no absolute standards for organizing human communities because human nature, while a coherent concept pointing to a true sort of being, isn't so uniform, isn't so homogeneous, isn't amenable to manipulation by either the warm fuzzy feelings of modern liberals nor by the harder-edged feelings of the followers of Burke nor Kirk nor Locke nor Jefferson nor—most certainly—those of the followers of von Mises. To anticipate a little, Ryn points to the importance of differences in cultures and local traditions but recommends a path for moral reform in the modern world which would be most plausible for those of northwestern European descent. And that probably won't work even for those particular peoples because the West is currently dominated by a self-righteous American nation.

I consider myself to be, without qualification, a defender of Western, Christian Civilization, but I seem, with strong qualifications, to be turning away from much of post-Augustinian ways of thought. First I'll note what would be obvious to any of my steady readers: I do think the citizens of the West have no intention to take up their moral responsibilities to their descendants and to God; as a consequence, I think the Body of Christ will be moving to the great Eurasian civilization whose economic aspects are being consciously shaped by the Chinese, the Russians, and others. This is sad for Americans, but it's the Body of Christ which is of primary importance

and the United States and its citizens are of no greater importance than any other particular nation and people and it is the American people and their leaders who have chosen to turn away from their responsibilities and their debts to pursue delusions of absolute power.

Ryn writes as if he considers Christian morality as binding upon himself and also quotes Jesus: "Take the log out of your own eye first, and then you will be able to see and take the speck out of your brother's eye." And he goes on to speak with great wisdom and a tolerance of, perhaps even a liking or love for, the great variety to be found in men and their various communities:

The notion of universality that I associate with cosmopolitan humanism contains no implication that persons, peoples, and civilizations should conform to a single model of life or that universality can be imposed by means of political engineering. It may be helpful to contrast genuine universality with a type of universalism that today is particularly common and influential in the United States. I am referring to an ideologically intense variant of the Enlightenment mindset that assumes a single political system is desirable and even mandatory for all societies and should be everywhere installed, through military means if necessary. I have called this ideology the new Jacobinism. The French Jacobins summarized their putatively universal principles in the slogan "freedom, equality, and brotherhood." They saw France as the redeemer of nations. The new Jacobins speak of "freedom" and "democracy," and they have anointed the United States.

It is important to understand how radically that form of universalism departs from the older Western tradition in which there is an unsettled balance of the individual, or personal, and the communal in human nature.

The goal is noble, the method for reaching or even understanding the goal is defective. This becomes more clear in later lines in Ryn's essay:

According to the classical and Christian traditions, moral virtue is indistinguishable from personal character. It is first of all a form of self-rule. It means subduing and ordering the

passions. Jacobin virtue, by contrast, is primarily and directly political. It is a sense of moral superiority, of being a benefactor of mankind.

Though recognizing differences in “model[s] of life” and opposing ways of thought which assume “a single political system is desirable and even mandatory for all societies and should be everywhere installed, through military means if necessary,” Ryn advocates an individualistic approach to morality, “moral virtue is indistinguishable from personal character”. To be sure, he points to a true problem in the limited and deformed understanding the Jacobins had of what I call human communal nature. The problem with modern men is not an excessive longing for community; some modern thinkers hold a bad understanding of community in which all which is human is in the political sphere and some reject true community in favor of voluntary or even contractual relationships. As Ryn says, “Jacobin virtue. . . is primarily and directly political.” Our bloated estimation of what is possible by way of politics is a true problem but that indicates not that we should return to “personal character” as the only reality of human moral nature but rather that we should form proper communities in which our individual and communal natures can be properly formed and nurtured.

We men are, in fact, so tied in to communities in our moral and intellectual aspects as to make it difficult, at times, to think how we retain our individuality. I began to develop more clearly my ideas on this issue in Chapter , *Intelligence vs. Intellect* where I was responding to Jacques Barzun’s discussion in *The House of Intellect* [7]. I started my line of thought by responding to Barzun’s understanding of intellect which he stated simply:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

As part of my response, I claimed that there is a human communal mind and, more generally, human being is both individual and communal. For real and not just a matter of speaking ‘as-if’.

In Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*, I continued to develop my understanding of human being, individual and communal. These ideas are presented in their currently most mature form in *A More Exact Understanding of Human Being* [53].

We do remain individuals while also being fully our communities—both are true in this world only in some sort of extrapolation as confessors and psychiatrists and novelists can tell us. Though there are always the exceptions which prove, that is—test, the rule, personal character and community character move together. This doesn’t mean that all men in the future American states in 1776 were at the same level—the Founding Fathers were not uniformly moral giants but all did display at least the virtue of courage in difficult circumstances. (Though some weren’t particularly brave in the way of serving in the Continental Army but they all risked the hangman’s noose.) What it does mean is that the Founding Fathers, including a disproportionate number who were relative moral giants, were unusual; the American people never chose to even try to emulate men of (real or idealized) public honor and our current mess, as well as earlier messes, are the results of not just objective historical events but also of the lack of American moral character capable of dealing with serious problems or with great wealth and power. This isn’t a weakness which can be overcome by a sudden reform of personal character on the part of millions of individuals. It is a problem which can only be solved by a multi-generational effort on the part of individuals and communities alike, an effort to raise both personal and communal moral character, inch by inch, with the personal sometimes moving ahead and the communal at other times. Such an effort would interfere with our trips to DisneyWorld or our concern for the NFL playoff situation or the latest wonderful television show about shallow, unlikable, and morally disordered human creatures.

We Christians believe we are images of God, He who is Father and Son and Holy Spirit in one God. Each of the three Persons remains a true individual while each being fully God. I’ve developed a modern Christian understanding of Creation by taking the Western theologies and philosophies and empirical sciences seriously. Under this understanding, I claim that those who will be saved and share God’s life will remain fully themselves while being fully the true and perfect man, the Body of Christ, or

even—Christ.

Ryn, and most conservatives who may be Christians or have at least an appreciation for the Christian foundations of the West, know this. And they can't take the bull by the horns. Ryn speaks of a "cosmopolitan humanism" which is a gathering of peoples and not a mob of uniform carbon-based entities. But it also isn't anything like the Body of Christ which is an image of God in His unity as its members are images of the divine person who is the Son of God. With an imperfectly Christian understanding of community, Ryn then speaks of moral virtue as if each of us stands free from the communities to which we belong, though those communities remain important in some sense subsumed under the term 'cosmopolitan humanism'.

No.

The West was and is merely a fraud if it isn't the product of a 1500 year long period in the life of the Body of Christ, a period in which that Body was being formed by evolutionary and developmental processes from a large number of human beings in their individual being as well as their being as members of overlapping human communities formed of families and ethnic genetic-lines, religious communities and vocational or professional communities, neighbors and fellow-citizens of more or less coherent nations or other political entities.

We are bound to these communities of individuals and communities. We are shaped by them. We are them and they are us. We are Christ and He is us.

I think the Body of Christ to be a complex entity indeed in which each individual member is also a member of many of the communities which function as organs.

The Christian Church is the central organ, but not the entirety of the Body. The reasoning toward this claim is found in my various writings including the freely downloadable book referenced above: *A More Exact Understanding of Human Being* [53].

I welcome the idea that other groups, certainly Jews, will also become part and parts of this complete and perfect human community which is also Christ, the Son of God. That is to say, I think the idea is plausible and worthy of exploration.

Yet, each person in each community has to live and speak in specific terms if we are to diagnose and heal our civilization and such a healing—to a Christian—is a return to the path which can be traveled by men of goodwill and which leads to salvation; God is, of course, free to put some on

other paths where they have no direct access to human means of salvation. There is also the optimistic idea that men of weak good-will and even some rebels might well travel with the pilgrim Body of Christ even into the world of the resurrected. Do we retain a pagan view of being or do we adopt the view proclaimed by St John the Evangelist and rediscovered by 'radical' thinkers in quantum mechanics? (See two early chapters for the meaning of this statement: Chapter 156, *A Christian's View of Einstein and Bohr's debate on the meaning of reality*, and Chapter 157, *Quantum Mechanics and Moral Formation*.)

Civilization is what shapes us, what lives inside our minds and souls. Civilization is a narrative which tells us what it all means, including our lives individual and communal. Civilization, and not just the Christian Church, is the Body of Christ in its mortal, pilgrim form. A proper Christian civilization would be the best possible earthly school to prepare us for Heaven. And, finally, the Body of Christ in the world of the resurrected will be much like a completed and perfected civilization.

We Christians or Jews or Moslems or other believers in a personal God Who is concerned with this world are bound to very explicitly put God in the center of our thoughts and our communities and our civilizations. Since we Christians believe not just in a Creator but in a Creator who became man, immanent in His own Creation, then we particularly are bound to pay attention to empirical reality, including all of the abstract forms of knowledge derived from that reality. We must shape our understanding of human nature using the best of modern empirical knowledge, however disconcerting at times.

# 516 The Struggle Between the Individual and the Community in the Body of Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1956>. It was finished and uploaded on 2015/01/20.]

A large number of Americans, leading good lives in most ways, believe the United States is and always was a champion of justice and charity towards all nations when we really believe that the only good life is one ordered to the individualistic tendencies so attractive to those descended from the residents of northwestern Europeans. These tendencies were sharpened into truly dangerous weapons, used to sunder the individual from his communities, by a host of thinkers from Hobbes through Voltaire through Mill, father and son, through the classical liberals of the late 1800s and on to various barbarians home-grown in the hothouses of the modern West, no longer describable as Christian and not unified nor coherent nor complete enough to even be described as a civilization.

Oddly enough, the basic principles of the radical individualists were set in concrete as the evidence started coming in that they were wrong. In particular, the work of evolutionary theorists and historians and anthropologists and geneticists has tended to a rich and complex, and as-yet partially ordered, view of man not so much different in outline from that found in the Bible and in the great literary works of the ancient and Medieval and modern world. Men of the West, especially the Anglo-American regions, tend strongly to think, in a peculiar fit of self-righteous bigotry, that our ways of living are appropriate for and desired by all human beings when our ways are in a state of disorder as individuals, once the source of the creativity and

energy of the West, have been set loose from their communities and have run amok, having broken the ties to Western tradition which once nurtured that creativity and that energy and guided them toward good goals.

I've stated the problem in terms more or less forged by traditionalist critics of the modern West, but much of my work, in nonfiction writings and novels, is aimed at showing our situation is far more dire and the problems go even more deeply into our individual selves and our communities.

There is a conflict which is part of the evolution and development of human being, individual and communal, which is obvious in the 20th and 21st century in a particular and concrete manifestation. The West in recent centuries has been dominated by Northwestern Europeans who are now known to be strongly individualistic due likely to co-evolution of their genes and culture. A long history, including the response to Mao's policies, would indicate the Chinese have traits leading to the opposite problem of communal human being threatening to swallow the individual human being.

Those who know a little of modern geometry and topology can think of it in the terms I'm trying to develop into an appropriately rich and complex model, quantitative and qualitative, of human nature and maybe of all concrete created being. I'll present imagery in terms of a vague and necessarily simplistic model in two dimensions—the surface of a sphere with a bit of raggedness going into the third dimension.

Individual human beings can be seen as sheets—think of us as more or less flexible pieces of sheet metal. We are to be found on the surface of a sphere and making contact with other sheets in ways good or bad or mixed. We have to think of the surface of globe as truly being formed as the individuals form. We also have to bear in mind that this is one level of community and also one level of individual as he could develop in his primary communities of family and other local communities. We also have to bear in mind that we might sometimes have to imagine the globe's surface as being too small for the individuals and more local communities trying to find space and sometimes too large so that we can visualize isolated individuals or communities. Keep these complications in mind but I'll speak mostly as if we're dealing with simple and fully-defined individuals (being tangent to the globe's surface at a point which 'locates' the individuals) and just one layer of community. [The stuff about 'tangent' is very sloppy language and needs to be refined by use of some sort of qualitative limit process which are similar in some sense to the epsilon-delta limits of calculus. Some of this language has been developed in modern physics where 'small-enough'

regions of spacetime do have separable space and time and follow the dynamics of Newtonian physics. These small-enough regions are tangent to surfaces like that of a hypersphere but attach to that hypersphere in a way defined by the business of small-enough. In physics, the hypersphere of interest usually has spacetime rather than space and time and follows the dynamics of Einstein's general theory of relativity.]

In terms of this physical image, groups of human beings which are excessively individualistic make bad contact with others in their community and with their community or even nearly no contact in the extreme case of some mental or emotional disorders. Groups of human beings which are excessively communal make contact too easily in a way that produces smooth boundaries and uncertainty as to the start and stop of the individual.

There are two major groups of tasks for those who feel a calling to help the Body of Christ to better form in this mortal realm or for those who simply wonder, "What the hell is this guy up to?" First, philosophers and scientists and creative writers and others must develop this sort of a model (or maybe different but with similar potential descriptive power) so that we can understand what we human beings are and what our possibilities really are—as we can currently see them. I think I provided a solid introduction, though no explicit model, in my freely downloadable book: *A More Exact Understanding of Human Being* [53]. The second group of tasks is the practical task of working towards some goals in various communities and with various degrees of certainty and pure hope. Experimentation would seem to be much in need in the upcoming generations and that experimentation might proceed along with or even ahead of efforts to understand and describe.

In these terms, excessively individualistic groups of human beings, seem to be bad in a clear way but excessively communal groups of human beings seem not so bad in any clear way. I'm sure I've been biased in my discussions because I come from one of those excessively individualistic peoples and I'm trying to work my way to an understanding which might produce a better balancing, one equivalent in many ways to views found in the Bible and in the works of some great thinkers, certainly the Jewish sages so deservedly beloved by Jacob Neusner who saw, in particular, the disciplined emotions of men as being the binding forces of human communities—see Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*. Several of Neusner's books can be found in the bibliography to this book.

Strong individuals, who remain separate selves even as they become fully

their communities, are needed as a Christian would assume from Trinitarian theology where Father and Son and Holy Spirit remain fully their individual selves even as they are fully God. These sorts of statements communicate some important core truth but they are too simple even for the reality of human being, individual and communal; certainly too simple for the large and complex human communities which have emerged in recent centuries. Yet, they are a starting point for the beginning of an effort to understand human being more exactly and more accurately, in appropriately rich and complex terms. To a Christian, the Body of Christ in its perfected and completed form must have an exact and accurate self-understanding and human beings, Christian human beings and perhaps others, who will have a future as part of the Body of Christ when it fully shares the life of God must play their role in all of this by proper development of powerful individual and communal minds, hearts, and hands which will lead to that self-understanding.

I'll also suggest that the major cause of the often violent turmoil in human communities of our age is caused by this particular imbalance. I can see the possibility of moving forward, of realizing an overarching community—a civilization or prefiguration of the Body of Christ—on the great Eurasian landmass, reaching from China and her sphere of direct influence through Central Asia and Russia and perhaps other parts of Eastern Europe and perhaps even ending at the British Isles. Other regions of the world may participate to various degrees, perhaps even the United States once it is taken down a few notches and the juvenile leaders of the various political and economic and cultural and religious communities are replaced by adult leaders who are willing to take on the Augean stables of a promising country sunk into moral and cultural rot. But, a people gets the leaders it deserves and the American people will have to develop some true moral character before they could get any leaders with true moral character.

# 517 Islam, Violence, Repressive Governments, and All That.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1973>. It was finished and uploaded on 2015/02/11.]

In the article, *The Return of Fear* at <http://www.unz.com/pfrost/the-return-of-fear/>, Peter Frost, an anthropologist, gives a few facts which don't argue fully against the current belief among Americans and Europeans that Muslim men are prone to violence and fanaticism; those facts do tell us of the ethnic basis for this inclination. Indonesians—88% Muslim—have low rates of violent crime, as do other east Asians. It's also been known since at least the writings of the Ibn Khaldun (the great Islamic historian and philosopher of the 14th century; see [https://en.wikipedia.org/wiki/Ibn\\_Khaldun](https://en.wikipedia.org/wiki/Ibn_Khaldun)) that some of the ethnic groups which took up Islam are inclined to violence and fanaticism. Frost quotes Khaldun as claiming Arabs are a savage nation often making a living by looting—the early books of the Bible tell us the same thing.

Evolution is for real; genes are also for real. The inclination of a lot of modern human beings is to think those parts of life on earth are just so interesting when they tell us why the dinosaurs either disappeared or flew away, how giraffes got their long necks and zebras their stripes. We haven't learned to think in terms of modern biological science when it comes to human beings, nor do many appreciate the ongoing effects of evolution and genes when it comes to human beings. Even readers of the *Dune* novels by Frank Herbert (see [https://en.wikipedia.org/wiki/Frank\\_Herbert](https://en.wikipedia.org/wiki/Frank_Herbert)) novels don't seem to appreciate the ways in which a desert environment can select for a violent form of human personality which is radically individualistic but also inclined to accept the harsh discipline of warrior bands or

even conquering armies.

So, it seems to me to be wrong to assume it's Islam which causes the inclinations of Arabs—Khaldun also mentioned Berbers and other North African nations as being inclined to violence and fanaticism. It seems more likely that the Arabs and similar peoples have retained the traits of the desert nomadic ancestors. The 'early adapters' of Islam, including the founder, could be seen as regressing to an earlier form of Hebraic monotheism. That earlier form of Hebraic monotheism is more suited to a people who are yet desert nomads—at least in their inherited inclinations and aspirations. Such a religion would collaborate with a desert environment to both nurture aggressive tendencies and also reward aggressive men, desert warriors, with greater reproductive opportunities. Such societies will also tend to provide better reproductive opportunities for women who are submissive to these violent men, even strongly supportive of violent sons and husbands and brothers. Over time, as violent inclinations are reinforced in men, the women are likely to become more deeply, more 'genetically' submissive.

It would not be wise for a people with more peaceful inclinations to invite large numbers of a more violent people to settle in their midst. The peaceful people might become the victims even if in a great majority.

A violent people isn't necessarily an evil people and they, women as well as men, might well think Western men to be womanish and Western women to be mannish. And a peaceful people can be evil. Trivial truths. The more important truth is that a people with men of violent inclinations will need strong, centralized governments to allow the building of larger-scale and more prosperous societies; otherwise, the men of violent inclinations would cause massive disruptions and distrust. Without a strong ruler, such men are much better at looting than they are at even administering a conquered people.

To exaggerate, but not by much: it takes a Genghis Khan to rule a nation (or multiples nations) of desert nomads. We of the West do not wish to live under the type of repressive government which is needed to bring peace when there are many men in the population with inclinations to violence and fanaticism. Nor do we wish to live in a society with chaos and violence on the streets. So why do we open up our countries to immigration by those who don't have inclinations compatible with ours and with the sorts of societies we wish to build and to live in? Why do we send our armies overseas to destroy the sorts of repressive governments which have brought

order and prosperity to these countries with men inclined to violence and fanaticism?

# 518 Is the United States a Parasite Feeding on the Rest of Humanity?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1978>. It was finished and uploaded on 2015/02/17.]

Albert Jay Nock wrote of a friend of his who had spent some years in the United States and was returning to Europe. This friend spoke of his admiration of many American characteristics, but said he was disturbed on realizing that Americans are the first people in history to pass directly from barbarism to decadence without ever passing through a state of civilization. Nock and his friends didn't see the real danger in this sad state of affairs—as the wealthiest and most energetic frontier region of the West, the United States had a chance to take on the role of leader of the West, the role of nurturing and, in fact, rebuilding the West which was already showing the wear and tear of dealing with the Industrial Revolution followed by the less promising conversion of parts of the economy to financial, bank-based capitalism and the parallel conversion of the productive parts of the economy to a sort of monopoly capitalism allied with government regulators. But that wasn't all. Economic problems, usually opportunities missed or misused, were not the entirety of the reason for that wear and tear on the West. Not by a long shot. Christian leaders, ecclesiastical and cultural and intellectual, had failed to produce a new understanding of Creation which reconciled modern empirical knowledge with Christian beliefs. Leaders and shapers of opinion and great practitioners in the fields of literature and science and philosophy and history and so on achieved, at best, partial success dealing with the problems and opportunities of the Enlightenment

era and the succeeding centuries; their success was limited partly by the cowardly and faithless failures of Christians who loudly claimed to be brave and strong in their faith, but failed to face up to the new knowledge of the world and more as being knowledge of some of God's thoughts manifested as created being.

As the Catholic and Lutheran and Anglican and Calvinist churches had become corrupted in their own ways, they had turned inward, no longer in fruitful conflict with non-Christian peoples; Christian thought and customs began to soften and to simplify in various ways. When we Christians had engaged other peoples in fruitful and mostly peaceful ways, their very existence as well as their specific beliefs and intellectual or cultural traditions, even their personalities and ways of life, had been a spur to Christian understanding of a greater part of God's Creation, a part which wasn't and isn't us. They spurred us on in ways somewhat similar to a thorn in the flesh but should have been experienced as similar to the frustrations of trying to explain difficult thoughts and feelings to a good friend over a mug of beer or a glass of port.

The ancient Fathers of the Church developed the theologies we falsely think to be transparently true to human vision and they developed them in conflict and in fruitful collaboration with both pagan thinkers and with those who were seen, truly or falsely, as having strayed from Christian truth. For example, Augustine of Hippo developed a Christian understanding of history (largely still plausible and fruitful) in respectful conflict with both the traditional pagan idea of history as being cyclical and also in respectful conflict with the ideas of post-Constantinian pagan thinkers who had argued that Rome had decayed and was collapsing because of Christianity.

Many of the problems of the modern West come from those successes of Christian thinkers from ancient times and the Medieval centuries and, to a lesser extent, the early centuries of the so-called Modern Age. To the heirs of those earlier Christians, all of Creation seemed transparent to examination by Christian leaders, ecclesiastical or intellectual, and the Protestant Reformation didn't even shake this confidence that God's Creation was understood fully and was subject to imprisonment to the pages of textbooks—the conflicts between Catholics and others concerned other matters of apparently greater importance than the understanding of God's acts as Creator, matters such as control and ownership of various assets including entire countries.

Meanwhile, as the story goes and it's mostly true to reality, Galileo and

his successors headed out to explore those parts of Creation which were subject to exploration by their limited tools. Galileo was himself a follower of the Catholic tradition of respect for empirical reality, a tradition given us by Augustine and Jerome, Anselm and Albert the Great and Thomas Aquinas, and so on. Over time, as Popes and bishops and Catholic professors, and their Lutheran and Anglican and Calvinist counterparts, stuck to politics and financial matters, an implicit truce came into being: theology and much of philosophy and parts of history would separate from physics and mathematics and biology and other parts of history and of philosophy. If any conflicts arose, everybody would refuse to engage in fruitful encounters; all parties would instead wave their hands spasmodically and sing in unison: "There are no conflicts between religion and science." That is, all would agree to an unfruitful misunderstanding of Creation and of human knowledge. This agreement was extended to Jewish ideas and the ideas of other peoples; we extended to them the charity of respecting their ideas by ignoring them and saying, "There is no conflict between the ideas of men of good will, no matter the ideas." We even extended to them the further charity of thinking it possible they could be like us, think like us, feel like us, at least in the most important areas of human life, such as finance and politics.

It's most obvious in the Catholic Church—partly because it's more intact than most Christian churches in 2015, but all Christians accepted in public the fragmentation of knowledge of God's Creation in such a way as to imply strongly a fragmentation of the created being of which we have knowledge. Inside our own classrooms or sacred spaces, we talk and act as if the binding power of our small stock of Christian revelations applies to the entirety of our particular tradition of understanding the world, of writing greeting-card poetry and making elevator music as well as engaging in philosophical speculation or explorations of history which are far more shallow than what I saw in my childhood in old-fashioned Bugs Bunny and Mr Peabody cartoons. Knowledge became unified in a horrible and wrongful way: Christians forgot that all knowledge concerns God's direct revelations or those of His revelations which are His effects in the world as some Medieval thinkers put it in partial understanding of the greater truth of God's absolute power over all created being. Knowledge became unified in the mind of the knower, priest or professor, rather than being unified as a mostly communal image or mostly communal encapsulation of created being, one subject to change as we come to know more about God's effects

in Creation, or His acts-of-being as I prefer.

Americans are an extreme example of moral and intellectual and cultural disorder. We act as if believing that “I absorbed all I ever need to know from the fluids in my mother’s womb.” Not only are Americans not civilized, but we have increasingly set ourselves, as a country and as individuals, apart from and above the rest of Western Civilization and, indeed, all of humanity. If once we Americans were the pioneers on an important frontier region of the West, we are now an aggressive occupier, claiming Europe as our own. We need Europe for the deeper culture we can’t provide through our pep-rally religions nor through our utilitarian science nor, most certainly, through our mass-marketed literature and cinema and music. It’s not only Europe that we claim. The entire globe seems to be a bauble for us to play with, as if we were the god-like star-child from *2001: A Space Odyssey*. We have done our best to occupy much of the earth, at least in the sense of having soldiers stationed at about a thousand bases in dozens of countries. We need the entire world for the wealth which can support our way of life, including our grotesquely oversized military, and we can no longer generate enough wealth to even keep our large middle-class consuming strongly. Perhaps we feel an even stronger desire to control the entire earth and all its peoples to justify our sense of being the point of it all, both the end-product of biological evolution and the highest of all divine goals. More simply and more in line with the degraded ways of American thought in 2015: We Americans are the ones who got it right. Whatever “it” is.

I’m going to momentarily step to the side to point to John Hawk’s commentary on some recent work in experimental and speculative evolutionary science: *Notable: Coevolution drives biological complexity* at <http://johnhawks.net/weblog/topics/theory/population-genetics/coevolution-complexity-zaman-2015.html>. Professor Hawks tells us: “One of the most interesting parts of the paper involved removing the parasite from the population, after which the host complexity began to decrease. It’s similar to classic selection experiments, in which the selection condition is removed or reversed partway through.”

It seems to me that one way to look at the global situation in 2015 is: the United States has become a parasite preying upon the culture of Europe and upon the wealth of nearly all countries. In addition, we look for human energy and developed intelligence in immigrants from other countries, largely because American culture sucks the souls and minds and moral characters

out of our youth—even those who are good at learning from textbooks and can spit back the heavily schematized and lifeless knowledge on classroom tests and even those who can do quite well in making money on Wall St or in the laboratories and workshops of our high-tech electronic and medical industries.

We Americans need blood to keep going, rich blood of a sort we no longer have, not even in our children born with high spirits and serious talents, not after they've been raised on television and cellphones and adult-supervised games. We have allowed our own blood to be sucked out by an exploitive ruling class and we are allowing the blood of our children to be sucked out. We need fresh, rich blood and we have to go overseas to get it or, when it comes to sports, we have to go into the inner-cities or even to such places as the Dominican Republic.

We Americans need to gain natural resources cheaply because that is how we became wealthy; we have not yet learned how to work intelligently as opposed to hitting the lottery, whether the lottery run by the government or the one which is run by the contingent forces which put pools of black gold below some acres and not below others.

We invade. We, being incompetent as conquerors and looters, devastate countries and destroy infrastructure and kill large numbers of innocents. We destroy \$10 billion in assets for every \$1 billion we manage to steal. We who were once the best-liked of individuals and sometimes even the most highly admired of nations have become hated and feared. We're not feared because we fight or rule effectively. We're feared because our leaders are morally perverse juveniles with lots of firepower and we, the American people, join them in their moral perversion. We aren't the Macedonians or the Romans or the Franks or the Normans; we are Moe as Bismarck, Larry as Napoleon, and Curly as Patton.

And, so it is, that I come to my conclusion by a path long and twisted in many ways: the United States and Americans as individuals have become the thorn in the flesh of the pilgrim Body of Christ, that is, we have become the parasite or opponent or accuser who works for God in the negative way 2 Corinthians 12:6–9. We Americans, in our narcissism and selfishness, have taken on the role of the opponent that many peoples are uniting against. We are enemies of the pilgrim Body of Christ, enemies of Creation, enemies of God to the extent that the Body of Christ, Creation, and God don't serve American desires. We would rule all in our hubris, would subjugate God Himself to our schemes and plans.

And we Americans had the chance to take on the noble role of leader of Christian Civilization, of the Body of Christ. We could have put a part of our once promising, if immature, individual and communal selves into the Body of Christ, could have shaped it in an interplay between God's purposes and our personal desires and talents, as once did Jews and Greeks and Romans and Armenians and Syrians and even the Germanic peoples when still barbarians. Now, the pilgrim Body of Christ will continue its journey through this world bearing American marks only in the form of wounds and damaged organs. With all that we have to be ashamed of—the ethnic cleansing of native Americans, the brutal war in the Philippines after we pretended to free them, Dresden and Hiroshima and Vietnam and Iraq and Afghanistan and Pakistan and Libya and others—this is by far the worst of American sins: we claim to be a God-fearing people and we are waging war against God's Creation and the Body of His Son.

## 519 Hannah Arendt and the American Imperial Crisis

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1992>. It was finished and uploaded on 2015/03/19.]

With most of my books packed away and not easily accessible, I'm going to let my sometimes misfiring memory have a partially free rein. I remember that Hannah Arendt (see [http://en.wikipedia.com/wiki/Hannah\\_Arendt](http://en.wikipedia.com/wiki/Hannah_Arendt) had once asserted—I believe in *Life of the Mind* [5]—that Americans (by circa 1970) had already made political decisions which would force us to a crisis point in a generation or so (which would be circa 2000-2005). We Americans would be forced to either voluntarily fall back to a state of relative impoverishment or become more openly an empire and start stealing what we could no longer produce by our own efforts. In her earlier analyses of Adolph Eichmann, the master-planner behind the Nazi work-camps and the round-ups of Jews and others, Professor Arendt had argued that he was a nice man without real moral character and then had claimed this was true of Americans. Yet, she thought that the American people would accept a partial collapse of American wealth and power rather than becoming a looting and marauding empire. I'm not sure why a hardheaded thinker would imagine “moral niceness” to be adequate for making such a difficult decision, but, as it turned out, there was no explicit decision of the sort made nor were the common folk of the United States involved in the decision which was made by our ruling class.

She was certainly right that the American Colossus of 1940-1970 was beginning to lose his power to shape events throughout the entire world—the United States has retained plenty of power to cause trouble throughout the world, sometimes to the benefit of our ruling class but sometimes not

even to their benefit. Our leaders are Moe, Larry, and Curly pretending to be Alexander, Napoleon, and Bismarck.

Yet, how right Arendt was about the relative loss of American wealth and power even if she was somewhat wrong in thinking we would refuse to steal, for example, the portable wealth of the former Soviet countries or the oil of Iraq. We Americans might not be so good at this piracy business—the country as a whole doesn't seem to benefit much from the rather inept efforts of the Three Stooges in Southwestern Asia nor from our bullying of countries all around the globe. At the same time, various parasitical creatures and institutions—politicians and bankers and think-tankers and aerospace executives—make out well in the short-run. The American people pay good money for the chance to damage their own country as well as other countries; the American people make sure the profits remain high at Lockheed and General Dynamics and the zoo of mercenary armies we've spawned while immense amounts of money and human blood—American and foreign—are poured out on the sands of Southwest Asia.

So, what happened?

The American people didn't exactly demand our country invade various countries around the world and commit miscellaneous acts of financial terrorism and thievery in still more countries, but some did and the rest mostly went along. Our leaders made it clear not too many years after our retreat from Vietnam that they would return to the struggle throughout the world and would fight to the last drop of blood of the last American soldier to maintain that ruling class's power and wealth, though some of us only saw this in the rearview mirror and some still refuse to see it. (Some would claim that Nixon, when he took the dollar off the gold standard, was risking the prosperity of the common American citizen in a gamble to maintain the power and wealth of the American ruling class; I don't know if he consciously did so, but the general suggestion would seem quite plausible.)

Of course, there are reasons for serious historians to write 900 page books about topics such as this. The desires of the individuals and more particular groups in the American ruling class to create a New World Order where American hegemony was to be maintained forever was, so far as I can tell, the driving force in the construction of an imperialistic monster of sorts, a monster which spouts pious words about spreading democracy and respect for human rights as it wreaks havoc upon regions of dense civilian populations, using brutal attacks of modern weaponry such as bombs designed to suck the lungs out of nearby creatures and cluster bombs containing bomblets

which are covered with brightly colored plastic, looking very attractive to children, and holding explosive charges intended to maim rather than kill so that the victims will remain burdens to their communities. But we're too Christian to chop off heads. I don't think God is fooled by our pious and antinomian pretensions—see Chapter 320, *In a Complex World, the Community Must be Smart for the Individual to Be Smart* or the earlier Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*.

After destroying a country's infrastructure, sanitary and medical systems and schools and many residences, the moral giants who rule the United States will often try to rebuild the country to their own needs; they haven't quite gotten that part right even though they had mastered the arts and sciences of destruction.

There are many doctoral dissertations and many history books, academic and popular, to go before we can claim we have a good handle on exactly how this moral and political disaster has occurred, a disaster which probably will lead to a (perhaps) temporary end to the levels of American power and wealth necessary to support our accustomed standards of living. The activities of that giant juvenile delinquent known as the United States have certainly brought about millions of deaths and the destruction of vast amounts of infrastructures of countries struggling toward prosperity—and sometimes not doing so well in their struggles, especially when the American Colossus comes along to stomp on their collective faces.

# 520 Still Quietly American, We Destroy What is Not Us or Ours

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1995>. It was finished and uploaded on 2015/03/31.]

See Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American* for my take on the topic of one important aspect of American moral character. Solzhenitsyn had a similar take and summarized the situation as: Americans are a uniquely evil people. He was speaking of large-scale American crimes against Russian POWs and refugee peoples in the two or so years after World War II. See the Wikipedia entry on *Operation Keelhaul* at [http://en.wikipedia.com/wiki/Operation\\_Keelhaul](http://en.wikipedia.com/wiki/Operation_Keelhaul) for a description of those crimes, which apparently devastated a number of young American soldiers who had to carry out these crimes against civilians including children and then returned to the US to be told, "Shut up, we're celebrating how wonderful we Americans are and don't want to hear about it." I've listened sympathetically over the years to men only a few years older than me who had tried without success to speak of crimes they had committed in a war, that on the peoples of Vietnam, which was rudderless in Washington except for some guidance from McNamara's computers and was often—though there were honorable exceptions—poorly commanded on the ground. Those returning veterans had too often heard, "Shut up! It's in the past, so learn to live with it." And so it was that we've not healed ourselves from the real Vietnam Syndrome—the unwillingness to honestly evaluate our own actions—so much as we've repeated mistakes and crimes we refuse to even acknowledge.

And now for a take on the situation by a brave and honorable soldier who was a Green Beret combat officer in Vietnam and has served since

then in various ways, including high-level work in military intelligence and in mixed roles (combat/intelligence) as a military attache. Col Pat Lang, US Army (ret) describes himself as a rough boy, a man who can fight and kill with detachment so long as he thinks it morally proper to do so. Read a very brief biographical sketch here: [https://en.wikipedia.org/wiki/W.\\_Patrick\\_Lang](https://en.wikipedia.org/wiki/W._Patrick_Lang); Col Lang deserves a lot more than that and the United States, and all our victims around the world, would have been well-served if Col Lang had received the respect and hearing he deserved on various matters of national security, especially in matters having to do with Southwest Asia and contiguous regions. (But he has wise and insightful things to say about various situations in the world, including the dangerous mess we Americans have made in Ukraine.)

So it isn't too surprising that, in a recent essay, *The US as Shiva, Lord of Destruction and Renewal* at [http://turcopolier.typepad.com/sic\\_semper\\_tyrannis/2015/03/the-us-as-shiva-lord-of-destruction-and-renewal.html](http://turcopolier.typepad.com/sic_semper_tyrannis/2015/03/the-us-as-shiva-lord-of-destruction-and-renewal.html), Col Lang took the American people, as a nation and as individuals, to task for... Well, his concluding line is: "In pursuit of perfection in human society, we are making deserts so that we can call them Peace." Some of those deserts were once filled with human beings and some were even on their way to being prosperous societies with some serious possibility of peace and good moral order.

But read the entire essay. It's short and packs a punch, at least to someone who knows even a little about history and about the American activities in recent decades. It's a horrible story of a country once promising though always dangerous in its self-righteousness but, more recently, gone horribly bad, a country once well-liked and admired throughout much of the world and now a country increasingly feared, hated, and distrusted.

For those who like to examine the roots of a problem, I can recommend one of my own essays included in this book as Chapter 408, *The Need for Abstractions in Moral Self-understanding*. I point to bad signs which showed themselves right from the early decades of the New England colonies by exploring the attitudes of New Englanders toward the native Americans. Many critics have seen the problem of American bigotry toward other people and peoples and the hatred we show toward them when they don't act as we think they should. Usually, people think the problem is best solved by concrete means, including allowing radically different peoples into the United States to live and by replacing soldiers by medical or

religious missionaries. Against this view, I argue that even the very intelligent and well-educated Puritan elite showed an all-too American incapacity to engage in an inadequate abstraction of moral and other understandings of the world. As Melville and Hawthorne and others have pointed out, we Americans don't approve of the real world which was created by God; we prefer the one which floated around inside the communal mind of the Puritans of New England in those days and now floats (in somewhat different form) inside the communal mind of nearly all American citizens in this year of 2015.

Proper action in a complex world must be founded upon a proper, necessarily abstract, understanding of that world. Inadequate abstractions led the early New Englanders to improper action, but the effort to act as if the world is simple will simply lead to us acting as if barbarians who would enforce simplicity upon a complex world.

# 521 Liberalism and the Decay of the West

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2043>. It was finished and uploaded on 2015/05/05.]

By “liberalism,” I mean a closely related set of systems of freedom of a specific sort, those emphasizing and even ‘enforcing’ an individualism which in its moderate form is compatible with the traits of many north-western Europeans and fewer other Europeans and—for the most part—far fewer others. [An example of enforcing individualism would be changes to property laws or inheritance laws to take away family powers and rights and create only judicial power and individual rights.]

In a sense, this essay is something of a fantasia, if not an outright fantasy, but it is a fantasia or fantasy which serves truth by writing of one decay process among several. For example, much of the larger-scale destruction of the West has been the results of actions taken not by economic liberals but rather by families or ‘gangs’ which are often from the established power-elite but sometimes from outsiders—there are feudal aspects but the modern West, until recently, has been too dynamic for any rigid feudalistic structure. Even the wealthy and powerful men who formed dynasties and companies of vassals lasting at least a couple of generations have had to compromise to some extent with a society dominated by liberals ranging from collectivist liberals to libertarians. There are many liberals lying between those extremes as well as a number of conservatives or traditionalists who hold some liberal beliefs even beyond the handful which are truths to be found in the Bible and other ancient writings or traditions. All of these liberals are ideologically closer to each other than they are to those who think in terms of family wealth and power.

In addition there is the complication that liberalism has likely proven to be of some use to those who are more family-centered or even feudalistic. Close-knit units would be devastatingly effective in a war-zone where the enemy soldiers were fighting as individuals seeking their own survival and their own prosperity.

I'll bypass that greater reality to write of the liberalism of the early John D Rockefeller and the railroad magnates before they discovered how readily governments could be used to restrict access to markets. I'll write as if the Rockefellers and Harrimans and Fords and Paynes and Whitneys and Walkers (including the Bushes) are naught but households from which individuals leave to pursue their own goals and interests and to which they return home to eat a good meal and socialize before resting up so they might pursue their individual careers or interests the next day.

Mostly, I'll write of the liberalism of those conditioned to act as free individuals who truly "pursue their own goals and interests." And I'll freely admit that this liberalism has worked very much to seemingly good ends for much of the past few centuries. But freedoms were the goal and there were, and are, no logical constraints on the critique of power of communities over individuals (including the power of a ruling class over an enslaved class). The individual freedoms of liberalism became absolute moral goods, rather than goods within the moral order of greater communities, and many things, even marriages and the resulting families, were sacrificed to these greater goods. The decay processes powered by Western liberalism worked far more slowly than those powered by various flavors of Marxism but it remains possible the resulting decay was deeper and the path back to well-ordered and properly prosperous communities will be steeper and take longer to travel than the paths Russia and China are currently traveling.

Human being is what it is, what it was shaped to be by evolutionary forces acting in varying contexts throughout the world. Those evolutionary forces act in response to specific environments and not to select traits according to some philosophical program. If entities in this world are entangled with each other rather than being isolated, then we work from that point rather than ignoring reality and positing a complex entity created as if by magic, an entity born with a talent for freedoms not otherwise found in this world.

Of course, natural selection doesn't force any living entity upon any one course. There will generally be more than one set of responses which can lead to survival of a family line. Along with the varying environments of

the earth, this results in some variety of human traits. Anthropologists have found some general rules including these two which relate to agricultural activities and which seem to offer insight into the spectrum of human possibilities:

1. Grain-farmers are relatively more individualistic.
2. Rice-farmers are relatively more communalistic.

Northern Europeans are largely descended from populations which were selected in agricultural communities which depended strongly on grain. Northwestern Europeans are said by some modern anthropologists and geneticists to be even more individualistic than their cousins to the east in Northern Europe. It is even said that these Northwestern Europeans can be identified, perhaps defined, by their unique marriage habits—late marriages and higher rates of unmarried men and women and etc. Given such peoples, the political theories of Locke and Jefferson and others, the economic theories of Smith and others, and the resulting, full-blown Classical Liberalism of Bastiat and Mill and von Mises and many others, have strong initial plausibility. (See [https://en.wikipedia.org/wiki/Classical\\_liberalism](https://en.wikipedia.org/wiki/Classical_liberalism) for a discussion of this way of thought and attitude.) At the same time, we have to remember that these thinkers all lived in the modern age in which empirical exploration of this world was progressing rapidly and the most basic levels of reality were shown to be not quite, in some cases—not nearly, what they had been thought to be. This is a complex story in which some lines of empirical thought were adopted or at least celebrated only when useful to the political or cultural reformers or agitators of that day. On the whole, there was—to say the least—inadequate allowance for new discoveries about the nature of space and time and matter, human origins and the resulting nature of modern human beings, abstract and at least contingently absolute truths accessible to the human mind.

In broad terms, Christians and non-Christians in the West—including the main thinkers of Classical Liberalism have done their best to protect their favorite assumptions about this world, including human being, in order to protect their favorite doctrines. Sometimes, this protection was little more than willful blindness toward empirical knowledge not fully compatible with their favorite doctrines and sometimes that empirical knowledge seemed to strongly contradict those doctrines. Christians, following

Augustine—see Chapter 631, *Lost in a Sexually Polymorphous Cosmos*, saw men as creatures with a supernatural origin and a supernatural component and many modern intellectuals, including the main figures of Classical Liberalism continue to see men as having natures, minds and desires, which are universal and beyond the reach of what is merely empirical, especially when various local manifestations of human being seem to be outside the capture of a single universal model.

For most Christians, it's true everywhere and always that men are fallen creatures with transcendental souls because Adam and Eve were ensouled and in a state of grace and we are merely dirtied images of such blessed creatures and thus men of all ages since that (admittedly mythical but "meaningful") event are just as Adam and Eve were after their fall; so it is that Latin Americans and Africans are just potential middle-class Americans no different from the descendants of those who shaped this country to their inherited traits and the cultures and political systems built by ancestors who were at least developing those traits; so it is that Christians no longer are content to go to impoverished countries to help those peoples to improve their lot and instead bring them over here that they might realize their true potential as American liberals; so it is that any Amerindians or Latin Americans or Africans who don't take to our ways are defective human beings—see Chapter 408, *The Need for Abstractions in Moral Self-understanding*, for a discussion of this attitude on the part of the European colonists during King Phillip's War.

For most modern liberals of all sorts, it's simply the case that there was a time in prehistory when true human beings came to exist and they had minds immediately capable of accessing transcendental truths and desires which, very implicitly and even sneakily, assumed a certain type of human being; this all seemed to tell us that the only real human beings are those who take to life in a wide-open marketplace of individuals. Empirical reality enters only in the form of higher-level and highly stylized studies in history and sociology, levels and styles which could have been designed to hide such matters as the spectrum of human being: many Englishmen being highly individualistic and most Chinese being highly communalistic—apparently those from the south of China even more so. Englishman good, Chinaman bad.

Liberalism is mistaken, but it isn't inherently an evil system, though any system can be made evil in implementation. It's simply wrong in light of modern knowledge of human characteristics. And it has contributed to

a great evil: the decay of the West including the premature decay of the very young United States.

In complex human communities—and their various smaller sub-communities familial and economic and political and cultural, moral order is made possible by a correct understanding of the nature of human morality including the location of moral knowledge and responsibility—family or local community or state or religious community? Laws and institutions, ways of doing business and ways of entertaining yourself in public areas, create disorder rather than order when they aren't compatible with human being in the specific form it takes in that particular complex human community, such as Boston or San Francisco or the United States or the West as a whole.

Again, all human being is both individual and communal but there is a spectrum of those who are extreme individualists through various mixtures of individual and communal being and on to those who are extreme communalists, but even those at the extremes are a mixture or else truly pathological creatures. God's plans clearly allow and might need various mixtures of individual and communal traits in human animals. Much good and interesting and fruitful human being might well be found in the extreme regions of those who are radical individualists and those who are self-sacrificing communalists.

The countries of the West, most especially the United States, have instituted a form of economic organization to the benefit of only a small minority of the human race. (A reminder of reality: it benefited still more those wolves in sheep's clothing who entered the marketplaces not as individuals but as members of dynastic wolf-packs or other tightly-knit units.)

But liberalism in the economic domain wasn't entirely an illusion, not by a long-shot, despite the tendency of some of the greatest of competitors to turn to such behavior as collaborating with politicians and regulators to restrict market entry—once those competitors were themselves established. Yet, liberalism did increase material prosperity in the West and that material prosperity spilled over even into many exploited regions in Asia and Africa and the Americas.

And that seems likely to be the judgment of history: the liberal beliefs and ways of behavior which developed in the West in the post-Medieval period brought great prosperity—so long as the foundations laid by those from earlier generations lasted. No known form of liberalism is capable of building a civilization or even a major community of any sort inside an

existing civilization. At their best, liberals have provided cogent criticisms of specific abuses of communal power over individuals, but that negative power of criticism has led quite naturally to a license to attack any and all powers of communities over any and all individuals and those attacks have made one damned mess of the West and most of its communities and most of its individuals as well.

# 522 Power Without Responsibility and Morally Irresponsible Illusions of Power

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2046>. It was finished and uploaded on 2015/05/11.]

In March of 2015, Justin Raimondo wrote an essay, *Rand Paul, Revisited* at <http://original.antiwar.com/justin/2015/03/17/rand-paul-revisited/>, in which he quoted Gareth Garrett (see [https://en.wikipedia.org/wiki/Garet\\_Garrett](https://en.wikipedia.org/wiki/Garet_Garrett)):

“There are those who have never ceased to say very earnestly, ‘Something is going to happen to the American form of government if we don’t watch out.’ These were the innocent disarmers. Their trust was in words. They had forgotten their Aristotle. More than 2,000 years ago he wrote of what can happen within the form, when ‘one thing takes the place of another, so that the ancient laws will remain, while the power will be in the hands of those who have brought about revolution in the state.’”

Garrett was here writing of the New Deal but he might just as well have been describing our post-9/11 world. Yes, we still have a Constitution, which is hauled out and dusted off on special occasions—such as the need to start an unnecessary war—but for all intents and purposes it has been hollowed out.

Raimondo in his essay, and Garrett in the quoted passage from his essay, were dealing with the particular problem of Americans thinking that pieces

of paper and promises from politicians, even from those known to be crooks to some lesser or greater extent, would protect them. Vigilance becomes unnecessary and Americans could get the best of two worlds, gaining the benefits of being citizens of a republic without the sacrifices in time and energy which have always been necessary in healthy republics.

As I see it, the Constitution was probably unworkable as written; I should perhaps rather say, consistent with the general message of Garrett and Raimondo, that any written constitution is no better than the moral character and public habits and behaviors of the citizens, as individuals and as communities. Americans like to point to the Constitution and claim our rights; more generally do we claim that each and every one of us is equal to wealthy men, to prominent college professors or influential editors and commentators, to men who pull the levers in the political machines, to leaders of powerful or wealthy institutions such as religious communities and grant-giving foundations. In fact, powerful and wealthy men are . . . powerful and wealthy. If they are not given public recognition, they will work behind closed doors and in meetings in the shadows. They will conspire. Some of them will even collaborate on criminal or immoral acts and they will all cooperate on long-term projects such the creation of a regulatory agency or a national medical insurance program which can restrict entry of new competitors.

Powerful and wealthy men will do what they think necessary to at least hold on to what they have, but, given their desires and the nature of a dynamic world, they will likely be determined to increase their wealth and power as well as to have control over how it is passed on to future generations.

Anyone knowing even a little about history, the Bible, and science should have expected the United States to have decayed into a sham republic. New England shoemakers and classically educated southern philosophers of law created a Constitution for a country in which citizens were to be equal and no more than equal and those who were piling up fortunes in land or by way of merchandising profits refused such a great gift, as did such men even in the later Roman Republic with its body of rugged lovers of their sort of limited but true freedom. The Romans remained virtuous republicans so long as they had to work hard to feed and cloth and shelter all those on their estates or in their villages. Once they had hoards of surplus wealth, the game was up; in their case, that surplus wealth had been gathered from their wars which had seemed at first to be wars of defense though often

defense of borders which had been pushed far beyond Central Italy. The United States doesn't seem to have had more than a generation, if that, of status as a serious republic because there were not and are not many citizens with more than a complacent acceptance of the fruits of a republic earned for us by the struggles and sacrifices of a unique band of men—the Founding Fathers.

Most Americans are realistic enough to realize that most politicians have their prices, political power or money, but those Americans live in some sort of fairy-tale land where each citizen is as powerful as any other on Election Day and we don't bother to so much as contemplate the reality of our republic which has reached a truly degraded state. But the system did work remarkably well in the manner assumed by the citizenry. It produced much in the way of material goods, many of which were shared with the middle-class though it exercised little in the way of true political power. For a good two centuries, we Americans pretended to be free men and held out our hands to accept the gifts of our masters but this period of comfort at the expense of moral character seems to be coming to an end, an end which might prove very bitter for many over the 21st century and maybe far beyond. This is to say that the United States has much going for it but there is no reason to believe American citizens will suddenly show the moral character necessary to investigate the world and to make good judgments on the reality which lies behind appearances nor any reason to believe they will suddenly develop the moral courage necessary to act upon a good understanding of this sometimes nasty world.

The rich and powerful in the United States, even many in political power and acting in the public arena without morally responsible oversight, can exercise control over much, including the political system nominally controlled by the voters. The elite, however defined, have power without responsibility; once upon a time, an FDR committed his crimes knowing he'd pay at least a price in loss of power if the end-result wasn't favorable for the American people but even that constraint is largely gone. While we ordinary citizens dutifully march into the voting booths and then pretend the government is ours, the politicians and bankers and corporate executives get to work exchanging money and favors and rebalancing power-sharing relationships. Our pretense does nothing but allow this process to take place in back-rooms, maybe private dining-rooms at the local country club with its membership fees of hundreds of thousands of dollars per year and maybe a conference room at the NYC headquarters of a major bank and

maybe a Senator's office in Washington. Those sorts of power-sharing relationships will be formed and rebalanced when the elite power-holders feel the need. If we wish these relationships to be in the interests of a larger body of citizens and communities, we should recognize that our individual votes on Election Day don't give us any power over the government—as currently constituted. I don't know how to reconstitute the government of the United States or even to know if it be possible though I know the situation can be greatly improved if Americans were to develop the moral characters they claim to already have.

But I can also say that some compromise with the wealthy and the powerful will be necessary. I'll give one overly simplified narrative to point to the sort of compromises which could work if the wealthy and powerful were allowed more public, above-ground recognition of what they feel to be their well-earned rewards and if the rest of the citizenry were to be willing to challenge those wealthy and powerful men when they go beyond what has been allowed.

England was conquered in 1066 by Normans, Vikings who had learned how to mount large-scale military efforts, not just local looting operations, and also how to practice large-scale politics, organizing and administering larger areas and larger populations. The English and eventually the Welsh and Scots and Irish were under assault by a fresh population of energetic warlords, though warlords perhaps already organized in a ruling class of the sort necessary for a centralized state. Anglo-American political practices and theories emerged from these seemingly unpromising beginnings. The warlords were tamed, often helping to tame each other, by various means including one Americans will reject for falsely idealistic reasons: those warlords were publicly recognized for their high status and sometimes their capability and willingness to protect the ordinary citizens from other violent men; ambitious bankers and merchants and manufacturers greatly desired to join the ranks of those who had accepted meaningful constraints and public responsibility for their failures and crimes in return for public honor, legal recognition of a system such as primogeniture which allows the creation and maintenance of dynasties, and other benefits. Someone can certainly protest that this was exactly what the (leveling) Puritans of New England, and some others, wished to eliminate in forming what was apparently imagined as a great and wealthy republic which would be middle-class from top to bottom. Some acts of imagination can't be implemented and wise men will often recognize them in time to prevent damaging and ex-

pensive efforts to implement the impossible.

England was able to balance the needs and desires of the wealthy and powerful with those of the ordinary citizen up through 1800 or so; such a balancing act was never really considered in the United States because the Founding Fathers, great men but human and sometimes overrated, simply ignored the past behind the trends leading to greater power of the individual. Most of the Founding Fathers, excluding John Adams and perhaps a few others, seemed to assume that the granting of full, formal rights of citizenship, including voting rights, would secure the corresponding power for the individuals and for the masses of ordinary citizens. The victory of equality in the political arena and in court had been won once and for all time. Fat chance.

The English continued on their separate path but reached a point similar to the Americans, granting universal suffrage under circumstances which seemed to relieve the nobility and the other powerful leaders (such as Anglican bishops and a few other clergymen) of responsibility. Soon enough, the British institutions which tied together power and responsibility, and also otherwise moderated excessive concentrations of power, weakened greatly, but the power went to the bankers of the City of London and the owners of great factories and the politicians who learned to swim with the sharks—responsibility became that of elected officials for a while and then faded into the far-away heavens in the manner of a pagan god no longer needed but still remembered in the myths taught to schoolchildren and assumed by the many citizens who craved sophistication without effort.

I have no solutions for the problems of the United States and its citizens and doubt if years of contemplation would lead me to a program of reform in which I'd have any confidence. Any solutions will have to be worked out in that inconvenient realm of reality, but such a process can begin only after a recognition of our true situation: American voters and British voters and any voters in modern liberal societies are largely powerless. If those voters wish to gain any sort of power, any say over their own futures and those of their children, then it will take much energy and courage; there is no signs of such qualities in the peoples of the Liberal West.

# 523 Economic Problems More Fundamental Than Even Central Bank Shenanigans

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2095>. It was finished and uploaded on 2015/09/21.]

Fred Reed is still working away at his vocation of recent years: speaking to a mostly deaf American public about the more serious and fundamental problems confronting Americans or all of mankind in these early decades of the 21st century. That he takes himself, and his writing, less seriously than do many of our sages is to his credit. Not that all critics should write so tongue-in-cheek as does Fred in most of his essays, but we need our Mark Twains, who often speak in humor-laden wonder but always with some insight into the sheer strangeness of the peoples and cultures of the United States. Unfortunately for us all, we and Fred live at a time when American bigotry and closedmindedness (now called 'exceptionalism') have combined with our ignorance (history is now bunk not just to simple farm-boy technological geniuses but also to our leaders and even their highly credentialed advisors) to make us a dangerous people to ourselves and to much of the world. Our only remaining criteria for our actions is: Does it make us feel good about ourselves? We are a people who think that high-school pep-rallies are the height of human cultural activity. We destroy the world which we'll hand on to younger generations and feel good about ourselves because we give them lots of electronic junk at Christmas to make sure their minds and moral characters are turned to mush so that they can't even react strongly against us, their enemies.

In this essay, *A Matter That Should Give Us PAWS: The End*

*Times of the Modern Economy* found at <http://www.unz.com/freed/a-matter-that-should-give-us-paws/>, he points out that we don't have just technical disruptions of the sort the United States suffered throughout the 19th century and into the 20th. Though our obvious technical problems are serious: such as those caused by central bank manipulation of currency and bonds, big-city bank manipulation of all sorts of markets including gold and silver and mortgages, movements of vast amounts of capital to the seeming goal of generating short-term profits for speculators and executives looking for huge bonuses. As serious as those more obvious problems are, there is a more fundamental disruption to human communities—'rot' is perhaps a better word than 'disruption'.

So it is that Fred tells us:

To date, the only way we know to distribute goods and services (houses, food, that sort of thing) is to have people work and pay them for it. It is an imperfect system, having been devised by humans, and pays a quarterback millions for throwing a pointy object to a downfield felon while a shock-trauma nurse can barely eat. Still, it has been reasonably serviceable.

Despite the apparent beliefs of even some of the most intelligent commentators on our economy, we are facing a radically different basic problem from, say, circa 1900 when some major crafts and entire industries were shrinking into niches or even disappearing completely. We aren't seeing the shrinkage of horse-breeding operations and the associated leather-goods industries; we aren't seeing the opening of the auto-industry. We are seeing the introduction of new modes of producing goods and providing services; we are seeing automated production of goods and provision of services with most men and women being on the outside of the entire system. It's not so much that new products and services are replacing old as it is that the ways of manufacturing all products and providing all services are changing in ways which have eliminated many of the ways of making a living. And it's far from clear that most of the human race can function as workers in this new environment and not really even clear that most of the human race is even needed as workers of even the most menial sort.

The world has grown richer and more complex than it was when our current ways of living and making a living grew up and we haven't shown much

willingness to deal with the situation—other than an occasional fascination with dystopian novels and movies of our prospects.

Something of the sort was shown in Disraeli's novel, *Sybil*, which took place in the 1830s or so, a time when textile manufacturing skills had been replaced by sophisticated machinery and the craftsmen were less desirable as workers than their unskilled and uneducated or under-educated children. The United States took advantage of this transition quite well when the Lowells and others redesigned manufacturing operations to use the inclination of American men to acquire a variety of more general skills; those American men working in Yankee factories could out-produce those English teenagers. The jerry-rigged solution of the Yankee organizational geniuses have failed. Heck, those all-round Yankee workmen don't even exist. My generation (born 1955) was mixed in this regard but I can remember some of the last such American workers nurturing their skills on the rolling rust-buckets they bought as their first cars. Now, you can't work on your own car without a computer diagnostic system and you can't repair what has been sealed in modular parts designed to be thrown away and replaced after 40,000 miles of service. Anyone who has access to Daddy's modern machine-shop, and takes advantage of it, and anyone who goes to MIT—and goes through their remedial education courses for engineering students who can't wire up a simple electrical outlet, will gain deep knowledge and powerful skills. Few have those options and our modern economy doesn't seem to need many such workers, machinist or electrical engineer.

There are no solutions in sight because the modern factory can be automated to the point where it needs only one or more teams of experienced and perhaps highly skilled engineers along with a small number of blue-collar workers. As Fred notes, we aren't looking at a transition to new types of jobs, perhaps in new locations or in new industries. Rather are we looking at a wholesale disappearance of jobs as machines are beginning to take over in vast expanses of the economy. New industries might arise to produce new goods or provide new services, but the robots will be there from the beginning. Robots are even beginning to replace some sorts of surgeons.

This might have a good ending centuries from now; many of the upward movements in human history involved periods of great suffering, especially at the beginning of those movements. But we are certainly heading into a very bad middle which might include such disasters as massive depopulations of large regions of the Earth, disease and famine and war might come

upon us. Modern Europe began with the destruction of the Western Roman Empire by mass migrations which many historians think to have been more in the nature of peoples looking for better lives than of invasions by barbarian warriors—though there was some of that as well. The interested reader might wish to read *Empires and Barbarians: The Fall of Rome and the Birth of Europe* [70] by Peter J Heather and *The Fall of Rome and the End of Civilization* [144] by Bryan Ward-Perkins to gain an appreciation of the havoc which can result when there is a mismatch between economic opportunities in a region of the world and the needs and desires of the peoples in that region or bordering regions—where ‘bordering’ includes all who can see, for example, Germany on the television and read on the Internet about the prosperity of German corporations and generosity of German welfare systems. (I suspect bordering should also be generalized in our world to include the borders between inner-cities and prosperous suburbs or gentrified urban areas.)

# 524 Comatose for Generations, Western Civilization is Being Pushed into the Grave

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2102>. It was finished and uploaded on 2015/10/06.]

I had exquisite timing this summer, was well prepared to think in a rational, fact-based way about Europe's crisis with immigrants as well as with the slower moving crisis in the United States. For the umpteenth time, I was also reminded of one of my high school history teachers: a somewhat eccentric man who was the best sort of teacher in his devotion to his subject as well as to some vague process of 'teaching'. Once a student began to pronounce his opinions on some political matter—don't remember exactly but it was 1971, so guess if you will. Mr Bousquet came to stand in front of the row where the student was seated and stood there quietly until the student grew confused and then quiet. Mr Bousquet then said, "You have no right to an opinion until you've learned some facts about the matter," and then returned to the blackboard to teach as if nothing had happened.

If only the likes of American politicians and public-policy (pseudo-)intellectuals and Catholic bishops would have enough moral character to realize the truth in that admonishment: "You have no right to an opinion until you've learned some facts about the matter."

My good timing this summer was in reading several books dealing primarily or in part with immigrations in the context of early human history and human prehistory, most importantly: *Empires and Barbarians: The Fall of Rome and the Birth of Europe* [70] by Peter J Heather and also *The*

*Fall of Rome: and the End of Civilization* [144] by Bryan Ward-Perkins. These aren't books likely to be found in prominent spots at your average Barn of Books. (Actually, I once made some prime purchases out of the loft of a barn—three volumes from a collection of Nathaniel Hawthorne works, circa 1870. Not in good enough condition to be valuable but some of the pages hadn't even been cut—a claim probably confusing to many who are under the age of 100 or so unless they've read a history of books.)

These large-scale movements into Roman territory involved a mixture of peoples looking to steal or otherwise obtain the goods of a civilization they didn't understand, couldn't have—and didn't—maintain, and which they could easily destroy. The Germanic and other barbarians who came across the borders into a Rome which had moved much of their best and most loyal troops to fight the Sassanian Empire. Some of those top-notch troops were themselves Germans from earlier waves of tightly controlled immigrations into the prosperous regions of the Roman Empire. Some were Gauls (or Celts) who were pretty much fully Romanized; those Gauls were the ancestors of the modern French peoples, some of the Spanish, and maybe some of the westernmost Germans.

In those books mentioned in the above paragraph, we learn that Rome fell, and Europe suffered during centuries of true darkness. The European population was substantially reduced as the economy was disrupted and supportive communities were weakened or destroyed. Living standards for the survivors didn't recover until the 12th or 13th century. There was something for every couch-potato barbarian to enjoy—modern day political leaders and Christian leaders alike: poverty and ignorance and violence and famine and wars. Some of these things might not seem to be so righteously exciting once they hit London and Kansas City rather than just Baghdad and Damascus.

This somewhat indeterminate dark period (use the period 500AD-1000AD as a guide) was often hell on earth and never really reached the high levels of prosperity or the low levels of personal violence of the years of the Roman Peace.

Those historians and archaeologists and geneticists and evolutionary theorists and physicists/chemists who are producing a scaffolding, bare and not yet fully trustworthy, for an understanding of the story of modern mankind tell us that we should value these periods of civil peace because rates of death by violent acts of other men are higher outside of organized states, such as the Roman Empire or the pre-imperial United States. If

you wish to be humorously skeptical, you can adopt the language of some historians: the stationary bandits protect the taxable sheep against the nomadic bandits. Yet, you have to face up to those high death-rates of nomadic or other pre-state peoples. To speak in a dramatic but true way: those Amerindians in the Amazon and those peoples in the South Pacific, all glorified as so 'peaceful' by Margaret Mead and others, had or even still have higher rates of death by human-inflicted violence than Europe had in the 20th century with two great wars and a host of smaller wars.

Bottom-line: the destruction of the states, in general—of the settled communities, of Europe will almost certainly lead to a long period of violence and chaos. Women will retreat from the public areas for reasons of safety. Slavery will return. Literacy and economic productivity will shrink to low levels. Europe won't become a multi-cultural paradise—it will repeat the Dark Ages in perhaps a more modern form as the warlords fight it out to see who will be the prosperous stationary bandits of the next stage of European history. That stage might have such horrors as Nazism and Leninism—or maybe not. It might be prosperous and be conducive to the freedom of individuals and the communities inside the territories of the stationary bandits—or maybe not.

As for the opening of the borders in the United States?

It's a grand and dangerous experiment at best. The situation in the United States and the context of the Americas are far different from anything Europe has known, but any wise man or woman would be fearing for the worse and maybe the worst. So far, we don't have too much reason to believe that these immigrants from Africa and Southwest Asia will either assimilate to European-American ways of life or perhaps build compatible ways of life in separate communities. We can't even assimilate Amerindians to the extent of drawing them into ghettos in the mainstream of American life and even Mexican immigrants are said to de-assimilate themselves after—perhaps—a generation of promising achievement. I'm not sure that there will ever be a true merging of European-American and Chinese/Japanese/Indian communities—nor that there should be such a merging. Yet, we are perhaps creating a situation where—at least—the west coast of North America might become part of Chinese civilization, not by conquest but simply by of a peaceful takeover by hardworking peoples. A people who treat educational systems as excuses for dances and football games and pep rallies should be more cautious about the immigration of such hardworking and disciplined and serious peoples as the Chinese and

the Japanese and some of the peoples of southern Asia.

We live in interesting times indeed and have made these times far more interesting by engaging in a variety of unwise experiments upon human beings—individuals and communities. We Americans love to destabilize countries which were potentially chaotic regions—and known to be such by historians and diplomats and various analysts in the intelligence communities of this world, civilian and military alike. We have even allowed our ruling classes to destabilize our own countries. In the case of Europe, we have the example of the fall of the western regions of the Roman Empire when, according to recent historical analyses, that region of Romanized Europe was still a going venture. And, yet, American leaders through their lapdogs in Europe, and with the cheers of the likes of Pope Francis, have allowed conditions in Europe to approach the disastrous conditions of the sixth century in Italy and in the Romanized Celtic regions (France and Switzerland and Spain and the Western Germanic countries). And those same American leaders are conducting very dangerous experiments with their own country.

We are indeed blessed with interesting times and we seem determined to make them still more interesting and we do so by acts of fraudulent charity which will strip our children's countries of prosperity without doing any long-term good for the immigrants from the countries we've destroyed in Southwest Asia or North Africa and from the sub-Saharan countries where the residents refuse to moderate their own reproduction or that of their animals during the good years of the monsoon cycle and then start trying to get to Europe during the bad years.

# 525 Why Can Foreign Policy Realism Produce Good Insights?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2151>. It was finished and uploaded on 2016/01/18.]

Realism, as the term is used in foreign policy, builds upon the same foundations as Adam Smith's Invisible Hand analysis of economics. It is an empirical analysis at the level of human actors without necessarily making any explicit attempt to understand why it is that those actors behave as they do. Hence, the invisibility. And unlike thinkers in certain ideologies (such as neoconservatism or libertarianism), foreign policy realists look at the various actors, individuals and various sorts of communities—especially nations, as empirical entities—as Smith looked at the butchers and bakers in London and Glasgow of the middle of the 18th century. It's far from clear that we can build up the Soviet Union as of 1955 or the Scottish and English economies as of 1760 by using individuals as building blocks, but deeper insights can be derived by those who understand the history of Marxism as well as the history of Russia prior to the Bolshevik Revolution, by those who understand the history of the Scots: Gaels and Picts and Anglo-Saxons or Anglo-Normans, pagan Celts and Celtic Catholics and Roman Catholics and Presbyterians and various sorts of dissident Protestants.

Those human beings formed by the various historical processes were, and are, the result of general sorts of evolutionary processes. By the phrase, "general sorts of," I mean that these processes include the two understood well by Darwin, natural selection and sexual selection, as well as various genetic processes which sometimes operate with surprising independence—in the short-term—from reality external to genes. There are still other complications such as some mysterious and difficult-to-define "group selection"

processes which seem to exist except when studied.

These processes didn't operate to produce a human race which has remained free of deep changes ever since some magical date. The peoples in much of China and Southeast Asia have the characteristics, personality and others, which allow them to survive and to reproduce successfully as communal rice-farmers while the peoples of much of Europe have the characteristics allowing them to survive and reproduce in as wheat-farmers with a much stronger leaning to individualism. I wrote of this in two other chapters in this book:

- Chapter 324, *Yes, Genetics and Evolutionary Biology are Relevant to Our Political and Social Problems* and
- Chapter 326, *Darwinism is Fine so Long as I Can Still Believe All Human Beings are Just Like Me.*

As I noted in those essays, scientists now think human evolution accelerated greatly about 10,000 years ago when our ancestors began living in more complex societies, especially the civilizations at the center of large regions such as Mesopotamia and China. Relatively great changes in personality and—yes—IQ can occur in a surprisingly short number of generations when human populations are relatively isolated at least as a breeding population. For a good and accessible overview, see *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending.

So it is that we can learn from more specific works by the geneticist Bryan Sykes and the historian Norman Davies, two thinkers well-read in the field of the other, that modern Scots are a mixture, as a population and as individuals in varying combinations, of:

- the European population at the last retreat of glaciers which occurred on the order of 12,000 years ago,
- Scandinavians, settlers and Vikings (“raiders”), who were sometimes the same men,
- Brythonic Celts whose culture/language and much of whose genes came from the ‘Scythians’ who developed proto-Indo-European culture and language—roughly—in the steppes of Ukraine and southern Russian (north and northwest of the Black Sea),

- Anglo-Saxons—a catch-all for various Germanic peoples, some of who hadn't really developed a strong tribal identity when they showed up on the radars of the Greek and Roman historians, and
- Irish, Gaelic Celts, who are now said to be a mixture of those 'Scythians' and a people resulting from the slow movement of "first-farmers", coming from the region in northern Iraq and adjoining regions of Turkey where complex agriculture and cities first developed in Western Asia; those "first-farmers" migrated over centuries along the northern shores of the Mediterranean and mostly settled in the region of Portugal and northwest Spain where they mixed with a Celtic people before some moved into Ireland (largely uninhabited so far as anyone can tell) and maybe some parts of Great Britain.

This sort of information, along with information about the physical environments and climates of the British Isles and other parts of Europe, helps greatly in understanding why it was that particular British peoples responded in certain ways to specific possibilities given by the environment and by surrounding populations—as well as the challenges brought by pirates and raiders and invaders and merchants coming from previously unknown cultures and so on.

This is all still best understood by the traditional methods of historians, though supplemented by the new scientific knowledge. Certainly those who seek to understand must be open to other forms of human culture, to other forms of human being. I suspect that some day historians of human thought will explore one of the strangest and most contradictory of complex events: by way of empirical analysis of their own peoples and their own best (or at least good) ways of living and of organizing political systems and so on, a major line of thinkers (Hobbes and Locke and Human and Adam Smith and through the Classical Liberals and Libertarians of the past two centuries) have arrived at the idea that all human beings are supposed to be Northwestern Europeans with their strongly individualistic inclinations. In other words, empirical investigation of a specific group of populations of human beings was allied with a true blindness to the characteristics of other populations of human beings; the 'true' human nature of Nigerians and Samoans was at hand with a proper understanding of Anglo-Saxons. Even the West's own political and economic and moral and other systems were to be deformed far beyond the true particularities or peculiarities of the peoples

of the West. (And the nature of spreads in human characteristics even in well-defined populations tells us there are many human beings in Glasgow of 1770, who were not so individualistic as the entrepreneurs, butchers and bakers, observed by Adam Smith.

Read about this subject of foreign policy realism from the viewpoint of a thinker, Justin Raimondo, who follows von Mises: *Why the War Party Dominates the Media* at <http://original.antiwar.com/justin/2016/01/10/why-the-war-party-dominates-the-media/>.

Raimondo's essay was partly a response to one written by a notable advocate of foreign policy realism, the Harvard Professor, Stephen Walt. Walt's essay, *What Would a Realist World Have Looked Like?*, is found at: <http://foreignpolicy.com/2016/01/08/what-would-a-realist-world-have-looked-like-iraq-syria-iran-obama-bush-clint>

Walt's essay is definitely worth reading, along with his other writings and those of other foreign policy realists. Some of the foreign policy realists I often read are: Stephen Cohen, Paul Robinson, Chas Freeman, and William R Polk. And read Raimondo if you wish to see that wisdom can come out even when the thinker holds some wrongful understandings of human being—the same is true in spades of the late and great libertarian thinker, Murray Rothbard, whose thought was studied by Raimondo. Then again, I think Rothbard was and Raimondo is more pragmatically realistic than might be implied by their own labels of 'libertarian'.

# 526 Liberty for the Elite Doesn't Always Flow Down to the Common Folk

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2155>. It was finished and uploaded on 2016/01/25.]

Historical narratives will typically note that the *Magna Carta*, see [https://en.wikipedia.org/wiki/Magna\\_Carta](https://en.wikipedia.org/wiki/Magna_Carta), was a result of struggles between an unpopular king and a group made up of secular lords and lords of the Catholic Church in England. It's actually a pretty complicated story which played out over centuries and also had a long prologue, but the point is that noblemen struggling against the excessive centralization of many kingdoms and empires were only tangentially concerned with the liberty of commoners, and then mostly the merchants and bankers with whom they were allied. The serfs or free peasants, even blacksmiths and owners or managers of large textile mills or large grain mills, were of little concern to anyone. In the short-run.

So it was that European elites gained positive rights and liberties while most Europeans were repressed to a lesser or greater extent with some being essentially enslaved. But our history books tell us that, in the long-run, through the efforts of many, various sorts of positive rights and liberties were granted to wider and wider groups of residents becoming true citizens. Is this for real?

Partially. We need to recognize that the formal granting of positive rights and liberties doesn't, in and of itself, mean that those rights and liberties will be truly honored. More importantly, a people freed from serfdom or even less oppressed states might not be capable of properly exercising

their newly gained rights and liberties. In the American political tradition, the common voter chooses from a small slate of candidates chosen in a process managed by the political-machine operators captured in literature (*The Last Hurrah*) and cinema (*The Candidate* but perhaps more clearly if more comically in *Miracle on 34th Street*). More recently, the system seems to be largely in the control of managerial-elites reporting to the national committees of the two-headed monster, Republican and Democratic. (Rogues who are either scoundrels or honest and courageous men have disrupted the system, but the system rapidly returns to business as normal as soon as the better sorts such as Eugene McCarthy and Pat Buchanan and Ron Paul are cast aside with greater or lesser showing of respect. Or disdain.)

This was made possible and continues to be made possible by the moral irresponsibility of clergy and professors and authors and musicians and painters and—perhaps most of all—parents. In one of the most important and oft misunderstood books of the modern world, *The Revolt of the Masses* [60], Jose Ortega y Gasset claims—with good backup—that the elites of Europe failed the liberated masses of Europe in the 19th century. The failure has become an outright betrayal, but I'll just describe quickly how they failed the recently liberated commoners, noting first of all that it is parents who have the primary responsibility to see that their children are well-educated and that the moral characters of those children are well-formed. Training one's children to be fans of one or more teams of the National Football League is, at most, optional.

But let's go back to the 19th century when European school systems were expanding and peoples of at least a little literacy were trying to make sense of this greater world they were discovering, often after leaving behind farm or village to seek employment or perhaps higher education in Edinburgh or Berlin.

People who knew only their own villages and parish churches were suddenly exposed to, and sometimes sent out into, a world of many villages and parish churches of slightly different cultures as well as the Cosmopolis of the West in its different manifestations such as London and Paris and Rome. This was a world in which the old myths, of the Heavens as well as of tribal chiefs become national founders and pagan gods or heroes become Christian saints, were increasingly being seen as implausible, to say the least. (We now know that many of these myths held truths about, say, the founding populations of Europe, but that's another story.)

Those peoples were struggling out of states of illiteracy and of igno-

rance of the world outside of their villages and outside of their small stock of myths and legends and old housewives tales and so on. As Ortega y Gasset pointed out, those with the responsibility to integrate their peoples into what might be called Western Civilization chose instead to drop down to the level of a vulgar and parochial peasantry. So it is that we have the blind trying to lead the blind. For example, we have Christians trying to recover the glories of Christendom with pep-rallies and music which sounds as if written for television commercials; none can understand, perhaps few know, that those glories of Christendom began with an entire culture aiming for the Heavens. The early music came from the anonymous composers (monks?) of Gregorian chant and early forms of polyphony and other modern music; the later music came from Palestrina and Bach, Handel and Mozart, Beethoven and Mahler. Similar statements can be made about literature and architecture and even political thought—even the powerful and erroneous ideologies of modern politics and economics emerged in a healthy Christendom as it started to catch colds and other minor ailments; the future diseased state was likely hard to see at the time.

Can the people resulting from this failure to hold on to what was good and to improve it be able to understand ‘it’? Can they even understand liberty as more than a chance to look at dirty pictures or to choose a church community with more lively fellowship—independent of any effort to seriously think about the theological or moral or cultural issues?

If we accept the likelihood that there are scoundrels who wish to exploit others, then a regime of positive rights and liberties could easily be turned to a fraud in which the powerful and wealthy exercise their rights and the common folk are treated as sheep for the shearing and slaughter.

# 527 Political Machines Run the United States, It's Not a Liberal Democracy

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2187>. It was finished and uploaded on 2016/02/24.]

Bertrand de Jouvenel (see [https://en.wikipedia.org/wiki/Bertrand\\_de\\_Jouvenel](https://en.wikipedia.org/wiki/Bertrand_de_Jouvenel)) was a French political philosopher active in the middle two-thirds of the 20th century. He was considered to be an expert on the American political system, which at least means he didn't just naively take American leaders and academicians on their word that the United States is a liberal democracy. The United States is run by political machines and isn't anything like a liberal democracy, let alone the morally well-ordered republic envisioned by perhaps most of the Founding Fathers. We were told this by de Jouvenel and probably others. (See the website of *Liberty Fund*, <http://www.libertyfund.org/>, for affordable, good-quality reprints of some of de Jouvenel's most important works and for reprints of many other worthwhile books.)

As de Jouvenel quite reasonably saw matters, political machines exist to deliver the goods. As a consequence, they do their best—sometimes apparently quite good indeed—to screen out any potential political candidates who have much in the way of moral character. When Wall Street or the weapons manufacturers have paid you to deliver in the form of more tanks and aircraft carriers, you don't want Senators or Representatives or a President who tries to honestly determine if that is the right use of American taxpayer money at that time. No one with moral character need apply to the Republican and Democratic parties. Some with a little or even much

of moral character or integrity do slip through but the parties seem awfully efficient at screening them out in recent years and have even driven out some seemingly well-established honest politicians of the left and right. Others have simply retired or left when young to be replaced by types more acceptable to the political machines, moral invertebrates.

The classic ethnic political machine was the ‘Irish-American Bostonian’ machine as depicted in the novel, *The Last Hurrah*, by Edwin O’Connor which is discussed at [https://en.wikipedia.org/wiki/The\\_Last\\_Hurrah](https://en.wikipedia.org/wiki/The_Last_Hurrah); the protagonist was likely modeled on James Michael Curley (see [https://en.wikipedia.org/wiki/James\\_Michael\\_Curley](https://en.wikipedia.org/wiki/James_Michael_Curley)) who served in various elected positions in Massachusetts, including Governor and Mayor of Boston. Curley was always a powerful decision-maker and not just a front man. (My great-aunt, Mary Gordon Thompson, was a labor-union leader and feminist and campaigner for child-labor laws; she was a political enemy and a personal friend and admirer of Curley—she was very impressed by the man.) You can also see this sort of ethnic machine politician in action in comedy scenes—the meetings with the judge—in the movie, *Miracle on 34th Street* (see [https://en.wikipedia.org/wiki/Miracle\\_on\\_34th\\_Street](https://en.wikipedia.org/wiki/Miracle_on_34th_Street)); this setting was New York City and perhaps it was an Irish-American machine again.

Obviously, power was also exercised by the wealthy members of the establishment, call them ‘Wall Street interests’ or the ‘Eastern Establishment’ if you will. The national Republican Party, and perhaps many of the local Republican parties, were influenced greatly by Rockefellers and other bankers and their allies. The Morgans exercised great power within the Democratic party until the collapse of their banking empire, circa 1950; a Mayor Curley wasn’t about to do their bidding but his power was mostly local or statewide. Let me mostly ignore the past forms of political power exercised by Wall Street and its allies. I’m making a simple point by telling a part of a complex story of centralization by destruction of local power, but a centralization which seems to have merely created two nationwide, technocratic political machines where we once had a multitude of machines which would at least partly respond to real human needs beyond those of the investors and executives of JP Morgan and General Dynamics.

Let’s go back to the 1970s when Senator Eugene McCarthy (see [https://en.wikipedia.org/wiki/Eugene\\_McCarthy](https://en.wikipedia.org/wiki/Eugene_McCarthy)), a rather independent-minded Democratic Party politician, joined with Senator James L. Buckley (see [https://en.wikipedia.org/wiki/James\\_L.\\_Buckley](https://en.wikipedia.org/wiki/James_L._Buckley)), an equally

independent-minded Republican Party politician, to oppose some proposed campaign finance laws. (Libertarians and civil rights advocates also joined McCarthy and Buckley in their fight against those laws.) Usually presented as an effort to prevent public financing and limits on contributions to at least some sorts of campaigns, both McCarthy and Buckley said over succeeding decades that they were concerned that the laws were intended to destroy the (partially) independent political parties (such as the Progressive Party prominent in the Midwest and the Conservative Party of New York) and to outlaw any campaign corruption only if it were not under the control of the national committees of the Democratic and Republican parties.

I'll go out on a limb to claim that the political campaign 'reforms' which began in the 1970s, partially failing at first because of McCarthy and Buckley and others, were the first stage of an ultimately successful destruction of the ethnic (and perhaps other) local or statewide political machines and the centralization of political machine power in the two national parties, Democrats and Republicans.

The ethnic political machines no longer exist, at least not as independent power-centers. But power continues to exist in the form of political machines, those run by the national committees of the Republican and Democratic parties, run in a similar way to General Motors or Citigroup or McNamara's Defense Department. In other words, corruption controlled at the level of states and municipalities was simply replaced by corruption controlled by highly centralized and technocratic political parties, the national organizations of the Democrats and Republicans.

Political machines have greater control of the United States than before and they are machines allied to the American Warfare State; they are machines participating in the attempt by the Western, mostly American, power elite or 1% to steal all that doesn't already belong to them, in the Middle East or in Des Moines or in Moscow.

# 528 Is Putin Guided by General Moral Principles Rather Than Greed or Ideology?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2192>. It was finished and uploaded on 2016/03/15.]

I'll start with a link to another insightful and honest analysis by Paul Robinson, a seemingly true expert on Russia who is a professor at the University of Ottawa: *Patriotism is enough* found at <https://irrussianality.wordpress.com/2016/02/04/patriotism-is-enough/>.

Western analysts often mistakenly describe the people now governing Russia as nostalgic for the Soviet Union, an idea which Putin's recent statements about Lenin should surely discredit. But if it's easy enough to say what Putin is not, ideologically speaking, it is much harder to say what he is. Judging by a comment he made on Wednesday, the man himself might tell me that I am wasting my time trying to work it out.

What were Putin's words as quoted by Professor Robinson?

We do not have and cannot have any unifying idea other than patriotism. . . . You said that public servants and business and all citizens in general work to make the country stronger. Because if that is the case, then each of us, each citizen will live better, and have higher incomes and be more comfortable, and so on. And that is the national idea. It isn't ideological, it isn't connected with any party or any stratum of society.

It is connected to a general, unifying principle. If we want to live better, then the country must become more attractive for all citizens, more effective, and the public service and state apparatus and business must all become more effective. As you said, we work for the country, not understanding it in an amorphous way, like in Soviet times . . . when the country came first and then there was who knows what. The country is people, that's what working for the country means.

And Robinson ends by telling us:

That doesn't mean that Putin lacks personal beliefs. It's just that he appears to draw a distinction between what he believes and what he thinks should be the ideology of the state. Take Lenin, for instance. Putin doesn't like him. But he's made it clear that that is his personal opinion. If other people happen to like Lenin and want to have a statue of him in their city, or name their town square after him, then Putin isn't going to stop them.

I think we have trouble distinguishing between what might be called ideologies and principles. Ideologies are cathedrals, more often than not the product of some insane architect. Principles are more like general rules of building, perhaps even the materials as well.

Principles are mostly embedded in some way in our very bodies. For example, Lt Colonel Dave Grossman (in his book *On Killing*) deals with the imperfect but significant instincts found in some (many? or most?) species not to kill other members of their species. There are warriors and psychopathic sorts who enjoy killing. There are warriors who don't enjoy killing but can do it under moral circumstances without being disturbed, though they might walk away feeling genuine sympathy for the poor bastards they just killed. Most men, at least in the West, can't kill a recognizably human target without being greatly disturbed, perhaps in a slowly diminishing way for the remainder of their lives, yet men can kill members of their own species with greater ease than wolves can. Men can even be taught to see members of other tribes or ethnic groups as being non-human. Moreover, there is some reason to believe that some ethnic groups have stronger reluctance to kill, or abuse, other human beings; some have weaker reluctance.

The Fifth Commandment is written in DNA, though imperfectly. There is a principle there, which can be greater or lesser in scope. More people and types of peoples can be included in that category of human beings. Probably, more or fewer specific acts (rape, beatings, psychological torment, etc) can be included as what is to be excluded.

So, there is something that might be described loosely as a principle of non-killing which can be extended to non-violence and even non-coercion.

So, what is this ‘patriotism’ Putin claims to have as a political leader of Russia? I’d suggest it is simply a principle of bonding which leads to a significant unity not defined by accident (though based upon accidental circumstances) nor by utility—though not fully independent of utility.

Whether intending to do so or not, Putin has wisely retreated to a more fundamental stage of social morality, a stage where various peoples not yet one (and maybe not really headed towards unity) act as if one by way of a form of patriotism. Putin’s patriotism seems to certainly cover those who live near each other and perhaps are intermingled with each other, but it is more general than that.

Before continuing, I need to point out that I write and speak of a worldview as being an understanding of what exists and that I regard abstractions which have real effects as abstract being. If you wish, you can call it an effort to combine what seems right about dualistic theories of being with what seems right about more monistic or reductionistic theories of being. In these terms, an ideology is a corrupted worldview, though sometimes a once plausible worldview which has rigidified and become entrenched, even if clearly at odds with reality. It has also become necessary for the continued existence of human institutions of various sorts.

The people and peoples of the West hold ideologies which are nearly caricatures of a partially formed worldview of a more Christian West through 1800 or so. That older worldview was never more than partial, but that was a good thing because a Christianity which respects God and His works in Creation, respecting also currently existing understandings of God and those works but not idolizing those understandings, remains always open to revisions in its worldviews. During the centuries from, perhaps, the 11th century, human understandings of Creation have been growing rapidly, becoming richer and more complex, including new understandings of those parts of empirical reality which are human history and traditional human texts, such as the Bible. These new understandings often presented great difficulties to received ways of understanding the words of Jesus or the

Christian Creeds, but great thinkers such as Thomas Aquinas could deal with those difficulties. Sometimes this enrichment and complexification was in the form of technologies developed by trial-and-error and sometimes by way of more exact and more accurate knowledge of a misformed astronomy or chemistry (alchemy). But understandings which were forced by results of trial-and-error came from an honest effort to deal with a world rapidly becoming richer and more complex, partly because of growth in human communities and forms of human relationships and sometimes just because of rapid growth in knowledge of the earth and the heavens and abstract reasoning, especially mathematics. In other words, evolving and developing human communities were truly new forms of human being and they were evolving and developing in a world becoming much richer and more complex, a world of great and open possibilities.

Putin, for whatever reason and at whatever level of explicit awareness, has seemingly regressed from a 'pure' idea of Russian civilization (which may or may not be misguided) and is pushing a patriotism which covers many people and peoples, some Orthodox and some Catholic and some Protestant and some Buddhist and some Muslim. It's not even clear to me that the current autocratic state is intended to be permanent, even by the standards of this quite impermanent world. Even with smooth development and evolution of human communities, I couldn't even guess what we will see result if Russia, in its mixtures of peoples, and some neighboring countries, succeeds in generating true patriotic devotion. It might be something different from what we seen in history, in our tribes and kingdoms and empires and democracies and republics and theocracies.

In what way will it be different? A question worth addressing but the answers will be misleading and dangerous if you forget that we're dealing with a world which is more open, richer and more complex, than we humans can anticipate—God has a very powerful imagination. We can only anticipate ranges of possibilities and then try to remain openly perceptive of what happens and responsive to it.

Ideologies become still worse when they are hijacked by careerists, as seems to have happened in the United States with its system of politics which is not a democracy and not a republic, not truly liberal and not at all conservative. The United States is dominated by political machines which deliver the goods if they wish to get their required revenue. (It's certainly a distributed machine so that much of the money and benefits go to cogs or to smaller machines rather than all of it going to the national

parties of Democrats and Republicans. See Chapter 527, *Political Machines Run the United States, It's Not a Liberal Democracy* for a little more discussion.

Putin seems to be aiming at a new form of political organization but not directly—he has maybe retreated to a process of growth, of development, by way of a general principle which he labels ‘patriotism’, which seems to truly be patriotism though not of a jingoistic, or barbecuing, sort as found in the United States on those grand party days of Memorial Day and Independence Day. Veteran’s Day, which consists mostly of simple ceremonies to honor those who served and most especially those who died isn’t such a popular holiday. Who wants to plan a barbecue in Maine for November 11? Maybe it’ll be warm, but. . .

Anyway, despite seeming to be a true Russian Orthodox, Putin is trying to define a patriotism which might bind together a new Russia which would include a variety of Slavic peoples and Turkic peoples and others, of Christian and non-Christian peoples. Despite being from an autocratic tradition and seeming to be a member of an unofficial hierarchy of intelligence professionals, he has made no obvious claim to dictate who will be his successor—the truest mark of an autocrat of any sort. He also seems inclined to lay back a little and let the situation develop before responding, perhaps by temperament or perhaps by deliberate choice.

The contrast between Putin and American leaders is extraordinary. If he is corrupt, as some of his enemies strongly claim with no presented evidence, that has little effect upon his ability to take care of the interests of Russia—unlike the two thieves named ‘Clinton’ and the Wall St gangsters which are the (seemingly short-lived) dynasty founded by Prescott Bush. Though admitting that the Bushes were true patriots so long as American interests weren’t in conflict with the interests of those they served and perhaps still serve—their Walker relatives and perhaps other families from the Harriman and Brown Brothers branch of the House of Rockefeller, that isn’t enough in a complex world where such conflicts will regularly develop. If Putin is financially corrupt, he’s managed to arrange his investments to match the interests of Russia.

Even more important is the contrast with American leaders who view the world and plan their actions according to a complex ideology which doesn’t seem to match reality, though many seem to profit despite the mismatch. That profit is a loss for the country as a whole, but the think-tankers as well as the politicians and generals and weapons-manufacturers walk away

with wads of cash from each disaster Americans create overseas and others profit in a similar way from such disasters as Obamacare and the welfare system which is the real lure for illegal immigrants.

But Russia does seem to be in a bit of a mess after at least a couple centuries of misrule, brutal misrule under the Bolsheviks. And Russia has what we might label ‘entanglements’ with various non-Russian peoples. Rather than take up with pre-existing Russian ideologies, such as various sorts of Pan-Slavism or ‘right-wing’ Russian nationalism, Putin seems to have chosen that retreat to a patriotism which is not non-nationalistic but rather pre-nationalistic as well as pre-ideological—if ‘nation’ and ‘ideology’ are the right concepts to cover what is growing up. It isn’t clear what is going on, but Putin seems to be offering to lead the formation of an expanded multi-nation of sorts, a multi-nation including a variety of peoples living in or near Russia.

Could this be one of those great ironies of history? Putin and some of his allies are exploring the possibilities of that multi-nation or whatever it should be called, while Americans blab on about multiculturalism despite our proven inability to assimilate, that is—rationalize relationships with—native Americans, African-Americans, and now a variety of peoples who brought to the United States cultures radically different from those of the Anglo-American world, most of those recent immigrants not showing signs of interest in the cultural possibilities of the Anglo-American world. I would claim that, if we Americans were a people capable of respecting others and compromising with them, we should have long ago peacefully absorbed both Canada and Mexico into some sort of confederation of republics—with the current United States perhaps entering that confederation as several separate republics.

No peoples in their right minds would ever trust the current ruling class in the United States. The British peoples had struggled for centuries to ‘tame’ their Celtic and Anglo-Saxon and Norman warlords. Breaking away from those nations with their imperfect but somewhat effective ways of offering something to the already powerful and the ambitious in return for good behavior, the American peoples seem to have regressed so that we have a ruling class largely composed of soft-boy gangsters, banksters and fern-bar warriors, without even the warrior virtues of the earlier rulers of the British peoples.

Americans, especially those in the ruling class, are ignorant and bereft of imagination. Apparently, neither is true of Putin and perhaps this is

why American leaders hate him—it's the hatred of barbarians for one who seems to understand something they just can't perceive, let alone conceive.

## 529 Not Isolationism but a Short-term, Quiet Retreat

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2195>. It was finished and uploaded on 2016/03/21.]

For some reason, isolation is seen as only ‘isolationism’: a total policy, an ideological hardening of sorts. Even highly intelligent commentators of realist leanings will write and speak as if we Americans can choose only between some sort of major involvement in international relationships or a permanent and total withdrawal. This hardly accounts for all possible policies.

Yet, I would, in fact, advocate a near total sort of isolation from international involvement by the American government for the purpose of taking stock, evaluating our true interests, evaluating our true diplomatic and military needs, and then starting to prepare for a fresh engagement with the rest of the world.

I’d be pretty sure that an honest, self-examination would reveal that we have few solid and trustworthy experts for most countries or peoples in the world—not every people in the world has their own country or is likely to have one any time soon. Nor do we have so many experts in the setting of strategy for the purpose of meeting national goals of security and prosperity and so on; our alleged experts seem mostly to specialize in meeting the needs of the oil and gas industry or the weapons producing industry or the financial industry.

By experts, I mean those who speak the relevant languages fluently—a thick accent, as with Kissinger, is allowable; those who know the history and the modern culture; those who have some in-depth understanding of the technology existing or likely to exist; those who know the geography includ-

ing the situation regarding natural resources. It would seem to this outsider observer that American expertise in international matters now consists of knowing which countries are of interest to natural-resource extractors from the West and of being able to draw possible pipelines onto a topographical map before getting to work to overthrow dictators and elected heads of government without much distinction.

Even more dangerously, American foreign relations are held hostage to political campaigning needs. While we should realize that these campaigns are tied, by donations and in other ways, to oil-companies and weapons manufacturers and bankers and with ideologists who would see the reduction of entire regions of the earth to abject poverty and powerlessness before the American power-elite, we should also realize that American politicians are far from being without power, far from being mere puppets of other sorts of powerholders, though the intellectual and moral degradation of politicians and voters allows other sorts of powerholders to often manipulate the policies of the American government to their own purposes.

We, the American people should call a timeout and send ourselves into a corner for some quiet meditation on the mess we've created around us. If we continue even a moderated intervention in foreign affairs, we will continue to pass money over to the true criminals in our midst and we will continue to destroy this country and to greatly restrict American involvement in international affairs when we, inevitably, find our country as one of several great powers or even as a second-rate power wondering if the Chinese or the Europeans will extract compensation from us or inflict vengeance upon us. We are in danger of becoming a state and a people distrusted and hated.

## 530 The Issue Is Not the ‘Depth’ of the State but Rather the Moral Disorder of the West

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2202>. It was finished and uploaded on 2016/03/29.]

The title tells it all, but—of course—I have a bit more to write.

We are somewhat realistic about the inner-city results of disorder in modern human communities. Gangsters come to local power. Thuggish young men begin to form gangs which fight for control of the distribution of heroin and other drugs in a few blocks or more. They fight for control of street-walkers in parts of their city. They begin protection-rackets and demand payments from merchants and bookies. Yes, even bookies and that puts them in a struggle with established gangs, even the fabled mafia which perhaps had softened itself by taking on a limited role when they had first formed during an era of weakening but still substantial moral order.

Human nature is human nature. During periods of moral disorder, men and women of disordered moral characters are to be found in banks and the ranks of politicians and bureaucrats, on Wall St and even in the Pentagon. Higher-level crime might be more sophisticated and sometimes less violent, at least during the years of prosperity and highly profitable companies ripe for embezzlement and other forms of thievery. But gangsters make money according to their particular talents and opportunities. To take just one example, there were some gangsters in the CIA at the beginning around 1950, or at least men willing to play the role or to work with the Mafia or with, say, anti-Communist warlords of rather low moral standards.

I could write much more about heroin manufacture and smuggling and

of the CIA involvement in such matters during those years in which even good men committed terrible crimes, very destructive of Western structures of order, because they thought such was justified by, even made necessary by, the struggle against Stalin and Mao and various others. It's perhaps more informative for me to point to the work of Bryan Sykes (see [https://en.wikipedia.org/wiki/Bryan\\_Sykes](https://en.wikipedia.org/wiki/Bryan_Sykes)) and other geneticists researching various existing or deceased populations; there are also many historians and anthropologists and others working the same territory from a slightly different angle. They've discovered that men with a talent for **organized** violence leave a disproportionate number of descendants as a result of their success during periods of disorder. Tens of millions of men in Central Asia carry a Y chromosome (see [https://en.wikipedia.org/wiki/Y\\_chromosome](https://en.wikipedia.org/wiki/Y_chromosome)) which almost certainly comes from Genghis Khan (see [https://en.wikipedia.org/wiki/Genghis\\_Khan](https://en.wikipedia.org/wiki/Genghis_Khan)). There is allegedly an emperor of ancient China who left even more descendants. Similar statements, though with a few millions and not tens or hundreds of millions, can be made regarding an ancient High King of Ireland, Niall of the Nine Hostages (see [https://en.wikipedia.org/wiki/Niall\\_of\\_the\\_Nine\\_Hostages](https://en.wikipedia.org/wiki/Niall_of_the_Nine_Hostages)), who left many descendants among the Irish Gaels in Scotland and Ireland. (In *Saxons, Vikings, and Celts: The Genetic Roots of Britain and Ireland* [130], Bryan Sykes writes about this and even about an "Irish" founder of several important Scottish clans who turned out to have had a Scandinavian Y chromosome.)

Of more recent origins: a majority of Y chromosomes in modern Mexican men are of Spanish origins though other genetic evidence indicates nearly all mothers were native Americans.

These genetic facts speak more eloquently than mere tales of conquests and of wars of the brutality and exploitation practiced by men who are skilled in the arts of organized violence. They kill some men and wipe out the family-lines of others by providing such opportunities to their own sons as to allow them to greatly out-reproduce commoners. And we think that powerful and ambitious men really respect the lives and property of others? Some do, but 'some' ain't 'all'. Many of the most powerful and ambitious men in history, including some Popes and other religious leaders, have been gangsters. Gangsters don't always have the freedom to act according to their inclinations; likely there are many men in history who succeeded in honest and moral ways but would have been willing to act as gangsters if necessary to reach their goals.

Gangsters are very prominent during periods when civilizations or lesser regions of settled peoples present soft targets. During periods of moral disorder, even a civilization or lesser human community well-ordered in the past will present a soft target for both externally born and internally born gangsters.

Oddly enough, and as was true of the ancient warlord-emperors we know from the Bible and other sources, these violent and thieving men seem to have played a role in building the ordered structures of human communities: as some historians say: “Stationary bandits protect the sheep against the nomadic bandits.” This is because they are shearing and slaughtering the sheep in a sustainable manner.

Yet, even the most brutal of great conquerors and other nomadic bandits have their virtues, if only those of warriors supplemented by those of political founders. The systems built up by the violent warlords of the West, and others of a more refined moral nature, over the past thousand years and more are breaking down. The nomadic bandits are in the saddle again, though not always truly nomadic—some might be better labeled as ‘parasites’ or ‘fern bar bandits’. In recent generations, some barbarians have grown up in the midst of the great cities and they are itching to take advantage of disorder, stealing with the pen or with knowledge of the law or by violence if so inclined. The structures, including those created by such violent and brutal men as William the Conqueror, are breaking down—at all levels.

Reality.

Very disedifying for many, including those naive Christians who think that the gentle Jesus of Nazareth overcame in this mortal realm the brutal aspects of reality shown in the historical works of the Old Testament and interpreted, in some sense, by Isaiah and Jeremiah.

Didn’t happen. We still live in the same world as Uriah who was abandoned in battle to die at enemy hands—at the orders of King David so Beloved by God. Why? So David could cover the great sin he’d committed by impregnating Bathsheba, the wife of Uriah.

Our world is one of huge and greatly complex political and economic and religious communities, but it’s still the same—in some ways—as that world of brutal Semitic warriors fighting for control over such tiny regions of the world and over such small piles of wealth. It’s also a much different world if only because many of the gangs seem to live at least partially inside the power-structures we inherited from a world that no longer exists and

the members of the various gangs are sometimes embedded in those power-structures of governments, banks, corporations, and the Catholic Church. It has become possible, for example, for gangsters properly positioned, to carry out large-scale criminal conspiracies against the current powerholders, gangster or not, and against large numbers of private citizens and the various human communities. This might involve the destruction of an elected office-holder or a false-flag event or a pseudo-terrorism event of a scale making possible large speculative profits on the stock-market as well as the ensuing profits from criminal wars. It might involve the looting of gold vaults or maybe the looting of gold being transported by other thieves or by smugglers. MH-370 was flying the largest volume gold-smuggling route in the world, Kuala Lumpur to Beijing, and might have had some tons of vaguely described cargo; doesn't prove anything but it raises questions and points to similar opportunities for men of low moral standards and a high taste for risk.

I most certainly am not saying that all of this is done by gangs inside the CIA or the Russian FSB or such governmental agencies of the world, though I suspect there are revolving doors between private gangster organizations and the CIA/IMF/FSB/etc, just as there are revolving doors between the money-center banks and the SEC and other regulatory agencies. And we have to remember that Wachovia Bank wasn't just fined for laundering the money of Mexican drug-lords, it also had more than \$100 million of drug-smuggling profits seized; the banks and corporations might well have their own gangsters of the violent sort and not just the sort who steal through hiding profits or manipulating their own stock and the stock of other companies.

Acknowledge the stink of moral disorder and remember that Oxford- and MIT-educated financial experts, engineers, and bureaucrats will be better at carrying out Deep-State and false-flag criminal conspiracies than the illiterates who populate Al-Qaeda or the locally-grown drug-gangs. Again, let's remember that these become more possible, even more common, during periods of moral decay.

The world is neither a realm of Satan nor Sunnybrook Farm. The human race is neither fully depraved nor at all angelic. And something of the depraved man, something of the angel, is to be found in nearly all human beings.

The world is what it is, what it was made to be by God. The human race is also what it was made to be by God: a species evolved from apish

creatures and a species still struggling raise itself off its knuckles. More relevantly, so far as this essay goes, the human race has a very weak version of some laws, including the Fifth Commandment, written on its collective and individual hearts. We need to nurture what is good. Perhaps God lets loose the horsemen of the Apocalypse just because we need terrors and suffering if we are to be good in a tougher and more lasting way.

For those of us who think this world is a work of God and those who think of it in other terms, the world is what it is, in both the goodness and the disorder discussed by serious historians and moral theologians and evolutionary theorists and novelists and others. Currently, we in the West and perhaps some others in the world are going through a period of serious collapse into states of disorder. Until we make peace with the world as it is, we have no chance to return to a state of the moral order which makes possible peace and prosperity.

If we come to our senses, maybe we can even have a sustained state of moral order so that men of more peaceful inclinations can leave peaceful descendants; this was the case to a surprising extent during the last few centuries of the Christian West. A failure by Christians to properly engage the modern world, in its questions and possibilities, and the ensuing development of a secularism at a scale never before seen, killed the West and the various sorts of moral order it had established, however defective and incomplete those moral orders had been.

Who knows for sure? We could perhaps know a little better if we came to understand these issues of moral order and other sorts of order. And it will take work as some might know from having at least glanced at writings or documentaries about the discoveries by mathematicians and other scientists about the true nature of order. In this world, it seems to be almost always self-generated and not imposed in an hierarchical way—an issue which will cause great disturbances to the shrunken minds and bloated hearts and hyperactive hands of many, perhaps Catholics most of all.

Perhaps, in choosing hierarchies: kings with golden crowns rather than men with a hand on a plow and Popes on thrones rather than on fishing boats, we sow the seeds of disorder in our individual and communal selves.

# 531 Why Does a Developed Country (the United States) Have a Gangster/Warlord Ruling Elite More Suited to a Rising Barbarian Country?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2213>. It was finished and uploaded on 2016/04/27.]

I've been reading serious history books regularly over the past couple of years and a bit more infrequently for much of my reading life before that. My knowledge isn't so broad as that of many scholars in the communities of academics or even the communities of commentators in the mass media or the alternative media on the Internet. Yet, I've found that I sometimes can find hints of patterns in situations where even most deep-thinking historians only provide a fact-based narrative. Such narratives are important, but raw facts are essentially concrete randomness, manifested chaos—organizing facts chronologically and geographically doesn't nearly eliminate that chaos.

It's the transition from raw facts to facts ordered to some tentative or firm patterns, patterns necessarily set in a global understanding, that helps us to better and deeper understandings of the general human condition and that of, say, that of humans living in a river valley in the western region of Massachusetts. That transition can also produce ideological distortions, but I'm willing to take the risk if only because I tend to work from my new understanding of empirical reality rather than starting from any strongly formed political or social beliefs which can rigidify into ide-

ologies. For example, I have no particularly strong commitment to any of the accepted forms of political organization because I don't think that individual and communal human beings as we know them fit well into the structures of monarchy or oligarchy or aristocracy or democracy, though we Americans, as one example, do our best to pretend to be capable of self-rule when evidence is growing that the United States is not a democracy, is not well-governed, and is not morally well-behaved in our internal or external activities.

In these terms, my beliefs underlying my thinking is simply a firm belief in the Christian Creed (choose Nicene or Apostolic or Athanasian or any other similar statement). These beliefs allow God the freedom to have created a world, and human being, to suit His purposes and we can—mostly—read those purposes out of the empirical world which is part of His Creation.

I'll concentrate in this essay upon a level in between all of humanity and the residents of the Chicopee River Valley: the United States which is a region of highly mobile and thus interpenetrating nations and classes held together by a highly centralized political State (Washington) and an excessively financialized economic system (Wall Street). This is a form of order only loosely tied to traditional beliefs, moral and otherwise, of the West.

How did we get here?

Well, the legend tells of brave souls seeking religious liberty in the New World. The reality has more to do with a Europe, mostly England and Scotland and Wales to start, in which young men and women were acquiring education and gaining knowledge of a world wider than their village or their neighborhood in London. Unfortunately, opportunities—including the basic ones of employment or entrepreneurial possibilities—weren't developing nearly as fast as these young men and women were being freed from the constraints and securities of excessively local societies. It wasn't just that these men and women partially released from parochial lives couldn't find jobs "good enough" for their ambitious and literate selves. There were not nearly enough jobs for all of them. From the 1600s onward, some came to the United States (or the English/British holdings or trading centers elsewhere). You can check out the 'revisionist' writings of Bernard Bailyn (such as *The Peopling of British North America: An Introduction*) and others who discovered surprising amounts of documentation on those emigrating from the British Isles.

The United States wasn't some sort of "city on the hill" but rather a place where many could find ways of making a living and maybe even make a fortune. Most of these men and women seem to have been inclined to hard work and to peaceful and stable lives, though willing enough to make war against the natives. See Chapter 408, *The Need for Abstractions in Moral Self-understanding* where I tried to apply deep reasoning about the nature of human being and being in general to find patterns where most will find raw facts which can be harvested for supporting evidence of one or another ideology such as those centered around: the superior European Christian men at work building that "city on the hill" or the brave native American warriors fighting off vicious invaders or the victimized native Americans who never had a chance against a people who weren't superior but they were, kind of, you know... superior. There is truth in some of these ideological renderings, some great amount of truth even in the tensions between each of the conflicting ideological views. There is distortion as well, but—even more importantly—a lack of insight into the human condition, including that of the individual and communal human beings of the residents of the eastern seaboard English colonies and the United States which arose from them.

A civilization isn't set in a world of raw facts. That way lies barbarism. A civilization is, at root, an ordering and an understanding of those raw facts. In our current lack of such an ordering or such an understanding, we see clear evidence of the advanced state of decay of Western Civilization. So it is that I'll provide a tentative answer to the question which is my title: *Why Does a Developed Country (US) Have a Gangster/Warlord Ruling Elite More Suited to a Rising Barbarian Country?* To throw in a wrinkle, I'll provide an answer which emphasizes the contingency and chaos in the quite raw facts of recent American history:

- The ongoing failure to assimilate African-Americans or even to try to understand why this assimilation hasn't happening and shows no signs of happening for most African-Americans.
- The mishandling of our relationships with native Americans has continued in the form of a large unassimilated people who are largely ignored as our politicians seek desperately for non-European peoples to bring into this country with the illusion they will be assimilated.

- The criminal and unjustified wars against other countries—possibly Korea and certainly Vietnam and Iraq and Libya and now Syria.
- The corrupting interventions into the internal affairs and foreign relationships of many other countries—nearly every Latin American country if we go back to 1900 or so, the Philippines from the years of our brutal and murderous war of 1899-1913, Pakistan since its founding, Iran from the overthrow of Mohammad Mosaddegh in 1953 through the current deceitful behavior of the American government—and Kerry is quite proud of this—in not living to its side of the deal in the Iranian abandonment of some sorts of nuclear research, Russia during her prone years in the 1990s, and so on.
- The regular occurrence of events in recent decades, such as the assassinations or attempted assassinations of non-mainstream public figures in the 1960s, the destruction of Nixon in light of recent revelations by journalists who've actually listened to the White House tapes that George Bush and John Dean knew of the Watergate crimes before Nixon and Mitchell, the Iran-Contra scandal in light of plausible claims that it was mainly intended to protect the CIA's heroin factories in the borderlands of Pakistan and Afghanistan, the unexplained crash of Flight 800, the ever-famous 9/11 in which affair we can readily find as much circumstantial evidence of participation by the government of Israel and the CIA and the US Air Force as we can find of participation by the Royal family of Saudi Arabia.

Let's get one thing straight: from at least the time that the prophet Jeremiah was warning the people of Israel, intelligent skeptics have known that many wealthy and powerful men will kill or rob others when enough wealth and power are at stake. They will kill innocent people, even engaging in attacks upon population centers or unleashing useful barbarians or mercenaries. John Adams was aware of this general historical (that is—contingent) truth and apparently engaged in ultimately successful efforts to convince Thomas Jefferson that wealthy and powerful men will do what is necessary to pass on that wealth and power to their sons—no matter what the American illusion is of equal opportunity. Most of the advantages will come to the privileged children because they go to school with each other and marry each other's siblings and so forth, but murders and even mass-murders and epic-scale robberies have never been out of the question

when enough is at stake. And we should remember the always profitable manipulation of gold-prices, stock-prices, currency values, and so on. And, sometimes in all periods and regions of human history, such crimes can result from the efforts of vassals and other subordinates to take over or just to join their former masters in the top levels of wealth and power.

Such crimes require professional, unbiased, and competent investigations of the sort they haven't gotten in recent American history. I'm not going to attempt to determine who really did what—anyone who thinks Al Qaeda or even Saudi Arabian intelligence and military personnel could have pulled off the well-coordinated, technically demanding attacks on 9/11 is free to do so; belief in the Easter Bunny is optional. I am going to claim that we began as a country with wonderful possibilities but a dangerously inadequate understanding of human nature, even as made evident in the Bible and in other historical writings as well as the simple and well-justified skepticism which Thomas Jefferson found in illiterate French peasants but not in the supposedly more sophisticated American citizenry. He claimed Americans to have a perverse sort of literacy (literalistic deformations of texts and other presentations of facts or narratives?) which leads to an invincible ignorance. This ignorance still exists.

From the beginning, Americans were a hardy people who stood on their own two feet when it came to clearing woods to grow corn or to build houses or churches. They were also a people unconsciously dependent, **fully** dependent, upon European civilization in such a way that it was water to our fishy selves. Thus it is that we invite many non-European peoples, as well as having brought Africans in chains, thinking that we are all generic human beings. Exposed to a life which is simply human—middle-class American life in recent decades—and not a limited and defective type of human life (that of non-Americans), all immigrants could adjust easily. It was simply a matter of tossing aside the corruptions originating in the Fall of Man and taking on the life of that true, purified human being—us in the US@. As to the slaves from Africa? It seems likely the Northeastern slave-traders and Southern slave-owners alike considered them to be so primitive, or maybe child-like, as to be receptive to a permanent role of doing menial labor for more complete or more mature human beings. Some improvisation is necessary with any sort of ideology, even that which truly underlies American propositional beliefs such as those arising from John Winthrop's vision of the "city upon a hill". (See [https://en.wikipedia.org/wiki/John\\_Winthrop](https://en.wikipedia.org/wiki/John_Winthrop).)

If I tell someone about some recently declassified information that, yes, the United States (CIA and General Schwarzkopf the Daddy) overthrew a legitimate, democratically elected Iranian government in 1953 so that the US and UK could take Iran's oil without paying taxes or royalties or even offering jobs to Iranians, they shrug and move back to telling me how the Iranians aren't to be trusted because they don't think rationally like Americans do. Apparently, Iranian man is a close cousin to Neanderthal man and, like that robust man, would still be using paleolithic technology if not for contact with us who are truly modern men, wise-wise men or *homo sapiens sapiens*.

So it is that the citizens and other residents of a country once potentially great, and perhaps that potential will re-emerge, live in a world which is dream-like, even hallucinogenic. The country was started to provide economic activities and attracted men and women willing to work very hard for the chance to own their own farm or blacksmith shop or even simply a house in Baltimore in which the wife engaged in some sort of profitable home-craft and cared for the 8 children while the husband went off to build those famous Clipper sailing ships. Even in the 1960s and early 1970s, when I was a pre-collegian, even as the bloody war in Vietnam raged and was waged, I had a sense of some shallow but strong sort of American decency. Even as more and more men went to work for bloated corporations, including some aircraft manufacturers which were part of a more respectable but already dangerous American weapons industry, there was still a sense of stability, of respect for strong family ties, even a sense of place more readily associated with the American South. Sunday school picnics were truly part of our lives—up to my 12th year or so—and not a joke. Little league was in a proper proportion to the totality of human life and teams were sponsored even by churches and other organizations (including insurance agencies and other businesses) whose leaders assumed and quietly demanded a respect for Sunday and for good sportsmanship.

Many, perhaps most, Americans never developed a proper skepticism about men who seek wealth and power. Note I say “seek wealth and power” rather than, perhaps, “seek to do well while building great cars.” Countries formed by heavy application of broadswords had their gangster experiences early; in some cases, including England and the France in which lived those skeptical peasants Jefferson studied, countries went from constant local warfare between warlords to a greater order and stability, often because one warlord—call him Charlemagne if you wish—used his broadswords effec-

tively and intelligently against the lesser and greater in his realm. Those who couldn't act properly were sliced in half, top of the skull to the groin. And, over time, the surviving warlords and their descendants were integrated into their countries, receiving certain prerogatives and public honors in return for good behavior and for helping to keep others behaving well, or at least peacefully enough that the growing central power could collect needed taxes.

Americans didn't have to conquer warlords during the early generations of this country and never had to submit to a king who would bring those warlords under control in return for that submission.

Warlords are a form of gangster and that is a type of human being who can be found in all times of history and among all peoples, though some differences exist between Genghis Khan and William the Conqueror, between Ivan the Terrible and Henry VIII@. We now have a plethora of gangsters in the United States and that includes a heavy percentage of leaders in Washington and on Wall Street—though some are a bit softer in their own persons than was William the Conqueror. We've had them for at least a few centuries but they had few opportunities until the United States was founded and wealth and power began to consolidate and grow. In other words, a gangster is a pretty small fellow in lightly populated colonies with people struggling to feed themselves and make a future for their children. And, Americans, despite sometimes being good fighters as we saw in Morgan's riflemen from the western regions of Virginia, weren't much inclined to warrior ways as were, for example, the pastoral peoples disciplined into armies by Genghis Khan and by Shaka Zulu.

The gangsters began to show themselves in American history with a lot of probably justified smuggling to avoid British taxes and with early participation in the opium trade in East Asia; after all, there wasn't much New England could make or supply that the Chinese would take in return for all that blue and white porcelain dinnerware. Americans got into that opium trade in a bigger way after England, desperate to balance the trade between China and India before China could come to own India, fought wars for the right of English drug-dealers to exploit human beings of the Chinese persuasion. In the latter decades of the 18th century and early decades of the 19th century, Americans of mostly the northeastern variety got into the slave business in a big way. Men with "the moral character of gangsters" from all countries and all ages will make money trading other peoples as chattel slaves, trading substances that destroy other human beings from

inside out, stealing the wealth of other countries or that of their fellow-citizens. Quoted phrase is from Lord Acton who noted the problem with centralized and powerful governments is the way they attract those sorts: men with “the moral character of gangsters.” I’d say that all piles of wealth and power will attract such men, but Americans seem to assume that the gentlemen of honor, the George Washingtons, and even the bastards of honor, the Andrew Jacksons, are the ones who end up controlling the wealth and power of, say, the American government. Could be so, if the American political system had even as much integrity as the old-fashioned ethnic political machines, but the American political system is as well-ordered as the streets of our inner-city regions, as well-ordered as the money-center banks, as well-ordered as the boardrooms of our weapons manufacturing companies which resemble too well their depictions as true centers of evil in some science fiction movies.

Our government and our money-center banks and some of our corporations are run by men who are Harvard-trained and Stanford-trained gangsters, having no better moral character than the young thugs fighting for control of the drug-trade in inner-cities. And we have no social systems to keep them under control, no immune system which can handle these parasites run amok in our body public. And Americans remain oblivious to the real situation, some believing in universal conspiracies run by wizards in finely tailored business suits, the vast majority seeming to believe the world is run the way we learned in 3rd grade social studies and 12th grade American Government classes. The parasites will continue to suck out American wealth and misuse American power until the country collapses in one way or another. There is nothing that can rescue the United States of noble myth even if American men were to recover their balls and their brains. The parasites are attached to every major organ in the body public of the United States.

[For a more optimistic viewpoint—over the long-run when I’ve been long in my grave, see Chapter 484, *The Fragmented States of America*.]

# 532 Exceptional Could Have Been US

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2225>. It was finished and uploaded on 2016/06/01.]

Over the prolonged founding of the United States, we were bereft of the baggage of the past. In this lay our great promise.

Over the prolonged founding of the United States, we were bereft of the baggage of the past. In this lay our possible madness, but so strangely decent and often gentle and kindly form of madness.

Nowadays, historians hold newer opinions, and new than that at times: the colonies which would one day form the United States were settled in the main by men and women looking for a job, to put it a bit tersely. They were British people of some education or serious vocational training and with little hope of any good employment if they remained in the British Isles where population was growing even faster than the opportunities generated by the early (or even pre-period) of the Industrial Revolution. Those people dreamed of a decent pay for either entrepreneurial efforts or for honest labor for another, and those people were willing to work hard and smart to reach their dreams. A decent pay but also respect, a chance to form a household, perhaps for an existing family or for a new family formed in the New World.

A very modest dream for most. Few held even the dream of substantial but not spectacular wealth such as that achieved by Benjamin Franklin or, God willing, the flashier wealth achieved by the trader (and smuggler) John Hancock. We had our boasters displayed so well, as I dimly recall, in the characters of Davy Crockett and Mike Fink. We had our boosters and hucksters who played so important a role in developing the American West, building shacks with false-fronts planted in almost arbitrary spots in Kansas

to entice settlers and to trick the railroads into adding a station. We had our slave-traders and opium-dealers (the second category including Russell & Co with its operations officer, Warren Delano—grandfather to FDR). We've had our political scoundrels, including some who benefited from the conveniently timed demise of political opponents. We've had professional politicians who never made huge salaries given their needs to entertain and be seen in the best of clothes in the best of places; those same politicians seemed to have saved so many thousands of dollars out of their spare pennies so that they had tens of millions by retirement from the White House or Senate. The same stuff we sneer at when it happens in some Latin American banana republic or some African country manufactured to the needs of Western natural resource companies. Same old, same old.

And, yet, as someone who lived in a small town in a part of New England that knew few blue-bloods, I remember a basic decency that was a bit like those sit-coms on TV—but a bit more real and less plastic. It was perhaps inspiration for DisneyWorld and for Westworld, but still part of God's world. Hannah Arendt might have been right in her claim that, like the German middle-class of the 1930s and 1940s who built and ran the chemical factories and made the trains to Auschwitz run on time, Americans are better described as nice than as moral, generous and well-behaved in good circumstances and possessing little in the way of the moral courage which is needed in tough circumstances. We go along, even with leaders we've begun to suspect of being low-grade in morality or competence.

We weren't exceptional, though our citizens who had never been overseas but in US Army uniforms did read *National Geographic Magazine* and sometimes popular history books or middle-brow novels which seem to have great intellectual depth compared to most of what's published nowadays. We didn't need graphic depictions of bodies being ripped apart by bullets—an empathetic man or woman, boy or girl, could read Kenneth Roberts' *Arundel* and understand the sufferings of the New Englanders and Virginia riflemen as they made their way up to Quebec under the command of Benedict Arnold and Daniel Morgan. The war novels of James Jones and Norman Mailer told what an intelligent reader needed to appreciate the physical and psychological horrors of more modern forms of war.

And some of those less-traveled Americans, most of whom had never eaten in Thai or Lebanese restaurants, could identify a good number of countries on the globe. They knew the American states and cities and river systems. Many had some serious knowledge of the two World Wars and

maybe the Civil War and Revolutionary War. Some even could name some of the American Indian tribes which had lived nearby and could talk of the horrors committed by red-man and white-man alike. If biased a bit by current standards toward isolation, they could often justify their stance by some knowledge of and a gut-level feeling for the complexities of the world.

And those Americans were reasonably hardworking and pretty well-balanced in time they spent on other parts of their lives—family and church and maybe military reserve or guard unit. The children were also a bit better balanced. It was important to know the standings of the major league sports teams and of the power hitters in the Major League home-run derby and the goal-scorers in the NHL; it was important to run inside and catch the score for those early Super-Bowls; it was most important to spend Saturday afternoon playing pick-up baseball or tag football. It was good to spend Sunday afternoons at family picnics or church picnics or at the lake for those lucky enough to have an uncle with a cabin and a boat.

It was a country where people tended to get complacent about job skills and about the school system—we were on top and would never have to worry about competing with factories on Taiwan or about finding our children in university classrooms competing against Bulgarians who'd already had two or three years of (American) college-level physics in their high schools. Wasn't even on the horizon, though in 1973, when I was trying to figure out why I was floundering so badly in my freshman year of college, I could walk through science and engineering buildings and see a high percentage of Asian graduate students.

Over the prolonged founding of the United States, we were bereft of the baggage of the past. In this lay our great promise.

Over the prolonged founding of the United States, we were bereft of the baggage of the past. In this lay our possible madness, but so strangely decent and often gentle and kindly form of madness.

In past writings, I've noted the claims of Ortega y Gasset that the West entered a serious process of cultural decay in the 19th century because large numbers of peoples and people were freed from parochial lives and their leaders failed to raise them to a state appropriate for a cosmopolitan people. Instead, those leaders sank down into the vulgar masses to enjoy, in the modern setting, movies making the Three Stooges seem sophisticated and television shows teaching ideas which would have been considered morally perverse in Greenwich Village back in the 1950s. Clergymen and teachers, politicians and novelists, musicians and painters, prepared the way for the

low standards of mass entertainment and mass education. Remember—under such circumstances, standards will be low if larger markets are to be created even if the various peoples have rich and deep cultures. In recent years, the music industry has produced interesting and good quality collaborations between, say, African and Celtic musicians. Earlier such collaborations, sometimes unconscious and over generations, had produced some interesting and even some good-quality results, but mostly profitable ephemera, in rock-and-roll and country genres. Too often, what resulted from efforts to appeal to teenagers, white and black, urban and rural, Northern and Southern and Western, was sheer junk celebrating emotional and cognitive immaturity, as well as celebrating various moral and political ideas disapproved by most parents, though many of those parents were the ones who turned the television set to the programs which were the most questionable. And now such low, trashy standards prevail throughout American society.

We were a people of interesting innocence, streaked with that corruption which led morally conservative men and women to watch Norman Lear's fare along with their children. That innocence, cynical and likable at the same time, left us generally vulnerable to that cultural Marxist march through our institutions of education and entertainment, of journalism and political activities, of serious culture and religion. So it was that Lear and other pseudo-sophisticates, ignorant and untalented men and women with snooty attitudes, were able to complete that American process of passing from barbarism to decadence without going through a stage of civilization in between.

We didn't mature out of that innocence which sheltered us while building much, and tolerating crimes by our most ambitious against Amerindians and Africans—as they practiced for what they've started doing to all of us. We, as a people and a country, became the image of Dorian Gray—self-serving degeneracy gilded with a thin layer of likable innocence.

Ah, but we can at least cast a substantial part of the blame on some others.

Because of the moral irresponsibility of European leaders in the first half of the 20th century, we Americans were thrust into a role of world leadership for which we were far from ready even if we'd been able to handle the morally degenerate exploiters arising in our midst. We've performed as badly in the international realm as could have been feared, failing to even learn from experience, even those post-9/11 kinetic activities resulting in the

death of thousands of American soldiers and the psychological or physical maiming of tens of thousands of others and the deaths of probably better than a million people in Iraq and Afghanistan and Libya and Syria and the tribal lands of Pakistan. And to no purpose. We are no safer inside the United States, not that we were ever in so much danger as the residents of most other countries, and we've destroyed other countries while killing those million people in Southwestern Asia.

Only time will tell if we Americans have destroyed our capacity to be either a good or a great country, let alone both at once. For now, we're best described as a juvenile delinquent of a country.

# 533 Dorian Gray's Everlasting Day Off

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2232>. It was finished and uploaded on 2016/06/14.]

As I move forward on my project to make sense of human being as both individual and community, I'm reading in certain areas of mathematics (topology and differential geometry and abstract algebra and others) and also trying to keep up my readings in history and literature. The project threatens to swallow me at times, but I'm finding a sense of peace and even of wholeness as I seem to be recovering, as I approach the age of 61!, from some of the damage done to me by my failure to pursue my own interests and talents, by my failure and the failure of the adults in my life to help me develop both mind and moral character. Sadly enough, I can say only partly tongue-in-cheek that I'm recovering from being a modern American and a modern Christian—as I partly recover my mind and moral character.

Even by the mid-1960s—I was born in 1955, American culture—including most certainly the educational systems—was degraded so that it failed to nurture intelligence and moral character; it seems in retrospect that parents and educators were advancing the interests of a shallow sort of pop culture—television shows of the caliber of *The Monkees* and *Laugh-in* and rock-and-roll music and obsession with pro sports and all that—as if deliberately disrupting a healthy maturing process. The minds and moral characters of an increasing share of the American youth were being increasingly deformed and stunted; it's hard to see how the process could advance much further than it already has in 2016, but evil has often surprised those who tried to play the role of prophet or seer. In any case, even truly loving parents, other relatives, teachers, clergymen, and so on played a willing role

in deforming and stunting minds and moral characters under some strange ideas about childhood and young adulthood and how it was good to simply delay entry into full adulthood rather than to gently guide the maturing process, trying to keep it at a pace natural to the particular children or young adults.

This glorification of youth, this effort to see children as the true Adam and Eve—pre-fallen human beings, has served the interests of some corrupt and unwise members of the power-elite (or whatever you wish to call them) but the bulk of Americans, as if following Tocqueville's script, had started the process in some ground-up manner as if we were a chaotic mass with a tendency to self-organize into some state of perpetual youth, as if we wished to be a country of Peter Pans. Tocqueville had noted, in a book published in 1828—*Democracy in America*, that Americans were capable of overlooking even the most obvious of facts if those facts were in conflict with our own favored view of things and it would seem that our favored view is centered around some sort of Eden populated by Peter Pan and the Lost Boys. As some have recently written, Tocqueville—in the midst of saying many good things about Americans as they were and as they might be—feared we would develop into a self-brainwashing, self-censoring people living gladly under a gentle sort of totalitarianism.

As I approach my 61st birthday, I look into the mirror and see a gray-bearded fellow who matured enough to marry and form a family at about the age of 35 but had fallen into a state of poverty. I had been, from the age of about 12 to 35, a terrible under-achiever, first in failing to persist in pursuing my true interests of physics and mathematics once it had proven to be a difficult task—especially for someone with a weak secondary education, and then had failed to put in an honest effort in pursuing—quite reluctantly—a career in actuarial science and then...? Am I succeeding in what I think to be a true calling of reviving first my own mind and then providing some encouragement and maybe substantial ideas for the reviving and nurturing of other minds? Can such a revival occur and perhaps bring about a revival of Western Civilization? Can it at least help in the formation of a Christian civilization in some other region? Is it merely the meaningless flounderings of a man who has wasted his life?

It was a weak or immature moral character that kept me from digging in and doing my duty as a student and then as a well-paid insurance professional. I had good reason to feel cheated in life, but there is only a small percentage of even highly talented human beings who have gotten a good

chance to develop their talents. For all we know, some of the illiterate slaves of Plato or his friends might have been far smarter than any of the famous Athenians. There might have been an unschooled farmer born in 1770 who was potentially a better mathematician than was Gauss. Most certainly, there are men and women in the United States who are far better qualified to be President or Secretary of State or CEO of JP Morgan/Citibank/General Motors than those who have held those offices in recent decades; it is quite possible that some of those better men and women might have been kept out of power just because they had moral character.

What was was? Does it do any good to dwell upon these issues? Does it do any good to give up some chance of prosperity to recover a mind or a moral character? Will it help future generations in any way?

Can I even claim to have a firmer and more mature moral character as I live in poverty, surviving on the kindness of my sister and other relatives and friends?

If so, what does that say about a country and a (decaying) civilization which fails to support serious efforts in literature and philosophy and theology and the unification of knowledge (all of the preceding plus empirical science) yet throws millions a year to felons in the NBA and to those who make movies based on kiddie sci-fi shows (Flesh Gordon → Star Wars and Star Trek) and kiddie cartoons (Superman, Spiderman, Flintstones → the obvious) and to those who write books or make adult movies that make the 1950s with its middlebrow novels and history books and gorgeously filmed distortions of history look like a revival of the Elizabethan Age?

Arguably, Dorian Gray has stepped out of his picture to discover the world is in a far greater state of moral decay than he was and maybe still is. And there are signs that Ferris Bueller's Ferrari is choking and grinding to a halt; what will such a people do when they have to fix all the broken and non-maintained stuff around them?

# 534 It's Not Hypocrisy, It's Brainwashing Deeper than Orwell Foresaw

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2251>. It was finished and uploaded on 2016/07/26.]

Recently, I read *The China Mirage: The Hidden History of American Disaster in Asia* by James Bradley. In early chapters, Bradley describes the American role as junior member of Great Britain's Opium Trade in China. The Americans were freeloaders of a sort, relying upon the British Navy and Army to prevent the Chinese government from protecting its citizens against these predatory Western gangsters. To be sure, the British wouldn't sell Americans any opium from their plantations in India and Americans were forced to transport opium from Turkey.

Are Westerners born to be drug smugglers and slave-traders? Not really. The young men who came from the northeastern parts of the US and entered the China Trade were from respectable families, mostly of modest economic means though sometimes of relatively high education. They set out to make a fortune and to make it fast. As was probably true of most American slave-traders preying on Africans (and on future generations of Americans both black and white), the American opium-dealers were devoted to the highest possible rate of return on their time and money.

So, the opium trade in China wasn't started and run by men who were the equivalent of the semi-literate street thugs who are the bad guys of modern movies and television shows. It was started and run by the "boy next door," much like the young CIA agent in *The Quiet American* [63] by Graham Greene. That young man of that novel was in Vietnam in

the early 1950s to support warlords committing acts of terrorism including mass-murder; as described, he was a nice young fellow from a nice New England town by way of a nice American college. With a good voice, he could have auditioned for one of those 1950s groups which sang about summer romances and high school dances. The American opium-dealers in the “China Trade” and American slave-traders in the “Africa Trade” seem to have been early 19th century versions of that “boy next door,” though some were a bit more upscale at least in terms of lineage—Mayflower and all that.

So, it wasn't that there had been a conspiracy by pre-existing drug-smugglers. Why, then, had ambitious young British and American men starting coming to the coast of China to make their fortunes by preying upon the Chinese? Why did the British navy and army protect these men engaged in selling a substance, opium, that could ease pain when properly used but destroy bodies and minds and moral characters when abused? Moreover, it was a substance declared illegal in Great Britain because of its bad effects on individuals and communities—including the state.

It was tea that was the initial problem. The people of the British Isles loved their tea from China. Silks and porcelains were optional. And the Chinese wanted little of what the Western countries had to offer. The British tea-merchants started paying for the Chinese product with silver. The British government quickly realized that the China tea-trade would drain the entire Empire of silver and then would drain the Empire of. . . Something else valuable or else the flow of tea would cease and some powerful merchants would be out of business. Under the young Queen Victoria, who was either a fraud as a moral leader or simply out of her depths, the British government responded to a request by the Chinese government to bring British opium-dealers under control by sending warships which pounded some Chinese coastal cities, killing many innocent people as well as destroying much property. So it was that the Imperial government started encouraging the opium trade as an indirect but financially successful way to pay for the tea-trade. Morally repugnant but financially successful.

American opium-dealers, including Warren Delano—grandfather of Franklin Delano Roosevelt and source of most of his fortune, geared up their already existing operations. Delano and many others were able to engage in a nasty business without too much dirtying of hands—they brought in the opium from Turkey and turned to look away as Chinese smugglers came onto their ships or into their facilities and moved the goods. Those

good American gangsters returned to their Boston parlors and New Haven churches as distinguished (that is, rich) American gentlemen who told stories of the China Trade—silks and porcelains and all that, especially when the blue-blood or nouveau riche ladies were about. And the children. Even the sons who might take up work in one trade or another—though those blue-blood families left those trades in the late 1800s (higher rates of return in steel mills and railroads) until the Cold War led them to enable the opium and then heroin business of anti-communist insurgents in Southeast Asia. Enabling at times included smuggling heroin into the United States in coffins of American soldiers killed in Vietnam. The China Trade involved silks and porcelains and that newer Southeast Asia Trade involved the spread of democracy and freedom. There is also some reason to believe that this more modern trade had something to do with oil, copper, and gold in Indonesia which had originally been stolen (in the ground) by the Dutch and then by a group involving various American corporations as well as the Rockefeller family and. . . Some others from the usual suspects.

Time to forget in the way I can learn from some of my betters.

Franklin Delano Roosevelt was apparently born to forget, or even never know, inconvenient facts. As Bradley tells the earlier story, FDR never acknowledged by even a hint that his fortune by way of his mother came from opium-smuggling and not from all those silk gowns and blue porcelain plates and cups. Bradley gives a quote from FDR's son Elliot which shows he knew about the source of the family money. (FDR's father was prosperous but less so than the Delanos and I don't know where his money originated.)

This drug-gangster money was used to build hospitals and schools as well as factories. It was part of the fuel for the explosive growth of the American economy in the mid- to late-1800s. Undoubtedly, along with money from the Africa Trade, some money from the China Trade helped to develop the American natural-resource companies and investment groups which went to Indonesia and other countries in the 1950s to fight the spread of communism.

I've already mentioned the African slave-trade but I'll write a little bit more. Americans from mostly the northeastern states (New England and New York and Pennsylvania and Delaware) brought home chests of gold from that trafficking in human beings which began with perhaps some capture but mostly purchase of human beings on the west coast of Africa and went through the truly nasty transportation (as many as half of the Africans

died in chains and all of them sat in their own waste or the waste of others and the culinary offerings were less than healthy, the sleeping arrangements less than luxurious) and then the selling in various countries including the United States. According to Lincoln's most prominent modern biographer, David Herbert Donald of Harvard, the 16th President's planned generosity to the South at war's end was actually an act of justice in his mind because of that profitable human trafficking by northerners. Those virtuous men of the north left the southerners holding the hot potato, though I'd add those southerners had committed crimes as well in buying human beings to work in poverty for the enrichment of said southerners. They also committed crimes against their own descendants, indeed all future generations of Americans, by bringing into their own land a mass of (at best) difficult-to-assimilate human beings.

Gangster States of America?

But even those engaging in the nasty slave-trade apparently returned to the formal parlors of seaside mansions in Providence and Salem, returned to their Congregationalist or Unitarian churches, returned to perhaps finish up at Harvard or to fund a fraternity at Yale, returned to take up the honors of a rich investor in job-producing and wealth-producing factories, the honors of a benefactor of so many good and noble institutions.

Americans, including our historians, can be quick to point to the barbarian warlords and mercenary thugs who played important roles in many countries. We Americans are quick to remember the Nazis who killed Jews and forget the Americans who transported Africans across the Atlantic in ships of horror and the Americans who won the wars with the natives and then refused to give them a good stake in the country which resulted. We remember the Sicilian and Colombian and Mexican drug-gangsters and forget the men named Russell or Perkins or Delano who made their family fortunes by destroying the minds and bodies and moral characters of Chinese.

This isn't hypocrisy because we, as a people and nearly all of us as individuals or members of families, remember not our crimes as a people. This is a deep form of forgetting. What conflicts with our understanding of our world, what conflicts with our own imperfect individual selves but our somehow morally pure American selves, is erased by some as-yet mysterious process.

Mysterious? Yes, but in a solvable sense. I think that the solution requires a better understanding of human communal being, that the memory

erasure is driven by problems in the memory of the American community. Some events of our past go into libraries and some go into paper-shredders. This doesn't make the past crimes and sins of our past disappear. Rather does it make them part of us by making us self-righteous and by teaching us how to lie ever more, to ourselves and to our children and to . . .

I don't think we're fooling God about our past or about our bloody and exploitive present. Yet, this process of lying is so much a part of American identity that nearly all Americans participate freely and enthusiastically though it now hurts many of us. The exploiters of Africans and Chinese moved smoothly into the destruction of the political and cultural structures of Korea and Vietnam and Iraq and Afghanistan and Pakistan and Libya, with more countries in Africa and Asia and Latin America under active or planned exploitative destruction.

Oh, I forgot to forget. It's the Iraq Trade in Freedom and Democracy, the Afghanistan Trade, the Brazil Trade and . . .

More to come, even to our own neighborhoods, though I hardly even know what to say about the transfer of middle-class wealth to various parasites who found a way to make higher returns on their time and money than could have been imagined for even the China Trade or Africa Trade. We Americans are so good at forgetting that we do so even when the victims have been our own selves and our children and grandchildren.

# 535 The 1960s Were a Time for Reaping Rotten Fruit, Long Past the Time of Sowing

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2255>. It was finished and uploaded on 2016/08/09.]

In reviewing *A war for the Soul of America: A History of the Culture Wars* by Andrew Hartman, Seth Bartee writes:

In *A War for the Soul of America* Hartman argues that the late 20th century's cultural conflicts were born out of the tumultuous 1960s. To most observers this might not seem a particularly provocative thesis, but recent literature, as Hartman shows, has tried to downplay the radicalism of the '60s by demonstrating that this era was also a period of great growth for conservative ideas. Where Hartman diverges from this view of a more moderate or balanced 1960s is in claiming that these years universalized "fracture," thus setting up a wide plane of debate between the left and right that grew to a fever pitch decades later. [See the article, *How the Culture Wars Began (and Ended)* at <http://www.theamericanconservative.com/articles/how-the-culture-wars-began-and-ended/>

Baloney.

The 1960s were—at most—a political and cultural flowering of perversions long festering in the American mind and moral character and festering at a less toxic level in Western minds of various traditions. It was in the 1850s that Herman Melville expressed the fear that there as a strong streak

of moral insanity in the American character, and he thought that moral insanity was in the form of a rebellion against God. A decade or so later, a very mainstream Protestant group, the Congregationalists, dropped the requirement that the individual congregations (parishes or local churches) hold to one of the ancient Christian creeds. (For a book-length discussion of the dangerous silliness of people not holding to a Christian creed and still pretending to be Christians, see: *Without God, Without Creed: The Origins of Unbelief in America* [137] by James Turner.) A couple of decades before the Congregationalist apostasy, Tocqueville had already seen the possibilities of a gentle totalitarianism growing up from the ordinary citizenry—my words: this was a citizenry already man-centered and not Christ-centered nor even Deity-centered. Let's add: Hawthorne and Henry James, Sr, contemporaries of Melville, had very similar opinions to him about one early flowering of this insanity; the three of them considered Emerson and Thoreau to be morally insane, largely in their rejection of (Christian) charity and similar communal bonds.

What is true about the 60s is that it was a public, undeniable, and—thus—disconcerting flowering of this insanity so basic to the American character and a lesser but—as it turns out—deeply embedded part of the Western character in general. The psychedelic, politically disordered, morally disordered 60s were less a new growth and more a fantastic flowering out of a dying plant or society—the story could perhaps be better narrated by Edgar Allan Poe than by the greatest of historians, just because it was driven along by what was inside the American people rather than by objective factors.

But we Americans had moved into the 60s thinking it was all wonderful and moved on with barely a sense of a deep wrong in our own selves and in the United States and in the West. Ordinary middle-class men and women could live the country-club, out-to-eat, Florida-retirement-home life of the rich and the factory managers of earlier generations.

Intellectuals also, (self-deluding) conservative and (cartoonish) progressive, came out of the same environment as I did (born in 1955). I never met some of my mother's upwardly mobile cousins though I was close to some of their parents, my great-uncles and great-aunts. In Sunday School, I learned little of those creedal matters still accepted by some local churches which were Congregationalist, but not in mine; we learned the most edifying stories of the Bible as well as some context-free stories, such as that of Noah and the Great Flood.

The two world wars and the economic extremes of the first half of the 20th century had freed many Americans with even a fairly small streak of moral insanity, freed them to be the individualists of their own morally perverse but all-American imaginations. The leaders were also freed. Consistent with the career of Bill and Hillary Clinton, I'd say that many of those progressivists of the 60s would gladly have become LBJ, or still worse?, if they had the chance. A lot of so-called conservatives proved little better when given a chance at exercising or influencing power.

In the end, most were false conservatives in the sense they were just defending an already corrupted state of American, or Western, society. A truer conservative, such as Russell Kirk at his ineffective best, would realize that decay had already deeply damaged the true traditions, the "permanent things," if you will. A true conservative in the Modern Age can be an outright reactionary as was Orestes Brownson or an outright radical as was Augustine of Hippo—the lesson being that the reactionary and radical defenders of tradition are one in a strong sense. Defenders of the modern status quo, even that of the 1950s, are conserving very ephemeral things.

So it is that Hartman apparently made the same mistake as many would-be conservatives. He associated the state of a decaying civilization with some sort of true order, though it wasn't one Hartman would have endorsed:

Hartman observes that fracture became evident in the 1960s as the White Anglo-Saxon Protestant consensus disintegrated. And according to him, "The culture wars were the defining metaphor for the late-twentieth-century United States." He begins the story in the 1960s, with New Left radicals who challenged the idea of "normative" America. Opponents of the New Left included former Leninists and socialists who became neoconservative intellectuals, along with familiar conservative political figures such as Ronald Reagan and Richard Nixon. [See the article, *How the Culture Wars Began (and Ended)* at <http://www.theamericanconservative.com/articles/how-the-culture-wars-began-and-ended/>

More baloney.

I have significant sympathy and even some admiration for Reagan and Nixon, but each of those men—as Eric Voegelin might have said—merely wanted to turn around and crawl back to a more pleasant spot on the

downward path to decay and Nixon perhaps started his political career as the servant to established families which supported a sort of globalism-progressivism which served to protect or increase their wealth and power. Jacques Barzun might have also said something of the sort: after all, both Reagan and Nixon were born nearly 400 years into the downslope from the height of the West—see *From Dawn to Decadence: 1500 to the Present* [9] by Barzun. The “Present” of the title was 2000.

It took men more insightful than Reagan or Nixon, apparently more insightful than Hartman or Bartee, to see that the blush on the cheeks in the 50s was due to the fever preceding death. Tocqueville saw some bad signs in the citizens of this country who had freed themselves from the weight of tradition. Melville and Hawthorne, and maybe Poe in some sense, saw a bit more than even that great French thinker. Perhaps Flannery O'Connor saw the most deeply of all—she saw the South as a Christ-soaked but not Christ-centered region and seemingly saw the rest of the United States as voluntarily and happily free of the presence of Christ. I'd go still further in my understanding.

The 500 years of decay discussed by Barzun were a struggle by many in the West, not just intellectuals, to rid their individual and communal selves of Christ, blind to the fact that most of what was good in them, what was mature in them, what was sane in them, was intertwined with Christ and the communities of His friends—the Body of Christ. The West maimed its communal selves and its individual selves by the effort to remove Christ.

In my Christian understanding of human being, I make peace with Darwin and his successors. We are born human animals and something happens during some human lives to begin a transition to the state of moral person, including the higher state (not reachable in this world even by saints) of true membership in the Body of Christ. Perhaps we're now seeing a rejection of such membership by the many children of those who were sort-of Christians, at least they were sort-of Christians so long as Christianity and specific Churches or local churches served them. We're seeing a failure by the leaders and intellectuals of Christianity to keep alive some Christian understanding of this world and more. Perhaps we're also seeing other things at work, but the position of Hartman (and at least partly the position of Bartee) is wrong:

Hartman observes that fracture became evident in the 1960s as the White Anglo-Saxon Protestant consensus disintegrated.

And according to him, “The culture wars were the defining metaphor for the late-twentieth-century United States.”

Behind us, there was no consensus though our ancestors acted as-if there were. There is no possibility of such a state—there is either true community, that moving toward the Body of Christ, or there is nothing but an amoral struggle between individuals, even between a mother and the child in her womb. There is nothing so shallow as modern, liberal understandings of being. Yes, it goes that deep, far deeper than the political and economic and cultural issues which concern Hartman. The heavily compromised understanding of being held by modern thinkers including most so-called conservatives and even most self-proclaimed religious traditionalists is in direct and brutal conflict with all plausible Christian understandings, including the archaic and creaking understandings which pass in the modern world as “Christian truths.” When faced with problems of the sort which became obvious in the later stages of the Enlightenment (say, the late 1700s), Augustine and Aquinas became radicals to defend their faith and the true Christian traditions upon which their faiths rested. (All faiths, all human knowledge and feelings and acts, are—at best— approximations to the truth we’ll know if we join Christ in His Body.)

In the death and resurrection of Jesus Christ, we saw a new state of being, one seen in the Eucharist and the other Sacraments, indeed in all of sacramental reality. It took centuries before Aquinas and a few other Christian thinkers could develop an intellectual understanding of the being seen in the Eucharist. After the century or a little more of turmoil which followed the High Middle Ages, that deep understanding of being was thrown away pretty quickly, partly because the founders of modern thought, including those who built the foundations of modern political and economic liberalism, rejected Aquinas’ imperfect but promising understanding of being—divine and created, and adopted bad theories of being, mostly tinged or outright infected by some sort of Nominalism. Communities, even the Body of Christ, were nominalistic entities. The Trinity became not just a mystery beyond our immediate understanding; it was in direct conflict with our liberal beliefs in freestanding individuals and in the need to be able to touch and directly model any true being. Knowledge was fully externalized, bookkeeping entries, rather than man’s approximation to being, participation in God’s acts-of-being. More recently, thinkers remain obstinately blind to the lessons of Einstein and Dirac: true being can present

itself to the morally well-formed mind and imagination without being directly perceptible. To be fair, there is at least a hint of this in the claim of some scientists that “there are no facts without theories.”

No one saw that modern knowledge of the evolution of man and of the workings of the human body should lead us to fear that a man or a woman is but a placeholder, a named pseudo-entity, which actually points to a bundle of processes which sometimes fight against each other and of even alien creatures—bacteria and viruses which often play an important role in our good health.

No one foresaw, and few see even now, that modern mathematics provides ways of describing global entities made of regions which are real individuals in the sense of having their own independent parts and aspects. The universe is itself, a global entity, and also something of a collection of individual regions and localized entities, stars and comets and men and rattlesnakes.

The greater understanding of being which I’ve developed is that of a greater realm of created being which includes the perceptible and measurable being of this world and the more abstract forms of being described by mathematics and quantum mechanics and other realms of human study. It reconciles modern radical philosophers of quantum physics with St John the Evangelist in positing the primacy of relationships over stuff. Not surprisingly, this greater realm—Creation to some of us—can be seen only by a disciplined exercise of the imagination and only seen more clearly if the work I’m doing or the work done by others, philosophers and theologians and artists and poets and architects and technologists perhaps unborn, expands from philosophical sketches and contemplations to become part of a greater understanding of Creation, an understanding which is the true heart of a Christian civilization, an understanding implicit in the way we build houses as well as the way we speak of God and His acts-of-being.

Modern, Western man sneered at or simply refused that greater understanding of created being which existed in some form from the time of Aquinas or even earlier. In a weird and almost demonic dance of the mind and heart as well as of the hands, modern, western man gave up that understanding, gave up his faith, gave up a sacramental world, gave up the Sacraments given to us by the Lord Jesus Christ. To speak simply but not simplistically at all, the loss of faith in the Eucharist drove the West into what certainly seems to be a terminal state of decay. Perhaps the West might even revive without dying and being born anew, but such a revival

can happen only if Western man begins first to hunger for Christ's Body and Blood, begins to desire to be Christ's friend and to be part of the Body of Christ and to be Christ.

Otherwise, if something new springs up in Europe and the Americas, it will be pagan, though perhaps it and its members will be more open to Sacramental Christianity than are the current secularized, liberalized caricature of Western Civilization and its sad, cartoonish members.

It's sad that so many intelligent people have played seemingly profound games upon the surface of being, thinking that political and cultural and economic reforms, and other reforms, were possible without a re-understanding of a world different from, more complex and richer than, anything possible in the assumed or even proposed metaphysical systems of the modern world. Yet, modern man acted as if consciously knowing that metaphysics had to be obscured because the only such systems possible to Western men were those drawn ultimately from a truly weird but also truly profound and truthful combination of Biblical revelation with Greek philosophical speculation. Aquinas should be restored to a central position just because he was willing to somewhat (only somewhat!) distort Plato and Aristotle by subordinating them to St John the Evangelist. The distortion was not so great in the end because Plato and Aristotle saw truths of being more clearly than do the vast majority of self-proclaimed Christian thinkers of the modern West.

[At this time, I should point out that I also—honestly and explicitly—had rejected Thomism and other metaphysical systems, until I received some gentle but piercing critiques of that position in personal correspondence with Stanley Hauerwas. This is somewhat strange since Professor Hauerwas rejects, in principle, natural theology though my way of doing metaphysics through natural theology is closer to the ways of Aquinas and even Augustine than they are to modern forms of natural theology. And my way even resembles the way of that great, and persecuted, Catholic scientist and theologian named Galileo Galilei.]

# 536 Making the World Safe for Christian Beliefs

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2280>. It was finished and uploaded on 2016/09/24.]

Over the past few centuries or more, Western Christians have retreated from a proper engagement with God's Creation. Many modern scientists and philosophers now work actively to sequester religious beliefs in the most general sense. Sometimes this is as crude and as juvenile as claiming that the success of the equations of modern physics prove that there is no Creator of this universe, despite the fact that there were some strong, sometimes unconventional, believers among the true geniuses who created modern physics. At least some of the non-believers, such as Einstein who seems to me at times an atheist and at other times a pantheist, didn't claim any categorical knowledge that the God of the Bible didn't exist.

It is the very weaknesses in thought of most of the modern skeptics and non-believers in science that led them to offer battle on the wrong field; unfortunately, far too many theists have accepted the challenge on that field. Not me. I'm not bothering to accept challenges from anyone who thinks that God's existence and power rise or fall with the Big Bang or with Schrodinger's Equation. See the demanding but richly rewarding *Bangs, Crunches, Whimpers, and Shrieks: Singularities and Acausalities in Relativistic Spacetimes* [31] by the philosopher John Earman for a much deeper discussion of this matter—at the end of the book which is mainly concerned with a technical philosophical analyses of the meaning of possible 'defects' in the spacetime of our universe.

What we need to do, and what I'm doing, is to step back and take a more global view—as Newton and Einstein did—from various directions,

Christian or pantheistic. Mostly, this stepping back is into realms of abstract being as captured in certain mathematical fields which have been well-developed in the past two centuries or so. I'll conjecture that it's not just coincidence that those fields were so well explored by mathematicians and scientists—human thought is moving with the problems and opportunities raised by our responses and lack of responses to the increasing richness and complexity of human being and the increasing richness and complexity of created being in general.

Why has there been no adequate response in the form of a richer and more complex understanding of Creation by philosophers and poets and historians? There have been good responses—especially by those artists and writers and musicians willing to explore abstract regions of reality. Other responses were off-target, and still others were more in the nature of non-responses. On the whole, we live in a collage where the assembled scraps represent different realms and types of created being. Even the most scientific of thinkers love but have no way of understanding in even the most speculative of ways what it is that loves or what it is that is loved. Of all the men of history, we modern men know the most but understand the least because we enjoy various types of created being but struggle hard to drive out of our intellects any form of being which is not quantitative.

Let me be more specific to the failures and weaknesses of those who share my Christian faith: Why has there been no adequate response in the form of a richer and more complex understanding of Creation by Christians?

In *The Unintended Reformation: How a Religious Revolution Secularized Society* [64], the historian Brad Gregory tells us truly that Christians need to return to Christian practices, ways of life and habits and attitudes and thoughts. Even the most academic of Christian studies will stay on course only when those who study are praying and participating in the other liturgies, reading the Bible, and participating in good works as Christians. Professor Gregory also tells us a return to Christian practice and to a stronger faith will be possible only if someone is able to deal with the wide range of modern knowledge to show how we can see our world as a Creation and talk and write about it as a Creation.

Gregory claims, as do I, that many Christians know the attacks upon theistic beliefs have been propagandistic and have not proven, for example, that the very concept of God is meaningless. He knows that pointing this out is no longer sufficient. Too many ignored the danger or even voluntarily took the challenge on the wrong field of battle and the atheists and their

allies have won and then moved into the City of Man to take control of schools and mass-media and cultural institutions and political institutions and others.

I would say. . .

We need to re-engage on the right battlefield—the entirety of Creation. To do so, we need to ratchet up our thought to a higher level of abstraction that we might consider all being, abstract and concrete, which is within the empirical or speculative reach of the human mind. And, to do so, we need to develop new tools of thought; I’m proposing that we can start by borrowing from certain fields of abstract mathematics. We should back off from the battle on the grounds of physics and biology, recognizing that non-believers have gained control of what might be called the background assumptions and methods of analysis which are used to understand all this modern knowledge of spacetime and matter and biological evolution and the genetic history of the human race.

Once we have the proper tools, we can treat this world as part of a far greater Creation, one which includes various levels of created being, abstract and concrete, going back to the fundamental truths which God manifested as the raw stuff of all of created being, the abstract and concrete stuff of Creation. Creation also includes the world of the resurrected, those who will be raised from the grave to share the life of Jesus Christ, the Son of God.

To be sure, the two tasks need to be done at the same time, as I’m doing in my thinking and writing. In fact, my writings, including this book, constitute a plausible program of the sort Professor Gregory recommends. My program, as it has been developed publicly on my active blog, *Acts Of Being* at <http://loydfueston.com/>. But I don’t know who these people really are—many of my readers around the world might well be ethnically Chinese, either citizens of the People’s Republic of China or members of the Chinese diaspora.

It’s possible I’m building a foundation which is slowly being accepted as a plausible base for a revived or even new Christian civilization. It’s possible my writings are simply seen as some sort of eccentric but interesting reaction to Western post-Christian ideology. It’s also possible my writings are at least inspiring to someone who will build a different, maybe better, foundation for a new Christian civilization—perhaps in a way more to the liking of those from a region not part of the West.

We need to make the world once again safe for Christians and their

beliefs, to make the world one in which Christians can pass on their faith to the children of their communities without public schools and publishers and entertainment companies and others interfering to, very effectively, uproot that faith in the minds and hearts and hands of children.

# 537 What is This Elite Which is Seemingly Trying to Steal All of Creation?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2299>. It was finished and uploaded on 2016/11/28.]

There is much talk and many words being spoken or written about elites, those who are destroying what was once good in the West and who have concentrated much wealth in their hands. These are the famous 1% or even 0.1% or still smaller groups of the ultra-wealthy and ultra-powerful.

Some serious thinkers in academia as well as some who might be labeled public intellectuals have made strong claims that most of the struggles in unstable periods such as the one which began in the West during the Cold War, after World War II, are between groups of the elite. I can't say that I put it in those terms, but some six years ago, I looked at conspiracy theories as a whole and concluded that we're seeing a general moral breakdown and the powerful and wealthy are engaged in gangster activities, including brutal fighting against competitors for power. These gangster activities aren't so much different from what goes on in the inner-cities as youth gangs fight for control of drug distribution and protection rackets. It's possible that one or more of those elite gangs will be destroyed.

For a general background on the questionable moral order of the American elite in the Northeast, you can read Gore Vidal's series of novels typically labeled as the *American Empire* novels but formally labeled (I only recently learned this) the *Narratives of Empire*—see [https://en.wikipedia.org/wiki/Narratives\\_of\\_Empire](https://en.wikipedia.org/wiki/Narratives_of_Empire). (Start with *Burr* to get some background before that empire begins to emerge more truly.) Vidal,

himself something of a self-marginalized “blue-blood,” reveals in a later novel in that series that marriages made the Paynes and Whitneys quietly more powerful than the Rockefellers and Fords and others by the early 1900s. This is similar to the Hapsburg’s, who conquered nothing but got control of major parts of Europe and then the New World and other regions of the world by, shall we say, prudent marriages.

Vidal also hints of the war between the so-called House of (JP) Morgan and the also so-called House of Rockefeller. Morgan’s highly centralized financial empire fell apart in the 1940s or so and the Rockefellers won with their looser system of alliances between powerful and independent kingdoms, the Harrimans and Walkers (including their in-laws and loyal servants—the Bushes) and the anonymous men who were the partners of Brown Brothers. The House of Rockefeller also ‘included’ such powerful law firms as Sullivan and Cromwell, the original globalists (including the brothers Dulles who were very close to the Walkers and Bushes). That House of Rockefeller also included, besides Allan Dulles, other men who structured the national intelligence agencies of the US (see the introductory article on John J. McCloy at [https://en.wikipedia.org/wiki/John\\_J.\\_McCloy](https://en.wikipedia.org/wiki/John_J._McCloy) for one example besides the Dulles brothers) which have done so much damage to the West and to various countries (Iran and Pakistan and Iraq and many in Latin America and Vietnam and Indonesia and so on) which were targets of profit-takers.

It’s somewhat amazing to me that even most Americans with substantial historical knowledge, certainly most high school teachers of history and perhaps many college professors, can talk about battles between the elites in other countries (think of the Conquest of England by Duke William or the later English War of the Roses or the struggles between Julius Caesar and others seeking power over an emerging empire or even the struggle between the later Russian Tsars and various groups of reformers or revolutionaries) and then take the mainstream histories of the United States as the complete truth, though the battles for power in those mainstream American histories are but the above-ground battles between political parties as if American power-seekers honor the law more than foreign power-seekers. Maybe there is a Boss Tweed thrown in but there is no sophisticated discussion of the war that Thomas Jefferson waged against Aaron Burr or the goings-on of the Texas settlers (who sold their American citizenships for power and money and then reneged on the deal and expected American soldiers to be sent to teach Santa Ana a lesson) and the activities of those hungry for power in

the oil industry (similar to what is seen with the water barons in the movie *Chinatown*) and the Rockefeller Brothers' theft of the largest pit mine in history, in Indonesia, and the sudden interest of the likes of the Bushes and the Dulles brothers in Vietnam. As a barrier to the Chinese?

There are various groups of Anglo-American men who have engaged in specific conspiracies to control the price of gold or the basic bank interest rates or to manipulate the stock market. There were and are men who engage in specific conspiracies to start wars for the expansion of the American Empire. On the whole, the so-called elites fight each other and take the common people as pawns for their wars and financial manipulations and their internal battles for power. We're potential collateral and potential serfs or even potential slaves.

For reasons I don't fully understand (see the website of Peter Turchin: <http://peterturchin.com/> for some insight from a mathematically inclined evolutionary theorist) the power of the American financiers grew from 1850 to near World War II, but then the House of Morgan disappeared as a great power; the House of Rockefeller (perhaps because it wasn't so centralized) survived but the common people did relatively quite well from the 1920s until 1970 or so.

We have switched back to concentrated wealth and an increasingly divisive war of individuals and groups in the class of so-called elites, a war for wealth and power.

In the case of the United States, there is an additional factor, one being used by some groups of elites to increase their power and wealth while putting on a show of compassion and charity: immigration. The periods when the ordinary American citizen did relatively well and the elites relatively badly were periods when immigration was ongoing but low and not always encouraged. The decades in the middle of the 19th century were the beginning of a long period of high-volume of immigration and an increasing concentration of wealth in the hands of the elite, ending in the early 1920s with laws restricting immigration and a period of increasing prosperity for the American working class and middle class. The immigration floodgates were famously reopened in 1964 and wealth once again flowed from the American working class and middle class into the hands of an elite in which the managers of giant corporations and national security officians joined bankers and politicians and rentiers in the elite.

All of this raises a question. Why are these individuals and groups of peoples, families and property-owning classes, called the 'elite'? The 1913

Webster's defines elite as: "A choice or select body; the flower; as, the [e]lite of society." The implication is that this elite has higher levels of talent as well—probably—higher levels of education and training. While there is much truth in this, it ignores the fact that Henry Ford in his non-elite days actually made useful things and generated wealth and a tremendous number of pretty good jobs for laborers as well as very good jobs for skilled workers and college-educated engineers. JP Morgan was a man who inherited some substantial money and became very rich indeed by taking over control of wealth created by other men and squeezing out the wealth into his own treasure vaults. John D Rockefeller was involved in the creation of wealth as a wholesaler as well as a founder of companies including some oil companies; he "went bad" when he decided to go the banker route and moved from Cleveland to NYC, to be followed before long by allies such as the Harrimans and George Herbert Walker.

The American elite seems now to be made up of the most greedy and most ambitious rather than the most talented. Moreover, in Vidal's plausible depiction, they are non-ideological. They might play lip-service to the modern liberal faith in free-markets, but only for the purpose of manipulating markets for their own profit. They might make a pretense of supporting 'compassionate' programs such as the immigration programs mentioned above, but make sure those programs work to their own benefit, maybe accidentally helping the immigrants but certainly hurting the existing population of American workers and small business-owners. There have been Northeastern blue-bloods, such as some of the Lowell's, who were interested in making things and creating wealth, though they also tried to create a company town in the city named after them. Mostly, the American blue-bloods have aimed to become an established class of rentiers and, for at least a few decades or so at a time, they can succeed in gaining control of large percentages of American wealth.

The Russells and their business partners, including FDR's maternal grandfather—Warren Delano—and source of most of his wealth, were a group of mixed accomplishments. Like many other adventurous young blue-blood men, they made their initial money in the slave-trade or in the Chinese opium-trade—the second in the case of the Russells and Warren Delano. Many brought back fortunes which they then devoted to manufacturing enterprises in the US or development of agricultural regions or of mines. In *The China Mirage* [15] by James Bradley, we can read a summary history of the exploitation of China and some of

its citizens by opium-dealing Americans, most seemingly blue-blood. In *The Great Chinese Revolution, 1800-1985* [32], by John K. Fairbank (see [https://en.wikipedia.org/wiki/John\\_K.\\_Fairbank](https://en.wikipedia.org/wiki/John_K._Fairbank)), we can learn that the Russells weren't committed to, or limited to, criminal activities: when they could get higher rates of return by manufacturing farm machinery for developing the great American plains, they liquidated their opium smuggling operations in China and built factories in the United States. We can also learn in *Lincoln* [29] by David Herbert Donald (see [https://en.wikipedia.org/wiki/David\\_Herbert\\_Donald](https://en.wikipedia.org/wiki/David_Herbert_Donald)) that Lincoln knew that it was northerners who made the big profits in the slave-trade and then used those profits to develop the Northeast and Midwest, having abandoned slaves and Southern slaveowners to their respective fates. Some of those slavetraders and many of their relatives and friends and fellow college alumni jumped on the bandwagon to destroy the competing elites of the South while pretending to be morally opposed to the slavery system they'd help to create. Having destroyed a major opposing class of elites, the Northerners went on to half a century of peaceful looting and general mayhem.

The American elite is 'select' as Webster's put it, but the criteria seems to be greed and ambition, only accidentally tied to higher ability. They are manipulators lacking the warrior virtues and (almost certainly) the high levels of social intelligence of some of those who founded the West. (See Chapter 332, *Are Warlords and Their Top Warriors Responsible for Our 'Smart' Genes?*.) Why do we mis-use the term 'elite' for them? Or do we wish to define 'elite' by those lacking scruples but possessing plenty of ambition and greed? (To be fair, the elite who swarmed over England to their own profit but the purposes of Henry VIII, a highly intelligent and capable brute to be sure, seem to have been as low in moral character as the current American elite.) We could better define them as parasites, as does the controversial and insightful economist, Michael Hudson—see <http://michael-hudson.com/> for information on a book about the so-called elite with the interesting title: *Killing the Host*.

# 538 Looking Backward, Moving Forward, Moving in Circles

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2326>. It was finished and uploaded on 2017/01/23.]

Conservatism: looking backward for wisdom and understanding about human being and about all of God's Creation.

Progressivism (of a truer type): moving forward into an everchanging world.

Liberalism: unleashing individual human beings from traditions and from true progressive movements to the benefit of would-be centralizers in (corrupt) politics and (corrupt) business.

The real point I'm making is that there are bad forms of conservatism and bad forms of progressivism, but liberalism—in all its forms of political centralism and market centralism—is inherently bad just because it tears individual human beings from our communal reality, especially from our movement through time. In fact, that's the only point I'm trying to make, but I'll have to provide short comments on each of conservatism, progressivism, and liberalism in order to make greater sense of my claim.

Even in a time of greater wisdom, of greater strength in thinking and feeling and doing to proper moral purposes, there will be those calling themselves conservatives who are outright reactionaries as well as progressivists who are advocates of an unbalanced attitude of "any change is good."

We aren't in a time of such greater wisdom, and unwise conservatives and progressivists dominate in number and authority and power.

We have a multitude of conservatives who understand the past well but don't see the possibilities ahead of us—one reason we've failed to take advantage of openings and now seem doomed to some very hard times in

the West. Those conservatives seem to believe:

If it is good to study the past to learn the wisdom of earlier ages of men, if it is good to keep what is wise in our current human minds and hearts and hands, then surely it is good to try to recreate the past or, at least, to fight to keep any given present with its peculiar mixture of traditional wisdom and nonsense, of more recent wisdom and nonsense.

We also have progressivists who see any change as good. They seem to believe:

If it is sometimes good, or at least necessary, to tolerate people with morally dangerous behaviors or thoughts, then it must be good to move on and to nurture those behaviors or thoughts in young people still struggling to develop their personal identities.

If those with conservative dispositions and those with progressive dispositions were to come to their senses, we would be able to do much that could be good.

Liberals take human being, mind and heart and hands in their individual manifestations, out of the stream of time, out of the reality of human being in its communal manifestations. Though individual liberals have done good, mostly by acting as conservatives or progressives on specific issues, liberalism is dangerous: it is destructive to human being by way of first being destructive to human communal being, even that of Western Civilization which, along with Western Christian churches as central organs, was the first large-scale manifestation of the Body of Christ.

## 539 Another Take on the Reality of Communities and Other Complex Entities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2329>. It was finished and uploaded on 2017/01/30.]

[This essay is a lightly edited fragment from my upcoming book, *The Shape of Reality*, a book which might be delayed a bit longer (maybe middle of March?) because of a relatively mild but persistent sinus infection as well as major housecleaning tasks as the result of a death in my family.]

From ancient times, men have told tales and produced philosophical and theological works which state or at least imply that man has some sort of an interior which is immaterial in some sense. Many would-be traditionalists think wrongly that we can defend our religious and moral beliefs only if there exists an actual ‘immaterial’ entity which is part of an individual human being: soul or mind as conceived as a sort of strange substance attached to our physical substance. This assumption of a soul-entity or mind-entity is unnecessary, meaning it can be eliminated if not plausible given what we know about the world of concrete being. Soul and mind are useful ways of speaking about, of pointing to, relationships. Relationships involving human beings, other complex entities, all of Creation, and the Creator can account for all the immaterial aspects of human being.

Once again, the question arises: are communities real or just ways of speaking about gatherings of freestanding individuals?

At a speculative level, though we’re still dealing with sophisticated ways of thought drawn from modern mathematics, we can consider two sets of questions raised by the issue of communal human being.

- Can we think of the insides of an individual who then has communal relationships on the outside? Can we think of links between the insides of individuals or do all relationships between individuals take place on the outside?
- Can individuals overlap with other individuals in well-defined ways? Can individuals overlap with communal human being? Can communities overlap other communities?

Relationships are real. Communities are real. Conceptual tools, perhaps generalizations or abstractions of mathematical concepts such as state-spaces and manifolds (topological thinking in general), are good for providing disciplined ways of speaking about the plausibility of those realities, those parts of Creation. Such tools can lead to ways of thinking, frameworks if you will, which can provide for better testing for the reality and particular characteristics of communal human being. After all, even the most numerical of statistical tests, such as those used to test for group selection in evolutionary biology, can't provide answers outside the frameworks in which they are set; if you assume individuals are the ultimate and only reality in biology, then your tests will produce conclusions compatible with your assumptions. (Actually, insightful minds are often capable of seeing signs their ways of thought aren't fully compatible with reality. Such minds are those of Galileo and Newton and Darwin and Gauss and Einstein and so on.)

Relationships are real. Communities are real. After all, communities are relationships between individuals, strong relationships which outlive any individual. Biologists, as well as a variety of philosophers and other thinkers, consider the persistence of a gray whale or a human being to be proof of the real existence of those organisms despite the complete turnover of their basic physical stuff and despite the lack of any evidence acceptable to reductionists that the various cells and organs "sum up" to an organism—of course, we have to remember that the use of a reductionistic framework excludes any evidence of a non-reductionistic organism. The same thinkers don't consider the persistence of communities, genetic family-lines as well as cultures, to be evidence that those communities have a real existence. They make implicit or explicit appeals to *Occam's razor* (see [https://en.wikipedia.org/wiki/Occam's\\_razor](https://en.wikipedia.org/wiki/Occam's_razor)) without seeming to realize any such powerful, high-level tool can be used only in some particular context,

ultimately some particular worldview. Since I believe in the reality of the Creation of the Christian God, since I specifically believe in the reality of communal human being, I would use that razor in the context of such a Creation in which communal human being exists. The only test of the reality of a reduced universe against the reality of a Creation understood in Christian terms is the plausibility and coherence of empirical reality in terms of those major worldviews.

Relationships can create new stuff and relationships can shape existing stuff, including the concrete individual entities made of stuff. And so it is that I repeat: communities are for real, formed by relationships between concrete individual entities, not directly manifested in communal ‘stuff’, just as souls and minds are real so long as you remember there is no soul-stuff or mind-stuff. There are relationships.

Relationships do not respect inside and outside, nor do they fully respect boundaries. Minds are formed by relationships and then go on to help form many new relationships, sometimes coming into some sort of synchronization, sometimes even forming something of a group mind. This happens among teenagers who are together in school and other activities for perhaps ten hours a day during the week and some hours a day during the weekend. This also happens to scholars and co-religionists and medical professionals. Hearts and hands also come into synchronization, where ‘synchronization’ should be taken as a mere pointer to a process where the synchronized entities or parts of an entity are being reshaped so that they are effectively a better organized entity and perhaps one which is a community of entities which retain their own individual identity.

For several centuries, Westerners and some others influenced too much by the West have regarded human beings as freestanding individuals, as if we have shells which prevent any direct contact between our insides and what lies outside, humans and other entities as well as what might be called the entirety of an environment. Relationships are now seen as no more than communications between freestanding individuals who may not even know each other and don’t really have any deep effects upon each other. Against this, Christians have traditionally maintained that:

- The world came to exist because God **first** loved it; the Almighty didn’t create the world and then choose to love it.
- We can change each other and help each other even by praying for

those not physically present.

There is no magic that ties together a human being's literal heart with his liver and brain and big toes. They are part of a system composed of parts which are synchronized in such a way that a human organism results. If you have the sort of philosophical attitude that requires that all of reality be explained in terms of some mythical first principles you carry around in your head, then you might object that we need a way to 'explain' (whatever that might mean in this context) why an entity becomes one, why an organism reaches some sort of state of awareness and maybe even self-awareness. Won't work. The reality of communities, the relationships which form real communities, come from the greater reality, from the nature of Creation—'just' the universe if you prefer.

Complexity theorists and other disciplined thinkers have analyzed complex entities to tell us much about **how** they work, but the why of the matter might run into the true principle that the world is what it is and not something to be explained (away) by Kant or any other such thinker. In fact, I'd suggest that the mathematical models of complexity theory are abstractions of properties of Creation or of 'just' this universe if you prefer.

Kant's botched understanding of the geometry of space and of dynamics should be a stronger warning than it has proven to be—reality is what it is and not something to be constructed from some humanly preferred assumptions. To a Christian, even much that might be explainable in more basic (usually more abstract) principles can't in fact be explained without considering:

- Creation was made through and of the Person who is the Son of God and manifests the divine Being of a Person.
- The basic principles can't even be seen directly because they are the truths manifested by God as the raw stuff of Creation and lie realms of abstraction beyond or above or beneath the still not understood abstract form of being from which concrete matter and energy are shaped: the wavefunctions of quantum physics.

Even a physical entity such as a star is made up of regions which exchange energy and matter by way of processes which take hundreds of thousands of years or even millions of years. The light which comes to us from that sun took only 8 minutes or so to travel the 93 millions miles of space

between earth and sun, but that light took probably those hundreds of thousands or millions of years to travel out from the nuclear fusion core at the center of the sun to the surface where it might be emitted into space. This is because of the density of matter in the core of the sun and because of the complex physical interactions between particles as a photon or other particle travels outward through and from that core.

How can a star be a single entity if made of regions which 'contact' each other over such long periods of time? How can an individual human being be a single entity if made of organs and other parts which are in contact in vague and ambiguous ways over smaller but still significant periods of time? How can Western Civilization be real if it is no more than persistent, long-term relationships between various ephemeral groupings of ephemeral human beings?

A star is a single entity. An individual human being is a single organism. A particular human community, such as Western Civilization as a whole or the musical institutions of Tanglewood and others found in the Berkshires of Western Massachusetts, is a single human community.

An individual human being is a member of multiple communities. We should take reality on its own terms rather than trying to explain it away by use of allegedly fundamental principles we carry around inside our little minds. Sometimes, we should start our efforts to understand by viewing reality in its various levels of complexity, including individual entities being parts of greater entities whether they retain their individuality or not. There is a sense in which the world, indeed all of Creation, must be understood as a whole before we can understand so much as an elementary particle or a basic operation of arithmetic.

# 540 From the Ideological Frying-pan to the Ideological Fire

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2339>. It was finished and uploaded on 2017/03/03.]

From 2006 to the present, I've been writing about the need to make peace with empirical reality. This is not simply a matter of a one-time adjustment when reality reveals itself as different from, usually richer and more complex than, the inherited worldview of a particular human being.

Unfortunately, it turns out that most human beings aren't very good at making even limited adjustments in their understanding of their environments, however defined. Even most of those with minds capable of learning difficult material and difficult ways of handling that material are not really very good after their initial education or training at handling material, difficult or easy. If new knowledge doesn't fit into the slots formed in their minds during their youth, it is often ignored even at the cost of great incoherence.

So, what happens when a culture—far worse, an entire civilization—falls into a disorder connected to—perhaps even partly caused by—a collapse of the communal mind of that culture or civilization? We need new thoughts or new ways of behavior and even new attitudes but all we get from the intellectual and religious and cultural and political leaders of the West is great confusion and little in the way of plausible suggestions for fixing our problems so that we can avoid the collapse of the West. Of course, there are some in those leadership categories who aren't inclined to respond properly since they're busy looting the resources under their stewardship; we'll ignore those in this discussion.

There are various short analyses and short comments I've read about

this situation: the collapse of a civilization and the general failure to do what's necessary to save it or at least to pave a reasonably smooth road into a new civilization. In *The Evolution of Civilizations: An Introduction to Historical Analysis* [119], Carroll Quigley wrote about the formation of human instruments of a new or reformed civilization; over time, these instruments become self-serving human institutions which will struggle, through institutional means as well as the efforts of their individual members and supporters, to survive even at the expense of a struggling civilization or a new civilization struggling through birth. In a similar vein—if you think about it, a great scientist once shot down the idea that scientists are so purely disinterested in their own ideas or institutions or other interests:

A new scientific truth does not triumph by convincing its opponents and making them see the light, but rather because its opponents eventually die, and a new generation grows up that is familiar with it. [Max Planck, see [https://www.brainyquote.com/quotes/authors/m/max\\_planck.html](https://www.brainyquote.com/quotes/authors/m/max_planck.html).]

So, even scientists hold on to their already formed worldview or parts of it, even when confronted by solid evidence they need to change their understanding of reality and maybe even some of their fundamental ways of thinking. Yet, science, for reasons well beyond the scope of this book, is self-corrective in certain ways that are substantial though also limited—scientists also draw upon worldviews outside of science and outside of its self-corrective processes. Young scientists can move on to new modes about thinking about some particular aspects or parts of this universe. There is no evidence whatsoever that scientists will 'rise above' the moral disorder of their age or even perceive, for example, the takeover of a once promising country by human beings with the moral character of gangsters. As I've noted before, scientists and engineers have helped to develop some of our horrible—outright evil—technology, nuclear bombs and lasers that permanently blind enemy soldiers and bombs that suck the lungs out of anyone nearby so they suffocate with their lungs hanging out of their mouths. It's true that they have also participated in the great rise in standard of living, that they have performed magnificently in exploring reality. This is no more than can be said for the blue-bloods of the northeastern United States. Read histories of the industrialization of the United States and then histories of the American part in the opium trade in China and you quickly find

some families appearing in both; you will find comments (ironic?—hard to tell in the context of American thought) that these ambitious people, founders of American industry and finance, weren't dedicated to crime but rather to getting a good rate of return on their invested capital and time. Scientists, as communities look for funding for work they enjoy and have been trained to do.

Why can these things happen? The moral failings of scientists, individuals and communities, are likely due to the same phenomenon that Planck referred to in the short quotation above. Scientists are early on indoctrinated in an instrumental ethics, a good one, that regulates how they do science, but it says nothing about the moral goodness or evil of their goals. Some of the physicists in the Manhattan Project realized after the first bomb was ready to be dropped that there were deep moral issues in creating and deploying and using such a weapon; too late—at least from some hundreds of thousands of Japanese as well as the moral characters of many human beings, they tried to raise the issues. More recently, there seems to have been some well-meaning medical researchers who were surprised to discover that some think there are moral issues involved in use of the flesh of human embryos, whether aborted or grown in the laboratory. Those scientists thought the only moral issues centered around their accepted duty to heal some terrible medical problems.

We all form worldviews and usually lay the foundations of moral character as children and adolescents followed by a basic intellectual structure in our later adolescent years into our adulthood. Most human beings seem capable of building at this basic level but once and then their brain is set in its connections or their mind hardens or whatever. Yet, to refer to the scientists discussed in the above paragraph, all of us have holes in our worldview and nearly all of us have minds too rigid to truly see those holes when confronting others who don't have those holes—this isn't to take a position on those issues, but only to point out that there are issues to be resolved in the best-intentioned of weapons development and medical research. This rigidity, at least in the case of those who are properly leaders or science or religion or politics or other fields, can be at least partially eliminated by the type of thinking I've recommended in this book, thinking which acknowledges the importance of abstract being and forces us—regarding important issues—to step up a level from our particular viewpoints and interests.

What happens when human communities begin to disintegrate, as the West is currently doing? What happens when the individuals and commu-

nities inside a civilization or a major religious community find their own children rejecting their beliefs and taking up with ways of thought and feeling and behavior forbidden not long ago, maybe not even so much explicitly forbidden as not even thinkable? What happens when those people find themselves and their children under pressure to live in ways which are in conflict with their beliefs?

Many will struggle to hold on to their seemingly outmoded beliefs, but I'm going to concentrate upon another group, those who struggle instead to make new sense of reality. If we look at recent history, during the various periods of turmoil, only a very small percentage of human beings engage in that second struggle but many follow some of those who propose new ideas, Lenin and Mussolini and Hitler and Gandhi and Mao and Martin Luther King, Jr and others. The phenomenon occurs in mathematics and science as well as we can know from the above quotation from Max Planck but I've already claimed that science can be self-correcting over as little as a generation or so. Such a controversial idea as infinities greater than that of  $1, 2, 3, \dots$  can be absorbed by those just learning their multiplication tables at the time though perhaps not by those already tenured professors.

I'll make a few general comments on the difficulties encountered in politics and economics and philosophy and theology and many other fields without the self-corrective processes of science. They lack those institutional processes of self-correctiveness for various reasons including the fact that they involve much more than mathematics or most sciences entangled concrete and abstract being. The individuals in those fields outside the ones labeled 'science' in modern discourse also tend to have different attitudes toward knowledge than do those inside the privileged realm of modern 'science'. They don't explore newly exposed lands so readily. They aren't nearly so appreciative of new information as are scientifically-minded human beings, let alone the scientistically-minded thinkers who carry a sci-fi attitude into their feasts upon the pictures of the outer planets, the discovery of planets around other stars, the search for and discovery of one god-particle or another, the discovery of Neanderthal genes in living human beings, and so on.

All of this new data, sometimes processed into forms plausibly labeled as 'information', is good stuff; it's good stuff that tells us much about God's Creation as are the new discoveries about mathematics which has led to serious contemplations about the very nature of mathematics, contemplations which are one of the main inspirations of the worldview I'm trying to

communicate in this book.

Let's consider the reformation of an existing worldview or changes so substantial as to bring about a new worldview. First of all, we have to realize that most human beings are not capable of doing the sort of work I'm doing, that of constructing a new worldview—just as I'm not capable of leading or administering a country or an army or a corporation. It would be a world of turmoil if too many were inclined to the sort of work I'm doing. It would also be a world lacking in important practical accomplishments, such as many of those which have led to our high standards of living and made it possible and necessary to think about these abstract issues. Because of this division of talents and responsibilities, most human beings will absorb a worldview and many of its parts and aspects—such as general attitudes—from their surroundings. This is still a matter of genius by the standards of simpler phases of human history, let alone the standards of non-human species. In the end, propaganda doesn't work because human beings might be willing to accept political and moral nonsense, especially in the context of a prosperous society such as the United States decreasingly is, but they do pay attention to their human and purely physical surroundings. This is what has so badly damaged membership in and strong belief in Christianity, whose institutions were the first to go out of synch with the modern world and its mountains of data only partially digested into information which is itself less fully digested into knowledge.

Now it has become obvious that our political communities are also out of synch with the best current understanding of those parts and aspects of this world which can be explored and analyzed by those labeled as 'scientists'<sup>1</sup>. In fact, nearly all human communities, even families and ethnic social clubs and sports associations, are out of synch with this confusion of data and information and knowledge which has destroyed our inherited understandings of even our universe, let alone our world (the universe as understood in light of moral order), let alone our Creation.

At least in the current situation of ongoing decay in the United States and the West as a whole, a worldview and its plausible variants decay into a multitude of ideologies of various sorts but most being implausible and ugly in various senses—moral and aesthetic and intellectual and political and so on.

---

<sup>1</sup>In premodern terms, science is simply any disciplined study and can include literary analysis and musical composition and old-fashioned homemaking.

This process started centuries ago. Our current ideologies, New Left and Neoconservative and transhuman and trans-sexual and so on, are the ugly ideologies of the West, no more than the fragments and decay-products of the worldview of Western Christian civilization rigidified in recent centuries: the ideology of the nation-state as the center of human life or the overlapping ideology of the free-market as an absolute good are but two of those fragments or decay-products—two of the more plausible fragments at that, largely because they can be more easily integrated into a better and more complete worldview. What I refer to as the single worldview of Western Christian civilization (as it emerged from the wrongly vilified Medieval Period) was actually a spectrum of closely related variants; I'll ignore this complication as being unimportant to my main points.

I'll point to an interesting example of what I think to have been a promising political component to a better Western worldview: the American Old Right. The Old Right was largely non-ideological, in the sense I use it, because it was a mixed community of some who might nowadays be labeled as 'paleoconservatives' and of various sorts of morally conservative libertarians and even some who were inclined to old-fashioned village or local socialism. Despite the radical and incompetent (or perhaps dishonest) attacks upon the Old Right, it never congealed into an ideology as was happening in a very gradual way at first to New Deal liberalism and to certain branches of conservatism in the 1950s or so. As for the Trotskyites rebranding themselves as Neoconservatives, but keeping the taste for perpetual revolution itself rebranded as national security wars or wars to infect other countries with the American (corrupt, political-machine) political system, they are a strange and ugly story unto themselves.

So, how would I summarize my understanding of our current situation? I'll provide a mercifully simplified rendering of my complex understanding of recent intellectual and political history.

The Christians of the post-Medieval West, or Modern West if you prefer, failed to respond honestly and courageously and with faith in the Creator to the problems and opportunities raised by modern mountains of all that data and information and knowledge which came from exploration of the Earth's surface as well as the exploration of mathematical ideas and history and the behavior of light and so on. The worldview of the West began to decay into various strange and ugly ideologies, fragments of a badly deformed Western Christian worldview. These fragments ranged from:

- Western Catholic theology deformed as papal supremacy and Roman centralism of a degree certainly not recognized until after—not surprisingly—certain popes in way over their heads faced the loss of secular power. Not surprisingly, these exaggerated claims on behalf of the ecclesiastical descendant of the leader of the Apostles has resulted in various huge and unnecessary losses to Western Catholic Christianity.
- An implausible version of Christianity in the politicized form of reactionary aristocracy or monarchism.
- A still less plausible version of Christianity mixed with liberalism and concentrated by the Enlightenment into bloody and revolutionary democracy.

to the opposite extreme (by some understanding of ‘opposite’):

- Economic determinism of socialist and capitalist types.
- Scientism allied with technocratism.

And, yes, I do consider Marxism and runaway capitalism as being found near the worship of science and technology on this spectrum of nasty and unsustainable ideologies.

All of the above systems, which I would describe as corrupted by idealism or human ideas raised above empirical evidence, are closely related to good communal forms: Christianity or free-enterprise economies or science and technology. This would have to be the case because they are all fragments, decay-products of variants of Western Christian civilization (or communities inside of that greater community). It’s not that they are directly decay-products of that great civilization. Rather is it the case that a set of closely related worldviews at the foundation of Western Civilization decayed into a set of closely related ideologies. As the decay continued, those closely related ideologies fragmented and continued to decay, producing new ideologies that were thoroughly psychotic—detached from reality.

# 541 The Knowledge Possessed by a Creature

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2339>. It was finished and uploaded on 2017/03/03.

This essay is a lightly edited chapter from my book, *The Shape of Reality* [56].]

What is truth? Not so ridiculous a question as some would have it, certainly those who don't understand how difficult a struggle it has been to develop various plausible and implausible understandings of the abstract concepts of 'truth' and 'knowledge' over the past 10,000 years or so of rapid increase of human intelligence in certain Eurasian peoples—see the previously referenced *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending for an introduction to the genetic-historical study of the underlying events. If you wish to read of these events, or at least of snapshots of these events, from a philosophical or historical viewpoint, a viewpoint also more or less Eurocentric, you can see *The Origins of European Thought About the Body, the Mind, the Soul, the World, Time, and Fate* [106] by R B Onians, *Body, Soul, Spirit: A Survey of the Body-Mind Problem* [139] by C A van Peursen, and *The Discovery of the Mind in Greek Philosophy and Literature* [128] by Bruno Snell. General searches on the Internet or in your local library system on the *Axial Age* (see [https://en.wikipedia.org/wiki/Axial\\_Age](https://en.wikipedia.org/wiki/Axial_Age)) will lead you to to a variety of 'old-fashioned' and 'new-fangled' historical works on the strange and glorious transformation in human culture, including the intellect, which occurred from some time in the *Iron Age* (see [https://en.wikipedia.org/wiki/Iron\\_Age](https://en.wikipedia.org/wiki/Iron_Age)) and ended a few centuries or so before the birth of Jesus Christ. For a historical perspective which

relies on particular mathematical and statistical analyses rather than starting at the level of abstract being as I'm doing, see Peter Turchin's website at <http://peterturchin.com/> for an interesting, plausible, and powerful attempt at building applied mathematical models of events in human history; at the least, there are some good insights in the work of Turchin and allied thinkers. (One of Turchin's non-technical summary of much of his work, *War and Peace and War: The Life Cycles of Imperial Nations* [136] is itself a pretty work of history.)

The writings referenced in the above paragraph are but an entry into various sorts of literature dealing with the results of an important period of evolutionary and developmental changes in human being, changes which led to Archimedes and Augustine and Aquinas and Fra Angelico and Pascal and Newton and Mozart and on to Planck and Einstein and Picasso and Arnold Schoenberg and Eliot and Joyce and Sartre and others. A few minutes of serious thought will lead to the realization that any list of high achievers in recent centuries is remarkably short on great religious thinkers (John Henry Newman was at least a second-tier great thinker but few others reached anywhere near that) and writers or artists working in the traditionalist mode (Eliot was almost entirely modern in style though he advanced—did himself **adhere** to—important, central lines of traditionalist thought). Scientists and various mathematicians, including some great mathematicians discussed in earlier pages of this book, seem to be still more dominant, shockingly dominant, when we limit modern thinkers and writers and artists to those of undoubted greatness.

I'm not sure how many scientists or mathematicians would share my understanding of what-is, merely the universe to many of them and Creation to some of them and certainly to me. Only a few, mostly Platonists and mostly mathematicians, would even grasp the concept of abstractions as a form of being. Probably those Platonists would make the same understandable error as Plato—thinking of abstractions in terms of Reals which seem to be pure and ideal archetypes of complex entities such as human being; this idea seems implausible after Darwin and Einstein as seen through the eyes of the Reverend Monsignor Georges Lemaître (see [https://en.wikipedia.org/wiki/Georges\\_Lemaitre](https://en.wikipedia.org/wiki/Georges_Lemaitre)) and other founders of modern physical cosmology (in the 1920s).

After the work of evolutionary biology and quantum physics and history, we don't even currently know what are the basic components of being, human or otherwise—where 'know' can be taken as involving the actual

truth or just the most plausible speculation of an age. We don't even know if there are basic components of the sort found in particle physics or nuclear physics. I suspect not, having found it easier to make sense of Creation in terms of abstract being and concrete being—to be sure, I think of concrete being as shaped from abstract being so that abstract being is something like an elementary form of being but it's a bit different and more consistent with quantum physics. In other words, the wavefunctions of quantum physics aren't like the elementary entities of particle physics, though those entities correspond to quantum wavefunctions.

We have no coherent and morally well-ordered understandings of Creation in light of evolutionary biology or quantum physics. Our moral philosophers and moral theologians and various leaders don't know how to view our communities and individuals in terms allowing even potential moral order of a sort which once seemed so clear to our minds and eyes. Our theologians in Christian traditions don't know how to talk about man's meeting with God, in prayer or worship or more specifically in the Sacraments; they babble on using terms which once meant something when the Greek philosophers and Medieval Scholastics seemed to have provided solid understandings of matter and mind and even God<sup>1</sup>. Modern thinkers sometimes just accept schemes of words and concepts of premodern times and sometimes try to build up their own—none of those modern schemes seem to be at all plausible in light of what we now know about Creation.

We are creatures embedded in a Creation arising from raw stuff which is and are the truths manifested by God through His Son. To our minds and hearts and hands, this Creation is quite dynamic for at least three reasons:

- Creation is so because it is inherently so, evolving and developing as it moves from its original primordial state toward greater particularity and complexity.
- Creation is so because we learn about it through our own evolving and developing minds and hearts and hands.

---

<sup>1</sup>The Protestant Reformers disagreed, sometimes radically so, with the specific, 'higher-order' Catholic schemes for understanding Sacraments and a sacramental world and man's moral situation and so on, but accepted the words and concepts which existed at that time for discussing these things. Neither Martin Luther nor the Catholic Counter-reformer Cardinal Robert Bellarmine even pretended to engage in creative metaphysical or theological thought.

- Creation is so because our very efforts to understand and to exploit this Creation brings about changes in the evolution and development of our own human being and in much of the being with which we can directly form relationships of any sort.

In my updated version of Thomism, Creation is not a place containing entities but rather a set of relationships which are acts-of-being. Material stuff and even abstract stuff is the result of those relationships, most of which are highly dynamic. Human knowledge isn't settled from our viewpoint, human knowledge doesn't encapsulate the truth, until we can reach a better, more stable viewing place. But no such place can possibly exist so long as we're alive because we learn more about Creation and we also change what is by our active responses, as do all entities and lesser creatures, but only we humans can—in principle—encapsulate all that God has created in our own minds. Only we humans can—in principle—participate in God's greater acts-of-being, His thoughts and feelings and actions which take place in any realm or all realms of Creation. Only we humans can—in principle—share God's thoughts even as He creates from nothing.

Some principles can only be realized in the world of the resurrected where the friends of God share God's life by being part of the Body of Christ, by sharing directly in the human being of the Son of God. By so sharing we might even enjoy the dizzying sight of Creation from God's transcendental viewpoint. Then we will be able to understand.

## 542 From the Ideological Frying-pan to the Ideological Fire

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2343>. It was finished and uploaded on 2017/03/07.

This essay is a lightly edited chapter from my book, *The Shape of Reality* [56].]

From 2006 to the present, I've been writing about the need to make peace with empirical reality. This is not simply a matter of a one-time adjustment when reality reveals itself as different from, usually richer and more complex than, the inherited worldview of a particular human being—individual or communal.

Unfortunately, it turns out that most human beings aren't very good at making even limited adjustments in their understanding of their environments, however defined. Even most of those with minds capable of learning difficult material and difficult ways of handling that material are not really very good after their initial education or training at handling material, difficult or easy. If new knowledge doesn't fit into the slots formed in their minds during their youth, it is often ignored even at the cost of great incoherence.

So, what happens when a culture—far worse, an entire civilization—falls into a disorder connected to—perhaps even partly caused by—a collapse of the communal mind of that culture or civilization? We need new thoughts or new ways of behavior and even new attitudes but all we get from the intellectual and religious and cultural and political leaders of the West is great confusion and little in the way of plausible suggestions for fixing our problems so that we can avoid the collapse of the West. Of course, there are some in those leadership categories who aren't inclined to respond properly

since they're busy looting the resources under their stewardship; we'll ignore those in this discussion.

There are various short analyses and short comments I've read about this situation: the collapse of a civilization and the general failure to do what's necessary to save it or at least to pave a reasonably smooth road into a new civilization. In *The Evolution of Civilizations: An Introduction to Historical Analysis* [119], Carroll Quigley wrote about the formation of human instruments of a new or reformed civilization; over time, these instruments become self-serving human institutions which will struggle, through institutional means as well as the efforts of their individual members and supporters, to survive even at the expense of a struggling civilization or a new civilization struggling through birth. In a similar vein, a great scientist once shot down the idea that scientists are so purely disinterested in their own ideas or institutions or other interests:

A new scientific truth does not triumph by convincing its opponents and making them see the light, but rather because its opponents eventually die, and a new generation grows up that is familiar with it. [Max Planck, see [https://www.brainyquote.com/quotes/authors/m/max\\_planck.html](https://www.brainyquote.com/quotes/authors/m/max_planck.html).]

So, even scientists hold on to their already formed worldview or parts of it, even when confronted by solid evidence they need to change their understanding of reality and maybe even some of their fundamental ways of thinking. Yet, science, for reasons well beyond the scope of this book, is self-corrective in certain ways that are substantial though also limited—scientists also draw upon worldviews outside of science and outside of its self-corrective processes. Young scientists can move on to new modes about thinking about some particular aspects or parts of this universe. There is no evidence whatsoever that scientists will 'rise above' the moral disorder of their age or even perceive, for example, the takeover of a once promising country by human beings with the moral character of gangsters. As I've noted before, scientists and engineers have helped to develop some of our horrible—outright evil—technology, nuclear bombs and lasers that permanently blind enemy soldiers and bombs that suck the lungs out of anyone nearby so they suffocate with their lungs hanging out of their mouths. It's true that they have also participated in the great rise in standard of living, that they have performed magnificently in exploring reality. This is no

more than can be said for the blue-bloods of the northeastern United States. Read histories of the industrialization of the United States and then histories of the American part in the opium trade in China and you quickly find some families appearing in both; you will find comments (ironic?—hard to tell in the context of American thought) that these ambitious people, founders of American industry and finance, weren't dedicated to crime but rather to getting a good rate of return on their invested capital and time. Scientists, as communities look for funding for work they enjoy and have been trained to do.

Why can these things happen? The moral failings of scientists, individuals and communities, are likely due to the same phenomenon that Planck referred to in the short quotation above. Scientists are indoctrinated in an instrumental ethics, a good one, that regulates how they do science, but it says nothing about the moral goodness or evil of their goals. Some of the physicists in the Manhattan Project realized after the first bomb was ready to be dropped that there were deep moral issues in creating and deploying and using such a weapon; too late—at least for some hundreds of thousands of Japanese as well as for the moral characters of many human beings who came to casually accept the use of this weapon as they had come to casually accept the dropping of explosive or inflammatory bombs upon civilian populations. More recently, there seems to have been some well-meaning medical researchers who were surprised to discover that some think there are moral issues involved in use of the flesh of human embryos, whether aborted or grown in the laboratory. Those scientists thought the only moral issues centered around their accepted duty to heal some terrible medical problems. I can understand and even admire their acceptance of that duty but also puzzle over the way in which those scientists were oblivious to the moral beliefs of many in the West. Did they never so much as talk to one of their fellow-citizens who hold to the moral beliefs once shared by the grandparents of nearly all of us, scientists and non-scientists alike?

We all form worldviews and usually lay the foundations of moral character as children and adolescents followed by the development of a basic intellectual structure in our later adolescent years into our adulthood. Most human beings seem capable of building at this basic level but once and then their brains are set in their connections or their minds harden. Yet, all of us have holes in our worldview and nearly all of us have minds too rigid to truly conceive of our own holes when confronting others who don't have those particular holes. There are issues to be resolved in the best-intentioned of

weapons development and medical research, but few are those who step out of their ruts to so much as survey the region they're traveling through. This rigidity, at least in the case of those who are properly leaders or science or religion or politics or other fields, can be at least partially eliminated by the type of thinking I've recommended in this book, thinking which acknowledges the importance of abstract being and forces us—regarding important issues—to step up a level from our particular viewpoints and interests.

What happens when human communities begin to disintegrate, as the West is currently doing? What happens when the individuals and communities inside a civilization or a major religious community find their own children rejecting their beliefs and taking up with ways of thought and feeling and behavior forbidden not long ago, maybe not even so much explicitly forbidden as not even thinkable? What happens when those people find themselves and their children under pressure to live in ways which are in conflict with their beliefs?

Many will struggle to hold on to their seemingly outmoded beliefs, but I'm going to concentrate upon another group, those who struggle instead to make new sense of reality. If we look at recent history, during the various periods of turmoil, only a very small percentage of human beings engage in that second struggle but many follow some of those who propose new ideas, Lenin and Mussolini and Hitler and Gandhi and Mao and Martin Luther King, Jr and others. The phenomenon occurs in the purely technical side of mathematics and science as we can know from the above quotation from Max Planck but I've already claimed that science can be self-correcting over as little as a generation or so. Such a controversial idea as infinities greater than that of  $\{1, 2, 3, \dots\}$  can be absorbed—if not yet understood—by those just learning their multiplication tables at the time though perhaps not by those already tenured professors.

I'll make a few general comments on the difficulties encountered in politics and economics and philosophy and theology and many other fields without the self-corrective processes of science. They lack those institutional processes of self-correctiveness for various reasons including the fact that they involve—much more than mathematics or most sciences—entanglements of concrete and abstract being. The individuals in those fields outside the ones labeled 'science' in modern discourse also tend to have different attitudes toward knowledge than do those inside the privileged realm of modern science. They don't explore newly exposed lands so readily—scientists do explore, even the ones who sometimes reject what

they discover. Non-scientists are not generally so appreciative of new information as are scientifically-minded human beings.

All of this new data, sometimes processed into forms plausibly labeled as ‘information’, is good stuff. It’s good stuff that tells us much about God’s Creation. It’s good stuff that has led to serious contemplations about the very nature of mathematics, contemplations which are one of the main inspirations of the worldview I’m trying to communicate in this book.

Let’s consider the reformation of an existing worldview or changes so substantial as to bring about a new worldview. First of all, we have to realize that most human beings are not capable of doing the sort of work I’m doing, that of constructing a new worldview—just as I’m not capable of leading or administering a country or an army or a corporation. It would be a world of turmoil if too many were inclined to the sort of work I’m doing. It would also be a world lacking in important practical accomplishments, such as many of those which have led to our high standards of living and made it possible and necessary to think about these abstract issues. Because of this division of talents and responsibilities, most human beings will absorb a worldview and many of its parts and aspects—such as general attitudes—from their surroundings. This is still a matter of genius by the standards of simpler phases of human history, let alone the standards of non-human species. In the end, propaganda doesn’t work because human beings might be willing to accept political and moral nonsense, especially in the context of a prosperous society such as the United States decreasingly is, but they do pay attention to their human and purely physical surroundings. This is what has so badly damaged membership in and strong belief in Christianity, whose institutions were the first to go out of synch with the modern world and its mountains of data only partially digested into information which is itself less fully digested into knowledge.

Now it has become obvious that our political communities are also out of synch with the best current understanding of those parts and aspects of this world which can be explored and analyzed by those labeled as ‘scientists’<sup>1</sup>. In fact, nearly all human communities, even families and ethnic social clubs and sports associations, are out of synch with this confusion of data and information and knowledge which has destroyed our inherited understandings of even our universe, let alone our world (the universe as

---

<sup>1</sup>In premodern terms, science is simply any disciplined study and can include literary analysis and musical composition and old-fashioned homemaking.

understood in light of moral order), let alone our Creation.

At least in the current situation of ongoing decay in the United States and the West as a whole, a worldview and its plausible variants decay into a multitude of ideologies of various sorts, most being implausible and ugly in various senses—moral and aesthetic and intellectual and political and so on.

This process started centuries ago. Our current ideologies, New Left and Neoconservative and transhuman and trans-sexual and so on, are the ugly ideologies of the West, no more than the fragments and decay-products of the worldview of Western Christian civilization rigidified in recent centuries: the ideology of the nation-state as the center of human life or the overlapping ideology of the free-market as an absolute good are but two of those fragments or decay-products—two of the more plausible fragments at that, largely because they can be more easily integrated into a better and more complete worldview. What I refer to as the single worldview of Western Christian civilization (as it emerged from the wrongly vilified Medieval Period) was actually a spectrum of closely related variants; I'll ignore this complication as being unimportant to my main points.

I'll point to an interesting example of what I think to have been a promising political component to a better Western worldview: the American Old Right. The Old Right was largely non-ideological, in the sense I use it, because it was a mixed community of some who might nowadays be labeled as 'paleoconservatives' and of various sorts of morally conservative libertarians and even some who were inclined to old-fashioned village or local socialism. Despite the radical and incompetent (or perhaps dishonest) attacks upon the Old Right, it never congealed into an ideology as was happening in a very gradual way at first to New Deal liberalism and to certain branches of conservatism in the 1950s or so. As for the Trotskyites rebranding themselves as Neoconservatives, but keeping the taste for perpetual revolution itself rebranded as national security wars or wars to infect other countries with the American (corrupt, political-machine) political system, they are a strange and ugly story unto themselves.

So, how would I summarize my understanding of our current situation? I'll provide a mercifully simplified rendering of my complex understanding of recent intellectual and political history.

The Christians of the post-Medieval West, or Modern West if you prefer, failed to respond honestly and courageously and with faith in the Creator to the problems and opportunities raised by modern mountains of all that data

and information and knowledge which came from exploration of the Earth's surface as well as the exploration of mathematical ideas and history and the behavior of light and so on. The worldview of the West began to decay into various strange and ugly ideologies, fragments of a badly deformed Western Christian worldview. These fragments ranged from:

- Western Catholic theology deformed as papal supremacy and Roman centralism of a degree certainly not recognized until after—not surprisingly—certain popes in way over their heads faced the loss of secular power. Not surprisingly, these exaggerated claims on behalf of the ecclesiastical descendant of the leader of the Apostles has resulted in various huge and unnecessary losses to Western Catholic Christianity.
- An implausible version of Christianity in the politicized form of reactionary aristocracy or monarchism.
- A still less plausible version of Christianity mixed with liberalism and concentrated by the Enlightenment into bloody and revolutionary democracy.

to the opposite extreme (by some understanding of 'opposite'):

- Economic determinism of socialist and capitalist types.
- Scientism allied with technocratism.

And, yes, I do consider Marxism and runaway capitalism as being found near the worship of science and technology on this spectrum of nasty and unsustainable ideologies.

All of the above systems, which I would describe as corrupted idealism or human ideas raised above empirical evidence, are closely related to good communal forms: Christianity or free-enterprise economies or science and technology. This would have to be the case because they are all fragments, decay-products of variants of Western Christian civilization (or communities inside of that greater community). It's not that they are directly decay-products of that great civilization. Rather is it the case that a set of closely related worldviews at the foundation of Western Civilization decayed into a set of closely related ideologies. As the decay continued, those

closely related ideologies fragmented and continued to decay, producing new ideologies that were thoroughly psychotic—detached from reality.

# 543 Not Just Tradition, but Openness to What is Good and Beautiful and True and New

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2343>. It was finished and uploaded on 2017/03/07.]

In a recent article, *Sacred Music. An Appeal To Restore Hearing To the Deaf* at <http://magister.blogautore.espresso.repubblica.it/2017/03/05/sacred-music-an-appeal-to-restore-hearing-to-the-deaf/>, the Italian Catholic journalist, Sandro Magister, writes of criticism by musicians and musician-scholars of the loss of tradition in the liturgical music in the Roman Catholic Church: “This disdain for Gregorian chant and traditional repertoires is one sign of a much bigger problem, that of disdain for Tradition.” There is much more of interest in the article and much of the underlying criticism apparently comes from professional musicians with serious knowledge of theology and philosophy—at least one is a theologian as well as a choral director. Much of the criticism applies also to art and architecture, as Magister notes though claiming—probably correctly—that the issue of music is most important.

I’m fully supportive of these criticisms. Sometimes, I’ll put the hymnal back into its slot because of songs not worth the breath. In some of these hymnals, the best quality music is either traditional Catholic music—including those in the *Roman Gradual* (see [https://en.wikipedia.org/wiki/Roman\\_Gradual](https://en.wikipedia.org/wiki/Roman_Gradual)) and sometimes fresh settings of those chants—or else hymns from other Christian traditions, Methodist or Lutheran or African slave spirituals. And I will say there are times when music in a secular style might be good, especially in the beginning (entrance into) the liturgy

and the ending (exit from) of holy worship. I also believe the Protestant traditions of hymn-sings (outside of the Mass) can be very useful in helping even sacramental Christians to better worship God.

My problem with this article, and many others by supporters of the Western Christian tradition, is on the emphasis. Magister and the critics he's writing about know that the Western Church was a "maker and arbiter of culture," not just a lifeless treasure-store of some sort. I know that many traditionalist church (and synagogue) musicians strive to add to the tradition, or at least support those who do so strive. I'm sure Magister and the musicians mentioned in his article would agree that the tradition itself is alive and open to taking in what is good and beautiful and true in each age and adding to the store which it **dynamically** protects and nurtures and is. Unfortunately, this more complete view can get lost in commenting about an age where you have to search hard to find what is good and beautiful and true in the new—and the number of such new and worthwhile works can be low. And many traditionalists, especially those outside music, seem to have lost interest in the search so far as I can tell, perhaps because of the difficulty of finding something new which might plausibly become part of the tradition.

Those who strive for such new and worthwhile works don't seem to include the musicians who write for the hymnals now found in American Catholic parishes but some of the culturally conservative NPR classical music programs have provided a good screening. In my experience, the Minnesota Public Radio is particularly competent at finding and broadcasting good new choral music, much of it in one Christian tradition or another, though some is secular. After all, even Bach used the cantata form to glorify coffee.

All those who appreciate the wisdom of our Western Christian traditions and wish to publicly advocate for retaining what is good and beautiful and true in those traditions, should be careful to actively remember and actively say that this world and all it contains, including the pilgrim Body of Christ, is yet subject to the evolutionary and developmental forces the Creator set into play. They serve His purposes, including His main purpose in this world of nurturing that Body of Christ which was revealed to us in the life and death and resurrection of our Lord Jesus Christ. Yet, music is a part of human life, part of that Body of Christ; music surely fulfills one of God's secondary purposes, being part of what is good and beautiful and true.

## 544 Concluding Chapter from *The Shape of Being: A Short Wrapup*

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2357>. It was finished and uploaded on 2017/03/22.

This essay is a lightly edited chapter from my recently released book, *The Shape of Reality* [56], a newly released and freely downloadable book. This is the concluding chapter of the last part of the book, titled *What Have We Done and Where Should We Head?*. The other two chapters in that last part are printed in this book as Chapter 541, *The Knowledge Possessed by a Creature*, and Chapter 542, *From the Ideological Frying-pan to the Ideological Fire.*]

We need to do better if we are to deal with our problems. We may or may not be able to rescue Western Christian Civilization; we may or may not be able to build something new if that Civilization completes its ongoing and ugly collapse; if all else fails, we may or may not be able to contribute to a new Christian Civilization on the Pacific Rim or in Eastern Europe—the most likely centers for a new Christian Civilization in my opinion. We should try whether or not there be much chance of success.

What else do we have to do which is more important or more potential fun than exploring God's Creation with mind and heart and hands and then trying to understand and spiritually integrate and act upon what we discover? What could better prepare us to share God's life in Heaven?

Appreciating the glorious project in the previous paragraph, a project not to be completed in this mortal life, we can see that this is the best way to build a pilgrim Body of Christ—a civilization at least approximating

the true Body of Christ, however incompletely and imperfectly. We can see that a Christian Civilization comes into being as it develops such a rich and complex understanding and feeling and doing of the acts-of-being which God manifested in Creation. We can see that we start this project only by coming to at least somewhat appreciate and nurture our communal human being. Only a group of communities approximating what is needed for a rich and complex civilization can build themselves into a singular human being, a communal human being of the best sort we can be in this mortal realm—one human being awaiting only its head, Jesus Christ, to be a perfect and complete human being.

## 545 Civilizational Decay as a Loss of Shape

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2362>. It was finished and uploaded on 2017/03/28.]

The title of this essay refers to a book I recently published, *The Shape of Reality* [56]. That book is an effort to move forward in our understanding of created being, perhaps even move forward a little in our understanding of the Triune God of Jesus Christ. That book builds upon my understanding of created being, as having both abstract and concrete forms, and the related understanding that relationships are primary and create and shape more particular forms of being. I borrow heavily, unscrupulously and opportunistically, from abstract mathematics—especially the qualitative reasoning which has arisen in such fields as topology and modern algebra. In the *Preface*, I wrote:

Is a man a unity or is he a collection of warring fragments?  
Or is the proper question perhaps my favorite: Is man some  
sort of complex being not describable in current terms of dis-  
course? I should qualify my statement of the last possibility,  
which I believe to be the closest to the truth: I think mathemati-  
cians working in the most abstract regions currently accessible  
to the human mind have discovered tools of thought, quantita-  
tive and qualitative, which can provide us with superior ways  
of discussing complex forms of created being. That entire argu-  
ment is one which can be carried out only by way of a program  
to show such is the case. This book will be the first step in such  
a program—unless this step sends me into a brier-patch or over  
a cliff.

My entire body of writings, including my novels—which anticipated my more disciplined efforts at philosophy and theology, provides the background for what I'll be writing in the remainder of this essay; that recent book, *The Shape of Reality*, is an effort to start bringing my work on understanding Creation into a tighter and more accessible focus.

There are times in human history, including the history of the West, when things have gone from great order and prosperity to disorder and poverty—sometimes the decay was pretty quick. As a rule, the common folk got their suffering first but the elite would get theirs eventually, or at least the grandchildren of those elite dominating at the end of that period of order and prosperity. Note that the elite are powerholders and wealth-holders, not necessarily those of greater merit in the senses of talent or accomplishment or moral character. I often note that the prophet Jeremiah claimed a disproportionate percentage of the wealthy and powerful are outright evil; I agree with him, though I think a far larger percentage simply have weak moral character.

In any case, the High Middle Ages were years of relative peace and great prosperity. A quick search will turn up analyses based upon documents as well as skeletal evidence which tells us that childhood death rates during the High Middle Ages (say, 1100-1300) were usually very high because of diseases which could not be handled by the medical techniques of that age. Those who survived childhood were comparable to modern human beings in robustness and size. They were well-fed and lived actively but not in a way particularly nasty, brutish, or short. ["Life is nasty, brutish, and short. . .," said Thomas Hobbes.]

See Chapter 674, *A Very Simplified View of the Woes of Christianity—Now and at Two Earlier Times*, for a discussion of the beginning of modern liberalism; in terms of my current discussion, liberalism should be defined as something like: the denial of the reality of complex entities and the consequent fragmentation of Creation and of human being. It should be noted that the human organism was arbitrarily—from a purely logical viewpoint—chosen as the 'true' level of human being; if you fragment the universe by denying the reality of complex entities made up of smaller entities which retain their individuality to some extent, then Richard Dawkins has as much right to choose DNA as the 'true' level of human being as Duns Scotus and William of Ockham, Locke and Jefferson, had to choose the human organism.

So it was the human mind began to decay by way of a new retreat

into some strange region of human schemes of knowledge. Hume had some good insights—though he was even less of a pure philosopher than I am, but it took Nietzsche to ridicule the entire Western intellectual effort for the absurdity it had generally been for centuries. Meanwhile, there was a revival of respect for Aquinas who was the Saint of Honest Responses to Reality rather than the imagined Aquinas who was the Saint of the Philosophical Schemes Which Judged Reality. After years of rejecting Aquinas as another philosopher who spoke gobbledy-gook, I was gently criticized for my attitude by Stanley Hauerwas and then re-read Etienne Gilson's explanations of the thought of Aquinas as well as a few comments by Hannah Arendt and I realized I was fooled because Aquinas was an artist in using gobbledy-gook to speak true wisdom. The best way to understand what he was really up to is to read his commentary on St Paul's *First Letter to the Corinthians*, (1 Corinthians). Then you can realize that the problems with Western understandings of created being began after Aquinas and not in his writings.

Books can be written upon this decay of the Western mind, individual and communal, and upon the similar decay in the Western heart and the Western hands. What I would point out here is the prolonged nature of the crisis which showed itself in those thoughts of Duns Scotus and the related thoughts of William of Ockham, but undoubtedly were developing before the births of those two men who sharpened some very bad and dangerous ideas to a state of rationalistic brilliance, a brilliance independent of nature because it was meant to be used to judge and evaluate nature and, indeed, all of Creation. The intellectual schemes of Duns Scotus and William of Ockham transcended Creation even as they tended to pull the Almighty Himself into Creation by denying His existence is qualitatively different from that of creatures. This was a brilliance which was but a gloss upon the decay of the human mind and a retreat from Christian ideas of Creator and Creation.

Similar processes of decay were developing and advancing in those other parts of human being: heart and hands. That had to be the case because a human being is, in aspiration and principle, a unity and thus it is that the human mind is what we see when a certain light, call it 'metaphysical' if you wish, is shined through a human being from a specific direction. Heart is what we see when that light is shined from a differently specific direction and we can see hands when that light is shined from a third specific direction. As a rule, decay will make its way into all parts of human being even if it starts

in but one. This doesn't mean that, for example, intellectual decay leads to moral decay of a truly degrading sort but it will lead to moral disorder which will make it difficult for a community to see its way to regrowth any time soon. All important human activities have a moral component, even if it is forms of order describable as 'proto-moral', foundational order such as the peace and obedience to law which can be enforced upon a society by a warlord wishing but to keep his taxes flowing and to be able to leave his realm to his son.

Things were already falling apart in much of the West by 1300 or so—26 years after the death of Aquinas, partly because of factors at play in this year of 2017, including: an excess of so-called elites, a concentration of vast amounts of wealth and power in the hands of a minority of that elite, and a lack of good jobs for the common folk. By 1400 or so, the population of common folk in Western Europe was far less what it had been in 1300—up to a loss of 50% of the population according to some historians or as little as 30% or so according to others. Then the common folk were in a position to bargain for better pay and a greater share of wealth and the elite, in an Invisible Hand (Invisible Mind or Invisible Heart?) sense, realized there were too many of their own sort. Various families and other groups among the elites began to fight it out—such as the House of Lancaster and the House of York waging brutal winner-take-all war (see *War of the Roses* at [https://en.wikipedia.org/wiki/Wars\\_of\\_the\\_Roses](https://en.wikipedia.org/wiki/Wars_of_the_Roses)). In most such struggles, the winner family got the throne or lesser treasure, for a short time, and the loser family was more or less exterminated or at least reduced from an elite status.

We seem to have entered the early stage of a terrible period which may equal or even exceed the 14th century in a horrific devastation of the West, with the common folk bearing most of the suffering.

Let me correct an inadequacy in the above paragraphs. The decay of a civilization is a complex process composed of complex sub-processes. The decay of a civilization isn't just a matter of politics and economics and the elites who control centralized power in those realms of human communal life, but those sub-processes are very important and will likely become the dominant part of the avalanche once it gets going. Yet, the most important of all the sub-processes is the decay of human communal life; that will lead to recursive interaction with the decay processes involving the inner lives and moral characters, the intellectual and emotional and behavioral make-up, of individuals. As noted above, the West is decaying in mind and

heart and hands. Our thoughts and feelings and actions, individual and communal, are increasingly those of a barbarian people and the recursive interactions between individual and communal decay are probably well into that stage of an avalanche.

The astute reader who has kept up with my efforts to write about the shape of human beings, individual and communal, and even *The Shape of Reality* [56] might already suspect I'm trying to integrate my ways of understanding complex entities into my regular ways of writing. That astute reader would be right and, in particular, I'm interested in producing a better understanding of complex entities as made of other entities, where those 'smaller' entities retain at least part of their own individuality even as they become part of that complex entity.

If we imagine a civilization, or even the entirety of mankind, as the surface of a globe, we can eliminate complications and complexities in a useful way by producing maps of smaller human communities which are 'flatter' and simpler to work with—in the same way that maps of, say, the continents allow us to see regions such as European Russia and Spain and all that lies between in enough detail to understand some important matters of recent and even longfar agoway history. Usefully idealizing this mathematical process, we can then produce a new map from that of the pseudo-continent of Europe and examine European Russia and Spain separately and in somewhat greater detail. We can then map Barcelona or St Petersburg in the large to still 'flatter' maps than the ones above and then map neighborhoods of those cities in detail so that individual streets, even small side-streets, and major buildings can be all shown.

The smaller the region, the closer that region comes to being truly Euclidean when we speak of that simple case of mapping the surface of Earth. In mathematics, the functions useful for analysis are easy to work with, nice. Analogically, in carrying out this sort of a procedure for analyzing human being in its communal and individual forms, we can derive concepts and tools which are also easy (or at least easier) to work with. No guarantees of niceness, but a lot better than trying to gain an understanding of a complex and seemingly chaotic mess by using concepts and tools of thought developed in prior ages for application to much simpler forms of human being than what we have now. And are in danger of losing.

The individual human being as we idealize him is a limiting case of that extremely small region of of a manifold of communal human being far more complex than the surface of a three-dimensional ball such as Earth, even

allowing for Mount Everest and the Dead Sea set in the Jordan Rift Valley as well as the complex systems of valleys and mesas in all the badland regions of Earth.

We come to a difficult issue, especially when dealing with something so important as human relationships.

I noted in my recently released book that there is overlap, intermingling on the borders of the regions of any manifold which represents a true human community—even the abstract geometrical (that is, topological) representation of a community of two, marriage or friendship or intermingled economies of two countries or whatever, is extremely complex and complicated. One complexity is the ambiguity of boundaries between human beings: individual and individual, individual and communal, communal and communal. When one considers God's role in all of this, the general model I'm proposing shows itself as complex and complicated enough to be a plausible and perhaps realistic view of reality.

Think of a globe whose sphere (surface of that globe) is made up of regions which are separating in some ways, perhaps the areas shared with nearby regions are tearing apart in such a way that no regions, no human beings smaller than the global community, are complete to the extent they were before such a process of disintegration went into high gear. They have begun to shed communal human being, whether purposefully or not, whether consciously or not; they have damaged their individual human being in the process and the recursive interaction of individual and communal human being is underway. That communal human being which is really disappearing is not only necessary to the health of individual human beings, it is necessary for the very existence of complex human communities. The word 'really' in the prior sentence is important. In fact, I would deny any semi-liberal interpretations of the above claims. I would deny that we are watching freestanding individuals being freed from communal relationships for good or bad—we are watching the destruction and disappearance of human being.

The point of all of this—I can't say it too often—is that what seems to be, for example, qualitative functions drawn from modern abstract mathematics is true being, abstract being for sure but true being against the claims of the metaphysical foundations of modern liberalism—again, see Chapter 674, *A Very Simplified View of the Woes of Christianity—Now and at Two Earlier Times* for a discussion of those foundations as developed in the decades following the High Middle Ages—the peak of Christian

thought to that and perhaps this point, the thought manifested in Thomas Aquinas's insights into being and into the importance of grounding our thought upon empirical foundations. To be sure, Aquinas compromised his thought by supporting the idea of a mind or soul because he wasn't confident enough in the stuff God had created to support the opposing idea that a human brain can be the medium of even the most abstract thought—but he didn't know how dynamic matter, including the brain, can be. The dynamic nature of matter and the way in which relationships create and shape stuff and thing-like entities tells us of the reality of abstract being.

In somewhat simpler terms, the takeaway is:

If we live in an era or area where there are no plausible such functions involving rich and complex communities and also rich and complex individuals, or when or where such functions are grossly inadequate, then I'm further claiming that human being of that time or place isn't adequate, either because of a lack of properly developed mind in those responsible for understanding Creation or because of a more general lack of properly developed mind or heart or hands in some probably larger part of the human population.

The simpler sorts of communal human being, such as nuclear and extended families or tribes, can apparently reconstitute themselves pretty quickly—but they aren't likely to have the characteristics human beings ultimately need and we human beings of the 21st century desire that our lives be as rich as were in the near past. Civilization would have to be rebuilt, as is seemingly happening in China and the Chinese diaspora—though not in a clearly solid or sustainable way.

# 546 Is Democracy Possible? Is it Compatible with Christianity?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2393>. It was finished and uploaded on 2017/05/09.]

## 546.1 Introduction

On 2017/04/20, Judge Andrew Napolitano published: *What if We Don't Really Govern Ourselves?* at <http://www.unz.com/anapolitano/what-if-we-dont-really-govern-ourselves/>, a simple and coherent article questioning whether democracy exists in the United States and whether democracy is, in any case, an absolute good or an answer to our various political problems. Napolitano's essay is in the form of questions which move relentlessly through terrible possibilities. His essay begins:

What if our belief in self-government is a belief in a myth? What if the election of one political party over the other to control Congress changes only appearances? What if taxes stay high and regulations stay pervasive and the government stays oppressive and presidents fight wars no matter what the politicians promise and no matter who wins elections? What if the true goal of those whom we elect to Congress is not to be our agents of self-government or even to preserve our personal liberties but to remain in power by getting re-elected?

And that essay by Judge Napolitano ends:

What if the selective use of the data acquired from mass surveillance can be used to manipulate anyone by those who have access to the data? What if those who have access to the data have used it to manipulate the president of the United States? What if all this constitutes a grave but largely unseen threat to our liberties, not the least of which is the right to self-government?

What if we don't really govern ourselves? What do we do about it?

I fear and believe that we Americans are the citizens in a mostly gentle sort of totalitarian society. Such a society was, in fact, foreseen by Tocqueville back in the 1830s when he looked into the American soul and saw its potential strengths and weaknesses. (See any of the English language editions of *Democracy in America* which might be found in your local library or library borrowing system.)

For now, I'll move on.

A day after Napolitano published the above referenced essay, Pat Buchanan published *Is Democracy in a Death Spiral?* at <http://www.unz.com/pbuchanan/is-democracy-in-a-death-spiral/>, on the same, high-quality website run by Ron Unz.

Once again, I'll quote the beginning and end of the essay under consideration.

Buchanan begins with a quote:

"You all start with the premise that democracy is some good. I don't think it's worth a damn. Churchill is right. The only thing to be said for democracy is that there is nothing else that's any better.

...

"People say, 'If the Congress were more representative of the people it would be better.' I say Congress is too damn representative. It's just as stupid as the people are, just as uneducated, just as dumb, just as selfish."

This dismissal of democracy, cited by historian H. W. Brands in *The General vs the President: MacArthur and Truman at the Brink of Nuclear War*, is attributed to that great populist Secretary of State Dean Acheson.

Buchanan ends his essay thus:

How, outside an external attack that unites us, like 9/11, do we find unity among people who dislike each other so much and regard each other's ideas and ideals as hateful and repellent?

Democracy requires common ground on which all can stand, but that ground is sinking beneath our feet, and democracy may be going down the sinkhole with it.

Where liberals see as an ever-more splendid diversity of colors, creeds, ethnicities, ideologies, beliefs and lifestyles, the Right sees the disintegration of a country, a nation, a people, and its replacement with a Tower of Babel.

Visions in conflict that democracy cannot reconcile.

## 546.2 Is Democracy Possible? Is it Compatible with Christianity?

What is Democracy? Is it no more than a set of procedures for electing important government officials? Is it more complete, even to being a way of life? Is it a mere attitude which can cover the empowerment of a minority of Athenian men or a perhaps truer democracy in Switzerland or the political machine system of the United States?

Keep those standard ways of thought in mind, but keep another thought in the front of your mind: Christians are bound to believe that the Body of Christ is the perfect and complete human community; that Body is the union of Christ with all of His brothers and sisters. Our understanding of the Body of Christ should guide all of our thoughts about the best possible forms of human communities—including those we describe as 'political'. Even the most secular of political beliefs and acts should be compatible with our Christian beliefs.

That Christian thought should also guide us in answering two questions I'll raise, without claiming any plans or hopes of answering in any authoritative manner.

## Is Democracy Possible?

I doubt if democracy is truly possible, at least not for most human communities.

- First, most citizens in any large society will be ignorant of what needs to be known to be responsible voters and to retain their democratic forms; most will also lack the time or energy or sense of responsibility to learn what they should know and to think about it in terms of the issues or persons subject to votes.
- In addition, a successful society with any sort of government will likely build up wealth and centralized power that will attract various sorts of scoundrels right up to the level of ruthless men of genius and ambition, such as Julius Caesar or Genghis Khan. That's the end of the old form of government, democracy or other.

Let's consider the the United States which was founded as a republic (sometimes called a representative democracy) and fell from that state to one of political machines, including *Tammany Hall* (see [https://en.wikipedia.org/wiki/Tammany\\_Hall](https://en.wikipedia.org/wiki/Tammany_Hall)) which was founded a few years before the American Constitution was written and adopted. The distinguished French political philosopher, *Bertrand de Jouvenel* (see [https://en.wikipedia.org/wiki/Bertrand\\_de\\_Jouvenel](https://en.wikipedia.org/wiki/Bertrand_de_Jouvenel)), made this claim: the United States has a political machine system and not a democracy or republic. We Americans act within a republican form which is increasingly being corrupted to a pseudo-democracy which seems to be even more useful for the two political machines left, the national leaderships of the Democratic and Republican parties; beginning in the 1960s, those two machines destroyed the local and ethnic machines and concentrated the money-grubbing and electoral power in their own criminal hands.

I am not saying that those two political machines are all-powerful. Outsiders have had some success even to the extent of gaining seats and holding some power at the state level and in the Senate and House of Representatives. Some have even had some lesser success in running for president. Bertrand de Jouvenel pointed out that honest politicians did sometimes arise and win important office, under that older American political machine system, but they were exceptions and they are probably more exceptional under the current system. In any case, that insightful Frenchman observed

that political machines survive by taking in money and valuable (money-generating) favors from satisfied clients; those machines need amoral or immoral politicians who will vote with the interests of those clients rather than voting with the interests of the nation or their particular voters (for example, in Ohio) or their moral beliefs.

Sometimes cynicism is justified: when I hear American political leaders or high-level bureaucrats or think-tankers speaking of “spreading democracy,” I see them as vultures, ready to exploit the peoples of the United States or Iraq or Ukraine or Russia or nearly any country or group within any country.

I’m going to run around a lot of interesting analyses—which I’m not immediately prepared to carry out nor do I feel called to head in that particular direction—and claim that democracies, even republics, under modern conditions are impossible so far as their self-government characteristics go. The form might exist but the reality of self-government can’t exist. The world is too complicated for even local leaders to understand to any meaningful extent; the common man has no time, no inclination, often no capacity, for understanding even the general backgrounds of North African countries, Middle-eastern countries. . . Heck, most residents of the Northeastern states of the US don’t even understand much of what is going on in California or Texas or Michigan.

It is a great moral fallacy, a matter of sin to Christians, to think there to be a right to a certain political system under which the crucial decisions (who are to be the leaders) are made by people who don’t, and often can’t, understand the modern complex world. This is to say it is a sin to claim and exercise even the illusion of power when you have no plans, and perhaps no capability, of gaining some understanding of those who, for example, face death as a result of you helping to vote an imperialist or interventionist into the White House.

Moreover, it creates a situation where all sorts of scoundrels can take advantage of those masses who escape their confusion and anxiety about the world by adopting simplistic ideas about that world, about the moral authority of the American leadership elites, about the thievery and other crimes those elites are committing against their own citizens and the greater crimes they have committed and are committing against citizens of other countries.

We should be starting to see a major reason for the Christian failure to even try to deal with political systems from a truly Christian viewpoint—

other than the Medieval and early modern eras when Kings dominated and Christ was seen as King, as if our Lord the carpenter and itinerant preacher were really some sort of failed King during His mortal life. The Lord Jesus Christ accomplished what He came to do; we should understand His life in that light. He wasn't a failed King; if He had wished to be a King, then He would have been a successful King, still greater than King St Louis IX—to say the least. In fact, He was a carpenter and then became an itinerant preacher. And He never agitated for democracy or any other form of self-government. I think He was in favor of, and will bring His friends to, a state of self-government of a sort, but not any sort we can quite realize in this world. Worst still, we Christians have failed to even approach the issue of proper political structure by considering Christ's life on earth and what He was trying to accomplish.

In any case, Christian churches have let themselves become ghettos outside of the domains of modern empirical knowledge and thought—however much fools can wave their hands and say, “There is no conflict between science and religion.” In a sense, that's true, but the conflict comes in human beings, communal and individual. The conflict is realized particularly strongly in the youth who learn from their culture, including entertainment as well as schools, that men evolved from ancestors shared with chimpanzees and then are forced to go to church on Sunday to hear someone babble on about men falling into their currently imperfect and incomplete condition, falling from a state of some sort of perfection. Were our ancestors in a state of grace and perfection? Or were they apish creatures?

We now know our line of evolution passed through some apish creatures. We share an ancestor with chimpanzees, before that with all sorts of nice or nasty creatures. If we Christians are to continue to speak our Christian truths as part of a package which includes the non-truth of a fall from a state of grace, we are likely to have a bad understanding of human nature, a bad understanding of human political possibilities, a bad understanding of God's plans for us—that is, a bad understanding of the meaning of salvation.

We need to consider both aspects of human being discussed in the prior paragraph: how human being evolved and what God's plans are for us. Leave aside the clear fact that we have some idea of God's plans for us but need to speculate a bit, to prepare ourselves for sharing God's life in the world of the resurrected.

So it is:

1. We human beings are embodied. We have limited capacity to acquire or properly use true knowledge, abstract or concrete—the latter being largely empirical. We have limited time and energy. We are imperfectly virtuous. We, at least the American ‘we’, are very bad at choosing leaders who are properly knowledgeable, adequately intelligent, even minimally morally well-ordered.
2. God clearly plans for us, some of us or many of us or—unlikely—all of us, to share His life through complete and perfect communion with His Son and with every other friend of His Son.

### **Is Democracy Compatible with Christianity?**

The Body of Christ has no governance in the sense of a central power structure. Christ Himself rarely ordered His followers about and when He did, telling them to put out in their boat and He’d meet them on the other side or announcing they were going up to Jerusalem, He was quite gentle in His manner. That despite the fact that the disciples were strongly against going to Jerusalem, for reasons that proved to be quite valid from the perspective of mortal human beings.

Jesus’ leadership was quite different than that of a general ordering his troops into battle, even much different from the leadership of a general who went into battle with his troops—we can think of General Teddy Roosevelt, Jr going with his men onto the beach at the invasion of Normandy in June of 1944. To be sure, the leadership style of the Apostles was a mixed-bag of sorts. They most certainly didn’t have the Presence of the man(-God) who taught with such authority. They sometimes led by way of developing a consensus, after which the community—or, at least, it’s many lower-level leaders—moved in a way sort of describable as “one.”

In general, there are some more suited to specific roles of authority; we should follow certain men and women in learning how to carry out acts of charity in a manner non-condescending and other men and women in learning how to listen and to counsel troubled human beings or how to guide boys and girls trying to find their way in life or still others in coming to abstract understandings of God’s Creation or parts of it. This last is interesting if only because certain abstract thinking for the Body of Christ, or one of His constituent parts, might be provided by some not ordinarily considered to be talented in abstract thinking such as tinkerers as the

most obvious example. Henry Ford was one specific example, Thomas Alva Edison another—perhaps the sheer theoretical brilliance of Nikola Tesla explains the antagonism each expressed toward the other. Even fairly mundane technology such as modern American house-building materials and techniques represent a partial but important understanding of this world and of human life. It says something about differences between peoples when we think of the tendency of farmers from the tribes of Northwestern Europe to live in nuclear families separated from their neighbors whereas most farming peoples live in villages with their fields sometimes being communal.

The Body of Christ is the perfect and complete human community and the goal of true Christians is to play their part in the development and life of that Body; we are saved as part of that Body or we are not saved at all. St Paul tells us so in his *First Letter to the Corinthians*—all of chapter 12 is relevant but there are some verses which are particularly enlightening in this context.

For just as the body is one and has many members, and all the members of the body, though many, are one body, so it is with Christ. [1 Corinthians 12:12, *The Holy Bible*, Revised Standard Version: Catholic Edition, 1966.]

In a book I recently released for free downloading, *The Shape of Reality* [56], I reached something of a new level for my thought, making it a little more explicit how modern mathematical ideas can provide concepts and words for discussing the reality of communities. To date, I've largely drawn upon differential geometry and topology; I'm currently exploring basic abstract algebra as well as dynamics for further ideas on making my descriptions of complex entities more complete.

This is clearly of great importance in understanding all human communities, including political communities.

Communities are real and most certainly is it true that a Christian should believe in the real existence of that complete and perfect human community: the Body of Christ. That Body has properties seemingly inconsistent with the existing schemes for organizing human polities, starting with the targeted state of a Body which is itself and not just the sum of its members. Yet, those members retain their individuality even as they are

part of something truly greater than, in a sense—different from, any gathering of those individuals—however cooperative they might be. Communities are real.

But what about the Body of Christ, which I suggest has the properties I claim to be fundamental to a morally well-ordered world and a morally well-ordered Person or image of a divine Person: unity, coherence, and completeness?

Let me throw out this speculation about the Body of Christ, the perfect and complete human being: Maybe leaders in the usual sense are not necessary?

Maybe, just maybe, most human activities can be organized internally, and more or less spontaneously, by specific human sub-communities so that the members do what is necessary, taking on roles of leader or worker or user of products or services. After all, those sharing God's life in the world of the resurrected, or intending in this world to share God's life, would be mature enough to work together in proper ways, taking on or shedding various roles—including that of 'leader'—as needed. [Remember from my earlier writings that "to intend" in Thomistic and legal and biological traditions is not to have a motive or a goal but rather to move actively toward a new state. "To intend" is a growth process.]

This seems more than a bit speculative, but let's return to a great prophet: St Paul who tells us by analogy from an individual human body to the Body of Christ:

For the body does not consist of one member but of many. If the foot should say, "Because I am not a hand, I do not belong to the body," that would not make it any less a part of the body. And if that ear should say, "Because I am not an eye, I do not belong to the body," that would not make it any less a part of the body. If the whole body were an eye, where would be the hearing? If the whole body were an ear, where would be the sense of smell? But as it is, God arranged the organs in the body, each one of them, as he chose. If all were a single organ, where would the body be? As it is, there are many parts, yet one body. [1 Corinthians 12:14–20, *The Holy Bible*, Revised Standard Version: Catholic Edition, 1966.]

This is where my thoughts begin to fade away, because I'm not quite

ready to speculate further on a good way to use Christian revelation to provide either a narrative or a metaphysical structure for putting together modern empirical knowledge and modern abstract ways of thought (largely mathematics) in order to make sense of the world around us. (Both structures are likely needed.)

Yet, I will put forward some thoughts which are tentative even as speculations.

1. All that is human, all skills of building and of teaching and of exploring reality and of making theories about what is known and so on, will remain with the Body of Christ in the world of the resurrected. Though we think of this world, Heaven or Paradise, as being a place of pure rest and play, Disneyland raised to some strange perfection and completeness, all legitimate and worthy human parts and aspects will be completed and perfected in that world of the resurrected, as parts and aspects of the Body of Christ.
2. The Body of Christ isn't organized in a manner at all hierarchical, though Christ is the Head in some substantial sense. Yet, even Christ Himself is our Brother much more than He is our King. His Lordship isn't that of a human king raised to divine levels but rather that of a wise and generous older brother raised to divine levels; the Lord Jesus is tolerant of our failings and weaknesses and there to help us become more like Him.
3. To expand a little upon the above, but also to borrow from ideas found in the letters of St Paul, each individual human being saved as a member of the Body of Christ, will remain himself or herself while also being the entirety of that Body. This is to say that each of us will have 'use' of all the parts and aspects of Christ and also of all the talents of intellectual and artistic geniuses in the Body and also of all the talents of the giants of charity (Christian love) in the Body and also of all the talents of the practical men and women whose skills of homemaking and home-building will remain part of human life in the world of the resurrected which is the true home of the Body of Christ.

The bottom line, in the context of dealing with democracy and other forms of human political organization, is: there might be leaders but we will

all share in those leadership activities and those leaders will not be bosses or exploiters as they often are in this mortal realm.

I wrote this essay under the title: *Is Democracy Possible? Is it Compatible with Christianity?*. To answer these two questions:

1. Probably not.
2. No.

# 547 Self-government Isn't Government Structure

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2397>. It was finished and uploaded on 2017/05/22.]

Let me expand upon the title: *Self-government Isn't Government Structure*, it's a claim for (positive) rights successfully made by a morally well-ordered population; that is, a claim for rights not magically granted to us but earned by real-world efforts and made possible by a bit of luck.

We, the American people and our government, can't just impose self-government on other peoples and governments. The procedures can be designed but the reality of self-government depends on a variety of other factors. In the modern West, self-government has been associated with some sort of complex independence on the part of a substantial percentage of the residents of a region; that independence is complex because it involves moral and economic and political and cultural factors.

The Swiss peasantry owned their own land early on compared to most regions of Medieval ('post-Roman') Europe and by the 14th century, those peasants owned weaponry—the famous pikes still carried in ceremony by the Pope's Swiss Guard—which allowed them to stand up to the knights in battle. The Swiss peasants worked hard to develop discipline and ways of fighting while the knights remained convinced of their inherent superiority. By the end of that tumultuous 14th century and after decades of massacres of common folk by armies led by warlords and bishops and abbots—perhaps a hint of what's coming for the countries and peoples of the West during the remainder of the 21st century—those peasants were able to drive out their Austrian overlords with all of their suits of armor and warhorses and broadswords and the rest of that. During that same century, peasants in

part of Portugal did something similar to their Spanish rulers, but I'll leave it to others to find out the details.

The common folk of the British Isles were more lucky than determined or disciplined, yet, they also gained some substantial forms of political rights. This is a complex story and is coming to no good end—a bit like all stories in this mortal realm of tears. After gaining a good amount of self-government, the Anglo-American political communities concentrated political power in centralized governments which were not really under the control of or likely to ever be under the control of the mass of citizens; that sort of control by common folk could have been exercised only by way of political processes which could have been labeled 'federalist' or—even better—described as a political form of the economic system of distributivism advocated by the Anglican thinker G. K. Chesterton. (He became a Roman Catholic near the end of his life, but he was really always an English Catholic, which I consider better than Anglican or Roman Catholic for one who was an Englishman.)

Anyway, we can skip a lot of history, much of it quite disedifying to those who think human rights come to us by some 'natural' endowment. Let's consider the sad case of two countries glued together by fiat of European colonial powers: Iraq and Libya. As brutal as Saddam Hussein and Muammar Gaddafi were, they had created economic conditions which had led to the growth of a middle-class and even some growth of a reasonably prosperous working-class. Gaddafi was even increasing prosperity and expanding those classes in some regions of sub-Saharan Africa. The existence of such classes isn't a sufficient factor in the development of self-government, political 'rights' for much of the common folk. The existence of such classes is a necessary factor.

The American destruction of those dictatorships and their prosperity put an end to some terrible crimes but also put an end to some social and economic and political processes which might have led to self-government in some form. The psychopathic juvenile delinquents who rule the United States and staff too many of its private and governmental institutions put in some half-assed efforts to jump to the state of (formal) self-government in Iraq after destroying one of the necessary factors for that state. Self-government in the United States is at an end, probably ended in the 1970s, since such wretched excuses for human beings so dominate the American political and economic and—yes—cultural communities; we have no virtuous bastard of the likes of Andrew Jackson (see

[https://en.wikipedia.org/wiki/Andrew\\_Jackson](https://en.wikipedia.org/wiki/Andrew_Jackson)) to destroy the centralizers and it's unlikely one would grow up in the West without being co-opted by the institutions at the corrupt centers of wealth and power or marginalized as a danger to those centers. The modern processes of rising into the ranks of—supply your own scare-quotes—academia and politics and banking and business and intelligence services and (increasingly) military services and religious groups seem to include selection for lack of knowledge about reality, lack of knowledge about how to acquire reliable knowledge, lack of mature and well-practiced thinking skills, and utter lack of moral character. Some of them, especially religious leaders, have some virtues but not the courage to exercise them and not the will to gain courage by way of pretending to have it—painting ourselves into a corner can often be a good moral strategy and it's one I accidentally developed and still practice though with trepidation.

Be realistic about what the real situation was in Iraq and Libya and about what seems to be happening in the West, not just the United States. Those who are greedy and overly-ambitious control great wealth and great power and they are not friends of God nor do they desire to be living in communion of any sort with the bulk of their fellow human beings. They have largely, though not yet fully, destroyed one of the necessary foundations of self-government in the United States and in Europe (an independent and prosperous middle-class and working-class) just as they destroyed similar foundations under development in Iraq and Libya. As I've argued in past writings about the entirety of the foundations of Western Civilization: they are mostly inside of us. That proper independence of human being, individual and **locally** communal, develops out of an understanding of all that exists, especially our relationship to God, and we no longer have a coherent understanding of that sort. To the extent we, especially the younger residents of the West, have any understanding of all that exists or even of just this world, it isn't coherent and it most certainly isn't Christian, nor is it Jewish, nor is it even paganistic. It is radically secularized, fully without any recognition of divinity of any sort. This is new in history and is the largest single factor in the general self-destruction of the West, including the decay into moral degeneracy.

In my writings, I'm providing an understanding sufficient to reform or to build anew a Christian civilization, which means it's sufficient to repair our own human being, individual and that of all the communities to which we belong to any substantial extent. I'm confident my own efforts

or those of someone engaged in a similar effort will help greatly in the re-establishment of Christian civilization. The pilgrim Body of Christ will find a new embodiment in this mortal realm. It would seem it will take years, perhaps decades, for my works or similar works to gain much attention. It will probably take generations to see much in the way of larger-scale results. And it will likely develop first outside of the West, leading to the self-marginalization of the West as a major region in terms of power and wealth and cultural influence.

We have let our exploitive classes destroy our own insides, our minds and hearts and hands—including all that is meant by “moral character.” We have, in old-fashioned language, sold our souls in return for television shows and the Superbowl and affordable tennis clubs and fancier housing than we need. As terrible as their suffering is, the peoples of Iraq and Libya are in better shape than those of the West because they, unlike us, didn’t voluntarily participate in the destruction of their own human being, individual and communal. Human beings who have sold, and are selling, themselves and their children to the exploitive classes of the West have shaped themselves to be incapable of sharing God’s life, incapable of living in the world of the resurrected. If such human beings are resurrected, their ongoing existence will be hellish even if they are located in Heaven. (A purging, necessarily painful, would always be possible for a merciful God, but a mere pass into Heaven by an absolutely forgiving God would lead to a wretched creature living for time without end in a place to which he is unsuited.)

Convert, turn to God, or accept damnation and pray that it means a permanent grave rather than a hellish existence without end.

End of sermon. End of lesson on what Christian leaders would be saying if they were not so well domesticated by the exploitive classes of the West, if they were more in touch with reality and if their minds were not so clouded by edifying homilies based upon scholarship having little to do with modern knowledge about God’s Creation.

# 548 Whence Come American Values?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2424>. It was finished and uploaded on 2017/07/18.]

In a discussion of a recent speech by President Trump, Robert Merry gives a short summary of one aspect of our current political mess—see *Trump’s Warsaw Speech Threw Down the Gauntlet on Western Civilization: Is America just ‘an idea’?* at <http://www.theamericanconservative.com/articles/trumps-warsaw-speech-threw-down-the-gauntlet-on-western-civilization/>.

In Merry’s discussion, we can read:

In his Warsaw speech on Thursday, Donald Trump threw down the gauntlet on the meaning and essence of Western Civilization, and it fell at the feet of two writers for *The Atlantic*—Peter Beinart and James Fallows. They avidly took it up, and in the process distilled a fundamental debate of our time. Of course, Beinart and Fallows don’t see it as a legitimate debate, and they want to snuff it out. But it will continue to roil politics in America and Europe, much to the consternation of media elite figures such as these two writers.

The debate centers on whether American values, however they may be defined, are a legacy of the Western heritage or whether America is “an idea,” as Fallows puts it, that transcends any concept of civilization or the people who created it. Indeed, in the Beinart-Fallows view, merely an overly abundant mention of “the West” or “our civilization” constitutes a kind of white nationalism or tribalism.

I've proposed a better way of thinking about this general need to form morally well-ordered and sustainable communities, from families and friendships right up to civilizations. The three most recent and most relevant chapters are:

- Chapter 336, *What is the Totality of a Human Life?: Individuals and Communities.*,
- Chapter 337, *What is the Totality of a Human Life?: Individual and Communal Intent.*, and
- Chapter 338, *What is the Totality of a Human Life?: Unity, Coherence, and Completeness.*

Much of the problem relates to the secularization of the West and to a particular aspect of that secularization; we have forgotten that Christian communities, especially the ultimate Christian community which is the Body of Christ, are not just voluntary gatherings of individuals who are alleged to be the only real form of human being nor are they communities which absorb the individual so that only the community remains. Following St Paul, the Body of Christ is an entity with real existence and yet the members fully retain their individual identities.

In recent centuries, the individual parts and members of the West viewed as the Pilgrim Body of Christ were struggling to define themselves and to prevent other parts and members from wrongful intrusions. Parts and members include various communities at various scales, political and economic and artistic and athletic and other communities, as well as individuals. The struggles between these various human beings—communal and individual—can, and seemingly did, result in great damage to the global entity—the Body of Christ in this case. Many men and women of good-will can't even see that Body in the resulting mess which is the West.

As I discuss in more detail in the above-referenced essays, there is only one way to be a true Christian: to intend to do so, where “intend to become a true Christian” is used in the Thomistic sense of a process of growing and developing toward the state of being Christlike, a process as necessary for Christian communities as for Christian individuals. In this, I'd go a lot further than Merry, further than the public commentary of even Pat Buchanan who is clearly a devout Catholic. If we wish to rescue the Christian West, we must intend to be Christians. We must aim for a Christlike state of

being for our individual selves and also for our communities, aiming to be both individuals and communities who will be members and organs of the Body of Christ. In fact, the West isn't at issue. To those who understand the foundations of the Christian West, what is at issue is the growth and development of the Body of Christ. That Body doesn't exist for the sake of the West and its power and wealth; the West once seemed to be truly intending toward a Christlike state where it would have been a great servant, and also the largest and most complete this-worldly manifestation, of that Body. The Pilgrim Body of Christ in a way of thinking.

Christ will support and nurture what is legitimately human but that is different from thinking of Christ as the founder of human institutions which are the real things. The Lord doesn't play second fiddle to even an ambitious Christian ruler such as Charlemagne, let alone to the likes of Western leaders over the past few centuries. The Church Herself is not the entirety of the Body of Christ, as St Paul himself seemed to claim in a much different situation. The Church is the central organ which teaches us what it means to be Christlike and leads us in our worship of God.

In Christian terms, taking Pauline views of the Body of Christ seriously, modern efforts to understand the United States or the entire West as either "values" or "idea" puts individual Christians in a position of trying to be Christlike while living as members of a variety of communities which are non-Christlike. Unity and coherence and completeness of Christian forms of human being at all scales become impossible under these circumstances.

We need to view our human selves, individual and communal, as engaged in the intentional processes which will bring us to a more Christlike state, one which ideally (and impossibly in this world) lead us to become truly Christlike. So long as we live major parts of our lives, such as our political and economic parts, separately from these Christian processes, we will fail to recover the fullness of truths, though we may recover some parts of the West which were manifest in the glorious pagan civilizations and smaller-scale cultures from which we come or from which we have borrowed. The problem with that, at least to Christians, is that Plato didn't take on our sins and Caesar can't bring us to Heaven.

# 549 Whom the Gods Would Destroy, They First Make Mad and Then Stupid

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2487>. It was finished and uploaded on 2018/03/27.]

Nathaniel Hawthorne wrote stories depicting a moral sickness found deep inside the souls of New England Puritans, fearing he himself was infected by this strange malady which turned warm blood into ice-water. Great historians, such as John K. Fairbank (who mentioned in *The Great Chinese Revolution, 1800-1985* [32] that American opium-smugglers in China, all from the Northeastern states so far as I know, weren't devoted to crime but rather to good rates-of-return whether from criminal or legal activities) and David Herbert Donald (who wrote in *Lincoln* [29] of Lincoln's knowledge of the role played by Northeasterners in the slave-trade and how it led him to consider his intended 'kindly' treatment of the South after the war to be simple justice). More recently Alfred McCoy in authoritative books about or touching upon the crimes of the American national security agencies, Peter Dale Scott in a number of books on similar matters, and James Bradley in some books on the delusions and crimes behind the American Empire—which never really took coherent shape, have dealt with the role which drug-smuggling, arms-smuggling, aggressive war, regime-changes, and other crimes have played in this strangest of all Empires, tied together only by an American ruling-class which exploits its fellow-citizens as much as it betrays friends and foes throughout the world.

Here is the confession of Captain Ahab from Melville's great novel, *Moby Dick*:

All my means are sane, my motive and my object mad.

This quote from Captain Ahab inspired Chapter 348, *My Ends are Mad and Now I'm Also Stupid*, which I originally published as an essay on <https://loydfueston.com/> in 2006/12 near the dawn of my blogging activities. The title tells the truth about the American leaders and their lapdogs in Europe and other parts of the world.

It's perhaps still worse than that. The leaders, and citizens, of the Western countries are not only mad and stupid but also shallow. From inside their heads, they view reality as modern children view a movie about worlds of which they have no experience or knowledge, including the world in which their parents grew up only a few decades ago; that is, their minds glide over reality as do their hearts and hands. This is why so many find it easy to break their deepest relationships, such as those with family-members and others we saw often when growing up.

Something had gone terribly wrong in the West during and after the Enlightenment and that wrongness had ripened in Puritan New England and a few other states in which Calvinism had some major influence on feelings and thoughts and modes of behavior: New York, New Jersey, Delaware, and even Pennsylvania. The Calvinists weren't different from other Christians in this matter, only more advanced and seemingly more willing to or more capable of separating their internal models of reality from the world outside of them. Nowadays, even sacramental Christians such as Catholics and Orthodox—at least those in the West—have similar strangeness in their relationships with Creation and, thus, with its Creator.

The Americans of past generations and of this generation should have paid attention to Nathaniel Hawthorne and other insightful thinkers who saw the same problems in the New England Puritan moral character as he. Alexis de Tocqueville even predicted that Americans would form a sort of society never before seen, a benevolent totalitarianism in our modern terms, because of their ability to avoid seeing even the bluntest of facts if those facts conflicted with their existing view of things; Solzhenitsyn called Americans a “uniquely evil people” because of his realization of the same when he learned of the large-scale round-ups of civilian refugees (3.5 million or so) by the American and British armies in Europe during 1946-7, which refugees were turned over to the Soviets to be used as slave labor.

The more recent American problems have developed because of serious problems in our ruling class, children of privilege and students—if that be

the right word—of the Ivy Leagues. Writing of the problems in American human being rather than of the resulting crimes and suicidal programs, these were the problems Hawthorne saw in his own Puritan ancestors and also in the Americans of his day whether they retained the Calvinist faith or had become some sort of Deist or even a variety of atheist. As our goals and motives have become even more insane than those of Captain Ahab, we have held them all the more to be holy and righteous. Even attacks on American soldiers who are part of a criminal invasion are taken as signs of evil on the part of the residents of the victim country; we dig even deeper into our own minds as we, or our soldiers or our leaders or our corporations, come under verbal or physical attack in countries where we have no business being since we weren't invited and those countries were no danger to us. Let me try again: the fact those countries resist our invasions are proof of their evil. Or so goes the story.

Oh, well, what is to be done with a people who are so decent in their own communities and so ignorant of history and so willfully selective of the knowledge they take in of ongoing events?

That erratically great Founding Father John Adams tried to warn his fellow-citizens that a ruling class would inevitably develop as men who had gained great wealth and power—by fair means or foul—would do their best to pass that wealth and power on to their descendants. As President and as a private citizen, Adams tried to get his fellow-citizens to support the development of an explicit aristocracy to establish peace and order by drawing those powerholders and wealth-holders into the open where they would receive public honor in return for constraints on their behavior. Adams knew strange things would happen if those powerholders and wealth-holders remained in the shadows. That background 'conspiracy' described as "They go to the same schools, marry each other's sisters, etc." would operate in either case, but—in modern terms—if they remained in the shadows, there would also be a variety of crimes by means of which members of the ruling class protect what is theirs or increase what is theirs in ways that hide their very existence as a class.

So it is that the peoples of Vietnam and Iraq and Pakistan and so many other countries including the United States itself are seen as existing only to provide wealth and power to the leaders of the United States, who have developed a genteel and coldblooded version of the hotblooded greed and lust of the many conquering barbarians of history. So it was that the rational exploitation of the peoples of Africa and China and Hawaii was seen as only

the sane means to the insane ends of the ancestors of the dominant group of our leaders, the so-called blue-bloods and their proteges. ‘Sane’ is of course defined in terms of the rational calculation of rates-of-return.

The interested reader might wish to read two earlier chapters:

- Chapter 685, *Dualism: JFK and the Quite Speakable and Quite Historical*, where I discuss these aspects of the American ruling class (power-elite or whatever) in a little more detail.
- Chapter 534, *It’s Not Hypocrisy, It’s Brainwashing Deeper than Orwell Foresaw*.

Again, the American people have never called their allegedly great families to account for their activities and have learned to consider some truly brutal men as being genial and friendly because of their gentle public personas—there seem to be few Americans who can detect the presence of brutality verging on outright evil. Some perspective from a detached viewpoint can be found in the articles:

- *Opium Wars* at [https://en.wikipedia.org/wiki/Opium\\_Wars](https://en.wikipedia.org/wiki/Opium_Wars), and
- *First Opium War* at [https://en.wikipedia.org/wiki/First\\_Opium\\_War](https://en.wikipedia.org/wiki/First_Opium_War).

Americans were the beneficiaries of the first war more than the later two; in fact, some great New England families (and benefactors of some great hospitals and public libraries in New England and New York) were smuggling opium in Asia even before the American Revolution, before the British navy pulverized several Chinese port cities in response to the Chinese request (addressed to that alleged Christian, Queen Victoria) to stop the opium-smuggling operations run by British (and some American) companies and getting their opium from what were essentially slave-plantations in India—before and after the British had outlawed the West African slave-trade.

Alasdair MacIntyre wrote a powerfully insightful book about human beings titled *Dependent Rational Animals* [91]. We Americans have withdrawn inside our heads for our understanding of reality rather than learning from tradition or learning by responding to that reality or learning

by studying the experiences of those who have so responded or by learning from those who have analyzed what we know about reality to make some sense of it all. During that retreat into our necessarily inadequate selves, we of the West—with Americans leading the way and New Englanders leading their fellow-Americans from the shadows—have separated our minds from our dependency upon each other and upon any God we might pretend to worship. (That dependency takes various forms: social, economic, moral, etc.) We Americans, individuals in many cases but certainly we as a people, have learned to coldbloodedly treat others (and increasingly each other) as means to our ends. Even Americans who aren't exploitive as individuals are ready always to justify, or at least tacitly accept, exploitation of foreigners by the leaders of our societies, including well-meaning but self-serving and stupid forms of charity. Now those leaders need more than they are currently stealing from Asians and South Americans and all others; they are turning to more brutal exploitation of their fellow-citizens than we've seen since at least the *Gilded Age*—see [https://en.wikipedia.org/wiki/Gilded\\_Age](https://en.wikipedia.org/wiki/Gilded_Age) for a short discussion of the United States during the period of—approximately—1870 to 1900.

But who needs Christ or His Father or their Spirit? We can do it all on our own. Look at all we've accomplished. We've established a New World Order, extending it even to such backward nations as Iraq and Libya and Pakistan. If only we'd not lost our godly nerves and had dropped more napalm and more explosives, we could have extended our benevolent rule to Vietnam and North Korea and to more of Latin America. If killing 2 million Vietnamese and another 2 million Cambodians, 2 million Koreans in the north, hadn't worked... We should have killed 4 million of each of those peoples. Then they would have learned to love us and appreciate us for our moral superiority.

We're working our divinized American will, even as I write, in so many countries and have even turned inward toward the regions of the United States and Europe where human being isn't so subservient to the American ruling class as it is in, for example, the city and suburbs of New York.

This is a summary of my view of these matters:

Human being in the West lives inside of its individual and communal minds. The outside world is an annoyance at best, a Satanic Realm, a Flyover Realm, or a chaos needing to be organized to the purposes of Wall St and that swamp on the Potomac

River. Choose a description from the viewpoint of your favorite ideologue, whether Gramscian snowflake or Free-Marketer destroying human communities to enrich humans of the right sort or drug-smuggling/arms-smuggling National Security gangster. The world, the mere world, doesn't correspond to the truth inside their heads. The world must be either reshaped to be true or destroyed.

# 550 Not a Deep-State But a Chaotic Battleground Where Barbarians Fight for Power and Wealth

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2502>. It was finished and uploaded on 2018/04/23.]

I'll not write too much about this issue I've addressed before, but I'll go further than before on one detail: the United States government is barely such a thing and perhaps it's leading us into a fragmentation which might lead to multiple governments of some sort or a civil war or some periods of each. To be sure, the government in Washington has pieces of a government such as the Social Security Administration and the various management agencies for national parks and forests. It has a military which seems to be more corrupt in some ways than ever before, even in the 1950s and early 1960s when some of the top officers, including some on the Joint Chiefs of Staff, seemed nearly treasonous at times—see *Operation Northwoods* at [https://en.wikipedia.org/wiki/Operation\\_Northwoods](https://en.wikipedia.org/wiki/Operation_Northwoods). See also Chapter 685, *Dualism: JFK and the Quite Speakable and Quite Historical* which is a sort-of review of *JFK and the Unspeakable: Why He Died and Why It Matters* [30] by James W. Douglass. I state my objections to the overall understanding that Douglass has of these events—basically, he seems to see brutal fights for power and wealth in terms of some sort of struggle between Good and Bad; I do think there are evil men involved in these fights but sometimes those evil men might be on, say, the side of the American Republic (such as it is) and its citizens.

Unfortunately, the various gangs in the United States, centered in Washington or New York (Wall St) or the major corporate headquarter buildings have recently combined, mostly after the fact, when one gang or another has carried out some major crime—the murders of public figures, the CIA-bombing of the plane over Lockerbie (the CIA was protecting its drug-smuggling operations which seem to play a major role in keeping the bankrupt American economy supplied with enough cash to sort-of remain on its feet), the bombing of the Federal building in Oklahoma City (for what purpose??), and—of course—9/11 which was, in a limited sense, the largest and most murderous bank robbery in history.

A lot of evil men have gained power or increased their power during the slide of the West into moral and cognitive disorder. A lot of heirs to fortunes they could never rebuild or even maintain have become pirates of a sort. I don't see a well-organized army of evil men anywhere in particular but rather individual gangs of banker-thugs, politician-thugs, spook-thugs, manufacturing-thugs, police-thugs, and so on. Men of low moral character drive out men of better moral character during periods such as the one the United States entered following World War II when it was the only powerful and wealthy country standing; the other countries of the West were subjugated to American order or voluntarily took on that early version of a New World Order pushed by the globalists at the Sullivan & Cromwell law-firm (especially the Dulles brothers) and at investment firms such as Brown Brothers & Harriman (the usual suspects plus the Walkers and Bushes and all in tight cahoots with the Rockefellers); they all wished to share in the power and wealth as the US began trying to establish hegemony even as other countries began to recover from the disasters of colonialistic exploitation or the Great European War, Parts I and II. We Americans fell into the greater sin of antinomianism— see <https://en.wikipedia.org/wiki/Antinomianism>, a sin on display with the often openly expressed belief that we don't have to honor our agreements or international law and can bomb freely because we are the morally upright; others have to be punished brutally for committing small-scale versions of our great sins and crimes—if they even really commit those acts.

It's all a mess, largely an American-made mess, and the current revelation that, for example, Republican-thugs might ally themselves with Democratic-thugs against members of their own party is hardly surprising in light of history. Nor is it surprising when Douglass reveals notes from J Edgar Hoover stating that the CIA had infiltrated the FBI and placed men

loyal to the Dulles gang of thugs in key positions of the FBI.

The regions of centralized power in the West are disordered and we shouldn't engage in literalistic fantasies of well-organized evil striking out into the region of light. Satan is MIA but there are plenty of men and women who are not only greedy and excessively ambitious but also desperate as their dreams of hegemony are endangered by various people and peoples who won't let us win every game on the playground.

We also shouldn't engage in literalistic fantasies that simple reforms will bring the United States or the entire West back to a state of moral and political and cultural order. It would be good to replace most of our ruling class criminals with good men or good women but the decayed state of Western Civilization would continue to encourage men with the "mentality of gangsters" to try to enter the centers of power (money-center banks and large private corporations) as they've done in the United States since its founding. ("Mentality of gangsters" is Lord Acton's phrase used during his analyses of power and corruption.)

They've entered but not because they grew particularly powerful compared to what seemed to have been more competent grandfathers. Those grandfathers included the so-called Robber Barons, drug-smugglers, and slave-traders as well as the American Protestant missionaries become imperialists against the good of those they were "saving". There was a lot of overlap of these groups and, it must be said, nearly all of those criminals came from the 'blue-blood' Calvinist families of the American states of the Northeast.

These criminals didn't destroy the United States; they were merely parasites who were like termites chewing away at a decaying foundation which wasn't even subject to inspections and maintenance. It was the 'good guys' such as Luther and Calvin, numerous popes and cardinals, Voltaire and Emerson, Lincoln and the Roosevelts and numerous British political reformers who cared not for the foundations or even drilled holes—or worse—in those foundations. Notice the lack of 'modernist' musicians and novelists and poets on the list. I'll let the reader think about the common fates of the protagonists Madame Bovary and Anna Karenina though the first was the character of Gustave Flaubert, a nihilistic sort of existentialist and a great sinner, while the second was a character of Leo Tolstoy, an unbalanced but deeply spiritual man of doubtful Christian orthodoxy, by even the loose definitions of modern times.

I think that not only the work of scientists and engineers, but also those

of musicians and writers of literary fiction and history, were constrained by rules which reflect deep respect for certain forms of honesty—largely in the sense of honoring empirical reality. Many others were not so constrained, including:

- many philosophers outside of those working in technical fields such as science, and certainly those philosophers masquerading as literary critics,
- most theologians,
- politicians and businessmen and most academic economists, and
- teachers and clergymen and those used-to-be important Americans—local journalists.

Most of the remaining order in the West is of a cultural sort, though there are few—if any—worthwhile novelists, believers or non-believers, among those published in the past two or three decades. Yet, historians have re-turned to narratives often as well-written and as engaging as the great novels. Musicians can produce music which is as disciplined as that of composers in the Classical or Romantic Eras and yet has a modern feel and draws upon more recent understandings of the possibilities of music.

On the whole, we're in trouble. I could write with tongue only partly in cheek: we're doomed. But there are enough good signs to lead me to believe we can rescue the West, bringing it back to health in only a couple generations or so, but we have to first find ourselves a new class of leaders: more knowledgeable and more respectful of empirical knowledge, more intelligent, less sociopathic, and more respectful of the traditions of the various peoples of the West.

# 551 The Real Reason for the Insane Actions of American Leaders?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2505>. It was finished and uploaded on 2018/04/26.]

The problems of the United States, and of some other countries in the West—maybe most, are deeper than are usually acknowledged. I'll start by claiming, "Crimea is more truly part of the Russian realm than California is part of the Anglo-American realm."

American leaders are ignorant, functionally stupid, and maybe innately stupid; they are the enforcers of a system which doesn't allow for important reforms inside the US if those reforms don't match the stated goals and beliefs of the mobs organized by those leaders, call the members of those mobs social justice warriors or cultural-Marxists if you will. Some of the American leaders may agree with those strange goals and irrational beliefs, but nearly all of them are dependent upon that mob to keep better men and women out of office and to move forward with projects maybe intended to consolidate the Empire and its power-center in Washington. In fact, we become less of a coherent country each month as the pace of processes of diversification and imposition of alleged social-justice tear the country apart and increase the distrust which is incompatible with such programs as national medical insurance or welfare or the other traditional programs pushed by most big-government advocates in the 20th century.

These American leaders are struggling to hold onto power though they can't deal with the domestic problems the United States faces, indeed the entire West is in trouble for similar reasons; the centrifugal forces in Scot-

land and Catalonia and northern Italy are not identical to those in California (and maybe other regions or states of the US) but they are quite similar. I don't think we're in some sort of "Small is Beautiful" phase of history—human communities of loose sorts will continue to grow from more tightly knit local communities—call it distributivism or (anti-?)federalism if you will. The proximate, though certainly not ultimate, cause of the deep fragmentation of the Western countries and regions is the incompetence of their leaders as I discussed in Chapter 550, *Not a Deep-State But a Chaotic Battleground Where Barbarians Fight for Power and Wealth*. For those who wish to get a still different perspective on this issue, see Chapter 531, *Why Does a Developed Country (the United States) Have a Gangster/Warlord Ruling Elite More Suited to a Rising Barbarian Country?*.

The underlying causes of our immediate domestic problems seem to be three from a certain perspective:

- The United States and the United Kingdom (other Western countries—???) operate under a system which I think to be, at least, something like rentier capitalism: see Michael Hudson's explanation in *>Rentier Capitalism—Veblen in the 21st century* at <http://michael-hudson.com/2016/10/rentier-capitalism-veblen-in-the-21st-century/>. See [https://en.wikipedia.org/wiki/Michael\\_Hudson\\_\(economist\)](https://en.wikipedia.org/wiki/Michael_Hudson_(economist)) for some information on *Michael Hudson*.
- The established or existing middle-class (loosely defined), which is the most important element in nearly all modern societies, has a decreasing stake in a game which seems to benefit mostly the rentiers and some clients, often imported, of public and private social agencies as well as a mob of sorts made up of some quite unimpressive members of a pseudo-progressive intelligentsia.
- There seems to be fewer possibilities each year for the children of the existing middle-class to find their own places in the middle-class or for the less prosperous workers to join the middle-class.

The second and third items in the above list can be subsumed under the first, but I find it easier to understand these ideas if they are unbundled and I assume this is true of others. If nothing else, this sort of constant

re-packaging of ideas dealing with complex aspects of reality will act against the mind's hardening into literalistic attitudes.

We have the spectacle of a ruling class with such limited understanding of their own particular problems, a still more limited understanding of the problems of others and of greater communities, as to be committing self-serving acts of a suicidal type, as if they were teenagers slashing themselves or taking handfuls of pills to “show the world I can be a responsible and freestanding adult. You should be listening to me and doing what I tell you to do.”

In fact, the ruling class of the United States and probably those of other Western countries understand something isn't working but they aggravate the problem of the incoherence in each Western country and the West as a whole, by waging war upon major blocks of their own citizens (the “deplorables”) and by bringing more alien peoples into the failing countries of the West.

Maybe we can suggest to these rulers that they look up *Asabiyyah* at <https://en.wikipedia.org/wiki/Asabiyyah>. *Asabiyyah* is an Arabic word originally meaning:

social solidarity with an emphasis on unity, group consciousness and sense of shared purpose, and social cohesion.

The great Tunisian philosopher and historian *Ibn Khaldun*, see [https://en.wikipedia.org/wiki/Ibn\\_Khaldun](https://en.wikipedia.org/wiki/Ibn_Khaldun), abstracted and refined it to mean:

the fundamental bond of human society and the basic motive force of history.

We Americans have no such thing as *asabiyyah*. Our leaders, like unto those in Orwell's *1984*, are trying to create something like loyalty of the citizens toward themselves and the increasingly criminal American government by fighting wars against alleged enemies overseas. Matters are, of course, more complex and more complicated than this—no doubt confusing our leaders still more—but those who wish to understand need to work things out layer by layer before trying to produce a more global understanding; trying to jump to simple understandings will lead to literalism, a hardening of the brain-arteries.

The criminality of the American government is mostly restricted to gangs composed of small percentages of civil servants and appointees and

military personnel, aided and abetted by our elected representatives and external ‘forces’ on Wall St and Madison Ave and in various corporations. And public intellectuals and Hollywood filmmakers and others. A lot of people but only a small percentage of the American population. I don’t have a feel for matters in the UK, France, etc. Of course, the system works so that morally well-ordered human beings might be helping advance the causes of the criminals among us but currently concentrated in the American centers of power; for example, retired CIA officers have made it clear the criminals in that agency are a small percentage of the total workforce and likely a small percentage of covert operatives—most covert activities are criminal at some level, but sane national leaders know how to play games with ‘normal’ ways of stealing each other’s secrets and with the results of being caught.

In any case, these criminals apparently have no feel for their own country. They have no strong bonds to the country they rule—not even the military men, so far as we can tell. They are struggling to control what they don’t understand and apparently hold the strange (Roveian?) idea that they can simply move forward and do something to impose their will on the world. They don’t have to gather their breath and then learn a little about the country they rule or about Syria or the African countries subject to a stealth invasion by the American military. These leaders who know that will can overcome mind and muscle alike can just make decisions and take strong actions—for example, to kill more innocent people in Syria and to free the criminal covert operatives in the CIA to smuggle more drugs and weapons and to create more terrorist groups which seem to have ideas about reality very similar to those of the Bushes and the Clintons and Barack Obama and all those wonderful folk who’ve been in charge of the FBI and CIA in recent years.

# 552 The Future of the West Can Now Be Seen, If Only Obscurely Through a Dark Glass

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2510>. It was finished and uploaded on 2018/05/08.]

Jose Ortega y Gasset, see [https://en.wikipedia.org/wiki/Jose\\_Ortega\\_y\\_Gasset](https://en.wikipedia.org/wiki/Jose_Ortega_y_Gasset),

was a Spanish philosopher, and essayist. He worked during the first half of the 20th century, while Spain oscillated between monarchy, republicanism and republicanism infiltrated by communist agents, and dictatorship of a stabilizing and fascist-tinged sort. His philosophy has been characterized as a “philosophy of life” that “comprised a long-hidden beginning in a pragmatist metaphysics inspired by William James, and with a general method from a realist phenomenology imitating Edmund Husserl, which served both his proto-existentialism (prior to Martin Heidegger’s) and his realist historicism, which has been compared to both Wilhelm Dilthey and Benedetto Croce.”

Despite all that, he makes a lot of sense and is worth reading. Warning: he was one of the most insightful of the ‘pessimistic’ thinkers of the modern West. He also produced powerful and pithy and insightful quotes, such as:

We live at a time when man believes himself fabulously capable of creation, but he does not know what to create.

[Jose Ortega y Gasset, from *Brainy Quotes* at [https://www.brainyquote.com/authors/jose\\_ortega\\_y\\_gasset.](https://www.brainyquote.com/authors/jose_ortega_y_gasset.)]

This parallels one of the major themes in my writing: if Christian Civilization—the entirety of the Body of Christ—is to survive, we have to rebuild an understanding of God’s Creation in light of our small stock of revealed truths which are mostly those of the ancient Creeds or of very carefully enriched readings of the Bible from which those Creeds were drawn. This new understanding must also reflect modern knowledge which is not some ‘science’ opposed to humanism and revelation but rather knowledge of the effects of God in His Creation.

We certainly have no such understanding—outside of my writings. Otherwise, the best Christian understandings are to be found in the more open-minded Latin-Rite Catholic communities but they haven’t reacted so well as they need to do to new knowledge of human nature and what that tells us about the reality of human communities, human individual and communal morality, the possibilities of Hell (dubious in my opinion) and the world of the resurrected (the recognition of human nature along with a belief in Christian salvation seems to force something like a complex Purgatory), and so on.

To be sure, some (maybe) Christians—most effectively strong-faithed Baptists and Mormons, can bracket their beliefs to hold two worldviews: one covering their religious beliefs and one covering modern empirical knowledge. There’s much more to be said about this, especially about the ability of some religious believers to accept technology fully while not even consciously acknowledging the underlying understandings of Creation. All of this is beyond the scope of this essay and also not of the greatest interest to me. So, anyway. . .

Mainstream Christians are more than a bit confused because of their cowardly and weak-faithed intellectuals and other leaders who have adopted more and more of modern empirical understandings while trying to fit it all into an inherited worldview which was and is no more than a transitional worldview out of well-reasoned but excessively idealistic Medieval worldviews into. . . Well, we never made the transition because we never had the courage, or perhaps the good-quality thinkers, who could complete the transition by producing understandings capable of integrating quantum mechanics and evolutionary theory and modern historical knowledge into a Biblical framework. (There is much else which was and is revolutionary

in modern empirical knowledge, especially the general theory of relativity which is the first truly coherent definition and understanding of a physical universe; as such it opens many other doors being ignored by Christian thinkers.)

Without a good Christian understanding of Creation, there is no such thing as a Christian Civilization, there is no such thing as a Pilgrim Body of Christ. That brings me back to Ortega's quote: we of the West have (now diminishing) powers to create in some sense but we don't know what to create and thus we fail to create, considering our deformations of human being and other parts of Creation to be 'creative—rah, rah!'. If we were still a Christian people living in a Christian civilization, we would not know exactly what to create and there would be a healthy diversity of opinion about the set of possibilities, but we would be a more truly creative people—a people whose creative impulses and activities would make sense in terms of a coherent understanding of Creation.

Barbarism is the absence of standards to which appeal can be made. [Jose Ortega y Gasset, from *Brainy Quotes* at [https://www.brainyquote.com/authors/jose\\_ortega\\_y\\_gasset.](https://www.brainyquote.com/authors/jose_ortega_y_gasset.)]

We Americans, and others under our influence, are barbarians inhabiting the cities of a great civilization which is as if abandoned by those who truly knew and loved it, those who could maintain and protect it, those who had some chance of fixing it if things were broken, those who would defend it if under attack from inside or outside. We are left, the barbarians who are both childlike and childish and not ourselves capable of distinguishing between those two conflicting states nor the many others which provide us with many a cognitive and emotional roller-coaster ride.

We are a vulgar, badly-behaved people—good-hearted children who were never taught the basics of good manners and respect for others. We are entranced by trashy, degrading entertainment; even that which is not degrading and destructive of well-ordered human being is stupid—we, in fact, glorify ignorance and stupidity in choosing our leaders, in our jokes, and in the ways we mis-educate children both those having intellectual talents and those needing basic education to get on with their truer callings. As the West rose, sophistication grew and the well-ordered music of the Cathedral and monastery expanded also into the (truly) secular music written by the likes of Palestrina and Byrd and Bach and Hayden and Mozart and so on;

vulgarity of a different and richer sort was found in the truly wonderful folk music; we abandoned also that music since it tied us to traditions which would have constrained us.

On our way down, we have rap music and flat-toned singers moaning on about their lives of mass-market coffee shops and love affairs neither tragic nor uplifting.

On our way down, we have people texting each other at the same restaurant table or while walking down the street as part of a group.

On our way down, we have leaders—including those of Christian groups—who don't even pretend to care for or even care about the needs and desires of those for whom they bear responsibility.

Under the species of Syndicalism and Fascism there appears for the first time in Europe a type of man who does not want to give reasons or to be right, but simply shows himself resolved to impose his opinions. [Jose Ortega y Gasset, from *Brainy Quotes* at [https://www.brainyquote.com/authors/jose\\_ortega\\_y\\_gasset](https://www.brainyquote.com/authors/jose_ortega_y_gasset).]

Torn from communal structures—do we not have communal human being as well as our individual human being?, modern men find themselves missing much of their minds and hearts. Even hands don't do so well since we are creatures of habit and most habits of our ancestors were customary—communal at some level, perhaps village and perhaps continent-spanning empire.

Torn away from that communal part of our human being, we sometimes take a while to realize how badly damaged we are. We might feel some pain, even great pain, or we might live in the way of what some might call “worldly joy.” One way of relieving that pain, however temporarily, is to form opinions or to take on opinions from some talented demagogue. Most of our truth, most of our thinking, most of our healthy moral habits, come from the parts of us—our communal human being, which has been torn away. Any sense of loss is covered by shouting or shoving or shooting where we once would have thought or felt or acted in accord with the traditions of our ancestors. Those traditions would not have been perfect and often not even good, but they would have been some sort of guidance from what had helped a people to survive and to maintain their human being, individual and communal, in some sort of healthy form.

We can't directly undo the complex of problems Ortega referred to in the above quotes. We can't undo them because they are caused by a multitude of morally irresponsible decisions over recent centuries. We tore our own communal being away by turning away from our own civilization, by choosing flashy and degrading entertainment over the music and art and literature which takes an effort to understand and appreciate; we are willing to put in the effort to learn how to play a decent game of tennis but not to learn how to listen properly to either a symphony by Howard Hansen or to the earthy folk songs collected in a large number of volumes by Smithsonian. That is only a pointer to a number of ways in which we destroyed the Christian Civilization which was to be found, first and foremost, in the communal being of its members, in their thoughts and feelings and behaviors.

The future of the West is barbarism, at least for Europe and most of the Americas. The future of Australia and New Zealand might be found in a fortune cookie, so to speak; thus can they perhaps avoid that collapse into barbarism—by leaving the West.

# 553 Are the Gangsters Keeping Each Other Under Some Control?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2517>. It was finished and uploaded on 2018/05/18.]

The West has broken down into a gangster-land of sorts, with the realms of centralized governments and money-center banking collapsing into moral chaos. I've written often about this. But...

If the West is so disordered, morally and politically and so on—'morally' actually covers all human social possibilities, why don't the gangsters just take over in an open way?

Which gangsters?

The so-called Mafia is a cutthroat grouping of gangs and its history is full of wars between, say, the Genovese crime family and the Lucchese crime family. The same seems true of the various political and banking and national security gangs. The Bushes and the Clintons, the bankers at Goldman Sachs and at JP Morgan, the professional killers in the CIA (supposedly called the "jackals") and the corrupted field-agents of the DEA, cooperate but also compete. They know that they can't trust each other. They're all ruthless and have limited senses of integrity and honor. (Remember that the vast majority of human beings in those governmental and banking institutions are honest and hardworking, but remember also that the whole system forms a screen and even fortified wall behind which can operate corrupt politicians and bankers and bureaucrats and also true out-right gangsters.)

So, I suspect they have created—for how long?—a gangster ecosystem of sorts in which they keep each other under control.

I also suspect it's unstable partly because of internal forces and partly because it all stands on those protection and money laundering schemes which are the US government's debt selling operations (bonds, bills and so on) and that scheme, maintained in various ways by the US military and other government instruments of power has overgrown its criminal capacities—the world can't take more US government debt and the American taxpayers are getting suspicious (finally!) that their needs and the needs of the country as a whole aren't a high priority in Washington.

We'll step back about seven centuries to see how bad things became during a period which followed a period of great prosperity. The end of that first period (the "High Middle Ages") was showing huge wealth inequalities and the inevitable turn to methods of wealth acquisition and wealth maintenance which killed economic growth and failed to provide jobs for a growing population in Western Christian Europe circa 1300. One of the most dynamic of pre-modern economies, that of the High Middle Ages, had become a rentier economy which was failing to produce jobs, failing to increase wealth.

The gangster systems which were the aristocracies of Western, Christian Europe became increasingly unstable over the 14th century—see Barbara Tuchman's *A Distant Mirror* [135]. (The aristocrat-gangsters were tightly constrained until the per capita wealth began decreasing, the constraints were provided by various systems of aristocratic honor, of Christian morality, of competition between ecclesiastical and proto-nationalist power, and so on. They, including bishops and abbots, broke the moral order in a desperate attempt to maintain their high position in the European scheme of things.)

Let me repeat from a slightly different angle, some facts and claims I've raised and discussed before. The issue is very important and we may not have much time to prepare for the collapse of the West. Few knowledgeable and honorable analysts seem to think that collapse is more than—at the very most—two decades away. It might happen any month because the modern governmental and banking gangsters are rolling the dice to gain control over all human wealth before Russia, China, India, Iran, and other countries form, as a matter of course, a multi-polar world.

I repeat: by the end of the 13th century, which was the end of the High Middle Ages, the living conditions in Western, Christian Europe

were deteriorating rapidly—wealth had been concentrated in the hands of a small fraction of the population and they had settled in as landlords, rentiers. No proper economic risks were being taken, no wealth was being created, no jobs were being created. Few alms were available for the increasing mobs of beggars. (See Michael Hudson’s essay, *Rentier Capitalism—Veblen in the 21st century* at <http://michael-hudson.com/2016/10/rentier-capitalism-veblen-in-the-21st-century/> for an explanation of our own modern rentier economy and then use Tuchman’s book *A Distant Mirror* [135] as a good historical narrative giving concrete details of a similar period.)

Over the course of that 14th century, the population of Western, Christian Europe dropped by as much as half. By the middle of the century, the labor shortage was helping the “common folk” to regain a decent standard of living, (almost certainly) a better life-expectancy, and some measure of political power or at least consideration for their needs. Also, by the middle of the 14th century an army of Swiss peasants and bourgeois and even rich men of the local and productive variety had defeated an army of aristocratic knights—in full armor and on horseback—and various sorts of mercenary soldiers; the knights were Austrians and French and maybe others; the Swiss army was centered on pike-men carrying true combat versions of the decorative weapons carried by the Pope’s Swiss guard—nasty weapons which could behead a fully-armored knight or his horse as they charged a line of Swiss soldiers. In that same time-frame, a Portuguese army had also beaten an army of Spanish knights and their mercenaries. Note that Switzerland became independent of Austria and remains so; Portugal became independent of Spain and remains so. The secret to liberty: don’t let rentiers or other parasitical humans work their ways into your communities, local or national. We Americans failed to pay attention to the gangsters coming to dominance in our power-elites and history offers little encouragement that such creatures can be purged in any reasonable short-term.

By the end of the 14th century, the powerful and the wealthy had turned on each other to gain thrones (for one example, see *War of the Roses* at [https://en.wikipedia.org/wiki/Wars\\_of\\_the\\_Roses](https://en.wikipedia.org/wiki/Wars_of_the_Roses) circa 1455 to 1487) or simply a greater share of a shrinking amount of wealth available to the aristocrats and other rentiers. (Not all aristocrats in history have been rentiers but even many families originally productive aristocrats decayed into such when they lost the will to earn their way by, for example helping their farmers to achieve higher productivity through the building of mills

and other waterworks or by other investments of money or management time or...)

The West's current stability is questionable to say the least. It will likely collapse soon into a chaotic state complete with poverty and internal violence. Our desperate power-holders and wealth-holders are at their end as extorters of cash flows—that is, the Western governments, including their militaries and schools and medical systems, as well as Western banks private and public and quasi-public, will not be able to live off government debt instruments which no one believes could ever be paid off. Those bonds, especially those of the US government, have sold well because they were safe-havens for organized crime and tax-scofflaws and were the only game in town for those countries and banks and industries which need large amounts of American dollars to buy oil or to just move goods across borders. One of the marketing campaigns of the American government for their debt instruments was: buy our bonds and use our dollars or we'll destroy your countries, kill many of you including your children, and leave you with a miserable future.

Maybe we'll just be getting what we deserve for supporting these American powerholders and wealthholders with the "mentality of gangsters." (See Chapter 690. *A Plea From Syrian Christians—Will Any Western Christians Respond?* and Chapter , *Not a Deep-State But a Chaotic Battleground Where Barbarians Fight for Power and Wealth.*)

When that collapse comes, we in the West and many others might find out what Hell is like. We might find out what, at least to an extent, our leaders did to the peoples of Vietnam, North Korea (and South Korea to some extent), Iraq, Pakistan (probably to make the border with Afghanistan safe for the heroin factories of CIA allies), Libya, Egypt, Chile, El Salvador, Nicaragua, Brazil, etc. We should remember that the US military has occupied a number of small bases in Africa and no one is telling the American peoples what that is about. I would guess it's simply part of the operating principles of the gangsters running the US government: If it doesn't work, then keep on doing it but make sure you destroy even more infrastructure and kill more human beings. People of Africa: Beware for here comes the American behemoth, not particularly smart but an awfully powerful beast.

But, as I said, the gangsters are keeping each other under control, in some ways, for now. We can only pray we won't see a Napoleon or Genghis Khan or Lenin before the US begins to dissolve into more coherent entities which can defend their local interests against centralized power.

# 554 Do Americans Have What It Takes to be a Self-governing People?—Part 1.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2547>. It was finished and uploaded on 2018/09/03.]

Political scientists and political philosophers seem to be fundamentally irrational by way of an excessive faith in rationalistic *a priori*'s; in particular, they are almost willfully dense, on the topic of citizenry and have been since the failure, unlike physics and even mathematics, to reconsider their metaphysical assumptions by way of empirical tests—a single case or event in the real-world which contradicts an alleged absolute truth actually denies that 'truth'. The greatest of political thinkers and the ones who smell of shallowness alike assume they can settle the nature of human nature by thinking about men based on ideal thoughts and some vague body of anecdotal evidence a particular thinker has about how capable men are of participating in the government of a village or a large town or a city or a nation-state or even the strangest and most incoherent empire in history (the US).

The Greeks and other ancient thinkers as well as various thinkers from then to modern times left us radically incomplete catalogs and understandings of human political possibilities but those catalogs clearly pointed to these fundamental questions such as: "Is the common man capable of understanding the real situation in radically different human communities such as those of tribal Iraq with its nationalistic leaders, such as Saddam Hussein, trying to form a nation?" Even some with serious historical knowledge don't seem to realize Saddam wasn't in the position of a tyrant trying to

suppress a ‘liberal’ society but rather in the position of a William the Conqueror or a Henry II trying to subordinate his fellow-warlords to the needs of a nation. (And we shouldn’t assume that the movement toward modern nations was an unqualified good, but it is the movement Europe and China and India—less successfully—went through and many countries have gone through or are still going through in the so-called *Modern Age*.)

So, we have a useful ancient catalog of political structures for the purposes of setting up my discussion: monarchy, oligarchy, tyranny, democracy. We could add my favorite as the best possible, if implemented properly: a federated republic—biased toward the assumption of locally concentrated power, authority, and wealth. In any case, I won’t do the analysis here but I suggest the reader should consider these possibilities in light of what they assume about the capabilities of perhaps a specific population of ordinary citizens who might be literate or not, might have access to knowledge adequate for the decisions to be made by responsible voters or might not, and so on. I’ll leave it to the reader to think through the possible capabilities of, perhaps, a well-educated elite which members are formed to high standards of honor—monarchy or aristocracy? That reader might also wish to consider if the West, especially the US, has slipped rapidly through a sort-of populist democracy into the rarely-admired category of oligarchy? But, if that last is true, we don’t really know if the populist politicians might yet use their partial but significant control over the “mob” and the political process to subordinate the bankers.

Let me continue my cartoonish, but serious, analysis of the understanding of human nature in political science and political philosophy. My term ‘cartoonish’ is actually my refusal to take seriously scholarly analyses which analyze the history of beliefs but pay no attention to the poor grounding of many of those beliefs, and the underlying lines of thought, given what is now known about reality. As one example of a great problem, we now know that man arose inside of nature and whatever capacity he has to rise above ‘mere’ nature comes from his evolutionary history, isn’t found in equal measure in all human beings, and continues to evolve and develop. When the first “anatomically modern human beings” arose, say about 500,000 years ago or less, that line of creatures co-evolved with his tools and his communities—all that is studied by those who study human being. Those creatures were not simply early versions of modern men who hadn’t quite learned how to mine and refine metals and make metal tools, who hadn’t gotten around yet to writing books on geometry and aesthetics; those creatures weren’t

even capable of conceiving of the technology and art and social forms of small villages and wouldn't have been able to maintain simple huts or to use Neolithic (New Stone Age) tools if they'd been given to those early humans. Iron Age humans, likely including most modern sub-Saharan if they even have reached that level, would not be capable of using modern chemical plants built for them by friendly Europeans and would likely hurt themselves if left to do so; similarly, if they were living in an advanced civilization, such as the West, they wouldn't be able to deal with the abstractions of the appropriate legal or political systems and would likely act as if they were in a tribal society where justice is a matter of battles and payments between family groups or villages. This latter statement is a pretty good description of what is happening in the United States and much of Europe as the percentages of third-world peoples rise and as they and the Africans immorally and mistakenly transported to a human realm beyond the capacity of many and apparently far beyond the capacity of a good percentage of them struggle to cope with their political and social environments.

With that as a sketchy background, "cartoonish" has become "sketchy", I'll move on.

The strongest tradition of political thought in the West is what might be called 'liberalism', in a general sense.

Some liberals assert that individual human beings are made for self-governance (or not or whatever based on their 'intuitions'). This is true of modern collectivist liberals and libertarians and of any modern conservatives who advance far enough to even pretend to think. Neo-conservatives and various sorts of bomb-em liberals claim that as their goal, but we don't see many prosperous democracies, or even any countries with much in the way of order, among those which have been the beneficiaries of the wars of Neocons or the Bush Republicans or the Clinton Democrats or the Obama whatevers. But among the various sorts of liberalism favored by modern men, there are some rather optimistic versions that preach that the general citizenry could and would respond with some energy and moral responsibility to freer flows of knowledge of various sorts including at least some knowledge of history at the global level and greater knowledge of history at the local level. These liberalisms include classical liberalism and its various libertarian children, revolutionary ideologies such as the rather psychotic ones spreading across the American landscape, and the liberalism of many of the Founding Fathers which was more of a Deism for political geeks than

a coherent set of political doctrines.

Traditionally, most conservatives—at least those of intellectual temperaments—were more guarded, preferring to allow for some sort of aristocracy, natural and elected by sane processes or hereditary and selected over past generations. Such a system is imperfect, of course, but a democratically inclined republic has a chance of choosing men more intelligent and more knowledgeable than even a well-informed ordinary citizen so long as men such as John Adams or even that brilliant alcoholic Luther Martin are available rather than, say those crooks—the Dulles Brothers or other Wall Streeters who shaped American foreign policy to the profit of their law-firm’s clients. See *The Brothers: John Foster Dulles, Allen Dulles, and Their Secret World War* [82] by Stephen Kinzer for a discussion of the corruption of the Dulles brothers in this regard. See Tocqueville’s *Democracy in America* or Nathaniel Hawthorne’s introduction to the original edition of *The Scarlet Letter* for an early take on the drop-off in moral and other qualities of American leaders after the generation of the Founding Fathers—who themselves had feet of clay—and the proposed explanation that those Fathers chose themselves during a time when only brave men stepped forward while Americans seemed to prefer selecting leaders who were, and are, self-serving scoundrels on the whole.

There is little evidence that wide-spread citizenry rights will lead to a body of voters who take the trouble to learn about the latest target of our moment or decade of hate, country or individual or group. There is no more evidence that such wide-spread rights will lead to citizens who even think seriously about public schools and what is needed for the future of their children and the communities in which their children live and will live. There is certainly evidence that politicians of the scoundrel variety will at least accept decay in public education and will encourage the dropping of voting requirements such as some minimal literacy—I’d be willing to support some reasonable oral display of knowledge and reasoning ability but not the continuous flow of people into and out of voting booths when they don’t even know the Constitution is the law of the land and don’t have a clue what is in that document—if they even know it exists. To be sure, Bertrand de Jouvenel (see [https://en.wikipedia.org/wiki/Bertrand\\_de\\_Jouvenel](https://en.wikipedia.org/wiki/Bertrand_de_Jouvenel)) told us decades ago that the American political system was nothing like a self-governing democracy or republic but rather a political machine system which had kept the forms of democratic voting—I’ll not bother splitting (valid and important and thick) hairs over the difference

between a republic and democracy. There is enough of decent form in the American political system that it sort-of worked so long as:

- the major parties were putting up candidates often (sometimes?) not too objectionable,
- so long as local parties (often in alliance with the national parties) kept some sort of check on the national boys,
- so long as the American government didn't overly-extend its constitutional powers domestically or internationally,
- so long as local politicians and newspapers and maybe intellectuals of various sorts were doing their job of speaking something akin to truth to power, and
- so long as various other conditions held which no longer hold—at least in a constant way.

Look around for the battles Eugene McCarthy (soft-left) and James Buckley (soft-right) engaged in against the political establishment in the 1970s as “political reforms” were discussed and enacted. Among other claims, one or both said that those reforms were an effort to destroy the partial freedom of state or regional parties and that it was an effort to destroy all forms of corruption not under the control of the two major parties.

Americans, on the whole—including my 20-something self in the 1970s, didn't pay much attention to what was really happening. Apparently, we—if I was even paying attention—passed right over the details and noticed only the important fact that these bills had some variation of the word “reform” in their titles.

Before and after that increase in major party control of the American political process, things were also going badly even as Americans grew more obsessed with professional sports, even as popular music and literature and cinema and art decayed to a quality suited for a people themselves decaying into a barbarian childhood of sorts—see Ortega y Gasset's *Revolt of the Masses* for one entry into high-quality thought on the decay of the West, even as people became entrapped by ever-new technology—good in itself but we have to know when some need has been met and then ignore the marketplace, even as the leaders of nearly all realms of the West—religion

and culture and politics and business and education—turned against the traditions of the Christian West and the many adherents and dependents of those traditions. Of course, that inside attack on the West was allegedly for the purpose of making the world a better place but all it has brought the peoples of the world is death or mutilation, poverty to some and increased poverty to others, loss of power. . . . But some have seen an increase in their relative wealth and power though it might be that the total power and wealth of the West have decreased in the most recent decade or two; it seems likely to me that that process of impoverishment and enslavement of the many by the few will increase in the West for as much as a decade or two before the West cracks underneath its morally degenerate leadership.

Why do I speak as if some end of the West were certain?

Our leaders are desperate to continue interfering in regions of the world or individual countries where we've done little or nothing good for the peoples of those regions or countries, nothing good for the United States or its ordinary citizens; often the United States has done much harm in these regions and great harm to the limbs and lives and psyches or moral characters of our soldiers.

Coming out of Vietnam and with hints that there were problems even in the "Good War," hints that "Good War" was a bit morally ragged even for the "Good Guys," Americans proved themselves more inclined to "give it a break" than to try to learn from recent mistakes or even mistakes from decades prior. In his overview of problematic issues regarding World War II which should receive further attention from historians and philosophers and political scientists and politicians and religious leaders and so on, *No Simple Victory: World War II in Europe, 1939-1945* [27], Norman Davies, the distinguished and largely retired British historian, expert in Central and Eastern Europe and in that "Good War," tells us that Churchill and Roosevelt look good only in comparison to Hitler and Stalin—which is akin to: "Our town's gangster is a saint compared to Al Capone." I've also read in several essays by respected historians that American combat troops had good records with regard to crimes but the unbattled American occupation troops raped and stole with the worst of other country's soldiers. The death of a million or so German POWs in American camps? The missing ten million German civilians who were fled or were driven out of their homes as the Soviet armies advanced—why were they not listed in documents in the Soviet archives and are the hints valid that they had fled into American controlled regions before disappearing? The American-led over-

throw of Mosaddegh's legitimately elected government in Iran (1953) and his replacement by a nasty lapdog with a national police force reminiscent of the Gestapo? Korea and Curtis LeMay's admission his bombers killed two million people and leveled nearly every building in what is now North Korea—most of the people died in napalm bombings? Vietnam? Cambodia? Guatemala? Nicaragua? Chile? Pakistan? Iraq? Iran again? Libya? Syria? Yemen?

Why do these people not love us? Why are they so unwilling to let us take control of their countries and reshape them for the good of . . .

American people, our leaders who think it their right to rule all the Earth are committing these crimes in the name of your country and the immediate (and mostly innocent) agents of these crimes are your sons or that nice, young fellow who was in your Sunday School class. And we Catholics, I'm sure most Protestants as well, pray for our "soldiers who are working for peace around the world." That's nothing but a part of our self-deceiving, self-righteous efforts to justify our pandering to the powers of the world, powers which serve God in some way but powers we're supposed to question—in a pushy way if necessary. The Bible tells us evil men are likely to grab control of great power and wealth; sometimes, good men are corrupted when they hold great power and great wealth.

We sin every time we pray for the success of the American "quest for peace," and don't bother to even listen to the horror stories brought back by the men who'd been forced through Hell, sometimes committing crimes to stay alive and sometimes being tricked into committing crimes by planners back in Washington or Arlington, sometimes being the victims of terrible crimes.

The death-toll is tremendous—for the native populations on the ground but there has been a terrible toll of needless deaths and disablements, physical and moral and psychological, among Americans and our allies. The destruction to American freedoms, to the proper operation of our governments, to our soft-power (credibility and long-gone reputation as a country), to our individual self-respect and the respect we as individuals used to get from other peoples, to our wealth, has been great and will likely bring the United States down before long, one way or another—we can hope for something as little terrible as a breakup into more stable and coherent nations which might come together again in a century or two.

All of this has been tolerated by American citizens though there are surprisingly honest books about the crimes of our largely self-serving political

and business and intelligence(???) leaders. And sometimes military leaders. Psychopath is the term for far too many members of the American elites (and not just in politics) though perhaps many of them aren't psychiatric psychopaths so much as somewhat selfish people trained to be greatly selfish, egotistical, driven to seek wealth and power or at least an association with those who hold wealth and power. And our religious leaders have kept their mouths shut, though sometimes allowing or even encouraging open dissent against American crimes by clergy.

Criminals will be criminals. An American ruling class willing to carry out regular, large-scale international crimes—mostly war crimes—against other peoples will also be willing to carry out crimes against Americans when it suits their purposes and when they can get away with it. It might seem to some that they can almost always get away with their domestic crimes and pretty much always get away with their international crimes—in fact, it does seem that punishment comes to criminals in the American ruling class only when a competing group of criminals sees a chance to bring down a rival as a result of a domestic fight for power.

It can also be hard to understand the complex and seemingly willful (and morally culpable?) ignorance on the part of Americans when it comes to the unusual, large-scale crimes of the six or seven decades. My experience in talking openly to some people is that there are a small but significant number out there who understand the suspicious nature these crimes; there is also an overlapping number of Americans who are highly suspicious of our country's international interventions going back to at least the American invasions of the fading Spanish Empire—mostly the Philippines and Cuba. There are also technical specialists such as pilots and other flight experts (including anyone who was a aircraft carrier flight crew or a non-pilot crew member during their military service) who can tell us how unlikely it is that:

- “foreign terrorists” really took down Flight 103 over Lockerbie—see the *Time* archive for the article *Pan Am 103 Why Did They Die?* at <http://content.time.com/time/magazine/article/0,9171,159523,00.html> where we learn US military investigators told Time reporters that the CIA blew up the plane to kill a Green Beret traveling back to Washington with information about the CIA's international drug smuggling operations in Lebanon,

- Flight 800 went down the way the US government claimed; I've heard a professional pilot and retired Air Force flight crewman deny it was possible and have read a CIA officer's account of the rumor among the high-level, sub-political officers of CIA, FBI, etc that it was shot down by accident by an inexperienced Navy pilot who was part of the training exercise taking place from a nearby carrier,
- McVeigh's van-bomb could have taken down the Federal Building in Oklahoma City—see Gore Vidal's essay in *Perpetual War for Perpetual Peace: How We Got to be so Hated* [143] or talk to an honest explosives expert who trusts you—a hint which is very important also for understanding the next entry: modern-day skyscrapers,
- that the hi-jacked airplanes on 9/11 were really flown by amateurs rather than military-quality pilots or (much more likely) electronic controls, that modern building materials could be set aflame by a substance (jet-fuel) which burns at too low a temperature for materials meeting building codes even for low buildings, that there would be no claims against manufacturers and builders if that nearly impossible situation had occurred, that the first-responders who barely came out alive were imagining all the “secondary (not related to the planes) explosions” they said were occurring on lower floors—see *9/11: A Conspiracy Theory* at [https://www.youtube.com/watch?v=yuC\\_4mGTs98](https://www.youtube.com/watch?v=yuC_4mGTs98) for the greatest (that is, wackiest) conspiracy theory a black-humorist or government official could imagine or read a serious article, *Ten Short Videos About Nine Eleven* at <https://digwithin.net/page/1/> which points to videos of testimony by first-responders and by nearby witnesses about explosions in lower-floors which started as the planes were hitting the buildings many floors above—some of those interviews were shown on major television networks or major local stations, or
- that *ad nauseum*.

Americans can't govern themselves. They don't even concern themselves with the crimes committed in their names, crimes which might be thus imputed to them by a God who, despite modern rumors, values justice as well as mercy. They also don't concern themselves for long with crimes committed against their communal self, crimes which greatly impact a few,

leaving the rest to just “give it a rest” and get on with their plans to take the children to DisneyWorld or to Yosemite. That ordinary life has much good in it—though I’m not an advocate of theme-parks, but it has been hollowed out and deprived of its once shaky but okay foundations. And then the next few generations.

The American Age will come to an end as do all things, and maybe very soon, but it could have been kept going a good while we as a country and citizens could have eased into an honorable role as a country among the, say, five or six most wealthy and most powerful on Earth.

From a slightly different viewpoint: Americans, perhaps like most human beings, tend to accept the facts or pseudo-facts and also opinions without checking even that which can be found in books in local libraries or in their lending partners, by reputable authors and well-established publishers. Moreover, Americans tend to forget what they might have once been told—as is true of the above-mentioned videos shown on national television in which first-responders and others testified that “secondary explosions,” that is—not caused by the planes hitting those two towers, began to occur on the lower floors of the towers about the same time the planes hit high up on the building.

There is no evidence that American citizens have bothered to acquire the knowledge necessary to do their jobs, no evidence they talk about these strange and nasty events (downing planes filled with civilians or the destruction of buildings holding more than 2500 people) with friends. I know some who think themselves skeptical for questioning if the attacks could have been stopped by, say, intelligence and police officers paying more attention to hints of terrorists in the country, but those false-skeptics don’t go any deeper. Their minds are stuck in the idealistic lines of thought they were taught in fifth grade, even the Christians who have read in the Bible (most clearly in Isaiah and Jeremiah) that powerful and wealthy men include a disproportionate number of evil men, men with the “mentality of gangsters” in the phrase of Lord Acton who started off a famous paragraph by telling us such men are almost certain to gain control of centralized power and wealth and ended that paragraph with his famous claim that power corrupts and absolute power corrupts absolutely. (Thus he covered both those who were evil before gaining power and those who became evil as they held power or served those who held power.)

Americans are naive and innocent in a thoroughly unattractive and morally irresponsible way. So we can learn by paying attention to the

events of recent history and those in the preceding half-century and to the ways in which Americans failed to act the role of morally responsible adults. Those in my generation (born 1955) and the two generations before that deserve to suffer for our moral irresponsibility and cowardice but it will be mostly the next few generations which will suffer for our sins—so much for the rumors that the son doesn't pay for the sins of the father. But much of our distortion of our Christian faith, especially a sinful generation preaching that God is a God of Mercy but not a God of justice, are but efforts to justify our cowardice and sloth. We'll pay our prices as we face God and see ourselves for the self-serving cowards we are.

In the next chapter, I'll examine the possibility that most human beings aren't up to fulfilling the role of morally responsible citizen in a complex civilization or even in many lesser communities such as nations. By the time we descend to cities and towns and even families, we might discover that many more human beings are capable of fulfilling the roles of morally responsible adults.

So maybe the ordinary citizen isn't culpable but, if so, only because he's not capable of being a morally responsible adult at levels higher than family and local communities.

# 555 Do Americans Have What It Takes to be a Self-governing People?—Part 2.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2552>. It was finished and uploaded on 2018/09/19.]

In this second part of this discussion, I'll be looking at this question from a slightly more abstract or theoretical perspective. That is, do we have reasons to believe that Americans, or the citizens of any nation or federation of nations, have the ability to be a self-governing people in the context of the immense complexity of social and economic and political and cultural relationships in the modern world. This increase in complexity is driven by:

- Pure, simple growth in population and in land under use and natural resources being exploitable.
- Increased complexity from such factors as improved knowledge of empirical reality along with the resulting technology and understandings of Creation.

Are we even capable of living up to our roles as citizens in modern, complex human communities?

Let's be blunt.

Most American citizens, most human beings alive anywhere on Earth in 2018, don't understand much about complex systems such as the sorts of political systems necessary to and proper to modern civilizations. . .

Let me stop there and point out that Saddam Hussein wasn't particularly brutal in his efforts to forge a nation compared to the likes of William the Conqueror and Henry II and Henry VIII and the other kings/warlords who created the British nations—Ireland and Scotland as well as England and Wales which was so brutally suppressed by one of their own—Henry VIII. I should add Saddam also wasn't particularly selfish in grabbing a disproportionate share of the fruits for his family and tribe and other allies. Local warlords and tribal leaders aren't often soft men and aren't ready to give up their own power or their people's independence to central authorities, not even when that central authority (government and more) leaves a good amount of power and wealth in the hands of local political and other institutions. How many Americans could even dimly ask the questions which might lead to a new perspective on a man brutal but much like the brutal men who ended such things as the personal, not law-based, laws of tribal societies in what became the West?

The above is but one example of controversial and sophisticated thinking which seems quite beyond the average citizen of the US and of nearly all countries I know anything about; it also seems beyond the typical Senator or State Department/CIA official, and so on. At the same time, a good educational system along with a properly complex (sophisticated) culture in general can plant a good worldview in the minds of many citizens—certainly the ones smart enough to understand though not smart enough and creative enough to think thoughts which are new, at least to them. And here's a sophisticated thought which would confuse many: An old thought in a new context can be as good as a new thought. Or as bad as it might have been the first time around. True thinking can't be automated.

Intelligence isn't the only issue. And lack of relatively high levels of intelligence on the part of most citizens is more a feature than a problem. Everyone has a role in life and some are given more powerful minds to serve their own needs and the needs of their communities, others are given generous hearts or drives oriented towards the good of their families or other communities, still others capable hands—that is, the skills and inclinations to turn good ideas and good 'feelings' into real-world results. Powerful minds aren't an unqualified blessing—Einstein wasn't omniscient and neither were the great inspirational leaders nor the great businessmen or politicians.

Americans are inclined to—sort of—respect famous intelligent people such as physicists who win the Nobel Prize and engineers who advance

technology or famous professors from Harvard and Yale who justify the stupid and poorly-managed wars which—sort of—meet the political and economic and psychiatric needs of the rulers of the US. There is little respect among American citizens for those who have bothered to gather information on Iraq or Iran or the families engaged in banking or politics; there is little indication that American citizens realize that, while smart people don't always think well and don't always get to the right answer, smart people think thoughts about a complex situation which aren't usually possible for most others to think; there is little realization that even a smalltown public library will have some books documenting the criminality of some American leaders from the 19th century and the stronger tendency to criminality as Wall St lawyers (such as the Dulles brothers) or investment bankers (such as the Rockefellers after moving to NYC or the Bush sub-clan of the Walkers) began to periodically and then consistently dominate international relations and then began to loot the country's pension funds, mortgage guaranty funds, and who knows what else. See the disturbing story of the \$21 trillion (as of 2018 or so) which is missing from the US government at the website of Catherine Austin Fitts: <https://missingmoney.solari.com/>. "Banana republic" isn't nearly adequate as a description of the US at this time.

High school students learn a great deal of mathematics and science and history (patterns) which were the results of the activities of great thinkers (Archimedes and Newton and the Founding Fathers); those thoughts were often great mysteries to all but the smartest people for generations as they were being absorbed into the communal mind and made accessible to those lacking in intellectual gifts. Often those so lacking in the abstract reasoning skills needed to understand, say, the so-called "Big Bang"—a phase change and not a creation event or lacking the somewhat different reasoning skills to understand the messy development of Western political systems, have quite a bit to offer in general but specifically in making decisions based upon that communal knowledge, but thinking to be independent-minded and intellectually freestanding they become pawns of demagogues and propagandists and fear-mongers.

And we are divided by our distrust of others who speak or write in complex sentences or who read too many books, of others who call us to account for our own crimes and sins or for those of leaders we support, of those who conceive great and noble projects which demand energy and sacrifices of various sorts.

The first Catholic Mass reading for 2018/09/18 makes the point:

Tuesday of the Twenty-fourth Week in Ordinary Time

Reading 1 1 Cor 12:12-14, 27-31a

Brothers and sisters: As a body is one though it has many parts, and all the parts of the body, though many, are one body, so also Christ. For in one Spirit we were all baptized into one Body, whether Jews or Greeks, slaves or free persons, and we were all given to drink of one Spirit.

Now the body is not a single part, but many.

Now you are Christ's Body, and individually parts of it. Some people God has designated in the Church to be, first, Apostles; second, prophets; third, teachers; then, mighty deeds; then gifts of healing, assistance, administration, and varieties of tongues. Are all Apostles? Are all prophets? Are all teachers? Do all work mighty deeds? Do all have gifts of healing? Do all speak in tongues? Do all interpret? Strive eagerly for the greatest spiritual gifts.

[Lectionary for Mass for Use in the Dioceses of the United States, second typical edition, Copyright 2001, 1998, 1997, 1986, 1970 Confraternity of Christian Doctrine.]

The above reading gives the answer to more responsible and more capable citizenship in Christian terms. This answer can be restated in terms congenial to any tradition which respects the reality of communities. If you have real communities, you'll have trusted members in each community including towns and cities and local churches who have:

- strong hearts to detect the presence of moral disorder or even outright evil as opposed to the claims of starry-eyed idealists or the corrupted powerholders and wealthholders, those strong-hearted human beings will be the true reformers;
- strong minds and a curiosity that seeks knowledge and truth to tell us what might be or is going on as opposed to the claims of powerholders and wealthholders, those strong-minded and curious human beings will produce plausible understandings of the increasingly complex events and structures of our world;
- strong hands to protect the communities against predators who would simply exploit youth or others in the community or those far more

dangerous predators who seek to control or destroy all the intermediary organizations which are the relatively local communities.

No, Americans are not a morally responsible, self-governing people and can't ever be such until we restore our families and local communities and local churches and local ethnic/social clubs and all the communities and institutions which lie between those most concrete, mostly deeply flesh-and-blood, communities and the central powers which currently are not true communities but rather institutions for exploitation of the naive, ignorant, or simply powerless by the sophisticated, knowledgeable and powerful. (Take this last comment in light of the type of sophistication and knowledge and power appropriate to corrupt human institutions, even those which have some of the characteristics of true communities—as the United States once did.)

And it's our fault as much as the fault of our exploiters. It didn't take threats to make us give up our communities. It didn't even take substantial bribes. All it took was the offering of their cultural trash—the cultural Marxists were employees and not great revolutionaries—and we grabbed at it, more and more so, as our minds and moral characters decayed over a remarkably short period. We, the citizens of the US, watched Superbowls and trashy movies—has Hollywood not yet produced a movie for pseudo-adults about any of the comic book characters I lost interest in at the age of 11 or so?—and did nothing to maintain those foundations let alone to strengthen them against the cultural and intellectual acids which are a side-product of revolutionary changes such as we've seen in the West over the recent centuries. And now the superstructures of our once-great civilization are collapsing even as our exploiters make short-term profits by alienating (stealing) the contents and building materials.

# 556 Let Venezuelans Be Venezuelans

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2604>. It was finished and uploaded on 2019/02/19.]

There are writers on the Internet, some maybe just scribblers but many are thinkers of some capacity, who criticize other peoples, including most Latin Americans, for being too dumb to handle complex, American-style economic and political systems. To be sure, many of these criticisms are quite true, though we should realize that current immigration patterns along with the dumbing-down of American culture and entertainment might soon render the US incapable of maintaining such systems; we may have already reached the point where we won't be able to fix our systems if they break as badly as they did during the financial crises of the 19th century or that of 2008 or the Great Depression of the 1930s. One warning sign is that a lot of our immigrants are coming from peoples with lower average IQs than is necessary for complex economic and political systems. Even if a lot of geniuses are present in a country, economists say that it is average IQ that correlates highly with such measures as high per-capita Gross Domestic Product and advanced technology.

Sometimes those writers, like me, believe there to be some important differences between Latin Americans, Southwestern Asians, sub-Saharan Africans, Southern Asians, East Asians, Ashkenazi Jews, Northwestern Europeans—including descendants of the colonizers of the US and Canada, and so on. By measured IQs, these peoples I've named might be ranked (highest to lowest): Ashkenazi Jews, East Asians (at least Japanese, Koreans, Vietnamese, and Han Chinese), Northwestern Europeans, Southern Asians (though there is a great variation by region and religion), Latin

Americans and Southwestern Asians (nearly a tie?), sub-Saharan Africans. From all evidence, the IQs of all those peoples are different, as are the ways the mind-personality complex is organized. The cultures are also different, reflecting their environments plus past responses of the local populations to their external environments, their own cultures, and their own mind-personality complexes which reflect the responses of past generations of those peoples.

It's all very complex and not much like the simple conceptions found (necessarily) in ancient times when abstract reasoning was evolving and was being shaped in particular cultures, when abstract reasoning was not yet applied in a fully disciplined way to the entirety of being and thus was not always shaped properly even when geniuses were producing promising ways of thinking, including tentative ways of understanding that entirety of being. It's all very complex and not much like the simple, verging on simplistic, conceptions taught (necessarily) in high-school biology and most popular books on biological evolution.

In those earlier ages, abstract reasoning was applied to what might be labeled 'metaphysics' and 'theology' and thus, despite Archimedes and a few other scientific stars, empirical science (physics and mathematics but also history and literary studies and so on) fell well behind, resulting in some serious distortion of those understandings of the entirety of being. In the past few centuries, empirical sciences generally raced ahead—with mathematics and physics even penetrating into the regions of metaphysics and (potentially) theology. By referring to theology, I mean to point to speculative efforts such as mine to understand communal being (including possibly the Holy Trinity, one God in three Persons) by use of modern differential geometry. Understanding means to accept reality, to draw concepts from even the most brutal of facts and of 'pure' understandings of regions of concrete, thing-like being, and to use those concepts for proper discussions of more abstract realms of being. For example, I've suggested—following the German philosopher, Kurt Hubner—that quantum mechanics seems more reasonable if we conjecture that relationships are primary rather than stuff. Relationships create and shape stuff rather than stuff existing first and then starting to form relationships.

It's certainly true that we human animals arose in the midst of messy processes occurring in a complex and complicated world. Multiple family-lines of humans moved into different environments and began to respond to those environments. And then new family-lines were formed in some of

those environments—creatures of Africa adapting to life on the steppes of northern Eurasia and so on. We now know this wasn't quite a one-way process even with the lines of human beings which moved out of Africa—there were some returning and breeding into African family-lines as well as, for example, males of the group named Ancient Northern Eurasians breeding with women taken from the regions of the ancestors of Han Chinese—the mixed lines forming new family-lines which became the bulk of American Indians. There are even signs of large-scale inter-breeding with 'archaic' family-lines of human beings—Neandertal and Denisovan; there is evidence in some of the genes of Southeast Asia and various Pacific islands of smaller-scale inter-breeding with some truly archaic, relatively small-brained human beings.

Even way back in the days of the African Eden, the archaic humans who were adapted to life in great savannahs of Africa were likely different at an early stage from those adapted to life in a forest setting in Africa, both being different from archaic human animals who had adapted to life in Southeast Asia or in the plains and great oak-forests of Europe. It's quite possible that higher levels of abstract reasoning began to develop in some simple way in some of those very early human populations and not in others, though those differences might have been washed away well before the major Out-of-Africa crew moved into Southwest Asia 50,000 years ago or so. Major differences in abstract reasoning probably developed even among human family-lines with significant capabilities in abstract reasoning during the periods over the previous 10,000 years or so when we can see signs of an acceleration in the development of both technology and social forms of organization—see *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending. That first happened in a few regions such as Southwest Asia—modern-day Palestine into the plains of modern-day Iran, parts of east Asia, and on the steppes of modern-day Ukraine and southern Russia. Similar developments occurred in other parts of the world.

The bottom-line in our day is that there are peoples, including those in Latin America, who have the capability of sustaining a part of a modern civilization and that part is distinct enough that they can call it their own; they don't have the capability of truly adapting to the more advanced parts of a modern civilization, Western or Chinese or Indian, or any other civilizations you might claim to exist.

Even within civilizations, there are differences in IQs and personality

characteristics. Accomplishments in science would indicate there are higher IQs in some European peoples than in others. History would indicate that a people, such as the Italians, could be intellectually dominant for centuries (the Renaissance and some centuries before that) and then drop down to lower levels later on—though some studies indicate that Italians have one of the highest average IQs of modern European peoples. Some possible reasons for such historical changes, and ways of possibly thinking about underachieving or overachieving peoples, are explored in three books I've recommended before:

- *The Genius Famine* [21],
- *At Our Wits' End: Why We're Becoming Less Intelligent* [105], and
- *A Farewell to Alms: A Brief Economic History of the World* [22].

You can also do a search on my blog, *Acts of Being* at <https://loydfueston.com/>, for my discussions of authors such as Jacques Barzun, Jose Ortega Y Gasset, Hermann Melville, Nathaniel Hawthorne, and Garry Wills regarding signs of decay in intelligence or literacy or moral character which could be seen in major areas of the West even before the American War Between the States. I claim that deeper understandings of human being, individual and communal, come from consideration of quantitative studies along with these more 'literary' studies.

So...

Are the Venezuelans capable of running a smaller-scale version of the United States or Germany or China? No. Nor are the Argentinians nor are the Iraqis nor are the Greeks for all their ancient accomplishments. Heck, the (Asiatic) Indians don't even seem up to the task of running a same-scale version of their own country/civilization. And the question can barely even be asked about the sub-Saharan African countries without moving into fantasy-regions of advanced African civilizations populated by comic book characters.

We should have good relationships with these countries, respecting what they can and can't do. We shouldn't colonize them nor force upon them excessively one-sided deals. Nor should we allow too much immigration into the West of the human beings from these countries who have the intellectual levels and personality characteristics to succeed in the advanced countries; that gives them opportunities but decreases the chances that

those countries will advance toward higher capabilities, or even retain their current capabilities. We should trade with them in reasonably fair ways. We should interact with them, allowing them to adopt the parts of our ways and views which they can handle and maybe use to enrich their own countries' cultures.

We should let them follow their own path, borrowing from us but not being shaped by us. We should be wise enough to realize that they can't really be 'like us', even in the good sense of developing their own more advanced ways of technology and social organization, unless they choose that sort of a path by, for example, developing cultural and social ways which give reproductive advantages to those with higher levels of abstract reasoning power and with personality characteristics which can drive them, especially their geniuses, to higher accomplishments.

They may not choose this path. I think some peoples have to do so and will do so. The alternatives may be dire, especially if large reservoirs of oil or other natural resources make them attractive to predator nations. Of course, it probably won't happen that the 'undeveloped' or 'underdeveloped' peoples will be allowed to choose their own paths forward. After all, the human race contains many aggressive and energetic men inclined to conquest or even extermination (sometimes only extermination of the males) when confronting peoples occupying valuable lands. The human race also contains a lot of self-righteous bigots who think to be doing good when they impose their ways upon other peoples—in the name of charity. Maybe that is how things are meant to be or at least how they have to be until we pass into the next world, the world of the Resurrected. But, maybe, we have a chance to advance toward that perfect world by doing a bit better by ourselves and by others in this very imperfect world.

# 557 Enabling Peace? Or Delaying War to Make it Nastier?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2621>. It was finished and uploaded on 2019/07/01.]

Early in May, I read *The Birth of Modern Belief: Faith and Judgment From the Middle Ages to the Enlightenment* [127] by Ethan H. Shagan. I thought the analysis was pretty good, but I didn't like the 'global' conclusion:

Enlightenment rationality did not devour the world in its ravenous maw, it was only a subset of the larger project to liberate human judgment. The outcome undoubtedly holds perils: the rights of subjects to formally equal beliefs on every topic from physics to philosophy, regardless of their ignorance, and the rights of subjects to sift and choose which facts to believe, even alternative facts that might seem irrational or poorly attested. But it also enables peace in a diverse society. [In his summing-up, page unrecorded before book was returned.]

There are various issues underlying the complex changes discussed by Professor Shagan. Let me present my current thoughts on this general matter—in a schematic form:

- Beliefs matter. Any human community, at any scale, will have problems if a good number of its members with voting or decision-making powers have beliefs which are not in synch with a presently plausible understanding of reality.

- Any human community, at any scale, will have problems if a good number of its members with voting or decision-making powers have beliefs which are not in synch with the present and past of that community.
- Plausible understandings are becoming ever more complex, though it seems likely that some sort of breather will take place as we deal with various problems which are building to intolerable levels, especially in Africa but also in nearly every inhabited part of the globe.
- Those plausible understandings rely upon very sophisticated knowledge, most of which can be accessed only in highly technical forms—even the best of accessible, ‘popular’ works are best used as introductions to give technical learners an overview of the landscape before they begin to travel it. I’m referring to good, technical understandings of quantum mechanics (matter and energy), general relativity (time and space), transfinite numbers (infinity including eternity), a stew of complexity and chaos theory and more (self-organizing systems and such-like), genetics and evolutionary theory (human nature including the mind which seeks understanding—at least some minds), psychology in a disciplined form (individual human nature), history of a traditional sort as well as some history run through some mathematical modeling, and perhaps more.
- If there were some way to produce a “spectrum of freedom” to correspond to both the ability to form worthwhile opinions and the willingness to put in the effort to acquire the necessary knowledge and then to contemplate it in a narrow and a contextual way, Shagan’s ‘global’ conclusion might be a good one. Such “spectrums of freedom” might have existed in various parts of Western Civilization before the Modern, Liberal project gathered steam.
- Finally, for now: Can men, or at least most men, be truly free in the context of a homogeneous mass of men? And these men in that blob are truly mass men, shaped by large-scale (even global) markets and political forces.

These preliminary thoughts, logically enough, lead to a preliminary conclusion:

In an age of complex and poorly understood problems, the opinions of some are worth more than the opinions of others.

After all, we in the United States have something akin to peace (at least for now) despite the incoherence of many lines of thought which are driving our public policies. On the other hand, the peoples of Korea and Vietnam and Iraq and Iran and Syria and various other countries have paid a big price for the low standards of knowledge and of opinions of our leaders and theirs. The problems of those peoples and the coming problems of the American peoples are being born of and nurtured by the inability and unwillingness of the American citizens to even acquire basic information about those many countries. In most cases, our leaders seem to be as ill-informed and as lacking in thinking skills as most ordinary citizens—all have been formed by American culture and that formation is reinforced by the American educational systems as well as the propaganda of the American ruling elite.

## Part VIII

### What Means It All?

## 558 Introduction: What Means It All?

In this part, I've collected essays or articles from my weblogs, *Acts of Being* at <http://loydfueston.com/> and *To See a World in a Grain of Sand* at <http://loydf.wordpress.com/>, I deal with the human response to God's purposes as we can discern them in the world's demands upon us and in God's revelations found in the Bible, especially the Gospels of the Lord Jesus Christ, and in some other limited sources of lesser authority.

## 559 Modern Decision-making: Driving Over the Cliff Backwards

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=52>. It was finished and uploaded on 2006/12/16.]

We're all liberals and individualists nowadays, even those who pretend otherwise (forget the Amish for a few minutes, please). Our views of self and society lead us to act according to a cowardly form of prudence. Let me take a quote from the 1913 Webster [140]:

Prudence supposes the value of the end to be assumed, and refers only to the adaptation of the means. It is the relation of right means for given ends. –Whewell.

In other words, true prudence comes into play only when moral decisions have been made. I think I would be well-justified in saying that this is not the order in which modern people make their behavioral decisions. Rather than deciding what is right to do and then trying to find the safest means to do what is right, and the means which might best reach that goal, we first – often implicitly – decide what options are available for moral decision-making. The available options are limited to those which maximize our chances of living safe, comfortable lives.

Pro-life Christians see that our medical systems are becoming increasingly evil but they do not consider the possible call to refuse the benefits of those medical systems. You see, pro-life Christians are also modern human beings and have to take care of their own safety and comfort first. After they go for their annual physical, buy all their prescribed drugs, visit the chiropractor a few times, and consider that surgery to relieve their carpal

tunnel pain, then they settle down to deal with their disgust with modern society, including those increasingly evil medical systems.

We feel that we have a right to be treated for our physical and mental ills despite the fact that we have to deal with the same medical establishments, government agencies, and insurers which are funding abortions and artificial reproduction and experiments on babies being grown in test-tubes.

Oh, those are evil people who are killing some unborn babies, creating fertilized eggs in laboratories, and even making test-tube babies for medical experimentation and maybe for eventually harvesting organs. We'll show them. Our Lord, Jesus Christ, and His saints showed us how to deal with such great evil. We'll reschedule our appointments with our doctors and we'll head down to Washington to march in front of the news cameras. That'll show everyone we know how to carry our crosses. Then we'll return and make new appointments.

Maybe everyone who pretends to moral integrity should make their moral decisions first? Maybe we should decide that we shouldn't accept benefits from a system which is doing great evil? Maybe Christians in particular should realize that the crucified Son of God didn't teach us to first screen our options that we might secure our comfort and safety? In the case of Christians, even a proper prudence will tell us to meet our higher calling by sacrificing our comfort and safety, that we might follow our Lord and obey His commandments. But that might lead us to a new form of martyrdom: suffering and dying when the magicians of our society can relieve our pains and ills. Surely, we Christians have passed beyond that primitive need to accept martyrdom when we can obey Pilate and also follow Christ? Surely, we modern Christians can be fully members of modern societies and then find ways to be Christians if only in the gaps of those societies.

Am I reading the Bible wrong? Or is there wrong in the thinking, or non-thinking, of all those who first nurture their careers and secure good benefit packages before they set out to protest against a materialistic and corrupt society?

I have to admit I'm inclined to utter a new version of the famous prayer of St. Augustine of Hippo:

Lord, make me willing to be your true servant whatever the cost. But you don't have to rush. Christmas is coming and then there's the Superbowl and...

I also am a modern Christian.

# 560 What is God's Covenant with Noah?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=62>. It was finished and uploaded on 2007/01/18.]

Here's a definition of covenant [140] to start my discussion:

**covenant** 3. (Theol.) The promises of God as revealed in the Scriptures, conditioned on certain terms on the part of man, as obedience, repentance, faith, etc. [1913 Webster]

I will establish my covenant between me and thee and thy seed after thee in their generations for an everlasting covenant, to be a God unto thee, and to thy seed after thee. –Gen. xvii.

[1913 Webster]

In chapter 9 of Genesis, God adds, “When the [rain]bow is in the clouds, I will look upon it and remember the everlasting covenant between God and every living creature of all flesh that is upon the earth.”

As I interpret this: God is a Creator and not a meddling Deity of the sort worshiped by most Catholics and Protestants and Jews of this modern era. In Scholastic language, God is the Primary Cause (the Creator) and not a secondary cause (a super-creature like most of the gods of pagans, even the God of Plato who created from nothing but in the manner of a human workman).

We become Deists, even when we profess belief in the Holy Trinity, when we see the world as a battleground between God and Satan. God is all-powerful. He does not struggle with any of His creatures, nor does He struggle with any part of the physical universe. If Satan exists, he'd be as

powerless as us men regarding matters of salvation or denial of salvation. Only God can save, only God can bring a creature of this universe, this phase of Creation, into a new phase where development and corruption are at an end but life is richer and more complete.

The universe is part of God's Creation. It's a special part of Creation, the womb in which the companions of Jesus Christ are growing and developing. It's not the safe comfortable place that a human womb typically is, though even a biological womb can be hostile if the mother's body misdetects the embryo as a foreign growth. Miscarriages are sometimes, perhaps usually, caused by the mother's own immune system waging a war against this 'infection' in her body.

God Presumably has His reasons for creating such a world, but I can make a few observations, starting with the fact that we are part of this universe, from a wider perspective – part of the Creation of which this universe is but one phase. If God had decided to make a better universe with less sinful creatures, that would not have been this universe and those creatures wouldn't have been us.

God loved this universe before He created it. He loved each of us before we were conceived in our mother's wombs. Having shaped this universe out of the more general stuff underlying all of Creation, God promised Noah that He would respect this universe and all the living creatures in it, rattlesnakes as well as pretty little girls.

I'm most certainly not a Biblical literalist and I tend to follow the teaching of St. Thomas Aquinas that revelations come to us when we align our thoughts with those God wishes us to have – He doesn't speak to us in the way of a companion sitting on a facing chair. The Son of God took on a human nature so that He could do exactly that, but He seems to have restricted His conversations – at least verifiable ones – to His own mortal life-time and a few short years afterward when He appeared to Saul on the road to Damascus.

During His Incarnation, the Son of God Himself performed no acts that need be regarded as the sort of paganistic magic which most modern people imagine miracles to be. Maybe Lourdes has occurred to point us towards this Biblical truth? The high number of extremely unlikely spontaneous cures associated with Lourdes indicates something is happening there on a regular basis, though there is no guarantee. Cures do not automatically come when you step into the waters of the pool. But a strangely high number of cures do come. Very unlikely cures. And cures subject to medical

investigation and statistical analysis.

Not a one of those verified cures is close to being impossible in the logical sense. Sometimes such cures happen when someone is on their death-bed with an advanced cancer or some neuro-muscular disorder. In fact, I'm not sure if it would be possible for an event to occur in this universe which violated the 'laws' of Creation and mostly, almost entirely, this universe has its own specific laws of the sort explorable by empirical means. The more general laws of Creation are also somewhat explorable by disciplined speculation starting from empirical knowledge and from our very small stock of revealed truths. This speculative exploration is part of my task in my various sorts of writings and I do my best to discipline my thoughts to the demands of the best available empirical knowledge subjected to the moral and theological ordering which comes from Christian revelation.

The point I wish to emphasize is that God is a Creator and it's best to think that He will respect the rules He Himself set-up when He first created, the rules He Himself re-instates with each instant that He brings all that is not Himself into fresh existence. Let me try to say this in stronger words:

In God's ongoing acts of Creation, He acts as a Creator and those acts will be manifested in those regularities we see as the rules or laws of this universe and those more general rules or laws of the greater Creation which sometimes show themselves – but mainly during the Incarnation of the Son of God, including His Resurrection. And those more general rules are that – higher-level versions of the rules we see everyday.

The Incarnation and the Resurrection don't contradict the laws our universe. Rather do they reflect the greater possibilities which can arise from that manifestation of the abstract truths which God chose for Creation, creating and manifesting those truths from which He shaped stars and spiders and human babies.

There can be no contradictions between the rules and laws of this universe and the greater truths of Creation if God is the God of Jesus Christ. Enrichment as we see greater possibilities, yes. Contradiction, no.

God respects His Creation but not in the way of a player respecting the game he has chosen to participate in. God respects His Creation in the way of a Creator who has made the board, the pieces of the game, the rules of the game, and the players.

## 561 What is Sin?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=87>. It was finished and uploaded on 2007/04/05.]

Many Christians throughout history have insisted on seeing imputable guilt behind all the sins for which we are responsible. This seems wrong to me. You can be responsible for a situation, say the self-destructively rebellious state of a teenager, though you might well be free of guilt in a criminal or moral sense. Being responsible, you can incur criminal or moral guilt by not doing what you should to help that teenager, imposing controls or counseling him or getting him to a doctor or whatever. But responsibility doesn't imply you, or some mythical ancestor, caused the situation. It does likely mean that you, in some sense, share or shared that state with that teenager.

Your responsibility can come from your state and your relationships to the states of other human beings (such as that rebellious teenager) or the property you hold as a steward in God's world or political responsibilities entrusted to you as a steward. Culpability isn't necessary for responsibility. Advocates of *Original Sin* were right that we're responsible for our sinful states but they were wrong in speculating how we got into these states. They were wrong because of their felt need to find some sort of culpability as causing our responsibility. They took literalistically their own analogies drawn from human legal systems. They still could have seen they were wrong if they'd known more about the origin of the human race – it's hard to imagine an apish creature from the Neolithic Era making a decision that would bind the entire human race for all time. And yet we are bound by our responsibility for who and what we are – our inborn traits as well as the vices and virtues we turn those traits into and most certainly our conscious sins of commission or omission. After all, it's what and who we are and our

only way of getting rid of that responsibility in this mortal life is to stop being us.

Maybe my psychological make-up is unusual, but I know that I'm me and I feel responsible for being me with all my weaknesses and faults, with my history of deliberate sins and accidental misdeeds. I feel the more responsible when I look forward to the possibility of becoming a Christ-like man, God willing, after my resurrection. I disagree with the supposedly more traditional thinkers who would say I'm culpable in the sense of justice for my misdirected or mistimed desires. I disagree far more strongly with the supposedly more modern thinkers who feel we're only responsible for sins in the first-degree – those we commit with full intention and after months of planning.

The error of those supposedly more traditional thinkers did have a very serious result. The view of man that underlay their confusion of responsibility and guilt (in the sense used in a modern court of justice) fed into the modern idea that I am the conscious stream of mental and emotional activity that is most readily identified with someone I label uncertainly as 'I'. That is perhaps the continuity between the supposedly traditional and supposedly modern thinkers: that view of man as being that conscious stream of mental and emotional activity evolved into the modern, liberal idea that man is an autonomous agent. If man is responsible for his state of being, then man can surely change that state even to selecting to become a woman under the scalpel of a butcher. In any case, a man can act more modestly than seeking a change in his sex. He can enter the marketplaces to select a seemingly more pious life-style in the same way he selects a toothpaste. In fact, our very ways of developing and marketing toothpastes and then selecting them when we shift roles from marketing-widget to consumer-widget will itself eliminate a vast array of life-styles which might well be more human and humane than those available to us in the marketplaces. Certainly, it will eliminate God-centered life-styles.

Along these lines, I agree with the farmer, poet, and essayist Wendell Berry that we'd solve our ecological problems if we found ourselves moral ways to make our livings. More generally, we'd solve a host of ecological and political and social problems – perhaps even some literary and intellectual problems – if we found moral ways to organize our lives and our communities. This isn't to claim the possibilities of perfection on the part of old-fashioned families or traditional communities. We are what we are and will commit sins in those institutions just as we commit them in the

marketplaces – though the number and severity of sins might well lessen without Hollywood to teach us ways of evil. Those old-fashioned families and traditional communities aren't perfect but they are more human, in scale and in the forms of relationships between individuals.

I've been struggling with this topic for years, feeling one with the likes of St. Augustine – and Jesus – in feeling myself responsible even for the desires pushed into my head by perverse rock-and-roll lyrics, by viewings of too many centerfolds when I was young, by watching perverse movies of the sort to which even young children are nowadays exposed. I confess my age when I admit that, as a young man, I went with a group to an X-rated cinema in a seedy part of Springfield, MA to see a movie (*Flesh Gordon*) far milder than some shown on TV nowadays.

Others may have incurred conscious guilt for providing this trash – in the sense of morality if not a court of justice – but my responsibility remains. And 'me' certainly is disordered in some important ways, because of my inborn traits and also because I reflect some of the disorder of a strange society – a physically prosperous and technically advanced society populated by the barbaric children Ortega y Gasset described so well in *The Revolt of the Masses*, an often misunderstood and misread book – but that's another topic.

Still, I've found digression to be necessary in exploring paths that might lead to a better 'me' and might allow me to describe futures which might be more desirable than the ones to which we're headed as we follow our exploiters deeper into the alleys of marketplace cities bereft of sacred spaces or even natural spaces. I digress away from the paths those exploiters would prefer me to travel. Sometimes I find a better path, or at least one more interesting. Digression is probably non-productive if someone doesn't have the odd combination of ability to follow a complex line of thought and also to shift rapidly between lines of thought which is part and parcel of creative thought in philosophy or literature or physics. Digression is part of who I am and it leads to me failing to follow certain real-world responsibilities, especially in our bureaucratically stifled world but it also leads to the possibilities of new insights and also prophetic warnings based on known truths.

Let me try this tack: I don't equate myself to the conscious stream of mental activity which commits sins or crimes deliberately. This deliberation implies awareness though not necessarily full intent or any sort of planning. Perhaps I see this more clearly than many just because I'm aware of how

rapidly my stream of mental activity can shift to a new rut.

As for the Biblical position on this issue? I seem to be only following Jesus in thinking myself to be responsible for the glandular flows and visual systems in my brain that lead me to look wrongly at a woman, not just responsible for going over and talking to her while plotting to seduce her. Those glandular flows are also me even if I don't act out their urgings. Those flows must also be brought into my Christ-like state if I'm to be saved, if I'm to share the Life of God for time without end.

## 562 The Importance of the Liturgical Calendar

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=72>. It was finished and uploaded on 2007/04/11.]

In this modern age, we maintain constant levels of activity and production by smoothing out or eliminating the effect of seasons. In doing this, we create various disturbances in our bodies and minds and souls – but we assume our unnatural manipulation of our schedules and life-styles to be natural just because it’s what we’re born into. As a consequence, those who have natural rhythms to their energy and alertness levels will think there is something wrong with them when they feel lethargic and a little depressed during winter. In most cases, the lower energy and alertness levels are part of our natural rhythms. Our ancestors, from whom we receive our traits and tendencies, had shorter workdays in winter and spent much time in low-key activities, such as repairing tools or clothing, and also resting or telling tales or teaching and playing with children. Farmers who follow traditional ways, such as the farmer-poet Wendell Berry will follow this sort of a schedule, lessening their physical activities in winter, perhaps to pick up a pen to write poetry or a Bible to refresh their soul.

The liturgical calendar is not something imposed upon us. Our modern schedules are imposed on us because we’ve built societies and economies which require constant high levels of activity or else they will collapse. We have not the option of satisfying our needs and some additional desires and then settling into a period of leisure, which would include not only rest but also important activities requiring lower energy or energy of a different sort – catching up on all those good books we’ve been meaning to read or making music with the children or making wooden toys for the

grandchildren. Maybe even praying or reading the Bible.

The liturgical calendar of Sacramental Christianity moves along with the natural rhythms of life, as did the calendars of ancient peoples, Hebraic and pagan, and also the calendars of modern Jews.

The calendar begins with Advent, early winter in the northern hemisphere where the Christian Church first spread from Israel. The days are short and still have not reached their shortest length. Our ancestors would have been retreating from their active outdoor lives though they would have been chopping firewood and caring for animals and maybe doing routine maintenance work on houses and barns and tools and shops. Advent is intended to be a time when we contemplate our situation and remember why it is that we need a Savior. We should live a mildly repentant life, not so extreme as Lent, and we should wait for our Savior. We certainly shouldn't take it as a period of hectic shopping nor as a period of excessive eating or drinking.

The Savior is born and we move against the cycles of nature, rejoicing and given praise to the Lord in human flesh, near the time when the days are shortest, when the sun might be threatening to leave us. We begin our celebration on the night that God and man united in the baby Jesus, conceived of the power of the Holy Spirit in the womb of Mary. We share joy and wonder and perhaps even some fear along with Mary and Joseph. No one knows when Jesus was born but the Church in early centuries chose to celebrate this birth near the winter solstice, near the time when pagans gathered to feast and worship the gods who might bring back the Sun who seemed to be disappearing. This is good and not a matter of criticism. Unlike those who see nature as an enemy to be conquered and enslaved to serve human desires, Sacramental Christians know that God Himself is present in nature – a choice He freely made in becoming our Creator. We rejoice and feast and celebrate for ten days and then return to the rhythms natural to human nature. Yes, we celebrate in parallel to the pagans for they were right to plead with the great powers to save them by preventing the Sun from dying. We plead with God to save us from our own deaths.

We move through ordinary time for a month or slightly more and then, anticipating the time that life returns to nature and eternal life is offered to men, we acknowledge that ashes we are and to ashes we will return. We enter the desert with the Lord for 40 days, fasting and praying and giving alms. Unlike the Lord, our journey is eased by those oases, Sundays, which we enter to joyfully praise God, Father and Son and Holy Spirit.

We end the journey to enter Jerusalem spreading palms and cloaks before the hooves of the Lord's humble donkey. We're in the Holy City of David, but all is not well. Jesus Christ will gather His Apostles together to humbly wash their feet and then to give them the gift of the Eucharist in the way He celebrated the Passover feast with them. They don't understand but the Lord Himself will soon enough be the Paschal lamb, He who is offered up for the redemption of the world. Nor do they understand that they had just been ordained as the first priests of a Church not yet founded. Jesus leads the Apostles out to the Garden of Gethsemane and begins to pray so hard that His blood oozes out His pores. Meanwhile, the Apostles have already betrayed their Lord and have already cast dishonor upon their priesthood. Filled with wine and food, they have fallen asleep.

Judas Iscariot enters the Garden with a company of soldiers sent by the High Priest. Identifying the Lamb with a kiss, Judas turns His Master over to those soldiers and Jesus begins His ordeal. At this point, most Christian traditions watch Jesus from a distance, partly to acknowledge our cowardice and confusion and partly out of respect for the Lord and also for human nature. Our modern obsession with the details of the sufferings of our Lord is one with our perverse taste in entertainment. We're but one step away from funeral orations that give gory details of Grandma's death agonies. I'll say no more here as Jesus is dying in the sight of His mother, some other women loyal to Him, and the Beloved Disciple.

Just before the death of our Lord, we wonder at one of His most important acts, one ignored by many who claim He didn't found His Church.

When Jesus saw his mother, and the disciple whom he loved standing near, he said, "Woman, behold, your son!" Then he said to the disciple, "Behold your mother!" And from that hour the disciple took her to his own home. John 19:26-27

The priests have a Church to serve but it's the Virgin Mary who's the first Christian, both mother and older sister first to the Apostles and then to all who accept Jesus as their Lord and Savior. Even as Jesus dies, we're left in the disturbing position of having much to rejoice over.

Church or no Church, Holy Friday is another sorrowful day. We fast to greater standards, as we did on Ash Wednesday. No Mass is celebrated, no Eucharistic Rite, for the Lord Himself seems to be gone. Yet, we attend

the Supper of the Lord's Passion and receive Holy Communion. Hoping. Waiting.

And Holy Saturday comes. We're still hoping and still waiting. So far as we know, the Lord Jesus Christ lies in His tomb. It's all over. All the promise of His mission, all the messianic dreams, seem lost. Yet, we hope. We wait.

The day ends. Darkness comes upon us and surely this is the end. We know that God has abandoned us... But no, we're gathered with all the others who fasted and prayed and gave alms, all the others who were too weak in faith to remain with the Lord as He prayed to the Father, too concerned about satisfying the spirit of our age to even stand at the foot of His cross. We're gathered for the Easter Vigil Mass and suddenly a voice begins to speak:

Dear friends in Christ,  
on this most holy night,  
when our Lord Jesus Christ passed from death to life,  
the Church invites her children throughout the world  
to come together in vigil and prayer.

Can it be true that Jesus has risen from the grave? Is our hope fulfilled? How can that be? Didn't we see as much suffering on the news reports as we saw during the darkest days of Lent? Don't we still feel weak and disordered, longing to be true friends and children of God and yet not really wanting that until we've tasted more sinful pleasures? Secretly we pray with the ever insightful St. Augustine: Lord, let me be continent, but not just yet.

But maybe the risen Christ is at work in us?

Maybe. We can only hope.

And we can peer between the bodies of our fellow-worshippers to see a priest from the line of Melchizedek, a man who received his holy orders down through the ages from the Apostles themselves, and he's blessing a large candle which he then lights. Soon, a deacon and altar servers are helping the priest to spread the light through the church, lighting the candle of one weak and frail man who then lights the candle of the neighboring weak and frail woman. A voice rings out singing the Exultet.

Rejoice, heavenly powers! Sing, choirs of angels!  
Exult, all creation around God's throne!

Jesus Christ, our King is risen!  
 Sound the trumpet of salvation!

We're proclaiming joy for the Lord has risen from His grave. Death has been conquered and we can share in the victory so easily. All we have to do is to turn to the Lord, pay attention to Jesus Christ and listen to His word, receive His Body and His Blood in Holy Communion. He'll do the rest. He'll supply the strength and the faith which is beyond our capacity.

We go to our rest that night, joyful for all that God has given us and we wake up to Easter Sunday. We enter the Easter Octave, celebrating the Resurrection of the Lord in a more intense way through the Second Sunday in Easter. Those of us who pray the Liturgy of the Hours will use the Easter Sunday prayers through that Second Sunday. Yet, Easter goes on past the Octave for five more Sundays and all the weekdays in between. Near the end of that period, we'll watch in wonder as the Lord Jesus Christ ascends to His Father. How sad we mortals are to lose Him and yet we're reminded that the Lord will send us an Advocate, a divine Helper. On sixth Sunday of Easter, we'll hear that promise in the reading from the Gospel of St. John [John 14:23–29:

Whoever loves me will keep my word, and my Father will love him, and we will come to him and make our dwelling with him. Whoever does not love me does not keep my words; yet the word you hear is not mine but that of the Father who sent me.

I have told you this while I am with you. The Advocate, the Holy Spirit, whom the Father will send in my name, will teach you everything and remind you of all that I told you. Peace I leave with you; my peace I give to you. . .

On the Eighth Sunday of Easter, Pentecost Sunday, we stand with the Apostles and many other disciples. Along with them, we receive the Holy Spirit.

We now enter an extended period of ordinary time punctuated by a few major Solemnities. Is it coincidence that this extended period of ordinary time occurs during the long growing season in the northern hemisphere where Christianity first took hold? Of course not. God demands a share of our time and our wealth but He wishes us to be able to make a living and to take care of our day-to-day responsibilities. After all, we've got to

grow grain and grapes that we might have some for offering up in sacrifice in the Eucharistic Rite. The world belongs to its Creator and the rhythms of the world are ones He established for us and for the other creatures. We violate those rhythms, those patterns of the seasons, at great risk to our minds and souls and moral natures. We have our role to play in our own salvation and that role is one in a world where God's grace doesn't destroy nature and its rhythms but rather perfects it.

## 563 What is Redemption?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=90>. It was finished and uploaded on 2007/04/26.]

We know Christ redeemed us, but what does that mean? The usual answer is: Christ paid for our sins on the cross including our original sin. A gruesome scene arises in the imagination of Christ being tormented by every sin I ever committed but most of all by the original sin we're all said to bear because of the unfaithfulness of our ancestors Adam and Eve.

We clearly are in states of sin or – more generally – disorder. We clearly need to be rescued from this state if we are to be saved by any definition. But what is sin? We've mucked up the concept by reading Biblical stories in the light of a modern idea of sin as being very similar to culpable crime in the sense of modern jurisprudence but that is arguably a misinterpretation we inherited from some of the Fathers of Christianity, many of them lawyers. We need to repent and do what we can to let God cleanse us of the effects of specific transgressions, but that only takes us to the foot of cross. A bridge into eternal life seems to be anchored there, but what is that bridge? It takes us from death into eternal life, but what does that really mean?

The concept of redemption might be our key to understanding salvation, but we have to first remember that the claim that our natural and moral sufferings must be due to some great primeval transgression – the rebellion of our ancestors Adam and Eve – was a human speculation of early Christian thinkers. This assumption might be due to the legalistic nature of just and admirable societies. Everyone could see that terrible things happened if punishment were not tied strictly to the crime. Surely, we'd not have to suffer disease and famine, war and poverty, unless we'd done something for which we were morally culpable. And the redemptive act of our Lord Jesus Christ becomes an act of atonement for specific crimes, including the Big

One committed by Adam and Eve.

Now we know more about our ancestors, we know that those knuckle-draggers couldn't have possibly committed any act of rebellion of the sorts which could shake the spiritual and metaphysical foundations of this world. In fact, I don't think Caligula, Hitler, and Charles Manson could combine to do such – the Creator and His work are a bit sturdier than that. A more plausible reading of the book of Genesis indicates its Hebraic authors were telling us that the awakening from a state of animal sin into a state of human, self-aware sin brings both the culpability for our misdeeds and also the possibility of a struggle towards a better fate than life in a paradise which is such only to animalistic men and women. Eden was not remotely like Heaven – Adam and Eve visited with God but didn't live in a true or constant awareness of His Presence. They weren't His companions in the same way that the resurrected will be.

We also know that most of those knuckle-draggers and all their human ancestors have endured some serious suffering if only the trauma of a normal birth. It would seem that God created a world in which disease and famine, war and poverty are disturbingly natural. We are what we are, apes with weak and frail moral natures, and we are that by the will of the Creator.

The Lord Jesus Christ redeemed us by His death on the cross, but from what did He redeem us? Let's start by asking: What does the Bible say about redemption? One entire book of the Old Testament, though short, is devoted to redemption – the book of Ruth. Remarkably, Ruth – though needing redemption – is one of the most admirable characters in the Bible. She's not a criminal. She's not a fallen woman in the way of the Israelites (and the Jews and Christians to follow) – see the prophet Hosea though many books of the Old Testament speak of various forms of idolatry as prostitution.

Ruth is a good woman who sacrifices much to take care of her mother-in-law after Ruth's husband has died. The two women return to Judah and, then, Boaz, a relative of Ruth's husband, comes to admire her, redeeming the land of Ruth's husband – and also Ruth and her mother-in-law. Those laws of Israel which led to this redemption are interesting but not of issue here, except to note that they had nothing to do with redeeming criminals. Ruth is redeemed from a bad situation which was not her responsibility. In her case, she was in that particular bad situation because of her moral courage, her faithfulness to her mother-in-law.

This opens the possibility that Christ redeemed us from a situation

which isn't our fault. This doesn't mean I deny we're sinners. I try, and usually fail, to confess at least once a month and, while I sometimes struggle to come up with many specific sins – being a spiritual neophyte – I do have a strong sense of my character defects and general tendency towards various sinful behaviors and attitudes. While I feel a responsibility to do what I can to correct those problems, or rather – to respond properly as God corrects those problems, I don't think those problems are what keep me from salvation. By this I mean that if I were to correct those problems, I would be some sort of baptized virtuous pagan, still headed towards the grave. Moreover – but this is an idea difficult to state in terms of language distorted to the needs of modern liberal individualism: we are responsible for who we are even though it was God who made us. I might well be trying to deal with the proper way to say that over the remaining years of my life.

This we know:

Christ redeemed us from death, a death which is our natural fate in the world created by God and created in this particular form.

Christ suffered as He did, freely and out of love for us, to offer us a bridge to eternal life, to help us escape the fate that He and His Father and Their Spirit had ordained for us when they created this particular world. We should remember that we are embedded in this world in the deepest possible way – we're not characters just passing through this world the way an actor passes across a stage. We're made of the stuff which is the stuff of this world and we're shaped by our responses to this world, especially our responses to our fellow human beings. We're also shaped by our responses more directly to God, but I'll leave that aside in this entry.

There are many Christians, including Luther and his followers, who've had the intuition that we can't do anything to save ourselves, but they missed the target completely in trying to understand why this is so. We are called to works by God and we should offer up works in gratitude just for our mortal lives, but we can't earn salvation just because a righteous man is still a member of a unique species of ape – a mortal creature by his very nature. The point that Luther missed, but St. Augustine saw, is that it's very unlikely but possible that an ordinary man could escape the chains of sin. It's even more likely when we talk specifically about women with strong maternal instincts – there are many who've sacrificed themselves and

poured out love in the way of the Virgin Mary herself. The Virgin Mary had a sort of guarantee of sinlessness but that came because she had a share of divine life from her very conception. Her immaculate conception was not a scouring of original sin as much as it was a promise of a purer and truer sort of life; God would watch over her in a special way.

It isn't pious to define Mary's uniqueness in terms of her freedom from sin, it's a sign that we're not fully free of the errors of those labeled as white sepulchers by the Lord Jesus Christ. It was the indwelling of God that made Mary immaculate in human terms. But Mary's unique path of salvation raises a big question. Why it was that the Son of God had to suffer so to offer us eternal life as His companions? Couldn't God have made us suited to that greater life from our conception as He did to the Mother of God, Mary who bore Christ in her holy womb? It's not likely that there is an explanation to be built as if a mathematical proof. Most attempts at explanations, even those by great theologians and saints, have sadly compromised God's all-powerfulness. Some have proposed atonement theories which, in the manner of a Deist, bind God to rules which are somehow greater than the Almighty. Some have proposed semi-manichaeistic theologies in which fallen angels are somehow powerful enough to take things away from God.

Read carefully this hard truth:

If God is all-powerful and all-knowing, then the world was created for the purpose of Christ rescuing us by His suffering, death on the cross, and resurrection.

This is clearly a falsehood if God is all-powerful and all-knowing:

God created a world inhabited by men who were truly God-centered and filled with grace. Those men fell and then God had to scramble for a way to save them.

Moreover, God in His chosen role of Creator is bound only by truths which He created, that is, truths manifested in Creation. The Son of God was not bound to atone for our sins because of some transcendental rule of justice which binds even God. Still, even the speculation of atonement, when developed by a master like St. Anselm, seemed to claim that Christ's death on the cross was an improvised method of saving men who fell despite God's best efforts.

Rather than starting from some abstract truths to explain Christ's death on the cross, we should look for a true story, a morally ordered narrative. I think it's hard for us to see just because we modern liberal creatures have so much trouble seeing the moral purposefulness which is inherent in the very telling of a story, especially that giant story which God is telling – His world. Rather than seeing the world as being morally well-ordered, though that order is fully visible only to God, we tend to see chaos which can only be disciplined by the proper political policies and the proper forms of economic organization.

I've said elsewhere that we're products of this world and wouldn't have been us if God had chosen to make a better world with better creatures. I won't argue this in detail here but think of it this way: we're not just processors of experiences but rather are shaped by those particular experiences and the memories they leave in us. There's more to it than this but the words are hard to find. I struggle to form a coherent concept in my mind, knowing from experience the error of those who believe a human language is transparent and capable of expressing all truths. The language we modern Christians inherited from our liberal ancestors isn't adequate for speaking the truths of God nor those of God's Creation. Our language isn't adequate for theology or philosophy or science. Our language has been reshaped so that it keeps our minds from dealing with the truths of human nature and of our relationship to Creation and of our relationship to our Creator. Our language is appropriate for textbook learning and for justifying ourselves in court.

Our ideas of sin and redemption, even those of Christian theologians who read the Fathers, are shaped by the needs of our modern bureaucratic systems including our systems of jurisprudence. There's much good in those systems, however much we deformed them under the delusion that our major goal is to be safe and comfortable. Even when we imagine those systems in their better forms, their concepts don't match up with Biblical ideas of crime/sin or of redemption, nor do they allow us to readily move towards concepts which can handle the modern empirical knowledge about God's Creation – genes and evolution and matter/energy which are frozen forms of some strange stuff which we can't even yet describe mathematically.

So we must move on from a conceptual framework which is near collapse. This is one of the reasons for young people drifting away from Christianity. They don't have well-formed minds because of their upbringing, but they have normal raw intelligence and – at some level – they often sus-

pect they're being taught untruths about some matters in their Christian instruction. Their suspicions are verified every time they see a TV documentary about the evolution of man and those suspicions are reinforced by the ideologically distorted versions of evolution, of science and mathematics and all other subjects, which they hear in the public-school classrooms. What happens in modern classrooms is little different from what happened in the classrooms of public schools in those Lutheran immigrant communities in O. E. Rolvaag's classic novel, *Peder Victorious*, where thoughts of God were systematically replaced by thoughts of Abraham Lincoln. Now, the idea of a saint is being replaced by the image of a violent ape who's incapable of controlling his sexual urges.

The problem is still worse than that in the sense that evolutionary theories free of ideological distortions are still in conflict with Christian speculations about human nature and even about God's actions as Creator. The Catholic Church and several main-line Protestant churches endorse the teaching of evolution in the school systems but apparently neither the theologians nor the spiritual leaders realize that their views of human nature and of sin and of redemption are not consistent with evolution but are rather consistent with the anti-evolutionary teachings of the so-called Fundamentalists. This is easily seen by an intelligent reading of *The City of God* by St. Augustine of Hippo and also other similar works of the Fathers of the Church. Their knowledge of science and history was such that they interpreted the story of Adam and Eve in a way similar to the interpretation of the modern-day Biblical Literalists.<sup>1</sup> Those interpretations were plausible in terms of their empirical knowledge and also their general outlook which was biased greatly towards interpreting the Creator in terms of human systems of justice. Whatever the merits of the great moral theologians of recent centuries, few have seen the need to update the anthropological theories which underly Christian moral teachings.

Those teachings are no longer plausible because our view of God the Creator doesn't allow us to restrict Him to that role of a human-style Judge.

---

<sup>1</sup>As I've noted elsewhere, the situation is worse when we read *The City of God* with a little alertness and intelligence. St. Augustine considered the possibility that the human race had risen from a lower race, rejected it, and went on to what is now considered the only possible understanding of the story of Adam and Eve. If he had had the courage to suggest human beings were fully members of the animal kingdom and had emerged from a non-human species, could he have developed or supported the theory of original sin? I think not.

Our empirical knowledge has not only shown us a vast universe, without a Heaven or Hell, it has also forced us to see time and space as creatures – an insight also found in the letters of St. Paul. We have expanded our views of the nature of infinity and eternity, yet theology and philosophy students are taught ‘proofs’ of God’s existence which depend upon invalid understandings of infinity which the Fathers took from the pre-Christian Greeks.

The bones found in the sands of Africa are not to be feared and they’re not to be denied. They’re empirical facts from God’s world. They’re evidence of past chapters of the story which the Almighty is telling.

And so I return to my claim that our sins, while important, are a lesser matter than our natures. We were first shaped by God as members of a certain species of ape, shaped in such a way that we could conjecture the existence of a Creator and even hear His word. This is all within the context of our ability to hold the memories and develop the concepts which allow us to tell true stories, morally-ordered narratives. The Son of God took on a human nature and came to offer us His friendship. This is to say that, as a true man, He was able to perceive His environments in such a way that He could imagine a plausible version of the story His Father is telling – the world. And the Son suffered, died, and rose from the grave to conquer death for our sakes, but also for the sake of God. The instant before His conception in the holy womb of Mary, the Son understood the story fully – including the need for Him to learn discipline as a man, to suffer, die, and rise from the grave. At some time during His development as a human being, He was able to see and understand the story which is the world well enough that His mission began.

The rest of us can develop to a state where we can also see and understand a plausible version of God’s story, but our story is far from complete and most certainly doesn’t include an awareness that we are God. In fact, our version of that story should include an awareness of our own mortality, of the giftedness and contingent nature of our existence even from one second to the next. Death is the fate of all mortal animals which have evolved on earth. Modern physics teaches us that it is nearly certain that some sort of death is the fate of the universe as a whole. It might be a great implosion or it might be a whimper in which all fades away to a state of absolute quiet. But we’re mortal and so is our universe. Creaturely existence is a gift from one second to the next.

Our Creator made us this way. And the Father sent the Son to suffer,

die, and rise from the grave to save those who belong to the Son. And He knew this outside of time and space. Given God's omniscience and all-powerfulness, it's not wrong to say that He created the universe in order that our Lord Jesus Christ might die on the cross. His death in human flesh, and ours, weren't brought upon us by the rebellious ancestors of mankind. We aren't capable of surprising God, aren't capable of forcing Him to change His plans. Jesus redeemed us from the death which He, along with His Father and their Spirit, had given us in first giving us mortal life.

And, yet, we have too restricted an idea of sin, certainly of responsibility. If we were created mortal, we are yet responsible for that just because that is part of our nature. We are as responsible for our mortality as we are for our thoughts and our actions. It's part of us and we can't deny responsibility without denying ourselves just as we can't deny our responsibility for seeking the easy way because that also is part of the nature of an animal which has to conserve energy for the times when it's really needed. But responsibility is not culpability and sin is far more than those acts or attitudes or thoughts for which we would be responsible by the rules of a human system of justice.

It's possible I may yet conclude that a man's willingness to take responsibility for his own self as created by God is one of the signs that he is on his way to becoming a true person, a Christ-like human being.

We are crippled in thinking these matters through by the great reshaping of modern languages to suit the needs of the liberal marketplaces, commercial and political. And judicial as well.

# 564 Christian Misuse of the Concept of ‘Person’

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=87>. It was finished and uploaded on 2007/08/16.]

Trinitarian Christians believe this of Jesus Christ:

He was true God and true man. He was the Son of God, true God and true man in one divine Person.

We modern human beings have created a problem. The term ‘person’ in traditional Christian thought was defined vaguely but constrained by our need to speak our beliefs about Jesus Christ. We now claim that each human being is a person at conception. Before confusing ourselves and our children, we Christians should ask ourselves:

Was Jesus of Nazareth a human person at conception?

If we say, “Yes,” we cast into doubt our belief that He was a divine Person. If we say, “No,” while saying all the rest of us are human persons at conception, then we deny that the Lord Jesus Christ is true man. We deny He is truly one of us and we cast into doubt the reality of our salvation.

Some will counter it’s important to have a way of defining a human person as having from conception a special dignity. Some will say we need a way to speak of human beings as being exceptional, set apart from other species in the animal kingdom. We need to fight all those who would abort babies and would clone human beings. In a simple but accurate sentence:

We need a way to argue against the powerful trend in the modern West to cast aside Christian beliefs and to use defenseless human beings as means to the ends of the powerful.

This is true, but when we speak as if we can demonstrate, or assume, the absolute value of human life within the realm of natural reasoning, we degrade revealed truths into mere products of human natural reasoning. In my various writings, I've advocated that we be willing to re-examine many of the speculative beliefs of Christianity, even the belief that life after death is secured by an immortal soul. We should be willing to creatively analyze modern empirical knowledge by use of disciplined human reasoning. Those processes are one process of updating our Christian understanding of Creation rather than being a 'holy' process and a 'profane' process.

But there are truths which Christians must defend, even unto martyrdom:

- The Almighty is Father and Son and Holy Spirit, three Persons in one God; and
- Our Lord Jesus Christ is the incarnate Son of God, who took up a human nature, becoming true man while remaining true God.

We need a word to mean what 'person' means in the traditional creeds of Christianity and it's pure silliness to use 'person' in the modern sense for supposedly practical reasons. In theory, we could invent a new word to mean what 'person' once meant but it's more likely that a continued corruption of that so-important word will be a factor in the ongoing erosion of Christian belief even in the minds and hearts of those who pray and attend worship service faithfully. We are all in danger of becoming Unitarians of some sort.

# 565 Why are Human Beings of Greater Worth than Chimpanzees or Rattlesnakes?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=88>. It was finished and uploaded on 2007/08/17.]

In Chapter 564, *Christian Misuse of the Term 'Person'*, I spoke of the need for Christians to give higher priority to revealed truths even at the cost of eliminating some arguments which seem of practical value in protecting human life. That leaves open the question given in the title of this entry. Why, indeed, is human life of greater worth than the lives of other sorts of biological creatures?

Let me seemingly divert to a question which turns out to be the same:

Why did Jesus Christ, the Son of God, accept baptism?

Surely, He didn't need to be baptized. He bore our sins but was Himself free of all sin. The second antiphon for the Morning Prayer, (Liturgy of the Hours – modern Roman Catholic version) on the *Solemnity of the Baptism of the Lord* tells us what occurred when the sinless Lord of Creation entered those waters to be baptized by one of His own creatures:

Springs of water were made holy as Christ revealed his glory to the world. Draw water from the fountain of the Savior, for Christ our God has hallowed all creation.

Water is good in its natural qualities. It refreshes and cleans. It's all-important to life on earth because it irrigates so effectively, bringing in nutrients and carrying away wastes.

It's fitting that the Lord chose such a substance to play a role in baptism, a rite in which we're cleansed as we move towards salvation. But we must remember that water as a natural substance isn't the source of the grace which can lead us to salvation. That grace is in the waters of baptism, when united with the proper words – I baptize you in the name of the Father and the Son and the Holy Spirit – because that grace flows **out** of the Lord Jesus Christ and **into** the waters of the world and that flow of grace began when the Son of God let His human body be baptized with water.

Human beings, in and of themselves, are a particular species of physical animal. In a moral sense, we're not so high above our fellow-animals as some would think. For example, we have our instincts which make us reluctant to kill other human beings but wolves have stronger instincts against killing members of their own species. (See *On Killing* by Lt. Col. Dave Grossman for a fascinating and frightening discussion of this entire issue.)

We men are morally superior to other animals in our ability to abstract from our moral instincts and to produce moral systems of thought and behavior. This general ability to think abstractly and the consequent ability to raise ourselves above our environments, vaguely seeing the possibilities of a Creation and a Creator, is probably the reason we can please God as companions, here and in the world of the resurrected. This is a fascinating, important, and terribly complex issue which arises in many efforts to make sense of Christian revelations and empirical knowledge as part of the same story. It's important that we Christians learn how to deal with this issue if we are to spread the Good News in this third millennium after the birth of our Lord, but that larger issue is the work of a number of lifetimes and beyond the scope of this posting.

Our Creator decided to offer us that chance to be His companions on the other side of our graves and that offer was made in the incarnation of our Lord Jesus Christ. Human life became qualitatively different from other forms of life when the Son of God took on human flesh, being born as the defenseless human baby who was named Jesus by His mother, Mary, and His foster father, Joseph.

The Incarnation didn't happen because human flesh was already divinized and somehow worthy of providing the stuff of a creaturely nature for Christ. It was Christ who made human nature holy in some sense by becoming one of us, just as He made the waters of the earth holy and suitable for our baptisms.

Getting back to the value of human life, this is the situation of men

without Christ:

Men tend to place a high value, but far from any absolute value  
on the lives of other human beings.

The Romans of the Republic had a harsh moral and legal code, though they tended to follow those codes far more faithfully than modern Christians follow their professed beliefs. Historians have written that those Romans knew that abortion was murder but those hardheaded and virtuous pagans could handle hard cases without feeling the need to justify themselves. They were willing to break their own laws or moral beliefs if there seemed to be a strong practical reason to kill a baby in the womb or to kill a misbehaving adult who was a threat to the clan, but they didn't feel a need to turn a crime into a social good in order to justify themselves. I repeat:

Men tend to place a high value, but far from any absolute value  
on the lives of other human beings.

That is about as good as it gets on the basis of our natural instincts and our natural reasoning. We have to understand that the non-Christians of our society aren't being deliberately thickheaded or evil when they deny that all human life, all that might be human life when we don't know for sure, has absolute value. For centuries, we of the West have fooled ourselves. We collaborated with the modern Deists and other sorts of pagans in trying to keep what was good in the Christian West by deriving revealed truths through processes of natural reasoning increasingly tied to pre-modern and nonviable understandings of nature, of empirical reality. We continued to worship as Christians on Sunday while paganizing our political and social systems, even our basic moral codes, on the other six days of the week.

Some of the moral catastrophes of the modern West are due to the fact that we aren't a mixture of Christians and pagans as so many believe. We're a mixture of Christians and pagans and paganized Christians. The third group probably is dominant in the modern West in a variety of ways. Those paganized Christians deal poorly with the hard case morality which arises naturally in pagan societies and they feel the need to feel justified and saved in the way of their Christian ancestors. They can't just murder human babies in cases where there is some true hardship. They have to turn the murder of human babies into a social and moral good just because of

the moral attitudes they inherited from their Christian ancestors, attitudes now severed from Christian belief. Now, we have some more honest sorts of pagans, not necessarily of the virtuous sort, who bluntly deny any absolute moral rules and claim the right to use one human being as means to meet the ends or needs of another human being.

We got to this point because so many well-intentioned Christians joined in the efforts modern pagan thinkers to retain the moral beliefs of Christianity while getting rid of the Person of Christ. The absoluteness of Christian morality which comes from the Incarnation was dangerously and weakly justified on natural grounds and – again – those natural grounds are drawn from pre-modern understandings of empirical reality.

The inevitable has happened. Nature herself doesn't give us any reason to believe human beings are so much different from other animals as we imagine. The fraudulent effort to turn some of the revealed truths of Christianity into products of natural human reasoning failed and those who see absolute value in human life now engage in ridiculous and childish arguments with those who are willing to see other human beings as means to their ends.

Human life has absolute value right from conception.  
Does not.  
It does.  
Does not.

It's time to start with the core of revealed truths and the huge and largely unorganized piles of modern empirical knowledge and first learn how to tell the story of Christ and His brethren in a way that makes sense of both. Once we have a plausible version of the story being told by God, the story which is our world, we can begin to live once more as Christians no matter the cost we have to pay to be true to our Savior. Then maybe we can return to the Christian vocation of spreading the Good News of Christ.

# 566 Visiting a Monastic Community

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=92>. It was finished and uploaded on 2007/08/28.]

Seventeen years ago <sup>1</sup>, I'd made my break with the corporate world, forced by a bit of willful incompetence in my last position to be sure. Barely escaping bankruptcy because of a drop in real estate values, I'd moved up to Petersham, MA, renting a small apartment in an antique farmhouse owned by a young couple. I chose to rent that apartment because it was a 5 to 10 minute walk from there to the brother-sister Benedictine communities of St. Mary's Monastery and the Priory of St. Scholastica. I'd been visiting those communities on occasional weekends for a year or so.

After moving to Petersham, I participated in the prayer and worship of those Benedictine communities as a lay visitor. I attended Lauds some days (at 6:00AM or so), Vespers most days (at 6PM or so), and daily Mass often. I also attended Sunday Mass at St. Mary's rather than going to one of the parish churches in Athol – there was a mission church in Petersham with no resident priest and a limited Mass schedule.

When I had to leave Petersham, I fell away from the practice of my Catholic faith for nearly nine years. About five years ago, I began my slow return to practice of my faith and have now become very active in my parish.

A few years back, I returned for a visit to St. Mary's, attending Mass with a friend but that was more of a field trip and included a long hike through the Harvard University forest a little down the road from St.

---

<sup>1</sup>As of the time this was written in 2007.

Mary's. I was too confident I remembered the trails and got us badly lost.

About a month ago, I went up with some other friends and had a very unusual experience. The Superior is a Visitor for the Subiaco Congregation of the Benedictines and goes to 'inspect' monasteries in various places around this globe but most of the monks stay put most of the time. After all, they even take a vow of stability. Yet, my friends and I arrived to find that all but one of the monks had left for a visit to a relatively new monastery of their congregation that was near Chicago. A parish priest came in and celebrated a very nice Mass but it was a regular new Mass in English. We'd gone up to see that new Mass celebrated with Gregorian chant in Latin. But we didn't give up. We returned for Vespers just about a week ago as I write. And we stayed for Compline.

Vespers or Evening Prayer (6PM for about 20 minutes) was a challenge because I'd been away from Latin long enough that the words in chanted psalms blurred into one long sound. By Compline or Night Prayer (8PM), I'd already adjusted so that I could follow along, chanting some of the psalm with the monks.

Between Vespers and Compline, we had some time to 'soak in the atmosphere' and I went for a walk with the superior, Fr. Anselm, an Englishman formed as a monk at Plusgarden Abbey in northern Scotland. When St. Mary's was first starting up, the Abbot and other monks at Plusgarden had generously stepped in to sponsor the new monastery and to help that institution get up and running. Fr. Anselm had come over to help Fr. Cyril, the founder of St. Mary's, and remained to try to keep the monastery going when Fr. Cyril was killed in a car crash while returning from giving a parish mission. Eventually, Fr. Bede, a Scotsman from Plusgarden joined St. Mary's as well. Now, that is – as of 2007, they have another three who are priests as well as being under permanent vows and two who are under permanent vows as brothers.

It was a wonderful time. A short period of peace, comparable to the most consoling times of prayer or worship. Even walking around, I felt the deep peace which comes from hours of prayer and worship each and every day. I was in a truly holy place. It's not that God is there and not in an ordinary Christian church. It's not that the monks are necessarily saints, though I suspect most of the monks I've known are well ahead of the pack in that regard. Some have been true friends of God in an unqualified way. Most certainly, it's not the case that you escape the world by entering a

monastery, though it can provide a temporary escape for those who visit for a day or a week.

The world follows monks into the cloister though a monastery does what it can to provide special insulation for those in the early stages of spiritual formation as monks. But the world follows men, and women, into their cloister, sometimes in an intense and painful way. Some monks and nuns are holy in a quiet way unrecognized by those outside their cloister and, undoubtedly, there have been some whose sanctity wasn't fully appreciated even by those in the same cloister. Others become renown for their sanctity and find themselves counseling special friends or even strangers who find their way to the cloister thinking a holy man or a holy woman will give them special words of wisdom or perhaps provide a direct channel to speak to God.

The prayer of a righteous man has great power in its effects.  
[James 5:16]

But monks part of this world of turmoil. Just like the rest of us. They don't pray because they're holy so much as they pray to become holy, but even a true holiness will bring no end to the troubles we endure in this vale of tears. The founder of St. Mary's, Fr. Cyril, radiated a peace so profound as to give the impression he had a foot in Heaven, but he'd had to persevere through some very hard times to gain that peace. And he had a sleeping disorder, which probably led to his fatal car accident. To the end, he was also bearing the troubles of all those who came to him for solace and counseling. They were many, apparently not all Catholic and not even all Christian. And I heard rumors they didn't keep to banker's hours when they visited Fr. Cyril.

I would recommend a visit to St. Mary's Monastery and the sister community of the Priory of St. Scholastica if you'd like to see liturgies done in the traditions of St. Benedict and would also like to feel a bit of the peace which can come when even mortal men and women devote their lives to prayer and worship. There may be some out there who would like to explore a vocation in a place of prayer which keeps to a very traditional practice of the Rule of St. Benedict without cultivating a reactionary or self-righteous spirit.

You can find more information for *St. Mary's Monastery* on the web at <http://stmarysmonastery.org> and for *Priory of St. Scholastica* on the web at <http://petershampriory.org>.

# 567 Praising God by Understanding His Creation

In my writings, I try to use the entire spectrum of human knowledge to construct what I call a worldview. In this worldview, I extend the Biblical perspective to view the entire universe of this age after Einstein as a narrative. God is telling a story in which a surprisingly important part takes place on an insignificant ball of dust circling a rather ordinary star which itself is part of a complex of galaxies streaming towards something called the Great Attractor, a gravitational center of a large group of groups of galaxies. And the story continues to grow and develop.

More importantly, when this narrative is seen as such, it's morally ordered, as all narratives are. Even when it comes to historical events which were far from well-determined, we can only tell the story of the modern British people by way of a Shakespearean 'fiction' that a nation was in formation, in a purposeful way, in those centuries after the conquest by the Normans, the Normans' bureaucratic rationalization of England and Wales, and the integration of Normans into the culture of the Angles. In the great play by the Bard, Henry V is seen as conscious of the larger movements of which he was part – and some participants in history have been surprisingly aware of the greater state of affairs. But it's not necessary that purpose be served consciously. It is necessary that we realize a mere recitation of facts under the pretense that there's no order in this world is meaningless and a sheer waste of time and effort. In any case, the world is a world, that is, it has a purpose revealed to us in the life, death and resurrection of our Lord Jesus Christ – though obscurely to our creaturely minds.

Theodicies, efforts to justify God by explaining why children suffer, are not the only symptoms of our modern spiritual illness. We also bring our own preconceptions to our thoughts which necessarily contain much in the

way of speculation – for example, speculation as to the way in which God will realize His promise to resurrect those who belong to His Son. Most of our preconceptions are traditional in the bad sense, that is, they embody outmoded empirical knowledge and no-longer plausible human speculations which corrupt the truth. They didn't corrupt the truth in the centuries when they seemed to truly reflect the contingent truths of Creation, but now our youth can see star maps which show no Heaven above us, cross-sections of the earth which show no Hell below us. Where is Heaven? Atheists can tell our children where Heaven isn't.

Why don't we consider it important to understand something about the Heaven which is somehow part of the same Creation as this universe? Why do we repeat ancient stories developed in the days when Heaven lay beyond the orbit of the moon? Why do we fill children's heads, and our own heads, with stories in which talking lions and magical rings are supposedly appropriate to the task of understanding the triune God and the incarnate Son of God? Why do we lead them to believe that black holes and genetic relationships between humans and gorillas can be ignored as if this were some sort of false Creation? Did God intend to create Middle-Earth and somehow the Almighty botched the job?

Our children know something about quantum strangeness and viruses and, consequently, know that the traditional stories to make sense of Christianity are lies in some way. Why do we consider folklore about angels and demons and immortal souls to be so important that we insist on teaching it to our children when science has constricted the possible domains of such entities to small and unimportant regions? Isn't the world that God actually created of some importance that we should learn to accept and even love it? It's not a sign of true piety or even mental or spiritual health to value pagan myths over the stories which could be built out of the materials of the world God chose to create. But we won't build those stories until we have the faith and the courage and the imagination to deal with empirical realities in light of Christian truths.

I've tried to purge myself of any preconceptions and most certainly those which rely on our ignorance about specific empirical questions. I don't rely on gaps in empirical knowledge, assuming that there's something called a 'soul' which will remain beyond scientific discovery and understanding – as one example. Consequently, it doesn't bother me that there is an increasingly complete list connecting types of human thoughts or feelings to bodily states or bodily actions. I find it interesting and not upsetting

that scientists have done brain-scans of human beings as they were having out-of-body experiences or near-death experiences. It turns out that those experiences are caused by disturbances to brain systems that regulate our sense of awareness of our own bodies, our sense of our own selves, our bodily location in time and space and the location of our hands and feet relative to our bodies. Those who believe we're born with some sort of immortal souls which can exist apart from our bodies should be seriously upset by that recent discovery that our sense of self is constructed in a manner loosely analogous to a computer simulation. More accurately, we're characters in a story and we develop along with that story.

I prefer to take the world as it presents itself and then to praise God for that world as well as to praise Him for His promises of salvation to those who belong to the Lord Jesus Christ. Part of my way of praising God is to tell a human version of the story which is this world. I wish others would join in trying to tell this story in a way that respects modern empirical knowledge.

To my way of thinking, it's good, very good, that I live in an era when empirical knowledge has piled up, waiting for the story-telling efforts of those with courage and living imaginations. It's bad that few Christian leaders and thinkers even seem to be aware of the need for this sort of courage and imagination.

I praise God when I attend Mass and when I pray. I praise God when I help friends raise money to go on an overseas mission. Maybe I'll one day praise God by going on a mission to Jamaica or to the Appalachians or by participating in a mission to my own neighbors. I praise God by visiting some elderly shut-ins down the street – not even a painful duty since they can share their wisdom and stories, funny or interesting or both. I praise God when I try to make sense of mathematics or physics or evolutionary biology and to teach others that all of this is a story being told by the all-powerful God of Jesus Christ.

I'm unified in the sense that I don't have to drop one set of attitudes or beliefs when I leave Mass and go home to read a book on the evolution of the human brain. Undoubtedly, my understanding of Creation is incomplete and defective but I've done my best to honor and praise God in His freely chosen role of Creator as well as my best to honor and praise God in His transcendence.

## 568 Where is God?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=96>. It was finished and uploaded on 2007/09/08.]

A seemingly silly question. Any child could tell you that God is in Heaven just as many pagans could have told you that Zeus is on Mt. Olympus. Actually, it's not clear that either the child or the pagan would have a well-formed idea or image corresponding to those words, but they would have their standard answers and that's not bad so long as those standard answers are those appropriate for a child not yet capable of understanding deeper answers and that's not bad for a pagan or anyone else so long as the standard answer is consistent with the overall views of a coherent culture.

In particular, a child or a pre-Einsteinian human being (yes, even Newton) will have a view of physical reality tied to naive perceptions of space and time and matter. Energy and fields were different in seeming magical to even the most rational of physicists prior to an understanding of the relationship between matter and energy and fields. Measuring instruments and precise mathematical equations can be instruments of superstition. Superstitions of a sort have in fact grown in modern times though having been with us always: we think to find some sort of 'theory of everything' not realizing that we would then be left with the difficult task of understanding the elements of any such theory.

To understand is to accept reality and to have a way of viewing it as a coherent whole. Modern physics, especially the cosmological models derived from Einstein's general theory of relativity, and modern mathematics, including geometries and logics and theories of randomness, have cast doubts upon the absoluteness or transcendental nature of any of our scientific or logical or mathematical truths. Time and space are not necessary, though they are necessary for the existence of life as we know it.

But, we all tend to think as if the necessary truths of our sort of existence are necessary truths in an absolute sense. If we wish to talk to God, we literalize that action in our imagination, thinking ourselves to be facing God and talking to Him as if He were a human companion. Of course, a Christian believes it's possible to speak with the Son of God in this way and we believe that Jesus Christ is true God as well as true man, but we quickly get ourselves into trouble this way because the Son of God is not only facing us in His human body but also inside of us, bringing us into being and energizing us each instant that we exist.

The God of Jesus Christ is present in this world of time and space. In fact, He's deeper inside of us than we ourselves can reach, as St. Augustine of Hippo pointed out. Going back into the Hebrew Testament, He is the God who declared His own name to be I-am, a name hard to understand because we are tempted to interpret it in terms of an unbalanced existentialist theology that disdains creaturely substance, but we are equally tempted to think that Moses was merely told that God has necessary being and is the only entity which is truly immortal. The Father of the Gods in the higher forms of paganism could have also claimed such as he sat on his throne.

Elijah learned that God is more a whisper than a clap of thunder, more a whisper than a wind or earthquake which can shatter rocks or mountains. He is most certainly far beyond a rock or mountain, except for the most limited of metaphoric statements. I can conjecture that God is quiet as a whisper because He is pure existence and isn't a pagan god of divine substance who yells out thunder and treads earthquakes. Thunder and earthquakes are His creatures. As is a whisper but the comparison of God to a whisper should make us stop and think. What sort of Being is the Creator if He can be compared to a whisper.

It was St. Thomas Aquinas who forged the language for speaking of God as His own Act-of-being and also the source of the acts-of-being of all the things or bits of space and time or even many (all?) of the truths of Creation. I've claimed elsewhere that ultimately there are only two sorts of knowledge: knowledge of God in His Triune Self and knowledge of Creation. The second sort of knowledge, of Creation, is really knowledge of God as Creator, knowledge of God in His contingent, free-will decisions. In a sense, we creatures in our pride or humility disappear except in our true natures as being objects of God's love.

So why does this all matter? And where is God?

Elijah gave us as good a hint as he could given the language and the

metaphors and the level of scientific knowledge and metaphysical speculation which was his cultural inheritance: God is a lot like a whisper. The Almighty is like a whisper. He's like a whisper because He underlies all that is. He is His own cause of being and also the cause of being of all that is not Him.

God's being is a totally different order of being than created being which is substance. We assume all being is substantial and have no good ways to talk about God or even about the acts-of-being, the divine acts of love, which are us as we come to be.

God is pure existence. God is His own Act-of-being, the Supreme Act-of-being. And He is the agent in the acts-of-being for all else that exists besides Him.

We can't deal with the concept of an order of being that is pure existence, an explosion of being which didn't begin and won't end. And so we tend to think of God as something of a Super-creature who occupies a particular point in time and space.

So, where is God? It's safest to say that God is everywhere because no thing and no region of time or space could exist but for God continually creating it by acts-of-being. And, yet, it's often hard for us to see God in ourselves, in our neighbor, in a poisonous snake, or in the humblest of weeds.

God is like a whisper. I have a little card printed by an outfit called *Hermitage Designs* which shows pine trees in the foreground, rugged mountains in the misty distance, and also has a printed message: Nothing in all Creation is so like God as silence.

But we know God is also present in words of praise or songs of praise we offer up to Him. He's present in Mozart's *Requiem Mass* and also in a dirge from the mountain folk of Appalachians. Can He possibly be present even at concerts of rap music? Was He with those numerous jazz and rock musicians who destroyed their bodies with heroin or alcohol? Was He in their music?

I fear too many, even too many devout believers, push this away. This isn't just an academic question. It isn't even a question for those who would push our theological and philosophical discourse forward, or perhaps pull it forward so that the Christian Good News can be ever fresh and ever stated in words understandable to the men in each age. The Gospel is always true but always needs to be restated in terms which make the most sense to each age.

This is primarily a spiritual question: Where is God? It's a question to ask when you're at the bedside of a child dying of leukemia and a question to ask when you have to start taking your mother for walks because she needs to walk to relieve the pain but she's likely to fall or to get lost no more than a few blocks from home.

It's too easy to say, "God is with that child and also with the parents and grandparents. He suffers along with them." It's too easy to say and that allows us to avoid the effort that would shift our attitudes and our ways of thought so that we can truly think of God, speak of God, act towards God, as He who truly is with that child in her suffering, with the parents in their suffering.

We should praise the God who's here with us at this very instant. We should pray to Him. We should sit quietly and let Him teach us how to think and pray along with Him. We should contemplate the mystery of God's Presence so that it becomes part of our very being, so that the pathways in our brain, the flows of hormones in our bodies, put themselves in rhythm with this God who is always with us and always in regions of our own beings that we can't even reach ourselves. We can fool ourselves but so long as we can catch ourselves occasionally speaking along with our skeptical age, so long as we catch ourselves thinking in ways that are inconsistent with God's all-powerfulness or His love for us and all that He has created, we've not completed that task.

That's the trick to much of this business of serving God, of centering our attention upon our Lord. We have to put in the time and effort to reshape our very bodies, our human beings, to His ways, to His truths, some of those truths being the more complete versions of the truths of this universe and some being truths which lie beyond beyond our most ambitious reach.

It takes an effort, not necessarily a strenuous effort, to re-shape our paganized minds so that we stop thinking of God in terms of a super-Zeus in a Heaven much like the top of Mt. Olympus. It takes an effort to learn how to speak in terms of a God who is beyond our comprehension. It takes an effort to think always of God being present even when we think our most evil thoughts. When that effort is no longer necessary, we'll have reached a higher state of blessedness.

## 569 Abstract Mathematics and the Real Presence

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=108>. It was finished and uploaded on 2007/09/13.]

Christ is ever present in all that exists, along with His Father and their Spirit. Yet, the traditional Christian belief is that He becomes truly present in the consecrated bread and wine during a proper Eucharistic Rite. See John 6:53 for one of Christ's own rather blunt statements on the issue. Yet again, even many who claim to be Biblical Christians as well as most non-Christians, think it absurd that Catholics and Orthodox along with some other Christians believe Jesus Christ becomes truly present on the altar, His Body in the consecrated bread and His Blood in the consecrated wine. I'll try to show that the common sense philosophical beliefs that lead them to reject the words of Jesus Christ Himself aren't so common-sensical after all.

Yet, as a believer in the Real Presence, I know it's hard to accept that truth because of the inability of our minds to grasp any form of being but that of substance. And, yet, we regularly deal with truths which are not necessarily attached to substance in any way. Some of those truths, including some of those found in transfinite set theory, might be such that they can't be attached to substance as we know it. Then again, the human brain seems to be able to somehow reach such truths. (Transfinite set theory deals with various infinities, some of which are far, far larger than 'ordinary' infinity. It's interesting that St. Augustine of Hippo stated an intuition that there is at least one infinity far larger than the infinity of 1,2,3,... and that intuition came from his belief that God is far beyond even statements about infinity or eternity.)

In *To See a World in a Grain of Sand* [41], I imaginatively followed the universe back through the ongoing expansion to reach the so-called Big Bang. I traveled through that point, unseen as yet even in the imaginations of mathematical physicists, to get to a new realm of created being. As we travel back in time, the observations of astronomers and the experimental results of particle physicists and the theories of theoretical physicists, tell us that matter and energy and fields begin to collapse towards a single form of being. For example, there was a time early in the expansion of our universe when the forms of energy generating weak nuclear force and electromagnetism were one type of energy. Go back further to times of higher density, when the universe was compressed into regions far smaller than a single atom in the current state of the universe, and other forms of energy as well as matter and fields might be plausibly conjectured to melt down into something as yet beyond explicit description.

I traveled back into that realm by assuming that this process of homogenization, of collapse into a single sort of physical entity, points back to a time when only the Primordial Universe existed. As I define *Primordial Universe*, it is a manifestation of the truths which God chose for Creation. God shaped this universe from the strange stuff of that Primordial Universe. In a way that we perhaps could never understand, this universe is embedded in that Primordial Universe. Manifested truths of the most glorious sort are all around us. We need to develop the right way to speak of the reality in its wholeness and not just of the concrete levels of reality which can be directly perceived, at least some parts of those concrete levels.

That journey back in time to the Primordial Universe is only a useful analogy provided by the universe. The true journey is into that richer form of being which is all of Creation, including the world of the resurrected.

We need to see the truth in the Thomistic claim:

Things are true;

I extended that claim:

Truths are thing-like.

The ability of a transfinite set theorist to conjecture infinities of different sizes and to understand how they relate to each other, the ability of certain mathematicians to develop abstract algebra a century before anyone could

guess it could be useful in physics (especially nuclear physics), the ability of other mathematicians to think in terms of geometries impossible in this particular universe, show us that we can see shadows of greater realities. In this, they provide us with an analogy to what happened when Jesus Christ Himself turned bread and wine into His own flesh and blood, to what happens when a Christian priest calls upon the Holy Spirit to turn the bread and wine on the altar into the flesh and blood of the Lord Jesus Christ. A richer level of being into this universe makes itself known in this universe though we can see only a shadow where that richer being, or Being, presents itself to us.

We need ways to think about and speak of the processes by which human beings can deal with numbers far larger than the infinity of ordinary infinity. True it is that Cantor's original proof that the set of real numbers is larger than the infinite set of natural numbers (the non-negative integers) is so simply stated that it's often presented to sophisticated high school students. Still, how can such a thought register on a brain of flesh and blood, a brain small enough to fit in a human skull? From another angle: why is it that infinity can be reached by a reasoning process possible to a finite brain? Why are such concepts as infinity so accessible to forms of reasoning which can be used to extrapolate so easily from finite concepts by way of finite steps?

How was it that Cantor was able to prove that set of real numbers is larger than the infinite set of natural numbers? The symbols which we use for numbers in conjunction with the concept of mapping forced Cantor to realize that it was provably impossible to develop a map from natural numbers to real numbers. No matter what map you use, there are real numbers which aren't mapped. Cantor's proof is an instance of a shadow which the richer being of the Primordial Universe casts upon our universe.

Our minds can somehow sense these shadows and make sense of them, accessing realms which would seem by common sense to be well beyond the reach of finite reasoning. We access those shadows of manifested truths by disciplining and training the human mind so that it can move with the grain of the universe and then with the grain of Creation as a whole. We are made of the stuff that is manifested truths, including those truths we label 'mathematical'. Those truths are deep, deep inside of us. They are deep inside of all matter, all energy, all fields, all specks of space and time. And yet we see them by ways of shadows they cast, shadows seen and then seen more clearly as human culture develops more and better conceptual

and linguistic tools.

I try to practice metaphysics as an act of submission to reality as given to a finite man of this age, a reality which we know through a very small number of transcendental truths revealed to us by our Maker and by huge mountains of empirical knowledge not yet organized. To speak truthfully is not to speak of complex systems of truths built up in the way of a skyscraper, tiny truths playing the role of I-bars and rivets. The universe isn't a skyscraper, though we can use some useful metaphors from human technology for describing the universe and the creatures which inhabit it.

Sophisticated mathematics developed as human beings saw first that Cosmos of great pagan thinkers, a view of reality which is radically incomplete compared to the Einsteinian universe. The mathematics developed by men with a less adequate understanding of this universe was less adequate than our current mathematics. We don't develop mathematics to understand the universe. The universe teaches us mathematics when we interact with it in the right way, when we explore it and shape our minds to encapsulate that universe. The universe will even reveal to us in various ways those shadows of richer being.

As mere human symbols can be adequate for bringing into focus some shadows of mathematical truths which seem well beyond any finite mind, so can the Eucharistic Rite be a means of bringing into focus shadows of a far greater Truth, the truth of a God who inhabits His very Creation, who even sent His Son to take on human flesh. But this is shadow is real even as it enters our body because it's a shadow of our Maker and our Brother. It's a shadow He casts over some who belong to Him, a shadow He wishes to cast over all who belong to Him.

# 570 Could Adam and Eve Have Made Christ Unnecessary?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=100>. It was finished and uploaded on 2007/09/29.]

The answer is: Christ's self-sacrifice was necessary to save us, to make us true companions of God. No action by any human being could have changed that fact. No action by any human being could have reduced our dependence upon the work of Jesus Christ. In the sense of needing salvation in Heaven, no possible creature could be saved by some sort of natural grace because God has to act to make that creature suited for life in a radically different phase of Creation. The Almighty has to act to purify and raise that creature to be able to share His life.

There are many who would claim to believe that we need Christ to save us and then they go on to claim the Bible tells us that Adam and Eve were created in a state of grace the same as the state of the saved who belong to Jesus Christ. Then, as the story goes, the snake seduced grace-filled Eve into an act of disobedience to God and she, in turn, brought grace-filled Adam into that state of disobedience. A careful reading of the third chapter of the book of Genesis might lead to the suspicion that we're reading the story of Adam and Eve through interpretive lenses and not simply accessing a clear and obvious understanding of that strange story.

The story of Adam and Even is presented in a mythical form and apparently borrows much of its content from the heritage the Hebrews shared with the various pagan traditions of the Near East. To treat it as if it were presented as historical fact is, among other errors, to do great injustice to the treatment of the story of Jesus Christ in the four Gospels. Some might think that the entire Bible should be raised to the level of the Gospels in the

sense of historical reliability and truth-bearing capacity, but the real effect is likely to drag the Gospels down to the level of the books of the Bible which are intended as myths or allegories which teach a lesson of some sort rather than relating historical facts which carry their own direct truth.

That story of our mythical ancestors also has an edge to it. God Himself isn't presented in the best possible light. The all-knowing Creator is presented as being surprised by actions of His creatures. He seems to be defeated, at least in the short-term, by the snake and can do no more than promise a decisive counter-attack at some vague time in the future. Moreover, God seems unreasonable in punishing Adam and Eve for not meeting expectations that might well have been beyond human capabilities.

Something is wrong with that story of Adam and Eve or perhaps something is wrong with our interpretations of that story.

Let's consider a little bit of modern empirical knowledge.

There is serious reason to believe there was no human man and woman who were the common ancestors of the human race in the way of Adam and Eve in the book of Genesis. It seems almost certain that any common ancestors of the entire human race existed well before human beings came to full moral self-awareness. The genealogies of Cain and Seth indicate the authors of *Genesis* believed, as I do, that that awakening was tied to the development of technology, including true agriculture, and the growth of the early cities. So far as I know, the earliest evidence of craftsmen gathering in community – perhaps seasonal at first – shows in layers of soil about 10,000 years old in the vicinity of Jericho. Perhaps that indicates the reason for the inordinate importance attached to that city in the Bible. Specialists have done genetic sampling of human beings from across the globe and think that our last common ancestor lived about 70,000 years ago in the vicinity of Nigeria.

The very important conflicts which underly the story of Adam and Eve – and their sons – seem to have arisen more than 50,000 years after any possible common ancestor of all humans. A specific and concrete act of rebellion by a particular human couple doesn't seem to be a plausible explanation of the sinful nature of human beings or the disorder which often arises in the world. As St. Augustine told us: we do not sin, we are sin. Yet, the particular forms of sinfulness which bother the Biblical authors involve forms of human social life which appeared with cities. The disorder in the physical world, more accurately – the struggle between order and disorder, have existed since the so-called Big Bang about 15 billion years ago, a bit

before human beings appeared.

In a potentially dangerous way, I'll speculate that those authors of *Genesis* knew that human uniqueness, the reason we have the potential to be companions to God, is tied up with our ability to abstract ourselves – so to speak – out of the concrete environments in which our species evolved. As our ancestors developed technology and the ability to live in cities, they abstracted themselves out of the grasslands and a tribal foraging life. They had the problem of reshaping to some extent their own moral natures to match the new possibilities and dangers which arose faster than they could adapt and continue to arise faster than we can adapt.

We develop technology and ways of life that reshape ourselves and our children in important ways. This reshaping is not just on the skin. As we learned at Hiroshima, as we learn when children are corrupted by modern entertainment, we can reshape ourselves to serve evil and sometimes, as Hannah Arendt told us after her studies of the Holocaust, evil is served most effectively by nice human beings who are well-adjusted to modern bureaucratic life.

What does this have to do with human sin and human salvation? In adapting ourselves so effectively to serve good or evil, we show we're capable of reshaping ourselves to the higher demands of God, demands which exceed natural morality, demands which culminate in the command: "Be perfect." Be Christ-like. Cooperate with God as He reshapes you to share His life.

The problem the authors of *Genesis* seemed to be dealing with was this:

The all-loving God was the same as the Creator who made a world which placed impossibly difficult burdens upon morally self-aware human beings. The human race seemed to be condemned by God the Creator for the crime of using the unique abilities He'd gifted to men and women. If a St. Francis is possible, then so is an Adolf Hitler. Does the possibility of St. Francis justify the sufferings of so many at the hands of Hitler?

Adam and Eve didn't rebel against God so much as they recognized the burdens of God's demands upon human moral nature. As the great Southern writer Andrew Lytle realized, man had to leave paradise to fulfill his God-given role. (See the under-appreciated novel, *The Velvet Horn*, for a rich display of Lytle's views on this issue.) But paradise wasn't what most think it to have been. It wasn't Heaven. It was the same earth Adam

and Eve later lived in. The difference was that Adam and Eve awoke and left behind their animal state of innocence, the innocence that left them fully as victims of their own human natures as those natures existed before self-awareness. Go back and read the third chapter of Genesis and see if this makes sense. Adam and Eve took up their yokes, but those yokes were yet hard and those burdens were heavy. Our ancestors were called by God to be His companions but that task is well beyond human capacity.

The traditional interpretation of the story of Adam and Eve is inconsistent with the Christian belief that we can be saved only by Christ. That traditional interpretation makes the claim our ancestors were born in a state of grace, a state of salvation, and would have remained in that state if not for an act of rebellion. Even if God had created a world and a human race better suited to perfect creaturely virtue, we would still not be suited to be the companions of God.

Only Christ can save us. Only Christ can make us Christ-like, God-like, so that we can share God's life. Life with God for time without end would be hellish for a creature not suited to share God's life.

I think that the empirical knowledge of evolutionary biology, viewed properly, is a message from God, a wake-up call. God is driving His story along in a particular way at this particular time. Evolutionary biology leads me to the speculation that we human beings have natures that allow us to be reshaped to share God's life. We're not born in in a God-like shape and we don't have long-ago ancestors who were in that shape before some fall from grace. Nor do we have the capacity to reason towards absolute truths which are binding upon God Himself. God shaped us to be reshapable as His companions and He must do the reshaping, He must tell us the greater moral truths which are the perfect and complete versions of the moral truths which have arisen in the course of evolution.

We can see this in the way that Jesus Christ astonished or shocked His followers with the *Sermon on the Mount* and with His claims that they were to eat His Flesh and drink His Blood. Many, including many who claim to be Christians, still discount the commandments to be perfect even as many refuse to accept Christ's words in instituting the Eucharistic Rite or in saying that only those who eat His body and drink His blood will be saved (Matthew 26:26–28, Mark 14:22–23, Luke 22:19–20, and especially John 6:53–58). There are many Christians who swallow camels and then strain at gnats, finding literal truth in an ancient Hebrew allegory and then denying or diluting the words of Him who they acknowledge as Lord and

God.

Adam and Eve weren't rebels who removed themselves from God's direct Presence. They were apish animals who heard God's invitation to be His companions and realized they weren't suited to such a life. There were contradictions in the human situation and those contradictions are prominently displayed in the story of Adam and Eve. The tree of knowledge was set in front of them and to eat from it was natural to human beings – it had to be done for them to realize their own natures. Having eaten that fruit, they gained self-awareness, awareness of their own nakedness, and knew sin. Sin had already been with them. They, in fact, had already been sin, but suddenly they knew that they were sin. But good or bad behavior, only a small part of the Biblical understanding of sin, is still not the point and the story is confused when it should be confused – the authors of Genesis admit their confusion and ignorance to anyone who reads with any sensitivity. The story of Adam and Eve seems to be almost a scream of frustration:

What do you want from us, Lord?

How were Adam and Eve to live forever? How were they to share the life of God? God Himself seemed unwilling to help them. God seemed to have booby-trapped His world, leading men and women to realize the potential of human nature, and then hinting at a transcendence of that nature. But He left men and women with no way to transcend their animal natures. God seemed to have played the nastiest possible joke on human beings, calling them to a life which could be seen only at a distance as well as through a glass darkly. The authors of Genesis were inspired to look at a tiny image that God was holding miles away from them – behind a smoky hunk of glass.

Only Christ could save human beings and He was free to do so or not. He was free to come when He chose.

# 571 Christianity and Privacy

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=104>. It was finished and uploaded on 2007/10/19.]

Holy Father, keep them in thy name, which thou hast given me, that they may be one, even as we are one. [This is the second sentence in John 17:11 [141].]

This is a very difficult verse which speaks to a theme winding its way through the New Testament, a theme related to the most fundamental beliefs of Trinitarian Christianity. Father, Son, and Holy Spirit are three Persons but one God. They act together, think together, love together. If we are to be one in that sense, there will be no privacy in Heaven of the sort that so many of us like so well. We will not be individuals holding our own thoughts and feelings separate from others and, yet, we'll be our own selves, just as the Father is Himself, the Son is Himself, and the Holy Spirit is Himself. They share all and act together in all They do but each one remains Himself.

Each of us will initiate and all will participate in what we start. All will complete my thoughts and feelings along with me and I will complete theirs – assuming, of course, that I'm resurrected into the Body of Christ.

And that's the key – Christ will be one of us even as He is still one of the Holy Trinity.

We'll be sharing the life of God – the only life which can allow life without end. We'll have given up so much that we consider valuable in this life, including our privacy, and we'll have that share in the life of God.

I long to share that life. I'm also scared to give up my privacy even knowing that I'll gain so much more.

I'm also curious. How can I give up my privacy and yet remain myself? How can Father and Son and Holy Spirit share all and yet each remain Himself? Do each of these questions have the same answer, or at least very similar answers? I think so. I'll bid my time until I find out.

# 572 Quantum Collapse, Consciousness, and God

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=123>. It was finished and uploaded on 2007/12/20.]

The reader might wish to refer to Chapter 156, *A Christian's view of Einstein's and Bohr's debate on the meaning of reality* 156, for some background on this general issue. I follow the philosopher Kurt Hubner (see his book *Critique of Scientific Reason*) in claiming that Einstein's position was that things have relationships with other things without any of those things being substantially changed by their interactions. Bohr's position was that relationships can bring substance into being or at least change it in deep ways. I qualify this statement by further claiming that God can change substance by either bringing the underlying stuff of things into being from nothing or by shaping things by way of relationships. We creatures have limited but real powers to shape things by way of relationships. The ultimate relationship is love and that is what 'powers' God's creative efforts. Creation came to be when God chose to actively love it. We as individuals come into being as a result of a particular love God has for us.

In *The Quantum World* [117], the physicist and Anglican priest John Polkinghorne provides an insightful and disciplined discussion of the issues involved in quantum mechanics. One particular problem is that of 'reduction of wavepackets' or quantum collapse. This reduction leads to the uncertainty and non-locality that were at issue in the debate between Bohr and Einstein on the nature of reality. Wavepackets are, from our viewpoint, a vague sort of being describable only in mathematical terms and those wavepackets reduce themselves to thing-like being for poorly understood reasons. If they didn't reduce themselves, we couldn't exist and

neither could the most basic types of matter such as electrons or photons. I'll make one more passing comment for the reader's benefit: wavepackets behave in a fully deterministic way and follow very elegant mathematical rules of development over time while uncertainty and messiness of other sorts arise when wavepackets are reduced to thing-like being. The reader who doesn't know about quantum collapse can look up "Schrodinger's Cat" in their favorite WWW search engine. Better still: get hold of a copy of Polkinghorne's book.

Quantum physicists noted that laboratory measurement under the control of a conscious scientist could cause a well-determined but 'abstract' Schrodinger wave to collapse to a particle in a particular place and having particular properties. By a leap of logic that is at least heroic and perhaps humorous, some concluded that it was consciousness that caused this collapse of abstract possibility into concrete photon in a particular spot with particular properties though no one was silly enough to suggest that the scientist's consciousness somehow joined with the laboratory instrument as it made 'contact' with the wavepacket. It's the measuring instrument and any photons it sends out which make are the proximate cause of the reduction and that situation doesn't seem so different from your average star making 'contact' with a wavepacket by sending out photons or by generating magnetic fields or whatever.

One interesting counter-argument to consciousness-based theories of quantum reduction is based on a claim of some philosophers that has seemingly been confirmed by modern brain-scientists: consciousness doesn't even directly control our own actions let alone dictate the existence of things around us. The regions of the brain associated with conscious awareness respond later than those regions which control bodily movement. It's hard to imagine how consciousness could be causing quantum reduction at the present time when consciousness is dealing with past events.

If we cause the collapse of wavepackets into thing-like being, it is by way of our physical interactions with our environments and, in that, we're no different from that laboratory instrument and that star I discussed above. (See *How Brains Make Up Their Minds* [35] by Walter J. Freeman for a good discussion of the nature of consciousness and related issues. The interested reader can also read my chapters reviewing this book, beginning with Chapter, 83 *Is Christian Morality a Natural Morality?*.)

As a side-comment, I would emphasize another possibility for consciousness which is implied by Freeman's views (and the similar views of Merleau-

Ponty and other philosophers): consciousness allows us some limited power to change our state of being so that we act in a desirable way in the future. Over the course of our lives, our conscious self can even guide us – by a slow and often painful process – into a Christ-like state. This extends the effect of consciousness into our future, but its domain of interaction with the surrounding environment would lag the collapse of wavepackets which form that environment, reshaping us for the future but after we've already acted in particular situations. Quantum reduction is faster than our conscious selves can apprehend even the most immediate parts of our environments or our own bodies.

But I also wish to quickly discuss a complex theological issue raised by Polkinghorne. He implies an error which I'm sure he, an Anglican priest, doesn't support.

On page 66, he tells us:

The dilemma of those who evoke consciousness as the basis of phenomena was succinctly stated by Ronnie Knox in his limerick on idealism:

There once was a man who said "God Must think it exceedingly odd if he finds that this tree Continues to be When there's no one about in the Quad."

An anonymous author provided an answer along lines approved by Bishop Berkeley:

Dear Sir, You astonishment's odd; I am always about in the Quad. And that's why the tree Will continue to be, Since observed by Yours faithfully, God.

Such a riposte would not, however, be available to a defender of the interpretation of quantum mechanical measurement presently under consideration, supposing him to wish to avail himself of it. Divine reduction of wavepackets would be an overkill, since it would operate everywhere and always, forcing the electron each time to go through a definite slit. The point about measurement is that it only occurs spasmodically. [The observation is in accord with the classic theological understanding of creation, which sees God as the ground and support of all that is (in our terms, the guarantor of the Schrodinger equation) but not as an object among objects (no collapse of wavepackets).

While disagreeing with this interpretation of Bishop Berkeley's philosophy, I do agree with the main point Fr. Polkinghorne is making about God being "the ground and support of all that is (in our terms, the guarantor of the Schrodinger equation) but not as an object among objects." Correct as stated, these words say too little and need to be supplemented else they might lead us to a rationalistic Deism.

The Almighty Lord is free to act in the way of a creature when He wishes. In fact, we Christians believe He spoke along with Moses and Elijah and others. We believe He intervened directly at crucial points in the history of the Israelites. Some of us believe that angelic appearances, when not religious poetry, were manifestations by which He made His Presence sensible to the eyes and ears of an embodied creature, a human being. We Christians all believe He acted to incarnate His Son in the holy womb of Mary. He still acts directly as if a super-creature. He might well be curing the lame in the waters of Lourdes. He might well be easing the pain of that poor woman lying in the ICU with tubes and wires running in and out. To do so, God might be collapsing wavepackets, though He may have other ways to directly shape things and to bring about events in this world.

We have to be careful that we not bind God to the world He created of His own free-will but we have to also be careful not to exclude God from this world. If He can create it, He can act inside of it and the Bible tells us pretty clearly He has done so on a regular basis.

(For what it's worth, I read Bishop Berkeley as claiming that God doesn't secure existence by observing things. The Almighty brings things into existence by thinking of them. While a bit confused about the difference between things and the underlying stuff of things, Berkeley was making a claim similar to my claim that things are true because they are manifestations of thoughts of God. And that claim is more or less a statement of the traditional philosophy of Christianity – methodical realism.)

# 573 Do You Believe in St. John the Baptist?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=124>. It was finished and uploaded on 2008/02/02.]

Under the modern circumstances, it's not so hard to believe in Christ. And many who don't practice Christianity probably do. After all, He took all our sins upon His shoulders and opened the gates of Heaven to all. Well, maybe you can't go in if you're a serial rapist or Hitler, but He's a generous Savior indeed opening those pearly gates to nearly all.

John the Baptist is a bit rougher character. He was so impolite as to denounce some of his fellow human beings as "vipers." He seems to have often spoken harsh words even when preaching salvation from a loving God. He was not a respectable sort for a society of genial and gentled men. A more honest reading of the Bible might give us hints that Jesus wasn't so gentle as we imagine, but certainly the Lord wasn't so brutal in His behavior as was John the Baptist.

We haven't learned how to view John the Baptist through rose-colored glasses as readily as we view our tender, modernized Christ and thus I ask:

Do you believe in St. John the Baptist?

Do you believe that God can fire up a man and call him to a life of hardship and prophecy for which he'll be despised? Do you believe that God has a right to do something like that to a human being, even to you?

Do you believe that the Almighty has a right to demand that you accept a terrible death in the jaws of lions or in the flames of bonfires rather than renounce your belief in God? If you don't, it would be very hard to believe in John the Baptist, that is, to believe he was truly called by God.

If you truly believed in John the Baptist, you would be forced to suspect that maybe the gentle Christ and His kindly Father might really be willing to demand much of us and to damn us if we didn't deliver.

If John the Baptist were to return, would you listen to him or would you start looking for Herod to return so he could behead this annoying S.O.B. once again?

## 574 Proving the Existence of Zeus

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=126>. It was finished and uploaded on 2008/02/06.]

Suppose you had an invisible benefactor. He doesn't make it easy on you all the time. Rather than leaving you food, he provides what you need to grow your own or forage or hunt for your own. Water has been made available though sometimes it has to be treated to be safe. Materials are provided to allow you to build adequate shelter and to make clothing that's at least good enough. Hard work is often necessary but a good life is often possible.

Can you describe the invisible benefactor? Not really. All you can do is tell of some of his specific actions. Those actions might imply certain characteristics but don't provide a true description of the benefactor's nature, even if he were a creature much like us. They don't even provide any certainty that this benefactor is an entity with personal characteristics. Moreover, and given the hardships of your life, they don't even provide any certainty this entity, personal or not, really has your best interests at heart.

Let me move to the real world and various efforts, such as Intelligent Design, to prove God exists in a rational and creaturely way, that is, by proving that God exists through His actions as Creator. We can try to make sense of the complex evidence of our environments and we can prove the existence of Zeus.

All we can prove, and prove is even too strong a word, is the existence of a powerful being who can impose his will upon this physical stuff. Even if we start out with a belief in the God of Abraham or the more fully revealed God of Jesus Christ, we can only speak of His free-will decisions as Creator

in the sense of He who shapes the stuff of our physical environments. We can't prove that there is a Creator who can make stuff from nothing. We can't prove that He's all-powerful, all-knowing, or all-loving, only that He's powerful and probably knows a lot and sometimes acts in a kindly way.

The great thinkers of Christianity have always started out with faith and moved on to understanding, though that faith can be somewhat vague at the beginning of a formal reasoning process. It might be no more than faith in a true Creator or perhaps faith only in the God described in the Bible understood in a naive way.

I believe that I might understand.

Understanding is important for sure and one reason for the decay of Christianity in the modern age is the lack of effort of Christian thinkers and leaders to make true sense of what is now known of our world in light of Christian truths. Hand-waving and vague comments that there are no conflicts between science and religion don't cut it – to put it mildly – and may even make matters worse. But efforts to understand this empirical knowledge are misguided if we think to find proofs of the existence of any sort of divine entity, let alone the God of Jesus Christ.

We have faith in God that we might understand both His revelations to us and also His world. We seek to understand the physical universe by way of empirical knowledge and then we apply our faith in attempts to understand that universe in moral and spiritual terms, to understand it as a world – that is, as a morally ordered narrative.

## 575 Was Jesus Insulting Us?

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=127>. It was finished and uploaded on 2008/02/14.]

Now they had forgotten to bring bread; and they had only one loaf with them in the boat. And [Jesus] cautioned them, saying, 'Take heed, beware of the leaven of the Pharisees and the leaven of Herod.' And they discussed it with one another, saying, 'We have no bread.' And being aware of it, Jesus said to them, 'Why do you discuss the fact that you have no bread? Do you not yet perceive or understand? Are your hearts hardened? Having eyes do you not see and having ears do you not hear? And do you not remember? When I broke the five loaves for the five thousand. . . [Mark 8:14–19]

To the modern mind, it makes little sense to tie together hardness of heart (the spirit, so to speak) with perceptual and intellectual incompetence, perhaps willful intellectual incompetence. Certainly, Jesus wasn't making an attack upon those with congenital problems in these areas, those born blind or those born with relatively severe cases of Down's Syndrome.

The Lord was ever striving to raise His disciples to a higher level of life, of awareness, so that they could perceive the world and their Lord more clearly and think more clearly about what God has done in Creation. And we always sink down to a more passive state than Jesus wished for us, a more passive state than will be possible in the world of the resurrected.

The disciples were dense because they were not paying proper attention. We're no different than they were. We would just as soon be entertained and not be bothered by most aspects of reality unless our safety or comfort is

threatened. Even when we're under threat, we'd as soon delay our response until it's truly forced from us.

After all, life can be tough and it was more so for our ancestors. Even during ages of prosperity, healthy men and women would be worn down by the physical labor and the occasional shortages of food and the medical and dental problems. Like most living creatures on earth, human beings have learned to relax whenever life allows. We've gained enough control of our lives, through machinery and social organization, that we have gained the power to dull ourselves with pleasures, to sit and wait for something entertaining to happen before we pay attention.

Don't be frantic and always busy. Relax and enjoy yourself in the proper measure, but be alert and be always pondering in your heart what God is doing in His world, maybe right in front of you.

## 576 Visualizing Heaven

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=138>. It was finished and uploaded on 2008/03/06.]

We can't visualize Heaven, that is, the world in which the resurrected will live with the Lord Jesus Christ for time without end, but we need to try just because of the sorts of creatures we are. We're flesh-and-blood creatures needing images to believe in the reality of a place or an entity, yes, even the triune God who we imagine as Father and Son and Holy Spirit as flame or dove. The Holy Spirit has, in fact, been more difficult for us to understand and relate to just because of the lack of a proper analogy from human beings.

The problem is that we are a particular sort of creature, made of flesh-and-blood, and we understand our physical human nature pretty well in terms by modern empirical knowledge. We accept that physical nature when we enter the hospital to extend our lives or when we take a troubled loved one to a psychiatrist to deal with one disturbance or another, but we Christians tend to visualize Heaven as a place in which we'll flutter about as some sort of spiritual creature with wings. And, of course, we flutter in the company of winged angels. For the most part, this is an admission that we don't consider Heaven as a real place.

Whether you regard modern empirical knowledge as an evil that has infected our views of reality or as enhancements of our views of reality, the fact remains that our modern views of reality are radically different from traditional views of reality. This is true even for those who consider high school chemistry as much a mystery as quantum mechanics. By not recognizing this, Christian leaders and teachers have turned another, truer mystery – Heaven or the world of the resurrected – into a ghostly realm. We can try to imagine realms which are mysterious and beyond direct

knowledge by using our hearts as well as our heads but Heaven has become an unreal place, beyond the human imagination even in principle.

We human beings probably couldn't live in a place so alien as to be fully beyond our imaginations even in principle. Heaven is no longer a place for us to anticipate. We try to long for Heaven but it's a ghostly longing and possible only to the extent we can separate our human selves into a piece that lives in this world and a piece that can somehow live in a realm not even imaginable to our physical selves.

The radical secularization of Christian society was made possible by this inappropriate Christian response to modern empirical knowledge and perhaps even partially caused by that response. We've split our own minds into two pieces, one that can handle the 'real' world with its practical concerns and its verifiable scientific claims and one that has faith in something we can no longer imagine in specific terms. Faith is no longer grounded in that ideal unity of the Christian which is a union of all our parts including our brains and our minds, our bodies and our souls, including our imaginative faculties. Faith is not expressed in modern terms as are the fields of knowledge we respect more. Christian philosophy and theology are typically expressed in pre-modern terms. The same is true of Christian works of visual art and literature, Christian popular song and the earthy sayings which spring out spontaneously.

We have no unified conception of God's Creation and thus no way to visualize anything that's not directly in front of us.

Why not use the old images of clouds and winged angels? Are they not drawn from the Bible? No. The Bible is surprisingly vague and even abstract on this issue of the after-life and we get hints of the reasons in the reverently strange stories of the Lord Jesus in His post-resurrection appearances. The Lord's perfected body was not subject to the constraints of flesh-and-blood bodies, the sorts of bodies which are our substance in this mortal existence. The Lord's human substance was still a body but wasn't constrained by some of the laws of this universe. And, yet, it was similar enough to a flesh-and-blood human body that the disciples, creatures of this world, could perceive Him and converse with Him. It was apparently close enough to flesh-and-blood that the Lord could eat a piece of fish.

Surely, we can have confidence that the world of the resurrected exists if our faith is founded upon the stories of He who is the first of those who rise from the grave. Surely...

But our faith is of a whole with our other thoughts and feelings, the

entirety of our beings. Even the most altruistic of us remains a particular creature in one spot and we need to look out to see our environments or the world in which they are enclosed, though we see that world only with our imaginations. We human beings have a need to be able to imagine a place, however inaccurately, for that place to take on some sort of real existence for us. In the end, we have to accept on faith that God will construct a perfected world in which live His Son and those who are part of the Body of Christ. In the meantime, while we're waiting to see if the Lord accepts us into His Body, we need a grounding for our faith that we might have a home on the other side of our graves, a test of its plausibility, if you will. Our inability to produce imaginative views of Heaven is a very bad sign. It isn't the case that our faith is in vain but it is the case that we've not properly nurtured that faith, or the mind and soul which underly a healthy faith.

We can do better though I have only very tentative ideas about what Heaven might be like. I have less than that when it comes to imagery. How am I sure we can do better? I have confidence that the human mind is the sort of entity which can encapsulate God's world, making its own the very the thoughts which God manifested as shaper of this world and even some of the more abstract thoughts He had manifested in the basic stuff of Creation which He created from nothing. This is a matter of principle. Obviously, no particular human mind could ever encapsulate the entire world.

If Creation is a rational whole, and Christians can't believe otherwise, we should be able to imagine the world of the resurrected by creatively and rationally extrapolating from this world. Else, we'll be in a state of explicitly or implicitly casting doubt upon the reality of that world of the resurrected.

To be sure, we can do that only by first imagining this world into a plausibly real existence by gaining a good understanding of this physical universe in terms of modern empirical knowledge and then imagining that universe as a world by applying the order implied by our Biblical knowledge of God's purposes as Creator. We can produce the sort of worldview and confidence that would unleash imaginative efforts in music and drama and architecture as well as in theology and philosophy but we either reject our faith and head out into the brave new world or else we fearfully try to hold onto our faith by using images at odds with the rest of our modern views and behaviors.

Do I have any advice for starting this revival of the Christian mind

and imagination? Nurture first the imagination as I recommended in the bibliographical essay at the end of my book, *To See a World in a Grain of Sand* [41]. Take this advice for yourself or give it to any students under your guidance. Read *Moby Dick* for the sheer pleasure and not as a duty. Read *Don Quixote* and *The Life and Times of Tristram Shandy, Gentleman*. Read *One Hundred Years of Solitude* and *The Violent Bear It Away*.

With a healthy imagination, a man could make better sense of modern empirical knowledge. He might even find himself capable of seeing God's world and seeing at least hints of that greater world on the far side of the grave.

# 577 The Only Sane Christian in the Modern World

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=161>. It was finished and uploaded on 2008/06/13.]

Like most Christians, I believe that – if Christ chooses me – I’ll be raised from the dead into a world that might be called ‘Heaven’ where I’ll live with Jesus Christ for time without end. I’ll take this as a typical schizophrenic Christian belief. See *A Thomistic Take on Madness and Modernism* found at <http://loydf.wordpress.com/?p=107> for a discussion about the general madness of modern human beings, this schizophrenia “characterized by loss of contact with environment and by disintegration of personality.”

In the Bible, we’re told that Christ had risen from the grave. We’re also told that the Jesus Christ had promised to raise from the grave those He chose as His friends, but not here on earth. The Lord will resurrect His own in Heaven.

Where is this Heaven supposed to be?

The direct words of Jesus and St. Paul give few specifics for answering this question and the only exception, St. Paul’s talk of ascending through layers of heavens, leads to the concept of the cosmos developed by the great pagan thinkers. And so an answer was taken from those pagan cosmologies: the heavens, an ascending hierarchy of ever purer being, lie on the other side of the moon’s orbit. Moreover, a literalization of some Biblical allegories, such as the story of Adam and Eve, and the apocalyptic tales in such books as Daniel and Revelation gave images and concepts and words to speak of Heaven.

What is this resurrection supposed to be?

The Bible speaks of a resurrection in the body but it again gives little

for the human mind to work on other than the apparent strangeness of the resurrected body of the Lord Jesus Christ. Some of the early Fathers of the Church borrowed the concept of the soul from pagans, though it's likely they misunderstood it, especially if they had intended to borrow from Platonic thought. Plato never claimed any direct relationship between the soul he conjectured and the individual human being. (So far as I can tell, most commentators on the Bible who've taken the trouble to try to understand the body of thought in which Saul of Tarsus was educated think he meant something by 'soul' different from what modern Christians would mean. I'll leave the matter there.)

Plato would have likely agreed, for the most part, with this statement from St. Thomas Aquinas:

My soul [in Thomas the organ for thought] is not I; and if only souls are saved, I am not saved, nor is any man. [From the *Commentary to 1 Corinthians* by St. Thomas Aquinas as quoted by Hannah Arendt in *The Life of the Mind* (page 43).]

I don't know that Plato had such a clear understanding of the soul as Aquinas did and I also think Professor Arendt would have been better to say Aquinas thought the soul to be the organ for abstract thought. In any case, Aquinas clearly located most human characteristics – including our love, faith, and hope – in the physical human being. I think it also clear that Plato and Aquinas both considered the soul to be something impersonal – to speak a little bit loosely.

In any case, the soul was purer stuff and could just 'float' up to more ethereal regions when freed from the body – in much pagan thought and arguably in Buddhism where the goal is to release your self from individual existence. After this release, what remains is something more pure than that which struggles to exist in a concrete world. I'll state the obvious that St. Thomas Aquinas didn't propose any such ideas, knowing that that which struggles to exist in a concrete world is us. He felt himself forced to conjecture the accidental attachment of an impersonal soul to each human being only because he thought it necessary to explain our ability to think abstractly. Modern brain-scientists, including some who admire the general Thomistic view on the mind, would point to a lot of evidence contradicting St. Thomas. This idea of a soul, however much he realized it "is not I," was the biggest mistake Aquinas made in his teachings about human nature.

The above discussions of traditional understandings of Heaven and the possibilities of human life after death are simplistic, to be sure. A fuller discussion would require a library of books discussing both the modern empirical knowledge of the universe (as opposed to the ancient speculations of the cosmos) and the modern empirical knowledge of human nature, as well as the intellectual histories of thought on both those subjects and many related subjects. I've presented this summary only to provide some support for the plausibility of this claim:

The post-biblical but pre-modern Christian understandings of the resurrection and of Heaven (where is it?) were linked with, coherent with, even founded upon, Hellenistic theories of the cosmos and of human nature.

Those pre-modern Christians didn't have to believe in multiple realms of truth. They didn't have to shed their beliefs about Heaven when they left church because those beliefs were the same they had when looking into the sky, whether they were astronomers or educated laymen or illiterate peasants. The pre-modern ages were not really homogeneous in their beliefs, nor were the inhabitants of all places and times rational within the context of any particular set of beliefs. Admitting that, it was still true that there was a substantial body of common beliefs about the nature of created being which allowed pre-modern Christians to understand a Bible story or to recite the creed without contradicting their general beliefs about the nature of the only reality they knew – this mortal realm.

So far as I know, I'm the only Christian in the world who actually thinks of Heaven and the resurrection in terms of words and concepts which are mostly the same as, and always consistent with, the words and concepts I use to speak of modern empirical knowledge such as that of quantum mechanics and gravitational theory, transfinite set theory and randomness. I can, somewhat tongue-in-cheek at this early stage of developing this new way of thought, ask *What are the Thermodynamic Properties of Heaven?*, which is the title of Chapter 191. I even have a very rough beginning of an understanding of the Real Presence in terms of my understanding of this only part of reality we truly know – see Chapter 569, *Abstract Mathematics and the Real Presence of Jesus Christ*.

Let me put the insanity of modern Christians in terms that I've used before. In past centuries, when a parent or clergyman or a teacher spoke

of Heaven, they had a clear idea – however wrong – of where Heaven was and what it would mean for us to ascend to Heaven. Nowadays, when a child asks the appropriate questions, what answers do we have? Basically, we have answers that would lead the child to think, “Heaven doesn’t really exist but it’s a nice place.” After all, we tell that child and ourselves: “It’s not a place we can see or reach in this life but it’s also not a place we can describe in any sense.” Unless we go back to the pre-modern descriptions which the child knows to be a lie as soon as he learns that there’s no Heaven in the solar system, nor in the Milky Way, and probably not in any other galaxy.

I don’t have this problem. By simply taking modern physics seriously, I realized that this universe is but a phase of something far greater. Moreover, this universe is highly particular, shaped from something with an abstract sort of being which we wouldn’t be able to directly perceive but a disciplined human mind can grasp this sort of being, however tentatively. By a complex line of speculative reasoning, I concluded that that abstract sort of being is the manifested truths which are the foundation of this world, this universe seen in light of God’s purposes, and all other possible worlds He could shape – such as the one in which the resurrected brethren of Christ will live with Him for time without end. Heaven is simply a particular world shaped by God from the same stuff He used in shaping this particular world, but Heaven would have to be shaped in such a way that a complete order is present from the start or else order evolves in such a way that destruction and decay aren’t side-effects. I can speak of Heaven without having to pretend to enter another realm of being and without having to brush off conflicts between scientific knowledge and Christian beliefs by implausible claims of non-conflict. Of course there’s a conflict involving the beliefs of nearly all modern Christians, including Jesuit scientists, but it’s a conflict between pre-modern empirical knowledge and modern empirical knowledge, a conflict between the Christian mind and a world which doesn’t match up so well to assumptions of pre-modern ideas of being, including time and space and even mathematical truths.

# 578 What's Really at Issue in My Work?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=162>. It was finished and uploaded on 2008/06/16.]

Modern human beings, and especially Christians, might misunderstand the work I'm doing. Some might think I'm some sort of champion of modern empirical knowledge for its own sake, a fan of physics and history perhaps. In fact, what's at issue is respect for God's Creation and, hence, for the Creator Himself.

You respect Creation by honoring it for what it is, not by imposing comfortable tales upon it, tales embodying knowledge once plausible but now known to be false or incomplete.

You show respect for the Creator by accepting even the hardest truths He presents to us, through His Biblical commandments or through the example of His humble Son or through the knowledge to be gathered from Creation by disciplined efforts. You accept those truths and try to make sense of them by way of hard thought.

How are we to find truth? St. Thomas Aquinas told us the human mind, that which is human thought and not some organ of thought, is shaped by responses to its environment. I've added that the human mind can shape itself by responding to even hints of a cosmos or a universe, a greater thing out there which contains all that we can know as reality in this mortal life but also being itself something. A human mind can go still further, struggling to see God's revealed purposes for Creation in the workings of galactic formation and in the workings of biological evolution and even in the workings of human history.

To turn away from this process is to turn away from the process of

perceiving and understanding the truth – however poorly we might perceive truth during this mortal life. To turn away willfully, perhaps because you don't like the effort of learning history or biology or mathematics in a disciplined way, is another way to say, “non serviam.” “I won't serve, Lord, because I prefer my own ways and would like to have my own world which can be understood in terms of myths and allegories involving great, god-like beings who bring us evil or good.” At that point, you're refusing to acknowledge that truth is to be found in that to which we respond in shaping our minds. If we respond to views of reality at odds with our best empirical knowledge, we respond to lies of a sort and shape out minds to be those of liars.

Our one way to truth is to open up to God's word and His world, shaping our minds in response to some complex and necessarily contingent understanding of the Lord's world in light of His word. It's the faith in God which is most important and specifically the faith in God as an all-powerful, all-knowing, and all-loving Creator. It's this openness that allowed so many to see profound truths even if they didn't have an advanced physics or biology to have good understandings of what they directly perceived. Perhaps surprisingly, you can actually see far without the great Christian faith of St. Augustine and St. Thomas Aquinas. Aristotle saw far with no more than his faith in the reasonableness of what exists which he expressed in terms of a God who was the result of a logical argument rather than a God who revealed Himself out of His great love for us.

Sometimes you find what you're looking for if you have enough sense to look for something that exists. It might be different than what you thought you were looking for. Then again, is the nature of being much different than was anticipated in the programs of that first mathematical physicist – Plato? Is the flow of events in this universe shaped from that being so much different from what we should have expected if we'd paid attention to the Bible rather than imposing upon it our own ideas?

To quote the physicist Niels Bohr out of context: Don't tell God what to do. That is, don't impose your own expectations upon God, or even upon a god-less Nature if that's what you believe in. Pay attention to Creation. Listen to what Creation has to say, see what Creation is made from, observe how that stuff behaves, observe the behavior of living creatures made from that stuff. See Chapter 13, *Einstein and Bohr: Don't Tell God what to do* for a short discussion of the perhaps apocryphal response by Bohr to Einstein's claim that God doesn't play dice with the world.

# 579 Pascal's Wager for Those Who Believe in a Personal and Loving God

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=180>. It was finished and uploaded on 2008/08/05.]

I have mixed feelings about *Pascal's wager* (see [http://en.wikipedia.org/wiki/Pascal's\\_wager](http://en.wikipedia.org/wiki/Pascal's_wager)) and wouldn't use it in an apologetic argument unless I were speaking to an intellectually sophisticated man or woman and wishing to engage in an interesting and inconclusive debate. For those who've forgotten the details and don't want to know all the details, that Wikipedia article tells us:

Pascal's Wager (or Pascal's Gambit) is a suggestion posed by the French philosopher Blaise Pascal that even though the existence of God cannot be determined through reason, a person should "wager" as though God exists, because so living has potentially everything to gain, and certainly nothing to lose.

This argument is based less upon a pure leap of faith and more upon the consequences that Pascal saw in the uncertainty of human reason. Quite properly in my opinion, some atheists – including Richard Dawkins as mentioned but not explained in the Wikipedia article – have claimed that sort of an argument can work in different directions than the one Pascal seems to have intended in his notes towards a general apologetics. Since they were just notes and since Pascal gave signs of being one of the most extraordinarily and profoundly intelligent thinkers in history, we should be cautious

in assuming we know how, or even whether, he would have used his wager in that book if he'd lived to write it.

In any case, The various aspects of the certainty and uncertainty of human knowledge need to be explored and those of good faith, if only faith in human moral integrity, need to explore matters from their perspective.

Yet, there's a way in which Pascal's wager can be extended in a direction quite uncomfortable for those who have a belief in a personal and loving God, as taught by orthodox Jews or Catholics or others with firm and specific theistic beliefs.

If you do believe in God as described by some orthodox form of Judaism or as described by some form of Christianity with strong beliefs, then it would seem your best bet would be to give yourself fully and entirely to Him. Don't just bet what matters little. Don't just push your pile of chips into the pot. Climb up on the table and sit in that pot with those chips. Put yourself fully and totally in play.

# 580 Restricting God's Thoughts to Freshman Mathematics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=179>. It was finished and uploaded on 2008/08/29.]

Those who belong to that school of thought labeled *Intelligent Design* found at [http://en.wikipedia.com/wiki/Intelligent\\_design](http://en.wikipedia.com/wiki/Intelligent_design) typically describe themselves as Christian, sometimes Jewish, and sometimes there is only an impression of a vaguer sort of Theism. In any case, most of these thinkers would likely claim to believe in a Creator who is an all-powerful and all-knowing God. Yet, they think to understand the Lord's work and His thoughts using what can be readily learned in less than two years of modestly difficult college work – a little calculus and some probability and statistics, a little chemistry and some astronomy and physics.

Do these thinkers imagine God's thoughts and the possibilities open to Him as a Creator to be so limited? Math is hard. Physics is hard. Philosophy and literary studies are hard. Understanding God's acts of Creation is all of that plus one hell of a lot harder. Anyone who thinks the Creator's thoughts and acts can be understood by simply applying a few equations from Probability Theory 101 is deluding himself and insulting God.

# 581 If You Sell Your Soul to the Devil, Don't Be Upset When He Comes to Collect What Belongs to Him

[The original version of this essay was published on the blog-site, *To See a World in a Grain of Sand*, <http://loydf.wordpress.com/?p=397>. It was finished and uploaded on 2009/04/03.]

Catholics and some other Christians are worried about the loss of a right by medical personnel to refuse participating in procedures which they consider wrong on moral grounds. That seems appropriate, but so does the statement [141]:

You have heard that it was said, "An eye for an eye, a tooth for a tooth." Matthew 5:38

But Jesus tells us that isn't just inadequate, but fully wrong. He demanded of His followers [141]:

But I say to you, Do not resist one who is evil. But if any one strikes you on the right cheek, turn to him the other also; and if any one would sue you and take your coat, let him have your cloak as well; and if any one forces you to go one mile, go with him two miles. Give to him who begs from you and do not refuse him who would borrow from you. Matthew 5:39-42

The followers of Christ are commanded to act in a way different from the morality of the world. We're called to live as followers of Christ, obeying His

commandments and trying to imitate His ways of speaking and behaving. Does that mean that when confronted with threats of evil from those who might be either willfully evil or merely misguided and deluded, we are to arrange for campaigns to swamp Pilate's telephones with protests and to bury the Sanhedrin's poor secretaries under mountains of post-cards asking that they respect the conscience of that poor Jesus of Nazareth?

I say this tongue-in-cheek but such campaigns of moral pressure might be appropriate, they might work, if our Pilates and our High Priests are in substantial agreement with us but prone to stray because of the temptations and pressures of power. That's not the case in 2009. Our leaders, even when they make great shows of attending Christian worship services, clearly don't feel bound by the *Sermon on the Mount*. Many clearly don't feel bound by the *Ten Commandments*. Many radiate a sense of self-righteousness as they propose and carry out programs which violate the traditional moral teachings of the West but can be presented as a compassionate response to the sufferings of those with horrible diseases or those who feel sexual urges not allowed by traditional Christian morality. Some probably are truly motivated by subjective moral urgings to try and solve those problems. Certainly, that seems true of many of the medical researchers involved in stem-cell research which might involve embryonic lines of cells and might be moving towards human cloning to produce creatures with diabetes or Lou Gehrig's Disease for experimentation, creatures which will never move beyond an embryonic stage and will never live outside of some antiseptic and glistening laboratory container. Years ago, doctors associated with Harvard Medical School made available lines of embryonic stem-cells for such experimentation and every so often announcements are made that someone has managed to engineer a line of stem-cells, maybe embryonic and maybe not, to have a certain defective gene or metabolic condition. We also have to remember that the techniques developed even in moral lines of research on adult stem-cells could be deployed rapidly to clone human beings or human-animal hybrids. In an age of moral disorder, all technologies can be deployed for questionable or downright evil purposes.

I'm willing to claim that nearly every research hospital in the United States, including probably most that were founded by Christian organizations – even Catholic religious orders, engage in activities which are in violation of at least the more demanding moral systems developed from the Sermon on the Mount and may well be in violation of the most lax interpretation of the Ten Commandments. At the very least, Catholic hos-

pitals will ship poor and uninsured patients to ‘welfare’ hospitals in the same way as for-profit corporate hospitals. Finances force them to do so, you say? Why did they reorganize their finances so that they would be in such a position? Was there no one in those hospital systems, no one in the bureaucracies of the dioceses, no one in the ranks of Catholic businessmen serving on boards of trustees, no one at all who could see that they were transforming Catholic institutions into servants of the Principalities of this world? I would conjecture similar statements could be made about all those hospitals founded by other Christian groups, some of which still bear names including terms like ‘Presbyterian’ or ‘Methodist’ in their names.

If the medical systems in the United States operate in ways that are morally objectionable to Catholics or other Christians, if the American government – duly elected by the American citizenry – increasingly subsidizes acts which Catholics and other Christians consider to be evil, why do Christians wish to participate in those systems and why do they accept money and other gifts from that government?

I’ve seen arguments that any who disengage from these increasingly evil institutions need time to do so gradually but now we see that such doctors, nurses, and others might have no place to go. If it were ever possible to aim at some sort of separation, the time has likely passed. We, and our parents, have forced us into a position where we have but two choices, suffering as did our Lord Jesus Christ or surrendering to the Principalities of the world.

In allegorical terms, Christ is being freshly crucified in these United States of America, and few Christians have picked up their crosses to march alongside their Lord. Those who take their beliefs seriously are more likely to be canvassing the crowds of those watching in confusion or horror or glee as Christ moves by under the burden of His cross. Why are those Christians canvassing the crowds? Apparently, they think to convince Pilate and the Sanhedrin to change their ways of thought and behavior. They think to convince the Principalities of the world to give up what supports their worldly power and take up with beliefs that will deny the authority of earthly rulers to dictate what is right and what is wrong.

They think the world is to be redeemed not by acts of suffering and martyrdom but rather by political processes by which we’ll somehow achieve that fantastic result of non-believers and weak believers choosing to live by

Christian moral laws. Didn't Christ give us those laws in the Sermon on the Mount? Well, yes, Christ gave us those laws in a very emotional way that provided for some of the most moving scenes in the history of Hollywood productions. I'm sometimes proud and sometimes ashamed when my subjective emotions lead me tears when I read those words of our Lord, but such emotions played no part in our Lord's own ways of showing compassion, nor in the ways of the greatest of saints, detached as they have to be when relieving spiritual or corporeal sufferings. The *Sermon on the Mount* isn't validated by those subjective feelings, warm or shivery, which they draw forth, nor were they validated by internal coherence nor by natural law reasoning but rather by His later submission to the unjust acts of His own creatures. When Christ hung on His cross, His authority to make extraordinary demands upon us were validated. If we take Christ's own actions seriously, His refusal to so much as preach to Pilate or the Sanhedrin, we are forced to believe the only way to change the behavior of non-believers and weak believers is through suffering and death, that of Christ first but that of His followers when necessary. Not all ages are filled with martyrs and not all forms of martyrdom have been the same.

Let's think seriously again about our situation in 2009. Having corrupted even knowledge of God's own Creation to our own purposes, having accepted gifts from men who value money and power above all conflicting moral demands, we wish to claim to be loyal followers of the God whose commandments we've disobeyed. We tell ourselves that it might be true that even Catholic hospitals accept money from a government which helps to kill American children in the womb and actively kills Iraqi and Pash-tun children on the ground, it might be true that even Catholic researchers accept money from government agencies or private foundations which are also paying for research into such horrors as human cloning – even human-animal hybrid cloning, but we can remain above that. We're part of the system but the evil work is being done in the lab down the hallway and we never go past that doorway into that evil place.

The Church will recover and begin to grow again when Christians are willing to suffer, even to accept painful and degrading deaths, rather than accept the gifts of an increasingly evil medical system.

Christ suffered to save us and gave us no other way to defeat evil than to suffer along with Him. Yet, even before we suffer to save others, we have to remember the simple common-sense rule:

If you don't wish the Principalities of this world to make a claim on your soul, don't accept their gifts and don't let yourself become dependent upon them.

## 582 Taking the Fresh Fruits and Giving God the Leftovers

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=466>. It was finished and uploaded on 2009/04/03.]

The point I'd like to make is a general one, but I'm mostly targeting my fellow-Christians who have the greater responsibility if they truly have the belief they claim to hold: God is the all-powerful Creator of this world. First, a poem by Emily Dickinson:

Faith is a fine invention For gentlemen who see,  
But microscopes are prudent In an emergency!

I'm not sure Emily Dickinson would agree with the fullness of the claim I'll be making but she's at least noting a certain fragmentation in our thought where faith is no longer allied to matters of 'prudence', of practical decision-making. At a more fundamental level, faith is no longer allied to our views of created being and that means faith has been separated from the mainstream of modern empirical knowledge.

Faith is a fine invention, especially when we're cheerfully singing songs of our God conquering evil and bringing a new world to existence, a world which is free of evil and corruption. On the other hand, microscopes are prudent – MRIs even more so – in an emergency. If our faith, or rather – our human statements of our faith, be in conflict with the underlying assumptions of the use of microscopes and MRIs, we can always discard that faith or hold it in abeyance when we enter regions where our worldly ills are to be ameliorated or even healed, if only for a matter of a few years.

When the life of a bishop or a priest or an evangelical minister or the most devout members of the Christian laity is at risk, they rush to a hospital

which practices medicine according to the highest of scientific standards. Then, that Christian clergyman will return to give his sermons or homilies based upon understandings of man and Creation which reflect nothing of that modern knowledge so useful to solve his medical problems and give him some comfort and some relief from pain.

When our own lives and comfort are at stake, we Christians take out the fresh food in the front of that refrigerator. Nothing but the best for our precious selves. When it comes to paying God honor and glory by understanding ourselves and the rest of His Creation, that fungus-covered, rotting stuff is good enough.

# 583 Confronting Tradition Respectfully

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=470>. It was finished and uploaded on 2009/04/07.]

There are those who passively accept what they're taught and there are those who rebel as if instinctively, denying traditional beliefs and outlooks by denying conclusions without remembering that human thought is a process. It remains a process even when dealing with truths revealed by God – which are far fewer in number than many believe. And, I should add, there are those who actually think, neither accepting passively nor rejecting by reflex. In this entry, I'm particularly concerned about how we approach the thoughts of past generations, streams in greater or lesser rivers of tradition. I'm interested in the general failure of even serious thinkers to respectfully approach the past, even when a little contemplation will reveal the likelihood that some of those ancient thinkers were smarter than us and harder of head than us. Even the lesser thinkers might have something to say to us.

And, so, I'd like to make a proposal about the attitudes we carry to the task of evaluating traditional beliefs, including older scientific theories or general viewpoints of created being, in light of our updated empirical knowledge. As a rule, we should try to put ourselves in the place of those creative thinkers who first developed the ideas underlying those beliefs and theories. They might well have had good reasons for developing systems of beliefs or theories which can now be seen as inadequate and maybe outright wrong. It's also likely that, being human, they made little mistakes along the way or simply missed opportunities to produce better systems of beliefs or thoughts. And it's also likely, that being among the serious thinkers

of their ages, they had some insights which could be carried forward into updated theories, at least in the negative form of learned lessons. But these lessons are to be learned by discovering why it was that earlier generations of theologians and philosophers filled the cosmos with angelic and demonic beings, not by a simpleminded rejection of what now seems silly in an age where science fantasy seems more attractive than baptized myths.

Many serious thinkers have always tried to understand the predecessors when trying to correct their errors or to go beyond the points earlier thinkers could reach. Einstein, while busy working on ideas at odds with the time-space assumptions of Newtonian physics, was apparently aware that Newton, for his part, was aware that some of the those metaphysical foundations of Newtonian physics were at least questionable. To be a little more accurate, Newton never elevated the foundations of his scientific and mathematical work to metaphysical principles but he would have been aware that it was going to happen in succeeding generations. And I'm sure he wished he could do better. Men, at least the vast majority of men, can't hold strong and specific ideas about their physical world while holding metaphysical ideas in suspense. Not that many are inclined to metaphysical contemplation but all men hold some assumptions about created being, even if found in the likes of astrological columns. In any case, rather than being overly critical of Newton, Einstein seems to have held the proper respect for a great scientist who did as much as he could in his day and age.

To jump to a different field of study, John Henry Newman and Jaroslav Pelikan – a more recent follower of Newman as a historian of Christian thought, have approached that topic in a direct manner both honest and respectful. For example, Professor Pelikan spoke of the core Christian doctrine of the bodily resurrection in relationship to the secondary issue of, "How?" In particular, do we have some sort of soul which is separable from the human body, surviving to be reunited with that body after resurrection? In the first volume of his history of Christian doctrine, *The Christian Tradition* [110], Professor Pelikan tells us that the great thinkers of Christianity were not in uniform favor of the idea of a separable soul. For example, St. Athanasius attacked that idea as a pagan corruption of Christian thought in the very same books for which he's generally credited with establishing more explicitly the Christian doctrine that Jesus Christ was one Person with two natures. Pelikan makes the reasonable claim, one I'd support with full heart, that our views of how God will fulfill His promises of life after death are dependent upon our assumptions about the fundamental properties of

Creation. What is time? What is space? What is matter? Are immaterial substances needed to complete the fullness of created being?

My addition to that part of the conversation would be to advocate the Thomistic principle that metaphysics uses the specific sciences. More specifically, metaphysics is disciplined by empirical reality in the same way that theoretical physics is disciplined by specific sorts of empirical evidence. Theoretical physics isn't bound by that evidence in the way of a prison. Newton and Einstein engaged in theorizing that had a distinctly free-form air to it, and so do most good physicists. Perhaps Nathaniel Hawthorne said it best when he advised us in one of his notebooks to keep our imaginations sane, but that writer certainly advocated strong and vigorous imaginations in the very way he worked.

We are to make sure that even our most abstract thoughts connect to the mundane realities of this universe.

Great thinkers of past ages have proposed speculative answers to those questions such as "What is time?", many of which answers have been rejected by modern thinkers either because of modern ideological biases or because those past answers are in conflict with modern empirical knowledge. If we are to provide answers as fruitful as possible, answers which don't just close off questions in the interests of self-serving human ideologies or the institutions which are the temples of our ideologies, we need to understand the answers we're rejecting from the past and those we're accepting from the past on the terms and in the context which correspond at least fairly well to the terms and contexts of the original thinkers. We need to understand why St. Athanasius thought the idea of a soul separable from the human body was a paganistic corruption of Christian thought while so many other fathers thought a belief in a soul separable from the body to be necessary to secure the Christian doctrine of the resurrection of the body. We need to understand why the young Augustine thought of 'soul' (and 'angel') as being made of some sort of matter thinner than that of our bodies but similar and then why he passed through a spiritualistic phase on his way to what Jacques Barzun has called a 'grotesque physicalism'. (In *The City of God*, he proposed that the possibility of sinlessness by human effort was supported by the story of a man he knew who had such control over his body that he could fart out a tune of sorts and also became concerned,

perhaps somewhat tongue-in-cheek, about the fate of our life-long nail- and hair-clippings relative to our resurrected bodies.)

These are not just matters of importance to those concerned with Christian doctrine but rather to all concerned with the nature of created being in general and with the Christian foundations of the West, foundations which have shaped the thought of even non-Christians who took part in the culture of the West. So it is that we need to understand why early modern thinkers, scientists and philosophers and theologians, used the undefined term 'mind' as if it were obvious that we have some sort of mystical organ which has direct access to a variety of absolute truths. Many still write and speak as if this were true, even some who are labeled and self-labeled as 'materialists'. More recent empirical research would force honest and courageous thinkers of all viewpoints to a direct and open encounter with the modern effort to understand 'mind' by understanding physical processes in the brain. I think we also need to see modern understandings of 'mind' in historical context, how did these modern ideas of 'mind' develop from earlier ideas of 'mind'.

We need to understand not only modern efforts to answer fundamental questions about created being but also the efforts leading up to ours if only because neurobiologists and philosophers, clergymen and lawyers, butchers and bakers and candle-stick makers, share a common vocabulary which comes from those efforts of our ancestors. In a very interesting book, *Philosophy and the Mirror of Nature* [124], Richard Rorty played around with a 'neuron-based' language which would eliminate the need for language which has so much as a dualistic past, all non-objective references in our human languages. Probably a little tongue-in-cheek, he would have had us report neurological events directly, others knowing that specific such events, involving a specific group of neurons, correspond to feelings of pain or happiness or whatever. It's the sort of effort we can hope an intelligent and courageous thinker will make. Once. And then drop it to return to the more reasonable effort to ensure that our speech is sane even as we use terms and concepts which have ties to dualism and other doctrines which rest uncomfortably with modern knowledge about created being, even space and time. A clean reestablishment of knowledge in some pristine form corresponding to our current empirical evidence is both undesirable and impossible. An understanding of our intellectual heritage in light of our modern empirical knowledge, and vice versa, will likely bear much fruit.

# 584 Knowing Truth in a World Where We Perceive What is Useful

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=503>. It was finished and uploaded on 2009/05/22.]

Ten years ago, I'd read a book about the modern understanding of human color vision: *A Vision of the Brain* by Semir Zeki, a prominent neuroscientist. This book provides a summary of the history of theories of color vision. Recently, I realized this subject provides a good example of why there is no knowledge problem from a philosophical viewpoint, that is, why epistemology isn't a valid field of study – at least to a follower of the empirical methods of St. Thomas Aquinas.

Think of a bright red object, perhaps a child's ball. Put it in the direct sunlight of a July day and you see a bright red ball. Move it to the shade and you still see the same ball with the same bright red color, though it's now reflecting a very different set of light-waves. Helmholtz and one or two other great scientists of the 1800s pointed to this fact and noted it disproves the usual theories of color vision – that we perceive colors directly. As late as the 1960s by my personal experience, perhaps to this year, elementary school children were being taught that three primary colors are mixed to produce all other colors. All those colors, especially the primary ones, were treated as having objective and absolute existence.

The theory of the absolute and objective nature of colors survived despite the inconvenience of not being able to deal with that simple counter-observation that the same object reflects different light-waves under different conditions, yet we usually can see that same object as being the same

color. In the middle of the 20th century, Edwin Land, an expert in film-technology and founder of Polaroid Corp., thoroughly disproved the theory by showing that without context, without a chance to consider contrast with surrounding areas, we see no colors even when we're staring at films of the brightest of reds or oranges. When we're able to contrast one region with another, our eyes and brains work to produce a colored vision of the world by some biological equivalents of complex mathematical calculations comparing wavelengths of neighboring regions of the regions of the world around us. The resulting brain-states generate that useful and often wonderful illusion of a world of color.

Why would the blind processes of evolution produce such a marvel? Our color vision seems to be adapted to the task of allowing us to recognize the same object, say a ripe apple, under various lighting conditions. There is, thus, an immediate sense in which our color vision does help us discern truth, but the colors mislead us by seeming to present themselves as objective aspects of the world. They're actually codings of a sort, codings of some very complex aspects of reality which give us useful information as we go about our lives. Those codings are embodied objectively in brain-states but the corresponding colors can't really be found in the external world.

This entire issue helps us to see the legitimacy of epistemological considerations from a neuroscientific and physiological angle, but leads us to understand why epistemology isn't legitimate as a philosophical enterprise. In principle, we can know the objective truth which lies behind the color vision our eyes and brains produce. We can see, if only by way of formulas and visual simulations, the true wavelengths of light emitted by that bright red ball under different conditions and can even see the objective brain-states which are the objective foundation of this subjective vision of a colored world. We can also see DNA unraveling and stars exploding billions of years ago, near the beginning of this expansionary phase of the universe. We can control industrial processes by seeing the 'true' colors of hot metals being forged and we can see inside the skull of a child so the surgeon can plot out his strategy for dealing with a life-threatening epilepsy. True knowledge problems involve the acquisition of knowledge in a world which is remarkably transparent to the efforts of hard-thinking and hard-working human beings.

In Chapter 405, *Ways of Thought in the Modern West*, I discussed the views of the historian Carroll Quigley who summarized the fundamental Christian philosophy, methodical realism, in these words:

The truth unfolds in time through a communal process.

It's not easy to be truthful, especially if you raise the stakes and define 'truthful' in an active and not just a passive sense. To be truthful in a fuller sense means that you don't just sit still and try not to lie, you go out and play an active role in this communal process by which the truth unfolds. We can transcend our perceptual and cognitive limitations in many ways, attaining a more complete and less biased understanding of our world by proper use of our brains and these opposing thumbs which allow us to make some remarkable instruments. Problems of knowledge are particular, practical problems which can, at least in principle, be solved in somewhat final ways rather than being part of the open-ended understanding of created being and the story which God is telling with that created being.

## 585 Killing the Sense of Wonder

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=508>. It was finished and uploaded on 2009/05/29.]

We need to develop a healthy fear of what passes for education in the current age because that form of mental development is, in fact, little more than deformation of the pliable student into a trained monkey. To speak first of abstract thought, book-centered learning is best done by minimal years spent on basic reading skills followed by supervised – but, ideally, flexible – courses of individual reading interspersed with perhaps gatherings for discussion or problem solving and then – most importantly – writing and problem-solving exercises. In response to those who might object that such a program is best-suited to the needs of the intellectually talented, I can only ask – why torture other students and waste resources on the pretense that we can develop the higher-level intellectual talents of those students who have no such talent? Why not give those students the education they need, basic literacy skills combined with apprenticeships in law or journalism, engine-repair or computer programming? Don't force anyone but let them gravitate to what suits their inclinations and then let them gravitate elsewhere with no more demands than serious effort in return for the use of valuable resources. As it is, we have a bastardized educational system that kills enthusiasm in potential mechanical geniuses and musical geniuses as rapidly as it kills enthusiasm in potential physicists and language scholars. (We also have put ourselves in a position where it's going to be hard to finance any serious educational system for all of our youngsters, but I'll pass by that problem in this article.)

It's enthusiasm that most concerns me here. It's a sign of wonder, of a young human creature who's fascinated by numbers and symbols, by reading and writing stories, by producing wonderful sounds with that guitar

or piano, by taking apart an engine to see what the insides look like, by building walls or cooking delicious pot-pies, by caring for children or caring for horses and cows. Stop thinking of that child as a generic six year-old piece of human flesh. Stop thinking of that child as a future doctor or mother. Let him or her explore and start to show both talents and inclinations before guiding them. Don't be surprised or upset if boys and girls show different leanings and a different set of talents and don't be upset if differentiation also shows up between different ethnic groups.

Is this practical? Probably not, but we need to see some sort of clear image of paradise so we can build a better shantytown. In any case, I wish to concentrate upon that one aspect of the human being, that one admirable aspect not well-developed in our incompetently utilitarian age – the sense of wonder at what lies around us, seen and unseen. This is a sense of wonder common to Gore Vidal and Duke Ellington and Richard Feynman and Bill Elliot – the Awesome Bill from Dawsonville who never started a car engine he couldn't push and push harder. In response to the legitimate needs for mental, moral, and spiritual development, we tend to ignore that sense of wonder, in fact, to kill it that the student might be more readily molded to the needs of the educational bureaucracies and the other bureaucracies of the modern world. In other words, we don't educate so much as we try, at best, to train a higher-quality monkey. Or at least a more compliant monkey.

Provide opportunities and see which ones the child responds to. And it's likely that a given child will respond to specific opportunities with different levels of enthusiasm. And those specific responses will change as he matures. The child whose visual systems mature slowly may be late in taking to reading, but he may turn out to be a great scholar of the languages of ancient India. In the meantime, let him play with the dog and nurture his sense of wonder with walks through the woods. Avoid the stupid and cruel assumption that there's some sort of standard schedule of physical and mental development to which all children should conform.

It's that sense of wonder which is important, a sense of wonder which often starts out so poorly focused. It's that sense of wonder that might lead that child to become a truly educated human being rather than a trained monkey. What is a truly educated human being? It's what might become of that girl who bloodies her toes practicing ballet steps. It's what might become of the boy who insists on taking machines and electronic devices apart to see how they work. It's what might become of the boy who has

become obsessed with numbers and symbols at a young age. It's a good mechanic who knows how to deal with customers and suppliers as well as the historian who can talk properly at a conference or when he's negotiating entrance to the archives of a hostile government.

Some men of greater wisdom have claimed that true education has little to do with particular stocks of knowledge and is instead a developed capacity for learning. I'll broaden that claim:

True education is what results in the capacity to respond confidently and appropriately to God's Creation.

In terms of traditional Christian teachings about virtue, the opposite, the incapacity to respond confidently and appropriately to God's Creation, is the sin of sloth. In more recent centuries, sloth has been somewhat officially redefined as mere laziness or idleness, mere inactivity. In fact, many human beings who are guilty of the traditionally defined sin of sloth have busy schedules, even if many slots in those schedules involve shopping or submitting passively to being entertained. Sloth is a lack of faith in the goodness of Creation more than a mere laziness.

The opposite of sloth is a disciplined capacity to wonder. The opposite of sloth can involve hours spent staring at the stars in a clear winter sky or hours dreaming of a life lived in Colonial Massachusetts. Somewhere, Jacques Barzun pointed out that the successful creators are those who know how to properly loaf. To loaf in a sense of wonder is to learn how to align your thoughts with those of our Maker. It's to learn how to enter into His creative acts, His acts-of-being. It's also to prepare for periods of more active learning or the production of a book or the building of a plumbing system for an innovative factory, periods in which a more conventional discipline becomes necessary.

In terms of Christian salvation, I'm advocating education as a path of preparation for participation in the life of God. It's the capacity to wonder and to respond properly to the object of wonder which might make us creatures capable of enjoying life without end.

# 586 If We Can't Understand What We Shall Be, We Can't Be It

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=554>. It was finished and uploaded on 2009/07/08.]

Beloved, we are God's children now; it does not yet appear what we shall be, but we know that when he appears we shall be like him, for we shall see him as he is. [1 John 3:2, RSV, Catholic Edition, Ignatius Press]

I was struck by this verse when I recently saw it quoted because I know that some, perhaps many, of my fellow-Christians will use verses such as this to justify pessimistic assessments about man's ability to understand. Mostly, we human beings tend to be pessimistic about those lines of thought which require great discipline, a lot of time, and a bit of sheer effort before we can make those thoughts our own. They say that mathematics is hard but so is any historical analysis or any theological speculation which is worth much.

If I'm an image of God, or a potential image of God, I can understand what I'll be and where I'll be, assuming I'm amongst those who are resurrected. That is, I can understand life after death in rational terms and I can understand what Heaven is in similar terms or else I wouldn't be suited to that life. In terms of modern empirical knowledge, we would probably need to consider what physicists have learned about the nature of matter and how it's organized – including thermodynamics, what biologists and historians and others have learned about the developmental nature of this

world – including the evolution of the human mind and the development of an individual man's mind, what mathematicians have discovered about the abstract aspects of Creation – including the way in which seemingly chaotic systems can suddenly self-organize. From these piles of poorly integrated empirical knowledge, we can construct philosophical and theological systems worthy of the name. This is what Augustine of Hippo did in laying the foundations for the Western Civilization which rose from the ruins of Roman and Hellenistic civilizations. But that took a lot of courage and faith, one hell of a lot of work, and modern Christian thinkers seem to be missing either the courage or the faith.

This is not to say that any human thinker can reach the complete truth about life after death. After all, we know that Augustine's system, and the system which Aquinas put together eight centuries later, eventually proved inadequate. Human additions to our knowledge of Creation have proved many of their speculations wrong and left many Christian beliefs unsupported – the traditional understandings have eroded.

Christians are always ready to claim, "We human beings are images of God," but seem to have no sane way of speaking about the meaning of this claim. Christians have a number of doctrines which seem to be no longer expressible in sane language. God has invited us to participate in His life and His work and that implies we have the capability and the responsibility to understand Creation. Our earlier understandings of Creation and of most Christian doctrines no longer make sense because we now know more about Creation, that is, we know more about God's acts as Creator. We're capable of higher understandings. We need to respond in our proper way to God's Creation. We need to be fearless and confident. Some participate in God's work by dancing or playing the piano, by teaching young children or caring for those who are dying. We who are called to intellectual work participate in God's work by being the pioneers in a never-ending effort to shape the human mind to encapsulate God's Creation, to share in the divine thoughts manifested as the stars in the sky or the children playing in the front yard, most importantly – as the story in which the stars and those children play a role.

Pioneers are succeeded by those who live more routine lives. Not quite 2,000 years ago, the Egyptian scientist Ptolemy invented trigonometry as part of an astronomical and astrological research project to predict and explain the movements of stars and planets. Though trigonometry still is difficult for many to deal with when presented in the classroom, I grew up

knowing men who had entered the mills after sixth grade or so and had acquired some pretty high levels of skills in trigonometry over the course of their careers as metal-workers. Double-entry bookkeeping was introduced to Europe during the Renaissance and was considered so difficult as to inspire the same sort of awe we 21st century folk feel towards quantum mechanics or general relativity. Nowadays, your corner drugstore has piles of account-books which are intended for use in that form of bookkeeping.

The older discussions of Christian beliefs are no longer tenable and few Christians have responded to the ever-present call of God's Creation – "Talk to me, explore me, wonder at me." What were once rationally defensible doctrines have become mysteries of the sort found in Christian fantasy novels. God is a rational, all-powerful Creator and not a magician who calls upon forces which exist independently of Him. If we are truly His images, or maybe it's better to say – "potentially His images", then we're not magicians nor are we intended by our Maker to be uncomprehending citizens of a world of forces beyond our understanding. We're children who are called to watch our Father and to playfully imitate His actions as He goes about His work in Creation.

If we are to live in the world of the resurrected, the same would hold. The Son of God isn't resurrecting us to put on a never-ending magical act to amuse us. He's resurrecting us to share His life, but we can't share that life if it's a mystery to us. We can share God's life only if we can truly imitate His actions as Creator, if we can think the thoughts He manifested in Creation, if we can have some hope of truly understanding this story God is telling. This understanding is a matter of principle and no particular human mind is capable of understanding so much as a flea, let alone this world, let alone the world of the resurrected. Yet, we have to realize that the human mind is the sort of entity which can shape itself to be a reflection of God's thoughts manifested in Creation. If we truly love the Creator and truly wish to be His images, then we Christians before all others are bound to respond to His world rather than to retreat into a dreamworld which is more comfortable in the short-term.

## 587 After Reading a Little of Hume on Cause-and-effect

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=572>. It was finished and uploaded on 2009/08/06.]

I've browsed lightly in Hume's *A Treatise on Human Nature* and haven't yet figured out why I'm sympathetic to his general train of thought though I'm in opposition to some of his most important conclusions. Maybe I'm in sympathy with his thinking. It's hard to say because he was trying hard to respond to empirical reality but he was somewhat entangled in language and concepts which simply assumed that, as one example that concerns me, human beings use something called a 'mind' to analyze and pass judgment upon reality. Maybe this mind is a substance or maybe just a faculty but it doesn't seem to be grounded fully in the observable human being. I haven't read any passages from Hume where he, in fact, explicitly stated any such beliefs on the 'mind', but he has written the first sections of *A Treatise on Human Nature* as if there is a real entity called the 'mind' which doesn't seem to be a bodily organ and which is capable of accessing some realm of truths independent of our concrete world. I don't think Hume's heart is in this business of viewing mind as a given, mystical entity, but what choice had he? What could he have known of the remarkable properties of the human brain, properties which seem coextensive with those human aspects which were once seen as explainable only by a mystical, supernatural 'mind' or 'soul'. What could Hume have known of the remarkable properties of the matter from which the brain is made? Empirically oriented thinkers such as Aristotle and Aquinas also backed off on this issue, positing – with one degree of certainty or another – the existence of an immaterial mind or soul because of their time-bound and well-justified belief that matter wasn't

plastic enough for abstract thinking.

Hume didn't know, and can't be blamed for not knowing, that the visual system, eyes to visual processing systems to higher level creation of a surrounding environment, is shaped in response to actual experience. There were interesting experiments done on some poor kittens when I was young. If they weren't exposed to, say, vertical lines when their visual systems were developing, they'd be blind to them all their lives. It would be sadistically comical, I guess, to watch them continually run into vertical wooden rails and they'd still not perceive them with their eyes.

This is to say that our eyes and brains don't just process experience and allow it to form ideas in some sort of generic idea-processing organ. Our organs, speaking more generally than I usually do, are shaped by our responses to our environments. Our hearts and thigh muscles are shaped to wolf-like standards of endurance if we are, for example, nomadic hunters. Our eyes and visual systems see, at least more accurately, what we've responded to during crucial periods in our development. Our bodies are manifestations of our relationships to our environments and our minds, at their best, are more or less accurate images of God's acts-of-being. You can think of acts-of-being as manifestations of God's thoughts. In those manifestations, even the most humble of things, we can perceive thoughts of God and shape our minds to be embodiments of those particular thoughts of God.

In my writings, I've been trying to speak of a new way of understanding what 'mind' and 'thinking' really mean. I've not yet figured out a good way to say clearly what this new way really is, but I'll try again. Let me present a crude diagram of the traditional view of the relationship between absolute truths, God, and Creation:

We should notice first of all that human thinkers stand outside the flux and uncertainty, at least in principle. Hume, and a few others, moved towards an empirical view that was entirely inside the third box but stayed with the big picture. Somehow, a fully empirical creature, that is an entity belonging to Creation, could judge worldly knowledge as if it had a mind which wasn't quite a creaturely entity, but... Confusion of a sort reigned, if not detected by most readers, but some modern thinkers were moving in the right direction even before historians of human thought, such as Snell or Onians began their work which showed the development of human thought in historical time, even before the neuroscientists, such as Broca and Ramon y Cajal, began their work which showed the physical foundations of the mind.

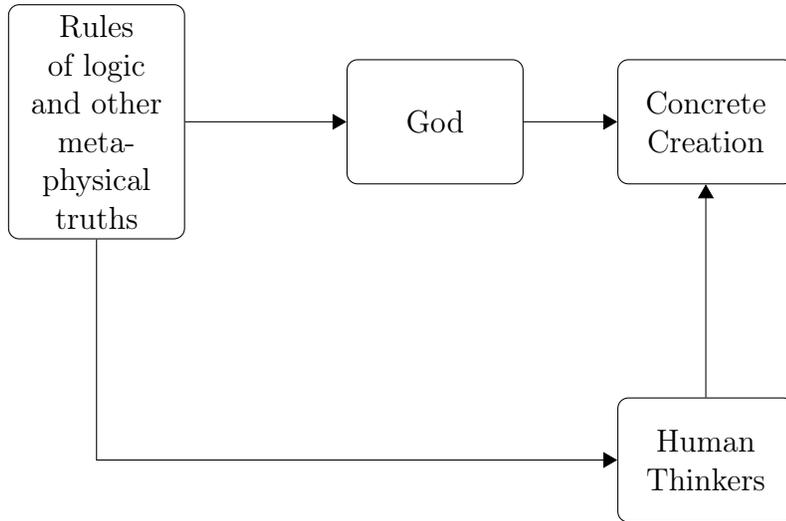

Figure 587.1: Conventional View of God and Created Being

Based upon my understanding of modern empirical knowledge and the ways in which human beings shape their minds, I'd change the above diagram to this:

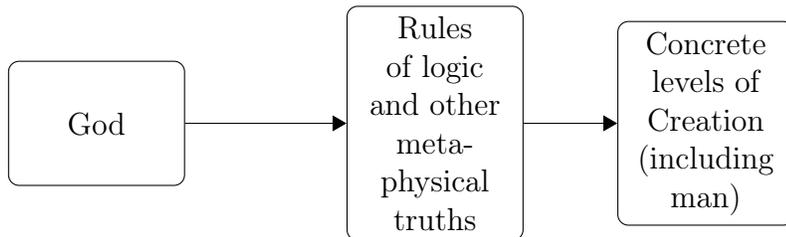

Figure 587.2: Loyd Fueston's View of God and Created Being

Moreover, I've claimed that middle box is actually a part of Creation, what I call the Primordial Universe. It's the manifested truths from which concrete worlds are created, this world and the world of the resurrected. That second box is with us in this world of the third box. We can see it clearly in the abstractions, such as the initially strange mathematics of relativity theory with its intertwining of space and time or of quantum mechanics where mathematical certainty and elegance is found in wave-

functions which then collapse to concrete electrons or photons in ways that seem so ugly under traditional ways of thought.

With these diagrams in place, let me repeat a few things I've said often in my writings so that I can indicate how all of this ties back to cause and effect. Note first that in my model, the burden for verifying reason has been taken away from the human thinker who is himself embedded in concrete creation. Thought is more or less the processes by which man learns to bring the truth in things into his mind, to encapsulate it as the thinking processes of that mind which is then capable of moving on to ever more abstract truths which I've claimed to be so thing-like that things are shaped from them. This explains the ways of modern mathematicians and physicists, and increasingly other sorts of thinkers who deal with abstractions. We don't have minds equipped with the circuitry of abstract reasoning which then simply need 'facts' to operate upon. We, most especially creative thinkers such as Einstein and Melville, are embedded in the thoughts God manifested in this world and we need to learn how to perceive those thoughts, whether manifested as the concreteness of a hunk of metal or the abstractness of the subatomic particles which give that hunk of metal its properties. We need to learn how to let our minds move along with human approximations to those concrete and abstract manifestations of the thoughts of a rational Creator.

Man is embedded in a world which seems at first to be made of concrete entities which 'obey', to some extent, abstract laws. As man has increased his knowledge of empirical reality, his best thinkers have started to work as if the abstractions are as inherent to this thing-like world as are the nails and semiconductors. The theories of relativity and of quantum mechanics deal not with abstractions which time, space, and matter obey. They are the behavior of time, space, and matter. They are also the proper thoughts of a physicist rather than being theories he processes with some sort of 'mind' which can stand in judgment upon those theories.

My ideas arise from an effort to openly and honestly respond to what we know of our world and I'm motivated by a Christian faith that the transcendental God freely and willingly took on a role as a certain sort of all-powerful and all-knowing and all-loving Creator. No matter how strange the discoveries of modern empirical knowledge might seem, they are revelations of manifested thoughts of that Creator. If matter interacts in such a way as to indicate cause-and-effect relationships, if we can develop theories about those interactions which include those relationships in a necessary way, we

aren't forming some abstract picture of concrete things so much as we are seeing abstract aspects which are part of concrete things. We are seeing the inherent behavior of thing-like being. We are seeing not abstractions in the sense of mental acts of imagination but rather abstract levels of the being from which those things are made.

I get this impression that Hume had an instinct that something like this is true but he didn't have the empirical knowledge or the abstract thinking tools to form a more coherent view uniting the concrete (billiard-balls) and the abstract (cause-and-effect relationships). Even now, in this time after Cantor and Einstein, Melville and Wallace Stevens, I'm having a great deal of trouble setting down my views on what a human mind is and how it forms, what it's relationship is to our world, but I think I'm moving a bit closer to a clear statement of my views. To do this, I'm beginning to speak a different language than those around me. I'm pretty sure that even if there are problems in my work, even if someone else finds a better way to deal with these matters, I'm speaking a childish version of a language not to be spoken in a mature form for a generation or more. At that time, richer concepts of being, including both concrete and abstract levels, will be as natural to well-educated youngsters as Darwinian ideas of life and Einsteinian ideas of time and space are now. Those richer concepts of being will, of course, include those Darwinian and Einsteinian ideas, or some more advanced and more sophisticated versions of those ideas.

## 588 What is Wisdom?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=591>. It was finished and uploaded on 2009/08/25.]

Wisdom is the fumbling substitute for perfect knowledge. [The American Story by Garet Garret, Henry Regnery Company, 1955 and made available as a pdf file on <http://lewrockwell.com/> through the generosity of Lew Rockwell and his associates.]

Ahhh, but what does it mean to know?

In the old testament, “to know your wife” meant “to be in intimate union with your wife,” including even “to have sex with your wife.” In old-fashioned language, “to engage in the marital act with your wife.” In general, the ancient Hebrews and the ancient Greeks, at least those in the line of Plato and Aristotle, used “to know” in the sense of an intimacy, a profound communion. Knowledge, to modern man, is often no more than an organized form of data of the sort which can be stored in computer memory.

Love never ends; as for prophecies, they will pass away; as for tongues, they will cease; as for knowledge, it will pass away. For our knowledge is imperfect and our prophecy is imperfect; but when the perfect comes, the imperfect will pass away.

[...]

So faith, hope, love abide, these three; but the greatest of these is love. [1 Corinthians 13:8 [141].]

As I understand these issues, knowledge deals with God’s world in terms of what can be learned by empirical investigation while prophecy deals with

God's revelations of His transcendent Being and also of His revelations of His purposes for Creation. Human knowledge and human prophecy in this mortal realm are both quite imperfect, but they can tend towards the perfect forms of knowledge and prophecy. Prophecy is to speak truly of God and of His love and His laws. It is a form of knowledge of God Himself and it will certainly not pass away in the world of the resurrected so much as it will be perfected. At that time, knowledge of Creation, of ourselves and others, of the meaning of time and space and matter, of morality and narrative, will be perfected. Faith and hope will have disappeared. What sense does it make to have faith that God exists when you live in the presence of His Son? What sense does it make to hope for God's mercy when you've already received it?

Each resurrected human being might still have only a tiny share in the perfected knowledge held by the Lord Jesus Christ, but it will be a share of the perfect knowledge of the Head of the Body of Christ. Wisdom, so called, will be part of our memories of things outgrown, as will be true of faith and hope.

# 589 Passing Beyond the Limitations of Scientific Materialism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=605>. It was finished and uploaded on 2009/10/09.]

We do need to pass by the limitations of scientific materialism and to do it without falling into the temptation of dualisms which invoke hand-waving to explain immaterial phenomena. My very working method, as well as my respect for the totality of human experience and human knowledge, rejects any possibility of scientific materialism or reductionistic materialism as I've sometimes referred to that attitude. Dualism of created being fragments Creation while scientific materialism or reductionistic materialism denies meaning, and even ultimate reality, to our experiences.

I've started reading Alfred North Whitehead's *Science and the Modern World* [148], a copy of which I bought 20 years ago or so in a used-book store. I'm nearly a century late in seeing the need to pass beyond scientific materialism. Whitehead seems to have taught that the greatest philosophical need of our era is a metaphysics to replace the irrational metaphysics of scientific materialism. He considered the irrationality of this mostly implicit metaphysics of the modern era to be tied to the belief that matter has a permanence and simple location, largely the view defended by Einstein in his debate with Niels Bohr – see Chapter 13, *Einstein and Bohr: Don't Tell God what to do*. for a short discussion of Bohr's insightful (but possibly apocryphal) response to Einstein's claim: "God does not play dice". Chapter 12, *The Metaphysics of Position, Momentum, and Missed Field-goals* is a short discussion more directly in line with Whitehead's criticism

of a physics based upon the permanence and simple location of matter. See Chapter 156, *A Christian's view of Einstein's and Bohr's Debate on the meaning of reality* for my discussion, and acceptance, of the understanding of that debate reached by the German philosopher Kurt Hubner.

I don't claim to fully understand Whitehead's proposed way of thought, but it's similar in some ways to my metaphysics, Thomistic existentialism which recognizes explicitly the primacy of relationships over matter and which is updated to consider modern empirical knowledge. To the extent I understand Whitehead's tentative sketch of a more rational metaphysics than scientific materialism, I can say he was proposing an organistic view of all physical reality, proposing that evolution is a real and fundamental part of reality. Its not just a process occurring in life-forms which are just an accident occurring in a scientifically materialistic world. Whitehead proposed a metaphysics which was not only organistic but also event-based, resulting in what I would call a "smearing over time and space." It seems to be a proposal that our world is something like a narrative, as I've proposed, but my metaphysics is multi-layered, allowing for the contingency of space-time itself. This world is a narrative but is shaped from the abstract being of what I call the Primordial Universe, allowing for a great freedom in the sorts of universes which could have come into being and also somewhat forcing the need for decisions in such matters. That is, my metaphysics works more smoothly when we admit the existence of a personal God and also gives Him the absolute freedom which only the Almighty could possess or use.

Whitehead strongly desired to protect the independence of metaphysics from theology:

What is the status of the enduring stability of the order of nature? There is the summary answer, which refers nature to some greater reality standing behind it. This reality occurs in the history of thought under many names, The Absolute, Brahma, The Order of Heaven, God. The delineation of final metaphysical inputs is no part of this lecture. My point is that any summary conclusion jumping from our conviction of the existence of such an order of nature to the easy assumption that there is an ultimate reality which, in some unexplained way, is to be appealed to for the removal of perplexity, constitutes the great refusal of rationality to assert its rights. We have to search whether na-

ture does not in its very being show itself as self-explanatory.  
[page 92 of *Science and the Modern World* [148].]

I have more than a little sympathy for a program to explore and try to understand the world accessible to human perceptions or human thought before invoking a faith in a transcendent Being, but even the most rational of atheists must honestly confront a very difficult question: How do we explain the aspects of our world which can be described as contingent, particular, or random? That is, how do we explain the factual nature of created being, at least of concrete being? See Chapter 160, *Randomness as a Sign of God's Presence* for my take on the meaning of randomness and the reasons I can claim:

There's a simple summary of the situation:

Only God can make a truly random number.

And again:

Only God can act in a truly random way.

Whitehead doesn't seem so concerned with dualisms as I am, perhaps because of his desire to keep theology and metaphysics apart – though I don't know if he even considered theology to be a legitimate field of study. He certainly had respect for the Medieval Scholastics who didn't always differentiate so clearly between theology and metaphysics. I share that respect, as well as his belief that those Medieval thinkers were overly rationalistic. Whitehead also gave the *Lowell Lectures* which are the matter of *Science and the Modern World* [148] in 1925 before Godel and Kolmogorov and Chaitin and others, such as Stephen Toulmin, anticipated the factual nature of randomness. In a critique of evolutionary theory, early 1960s, Toulmin, a philosopher, noted that whenever an evolutionary thinker speaks of randomness you could substitute some complicated phrase about the interaction of two or more fully deterministic and independent systems, such as the genes of a family line and the environment(s) of that line. I think that modern science, mathematics and the evolutionary work in various physical sciences, forces us to deal with the factual nature of the universe, the particularistic or random nature. And it leads me to speculate that a proper metaphysical analysis of modern empirical knowledge, including

abstract mathematics, forces us to conjecture that “ultimate reality” which Whitehead preferred to avoid in his program for a new metaphysics.

Still, Whitehead seems to have had the same general program in mind as I have, with that major difference about the relationship between theology and metaphysics and, in fact, I would put all human knowledge into a single worldview in which metaphysics plays the role of glue, along with abstract mathematics. He shared my concerns about scientific materialism but also shares my respect for science. I find it interesting that, nearly a century ago, he saw a need to move beyond scientific materialism and, so far as I can see, little has been done to carry out such a program.

# 590 Theology, Physics, Philosophy, and Politics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=618>. It was finished and uploaded on 2009/11/24.]

Once the thought of Plato and Aristotle had a home – the Greek city-state. Once the thought of St. Paul and St. Augustine and St. Thomas Aquinas had a home – Western Civilization. The two situations were different because the Greek philosophers struggled to find the best way to inhabit a home built by their predecessors while the Christian Fathers and their successors built a home for Western Christianity. In both cases, there was a rooting of philosophical form in the social and political context and a weaker tie between philosophical substance and that same context – this is to say that all human thought has such a context but may also contain truths from levels of abstraction above that context. We understand Creation as best we can in each generation and such general understandings affect the way we perceive and think about the most human of efforts which are, after all, directed to some purpose in our world as we understand it.

In recent centuries, in the United States in particular, we've lived in the house while treating it as the most natural and most permanent of structures. As if we were children not knowing what our grandparents and parents had done to make our home and to put bread on the table, we accepted a warm bed as something natural and to be expected, we came to the dinner-table with no real understanding of our need to be grateful for what had been done for us, we had no need to focus our thoughts and our playtime upon our duty to someday take care of the house and to fill the pantry. Lord knows we had little reason to believe that the electrical wires and water pipes were anything but part of the natural world.

When homeowners think and act this way, they'll awake ten years into their ownership to find themselves with inadequate wiring, badly corroded water-pipes, siding that needs a lot of repairs at once, and so forth. In an extreme case, the house might need to be torn down and rebuilt from foundation up. And suppose the foundation itself has decayed? And what to do when the breadwinner realizes he has not the skills or the tools to do any such thing? Nor has he the money to pay someone else to do the work since the bank accounts inherited from Daddy and Grandma are emptied and that nice, soft office-job has disappeared.

To a Christian, that metaphoric house is a mixed mess of sorts, containing the altars attended by the priests who serve the imperfect Body of Christ forming in this mortal realm – including the Church however defined and also the workrooms and kitchens attended by farmers and merchants and politicians, the secular kingdoms and marketplaces of mankind. I'll not even try to develop that metaphor properly at this time because a muddle is likely to result, but the point is that, to a Christian, the ecclesiastical and political realms are both part of the Body of Christ and neither has complete dominance over the other though they each have some rightful authority over the other. I'll skip those problems for now and maybe get back to them some day, God willing.

The home built by much earlier generations of Western Christians and left to us has decayed so badly that substantial new construction is necessary. Christians, who failed to enrich and maintain their culture, have only themselves to blame but they're plenty ready to blame others. Far too many Christians have taken to berating the pagans for not maintaining the Christian Civilization of the West. If your plumbing started to leak in the shower, under the kitchen sink, at the outdoor spigot, would you blame your neighbor for not taking proper care of your house? Yet, when our children talk in barbaric jargon or blast out rap music, we do blame schools and movie producers and all the others who perhaps were most guilty of filling a vacuum left by the sorry descendants of Dante and Fra Angelica and Rembrandt and Milton, the vacuum sustained against the efforts of a few, such as Graham Greene or Flannery O'Connor, to bring a sophisticated Christian sensibility to the modern world. Jacques Barzun said it truly in the title to a collection of his essays: *The Culture We Deserve* [8]. I could add: *The Politics We Deserve*, *The Science We Deserve*, *The Sports We Deserve*, and so forth, but I'm sure Professor Barzun was considering all of those in his more general title.

I'll move on and produce at least some general ideas about a plausible Christian civilization which we could build using the vast resources available in the modern world, resources that Christian thinkers seem to think part only of some anti-Christian realm. For example, as I noted a number of times, those bones dug out of the sands of Africa weren't planted there by demons from Hell, they were left by hominids or ancestors to hominids which were part of a complex story. A later part of that story involves chapters on Babylon and Egypt, the Roman Empire and the succeeding Germanic empires, the accidental development of somewhat universal suffrage in the Anglo-American territories and the ongoing loss of much that was gained by those accidental developments as mediated by the best sorts of opportunists (such as George Washington and John Adams and Thomas Jefferson). Is it possible the West has decayed so badly because our human world became more complex in synch with our more complex understanding of our greater world and we didn't learn the requisite lessons?

We and our ancestors have allowed this bad situation to develop by our passiveness caused by lack of courage and by lack of faith in God as Creator. This is the sin of sloth in Medieval Christian thought. More than just pointing this out, I wish to raise a larger point: at each stage of history, serious thinkers can make interesting and important contributions to our understanding of Creation, but a failure to move on will leave even the valid insights intertwined with errors. In the case of moral nature, spectrums of behaviors were split into categories of vices and virtues which were themselves treated as the basic building blocks of human moral nature. The insights of Medieval thinkers can be lost because it's not so easy to reconcile systems of vices and virtues to the realities of the embodied human being as described by modern biology.

I'll propose a model of important aspects of this world, a model which is far from original in its pieces, but I'm aiming at a more complete worldview which covers human politics as well as theology, physics, and philosophy. At some level of abstraction, being is unified, so I can claim:

1. The components of thing-like being arise by local processes which allow the possibility of some substantial freedom.
2. In this world, certain patterns exist at a global level, including the fundamental structure of space-time. Local entities will respond to those global aspects of this world as they – so to speak – grow up into

the world. The local entities will change themselves to somewhat encapsulate what they respond to. Over time, some entities will achieve some sort of success by a combination of proper responses and luck. Other entities will fail. Over time, complex environments will also develop.

I'm trying to reach a proper level of abstraction so that I can speak of the evolution of both galaxies and gorillas and I'm trying to do it in a way that allows a coherent discussion of moral freedom – which of course leads to social and political issues. My preferred, and admittedly sparse – for now, understanding of the aspects of reality described by modern physics is a slight variation on the view expressed above:

1. Locally, we have the components of things coming into being by processes described by quantum mechanics (speaking simply for summary purposes).
2. Globally, we have the structures, space-time at the least, which force those components to respond in ways that produce simple and complex things.

As creatures of a world which is the free-will creation of an all-powerful God (theology), a world which has some fundamental aspects explorable and describable by empirical knowledge-gathering efforts of men, a world which is understandable in a quite contingent and time-bound manner by speculative thought, we would be doing well to shape our minds to encompass what we know of the Creator and His Creation and we would be doing well to also shape our ways of organizing our communities to those same two bodies of knowledge, of God in His transcendent and necessary Being and of His freely chosen acts as Creator – to see my understanding of human knowledge, download *Four Kinds of Knowledge* [43] where I explain why there are really only two kinds of knowledge.

How can I make such a claim about politics, a realm of human moral action, of human freedom? How can I claim that politics is somehow deeply tied to astrophysics? What is the sort of politics implied by my understanding of Creation?

Let me first state my claim in the form of a description of biological evolution:

1. Organisms arise by way of somatic and genetic inheritance and, in a manner of speaking propose responses to the demands of their environments. Failures occur due to luck or inadequacy of the proposal. The form of success which counts most in biological terms is to have lots of descendants, that is, those who carry your genes and not necessarily those who resulted from your own acts of reproduction.
2. Over time, family lines of organisms are shaped to the realities of a particular locality and also to the larger-scale realities of the world. Social mammals have added new levels of complexity by developing what might be called cultures, so that new responses to environments arise through community behaviors. Human beings have developed very complex cultures supplemented by technology. These advances also lead to new ways to fail.

We speak of self-organizing systems in the modern world but we should remember that a system developing from below will reach some sort of stability only by properly responding to the local environments, including the locally manifested structures of space-time in our world. Christians can place this sort of understanding in a greater context by way of an explicit recognition that we, our minds and our social relationships, are best shaped in response to the Creator's will as given in Holy Scripture and in Creation itself including our own bodies and our natural forms of interacting with our fellow humans, with other creatures, and with the non-living parts of Creation.

Such a general principle gives us little help in structuring a government, or a way of choosing leaders, but perhaps at least helps us to filter out wrongful forms of government and might help us to eliminate leaders who fail to properly respond to Creator and Creation. This is what we should expect if the world is as I claim it to be, at least from the viewpoint of a developing creature. We freely seek what is proper but we know if it truly is proper only when we test it in our environments or against what we know of the world. All existing complex entities or communities in an evolutionary world are the result of a number of generations of experience and responses, indicating the need for a proper conservatism recognizing the value of that embodied experience. At the same time, a system which is the product of any sort of historical development, Anglo-American court systems or the great white shark, needs to be open to further development

when its responses are no longer proper to its situation. Experimentation can be as important as adherence to tradition. I speak known truths, but my goal is to speak them in a way that allows human politics, in fact, all of human social and moral interaction to be discussed in terms of the created being as we know it from the best of modern knowledge.

Let me raise the political question which is primary from a Christian viewpoint: Why did the Lord Jesus Christ accept humiliation, torture, and death rather than use His divine power to conquer those who opposed Him? The first general answer I'll propose is that God's ultimate power is that of the supreme Act-of-being, He who is His own Act-of-being. This is to say, He is the source of all being, His own Being as well as that of every creature. He worked to create in the beginning and He's working still. He's not a Jovian god who conquers a creation which is possibly co-eternal with him, but rather the God of Jesus Christ who creates and sustains from a fundamental level of being which we can't even directly perceive though 2500 years of intellectual struggle from the pre-Socratics to now have allowed us to at least realize the existence of abstract forms of being.

I'll return to the question:

Why did the Lord Jesus Christ accept humiliation, torture, and death rather than use His divine power to conquer those who opposed Him?

Rather than using His power to conquer the Romans, the Lord Jesus laid down His life and then picked it up again. Having learned obedience through His suffering in human flesh, Christ reached perfection in His resurrected human body by responding freely to Creation and Creator. This is a bit strange to human perceptions since He was responding to His own Creation. He was creature, recipient of the divine gift of existence, and also Creator, giver of existence. He had created the possibility of creaturely perfection and then He achieved it.

The ultimate power is the power over being, a power denied to creatures. We must accept the world as God gives it to us but we have some freedom to participate in the creation of new things – that is, things that can be made from components already created by God. We have a little bit more freedom to shape ourselves and the things around us in response to the world as it truly is. If we fail to do so, those new things will fall out of existence or else revert to some other form. If we try to bring into being some things

or some new relationships between men which can't be generated from the basic stuff of this world, then those things or relationships will fail to come into being for even the shortest of times. If we fail to shape new things to the higher structures of this world, then they will fall out of existence. This will be true also of things that need to change in response to our dynamic world or to man's deeper understanding of this world. If we fail to change our social or political structures, or even our own thoughts, then alienation sets in and can work to destroy our minds.

The view of politics I've advanced in a very tentative form in this article is but a baby-step towards that important goal of achieving a unified understanding of created being, a goal I've argued for in various writings including that book I've made available for free download: *Four Kinds of Knowledge* [43].

# 591 The Reality of Perfection

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=624>. It was finished and uploaded on 2010/01/08.]

I've claimed that the human mind is the sort of entity capable of encapsulating the world though an individual mind isn't capable of fully understanding so much as a gnat. I've also quoted the historian Carroll Quigley about the nature of the traditional Christian philosophy of methodical realism:

The truth unfolds in time through a communal process,

or, equivalently,

The human mind forms in time through a communal process,

The individual human being who responds properly to God's Creation has started to travel a path which leads to a state of Christ-like perfection, but he travels that path as a member of a greater organism, a community. We won't reach perfection in this mortal life and it may be still more disturbing to some that we travel toward perfection as members of a rather unruly herd with some members having traits and behaviors which invite stronger descriptions than 'imperfect'. And I'm not preaching any sort of salvation-for-all creed. So far as I can see, many traveling with this herd aren't truly part of it and some stubbornly refuse to change, remaining what they were at the beginning of the journey. It's hard for me to believe that those who refuse to respond in a courageous and faith-filled manner to God's Creation could ever be happy in Heaven and I suspect that such human beings, many or few, having refused to allow God to lift them out

of their natural state as human animals will simply die a final death appropriate to animals.

The others will change at most a tiny bit in this mortal realm. Perhaps we gain a little moral and spiritual maturity as we age but some of that, and maybe most, is the result of losing the youthful energy to misbehave. Perhaps we learn a little but it's awfully hard to apply the lessons of experience during our lives and even major nations have trouble digesting the results of their own history. Few there are who can see the human condition in its greater scope as human nature develops somewhat, and our powers of narrating that development is blended in to help shape our future responses to God's world. Becoming moral individuals and moral communities is largely a matter of learning how to honestly narrate our past and to produce some sort of speculative narrative for our futures and to try to follow that narrative.

There are various Christian narratives but all have to see the same end to this mortal chapter of our story, a transition to the individual perfection of a Christ-like man and an entry into the community perfection which is the Body of Christ.

This is all well and good, at least as good as the typical Christian talk about some Heaven that remains beyond investigation, but why do I speak of the reality of any sort of perfection? Perfection seems not to be possible in this world except as a manner of speaking. This also doesn't matter to Christians because analysis of modern empirical knowledge under the assumption that we inherit a Creation, a work of an all-powerful God, points to a more reasonable view of created being as multi-leveled. The dominant pagan view was that this world was shaped from some vague sort of being they could only describe as 'chaos' or something similar. They were far from entirely wrong.

Philo was an Alexandrian Jew who was born a little before Jesus of Nazareth. Philo read the book of Genesis in light of Plato's speculative claim that the world was created from nothing by the God and Father of all – see Plato's dialog, *Timaeus*. Christians accepted Philo's reading at a time when Christian thought was being born. Since then, the tradition has been to read the first chapters of Genesis as if it were a story of a creation from nothingness. In fact, the word translated as 'create' has a meaning akin to cleave in the sense of separate. The interested reader can look up *Genesis 1 Through the Ages* [77] by Stanley Jaki, the Benedictine priest and polymath scholar who died in 2009.

The pagan idea wasn't wrong so much as it was incomplete. This world was shaped from some form of created being which is strange to our thing-based ways of thought. I'm not speaking of mystical ideas but rather those of modern mathematical physics, specifically the narratives of the birth of this universe in the events inaccurately labeled the 'Big Bang'. As we move backwards in time towards those early fractions of a second of this expanding universe, our best scientific theories speak of particular forms of matter and energy melting into a more general form of matter-energy which is a more abstract level or phase of created being. The God of Jesus Christ did create contingent being from nothing but we can't see that creation. There might be multiple phases of being on the other side of that so-called Big Bang.

In my proposed narrative of Creation, the level of created being "just on the other side of the Big Bang" is the space of states of being which Roger Penrose and other mathematicians or physicists have described in terms of 'possible universes'. Our universe is a highly particular one, a universe which seems to have nearly 0 probability of existing relative to all the set of possibilities which is that space.

As I see matters, that space of possible universes contains also that which is the world of the resurrected, the perfect and non-decaying universe from that space of possible universes which God chose to create. I could be wrong and we might have to go back several phases of God's shaping of the raw stuff of Creation before we get to the level where He 'restarts' in His creation of that perfect world of the resurrected. For now, the main point I wish to make is that it's possible for Christian thinkers to integrate modern empirical knowledge into our views of this world as being a part or phase or level or whatever of a Creation, a work of an all-powerful God who alone can create from nothingness. He created some strange stuff from nothingness, shaped this world from it, and shaped us inside this world as characters in a story He's telling. There is every reason to believe that a Creator can create a perfect world and resurrect us, re-create us, inside that world as perfected men.

I've not yet completed the development of the worldview which presents perfected men (resurrected into a Christ-like or 'spiritual' state of embodiment) and a perfected world (Heaven) as events in the entirety of the same Creation in which this moral realm exists. If I had, it would prove eventually to be as tentative and as contextually bound as the worldviews produced by St. Augustine and St. Thomas Aquinas. It's also true that

the very richness of modern empirical knowledge will force an equally rich understanding of God's Creation and I don't know that it will be possible to create a philosophical or theological system of the traditional sort. We may need to produce an open-ended narrative understanding that grows with new developments in God's story – and some sorts of developments seem to be happening awfully fast now that man is doing so much to invent powerful technologies and to explore physical and abstract levels of created being.

I've written about most of these ideas before but I have two reasons for writing again about this general issue and at this time. First of all, I'm trying to keep working on better statements and enrichments of my thoughts as already developed. I might well discover I have to reformulate some of my thoughts or might even hit on a new insight or two. In addition, I'd like to point towards a great error in the thought of modern historians and political scientists, an error which is most culpable in Christian thinkers and those non-Christians who should understand the Christian viewpoint.

So-called traditionalists and conservatives will often deny that real progress can occur in this world. This is a valid viewpoint for a pagan thinker but not a Christian. A Christian has to believe that progress is possible, at least in principle. The individual man can, at least in principle, develop towards a Christ-like state. The entire race, even including those men who will not be resurrected into Heaven, can develop towards the state which is membership in the Body of Christ. We can't achieve such a state of perfection, even in principle, in a world where decay is a fact. This is the place to point out that decay, increasing entropy, isn't a law but rather a direct world of God's choice to produce a world particular in certain ways – the world has been advancing towards a more probable state since then. This particular advance results in an increase of entropy. In other words, 'increasing entropy' isn't a fundamental property of matter and energy but rather a result of the universe starting out in a very specific state, specific in a sense still being explored by scientists.

As a summary of sorts, I'll note it remains true to a Christian thinker that:

Grace completes nature and doesn't destroy it to replace it with something else.

If what we are is the rough beginnings of a completed man – that is,

one perfected to a Christ-like state, then a healthy moral imagination can imagine moving towards that perfected state. The principle is established that what we are can be perfected into a Christ-like state. A similar though more convoluted statement can be made about human communities, families and political communities and economic communities and the Church, being rough – in fact, fragmented – beginnings of the Body of Christ.

# 592 Protecting Minds and Souls by Petrification

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfeuston.com/?p=643>. It was finished and uploaded on 2010/03/29.]

Jesus tells of a master going on a journey and entrusting a part of his treasure to some servants (3 or 10, there are multiple recorded versions). On his return, some had invested the portion entrusted to them and had made a profit. In each version, one servant had merely hidden away his share of the treasure, his talent, to keep it safe. And by doing so, he kept that talent sterile, non-productive.

There is a lesson we should have learned from those parables which would have maybe guided Christians, over the past two or more centuries, to a greater sense of moral responsibility. That is, those of us who believe in the all-powerful Creator, Father and Son and Holy Spirit, should go forth with courage and faith into the world to invest our talents in God's work. We should respond in good faith to God's Creation even – no, especially – when it gives us strong reason to reject some of our favorite human beliefs.

What happened to the Western Civilization built by St. Augustine and his successors over many centuries? It was Christian and was the home of the Christian Church and much else, Christian and Jewish and pagan. It was largely under the stewardship of Christians even when we consider the greatly disproportionate contributions of Jews and also the contributions of other non-Christians. In a word, it was ours to nurture or to lose and we lost it. Western Civilization wasn't taken from Christians by Satan or by masses of hostile pagans. We lost it and we lost it largely by petrifying the dynamic, living ways of thought given to us by the likes of St. Augustine and St. Thomas Aquinas. This process of petrifying our mental and spiritual

food led to a petrification of our minds and souls.

Still more directed to the angle I'm presenting in this entry:

We Christians walked away from Western Civilization and locked ourselves in various intellectual and spiritual ghettos.

Any rational efforts to construct a story where Satan or masses of pagans took Western Civilization over by force will prove false upon careful analysis. There are no great battles between Christian defenders of Western Civilization and demon-worshiping barbarians red of tooth and claw. There are very few Christian defenders worth mentioning in the, mostly, pitiful struggle over the past two centuries or so over the understanding of our world and our appropriate responses to it. For the most part, the emptied squares of the Christian city, a city of both God and man, were occupied by unwise men who tried not to return to barbarism or paganism so much as to create Hazel Motes' *church of truth without Jesus Christ crucified* from the novel, *Wise Blood*, by Flannery O'Connor. But those who created such strange ways of thought, whether Nietzsche himself or the mindless citizens and leaders of liberal democracies that Nietzsche so despised<sup>1</sup>, were themselves victims of the moral irresponsibility of those Christians who had the duty to protect and nurture Western Civilization, or find and educate those who might be up to the task.

Because of that moral irresponsibility of Christians who walked away from their duties as stewards of Western Civilization, men of the West have come to see Creation as apart from its Creator. Western Civilization was a home for the Church, but still better: a setting and itself a character in a drama in which the story of this world was played out by the likes of Augustine of Hippo and Albert Magnus, Fra Angelico and Michelangelo, Johann Sebastian Bach and Amadeus Mozart, Isaac Newton and Carl Linnaeus, William Shakespeare and Leo Tolstoy, Alfred the Great and George Washington. These men were but children learning to imitate their Father in Heaven as He went about His work as Creator. Yet, they were children of some greatness. Certainly, they were children of promise and they created a way of thought, as time-bound as each piece of thought proved to be, which allowed men to see the increasingly transparent universe as being certain

---

<sup>1</sup>We should remember that Nietzsche despised authoritarians and anti-Semites and others who've sometimes claimed him as much as he despised the mindless citizens of liberal democracies and the mindless worshipers of liberal Christianity.

aspects of a true world, unified and coherent and complete, a physical place yes but one which is a setting for a morally well-ordered story told by God.

For sure, there have been some serious Christian thinkers in recent centuries, such as the historians of theology, John Henry Newman and Jaroslav Pelikan, or the historians and philosophers of science, Pierre Duhem and Stanley Jaki. There have been some novelists, the somewhat Jansenistic Graham Greene and the Thomistic Flannery O'Connor come to mind, who've shown they can explore human nature from two radically different Christian viewpoints and produce serious literature, not pietistic nonsense but also not moral chaos. On the whole, I know of little in the way of modern Christian philosophy or theology which is so fruitful of insights as the anti-Christian writings of Nietzsche and Sartre.

The list of Christian thinkers who have responded with open hearts and open minds to God's Creation in recent centuries is frighteningly short, even if expanded to include all plausible substantial thinkers, at least those known publicly. Thinkers who did better may well have been buried in the dust-bin of history by bureaucrats and time-servers afraid of the newness with which Creation presents itself as Western Civilization developed, and often enough developed so explosively as to blow apart even those institutions which best served God.

On the whole, Christians have been in retreat from a world which had suddenly asked questions not to be found in our textbooks and our stale sermons. But what of all those who fill the catalogs of Christian publishers, Catholic or Protestant? Let me mention a few. C.S. Lewis combined some moral insight with non-Christian ideas about reality. His version of substantialist philosophy of the Neoplatonic variety is more consistent with a pagan idea of matter which co-exists eternally with God rather than a more radical idea of God as a true Creator. (To be sure, the alleged Thomist G.E.M. Anscombe wasn't so far from Lewis' viewpoint as she should have been – indicative of a deep problem with modern thinkers.) Hilaire Belloc was a second-rate mind, a high achievement indeed as there aren't that many first-rate minds. G.K. Chesterton was perhaps a third-rate mind with some worthwhile insights into the role of faith in human life. To mention a Protestant unfairly slighted: Jonathon Edwards perhaps had a first-rate mind, but one who proved the main thrust of Calvinism was a return to the higher paganism seeing human beings as not truly fit for union with God who is, Himself, seemingly not capable of descending into His Creation.

The main thrust of this highly opinionated article is: Christians have

shaped their minds to the limited environments to be found in the ghettos they built for themselves. There are libraries of books, many great, written in earlier times and written to produce systems of thought including ancient or Medieval understandings of Creation. We have enriched understandings of some aspects of that Creation and yet we haven't had the courage to revise our total understanding of Creation, to add any works to that library which show the faith and courage of Origen or Augustine. For example, our ways of understanding reality, when we think as Christians, remain bound to the understandings of time and space and matter derived by ancient, Medieval, and early-modern thinkers, not all Christians for sure. We think of ourselves as born as certain 'persons' rather than as dynamically developing entities in a story far greater than ourselves. We are defined by the overlapping developments of our bodies and our roles in that story being told by God. We are some endpoints of those developments. The greater endpoints are known only to God.

The ideal human mind is well-formed while being flexible enough to deal with new knowledge or new views. To withdraw, as a group of some sort, into an intellectual ghetto might seem the right way to protect our own minds and the minds of future generations in our group when we're under some sort of assault. It's never the right way for Christians for the simple reason that we believe that God is Creator and Sustainer of all that is. We learned the truths that emerged from the synthesis of Plato and Moses to be found in the works of Philo and we, especially Augustine of Hippo and Thomas Aquinas, made those truths still more fundamental to our systems of thought than did even the Jews who followed Philo. No one, other than perhaps me, has come up with even the beginning of a new understanding of God's Creation which properly considers the insights of Newton and Galois, Cantor and Einstein, Huxley and Watson. Nor has anyone produced a proper response to modernist streams of abstract thought other than perhaps Etienne Gilson, who had great respect for some of those streams, even some which were anti-Christian.

The world around us is God's in all senses. If we Christians can't make sense of the best knowledge of that world in terms of our faith, then we have a problem and we should work on that problem and not try to shut out the parts of God's world which don't fit conveniently into our systems of thought. I would even suggest it possible that such an attempt to shut out God's world is one form of the sin against the Holy Spirit. If we teach ourselves to be rigid in the face of inconvenient facts or events while we live

in this phase of God's Creation, what would make us think we'll magically loosen up in Heaven? In fact, I fear Heaven would be Hell to a rigid mind because such a mind would be constantly resisting God's own advances.

I came to these thoughts while thinking about occasional stories indicating that **current** religious believers might be dumber, on average, than non-believers. My speculation, for now, is that this is true but only because of the 'top end'. That is, smarter and more creative thinkers are more attracted to non-believing communities and ways of thought, at least partly because they wouldn't be allowed to use their higher intelligence and/or creativity if they were to become Christians. Some might remain or become Christians while keeping their more substantial intellectual and creative lives separate from their lives as worshipers.

I'll speak of a personal experience from 20 years ago or so, without naming the publisher or individual persons. I submitted to a Catholic publisher a novel about my spiritual conversion, years before I understood that conversion as it turned out, and the publisher wished to go with the book but his literary adviser told him he'd lose money because there's no market among American Catholics for serious literature, though the problem is more general. It's not too hard to find Catholics, or other Christians, who've read all the books of Robert Ludlum and maybe seen all the movies, but Flannery O'Connor is following Hermann Melville into some sort of an abyss.

Of course, Christians, maybe believers in general, are dumber than non-believers. Christians discourage thought and discourage the development of a living mind. They either cripple the mental workings of their children's minds or drive them out of Christianity.

# 593 Does the Christian Church Need a Home?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=651>. It was finished and uploaded on 2010/04/23.]

As Cardinal Ratzinger noted years ago, western Christians built Western Civilization as a home for the churches united to Rome. St. Augustine and St. Benedict and St. Gregory the Great laid the foundations and many others built upon those foundations. For centuries, Western Civilization was a home for the Catholic Church and then for Protestants and others as well. Etienne Gilson, the Thomistic scholar, and Joseph Ratzinger have both noted that it was Christians who failed to maintain the Church's home. Gilson gave a specific reason for this failure: Catholic intellectuals had no good answers to the modern questions raised during the Enlightenment and the bad answers given by others led to the slaughters of the French Revolution and gave men of little imagination and rigid faith an excuse to retreat into an intellectual ghetto. Christian intellectuals have generally remained in self-confinement since then.

It was new discoveries in God's Creation and the consequent changes in human societies which had created new opportunities and raised new problems. Violent men and scoundrels did no more than take advantage of the confusion caused by the failure of Western leaders and intellectuals to respond properly. If Western men were being tested by God, they seem to have flunked the tests pretty consistently, except perhaps for the scientists. Or, did we men of the West really do so badly? Maybe we can be more optimistic about the general development of human civilization and the necessarily parallel development of the human mind.

In any case, it would seem we need to build anew and to aim at con-

structing something like Western Civilization but better shaped to our newer, richer and more complex, understanding of God's Creation. There are many treasures in the rubble of the West and many more feeding book-worms and silverfish in those libraries which haven't yet replaced Austen by King or even eliminated most books in favor of video recordings of some sort. And then there are the old folk-songs and ditties of which I learned only a smattering in my childhood in the 1960s. I doubt if many born in the past three decades know so much as a song from their Scottish or Polish or French-Canadian ancestors. Even popular American folk-music, such as that of Stephan Foster or that performed by Burl Ives or Pete Seeger in the 1950s onward, isn't heard often nowadays.

I don't speak in terms of a political or military decay but rather in more general terms of the decay of concrete aspects of human life, including the musical and culinary and literary sides of our times in this mortal realm. A civilization is formed from the ground up, the foundation coming from folk-music along with sophisticated liturgical music, nursery rhymes along with odes which celebrate concrete reality and what lies behind it, stories from the old country told by Grandpa as well as those great books we were taught to hate during our high school years. We are surrounded by art and entertainment that does more damage by its lack of intelligence and lack of historical roots than by its sometime despicable moral messages. But most of the art and entertainment which seems to preach moral truths is just as despicable. The seeming moral decency of *Father Knows Best* and *Leave it to Beaver* was unfounded, smoke and mirrors under the control of wizards who just wanted to sell us products and ways of life that would replace traditional ways of life to the profit of the greedy and the ambitious.

I've consistently argued the human mind forms as we respond to our environments, a claim which may explain my observation that there are intelligent and knowledgeable human beings who don't give any strong signs of having real minds, active and probing entities. They don't respond to God's world, don't actively reach out in an effort to understand. They grow up as passive victims of modern school systems as well as passive victims of the entertainment industry. Perhaps it's always been true that the vast majority of human beings pick up their most basic attitudes and beliefs in such passive ways. If true, that would argue against the possibility of good self-government in this dynamic world, but I'll not argue that issue one way or another. It does seem true that we in the modern West have failed to exercise their own human nature in active responses to the world around

us.

We must learn to be more active and more responsible for the formation of our own minds and our own moral natures, and we must help our children to do the same. The proper way to do that is to respond to God's Creation as we best know it and understand it, the upsetting parts of science and history as well as those parts which generate material prosperity or make us feel good about ourselves. We must move forward, remembering the lessons of the past, lessons of what worked well and what didn't work very well, but we must look ahead to a future which can seem awfully frightening because there are many signs of great changes in the world of men, changes largely forced by successes in exploring and using the resources of this world.

## 594 What Can We Say About the Body of Christ?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=657>. It was finished and uploaded on 2010/05/10.]

I'm going to propose a full-blooded organic understanding of the Body of Christ. This is intended as an expansion of the teachings of St. Paul rather than a new way of thought about that Body. It would seem appropriate to expand those teachings now that we have a deep and wide knowledge of organisms, including the ways in which complex multi-celled or multi-organ organisms evolved from simple cellular organisms.

An interesting question along these lines is:

Is the Christian Church Herself but one organ in the Body of Christ?

It's better for now to be a little vague about the definition of the Church, but it's clear the Church is the center of worship and communion with Christ and, through Him, with the Father and the Holy Spirit as well. The Church is the organ in which and through which the community of Christ's chosen brethren can share the life of God. Yet, there are other human needs met by other forms of human community which overlap the human community which is the Church but are most certainly not fully subordinate to Her though subordinate in terms of moral and spiritual guidance. Those other needs, economic and artistic and political, are lesser than our need for communion with God, the very Source of our being, but they are true needs and noble in their own lesser way. In terms which might seem to contradict some of my prior discussions, there are many human needs which can be

met only by entering the marketplaces, the regions in which individuals can interact with many of the organs of which they are members.

I've written in negative terms about the marketplaces in the modern world, especially in my book *To See a World in a Grain of Sand* [41], but I've also written in negative terms about the Church Herself in acting strongly outside of the region of Her competence in the Galileo affair and many other cases. But the problem doesn't come so much from one organ of the Body of Christ sometimes intruding into the regions of other organs – we don't yet know how the organs are defined or their responsibilities properly delineated. The problem comes when one organ intrudes and has the power to continue its intrusion and does so when it becomes clear that it has exceeded its own authority and competence.

To diverge for just a single idea: we need geometric descriptions of individual entities which inhabit 'spaces' which have no surfaces as such. Those spaces overlap completely and yet the individual entities would retain their own identity. In the view I'm now exploring, those entities would also form organs composed of multiple individuals but those organs would be part of an entity which might well be the entirety of the world in which they exist.

I'm forced to speculate far ahead of more specific and better-formed theories just because Western Christians and all others with responsibilities for Western Civilization have failed to respond properly to the enterprises of gathering modern empirical knowledge. Those enterprises have opened new possibilities for understanding God's Creation and have also demolished old ways of understanding the nature of man, the possibilities of resurrection, and other aspects of Creation and relationships between God and His creatures. My way of looking at created being as multi-leveled, going from abstract truths to concrete being, gives ways for human thinkers to ascend to higher abstractions for both more general understanding but also for a descent back down towards particular, or concrete, being which might exist. To reach some speculative understanding of the world of the resurrected, a human thinker ascends from this realm of growth and decay to high levels of abstraction and then tries to find a path down towards a world made of stuff similar to the stuff of this world, yet that world of the resurrected would be one where growth might be possible but decay doesn't occur.

In any case, Christian thinkers are behind two centuries or more in their understanding of God's Creation. We have a lot of ground to make up.

Let me return to a more limited line of thought for now. . .

I've spoken in the past of Western Civilization as being a home which the Christian Church (in the West) built for Herself. This is a metaphor used by Joseph Ratzinger (currently Pope Benedict XVI). Cardinal Ratzinger went on to note that Christians of the West hadn't properly maintained their home. Western Civilization isn't in trouble because of invasions by pagans or Satanic agents but rather because Western Christians were morally irresponsible in their duties towards their own civilization. Pagans and others didn't invade the West. They wandered into vacated public spaces.

With that as background, I'll move to the possibility that Western Civilization wasn't so much a house as a unstable colony of human communities which could be viewed as a first try at developing the Body of Christ. Some of those organisms, individual or communal, grew into parasites or cancers prospering for a while at the expense of the earthly Body of Christ as a whole. The functions of those organs, such as governments which destroy their own underlying communities, are important but have their proper limits. The evolutionary pathways of multi-cellular organisms, such as bipedal apes, passed through similar rough spots. I imagine there were paths which dead-ended when parts of organisms began to prey on other parts. A family line of creatures which develop fatal cancers near the onset of the age of reproduction will disappear pretty quickly.

If we believe there is a forward thrust in this development of the Body of Christ, then the organism as a whole – however primitive it might be at this stage – will eliminate the diseased organs and new organs might grow in its place but maybe different sorts of organs will grow. Let's consider this a process of a presentation and selection sort – natural selection is a specific such process.

And I return to my speculative claim that the Body of Christ is made of multiple organs and the Church is the most important of those organs because it is by way of the Church that we are united with the Lord Jesus Christ and, through Him, with the Holy Trinity. Given this hypothetical understanding of the Body of Christ, God's story which is this world isn't one where a righteous Church struggles against worldly powers which serve un-Godly purposes. It's a story in which the various organs of the Body of Christ are developing in themselves even as the greater Body also develops. The Church Herself has at times begun to take on the functions of other organs, threatening to turn cancerous, but She was returned to Her proper functions and proper boundaries, as if God truly does act to discipline Her but also to save Her. There is some reason to believe she's now the most

mature of the organs in the Body of Christ – at a time when her worldly power has shrunk greatly relative to that of cancerous and parasitical political and economic organs. Yet, those organs, no matter how diseased at present, also fill important roles in the Body of Christ – they meet human needs. The question is: are those merely needs in this mortal realm or are they needs of any being truly human, even a human being living in the world of the resurrected? I'm betting that human beings have political and economic needs and those will be met in the world of the resurrected.

We have to keep in mind that individuals are also developing, as individuals, as members of various organs, and as members of the entire Body of Christ. This is one of the reasons for my current speculations. If we are to be truly saved, as our own selves, then it must be true that grace completes and perfects nature rather than overriding it in any way. Our political and economic needs are to be completed and perfected when we rise from the grave to live for time without end with the Lord Jesus Christ. We human beings naturally form communities and institutions for several of our major categories of needs. I don't see the Church as being capable of satisfying all these needs. And – to repeat – I don't see those needs as disappearing in the world of the resurrected, not if we're to remain human beings.

These sorts of speculations make it possible to discuss the Body of Christ coherently. We can speak of life after death and still sound sane but we have to adjust to speak in terms consistent with those realms of Creation we can directly perceive or can reach by the proper exercise of our all-too human minds.

This program of thought would force us Christians to work hard to grasp difficult lines of thought, to be capable of thinking of the Body of Christ as a fantastically complex organism, not the simple choir in heaven of *Amazing Grace* but rather the embodiment and realization of an awful lot that's good about human life including many things we can't quite realize in this mortal realm. Political relationships would remain as would cultural traditions – all brought to their fullness but remaining alive and growing. The implied developmental processes and the resulting complex structures might be describable by tools similar to those used by Einstein to develop his general theory of relativity – differential geometry and the closely related tensor calculus. Or those processes might be similar to those of quantum mechanics. In any case, they don't seem likely to be well described in any meaningful sense by existing modes of theological or mystical discourse.

The question I raised to start is:

Is the Church Herself but one organ in the Body of Christ?

My best speculations right now indicate this to almost certainly be the case. Moreover, the Church Herself has acted in recent centuries, especially through the Papacy, as if She is to play the role of moral and spiritual guide for the economic and political and social powers, in addition to playing Her primary role in directly communicating with God through worship and praise. The Church in recent centuries, through the Popes and through the bishops sitting in council, hasn't claimed any right to rule directly, only to play the role of conscience, a role not yet acceptable to most of the other organs of the Body of Christ.

If the Body of Christ is forming now in this mortal realm, though the process might not get close to the final result in the world of the resurrected, then it becomes possible to explore that process and to come to some significant understanding of the Body of Christ and how it develops. More than that, the effort to understand the Body would seem to be the duty of those who claim to be Christian thinkers, theologians or philosophers or historians or creative writers. Pursuing this line of thought would seem the best way forward (in fact, the way out of the ghetto built by Christian thinkers over the past 200 years or more) for Christian theology and would provide a solid foundation for those very important topics in Christian theology: the nature of the union of God and man and the Eucharist.

# 595 Abstractions in Modern Thought and Art

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=663>. It was finished and uploaded on 2010/06/28.]

I've come to the position that created being exists across a spectrum going from abstract to concrete or particular. A thing, a particularized form of being, still has its abstract being in it the way that a vase has still the raw materials of its clay and glazing. In fact, as you penetrate the stuff of that vase, you'll 'go down' to molecules and then atoms and then electrons and protons and neutrons and then various sorts of entities which behave very much like 'collapse points' of 'quantum waves'<sup>1</sup>. Fields are very abstract already though, for all we know, there might be many levels of abstraction to go before we reach the stuff of God's initial acts of creating from nothingness. Even if you find physics and mathematics to be an alien form of thought, go and browse through a serious book on modern theories of gravity or quantum mechanics or a mixed field of study such as a reliable account of the early seconds of this expansionary phase of the universe. All those equations are not so much descriptions of objects we can touch so much as they are the objects themselves, abstract and beyond direct sensing by eyes or ears or fingertips.

The thing is shaped from more abstract forms of being, just as the vase

---

<sup>1</sup>I use the scare-quotes only because there is great uncertainty amongst physicists, mathematicians, philosophers, and others as to the best way to understand what happens when the fully deterministic entity described by the quantum wave disappears or something and something concrete appears, the something concrete being describable as a photon or something else. Quantum mechanics is currently both vague in its understanding and remarkably precise and accurate in its quantitative manipulations respectively

is shaped from its raw materials, and the abstract forms remain part of the thing just as the clay remains part of the vase. There are multiple levels of thing-like being within a human being – cells and then DNA and various minerals and biochemicals and then oxygen and carbon and then protons and electrons and then electroweak fields and quarks and so on to some very hypothetical levels of being of the sort studied by theoretical physicists. Once again, we explore more deeply into the stuff of a man and find fields which seem more akin to mathematical ideas than to earth and fire and wind and air.

My contention is that we should take this seriously, this spectrum of being ranging from highly abstract to highly particular. At the same time, I'd like to expand this idea beyond the aspects of being studied by mathematicians and physicists and all sorts of physical scientists and engineers.

Modern men, including Christians who are bound to pay attention to God in His acts as Creator, have been quite reluctant to do much with these richer ideas of being. We accept the medical and other technological benefits of these enriched ideas but we refuse to restate our understanding of Creation in terms which make sense in light of modern empirical knowledge. At the very least, we need to construct new narratives of Creation, of the human race, of ourselves as members of various peoples and as members of the Body of Christ, of ourselves as individuals. Many can and should play a role in this building of such narratives, including scientists outside of their 9-5 roles as reductionists, but historians and fiction-writers and poets and musicians and movie-makers and visual artists can play a special role. They can speak the truth, a truth which merges particular and concrete things which are true with abstract truths which are thing-like.

More generally, we need to move into a new phase of Western Civilization or into the start of one or more successor civilizations. There have been some who have dared to head off into regions opened up by the modern and richer understandings of created being, but its remarkable, at least to me, how little respect that effort has received in general. True it is that both the works of genius and also the obscene jokes played on collectors by Picasso are worth sometimes tens of millions of dollars at auctions, as are the works of van Gogh with his better-defined, seemingly sophisticated experiments in perception, especially color perception. Mahler and Stravinsky wrote various experimental works, often despised when first played but now part of the standard repertoire of symphonic music. The same was true of Beethoven – we forget how much he redefined music beyond the standard

understandings and we know only from sparse comments in his journals that he was engaged in a radical expansion of music at the time of his death. Literature? Well, traditional story-tellers, such as Tolstoy and George Eliot have produced great works and the best of the works of those particular authors have used traditional narrative techniques to deal with the modern world. There were also those who tried to expand the boundaries of human perception and understanding, creating narratives which take a substantial intellectual effort to follow because those narratives follow events – at least sometimes – at the abstract levels of being, perhaps by such ‘simple’ tricks as treating pieces of a concrete narration as words in a more abstract narrative. I can certainly mention in this context Cervantes (way back), Sterne, Melville, and numerous poets such as Pound and Cummings and T.S. Eliot.

Visual artists of the 19th and early 20th century seemed to be ahead of brain scientists in realizing that human vision isn’t unitary. As it turns out, our eyes deal with an object’s shape, movement, and color separately and our brains put together the more complete view of that object in a way that still baffles scientists so far as I know. (The interested reader can pursue this topic beginning with the scientific discussion in *A Vision of the Brain* [155] by Semir Zeki or the discussion by the same author from the viewpoint of a scientist interested in art that can be found in *Inner Vision: An Exploration of Art and the Brain* [156].) To cut to the point of this particular line of insight from modern empirical knowledge:

Reality is real but human perceptions of that reality are constructed.

This doesn’t mean our perceptions are false in any way. After all, our eyes and ears have been shaped to some piece of reality, however small, by responses of our ancestors over billions of years and by our own responses to our world, however small or large. We err, perhaps greatly, when we think as if our eyes were merely transparent panes of glass, letting some direct image of reality into our heads where resides a mind formed independently of the world around it.

Over time, men have moved to ever richer and more complete understandings of created being and of what I would call narrative realms in Creation, but not everyone has yet gotten the message. Every electron, every grain of sand or sand-flea, every human being or galaxy, has many components – use this term cautiously, each of those components as well as

the entity in its entirety have abstract aspects as well as concrete aspects. The things of this world are not objects separable from but describable by mathematical truths nor are they imperfect images of things existing in some realm of the Real. A thing is the node in a complex network of various sorts of abstract being joining in a particular thing. And those nodes in their turn join to form more complex and more concrete things.

At the very least, we need artistic visions which deal, perhaps playfully, with the full spectrum of aspects of created being, including those we call 'abstract'. We need van Goghs to give us new insights into human color vision, Picassos to question the way we see shapes and to even question the dimensions in which those shapes are set. I've already gone past my knowledge of painting and I want my words to be taken as suggestions optimistic as to what we can learn from those who somehow access the raw components of human vision and those who can consciously think through their own perception of colors or shapes or movements. I'm sure similar statements can be made about modern music, but I'll pass by that topic for now as my formal knowledge of music is also as slender as one would expect from a product of the American educational system. But I also believe that the greatest need we have is for poets and writers and philosophers who can speak of the entirety of being, in its more abstract and more concrete aspects.

That's the thrust of my efforts in writing creative fiction, efforts which began well before I tried my hand at theology or philosophy and, in fact, well before I could have stated my worldview in explicit terms or was even aware I'd developed such a strange beast. The world has been for me something of a marvelous mystery containing a multitude of mysteries. I had neither a reductionistic nor an occultist attitude towards these mysteries. I think that, by behavior if not by conscious thought, I had always an attitude of acceptance of reality, to the point where I wasn't aggressive enough in querying that reality in a way proper for someone with some intellectual talent and a small bent towards mathematics and physics. Yet, if I've followed a strange and slow path of intellectual development, in this country where development of the mind has not much been encouraged, I did seem to implicitly realize from a fairly young age that the problem with mysteries is not that they need to be reduced, though some mysteries can be reduced in a useful and truthful way. Nor are those mysteries to be simply accepted as occultist or as supernatural in the sense of beyond man's reach. I'm speaking here of mysteries which involve created beings and not of the

revealed mysteries of God's own Being and His transcendental life. Mysteries of Creation are, in principle, within the reach of the human mind though actual, individual human minds are too weak to grasp all of Creation and likely too weak to deal with some of the more profound mysteries of our world and the other realms of Creation.

And, yet, there's something to be done with mysteries, at least by those called to ponder them as interesting objects of study as well as sources of wonder, the more serious sorts of poets and novelists and various artists as well as philosophers and scientists of a philosophical bent. We can do what the human being has to do, well or badly, just to survive in this life: we can respond by shaping our minds to the reality which confronts us. We explore and we test and we try to find ways to speak about what we find, or think we find. In doing so, we better shape our minds that they might be able to form statements about Creation and its various processes and relationships – in ordinary words or the words or formalisms of mathematics and other specialized sciences. We tune our minds to correspond more closely to the world, to all of Creation, as we can know it during our age and within our culture.

This is to say we accept reality and shape our thoughts correspondingly rather than trying to reduce reality to rules which allegedly are given to the human mind independently of the mundane reality around us, independently of the experience which shaped the human race over the eons and individuals humans over their lifetimes. We don't live in our heads, inhabiting some sort of mental space equipped with all the tools to understand whatever it encounters. Our minds are our encapsulation of the environments around us, or the entire world, or even the entirety of Creation.

Mathematicians deal with the mystery of infinity by shaping their minds so that different sizes of infinity are part of those minds and the tools to deal with various sorts of numbers, including transfinite numbers larger than ordinary infinity, are part of the furnishings of those minds. Physicists deal with quantum mechanics not by thinking in terms of the common sense developed in our apish ancestors as they hunted mammoths or tamed wild ox; rather do they reshape their minds to correspond with the reality they confront when they explore different regions or levels of being than those our pre-modern ancestors knew about. The paradoxes of modern mathematics and physics aren't the result of conflicts between reality and some sort of pure reasoning but rather a conflict between reality and a mind shaped to an inadequate understanding of reality, an understanding not sufficiently

large and rich.

The truths of art are certainly more fuzzy than those of mathematics and the physical sciences, often more fuzzy than even the truths of history, but they are truths. The truths of art overlap with those of mathematics. After all, art speaks of created being though not necessarily of perceptible, concrete being. Then again, the same is true of mathematics and physics. We don't see by way of our eyes those abstract objects bundled with relationships which mathematicians call 'groups', but a trained mind can see them in an intellectual sense in some of the behavior of atomic particles and of the entities described by quantum mechanics, and by many other entities in Creation. I've never seen even ordinary infinity let alone any of the still larger infinities. I've never run my hands along a curvature in spacetime and can't even separate, by touch, space from the objects it holds. I can't separate my perception of colors from that of shapes and movements and hope I never can in this life – it's the sign of something going very wrong in a human visual system. It's hard to say if he had a mild problem with his visual system or simply had remarkable insight into the ways of his own eyes, optic nerves, and brain, but van Gogh showed us hints of color vision without shape and without movement and he also had some emotional and mental problems at various times of his life. His unique insights and his problems might have been tied together – problems with his brain might have allowed him to be both a great artist and also a Christian with a deep devotion bearing some resemblance to that of some of the disturbed saints of Christian history. In any case, van Gogh and Einstein both had to use well-developed imaginations to do their work. Those imaginations strayed from the beliefs of the men of their time, but strayed so that they had a richer view of created being.

The main point I'd like to drive towards is that abstractions in art are not only allowable but actually necessary if men are to explore and understand truth. I don't know enough to judge Picasso's works, but I can say this:

If there is any truth in modern theories of infinity and randomness, any in quantum mechanics and Einstein's theories of relativity, then something like Picasso's approach is necessary for artists to speak truth to modern man, though there's a sense in which there are as yet few modern men. If there is any truth to modern discoveries of the workings of the human visual system,

then van Gogh saw certain truths about the fragmentation of what is seen into color and shape and movement before scientists generally did.

I don't wish to claim van Gogh was a prophet of brain science but I do wish to claim he was speaking a truth not perceived by most other men even when he presented his work to men sure they saw the world about them in its truth and completeness. That crazy and charitable genius somehow knew something about how we construct our color-vision of the world.

This isn't to say that all abstractions in art are true, just as it's certainly not the case that all abstractions in mathematics and physics are true. Some abstractions are so false from the beginning as to be beyond consideration by rational men and others prove to be inconsistent with what's known or becomes known about Creation in all the realms and levels accessible to the human mind.

But the arts speak the truth about Creation and created being only when they deal with the completeness of that Creation and created being. This doesn't mean that all works of art, including literature, have to be exotic and difficult to understand. It does mean that modern man has a greatly expanded and enriched knowledge of Creation and created being and that knowledge is not well-contained in the forms of art and literature we've received from our ancestors. Modern empirical knowledge has added substance to our knowledge. The modern fields of empirical knowledge-gathering and analysis aren't just collections of recipes that allow pre-existing human minds to simply absorb knowledge as if it were marks on a ledger. The fact that human beings are a unique species of ape, descended from apes rather than a special creation of God or the gods, most certainly has some bearing upon our understanding of Creation and of human nature. The disconcerting facts being amassed by modern brain scientists give strong testimony that human thoughts and feelings are so tightly tied to physical events in the human body – mostly the brain – as to make talk of immaterial minds and souls far more than a bit questionable. This certainly has a bearing on our ways of speaking about human beings.

I'm going to end by referring to my novel, *A Man for Every Purpose* [37], which is the story of a man, well-educated and intelligent, who fails to properly shape his mind to his knowledge of both traditional truths and modern empirical knowledge. This novel was written five years or so before my philosophical beliefs took an explicit form but it deals with the problems

of a world where the fragmentation of knowledge of Creation into realms has resulted in human beings acting as if realms of knowledge correspond to different realms of created being.

We need to see Creation in a more unified way to restore our sanity, moral as well as cognitive.

## 596 The Never-ending Project

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=667>. It was finished and uploaded on 2010/07/26.]

I'm more often writing on some aspects of politics and the history of government which interest me and doing so in terms of my concepts of created being. I'll concentrate on American politics and will cover some interesting phenomena often seen as indicative of conspiracies. These articles will reflect both some of my reading of authoritative histories and also my take on ongoing events. I'm not putting myself forward as an expert in these fields but I'm trying to develop ways of describing and analyzing complex real-world entities which have both concrete and abstract aspects and I'm looking for interesting aspects of human moral life to provide specific descriptive problems. There seem to be a variety of such aspects to be had in studying and contemplating what seems to be an ongoing political breakdown in the modern West, and, in particular, a somewhat florid development of problems present in American politics from the founding of the United States. These problems often present themselves in the guise of conspiracies to many concerned people, because of a lack of understanding of what was possible and what actually happened in American history. To anticipate a little: when the world grows increasingly complex and most human beings insist on seeing that world in simple terms which were probably wrong to start with, reality begins to look very strange – we're looking at reality through lenses which attempt to tame that complex mess but end up distorting it all the more.

Again will I remind my readers that I consider concrete being to be shaped from more abstract forms of being but I also consider concrete entities, such as a human animal, to contain yet the various forms of abstract being which come together to form a complex concrete entity. A man is,

in a manner of speaking, frozen soul and the soul remains in all its phases even if the dominant phase of a human animal at birth is ice.

If created being comes from one set of truths manifested by God on the other side of the Big Bang – so to speak – then we can enrich our understanding of man, even in his moral and political aspects, by applying to our study of human nature what's been learned in modern physics and mathematics, as well as other fields of empirical study. But the previous sentence will produce a distorted view of my intentions in most minds just because we have the false idea that there are different, incompatible sorts of (vaguely defined) being and, separately, some forms of abstract truths which correspond to human fields of study. And so it is that I'm struggling to find good ways to talk about these issues. This struggle has quietly and contemplatively increased in recent months as I've been trying to find the time to write a summary work (possibly multiple volumes) on my worldview and also have been reformatting two ten year-old novels which deal with many of these issues. I plan to publish these novels on the Internet, perhaps one within a month or so. In fact, I've been thinking I might turn my dwindling, middle-aged energies towards works of fiction because rereading these older novels has convinced me that I worked out many of my ideas by writing the sorts of moral narratives I wish to deal with in these writings on politics.

Moral narratives are appropriate for exploring the nature of man, who is, after all, a physical creature. To my way of understanding Creation, physical creatures are (ultimately) shaped from the truths God manifested for His Creation and still 'carry' those truths in their very flesh and blood. Consequently, we can come to better understand man, and other creatures, by coming to better understand some mathematically describable aspects of created being, including that fundamental creature: spacetime. Human experience indicates that mathematics, while not capable of describing the totality of created being, is sometimes capable of leading the way towards new ways of describing that totality.

However we get to a more complete description, the various ways in which we understand men and stars have to come together in some sort of narrative of Creation and that narrative has sub-stories such as that of man responding to God's revelation as carried in the Bible and also God's revelations as carried in the workings and stuff of His Creation as accessible to the human senses and mind. If I succeed in any substantial way in this task, that success will be found in the entirety of my writings, novels as

well as books and articles on philosophical or theological matters.

What we need to provide intellectual foundations for a new phase of human civilization is to re-imagine, from the bottom-up, the meaning of Creation and the role played by human beings in Creation. I can point to a philosophical/theological work with a similar goal: *Summa Contra Gentiles* by St. Thomas Aquinas. That work was likely intended to present the beliefs of Christians to Muslim and Jewish scholars in such a way that they could see that Christian thought is consistent with the rationality of Creation as seen by the human eye and understood by the human mind. The goal of Aquinas was to show that Christian revelation could be reached in that bottom-up way, not as a lock-tight logical proof, but as a ‘proof’ in the older sense: a testing of coherence and consistency. He seems to have set out to work in the other direction, from an understanding of God developed from the Bible, in his other major work, *Summa Theologicae*.

Man is part of that Creation which is a particular work of God and reflects decisions which could have been otherwise. God could have brought into being not only a different Creation but even a different intelligent, God-seeking race in a Creation and a universe much like ours. The human race might have been an apish race with somewhat different characteristics. Speaking of just one characteristic: human beings have different tendencies towards being individuals vs. social beings. As a race, we could have had more of a leaning towards individualism or more towards social bonding; as individuals, we have a mix of inclinations of that sort. The particular range we occupy in this individual-social spectrum and the particular statistical spread of individuals over that spectrum are empirical matters. Men could have been different, in this aspect and others, but we are what we are, largely as a result of the hundreds of millions of years of evolution of living creatures on earth. More than that, we are what we are because of the characteristics of spacetime in our world, because of the properties of matter and fields, because of abstract mathematical truths, and so forth. We are creatures shaped from and shaped in response to the various sorts of being, abstract and concrete, in Creation.

There are two extremes that most thinkers fall into when they have stumbled into some vague understanding of the nature of being. Some, you might call them reductionists, think that all properties of more complex beings can be derived, in principle, by accumulating layers of more complex and complicated assemblages of the basic things – whatever they might be. Some, usually they take the form of dualists or more extreme preachers of

multiple forms of incompatible being, think that a man is so different from a puddle of the chemicals that compose his body that surely he becomes a man because something thoroughly different from physical being is accidentally attached to his flesh and blood.

Can a man be explained by understanding the various ways of assembling that puddle of chemicals? Can a man be explained by separating his bodily responses from his spiritual or moral responses?

Is there another way? Let me propose that we can build another way of viewing created being, including human nature, by borrowing three major insights from modern empirical science:

1. Concrete stuff, by which I presently mean matter and energy and fields and spacetime, seems to have been shaped from some more abstract stuff. So far as quantitative aspects of concrete being goes, this implies some serious truth in the radical version of Pythagoras' claim that stuff is made of number. Not "describable by number", but "made of number". For now, I'll only say there are more aspects to concrete being than those which can be measured or even described by qualitative mathematical methods and I'm contemplatively playing around with ways of describing the multiple 'flows' of abstract being into concrete forms but I'm not yet ready to describe a good way of viewing this 'flow'.
2. Relationships are primary and bring substances into existence. See Chapter 156, *A Christian view of Einstein's and Bohr's debate on the meaning of reality* for a short discussion of the issue. This insight might well prove to be the same as the first.
3. At the top-level, the universe can be seen as a narrative, morally well-ordered in my opinion. Moving downward, classes or species of complex entities evolve, perhaps over time-spans which are immense by human standards, and individual complex entities develop over their lifetimes. This points to the possibility that human moral relationships, including political relationships, are products of evolution and are not derivable from metaphysical systems of thought – unless those systems are constructed to include the evolutionary aspects of human relationships.

What is is. Our job as human thinkers is to accept what is, as best we can determine from the available human knowledge, and to understand what is by creating proper words and concepts and molding them into proper structures of thought. We can then follow our Creator by using those words and concepts and intellectual structures to tell proper stories in imitation of His acts-of-being or acts of creation.

Specifically, if we are to understand human moral nature, human political activities, etc., we need to take account of the three characteristics of created being I listed above – and maybe some more – and to start shaping our minds to created being as it is and not as Hobbes or Plato thought it to be, or Hamilton or Jefferson or Lincoln for that matter. The greatest of these thinkers, certainly Plato, understood much about the metaphysical problems I'm tackling though pre-modern thinkers were missing the very interesting insights to be gained from modern empirical knowledge.

This will involve a great deal of work over more than one lifetime and will, in fact, produce along the way the possibility of educated men and women in future generations who possess wide learning and deep culture in such a self-shaping way that they will be very similar to the liberal thinkers of traditional Western civilization though having a library including Einstein, Cantor, Pelikan, Kafka, and other modern thinkers who've contributed to a great, but still largely potential, enrichment of our understanding of Creation.

We should also realize that the very process of creating a greater system of knowledge from the totality of human traditional and modern knowledge will itself open up new possibilities for human moral life, including our lives as members of societies and as citizens of political communities.

# 597 Man Was Made to Glorify God

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=695>. It was finished and uploaded on 2010/09/20.]

Man was made to glorify God.

So goes the claim in an antiphon somewhere in the *Christian Book of Prayer* (one-volume version of the liturgy of hours, Catholic version).

This statement points to a great truth for sure, but we have to understand that all truths, even the greatest of truths revealed by God are spoken in human language and are interpreted by those who read or hear according not only to the meaning of individual words but according to human concepts.

What means 'made'? I'll answer from a Biblical standpoint.

God is a story-teller.

He tells a story by shaping landscapes and characters from stuff He made in a different way. We should always keep in mind that God's creation of the stuff from which He shaped this world is one sort of act-of-being and His shaping of that stuff into a particular world and into that world's stars and butterflies and used-car salesmen is another sort of act-of-being.

We have to avoid confusing the two sorts of creative act, that which brought into being from nothing the basic stuff of Creation and that which brought into being a world and its entities.

We Christians, and many others, believe God made man, but modern empirical knowledge indicates that the Almighty made man by processes corresponding to those in the Biblical narratives which describe God's shaping of the People of Israel. He made man by shaping Him through the

events of this world. We should respect the Creator and the ways in which He works and if those ways don't meet our standards, we should question our standards rather than trying to force our ideas upon the world.

As always, we should do as St. Thomas Aquinas advised [3]:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures He made...

This raises difficult questions, such as: was there a first human being and, if so, what were his parents? Such a question is best ignored after contemplating it for a while, but it leads to a whole series of questions about human nature and its moral aspects, about the incoherence which lies under the word 'person' as generally used. We begin to question free-will and see the need to radically revise our understanding of sin to retain the connotation of 'separation from God and His Creation' but to allow for all that we know of evolution and genetics and the brain sciences. We even need to see that some suffer that separation because of the events caused by God's chosen acts of shaping men and their environments. Over many centuries, we've been forced to see that disease is caused by microbes and nutritional deficiencies and genetic problems. We've been forced to see that volcanoes and earthquakes are caused by the same movements of the earth which give us fertile soils and harbors both useful and beautiful. Now, we're struggling against the realization that even serious sexual sins can be at least partially caused by genetic problems.

There is much effort being put into various revisions of our incomplete or impoverished understandings of Creation, but such revisions aren't good enough. We need to return to fundamentals, to realize that our Christian ancestors understood the most important of all empirical truths when they chanted, "Man was made to glorify God," – that God is the source of created being, but to also realize that they had radically inadequate or even incorrect understandings of the divine acts pointed at by the word 'made'.

Those who wish to understand why I think we should glorify God can download the short article: *Justice: The First Step Towards God* found at <http://loydfueston.com/downloads/justice.pdf>.

# 598 Reading the Bible as God's Word and not as Human Words

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=718>. It was finished and uploaded on 2010/11/05.]

What's infallible and absolutely true is what God said to Moses and St. Paul, not what they said to us and certainly not what they said to us as filtered through human interpreters and human commentators.

# 599 Flannery O'Connor Was a Pretty Good Thomistic Philosopher

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=723>. It was finished and uploaded on 2010/11/05.]

From a letter in the Library of America collection of Flannery O'Connor's works (page 953):

To see Christ as God and man is probably no more difficult today than it has always been, even if today there seem to be more reasons to doubt. For you it may be a matter of not being able to accept what you call a suspension of the laws of the flesh and the physical, but for my part I think that when I know what the laws of the flesh and the physical really are, then I will know what God is. We know them as we see them, not as God sees them. For me it is the virgin birth, the Incarnation, the resurrection which are the true laws of the flesh and the physical. Death, decay, destruction are the suspension of those laws. I am always astonished at the emphasis the Church puts on the body. It is not the soul she says that will rise but the body, glorified. I have always thought that purity was the most mysterious of the virtues, but it occurs to me that it would never have entered the human consciousness to conceive of purity if we were not to look forward to a resurrection of the body, which will be flesh and spirit united in peace, in the way they were in Christ. The resurrection of Christ seems the high point in the law of nature.

It's nice to occasionally run into a modern thinker who gives us thoughts worth commenting upon. Miss O'Connor hit the nail on the head though she bent it a little. Maybe I've bent that nail a little less. In any case, I'll assume so and will give some corrections to her wording of some good insights. Miss O'Connor does have an earthier way of expressing matters than I do. And I should acknowledge that she wrote the above passage when she was about 20 years younger than I currently am and without having enough background in modern sciences to realize how good a foundation Thomistic principles (though not all his use of those principles) can provide for understanding modern empirical knowledge. I'll move on to some specific comments about Miss O'Connor's words:

She's right that:

To see Christ as God and man is probably no more difficult today than it has always been, even if today there seem to be more reasons to doubt.

Yet, we should be careful to go from "reasons to doubt" to the difficulty of believing a hard truth. A reason to doubt is but one side of the coin. On the other side lies a question which has risen which allows for an enrichment and deepening of human knowledge. There are no guarantees our faith will survive even if we have the courage and the simple child-like curiosity to pursue that question, but we refuse to be images of God when we willfully turn away from these questions under the delusion that we protect our faith in the true God by refusing to adapt our inherited traditions to new knowledge of God's work as Creator. If we have the courage and the faith in the Creator that allows us to honestly address these reasons for doubt – not just by repeating old answers, we will find better reasons to believe than earlier generations had.

In knowing the true laws of the flesh and the physical, we don't know what God is in His transcendence, His necessary Being, but we do know what thoughts He manifested in bringing this particular Creation into being. We do know the role that God chose to play and even the limitations He voluntarily took upon Himself in order to play that specific role in a highly peculiar Creation.

I try to reserve the term 'spirit' for writing or speaking about our direct and conscious relationship to God. In place of Miss O'Connor's words, "flesh and spirit united in peace," I would write instead, something like:

“flesh resurrected in a form where it has spiritual characteristics.” Still better is my occasional claim that we can speak of body as being frozen soul. In the world of the resurrected, our bodies will be unfrozen and no longer subject to the decay found in a cooling universe.

So far as I know, Miss O’Connor read regularly in the *Summa Theologicae* of Aquinas but had no access to the work I recommend to those wishing to see his basic insights in a less systematic but easier to understand form – his *Commentary on 1 Corinthians* [3], where he gives us the following two bits of advice:

J ust as a disciple reaches an understanding of the teacher’s wisdom by the words he hears from him, so man can reach an understanding of God’s wisdom by examining the creatures He made. . .

T he wisdom which attains to God through the things of this world is not the wisdom of this world [in the sense denounced by St. Paul] but the wisdom of God. . .

Georgia farm-girl she was, but quite capable of penetrating the Medieval style of Aquinas to realize he was a better empiricist than nearly any modern scientist or historian or Biblical scholar. I would even say she’s the best I know of at teaching Thomism and a coherently empirical view of Creation to those of a more literary than technical cast of mind. At least I think she would be if, for example, Catholic teachers realized she teaches hard truths unsoftened by human sentimentality and affectations of concern about “man’s inhumanity to man” or of worries about “bad things happening to good people.” More than that, her willingness to see the comedy (classical sense and not *Three Stooges* sense) in a harsh world can appeal even to those who do enjoy studying technical knowledge.

# 600 The Promise and Comedy of Modernity

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=727>. It was finished and uploaded on 2010/11/09.]

See <http://chiesa.espresso.repubblica.it/articolo/1345475?eng=y> for a discussion of Pope Benedict's speech on 2010/11/07 during his pilgrimage to Santiago de Compostela in Spain. For those who've not heard of this place, it's said by some to be the burial site of St. James the Apostle, brother of St. John the Apostle. The traditions are too recent, Medieval Age, to be considered authoritative, yet, much good and no bad to my knowledge has come from the pilgrimages to this site. It is, in fact, one of the few pilgrimage sites which would draw me if I were a world-traveler.

During that pilgrimage, Pope Benedict stopped off in Barcelona to see the "basilica of the Sagrada Família, a masterpiece by Antoni Gaudí" and to consecrate this recently completed church. As I understand it, this basilica was designed in an apparently successful effort to use what might be labeled the 'modern viewpoint' to artistically manifest Christian truths. I applaud such efforts which run parallel to my similar efforts in metaphysics and literature, and – soon enough – theology since those trained as Christian theologians seem determined to go to their graves without having the courage and faith to serve God by engaging reality in a creative, courageous, and faith-filled way.

The bloodless pagans seem dominant in the modern age. They have diverted streams of the modern projects and have ridden upon the floodwaters in a way that can perhaps be seen as tragic, though I think one reason they're so bloodless is that they're no more than ex-Christians, at

least in a cultural sense. It's a sad fate to be defined by what your ancestors were and what you don't wish to be, but men of the modern West show no real aptitude for any sort of vigorous paganism, only for non-Christianity, a sort of nullity.

As ex-Christians, they fall into the realm of Christian comedy rather than pagan tragedy – Christianity knows of tragedy only from the outside since we're always free to choose Christ and, hence, a good end. Whatever might be the case with pagans, the modern phase of the Christian comedy has become a farce, played out by those who strive to remain Christians by remaining true to traditional human encapsulations of “the book of nature, the book of sacred Scripture and the book of the liturgy” as Pope Benedict termed these forms of human knowledge of God's Creation. These Christians live behind ghetto walls refusing to look at the huge amount of material our age has added to that “book of nature” and to our understanding of at least the history of “the book of sacred Scripture” and the history of the “book of liturgy.”

If we are to rebuild a Christian civilization in the West, we don't need hand-waving claims that religion and science aren't incompatible, nor do we need more groups of poorly educated Christians discussing the Bible in self-affirming terms, nor do we need more smiles and more mobs of laymen at the altars. What we need are Christians willing to walk the walk, to expend sweat and time studying “the book of nature, the book of sacred Scripture and the book of the liturgy.” We need new understandings of Creation in the form of new thought, new art, new ways of praising God – all of which activities would be very demanding upon our soft and underdeveloped minds and moral natures. We need most of all to develop these understandings and to use them to build a new Christian civilization on top of the ruins of the civilization we've allowed to decay by our sheer laziness and moral irresponsibility.

It's a bittersweet comedy that we modern Christians are acting out, a comedy in which we're offered always a good end which lies in another world but bittersweet to our perspectives because we fail to play our roles, fail to respond properly to Creation. By not responding properly to Creation, we also fail to respond properly to God. And that will have consequences of some sort.

# 601 The False Promises of the American Dream

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=733>. It was finished and uploaded on 2010/11/10.]

We Americans should feel ashamed of the mess we've made of a potentially great country, but: Do we Americans even feel shame? Solzhenitsyn said, "No," and labeled us a uniquely evil people as he prepared to return to what was still the Soviet Union. He didn't believe we were particularly evil in the number or magnitude of our crimes, compared to other powerful peoples of the modern world, but he saw in us a self-righteousness and ability to delude ourselves that kept us pure in our own eyes even as we walked away from our crimes. This wasn't exactly a shot out of the blue, though Solzhenitsyn had himself been fooled to nearly the end of his time in the United States into thinking Americans to correspond, at least approximately, to our own high opinions of ourselves. See a relatively early article I posted: Chapter 348, *My Ends are Mad and Now I'm Also Stupid*, where the title plays off the claim of Captain Ahab in *Moby Dick*:

My means are sane, it is my ends which are mad.

In fact, Ahab, a courageous example of an American type if not all Americans, was a man at war with Creation, deserting a young wife and their baby to return to the sea, disdaining human society, striving to destroy that in nature and human society which constrained him or prevented him from being what he wished to be and from doing what he wished to do. Over-estimating his own importance in the general scheme of things, he took personally all that he suffered at the hands of nature.

As Melville saw things even before the War Between the States, there was already a streak of moral insanity in the American character, refusing to accept the world as God had made it. Cowards that we are, we don't engage in direct and open rebellion as did Captain Ahab. We act as if the world is what we wish it to be. And we were blessed and cursed by a remarkable run of successes which allowed us to act as if it were our right to be prosperous and powerful in a world made for us. The world truly is what we wish it to be and not what it was said to be by the likes of Isaiah and St. John the Baptist.

Then again, it might well be that our streak of luck has ended and we're about to suffer instead from our tendency towards moral insanity and our increasing stupidity as shown by our growing incompetence in maintaining the former pride of the United States – the American infrastructure from transportation systems to sewer systems. I'll also mention in passing our inability to win wars though we have the most expensively equipped and trained military in history. Best or most powerful military in history? The results of wars from Korea to Afghanistan indicate it's more accurate to say "most expensive" rather than "best".

And, yet, we think we are a special people of God, an exceptional people who are truly what we feel ourselves to be. I know many who are aware of their personal weakness and sinfulness and yet, in their roles as American citizens, feel themselves to be part of a nation which can do little wrong if any at all and can even reshape the world to be a realm of democracy and justice and prosperity. More generally, we don't see any need to respond to Creation, knowing in our American hearts that we're already what God intended men and women to be, knowing in our American hearts that the world is what we believe it to be, though it might need a little tweaking. For a century or more, we've talked and acted as if the American Way is the path to Heaven and this very delusion that we're already God's blessed and chosen people relieves us of the responsibility of examining our actions as a people, of responding to Creation and becoming the best we might be.

We saw what what seemed to be in our grasp, a leadership role for the United States as the core regions of Western Civilization aged and lost some energy, but we simply assumed that we were already prepared for that role as a 13 year-old might assume he's already prepared to take on the role of family head. We assumed we could lead the world into a better future by just being what we already were.

Let me back up to note a point raised by the historian Carrol Quigley in

*The Evolution of Civilizations: An Introduction to Historical Analysis* [119]:

When troubled or aging civilizations are re-energized, sometimes a revival of some sort will occur in a younger region of that civilization. Sometimes one or more of those younger regions will even mature into a center for a new phase of that decayed civilization.

The United States had grown prosperous on abundant natural resources and the various cultural resources which flowed from Europe and the American people had the opportunity and duty to take on a leadership role in reviving the West. Instead, we – as was said more than a century ago – passed directly from barbarism to decadence without ever passing through a state of civilization in between. We failed to do our duty to ourselves, to our children, to the Christian West. Most of all, we failed to do our duty to the God we claim as our Maker and King. We're unfaithful, cowardly, miserably poor servants. Not only have we Americans, as a nation, shown an excessive concern for our own safety and wealth, we've also shown a rather shocking desire to demonstrate our toughness by stomping on the faces of human beings mostly defenseless against us, at least in the short-run.

Yet, I think an unlikely event to be still possible: God may yet force Americans to develop the virtues we've chosen not to develop on our own however much we claim them. If so, it will be a painful process, probably far more painful and also more humiliating than the simple collapse into relative poverty and relative powerlessness that seems to be the fate of Americans as a people. We'll have to shed our illusions and delusions, our willful and culpable ignorance, our self-nurtured stupidity, and face up to reality, to God's Creation.

Few would believe at this time, the end of 2010, that the American people could play much of a role in God's narrative. Certainly, it would seem as if the worldly power is bound to develop anew in two regions of ancient civilization: China and India.

And so it is that Pope Benedict recently continued to swim against the tide appealing to Europeans to revive the West, to discover new ways to read "the book of nature, the book of sacred Scripture and the book of the liturgy" and to create new forms of art and music and literature and technology, new ways of living a Christian life based upon those new readings of God's thoughts as manifested in this mortal realm. I remember

reading Joseph Ratzinger's comments about the time he was elected Pope when he noted American Christians have made as big a mess of things as their brothers in Europe and he said the Church doesn't have the resources to save American Christianity. The Church, in his opinion, would have to concentrate on saving Western Civilization, the home built by the Church for herself, in Europe.

I think Pope Benedict, Joseph Ratzinger if you prefer, is right to estimate low the possibility that the American people will summon the courage, faith, and moral integrity to save this country let alone to contribute much to any revival of Western Civilization. It would seem almost impossible at this point that we Americans can form a new center for that Civilization – we threw away that chance decades ago and perhaps even by 1900. Yet. . .

I'll do my best as a child of the American region of the West, my best to provide a literature and a way of philosophical and theological thought which can be part of the foundation of a new phase of Western Civilization, perhaps a phase in which the American people mature and play a noble role in God's narrative.

# 602 Responding to Efforts to Repaganize the West

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=752>. It was finished and uploaded on 2010/12/10.]

The issue of mythology arises in this article, <http://chiesa.espresso.repubblica.it/articolo/1345887?eng=y>, about the responses of Joseph Ratzinger (Pope Benedict XVI), and some related thinkers, to neopaganism in modern times. The article tells us:

In [the] judgment [of a philosopher supporting polytheism], man always needs myths, and the important thing is that these myths be numerous and open to infinite variations, as in ancient mythology, unlike Judaism and Christianity, which rest on unique and incontrovertible historical events.

I'd like to make two quick points. First, I'd like to give an opinion about the true nature of myths. Secondly, I'd like to comment on the refusal of most Christian thinkers to engage God's Creation in the richer and more complex terms made possible by modern empirical knowledge.

In Chapter 588, *What is Wisdom?*, I quoted with approval Garet Garret's definition of wisdom [59]:

Wisdom is the fumbling substitute for perfect knowledge.

In a similar vein, I'll provide this definition of myth:

A myth is an obscure telling of a part of the story which is our world, sometimes deliberately obscure.

As such, myth is an oft-abused tool of metaphysics and theology. It can be a useful tool. I don't use myth in my metaphysical or theological writings but that's largely because I live during a time when the major task for philosophers and theologians is to make sense of the empirical knowledge we've gathered over the past few centuries, knowledge of God's work as Creator. Plato and Nietzsche used myths extensively and I have to say that I found Nietzsche's honest critiques of decadent Christian thought to be more useful in my journey as a Christian thinker than the writings of any modern Christian thinkers but Etienne Gilson and, maybe, Flannery O'Connor. Even Joseph Ratzinger takes the backseat to Nietzsche in insight into the problems of modern Western thought which is far too often little more than a senile version of Christian thought.

Nietzsche also provides a bridge to my second point, one related to claims made by Joseph Ratzinger and Etienne Gilson. I'll not bother to separate the contributions by those two men and me.

The Christians of the West built a home for the Christian Church and that home was called Western Civilization. In recent centuries, we haven't proven ourselves worthy successors to those builders of the first 11 or so centuries of Christianity following the collapse of the Roman Empire. But 'builders' is perhaps the wrong term. A civilization is a large complex of human communities traveling through time. As such, it can be regarded as an evolving colony of organisms. In recent centuries, we haven't proven ourselves worthy successors to those men and women who nurtured Western Civilization in the 11 or so centuries following the collapse of the Roman Empire. We've wandered off to straight and narrow and level paths which lie off the paths which Christians should be traveling. Those better and more demanding paths lead us towards the home of the Body of Christ and it is on those paths that the mortal Body of Christ will form. But those better paths lead us through dangerous and harsh regions and we prefer to travel in comfort. We prefer cheap and settled answers to responding to the puzzles which the Creator continually poses to living minds. We prefer to be citizens of nations, members of churches, seen as already fully mature and ready to run the world rather than members of a developing organism which is quite immature.

As a modern Christian thinker traveling apart from the herd, I'll be blunt about those in the mainstream. They're analogous to bleached-white sepulchers. On the outside, they display regularity in structure which speaks of rigorous thinking and well-organized libraries. Inside, they're

just dead human systems of thought incompatible with the world outside of themselves. That world is God's Creation and needs to be understood in terms of the best empirical knowledge of a specific age of men before the Bible and the Creeds can make sense to the men of that age.

Joseph Ratzinger isn't guilty of this lack of responsiveness to reality but his – in a manner of speaking – entrapment in Church duties has kept him from developing his ideas. I think his way of moving Christian thought into the modern world wasn't adequately empirical, that is – adequately respectful of God's work as Creator of a particular Creation. Yet, despite Ratzinger's reputation in some circles as being a rigid traditionalist, he wanted to move forward and would have likely at least inspired students to deal with modern empirical knowledge. See Chapter 69, *Hellenistic Metaphysics is Too Small*, for my critique of one of Pope Benedict's talks on the subject of reason in the West and its Hellenistic foundations.

We the unworthy successors of Augustine and Aquinas and Galileo should be modest in criticizing the pagans of the modern world who've attempted to make sense of this world as we Christians have remained safe and secure – or so we imagine – traveling in circles on our green pastures. If we wish to have a Christian civilization, we should put on our traveling clothes and start exploring the more dangerous paths that lead to the Body of Christ.

In any case, it seems that God is now at work destroying those pastures and forcing us to move somewhere.

# 603 Seeing What Was Always Present

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=762>. It was finished and uploaded on 2011/02/05.]

When we suspect or fear that a miracle of any sort has occurred, we fool ourselves and fail to see that the miracle is nothing but an event tied closely to the always Present Whom we fail to see or to acknowledge in a proper way.

“Is nothing but...” is a funny phrase to use when talking about the Presence of God. Or is it? I’d suggest that we think strangely if we think the Creator needs to perform some sort of magic to shape the stuff of His Creation or form the relationships between entities in His Creation or to direct the events of His Creation.

I’ve started reading a collection of writings by the Jewish (Hasidic) Bible scholar and theologian Martin Buber: *On the Bible* [16]. These writings include chapters drawn from the many works of Buber – articles, studies, or lectures. The first chapter, *The Man of Today and the Jewish Bible*, asks, “the meaning [we might] find in the words that God came down in fire, to the sound of thunder and horn, to the mountain that smoked like a furnace, and spoke to His people?”

Buber proposes three possible explanations for such exotic events which are described in the Jewish Bible, also known as the Old Testament to Christians. Of course, there might be differences in the books which are included, but that’s not important for this discussion.

Buber says that the Israelites at the foot of Mount Sinai experienced a strange event – I’d even call it a theophany – which might be explained as:

- just words,

- an invasion of mortal realms by God, or
- a natural event experienced as a revelation.

I've advocated the last view in my writings and Buber seems also to prefer it. Let me elaborate on the three possibilities a little and then I'll speak a little more about my reasons for preferring that view.

- It's just words.

As Buber says, that seeming theophany could be a mere description, "figurative language used to express a 'spiritual' process[.]" In the same vein, we can speak of metaphors and allegories. I don't think the sorts of men who wrote and rewrote and redacted the Jewish Bible were likely to be so inspired by an opportunity for creative literary efforts. Nor were they likely to confuse fiction and the experience-based, if possibly distorted, stories of a people being formed by God. After all, those writers were part of that people and could see the results of often brutal historical forces.

- God might be invading our realm to show Who's the best magician of all.

It could be "the report of a *supernatural* event, one that severs the intelligible sequence of happenings we term natural by interposing something unintelligible."

Modern Christians seem predisposed to this view of God as a pagan deity who exercises dominion over a realm that lies at His feet. My fellow Catholics seem especially inclined to run around the world visiting theme-parks of a sort where the Mother of God, though not God Himself, has appeared to reaffirm our basic righteousness. We need to tune up our sinful selves, but the greatest share of the fault belongs to Satan, a view that I see as being strongly opposed to the teachings of the Biblical prophets Isaiah and Jeremiah. Could a clearheaded Christian really believe that Satan, not God, is driving history forward? I think not. I think that God is telling a story and we're trying to obstruct that great work. We feel in our hearts that we're doing as we should be doing, protecting ourselves and our understanding of God's Creation. We feel that Satan must be attacking our noble and

God-centered selves. And the Divine Magician will occasionally show Who's really Boss.

- It might be the realization that natural events are revelation.

It could be the “verbal trace of a natural event, i.e., of an event that took place in the world of the senses common to all men, and fitted into connections that the senses can perceive. But the assemblage that experienced the event experienced it as a revelation vouchsafed to them by God, and preserved it as such in the memory of generations, an enthusiastic, spontaneously formative memory. Experience undergone in this way is not self-delusion on the part of the assemblage; it is what they see, what they recognize and perceive with their reason, for natural events are the carriers of revelation, and revelation occurs when he who witnesses the event and sustains it experiences the revelation it contains.”

Of the above possibilities, the third is in line with my belief that a true revelation is an event or a moment or even a vaguely defined period of time when a prophet becomes such because his thoughts come into rhythm or synchronization with God's own thoughts. In the case of Israel gathered at the foot of Mt. Sinai, we speak of an entire people coming into rhythm or synchronization with God's own thoughts or – perhaps still more accurately – coming into synchronization with God's story, recognizing the role they were called to play and accepting that role. At least they accepted for a short while though later they rebelled, apparently thinking they deserved better from their Maker.<sup>1</sup>

We're blind to God's presence in His own Creation that lies in front of us. We go looking for brilliant flashes, which might well be real apparitions, but it's not to our credit that we need such. We're deaf to God's whispers and wish to hear the mother of His Son speak human words to admonish and encourage us. We can't think along with the thoughts God manifested in Creation and we think of too many of those thoughts as being demonic disruptions of a world intended to be some sort of Disney-managed Eden.

Blind, deaf, and stupid, we couldn't be happy in any Heaven consistent with Christian beliefs. Mark Twain once noted this to be true of Americans,

---

<sup>1</sup>The story may well be more complex and less edifying than this simple rendering. In addition, the editors and redactors who lived half a millennium after the events were themselves part of the prophetic moment.

but I think it generally true of modern peoples, even most of those who seem to be orthodox Trinitarian Christians. We prepare ourselves for a resurrection into a Heaven more like DisneyWorld than the life the Apostles enjoyed with the Son of God incarnate. We'll be what we make ourselves to be and we'll need that Disney-managed Eden to be happy. Or else, we'll need to spend a lot of time in some remedial education classroom in the entry-regions of Heaven. Heaven, as vaguely hinted in the New Testament and in the writings of great Christian thinkers, is a place of communion with God, not a place where we'll continue our preferred roles as passive spectators sitting in front of epic shows or sitting in vehicles passing through thrill-rides.

Given an understanding of the evolution of life in general and of human nature in particular, we can see what's wrong. We're creatures keyed to survival and reproduction in a world that can quickly strip us of the bare essentials of life. We're creatures who are keyed to plodding efforts occasionally interrupted by dangerous situations which must be met with bursts of energy and we seek to save energy when possible, to be relatively passive and let good things come to us if possible.

And we human beings have also a strong tendency to justify ourselves. We think we deserve the best, needs and security and luxuries, and we often don't get the best, especially those of us living at times when it would seem we've turned ourselves into flimsy obstructions to God's story. It actually takes multiple generations to reach this point but some have the bad luck to live at the time when the forces of God's story start clearing out all that obstructs the story.

We need to get ourselves in rhythm, in synchronization with that story God is telling. When we do so, we'll perceive the story and He who is telling the story. We'll know we're in the presence of God and we'll be able to start moving with God, taking on our proper roles in that story and willingly living those roles.

In principle.

In fact? The moments when we have a strong sense of God's presence, as individuals or as a gathering of God-centered people, are likely to be few and far between, and maybe so dim to creaturely vision that we can't be certain.

We aren't justified in falling back to a skeptical position which denies God's presence, either denying His existence or banishing the Almighty to some conveniently far location. Creation and its Creator should be inspira-

tions for our creative literary efforts but they can't be contained in our tiny imaginations. If we are to think independently enough to be true images of God, we sometimes need to turn from God while we grow up. If we are to be true adults, we need to turn back to God. During our mortal lives, that means turning to the presence of God the Creator in His own Creation, in the things which are our fellow creatures – living and not – and in the relationships of those creatures and in the entirety of this world and of this world we can directly perceive, if only in part.

We are most certainly not justified in falling back to a childish wish for explicit acts of magic from God, perhaps a dancing sun or perhaps the magical healing of the scars and wounds of evolution and development in this world being born. God may cause such events, but we should be careful about needing such evidence and careful about rendering our faith dependent upon miracles. And we should be careful not to bet our faith on what might not be truly a sign of God's special presence.

Though there are some with a well-founded but simple faith, a properly skeptical attitude can be good. Though the Christian Church, however defined, needs sophisticated believers who can move with faith intact across the best of modern knowledge in a variety of fields, a child-like anticipation of God's acts of revealing His presence can also be good. That skeptical attitude and that child-like anticipation both need to be set into the context of a spiritually and intellectually and morally mature search for the truth, a search conducted with faith and hope and love. That search must be for the story God is telling, a story which emerges to our vision in only a very obscure manner. It must not be a search for truths to be used in a schematic way to prove or disprove God's existence nor must it be a search for a God who is oddly enough coming to rescue us from the story He Himself is telling.

Moreover, that search is a communal search, however important might be the role of occasional prophets forced to work as lone-wolves.

The truth unfolds in time through a communal process.

When the Israelites stood at the foot of Mt. Sinai, they – as a community – experienced the story God is telling in a particularly clear way. God was present to them in a way that we can rarely accept, a way we often refuse to even acknowledge. Our blindness is not entirely to the bad since we are intended to live our mundane lives and we'd not be able to do so if we were

constantly living in the burning Presence of God. In addition, we have to remember:

It's not necessarily the case that all present at one of these moments of an intense awareness of the ever-presence of God will feel that intense awareness.

There might be some who play the role of seers, not having some sort of mystical vision, but seeing exactly what is there and has always been there – the presence of God and not miraculous events. Sometimes, a community might come into synchronization with God's story in a second-hand way – by coming into synchronization with the words of a prophet or seer in their midst or – more likely – a prophet long-dead. More typically, those who are blind to God's presence will also be deaf to the words of any prophets in their midst.

## 604 The Tree of Knowledge and Narrative Openness

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=>. It was finished and uploaded on 2011/02/12.]

In an article included in *On the Bible*, Martin Buber states that a knowledge of the language and culture of ancient Hebrews tells us that the meaning of the “good and evil” related to the tree of knowledge in Eden is “adequate awareness of the opposites latent in creation.” Apparently, the phrase “good and evil” is a way of speaking about all of those opposites. In my way of speaking, the ancient Hebrews tended to speak of abstract classes in concrete terms, using examples rather than speaking of species or classes or sets as Western man learned to do from the Greeks. “Good and evil” is one easily perceivable example of that class of opposites.

Continuing with Buber’s words:

This knowledge as the primordial possession of God and same knowledge as the magical attainment of man are worlds apart in their nature. God knows the opposites of being, which stem from His own act of creation; He encompasses them, untouched by them; He is as absolutely familiar with them as He is absolutely superior to them; He has direct intercourse with them (this is obviously the original meaning of the Hebrew verb “know”: be in direct contact with), and this in their function as the opposite poles of the world’s beings. For as such He created them – we may impute this late biblical doctrine (Isaiah 45:7) to our narrator, in its elementary form. Thus He who is above all opposites has intercourse with the opposites of good and evil that are of His own making; and something of His primordial

familiarity with them He appears, as can be gathered from the words “one of us” (Genesis 3:22), to have bestowed upon the “sons of God” (Genesis 6:2) by virtue of their share in the work of creation.

This is good stuff, what I agree with and what I disagree with.

I certainly agree with Buber that the *good and evil* isn't related to any tale of a primeval fall from a time when Adam and Eve lived in some sort of transparent communion with God. In scientific terms, the ancestors of all human beings were ape-like creatures with the brain structures which could be developed to handle abstractions, perceptual and conceptual, but those capabilities can't be developed without the proper nurturing and without the individual responding properly to his environment or environments. Once the human brain had evolved to an adequate level, it took additional millenia for human beings to develop minds capable of a more profound appreciation of *good-and-evil*.

As Buber says in a restatement of his general position:

*Good-and-evil* is the *yes-and-no* to creation.

I'm inclined to go with Buber on this issue, partly because of his deep knowledge of the language of Biblical texts and languages and the underlying history and partly because his answer has a good feel to it, as if it synchronizes well with God's thoughts as I can detect them by way of my responses to Creation, including scripture. My prior thoughts were along lines that Buber says are not supported by the sense of the language: the great event was an awakening of moral self-awareness on the part of Adam and Eve, or more prosaically, an awakening of moral self-awareness on the part of the ancestors of modern human beings, perhaps an awakening which occurred over a number of generations.

I'm not ready to renounce that theory that Adam and Eve experienced an awakening of moral self-awareness, but I'm ready to demote it to a secondary meaning – I tend to think that the Bible has multiple meanings, in particular over larger sections and in still larger groupings of sections or entire books, and those meanings might emerge over time – even if they can't be strictly supported by the language and culture which might have held in the time of the events or the time of the narrator. We must start with the primary meanings, those intended by those narrators, But we must go

beyond that in order to let Biblical revelation play its proper role in shaping our minds which are our best understanding, or image, of God's Creation.

We must develop a proper worldview as I call it, dangerously I guess because of strange uses of the term 'worldview' by recent scholars or commentators in theology and maybe other fields. My worldview is an effort to see a world, unified and coherent and complete (in its own nature), where we modern human beings see realms only loosely connected to each other – if connected at all. See Chapter 577, *The Only Sane Christian in the Modern World*, for a discussion of the need for such a worldview, at least for those who believe in an all-powerful Creator.

After verifying that our knowledge is consistent with empirical reality, we can apply a test to our understanding of that knowledge, whether a theory of gravity or an understanding of the meaning of an important story in the Bible:

Does it conduce to a narrative which helps us to see our world in its necessary unity and coherence and completeness?

So, was the so-called fall of Adam and Eve actually a discovery that God alone knows being and non-being, that: "He who is above all opposites has intercourse with the opposites of good and evil that are of His own making" and that "something of His primordial familiarity with [such primordial opposites] He appears, as can be gathered from the words 'one of us' (Genesis 3:22), to have bestowed upon the 'sons of God' (Genesis 6:2) by verdure of their share in the work of creation." A mouthful, but it rings true. It rings true to this world as we meet it and try to respond to it faithfully and courageously.

There are opposites which only God can truly know, 'being' and 'non-being' provides an obvious example. But I have a Thomistic optimism when it comes to the human mind. In principle, the human being can respond to Creation, shaping his mind to encapsulate it so fully that his mind is an image of Creation, that is, an image of the thoughts God manifested as this particular Creation which includes this still more particular world. In principle, we can know the 'good-and-evil' which is a fundamental part of this world.

We can't know 'being-and-nonbeing' nor can we know what God might have created but didn't though we can imagine a number of worlds He might have shaped from the basic stuff of this particular Creation. He shaped us

to be capable of being the image of the Creator, His own divine Self in a freely-chosen and self-limited role. It was the very act of God in freely choosing such a role that is the act of Creation, the act-of-being which is this Creation, including this particular world He shaped from some rawer stuff. For further discussions of this idea of God in a self-limited role as Creator, see

1. Chapter 574, *Proving the Existence of Zeus*,
2. Chapter 24, *Extraterrestrial Life*, or
3. Chapter 256, *Evolutionary Thomists Don't Do Ontology*.

I claim we can – in principle – know those opposites which stem from God's act of creation though we can't know all that lies on the 'other side' of that act, God Himself in His transcendence including all the thoughts He didn't manifest in Creation.

# 605 Myth and History in the Bible and Everywhere Else in Creation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=779>. It was finished and uploaded on 2011/03/01.]

[This is a somewhat freewheeling response to *Biblical Leadership* – first given as a lecture in 1928 and published as a chapter in the book *On the Bible: Eighteen Studies* [16], a collection of short writings taken from the various works of Martin Buber.]

In the essay, *Biblical Leadership*, Martin Buber states:

I believe that we are standing at the beginning of a new era in biblical studies; whereas the past era was concerned with proving that the Bible did not contain history, the coming era will succeed in demonstrating its historicity. By this I do not mean that the Bible depicts men and women and events as they were in actual history; rather do I mean that its descriptions and narratives are the organic, legitimate ways of giving an account of what existed and what happened. I have nothing against calling these narratives myths and sagas, so long as we remember that myths and sagas are essentially memories which are actually conveyed from person to person.

I'll start out with a quibble which should perhaps be directed at many who speak of historical matters. The term "actual history" is suspicious. There is no "actual history" accessible to man but only specific histories which are narrated by particular, concrete human beings. The term "actual

history" implies – at least to me – a direct knowledge of the story God is telling, in its completeness and unity and coherence. I have to confess that I also tend to misuse the word 'history', using it at times as if it denoted a direct access to the narrative which is this world, an access implying the perfect knowledge of this world which. After all, that is what we aim at, however far it lies beyond our reach. Our human beings are the right sorts of entities to shape minds to encapsulate the very thoughts God manifested in this world, but we are far too small and too weak to actually encapsulate much. We are children playing with make-believe tools in imitation, but true imitation, of our Father as He goes about His work.

But let me return to the specific topic of bible history, that is, a specific set of human renderings of human events within the story God is telling.

There are historians to be sure who specialize in finding and studying manuscripts or royal archives or other public documents which are what they are. Such documents are quite useful but they provide a limited view of a complex reality. 'Objective and true history' would necessarily be a replay of events. Judging by the general feel of his writings, I think that Buber knows quite well that history is, and has to be, a literary narrative by a human thinker who organizes material to produce that narrative. Perhaps that term "actual history" was a slip-up – I'm sure I've made many such errors. To see that the world is not quite what most men claim it to be is not sufficient to know how to speak more truly. I can understand King David's viewpoint to some extent but I don't know what it's like to dance in procession in front of the Ark of the Covenant nor do I know what it's like to move up into the woods knowing that multiple groups of competent and brutal warriors wish to kill me. Yet, my mind is totemic enough that I can sort of know these experiences. We can only weakly approximate to God's intimate way of knowing His own Creation in each and every part. Yet, we can do that and a competent historian can provide a convincing and sometimes entrancing overview of a part of God's story. So do many others, such as poets and myth-makers and those who design buildings to correspond to a particular view of the world and man's place in it.

I go along with Buber completely in having "nothing against calling these [Biblical] narratives myths and sagas, so long as we remember that myths and sagas are essentially memories which are actually conveyed from person to person." My understanding of American history has been shaped by readings of the novels of Hawthorne and Melville and dos Passos, not just by readings of the nonfiction of Nisbet and McDonald and Toucqueville

and the Founding Fathers. Moreover, I myself write novels and probably write most of my theological and philosophical works in the manner of a novelist.

History has to be founded on facts but facts alone don't give the proper narrative structure – that is, moral structure, nor are the facts of history verifiable or even fully objective in the way of measurements of the sun's radiation output. This is to say that history is an approximate rendering of a very small part of the narrative God is telling, the narrative that is the world – this universe as seen in light of God's purposes for Creation.

There is another deep problem for localized entities such as a man, one dealt with in that poorly named field of study: chaos theory. As I noted in my first published book, *To See a World in a Grain of Sand* [41]:

There's a pretty good way to generate physical events which are chaotic by some realistic and practical standard. The measurements of those events will be a stream of numbers random by some standard, sometimes quite high. You can simply put two independent systems in contact with each other and observe or measure what happens at the interface. That's all. It's a trick used in some of the simple experiments used to generate so-called chaotic motion. For example, take two pendulums with different periods of oscillation. Link the bobs of the pendulums and put one or both in motion. The two pendulums will clearly not be able to move as they would if each moved freely. In fact, the resulting motion will be chaotic, basically unpredictable. Equivalent experiments can be done with electronic components or even with simulations of the independent systems in software. There's nothing mystical involved in generating streams of physical events which are unpredictable or chaotic, generating numbers which are random by some low standard.

Chaotic motion can be visualized as an orbital path that never quite returns to the same point and is unpredictable beyond some length of time in the future or in the past. If you were to graph the orbits of such an object, and the orbiting earth is such an object, you would get a blur of orbits that lie close to each other and cross over often but no particular orbit is the same as any other. That sort of movement is patternless to human perception and measurement though usually staying

within some tight boundaries. Physicists have shown by way of demanding computer simulations that “the orbital movement of planets in the solar system is chaotic. . . which makes practically impossible any precise prediction beyond a few tens of millions of years. . .”

The early results of Professor [Jacques] Laskar’s research (his first simulations of the solar system [were carried out] in 1989) indicate that a mere 15 meter error in measurement of the earth’s current position makes it impossible to say if the earth’s orbit will be stable 100 million years from now. Because the equations of dynamics are symmetrical in time, this means it’s also impossible to prove the earth’s orbit was stable more than 100 million years in the past, with that range of ignorance moving with us so far as the future goes and also moving with us so far as the past goes. A few years later, Gerald Sussman and Jack Wisdom of MIT showed that after only 4 million years it is not possible to predict the orbit of the earth, or any of the planets of the solar system, with any confidence.

Undoubtedly, results will have been tightened up in the technical literature to which I have no access. But the principle is what’s important.

In a sense, knowledge is constantly coming into view ahead of us and constantly disappearing behind us. To be more explicit, this means that, despite common sense, we cannot prove by mathematical means that the earth stayed in its orbit 4 million years ago. So far as the equations go, with initial conditions provided by the current state of the solar system, the earth might have crashed into the sun or gone shooting past Mars 4 million years ago. Common sense sometimes tells us things that mathematics cannot.

You shouldn’t imagine that this situation occurs only at the level of planets like the earth. The sun itself is traveling a chaotic orbit around the center of the galaxy. Our galaxy, the Milky Way, is dancing around various gravitational centers of local clusters of galaxies and larger-scale clusters of galaxies.

There’s a deep and fundamental lack of determination about the

events in the universe, future events and past events alike. The strangeness of quantum mechanics does not really add much to this lack of determination, not in principle, though it's likely that it gives us a view of this looseness in reality on a different level. We're duty-bound to use this looseness in the chains of determinism to move towards God. We have a small but significant measure of physical freedom which we can use in making moral choices with some freedom.

There's a specific example of a chaotic or random stream of events that may be founded upon two interacting, independent physical systems which are largely well-determined – biological evolution. In the short-term and from the viewpoint of the individual organism, which is the entity being selected or otherwise acted upon, both genetic events and environmental events can be presented as well-determined, at least for the first stage of an analysis. The interaction of these two well-determined and independent systems produces a stream of unpredictable and under-determined events which are typically mis-labeled as 'random' by evolutionary biologists and popular science writers. Then again, they're random if we use the more recent redefinition of randomness to be factuality of a sort. They are random in the same way as the earth's orbit which doesn't quite repeat itself and is beyond the capabilities of human prediction, at least, given current understandings of what mathematics is.

Now let me state a principle that might help us move in the right direction away from the current confusion I've deliberately stirred up:

Things which exist are infinitely richer than any possible description of those things in either human language or human mathematics.

Statements and equations can only cover specific aspects of things and usually those specific aspects will not be fully covered. Even if it were possible to know a thing has only ten aspects by some system of categorization, you would have to push Humpty Dumpty off the wall to get at those aspects. An

equation describing the shell in all its surprising strength, a description of the genes in the yolk, and a philosophical discussion of the potential unity of these fragments and puddles of glop, won't get you Humpty Dumpty back again. No concrete thing can be broken up into sets of aspects which are non-overlapping but also cover the thing completely. Nor are we so good at dealing with aspects as some think. Again, it's St. Thomas Aquinas who had the better sense. While he defended the idea that the human mind could, in principle, comprehend all of this universe, he also noted that no actual human mind could fully understand so much as a flea.

The world remains a true narrative with moral purpose but also moments of uncertainty, moral and physical. To understand a man facing a moral decision is not necessarily to know what his decision will be. A man with a mind shaped to be an encapsulation of this world, or even of all Creation, doesn't know all that will happen or has happened; he only understands what he knows. Many men know much and don't understand much at all – their minds are shaped to another world than the one God created.

In a sense, we could even say that God, in His self-constrained role as Creator, has accepted a certain amount of ignorance as to the results of these moments of uncertainty. He meets us as someone who will respond to us, converse with us, as we respond to Him and converse with Him. He meets us as if He too were part of the developing world as it moves into a future free in some significant way which is difficult to even name let alone describe. The all-powerful God is the author of this world and its only true Ruler, but He meets us as a personal Lord who wishes us to return to Him, not as if our fate were already a foregone conclusion. This is the "I-thou" relationship so prominent in Buber's body of work.

So how is it that God can meet us in such a relationship when He's all-powerful and all-knowing? That's a subject worth exploring, by novelist and poet and musician as well as by theologian and philosopher and brain-scientist. See Chapter 596, *Freedom and Structure in Human Life – The Never-ending Project* for a discussion of exactly that – the impossibility of completing this project of exploring Creation, that is, the thoughts of God in His freely chosen role as Creator. That's not bad as such – exploring

Creation is one of the more interesting activities a man can take up and it might well be one of our main occupations in the world of the resurrected.

# 606 The Lines Are Further Blurred Between Flesh and Spirit

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=808>. It was finished and uploaded on 2011/04/13.]

Flannery O'Connor was a devout Catholic Christian who no mercy on those who preached what she once labeled "Pious Crap." Sometimes, that might even mean poking fun at the ways in which a truth is held or rejected. One truth she clearly held is:

The body is the temple of the Holy Ghost.

She wrote a short story titled, appropriately enough, *A Temple of the Holy Ghost*. In that story, two girls from a Catholic school, Temple One and Temple Two as they called each other, came to visit, putting on red skirts and loud blouses and lipstick as soon as they unpacked their suitcases. Soon enough, they were being courted by young fellows who sang to them:

I've got a friend in Jesus,  
He's everything to me,  
...

To which the young women responded:

Tantum ergo Sacramentum  
Veneremur Cernui,  
...

Temple One and Temple Two seemed to be doing their best to become sluts to the disgust of the slightly younger girl who seemed to be something

like Miss O'Connor. At least as she perceived herself. But the young girl wasn't disgusted for reasons of some sort of religious purity. She was simply disgusted that the two young women were...so stupid. And the two young men were also so stupid. Everyone was so stupid, some for rejecting the great truths, some for showing no understanding of what the great truths really meant.

In Chapter 599, *Flannery O'Connor Was a Pretty Good Thomistic Philosopher*, I quoted her from a letter found on page 953 of the *Library of America* collection of her writings:

To see Christ as God and man is probably no more difficult today than it has always been, even if today there seem to be more reasons to doubt. For you it may be a matter of not being able to accept what you call a suspension of the laws of the flesh and the physical, but for my part I think that when I know what the laws of the flesh and the physical really are, then I will know what God is. We know them as we see them, not as God sees them. For me it is the virgin birth, the Incarnation, the resurrection which are the true laws of the flesh and the physical. Death, decay, destruction are the suspension of those laws. I am always astonished at the emphasis the Church puts on the body. It is not the soul she says that will rise but the body, glorified. I have always thought that purity was the most mysterious of the virtues, but it occurs to me that it would never have entered the human consciousness to conceive of purity if we were not to look forward to a resurrection of the body, which will be flesh and spirit united in peace, in the way they were in Christ. The resurrection of Christ seems the high point in the law of nature.

If we "know what the laws of the flesh and the physical really are, then [we] will know what God is."

We Christians often take on the practices of disciplining the body found in the writings or traditions which come from the early Christian Fathers or from the monks of succeeding centuries, but we misinterpret them, choosing to talk and act as if we discipline the body because it's something that came from the Devil and must be beaten into submission that it not gain domination over our better, more spiritual part.

Baloney.

I should discipline my body because it is me. Other parts of me form, call them 'mind' or 'soul' if you will, as I interact with what lies around me and, by doing so, interact with He who lies deep within me as well as deep within all that lies around me.

My body is me as a moral agent. If I wish to try to save a child in danger at risk to myself, I must have a body disciplined (sometimes naturally inclined) to override its own instinctive movements towards safety or at least not into danger. If I – in particular – am to sit quietly in contemplative prayer or trying to put together a difficult scene in a novel or a complex line of philosophical thought, I must discipline my body to sit still. It won't always work, but I have to work to increase the chances of success.

We discipline our bodies, our very selves, by holding to good routines in our daily schedules. We exercise properly. We don't baby ourselves – too much – when it comes to cold or other discomforts, though we should take proper care of ourselves. We fast.

Fasting. A complex topic. The Catholic Church in this day has squishy soft standards for fasting – typically, a complete but modest meal and two smaller meals. Some exercise gurus and health experts recommend tougher standards and more often than twice a year – Ash Wednesday and Good Friday are the only fast days on the calendar of the Catholic Church as of 2011. I knew some in California who would go on regular fasts to purge their bodies of various poisons we take in with each breath and with many a bite of food. A typical diet, circa 1978 might have been a day or more of only clear liquids, such as clear vegetable broth, with maybe a day or two before or after of very light eating.

Now some scientist confirm that *Routine Periodic Fasting Is Good for Your Health, and Your Heart, Study Suggests*, see <http://www.sciencedaily.com/releases/2011/04/110403090259.htm>. Interesting, but hardly surprising and probably not established beyond reasonable doubt in the way of peer-reviewed science.

Maybe we Christians should think in these terms, that is, of our duty to God to purify the temple of the Holy Ghost. Junk builds up on those walls and floors inside.

Good for your health, and your heart. Good for your moral character, and your soul. I guess that makes fasting a pretty good thing. If only it were easier to do good things which leave us feeling uncomfortable. But that's the point of it all. To learn how to overcome the reluctance to feel discomfort

as I have to at the beginning of running season. At the end of winter, I try to get back to a regular running schedule and find myself in bad shape. Worse than that, I can't even reach the limits of a badly conditioned body because I have to relearn how to calmly take the next breath into struggling winterized lungs and have to tell those winterized legs to keep going because the discomfort is a sign of good things happening.

If I could fast properly, it might be easier to run or to start running in late winter if only because I'd be a few pounds lighter. But I'd also be better disciplined to endure a small but ongoing amount of discomfort.

I think it is not so much a more important matter as it is a different important matter to fast properly that it might be easier to pray, that I might better help others and might be better prepared to follow the Lord Jesus Christ even when that way leads through suffering or an early death.

# 607 Killing Babies and Children and Maiming the Body of Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=846>. It was finished and uploaded on 2011/05/16.]

Paul Gottfried is a political scientist always worth reading, his books and his short writings on the Internet. In this article, *What Drives the Religious Right* at <http://www.amconmag.com/blog/2011/05/12/who-misleads-the-religious-right/>, he made some good points about the nature of the religious right, predominately Evangelical Protestant though I know some Catholics who've taken up with their way of thought, or their way of intellectual laziness as Professor Gottfried describes their way of thought or non-thought or feeling good about themselves or whatever. I reached these sentences and had to comment on one issue that's been bothering me for a while:

Pat Robertson touted Giuliani as a presidential candidate on his television program, despite Giuliani's enthusiastic advocacy of a pro-choice position throughout his career. Robertson liked Giuliani because he was good on Israel. Leaders of the Religious Right have also had many nice things to say about Joe Lieberman, whose Zionism and advocacy of foreign wars seem to trump his support for third-term abortion. Bill Bennett backed Lieberman for president in 2008, without forfeiting (as far as I know) his credentials as an opponent of abortion beloved to the Religious Right.

So far as I can tell, there are a lot of my fellow Catholics, and maybe others, who describe themselves as pro-life but in practice are only opposed

to killing babies in certain ways. They're fine with killing babies so long as it's done in a morally and theologically proper way – shooting them with sprays of machine-gun bullets or dropping napalm on them or starving them to death or depriving them of important medicines.

We have to realize there are governments and other human institutions, even pro-life organizations, which have become parasites and/or cancers inside the Body of Christ, and some outside the Body of Christ as defined by the historical boundaries of regions predominately Christian – I know the problems with politicized or nominal Christianity but we have to start somewhere to understand this problem. I've written about these parasites and cancers with regard to governments in particular in Chapter 420, *What is a Conspiracy?*, which includes some comments I'd added later on my blog as Section 420.1, *Criminal and Not Satanic*. And we must remember that where there are powerful governments, no matter how evil, there will be many human beings ready and willing to do their bidding or fighting to take control.

The point I really wish to emphasize, what I'd like to keep in my personal scope of attention, is that the real issue is the Body of Christ. Compassionate might be the Lord, but He is clearly willing to tell a story in which the most innocent of creatures suffer. Human beings, including the sweetest of babies might be torn apart by vicious predators or they might have their skin stripped off their bodies by diseases that cause their own immune systems to attack the flesh just below that skin. God does what He does for His own reasons, but the most important reason from our viewpoint is: He is forming the Body of Christ by way of this story which is a world. This leads to a claim that there is something going on which is still more important to a Christian than even the mass murder of innocents – the American government in particular, but other Western governments as well, are acting as if to systematically destroy the Body of Christ starting with the outer (though often more ancient) churches in Asia. They say it's dangerous to be an enemy of the United States but fatal to be a friend. Enemy or friend, it seems fatal to all ancient Christian communities when the American military or intelligence services enters your country.

Many years ago, I read a story in which a Senator or Congressman was asked if he were accusing a colleague of being a Communist agent and he responded something like this, "No, but I am saying that if he were a Communist agent, he wouldn't have to act any differently." I'll say along those lines, "I'm not accusing the American people and their

leaders of trying to destroy the Body of Christ, starting with the ancient Christian churches of Iraq and Syria and others in Southwest Asia, but I am saying that they wouldn't have to act any differently if they were engaged in such an evil effort." [In fact, a little digging on the Internet will produce testimony that Western European countries and the United States also regularly betrayed the Christians of Poland and Russia and other Eastern European regions, often for the flimsiest of payments by Stalin or Hitler.]

The ancient Jews used to honor pious non-Jews with the title *Friend of God*. Perhaps the leaders of the United States, and all who march behind them, should honor each other with the title *Enemy of God*.

Or, perhaps we Christians in the United States should be watching our leaders more carefully and calling them to account when they act in evil ways.

# 608 The Proper Study of Mankind is Creation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=862>. It was finished and uploaded on 2011/05/25.]

Not only do I claim that the proper study of mankind is Creation; I also claim that the priority in that study for Christians in this mortal realm is the Body of Christ as it is developing in this mortal realm.

This doesn't mean that every human being should be a philosopher or physicist. It does mean we all have the duty to respond to objective reality in our own callings, the entirety of our lives.

I'm driven to remind myself of this because I've recently found myself reading comments on the Internet or engaging in conversations in which pious Christians have set out their all-too subjective concerns with Christianity as a human enterprise or with the Catholic Church as a set of human institutions. Acknowledging that things aren't going so well with our faith in this year of 2011, all of their solutions had to do with human institutional arrangements. Allow married priests in the Catholic Church. Allow women in the priesthood of the Catholic Church. Allow homosexual ministers in XXX denomination of Protestant Christianity. Feed the poor in Africa or build new, mildew-free houses for those in New Orleans who've still not recovered from Hurricane Katrina.

Some of the suggestions had some serious weight behind them as if dealing with duties which Christians have been neglecting. Some are the same old tired issues. The most viable suggestions, in my opinion, have to do with Christians trying to reign in their war-criminal leaders or showing themselves willing to pay a price to follow their Lord instead of always suggesting that the moral tone of society be improved by others giving up

sins that don't tempt most mainstream Christians.

Rarely do I hear anyone discuss the possibility which is so close to the heart of my efforts. Maybe we've lost touch with God's story which is this world? We do know something important about God's ultimate purposes as revealed in the life, death, and resurrection of Christ, maybe we should put in an effort to understand what God's doing in this mortal realm of His Creation? Maybe we should try to see what His purposes are for us and for the development of the Body of Christ in this vale of tears? Maybe we should be trying to perceive the thoughts God manifested in this universe?

This is close to the driving theme of the Hebrew prophets Isaiah and Jeremiah. God was nurturing some pagans that they might come to dominance in the region of Israel and Judea. Rather than trying to be excessively clever, let alone trying to stand up militarily to peoples of growing powers, it was time for the Judeans and Israelites to recognize their situation and to cooperate with God, not collaborate with violent barbarians but also not to stand in the way of powerful trends which were part of God's story.

Though wars rage throughout the world, I'm not really thinking of those particular aspects of mortal life in this context. I'm thinking, for example, of the general inability of Christians to address the nature of sin in light of biblical revelation and of Darwinian empirical knowledge. It seems that some tried only to lose their faith. I'm thinking of our lack of response to new understandings of time and space and matter which should lead to great enrichments of our understanding of the possibilities of resurrection and to radically new understandings of the sacramental nature of physical reality and of the Sacraments themselves – baptism and so forth. Maybe if we could present a plausible Christ-centered story which is compatible with this new knowledge of Creation, maybe, maybe we could preach Christ so that all of His children would stop and listen and maybe try to become a willing part of the story God is telling?

Perhaps we should work towards a better understanding of our own nature as developing creatures, members of a species which has evolved over an immense amount of time. Maybe we could then come to understand our problems and imperfections in ways that will help us deal with them a little better instead of babbling about free-will and a fall from a state of grace only to take our children and our friends to psychiatrists to deal with the imbalances in their brain chemicals.

See Chapter 25, *Broadening the Horizons of Reason*, for my response to a speech in which Pope Benedict expressed his awareness of this same

situation. In particular, he told us, “Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.” I would add to this that we need to gain a similarly more exact understanding of the foundational aspects of the world in which we find ourselves, a more exact understanding of time and space and matter and of all the extraordinary relationships which exist between various sorts of entities in this world. I think we can learn some important thoughts of God by studying not only those bones dug out of the sands of Africa but also planets and gas clouds and those longfar-agoway objects such as quasars and giant, first-generation stars.

Maybe then we could have something intelligent to say about the resurrection or the Body of Christ, however tentative our first ideas might be in this new adventure of the mind and spirit.

# 609 Natural Theology vs. Revelation

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1029>. It was finished and uploaded on 2011/09/19.]

I've started rereading *Science and Creation*[118] by John Polkinghorne, the physicist at Cambridge University who left his professorship to enter an Anglican seminary before returning to Cambridge as a chaplain and administrator.

Father Polkinghorne is quite polite to those who denigrate natural theology and to those who simply question what natural theology can really tell us about God. In particular, he responds in a respectful manner to Karl Barth, one of a number of those who study 'theology proper' and deny any possibility of understanding God at all through an understanding of God's acts as Creator. I put the case in my own way to show why I once published some essays in which I showed no respect whatsoever for this position, even on the part of so brave and distinguished a servant of Christ as Barth was. It's an absurd position, one which makes a mockery of God as a rational and coherent entity. It's more than absurd to say we learn nothing of an entity by studying his/His decisions and acts. In God's case, those decisions and acts come from a pure freedom which is itself beyond our total understanding, but even that freedom can be somewhat understood by studying and contemplating two implications of what we do understand about this universe:

1. It didn't have to be.
2. It could have been a radically different universe.

I've expanded this view out to the entirety of Creation, but it remains essentially the same argument at least to those willing and able to deal with very abstract realms of being. The concept of "abstract realms of being" is itself a major part of my worldview, but I'll deal with that, in passing, near the end of this short essay. First, I'll quote part of Father Polkinghorne's response to Barth and those who deny we can learn anything important about God by studying His Creation.

[T]he world is not just a neutral theatre in which these revelatory acts take place. Rather, it is itself, if theism is true, the creation of God and so potentially a vehicle also for his self-disclosure. God is to be found in the general as well as the particular. [118] [page 3]

That is, we learn about the Creator by understanding what man is and why he can be said to be the 'image of God', not just by experiencing the presence of God in some particular and 'personal' revelation. The reader should be aware that I try to be very careful about using the term 'Creator' whenever I'm writing or speaking about God in His freely chosen role as such.

This needs a few comments. First, Father Polkinghorne should not have qualified his claim with the word 'potentially' in the second sentence. A man's decisions and acts are what he is. God is different in that His act of Creation, the primary act-of-being by which He manifested the truths from which He shaped all of created being, is itself an act of absolutely free-will. He creates His own context for further acts-of-being and for what might be called His narrative acts. This means that Creation, in principle fully accessible to human exploration, isn't a guide to all that God is or all that He could do.

When a man studies any realm of Creation, the possible movements of his own body so that he might dance more freely or the role of genes in vulnerability to HIV infection, he doesn't just learn some facts or a way of better interacting with reality, though such claims help us in understanding the more complete and more radical claim which arises from this way of looking at matters: man shapes himself to encapsulate some smaller or greater realm of Creation. Man shapes himself to **be** some realm of created being which is a manifestation of particular thoughts of God in His freely chosen role of Creator. To become a true morally well-ordered human per-

son, man must also shape himself to the flow of the morally well-ordered narrative which is the world and also to a multitude of morally well-ordered or ill-ordered narratives which are our lives or the history of our particular culture or nation or . . .

Let me drop back to writing as if we acquire knowledge of being rather than writing in terms of the greater truth that we shape ourselves to become that being.

I wrote a book, freely downloadable, dealing with knowledge from that semi-traditional viewpoint: *Four Kinds of Knowledge* found at <http://loydfueston.com/downloads/know.pdf>. In that book, I explain that there are two kinds of knowledge: knowledge of God in His transcendence (theology proper) and knowledge of God in His thoughts and acts as Creator of this particular Creation. At the same time, I concede the limitations and general weaknesses of our human minds make it useful to think of knowledge as being of four kinds:

1. revealed knowledge;
2. speculative knowledge;
3. scientific empirical knowledge; and
4. practical empirical knowledge.

In my way of thinking about Creation, natural theology includes all knowledge but that of God in His transcendence and that natural knowledge is broken out into three major realms of knowledge. Ultimately, natural theology is knowledge of the transcendent God in His role as the Creator of this Creation. Ultimately, there is no real conflict between ‘natural theology’ and ‘theology proper’. Natural theology deals with God wearing His mask of a Creator of a particular Creation while theology proper deals with God in His fullness and transcendence.

The usual ways of splitting knowledge assume inadequate accounts of being, as I noted above. Ultimately, the human mind is a set of relationships, some dealing directly with our bodily actions or our practical plans of action and some dealing with more abstract realms, including the understanding and doing – very inadequate for now – of our more complex social and political and economic relationships. This last is my current main interest and it’s a good one for quickly giving a somewhat concrete shape

to my claim that we engage in natural theology to make ourselves images of the Creator, to shape ourselves to the thoughts God manifested in His freely chosen role as Creator.

We don't learn what civilization is and fit that knowledge into some slots in a generic human mind common to all men from that undefinable beginning of our race to the end of man's time in this mortal realm. We shape ourselves to a slowly developing cultural context which might be part of a civilization or might even grow into the core of a new civilization. Those particular cultures and civilizations are branches, fruitful or otherwise, on an evolutionary tree of sorts. Unlike the evolution of life, the evolution of human civilizations is guided to a goal, though one which leaves much room for various sorts of playful response in our ways of doing science and arts, technology and agriculture, politics and home economics. The goal is simply stated: by definition, a civilization must shape itself, in a faithful and profound way, to some substantial realm of this world, of the universe understood in light of God's purposes. A civilization is an imperfect and incomplete image of the Body of Christ, as more particular and focused communities are images of organs in that Body.

Even human politics, if we had the insight or integrity to do it right, gives us greater understanding of our Creator. In fact, these human social realms can even give us a greater understanding of one of the greatest of all mysteries of God. Despite what some think, God has manifested in Creation a potential image of those great mysteries, though we've not yet done well in developing that potential:

1. The Holy Trinity: God is three Persons in one God.
2. The nature of Christ: The Lord Jesus Christ is two natures in one Person.

We are individuals yet we are learning to be also true members of various communities in a complex network which reached its peak, so far, in this world as Western Civilization including that spiritual organ of worship – the Christian Church (however defined). We are following complex paths of evolution, not all cultures or civilizations are equally fruitful, and development, not all potentially fruitful cultures or civilizations reach harvest in a healthy state. Ultimately, as I've said before, a properly complex and rich understanding of the Body of Christ and a corresponding understanding of

human communities in this mortal realm which give lesser or greater hints of that Body will include an account of human beings remaining individuals while becoming fully members of the Body of Christ. Each of us, in a manner of speaking, will remain an individual human being while becoming fully a member of the one Body of Christ. If we can understand this, we will have some substantial understanding of the Triune God, three Persons – who remain individuals – in one God.

Let me summarize at the risk of repetitiveness:

1. The Triune God is three Persons, Father and Son and Holy Spirit, in one God.
2. The Body of Christ is a multitude of human persons and the divine Person of the Son in one Body.

It is possible to come to a better understanding of our Creator by better understanding a realm of Creation, in this case, human nature. In this case, we achieve a better understanding of one of the most fundamental aspects of His transcendental Self which God chose to manifest in human nature in its more complete individual and communal aspects. We also achieve a greater respect for the faithfulness and rationality of our maker and a greater respect for our relationship to Him, even two ways in which we can be images of God as individuals and as communities.

# 610 Belief in God is Intuitive and Not Reflective, at Least in This Age

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1039>. It was finished and uploaded on 2011/09/22.]

Without a doubt, we are children of our age. There have been indications that the young folk with higher IQs tend to drift away from Christian and Jewish belief and practice. The interesting exception in some of those studies is the Church of the Latter-day Saints. I've read lightly, but substantially by current standards, in the historical and biographical studies of modern science. This literature tends to support the general trends which have resulted in practitioners and admirers of science tending to pull away from traditional ways of believing and worshiping.

Let me run roughshod over the history of human thought to point out a matter of sheer contingency which can be seen in that history.

There have been major periods in history when the smart guys were mostly metaphysicians who didn't engage in the traditional religious practices of their age nor did they have a proper respect for empirical knowledge – ancient Greece comes to mind. There have been periods when the smart guys were mostly theologians, or at least engaged in empirical research or metaphysical analysis from a theological perspective – the High Middle Ages in Europe comes to mind. There has even been at least one period when empirical researchers were also serious theological students, such as Galileo, or even creative thinkers, such as Newton. As the Modern Age progressed, there was a tendency for empirical researchers to become skeptics about both metaphysics and traditional religious beliefs and practices,

though many scientists practiced their own form of metaphysical analysis and also claimed to have a strong if unorthodox faith.

Some sort of skepticism has become dominant even amongst scientists who are personal believers and practitioners of some traditional form of religion. This is largely because of two trends in modern thought which I've discussed often and from – I hope – multiple perspectives:

1. We have learned to separate mind from the created being which is us and also is the stuff around us so that we become allegedly disinterested judges of what's out there and also of human nature rather than being students shaping ourselves to the thoughts manifested by God in His freely chosen role of Creator. We continue to – necessarily – shape our minds by our responses to created being, but we do so in a manner both surreptitious and half-hearted. The relationships which result from that shaping process are what we call 'mind', but we would rather have some sort of immaterial and transcendental mind. We would be as gods even if we are partially embodied gods.
2. We have learned, largely as a consequence of that first wrongful thought, to separate created being into largely non-overlapping realms, such as science and natural theology and literature and so forth. Stuff, including human nature, aren't part of a unified nature and don't even exist in themselves, instead having one nature when studied by a physicist, another when studied by a historian, and still another when studied by a philosopher. We'll make sure nature conforms to the practical strategies we adopt because of our limited and defective skills of exploration and analysis. If nature refuses to so conform we'll... Well, perhaps those *Gods of the Copybook Headings* described by Kipling are once more catching up to us. (See [http://www.kipling.org.uk/poems\\_copybook.htm](http://www.kipling.org.uk/poems_copybook.htm) to read the poem.)

It's hardly a surprise to learn that research has indicated, with some serious qualifications, that *Intuitive Thinking May Influence Belief in God* – read the article at <http://www.sciencedaily.com/releases/2011/09/110920121615.htm>. In that article, we read:

In a series of studies, researchers at Harvard University found that people with a more intuitive thinking style tend to have

stronger beliefs in God than those with a more reflective style. Intuitive thinking means going with one's first instinct and reaching decisions quickly based on automatic cognitive processes. Reflective thinking involves the questioning of first instinct and consideration of other possibilities, thus allowing for counterintuitive decisions.

With the Divine Presence in Creation thinned out to a Ghostly Presence, we have to engage in strange séances to make any sort of contact with God. Was this necessary? No, we should have known from the start, or at least learned by experience, that even the most transcendental of God's self-revelations are necessarily received by way of vibrations in the air or by light-waves impinging on the eye. We should have known that even those revelations pointing to the transcendental attributes of God are necessarily understood by way of bodily processes in a physical creature and by way of communal knowledge, traditional or new, as embodied in both the knowledge and practices of communities of physical human animals.

In the modern worldview, permeating our ways of perceiving and our ways of thinking and our ways of acting even when we claim to be traditionalists, God is not to be truly understood as Father, Son, and Holy Spirit but rather as Ethereal Entity #1, Ethereal Entity #2, and Ethereal Entity #3. In Jewish terms, the King of Creation is to be seen as Ethereal Entity. Some would claim we can use the language of received revelation, such as Father and Son and Holy Spirit, while claiming that the received revelations are 'personal' and unanchored in our communal understanding of empirical reality, of created being, of Creation. They could have stopped at the valid point that our communal understandings must be endorsed by a personal experience if our faith is to be alive, but they insisted on passing on to an absurdity. Moreover, they ignore the evidence that some of God's most faithful servants, such as Mother Teresa of Calcutta – hardly an excessive rationalist, have been bereft of that personal grounding for their faith.

And so it is that we've become confused puppies, trying to hold on to the insights and the practical advantages of the knowledge gained by modern empirical exploration and analysis of physical reality and allied mathematical abstractions but also wishing to believe in what we – wrongly, for the most part – see as the spiritual ways of traditional forms of Christianity, Judaism, and other communities expressing a faith in a personal God.

Please join me, at least as an amused spectator, in an effort to do better, to provide better foundations for the human understanding of Creation and the Creator as we live through the decay of one phase of Western Civilization and – we can hope – the founding of another phase. My way of understanding Creation and the Creator will encourage you to use both intuitive and reflective ways of thought whether you are thinking about God or about some level or realm or aspect of created being.

# 611 Is It Unknown for the Many to Be One While Remaining Each Itself?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1084>. It was finished and uploaded on 2011/11/17.]

Let me state a certain political position as:

The United States of America are but Massachusetts is.

This is a grammatical statement of the classic States' Rights doctrine – see [http://en.wikipedia.com/wiki/States\\_rights](http://en.wikipedia.com/wiki/States_rights) for a discussion. This doctrine was at issue in many of the political debates and struggles in the years leading up to the American war between the states. It was, in fact, a matter of contention from the beginning of the discussion of some sort of federation between the North American colonies – some of the Founding Fathers of the United States hoped that Canada and, a big maybe, the French and Spanish colonies above the Rio Grande would join in a general rebellion.

The deeper question was the one implied by the title of this essay: if several or many entities join together in some sense, can they become truly one in some sense and – if so – what is that sense?

This is the general form of the question I'm asking in various writings about the most important of all corporations, that of the brethren of Christ into the Body of Christ. This is a question of development and of evolution as I discussed in Chapter 272, *Human Moral Nature: An Overview*. Jesus Christ is inherently and naturally the Head of His Body, but the rest of us

can become members only by the completing and perfecting processes of grace acting upon us.

The Body of Christ is. And the Body of Christ are.

For good reasons, we Christians always use the singular for God even when speaking of the Almighty in a sense where we are concentrating on the divine community of three Persons. God isn't just the supreme Act-of-being, His own Act-of-being: He's an act-of-being which brings into existence, from eternity to eternity, three Persons in one God.

Americans seem quite too well disposed to see unity in corporate collectives. We say, "General Motors is. . .," while the British and most others say, "General Motors are. . ." Let's call the whole thing a disagreement hovering in the wind high above solid ground.

If several or many entities join together in some sense, can they become truly one in some sense and—if so—what is that sense?

Let's at least make it clear what's involved rather than talking past each other.

Do positive laws, enacted legislation for the most part, bring a nominal entity into real existence? I think not.

Do we have any reason to believe that even the mortal corporate bodies we consider 'individuals' to truly be such? Maybe, but we haven't explicitly dealt with the issues, except perhaps for some science fiction books and other related entertainment.

There are known evolutionary and developmental processes by which groups of individuals act together and, by those acts, form a corporate body with at least some of the traits of a true individual. Cells come together to form various sorts of organisms, ranging from jellyfish which are barely more than well-organized colonies to human beings made of so many cells subordinate to various organs themselves subordinate to the entire human organism. Yes, those cells retain some of the characteristics of individuals, but they are mostly servants of the organism. The situation becomes more complex when we realize that many of the bacteria in our body are part of a complex ecological system which can be perhaps regarded as our greater biological self. After all, recent research indicates the various little critters in our guts and other parts of our bodies are the ones expected in our family lines. I don't know of any tight explanations of how this happens but those

little critters not only exploit us but also serve us by helping us in digestion and other metabolic activities and also by occupying niches which might otherwise be occupied by bacteria decidedly less friendly to us.

1. Sometimes, the several or the many can become one while retaining their own individuality.
2. Sometimes, the many can become one and lose their own individuality.
3. Sometimes, the many can become one and their individuality takes on an ambiguous status.
4. Often, we speak of the many as one but they are one only in a nominalistic sense.

I'm not at all confident that I have firm criteria for slotting particular phenomena in any of the above categories. I'm also not confident that I understand what happens when an individual, of perhaps defective unity, begins to fragment. That it breaks into free-standing entities and no longer exists as an corporate entity with its own individual self does not mean it was never such a unified corporate entity. I tentatively accept Ian Hacking's explanation (see *Rewriting the Soul: Multiple Personality and the Sciences of Memory*) of the multiple personality phenomena as being learned behaviors in which the original individual learns to wall off unpleasant memories and that process takes on a life of its own and creates 'persons' living on those various ghettos in the memory. But I don't know what that means because I've come to realize that I can't define how an organism comes to a true unity when an organism seems to be a conglomerate of a sort which evolved in a largely ad-hoc way. I don't doubt there is a true definition or a substantial understanding, but I don't pretend to have such.

We should be careful to provide good definitions for those entities, objects, processes, and relationships which are important to our understanding of ourselves and our world. We often literally don't know what we're talking about. We Christians tend strongly to be willfully obscure, pushing off God's self-revelations as mysteries of a magical sort when there seem to be always ways of speaking of God in terms of entities and objects and processes and relationships found in His Creation. After all, Creation is a manifestation of certain thoughts of God. Should we be surprised

to see that there is a good set of examples and counter-examples for discussing God's Triune nature: He who is Father and Son and Holy Spirit in one God? Augustine found one I don't accept but it's plausible and started us off on finding better ways of discussing the truths expressed at the Council of Nicaea, better than the Fathers of Nicaea themselves came up with. From the article titled *Augustine of Hippo/On The Trinity* and found at [http://en.wikiversity.org/wiki/Augustine\\_of\\_Hippo/On\\_The\\_Trinity](http://en.wikiversity.org/wiki/Augustine_of_Hippo/On_The_Trinity), we learn:

Augustine gave classic expression to the psychological analogy of the Trinity in which the unity of essence is likened to the rational part of the human soul, composed as it is of "the mind, and the knowledge by which it knows itself, and the love by which it loves itself." [*The Trinity* by St. Augustine of Hippo]

- The image of God in us consists of that part of the soul which the beasts do not have in common with us, i.e., the ability to contemplate the eternal forms and to make judgments (know things) according to them.
- This ability requires memory—the metaphysical warehouse in which we not only store sense impressions, but in which we discover things we never knew we knew (present illumination vs. Plato's reminiscence).
- It requires intellect (understanding) - the mind's eye, as it were, which takes on the form of what it beholds in memory and conceives thought thereby. It requires will—that which directs the mind's eye, as it does the bodily senses, to what it loves and attaches it thereto.

I think we can do better than Augustine was able to do in his time, though he should be honored for realizing it's inappropriate to speak of God in terms of substance. Unfortunately, Augustine didn't sharpen his ideas to nearly the point of Aquinas' claim that God is an Act-of-being, His own Act-of-being, the supreme Act-of-being. I think we can discuss even the greatest and most transcendental truths in terms of God's Creation, including even the most concrete and empirical aspects of this world of rocks and dirt, rattlesnakes and elephants, daffodils and redwood trees. We merely have to have the faith and courage and willingness to respond

creatively to Creation. In current terms, this means we have to be willing to draw upon the those mountains of partially digested information about this world and the abstract realms upon which it draws. We need to realize that analogies to the greatest theological truths can be drawn even from evolutionary biology and even from that bloody record of villainy and deceit and treachery we know as human history. Even our currently unlovable governments might be failed forms of something which is an important part of the Body of Christ.

There are two chapters in this book dealing with physical aspects of these issues. Chapter 366, *Creation and Freedom*, a commentary upon one discussion in Henri Bergson's *Creative Evolution*, which includes a short discussion of an experiment in which physicists created a new state of matter: "Cooling rubidium atoms to less than 170 billionths of a degree above absolute zero caused the individual atoms to condense into a 'superatom' behaving as a single entity..." Chapter 193, *A Universe is More than it Contains*, presents a claim the universe is an entity of its own and not just a collection of stars and gas and strange forms of matter.

## 612 Speaking (Along) with God

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1087>. It was finished and uploaded on 2011/11/22.]

God, the Creator of this universe and far more, isn't a lunatic speaking mere syllables strung together. God is rational and all-knowing. When He speaks, He knows. When He speaks, what He says is true, already or in some state of development. When He chooses to know something about contingent being in an active way, He speaks and what He knows comes into existence, not as a result of some magical words but rather as the flip side of the coin of speaking. He is our Creator, our Father if we choose to be His children in the fullest sense, our Brother if we choose Christ, our teacher and source of spiritual energy if we open ourselves to the Holy Spirit.

To speak with God, we need to be open to Creation, open also to the Spirit, but we need to know of what we speak. To speak with God, we must know as God knows, however faint and imperfect and ineffective our knowledge is compared to that of God. And we have to realize the knowledge we can gain by our own efforts (always working with God as a child works with an adult) is knowledge of Creation, of specific realms of thoughts manifested by God as various sorts of created being.

To speak with God is to accept His self-revelation in terms drawn from Creation and to understand Creation in those same terms, Creation's own terms. I've noted often that St. Thomas Aquinas told us this:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures He made. . . (St. Thomas Aquinas' commentary on 1 Corinthians.)

To speak (along) with God, we must know something, in our minds or in our bodies. God doesn't speak gibberish, though He seems to at least tolerate a lot of silly sorts of humor in poetry and songs. He seems to allow us our jokes and our good-natured satire, perhaps even tolerates the sarcasm and bitter satire we sometimes feel necessary to direct at those we see as exploitive or destructive because of their stupidity or misdirected greed.

On the whole, we can guess that this universe and its inhabitants are moving in a direction that suits the purposes of the all-powerful and all-knowing God. We need to learn how to speak and act as God speaks and His words become reality, the story which is this world, a story ordered to the purposes of the Almighty.

God demands more from us, His people, than mere piety in face of a confusing and dangerous world. He demands of us that we, as individuals, play our parts and some have roles related to exploring, some to explaining and narrating what has been discovered by the explorers, some to teaching what has been learned to the children and the adults who have not been given the particular gifts of the intellect or of narration, some to other tasks equally important such as managing the infrastructure of society or nurturing the children.

We each should use our gifts for the good of ourselves, our immediate loved ones, our immediate not-loved ones, and all men of good will. We should even try to bring those not of good will into a better state – if we have that calling and the opportunities.

When God speaks, what He says is true or begins to emerge as true. When we speak, we more often describe what God has done, but we also can speak in a way that helps God's will to emerge in this world. Our acts, our doing, should be part of our imitating God's acts of speaking. We are weak but not totally without power.

The question arises:

Why would God have made the world as I describe it, incomplete and developing in time, developing in such a way that the emerging good is often obscured or even nearly invisible while the innocent and the good suffer?

Perhaps God made the world this way, made this particular world within this more general but still particular Creation, because He loves us, includ-

ing that human being – Jesus of Nazareth – who is the human nature taken up by the Son of God? We human beings are creatures of this developing world, this world in which the good emerges through ugly processes we often describe as ‘evil’. It says something about us, a mixture of good and bad, that we are creatures of such a world but it says something unequivocally good about us that we can emerge from this world and – by the grace of God, the loving action of God – become creatures capable of sharing the life of the Son of God, our Lord Jesus Christ.

We have always to remember it isn’t our choice what sort of world this be, what sort of Creation it be part of. It isn’t our choice what roles we select from. Even when it comes to matters which are subject to our choices, we are limited to those options given us by our Creator. If we are to be rational and moral creatures, if we are to form rational and moral communities, we must study and understand our complex world as it emerges to our perceptions and our probing intellects. We must deliberately work to form those rational and moral communities or God will move on and raise new men from the stones of the field. More likely, we and the next few generations will suffer because of our lack of faith, our lack of concern for the world as God created it and not as we imagine it to be for the sake of our lazy and morally passive selves.

If we in the West have failed to such an extent that a century or more will be needed for morally healthy societies centered upon God to develop, then we can still move towards a recovery by working to better understand and imitate what God has done and what He is doing. First, we must have something substantial to say. Or to do. For there seems to be no difference between doing and speaking for the Creator, a claim that leads to a different understanding of revelation than is held by most Christians and perhaps most others as well. We also must know and do at the same time and there is only one way to do that: our knowing must correspond to our best understanding of God’s acts-of-being as Creator and our doing must correspond to our knowing.

# 613 Does the Body of Christ Have Non-human Components?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1144>. It was finished and uploaded on 2011/12/30.]

We usually think of entities of mixed biological and non-biological components as being monsters though good experience with prosthetics has perhaps eased that prejudice a lot. (I use ‘prejudice’ in a non-judgmental way as some prejudices are valid and some aren’t, some are dangerous to others and our own selves and some are not.)

Is it possible that as we form the Body of Christ, we integrate human technology such as the Internet viewed as a fancy memory device? For a secular and somewhat mundane discussion of what is an important issue, see the article *Internet Changes How We Remember: Knowing we can retrieve facts online later alters memory* at <http://www.scientificamerican.com/article.cfm?id=the-google-effect>. It’s possible that we are learning how to remember how to retrieve facts rather than remembering the facts directly.

Technology does become part of us. Michael Polanyi was a medical doctor before he left Hungary when the Nazis took over in 1933. He was also a physical chemist whose research was well-regarded and encouraged by Einstein and, in his middle years, became a philosopher of note. For a bit more background on this important thinker, see the article on him at [http://en.wikipedia.com/wiki/Michael\\_Polanyi](http://en.wikipedia.com/wiki/Michael_Polanyi). Professor Polanyi spoke in *Personal Knowledge: Towards a Post-Critical Philosophy* of our tools becoming an extension of our bodies when we become truly expert in using them. He spoke in particular of the scalpel from his own experience performing surgery. I would imagine the brain of a surgeon reorganizes

itself so that there are regions devoted to the control of scalpel and other instruments. I imagine the brain of a pianist also reorganizes itself and also that of a carpenter.

Truly does technology become part of us and not just the tools we personally use. We grow larger and more active when our health is improved by fresh water systems and sewage systems. Our minds grow as they respond to the use of microscopes and various sorts of technology. Our minds grow also as they respond to proper use of books, even electronic books. There are many books which are a part of my being and some of them alive to the extent that they change beyond what the author had written – this makes it dangerous at times for me to rely on my memory.

Truly does technology become part of our communal beings, our communities. Even our ways of worshiping God are tied to the building technologies of an age. Our forms of friendship, our range of friendship, can change with greater mobility, with electrical and then electronic devices. Our communities grow larger and more complex, safer and more stable, with better energy production. As individuals and as communities, we form relationships, political and economic and intellectual and spiritual, with more more communities, some of them longfar agoway. Yes, even with communities long gone. However superficial the museum experience might be for most, we yet connect a little with the ancient Egyptians and Mayans, Medieval Saxons and Moslems, Renaissance Italians and Ashkenazi Jews, Colonial Virginians and West Indians, early modern Japanese and Zulus.

We Christians have a tendency to etherealize the nature of heavenly and of resurrected human beings. In fact, our resurrected selves are completed and perfected versions of our mortal selves. If our technology has become a part of us and our communities here on earth, even a part of the pilgrim Body of Christ, then we would be mutilated creatures if we were resurrected without it, without perfected and completed technology of the sort which can aid in that perfection and completion of a true human life and in that perfection and completion of the Body of Christ.

## 614 The Thermodynamics of Love and Heaven

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1166>. It was finished and uploaded on 2012/01/17.]

Love is probably undefinable but we can at least understand some aspects of that love and can probably come to a substantial **narrative** understanding of some loves in their specific contexts. We can maybe even understand some of the ways in which a truer and incorruptible love will make the world of the resurrected, heaven, a far better world than this.

In the poem, *The Country of Marriage*, Wendell Berry, speaking to his wife, prophesies:

What I am learning to give you is my death  
to set you free of me, and me from myself  
into the dark and the new light. Like the water  
of a deep stream, love is always too much. We  
did not make it. Though we drink till we burst  
we cannot have it all, or want it all.  
In its abundance it survives our thirst.

There's more, before and after, but what interested me was the last sentence in what I've quoted: "In [love's] abundance it survives our thirst." Love never runs out. This points to a claim, a la St. John the Evangelist, that "God is love." I'm making my way toward an issue I've dealt with before in a very cursory way. In Chapter 191, *What are the Thermodynamic Properties of Heaven?*, I tried to make sense of the question in that title, a question seemingly simple but actually the question needed to be answered

by anyone who takes seriously (without necessarily holding any strong beliefs) about both the nature of this universe as currently understood and also the possibility of a world where some or all might live for time without end with their God, whether understood in Christian or Jewish or Islamic terms. In effect, we need to be able to speak about created being in a way that can help us to believe that there can be a realm, a form, of created being not subject to decay.

As I've stated many times: the Christian principle is that grace completes and perfects nature rather than replacing nature. If this principle be true, there must be some way of talking coherently about the world of the resurrected – Heaven in traditional terms – in terms drawn from our understanding of Creation which itself has to be based upon our understanding of this world.

Let's strip thermodynamics of its particular nature in this universe. Is there some abstraction behind the Second Law of Thermodynamics, that entropy or 'disorder' increases, or at least doesn't decrease for an isolated system? There's one abstraction well-known and discussed by physicists – the increase in entropy is actually a movement towards a state of higher probability.

This means we are discussing not necessarily well-behaved functions but rather movements along paths through state-spaces which might be somewhat 'pathological' as we might say. For example, there might be no paths to the state of greatest entropy but for those which pass through states with far lower entropy than the system currently has. This would put us in a valley of sorts, surrounded by insurmountable barriers, at least seeming 'insurmountable'.

The mathematician and physicist Roger Penrose has claimed, in constructing a plausible way of speaking about reality, that our universe is so well-behaved in moving relentlessly towards an overall state of greater entropy because it began to expand from a state of extraordinarily low-probability and low-entropy. When the universe began its current expansionary phase at the time of the so-called Big Bang, the opening in the balloon was pointing into the valley in which we find ourselves. This universe seems to lie in a region surrounded by regions of far higher entropy or disorder. There is no obvious way to escape this region, but there remains so much we don't know.

When we seek to understand the true possibilities for worlds in this Creation, we would have to first explore the nature of the state-space of possible

universes which could provide the stuff of a world, a universe ordered as a coherent narrative, that is, ordered to a purpose.

If I were willing to suggest that Heaven lies not in the empirical realm but rather in the transcendental realm where the Holy Trinity has His absolute existence, I could say that the problem is solved. God, who is love, who is beyond even absolute infinity, will take us into His own life so that we will stay there. Creation, any contingent being or even the set of all possible Creations, is so small compared to God that there would be zero probability of moving out of that transcendent realm – unless God willed it to happen.

The previous paragraph will almost certainly prove to be wrong in terms of better ways of thinking about these issues but perhaps, like many human thoughts about far lesser matters, it points towards a better way of speaking. In any case, it might provide many believers a way out of the intellectual ghetto in which they find themselves because they have no way, are putting no effort into discovering a way, to discuss this universe in terms of a Creation of the God of Jesus Christ.

I'm going to lay out a basis for part of an intellectual program which might help us find a way to reunite faith and reason (my writings over the past 20 years, including my novels, are all parts of a greater such program):

1. God is true to His self-chosen role as Creator and will remain true to Creation in the way that He shapes the world of the resurrected, that is, He won't suddenly bring His friends into a realm outside of Creation properly understood;
2. To first appearances, that world of the resurrected will be much like this but will not have decay or disorder, nor processes which might lead to such;
3. To provide for the dynamic nature of a world suited for the resurrected individuals and the Body of Christ of which they are members, there will have to be a movement towards an ever lesser entropy or – far better – a greater and more God-like order;
4. In terms appropriate to this universe and at least indicative of the more abstract terms suited to a description of all of Creation: movement of the physical stuff of any world, corruptible matter or matter perfected by grace will be a movement towards a more highly probable realm, an infinitely larger realm for the situation I'm dealing with

here and so it is that I claim that love, God's realm in a manner of speaking, is effectively all that truly exists.

If only we understood the state-space of Creation – to use the terms appropriate for physics in this world, we could see this more clearly. But the greater situation in this world, at least from the Christian viewpoint, is obscured. It would seem God has given us a valley as our place of birth and development and this valley is eroding and flowing locally toward the lowest spot in the valley. We're surrounded by mountains which prevent us from moving toward better regions of Creation. Or maybe there would be a way to, somewhat, reverse the processes of decay in this world if we could understand the mountains and learn how to move over or through them. I would doubt it but no human community has done well betting against the possibility of advanced technologies pulling off miracles of a sort.

More importantly, at least to a Christian and certainly one who takes seriously the viewpoint in the writings of the school of St. John the Evangelist, love is all. Love is the highest probability state of all though we might have trouble understanding that while we remain stuck in this valley, this "vale of tears" as a prayer to the Mother of God, *Hail Holy Queen*, terms it. Without God's help, we can't pass beyond all barriers to enter the absolutely good regions of Creation, though we might be able to pass the immediate mountains and better our situation. In any case, God – for reasons He hasn't given to us – has isolated us from regions where we could move toward greater order rather than to the disordered muck at the bottom of our valley.

Am I satisfied with my current understanding of this aspect of Creation? Am I satisfied with my understanding of the ways in which the world of the resurrected will have better thermodynamic properties than this one? No, I'm not satisfied with my current understanding by a long shot but I am pretty happy with my understanding as a very tentative position. I'll end by pointing out that, ultimately, we should question if it makes sense to use thermodynamic concepts to discuss the better-ordered, higher-probability regions of Creation. Yet, we have to be realistic about our limited natures and the general situation we're in. We have to make our way slowly toward a better understanding.

# 615 A Stage Lower than Hypocrisy

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1237>. It was finished and uploaded on 2012/04/12.]

In *The End of the Twentieth Century* [87], the Hungarian-American – and Catholic – historian John Lukacs points out:

[A]t the end of the twentieth century, many people respect religion as well as science, together; but the respect is faint. (This has to do with the fact that we have descended to a stage lower than hypocrisy, the problem being no longer the difference between what people say and what they believe; now the difference seems to be between what people think they believe and what they really believe.) [page 224]

I'd agree heartily and even add that there are many who think themselves to be Christians, Catholic or otherwise, because of a formal adherence to what we might label 'Biblical teachings' while their more deeply held beliefs seem to be paganistic, perhaps a regression toward the baptized form of paganism the Church tolerated, maybe unwisely, during the centuries of bringing the Good News of Christ to the European peoples. I think Professor Lukacs was speaking more of another group, those who have fallen into weak, liberalized forms of Christianity – Unitarians at Mass in a manner of speaking, but I think most Christians willing to publicly call themselves such are pagans, moving along with the herd as Christianity is repaganized. Given the strong religious instincts of human beings and the laziness leading to the acceptance of easily understood ideas, I suspect the

repaganized Christians will soon be dominant over atheists, unitarians, and also Christians who adhere to a coherent set of beliefs.

As I see things, a coherent form of Christianity necessarily is allied with that family of philosophical beliefs we can call ‘moderate realism’. This is the belief that we live in a Creation and we learn about that Creation and about any absolute or transcendental truths not divinely revealed by “examining God’s creatures” in the profound words of St. Thomas Aquinas in his commentary on 1 Corinthians. Even God’s own revelations are given to a human being by way of physical environments and the sensory organs which deal with those environments. As soon as we bring our favored absolute beliefs, immune from any empirical evidence, to the task of understanding God’s Creation, we have fallen away from that foundation of Christian belief – moderate realism.

Earlier in *The End of the Twentieth Century* [87], Professor Lukacs had stated we need to give up Darwinism if we are to recover our faith in the uniqueness and value of human life. I think he was talking about Darwinism as an ideology rather than a scientific theory. (I personally don’t feel any worse for being descended from an apish creature than I would for being descended from a man shaped from the slime of the earth.) Even at that, I think he was a little off because I think the repaganized Christians are the greater danger to the Church and to the Western Civilization built by earlier generations of Christians. Those repaganized Christians tend rather strongly to be anti-Darwinist and often anti-science, though they do tend to like technology. They also tend to pick up their understanding of history from rather strange attempts to literalistically understand the Bible or from the words of strange seers who have visions of the Mother of God or maybe visions of Satan. They don’t tend towards hardheaded understandings of the books given to us by prophets who seem to have been blessed as God’s interpreters of the Almighty’s acts in human history: Isaiah and Jeremiah. I guess those prophets didn’t pay enough respect to the powers of angels and demons. In any case, I don’t value highly the human nature which those repaganized Christians would defend.

Amongst those who have turned parts of modern science into ideologies, there are many who would blur the distinction between those two radically different sets of beliefs labeled as ‘Darwinism’, confusing the words of a biologist who is an aggressive proselyte of atheism with a hardheaded evolutionary theorist who might hold any religious or anti-religious beliefs, but he holds them in abeyance during his working hours as a biologist. This

isn't because there's a true wall between God and His Creation. It is because human beings are specialists and need to work together as members of communities, right up to those complex communities we know as civilizations. Most biologists shouldn't try to be amateur metaphysicians or theologians and most metaphysicians and theologians should accept mainstream scientific ideas, cleansed of obvious corruptions by those who can work in both fields.

Our Christian beliefs, at least in that tradition of moderate realism as developed by St. Paul through St. Augustine and on through St. Thomas Aquinas, teach a trust in God as Creator, a willingness to accept what God has accomplished as Creator and has given to us. We ignore what is contained in the best of modern science, history, literature, and other fields of empirical knowledge at the peril of turning away from He who shaped us from a line of apish primates and He who – as Isaiah and Jeremiah taught us – is the driving force of our lives and the events of our communities. (Note that God is Subject even when grammatically an object.) God is God even when His Creation involves volcanoes and man-eating tigers and genocidal madmen. We retreat from the appropriately honest understandings of Creation only by – at the very least – compromising our faith in an all-powerful God. We seek to justify a belief in a gentler God, one who tried to do well if only Satan hadn't (temporarily) conquered Creation, only by giving up the core of our Christian beliefs. We might profess a strong faith but we hold a severely compromised form of Christian faith, either unitarian or neo-paganistic.

# 616 Can We Just Invent Large Numbers or Desirable Communities?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1266>. It was finished and uploaded on 2012/05/18.]

I'm still contemplating a few issues raised or brought back to memory by my recent reading of *The Meaning of Truth*[78] by William James. The ideas of William James put pressure upon my own ideas, a form of updated Thomism, just because he knew how to respect empirical reality without being a reductionist but also, mistakenly in my opinion, without being willing to posit a world of which his empirically observed things and relationships are a part. So it is that I've returned to vague thoughts about that precise subject of mathematics. Can we make up a large number simply by writing down some symbolic representation and inventing a name for it? Is it meaningful?

The name *Googol* is from number theory and doesn't refer to the Internet search firm. See <http://en.wikipedia.com/wiki/Googol> for the story of how this name was invented as a whimsy of sorts. A googol is  $10^{100}$  or a 1 followed by one hundred zeroes. It was invented as part of an educational effort, the discussion of the difference between very large and infinite. In that context, the meaningless number acquired a good enough meaning to justify its use. More reasonably, large numbers might fall out of proofs involving questions such as: at what point do prime numbers become as common as they theoretically should be? (In the range of small and readily accessible numbers, prime numbers are too sparse according to number theory.) Large numbers can also fall out of calculations such as time and

quantum state calculations involving a number of particles similar to the number believed to exist in our universe.

Some sort of objectivity in naming a large number or writing it out in symbols seems to be required if only for intelligent discussion with other human beings. Otherwise, pure whimsy in the realm of numbers and other matters of cognitive substance could turn certain discussions into playground arguments: “Yeah, well I’ll take your number and multiply it by a million and my number’s a lot bigger.”

I think there has to be some sort of operational meaning to a large number, such as the above example where very large numbers sometimes pop out naturally in various sorts of proofs or explorations in number theory or explorations in theoretical physics. Very large numbers can also arise in studies of computer science and cryptography. An interesting example of large numbers arising in the theory of recursive functions, very important in mathematics and computer science, is the numbers produced by the Ackermann function, see [https://en.wikipedia.org/wiki/Ackermann\\_function](https://en.wikipedia.org/wiki/Ackermann_function), which, though a simple calculation, rapidly produces numbers which are very large even by the standards of mathematicians. The power of this function to generate large numbers is somewhat surprising and has been explored a bit in various modified forms. A reader with even a casual interest can read a little more in the way of background in this article, [https://en.wikipedia.org/wiki/Large\\_numbers](https://en.wikipedia.org/wiki/Large_numbers), on large numbers.

I return to the more general issue of truth having an experienceable nature as William James claimed in *The Meaning of Truth*[78] and I discussed in a recent essay, *What Can Be Experienced?* found at <http://loydfueston.com/?p=1230>. This is the issue: if truth is experienceable, if it must have some sort of operational meaning for human beings to grasp it, does sanity require boundaries on our imaginations? I’m most certainly not reducing truth to an operational form, but I am saying that human beings need something to grab hold of for any sort of truth to be such in our sorts of minds. Our minds are relationships and need to have a true relationship to even a number for it to reside in these minds. Put in other terms, we can understand the functional relationships which recursively generate very large numbers even though the sizes of those numbers are far beyond the size of our minds. In a similar way, we can understand entities too complex to hold in our minds, such as a non-symmetric black-hole or a human community or a strand of DNA in a plague bacterium. We can also understand things which don’t happen to exist but maybe could

exist in another plausible universe or in our universe if it had developed differently.

We can even picture a Jabberwock, described at <http://en.wikipedia.com/wiki/Jabberwocky>, at least with the help of the artist John Tenniel, see [http://en.wikipedia.com/wiki/John\\_Tenniel](http://en.wikipedia.com/wiki/John_Tenniel). Though that poem was no more, and no less, than a wonderful piece of whimsy, the strange creatures and even the meaningless words have some meaning to us. They can be experienced in a meaningful way, but maybe words which ‘fit’ but have no meaning are little different from a large number created by simply piling up exponents? In response, we could point out that many long extinct creatures, and a few discovered deep in the ocean, are as strange and as nasty as the Jabberwock as imagined by Lewis Carroll and his many readers.

That nonsense poem about the non-existent beast began as a different sort of nonsense poem, a parody of sorts first titled *Stanza of Anglo-Saxon Poetry*:

Twas bryllyg, and ye slythy toves  
 Did gyre and gymbles in ye wabe  
 All mimsy were ye borogoves;  
 And ye mome raths outgrabe.

It was apparently written to poke a little fun at the efforts of modern English-speakers to read older versions of their own language. It is historically-grounded whimsy, not an effort to shape something allegedly new by using some selected facts of human history to invent some nightmare world, such as a bar in which we can watch the interaction of races which evolved on different star systems and yet can easily communicate, heck! – they can eat the same foods and drink the same intoxicating liquors.

So, can we simply string together exponents:  $10^{10^{10}}$  . . . and call it a number? Can we simply make up other universes or entire infinities of other universes?

There seem to be two requirements to establish the legitimacy of efforts of whimsy, fantasizing or invention if you will. The first is that, like the ‘Anglo-Saxon Poetry’ of Lewis Carroll, it has to be plausible in some way, even if just by archaic appearance or sound. The second is that it has to be experienceable in some meaningful way, not a way that is fundamentally

dishonest. Incompetence in both content and execution should be eliminated, will be eliminated by time alone. Schlock of the sort dominant in science-fiction – there are a few worthwhile works in those piles of strange and smelly things – will prove to be ephemeral in its appeal since it stands in some dreamworld of one generation and not in some objectively accessible understanding of historical and scientific reality.

I don't think we can simply string together exponents:  $10^{10^{10}}$  ... and call it a number. Some sort of operational meaning is required.

I don't think we can simply make up other universes or entire infinities of other universes. Some sort of grounding in historical reality is required.

There are other streams of events which might have occurred in our universe and there are other possible universes, but we have to imaginatively work from the one universe we can directly perceive and explore. Our thoughts about universes and their various narrative streams: astrophysical or biological or historical, should be plausible in light of what we can perceive and explore.

The various confusions about proper use of the human imagination do little harm in mathematics and other fields of science as currently defined because of the forms of disciplined peer-review which tend to dominate, if imperfectly so. This could change. Even mathematics could lose its fortifications against irrationality, as we modern men settle down in that state of barbarian childhood seen and foreseen nearly a century ago by Jose Ortega Y Gasset in *The Revolt of the Masses* [60] which dealt with the failure of the masses of peasants and their urban equivalent to grow into the greater realms of civilization opened to them in the modern era. Ortega was actually most upset by the failure of the cultural and social elites to teach those liberated peoples, to help them to integrate themselves into the civilization of Moses and Plato and St. Paul and Dante and so forth rather than simply becoming part of a mass of consumers and seekers of forms of entertainment appealing to our raw animal desires. In fact, those elites have themselves sunk to that low level of cultural and spiritual vulgarity.

I'll make one final point about an inconsistency in the thoughts of many fans of so-called science-fiction and fantasy. A book or movie can be criticized for taking too much imaginative liberty with the facts and strongly established theories of physics and chemistry and most other fields, though a great deal of liberty is allowed in the realm of biology. Almost complete liberty is allowed to differ with the human nature we know mostly through history even in this age of neurobiology. History teaches some harsh lessons

about the political and social and moral aspects of human nature, the only rational nature we know about. Science-fiction often seems to imagine, in what I'd call a diseased manner, that the developmental and evolutionary processes of this universe could be projected ahead so that we can imagine the sort of creature which could be peaceful in a way which is in contradiction to the nature of such a universe.

We could speak in Christian or Darwinian terms, or even mixed terms as I often do, but it's hard to sanely imagine a world shaped by evolution being peaceful or orderly in the way we often desire and some think possible to realize just because they desire it and think they can imagine that peaceful world so that it can be realized despite the nasty lessons of human history. This is a mistake being made by not just science-fiction fans but by many Christians including prominent leaders.

I'm currently reading some histories of the ancient world and one lesson of those histories is the tendency of multicultural civilizations to break down into wars of one group against each other even for relatively trivial reasons. The Greeks were a homogeneous people and the Greek colonists in Italy who were descended from Corinthians couldn't live in peace with Greek colonists in Italy from the island of Samos, but neither could the parent-polities in Greece live in peace. This doesn't mean it's impossible to form a multicultural society which is peaceful over the long-term but to merely preach that peoples from a variety of alien races can automatically get along so long as they go along with the (undescribed) program is morally irresponsible and intellectually empty. A desirable goal, that of a human race where each loves the other and all groups can co-exist next to each other, isn't an intelligent plan of action, especially when that goal is probably unreachable in this mortal realm. We should remember the teaching of St. Thomas Aquinas about the intentionality which forms human moral nature and, hence, human communities. Intention isn't some subjective desire or motivation or goal, but rather a growth process, more often than not a slow and sometimes painful growth process.

We should be careful and morally responsible in our use of our imaginations and never assume that our imaginations correspond to reality. In my essay, *Human Moral Nature: An Overview* found at <http://loydfueston.com/?p=1079>, I discuss my understanding of the proper way to form abstractions and proper use of imagination is an integral part of this way. Part of that essay presents a sketch of an imaginative journey from the concrete reality of an apish physical creature up into more abstract regions

~~2910~~ CHAPTER 616. LARGE NUMBERS OR DESIRABLE COMMUNITIES

of being where moral paths and Einsteinian spacetime paths are the same sort of entity. This is one way to define proper use of the imagination, you can stray from what has been concretely realized but you must stay in the domain of what is possible when considering the abstract stuff from which that concreteness has been shaped. We must also consider the evolutionary and developmental processes by which that abstract stuff is shaped into concrete things and relationships, including creatures with community lives.

To act as if something is possible just because you can string together words describing some sort of alleged good, can be morally irresponsible. Even to act as if the possible can be directly realized – and by late this afternoon – is just as morally irresponsible.

## 617 Raising the Ante on Passion: Nabokov and Gibson

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1269>. It was finished and uploaded on 2012/05/21.]

Many modern Christians can't understand why a distinguished man of letters, Vladimir Nabokov, would have written a novel about a man attracted to girls just before adolescence or perhaps just entering that ripening of sexual nature. The answer is as clear as the glorification of Mel Gibson's gory movie, *The Passion of the Christ*. We of the post-Enlightenment are a numbed people who need extremes to feel even the normal pleasures of human biological nature. Nabokov saw this and depicted this situation though himself disgusted by those sorts of perverse desires. Nabokov was quite clearly a man of civilized thoughts and feelings who was somewhat horrified by the predominance of barbarian children in the modern West.

Nabokov was right. We modern men are so numbed in our minds and souls and moral characters and – necessarily – even our glands that only perverse forms of love can reach the strong levels once felt in more normal forms by our ancestors, including novelists and poets and philosophers and shoe-makers and founders of evolutionary biology. At best, we are lukewarm inside of our bodies and in our minds. We find it hard to love God in the way of St. John the Evangelist or women in the way of Robert Burns or men and women in the ways found in the novels of Jane Austen. In general, the quiet passions of the Victorian Age or any morally well-ordered age are nearly impossible for us to even perceive in the pages of a great novel or in the memories some of us have of those born in the 1800s.

Then there are religious feelings, not so fully separate from sexual desires. Mel Gibson, in *The Passion of the Christ*, appears to have explored

a view similar to that of Nabokov with the rather important distinction that Gibson wasn't and isn't a civilized man trying to make some sense of a disquieting situation but rather a barbarian child who has himself been deformed as he grew up in a morally disordered age. Odd it might seem that such barbarian children feel empty inside, lukewarm in their desires. Odd it might seem that they can't appreciate simple pleasures and basic sexual desires so well as can those of ages well-ordered to the brink of outright repression. Is it the case that moral order increases the strength and maintains the proper focus of our normal animal desires? Or is it the case that we modern men are numbed because of the sheer complexity and fast pace of our lives? Or is something else going on?

I can only agree with Nabokov's artful and highly intellectual presentation, Gibson's childish and unconscious presentation, of our modern selves as being creatures needing perversions to reach levels of passion which our peasant ancestors met in simple encounters on the marriage bed or in worship services.

# 618 Running From Hell Might Not Get You to Heaven

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1323>. It was finished and uploaded on 2012/06/29.]

This article hardly surprises me: *Belief in Hell, According to International Data, Is Associated With Reduced Crime* found at <http://www.sciencedaily.com/releases/2012/06/120619093217.htm>. The findings summarized in the article also don't make me happy. I would advise against any major effort to scare sinners away from Hell because that doesn't mean they will necessarily go to Heaven. If they do go to Heaven only because of fear of everlasting punishment, Heaven might turn out to be Hell for them. Some Christian thinkers from the Middle Ages knew this and supposedly had a joke: Heaven and Hell are the same place. I'll let you think about that way of phrasing matters.

Mark Twain said somewhere that he couldn't imagine a Heaven compatible with Christian beliefs where Americans would be happy. Americans have typically been responsive to warnings of Hell, at least for the period of a revival meeting and sometimes for as long as a strong-willed preacher or priest ruled the local community of worship. Even Americans not so inclined have certainly been aware of the warnings about a Hell which is a place of eternal punishment. Who wishes to go to such a place? Not I. Not anyone I know. Most Americans I know are convinced they are going to Heaven because they are basically good people, at least not active criminals or sinners. Most of those Americans lead lives where they engage in a lot of activities, many of them part of a good human life, but they avoid worship and formal prayer and the like. Some who enjoy watching football games extending over an elapsed time of three or four hours will complain about

any church service which goes much over a half-hour or so.

Those Americans, typically considering themselves Christians even if they rarely worship in any community, believe (quite falsely) that the promises of Christ can be met only if we are born with immortal souls (whatever those are in the minds of 'believers'). Most clergymen and teachers in Sunday Schools or CCD programs will reinforce that belief. Apparently, few with faith have faith enough to believe the God who created Tom once can re-create him in Heaven. And so we immortal human beings have to go somewhere when we die. Heaven or Hell. If you flee Hell out of fear of eternal punishment, then surely you flee toward Heaven, a place of eternal bliss.

Actually, in the thought of Aquinas and other Medieval thinkers, most clearly as interpreted by the poet Dante Alighieri in his *Divine Comedy*, it's the outer circle of Hell, 'limbo', which is the place of eternal life with the sort of physical comfort which all healthy human beings will seek and many will nurture as the common element of nearly all their desires. Those Medieval thinkers speculated upon such an arrangement because of Aristotle and other pagans who were men of high virtue, of moral discipline. They were not God-centered men and couldn't possibly appreciate, maybe couldn't even feel a hint of, the spiritual bliss which is the 'atmosphere' of a life shared with God. So it was that Dante depicted the ancient Greek philosophers in that outer circle of Hell, enjoying moderate physical pleasure and walking about as they continued their discussions of metaphysics. Maybe there's a region of that outer circle where someone could move from a television viewing room to a theme-park to sports stadium.

Personally, I think we're born as human animals, clever creatures who are cousins of the great apes. We have no immortal nature nor any part which survives our physical death. If I can enjoy Heaven, then the same God who created me once will re-create me, resurrect me if you will, and I'll share the life of Jesus Christ. That is, I'll be a part of the Body of Christ for time without end, being fully a part of that Body while still being a man and a particular individual. I'll be me but, by an ongoing gift, I'll share in being God by being a member of the Body of Christ.

I'll put that aside and return to speaking about the more typical American beliefs. They think they will survive death and, thus, if they behave, they'll go to Heaven and be rewarded by a less troubled version of earthly life. For example, those who spent their spare time offering themselves up as passive consumers will apparently expect Heaven to include the most

comfortable sofas you could imagine, those sofas being set in front of large-screen televisions displaying a non-stop stream of infinitely pleasing shows. I could make similar statements of those who are obsessed with sports or amusement parks, those who think rock-and-roll concerts are the greatest of all pleasures, those who like to turn other cultures or entire continents into theme-parks, those who read or listen to good music but only that which is well within their comfort zone.

Comfort-zone. Passivity. I doubt if such is part of the life of Father and Son and Holy Spirit, nor will we be able to tolerate life without end if Heaven is what John Newton seemed to anticipate in *Amazing Grace*: we'll be ever worshipping and singing hymns as we join in the Heavenly Choir facing God. . .

No. If we were to face God for time without end, Heaven itself would turn into Hell. Worship of God would itself turn to tedium and even wretchedness if we remained men outside of God, even if we were near to Him (whatever that could mean).

Heaven is bearable only if we can actually share the life of God who is timeless rather than eternal but He took on eternal life in relationship to His own Creation when He incarnated His Son as a man, as a creature doomed by human nature to the grave, to an end. We share the eternal life of the Creator rather than the timeless life of God in His transcendence. At this point, I'll give credit where due: the Eastern Orthodox have always viewed our life after death in terms of divinization of our mortal selves. They never made the mistake of believing, implicitly or explicitly, that life after death is some sort of infinitely pleasurable DisneyWorld.

To zag now that I've zigged, I suspect that those will be resurrected into Heaven who can enjoy it, even if they were morally undisciplined and seemingly allergic to most forms of worship during their mortal lives. In some way, anyone who will be able to enjoy sharing God's life has to at least render God the justice of acknowledging Him as our Maker – see my article, *Justice: The First Step Towards God*, which can be freely downloaded at <http://loydfueston.com/downloads/justice.pdf>. From that point, we need to develop a true sense of life, we need to learn how to live by actively engaging God through His Creation, a Creation which includes churches and synagogues, prayer groups and bible-study groups, but also includes many other thoughts of God manifested as forests and lakes, human technology and human arts and letters. Let us prepare for Heaven by responding actively to God's Creation so that we shape ourselves to encapsulate the

thoughts He manifested in created being of all sorts.

## 619 *Leisure: the Basis of Culture: What is Leisure?*

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1333>. It was finished and uploaded on 2012/07/03.]

I'm re-reading *Leisure: The Basis of Culture* [114] by Josef Pieper. As Pieper plausibly, and I think correctly, discusses matters, the loss of leisure and the consequent loss of culture is bound up, at least in this age of men, with the process of proletarianization, that is, the limitation of men to their laboring aspects. Pieper writes:

In antiquity and the Middle Ages, the essence of the *artes serviles* was held to consist in their being directed, as St. Thomas [Aquinas] says, 'to the satisfaction of a need through activity'. 'Proletarianism' would then mean the limitation of existence and activity to the sphere of the *artes serviles* – whether this limitation were occasioned by lack of property, State compulsion, or spiritual impoverishment. By the same token, 'deproletarianizing' would mean: enlarging the scope of life beyond the confines of merely useful servile work, and widening the sphere of servile work to the advantage of the liberal arts; and this process, once again, can only be carried out by combining three things: by giving the wage-earner the opportunity to save and acquire property, by limiting the power of the state, and by overcoming the inner impoverishment of the individual. [page 40]

Later in the book, in the second essay, he argues that leisure is related to the spirit which he considers, plausibly and without superstition

or enthusiastic mysticism, to be a relationship to the entirety of Creation, certainly within the context of what you can be expected to know of the various realms of created being. After all, he's an admirer of Aristotle and Aquinas, neither of who could have imagined how vast and rich and complex created being now seems to be, but those thinkers tried to understand all that they thought to exist.

To have leisure, or to take leisure by making sacrifices in your practical life, is to have a sense of wholeness, of Creation and, by reflection, of your own self. It is to have a self in the fullest sense. If man is capable – in principle – of understanding all of Creation and even a little about God in His transcendence, that man reaches his greatest fulfillment in gaining some such understanding, however imperfect and incomplete it will be. Moreover, by gaining that understanding, man makes a foundation for a civilization, an immature and incomplete Body of Christ – most likely very immature and incomplete for sure but we must grow slowly and carefully toward a higher state of communal being as well as toward a higher state of individual being.

Leisure can be active in its own way, at least in some phases of a healthy and more complete human life. It's even possible that leisure might seem much like servile labor at times. It's been ten years since I've lived where I could have a garden, but in those days – partly because I grew vegetables and flowers for pleasure and not out of need – gardening was leisure and yard-work was servile labor in that older language that Pieper uses to good purposes. I mowed the lawn so it would be neat and relatively free of annoying bugs; the goal was to have finished mowing and that goal was often on my mind as I pushed the mower around. When I gardened, I would lose myself in the activity – not always to be sure, but often. I gardened because I enjoyed the activity and it was a break from my reading and writing, giving me a chance to let ideas and plots and character developments stew around quietly in the back of my mind. But, even that need to relax from the strains of writing was not the real point. I enjoyed building soil and seeing plants grow. I enjoyed the feeling when I stuck my arm up to my elbow in soil which had been supplemented by home-baked compost and which had not known human shoes for a few years. I achieved a state of oneness with certain aspects of Creation by working with the things and forces of nature.

I think that even some farmers who live off their produce are in a state of leisure part of the time when they go about their tasks. In a similar way, someone like me is often in a state of leisure when I'm doing difficult reading

to prepare for advancing in my thoughts or just because I have a feeling that it might be good, perhaps useful by accident, to know something about an era in human history or about a field of physics. Even when I'm struggling through a boring stretch of a history of the Middle Ages or through some calculations hard on my middle-aged brain, I'm doing what I wish to do, what I feel called to do, and I'm often in a state of contemplation about the greater scale aspects of my work.

Perhaps leisure is the state in which our active responses to Creation and Creator begin to bear fruit, the state when we become something like images of our Creator because we've encapsulated the thoughts He manifested in created being, however incomplete and defective that encapsulation might be.

## 620 *Leisure, the Basis of Culture: Ends and Means*

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1339>. It was finished and uploaded on 2012/07/10.]

In *Leisure: The Basis of Culture* [114], Josef Pieper makes this qualification to the separation of leisure and culture from the pursuance of (mostly practical) goods:

[T]his is not to say that there is no sort of connection between the fulfilment of the ‘common good’ and the philosophy taught in a country! Only the relationship can never be established or regulated from the point of view of the general good; when a thing contains its own end or is an end in itself, it can never be made to serve as a means to any other end – just as no one can love someone ‘in order that’. [page 77]

I also think there to be such a “connection between the fulfilment of the ‘common good’ and the philosophy taught in a country” and I also can’t say quite what it is. Part of the problem is that of scale, over time and geographical space and over the large and conflicting goals and goods of the various residents of any country. Philosophers cover vast scales in one sense, that of moving up to abstractions which are the stuff from which many concrete situations are shaped, but ‘goods’ for mortal creatures are mostly those concrete manifestations of bundles of abstractions and we can’t trace back easily or accurately to the abstract stuff of philosophers or mathematicians and theoretical physicists.

A philosophy can seem right for a country, or more appropriately, a civilization, and it can be conducive to the ‘common good’, but it’s far

too complex and complicated for us to say how it is that Augustinian or Thomistic teachings on political philosophy might have helped create the conditions for the modern liberation of the common man. It seems just as complex and complicated to draw closer to, say, the founding of the United States and to speak about the effects that Locke's teachings and those of Hobbes may have had on the thoughts of Jefferson or Adams or Hamilton – none of whom seem to have been partisans of a well-formed philosophy as such. It most certainly isn't easy to understand the effect of the political teachings of the Jesuits who happily passed on the reluctant admission of St. Thomas Aquinas that even a king from a dynasty of long tradition could be overthrown if he refused to serve or couldn't serve the public good.

There are a number of angles from which I could approach Professor Pieper's claim but I'll start with the correction I made in the first sentence of the prior paragraph: though schools of philosophy originate in specific locales, I think countries as we understand them are the wrong scale for true schools of thought grand enough to be named as philosophies. That is, countries are the wrong scale for both time and space. In fact, I think spacetime is the correct setting for such definitions. Our awareness of the human race extends across the entire globe and back to the first stirrings of our single-celled ancestors. We have some plausible ways of projecting human life into possible futures. Even now, human life is already so complex and involves so many individuals and communities and so much interaction with our universe as to render implausible the simpler views of, for example, moral paths based upon simple ideas of human beings traveling through time across a Euclidean landscape. The space and time of human life and certainly of human communities interact in ways that force us to develop more complex geometries for visualizing and analyzing and describing human lives and human communal lives.

There is certainly a sense in which parts of a more general way of thought, such as a political philosophy drawn from Thomism or from Lockeanism, could be customized to the needs and desires and local beliefs of a country but something so grand as a true 'philosophy' is scaled more to the level of a civilization, the West and not even English-speaking peoples let alone England or the United States. The greater insight is that there is a level of abstraction where the human intellect, the communal mind, is the same as a civilization. The individual human minds are also somewhat the same because my mind is, so to speak, a localized and far more limited version of the communal mind of the West or at least of some civilization or

phase of the West which is still in an embryonic form. (The individual also has certain freedoms of movement not available to the entire community, but I'll not try to deal with that issue here.) So it is that an individual mind is also an encapsulation of Creation or any lesser understanding of what exists. Even the greatest communal mind we've yet seen, that of Western Civilization, perhaps a hundred years ago before the processes of decay intensified, was very much imperfect and incomplete. Any individual mind, even one so magnificent as that of Goethe, was far less complete than the communal mind of the West but possibly less imperfect in the sense of being more unified and coherent.

The three necessary characteristics of some very important entities, worlds and human persons and moral communities and divine Persons are unity and coherence and completeness. The entities of this sort which are yet growing and developing will be at various states with regard to these characteristics. A mortal human person, in his mind and his moral character, will promise the fulfillment of those characteristics but won't deliver. A resurrected human person sharing the life of God will be at least well on the way to fulfillment of those characteristics, however much even a perfected and completed human person will fall short of the three divine Persons. Similar statements can be made about various scales of human communities right up to the Body of Christ.

A philosophy is a major part of a human mind, it is his understanding of created being, at the level of concrete being and at the level of abstractions. Of course, the perception and understanding of concrete and abstract being were different in ancient Athens than they were in Medieval Paris. Moreover, they are currently different on the campus of Stanford University from what they are in a small town in Arkansas, and both of those understandings are far different from my worldview. This diversity is mostly good though diseased views of created being, including human nature, can grow up and can even threaten the health and sanity of an entire civilization.

A philosophy serves the 'common good' of a civilization by allowing the most unified and most coherent and most complete possible understanding of created being available to that civilization. Such a philosophy is liberal in the proper sense – open-minded and generous and true to what seems at least plausible. Such a philosophy isn't unique. Even at the most abstract level of understanding being, there has ever been a conflict between full-blown, 'essentialist' forms of Realism (such as various forms of Platonism), moderate forms of Realism (such as Aristotelianism and Augustinianism

and Thomism narrowly understood), and a form of moderate Realism which has taken a radically existentialist turn (such as Thomism as interpreted by Etienne Gilson and others including me). Fit the philosophies of Kant and Locke and Hegel and James in there as you will. The actual situation is, of course, messy and calls for another grand work of history of Western philosophy as much can be seen more clearly during or perhaps a little after the collapse of a phase of a civilization, or – equivalently – the collapse of a group of understandings of created being, the collapse of existing philosophies as men of an age lose their way in the cosmos and consequently lose the moral order in their communities and in their individual souls. We often can better understand the meanings inherent in an individual or a community after he or it is no longer with us.

I've made it clear that I'm on a mission to establish an understanding of created being, allowing for Christian truths and modern empirical knowledge, which will allow a great 'common good', the foundation of a new civilization or – even better – a new phase of Western Civilization. I don't know how to define more precisely the particular 'common good' to which I work because I can't see the future. I can't define it even so well as Aquinas or Kant could have defined it in their different historical periods, their different times within the life of Western Civilization. I can claim that I'm working toward a philosophy for a Christian civilization, a way of viewing created being which will allow residents of that civilization, full believers more so, to live morally well-ordered lives, will allow them to plausibly achieve some sort of balance in the different aspects of a good, full human life.

There isn't any 'common good' of a well-structured sort, not any engineered product. I speak of goods which are those of organisms and communal entities which are organic in more ways than not. Ultimately, the 'common good', at least to us Christians, is what is good for the purposes of the Body of Christ as a whole or of major organs. The 'common good' we should seek is the healthy development of a child not under our control but partly under our care, a child which will show its inclinations and talents as it grows, a child which is not to be healthy if its caregivers were to force it into a predetermined mold. Call it a communal child if you wish for we are part of that child. That insight points to various complex interactions which further emphasize the need for more complex and more complicated ways of understanding with our human lives and our communal lives.

In this light, the common good can be seen as involving practical, even

material, goods. Even those sorts of goods can be impossible to plan for – How many in the early centuries of the modern era would have foreseen anything like the engineering schools so important to our material prosperity? – but what is hardest to foresee and plan for is the goods related to such matters as moral character. When it comes to those matters, we need to rely on intent as defined by St. Thomas Aquinas. Under this way of thinking, we can say we intend towards the goals of a good human life and also good communal lives, morally well-ordered lives with the proper sorts of material and cultural goods, and we can move forward towards these goals one step at a time. But those goals are actually a huge expanse of twisting and turning settings for the stories which are our lives and the stories which are those of our particular communities and even the story which is the universe seen in light of God's purposes for it. The goal, the end towards which we target ourselves is open-ended until it's past and we see what we have accomplished in response to, in interaction with, our environments. We understand the ways in which we truly met the 'common good' and the ways in which we failed by looking in the rear-view mirror, but we should quickly turn our eyes back to the direction in which we move.

## 621 If It's Forced, It's Probably an Act of Rebellion Against God

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1342>. It was finished and uploaded on 2012/07/14.]

In Chapter 620, *Leisure, the Basis of Culture": Ends and Means.*, I tried to distinguish between ends of shorter- or longer-term. I came to a humbling conclusion that we can't shape the future but only "intend towards the goals of a good human life and also good communal lives, morally well-ordered lives with the proper sorts of material and cultural goods, and we can move forward towards these goals one step at a time. But those goals are actually a huge expanse of twisting and turning settings for the stories which are our lives and the stories which are those of our particular communities and even the story which is the universe seen in light of God's purposes for it. The goal, the end towards which we target ourselves is open-ended until it's past and we see what we have accomplished in response to, in interaction with, our environments. We understand the ways in which we truly met the 'common good' and the ways in which we failed by looking in the rear-view mirror, but we should quickly turn our eyes back to the direction in which we move."

This truly is humbling according to our current conceits, our current faith that we can know what the world is supposed to be now and at some spacetime ahead of us. Far too often we seek to shape the world to match those vague dreams we have which are shown even in many mindless movies, to be nightmares. We can't really build the world of the Terminator but we can build one where robots of various sorts roam about surveilling children or nudists or maybe child-like nude terrorists in their backyards. And sometimes shooting missiles or other projectiles at them. Shoot first and

find out later if you shot a gathering of terrorists or a wedding party; likely enough, you'll find out from some alternative news site on the Internet.

We take risks we don't understand when we force the world or the things in it to correspond to some vague image in our minds without understanding the consequences. We lay asphalt to make accessible wilderness regions – surely one of the silliest ideas of modern men – even as we forbid ranchers to protect their herds from wild animals. Grizzly bears and wolves can't be shot because we're busy turning them into characters in some grotesque movie about the sheer cuteness of wilderness. We destroy communities by forcing peoples to live together in blocks of concrete buildings where neighbors can't speak each other's languages or respond to each other's rules of behavior and we fund strange political groups which push out of power the more natural leaders and institutions such as the traditional ministers of African-American communities. When we act in such a way, we aren't intending the good but rather seeking to feel good about ourselves at the expense of others. For goods, communal or individual, are what prove to be good when we live our communal or individual lives in morally well-ordered ways.

The possible goods are constrained, greatly in the near-term and less so in the far-term, by our physical stuff and our cultures. Who knows what possible goods can be obtained in the long-term future? A Christian should believe that in the very long-term, not to be actually reached on this side of the grave, we will achieve a state of individual and communal perfection. The form of that perfection is certainly a matter of faith though I believe many men of various faiths can look in wonder upon all that has been achieved towards the goal of a god-like man and a human community encompassing all who are of good-will.

Clever, apish creature have gathered together into various sorts of communities which have built cities holding tens of millions and possessing huge sewer and fresh water systems. They have developed technology which would seem no less than magic to men of even a few centuries ago. They fly through the air at speeds far beyond those of hawk and eagle. They move thousands for thousands of miles in aircraft carriers built of concrete and steel and powered by nuclear fission processes based upon scientific principles unknown to even Einstein when he proposed his theory of Special Relativity and that of General Relativity. They have included the likes of Virgil and Mozart and Monet. They have brought deserts to bloom and can even, to some limited extent, live on the Antarctic ice masses. They have

flown to the Moon and will likely one day reach Mars and maybe beyond.

And they have done much to damage the earth and the seas and to litter even space miles above the earth's surface with now useless hunks of metal and plastic. They have waged horrible wars and have engaged, and still engage, in the immoral exploitation of other men and various sorts of nonhuman creatures. They have not always had the proper moral intentions, that is, the proper sort of active moral growth and development, nor have they always done what they should have done to develop proper relationships in their various communities and with other communities.

Progress is for real, but not automatic nor is it guaranteed to prevent any given war or ecological abuses or exploitation of other human beings. But we do move forward, purposefully but not according to the plans of any mortal creature. We move ahead according to the plans and purposes of our Maker. To me, this means we move forward as the Body of Christ matures, being completed and perfected, neither of which is to be a done deed before this world ends. At the same time, we should realistically evaluate what has been accomplished over man's time on earth. From creatures who made tools from flint and wooden shaft, we have become creatures capable of shooting rockets into space or nuclear-armed missiles at our enemies. We can feed billions and show some signs of raising the standard of living of many of those billions – if we can control our warmongers and other scoundrels. We have conquered many of the old diseases and parasites and have developed skills which might allow us to minimize the damage of any new diseases and parasites before they cause too much suffering or death.

Men descended from Celtic tribesmen who migrated to northwestern Europe from somewhere near modern-day Russia/Ukraine have learned of the existence of the native tribes of Australia and the Amazon River basin and have learned to speak with them and to somewhat understand their ways of thought and feeling. Men descended from Semitic desert warriors and now living in many lands have explored this universe back to the beginning of this stage of expansion, some 13 billion years or more, and have learned truths and have made plausible speculations about the nature of spacetime and of matter which wouldn't even register on the minds of Plato and Aristotle and would amaze Newton and Laplace and even Planck.

All this has been accomplished not by the grand planners of our race, for only God can truly remember and understand human history and can conceive of the possible pathways we'll travel in the future. We are his children and his apprentices and He has blessed us with the sorts of minds

capable of remembering and understanding but even ignoring the weakness and smallness of those minds, we have to recognize that freedom, including our own moral freedom, lies at the instant where our future is being shaped. We have not the total freedom of God Himself – not, that is, until we share His life in the world of the resurrected. The future we would need to foresee is being shaped now as each entity in this world moves forward as it will, sometimes with little freedom and sometimes with none. There are precious and dangerous times when we human beings have a great deal of freedom to choose our future. We should be prepared for those times, but even then our ability to shape the future is limited, however great it is by the standards of mortal men.

The Founding Fathers of the United States acted courageously and won some substantial forms of liberty for themselves and the other citizens of the rebellious colonies. A seer might have forecast a glorious future and some of that glory was realized but the American citizenry proved itself unready to handle the responsibilities of political and economic freedom and problems built up slowly by the standards of one human life but rapidly by historical standards. Those Founding Fathers didn't design a country nor did they even structure a government as such. From the administration of George Washington right up to that of Barack Obama, Presidents and cabinet officials and bureaucrats have been busy constructing more or less plausible structures costing increasing amounts of money and placing more constraints upon the activities of Americans and other residents of the United States.

The initial ideas were good and the Founding Fathers, as a group battling each other as much as the British and the French revolutionaries and the native Americans and anyone else standing nearby, stepped forward into a vast and open region, not necessarily restricting the particular directions or the developmental activities of future generations. One of the problems with history, particularly in the Modern Age, is that we have no reverse gear and only weak brakes on our communities as they move into those vast and open regions, moving more as a herd and less as an intellectual community of intelligent and morally self-aware creatures.

No brakes and no reverse gear and we are heading toward tough ground, probably not a cliff but toward a region so rough that it's breaking the herd into smaller groups. Many individuals, many groups, might not make it through the rough times ahead.

We shouldn't be pretending any longer that we are in control and

shouldn't be assuming our leaders have so much as a clue what they are really doing though they have what passes for a vision of reality which is nothing short of insane and perverse. We are being forced into ad-hoc improvisations and don't realize we're being dragged and driven as part of a herd into the worst of the regions ahead.

One point to remember is that we're still moving forward. We might act so badly as to drive ourselves back to a state of primitivism and might even act so badly as to pretty much wipe out the human race. Both of those situations seem unlikely. It seems to me more likely that we'll lose much of our prosperity and the so-called advanced nations will lose a lot of their power though they might still remain the dominant nations in a world reduced in ways that will force one and all to concentrate on more local matters. Consider that likelihood to be a rebalancing act built into the workings of this world.

God's story moves forward.

Each of us plays a role in this story, as does each and every living creatures and, indeed, each and every nonliving creature in this world. Some human beings have humble roles, whether that of running a family farm and household or studying and writing about the history of human thought. Others have roles which are more like those humble roles than not, but they are, in a manner of speaking, highly leveraged in future effects so that there is an air of greatness about them, such as finding the way of sustainable and humane living in a world of greater population and greater mobility than we've yet learned to handle or developing a way to understand the world so that the efforts of concrete reformers can be brought together into a coherent whole, a new civilization or perhaps a new phase of Western Civilization.

It's God and only God who can know what the long-term effects of our actions will be, our wise and unwise actions alike. Only God knew at the ratification of the Constitution of the United States that it would prove to be a fruitful failure, a certain sort of false path in the evolutionary processes driving toward a political organ suited for the Body of Christ. To be sure, I suspect the underlying project will yet move on and might result in something like a federation of republics living in liberty might grow up from the ruins we're about to leave over much of North America, but it's far easier to see failure, especially in its late stages, than it is to see what good or bad might come of that failure.

It's God and only God who can shape landscapes so that our efforts as

pioneers and settlers work toward the purposes He has set for this world, the purposes for which He created the raw stuff of created being and then shaped it by some complex processes to make it into this world. From our position in Creation, we see local processes naturally and have not yet figured out how evolution can produce such complex entities by way of processes which are blind to the future. True it is, that we can see hints about a part of the entire process, possibly a very small part, when we try to consider the world into which evolutionary processes select for survival – to consider the most important but certainly not the only process of biological evolution.

We have the sorts of minds which can understand what God has done and is doing in this world, but even at that we see the concrete manifestations of God's work and can't penetrate to His power as the God who can create from nothingness. That power is at work even as I write and is part of the mystery of His story-telling. I think that even there we can learn to speak as if we understood God's powers as a true Creator. Speaking in such a way, we will shape our minds so that something akin to true understanding will grow over time. We can do this, more humbly – we can play our individual roles, if and only if we work without ceasing but work toward goals which we can truly see without deluding ourselves that we can see far into the future, without puffing ourselves up to believe we can know and work toward the truly and absolutely and permanently good human society, without thinking to take over the telling of God's story.

It is sufficient and noble enough that we learn to properly live the stories of our own selves and of our well-formed communities without thinking we are the ones chosen from all time to settle the form of the communities yet in early stages of evolution and development. We are certainly not the ones to form the Body of Christ. That Body is forming as a result of progressive forces which seem at times to be as lacking in purpose and in moral order as the processes we observe in biological evolution and human history. Moral order, as well as other sorts of advanced order, have come into being but not in any way that allows us to set down in textbook fashion how it is that a sometimes brutal struggle for survival has resulted in the moral order of a wolf-pack or that of a Buddhist monastery. As surprising as it might seem at first, it's easier to see the struggle for power of Soviet functionaries or American bankers and politicians as part of that bloody struggle for survival which produced velociraptors and rattlesnakes.

We can perhaps see a little bit better if we consider those violent events

known as volcanic eruptions. They cover forests and living creatures with melted rock or smash them with rolling masses of terribly hot gases and ashes. They reshape the earth's surface. They have built the Hawaiian Islands and many of the islands off the coast of southeast Asia. They have reshaped some regions of the west coast of the Americas into beautiful homes for creatures much like the ones which were buried under molten rock. Some of those regions have proven to be useful to man as harbors and recreational areas. In these natural events, we can see hints of a Creator who works toward His goals by methods often violent and often locally destructive – until other natural forces start the processes of healing and making a region of the earth's surface still better than it would have been otherwise.

I wouldn't enjoy being a victim of those violent forces and I don't look forward to spending the rest of my life in a world which will likely be relatively impoverished and subject to the violent forces of war and mass immigrations of desperate peoples and – likely enough – famines and epidemics of historically short-term but devastating sorts.

Do I pretend to be a seer? No, but I know enough of history to know what will happen when dramatic changes need to be made and established power-elites, or other human or non-human entities, struggle to block the building pressures. I live in a neighborhood with a very thin layer of loam over dunes of sand and gravel which were built up during ice ages when the Chicopee River flooded the local valley and formed a lake. There was at least one period when the entire Connecticut River was blocked by a huge ice dam near modern-day Hartford down in the state of Connecticut. Near the end of that ice age, that dam gave way and the rush of water is said to have sliced a wide and deep canal right through Long Island.

To the extent I can see even shadows of the future, I don't see any events so violent in our near-term future, but we have tried to block and continue to block the forward movement of God's story and we do so primarily by not moving forward in our own lives and in the lives of our better-formed and local communities. We have ceased to move toward the state of civilized beings, human beings in formation as members or at least as-if members of the Body of Christ. We sit on our fat behinds and wait for others to entertain us or perhaps we become so active as to head down to a resort on a Caribbean island or – the horror of it all! – to DisneyWorld. Or maybe to the Superbowl where we can live the dissolute week gloriously parodied by Hunter Thompson. We no longer truly get our own jokes, perverse as they

are – we now think it funny that we distort our own beings for the sake of enjoying pleasures which aren't always despicable but they always are so when we engage in them as if deliberately blocking our own moral maturing processes and, more generally, our own proper acts of moving forward as God tells His story.

Now perhaps we can see more clearly why it is that we don't let God tell His story. He isn't telling a story we like. We have taken up with the pleasures preferred by some of the more perverse members of the human race. Too many of us have let those perverse creatures, but not necessarily evil creatures, steer us in our individual lives and in our family and kinship and church and neighborhood lives. Rather than taking in those perverse creatures and trying to teach them the sustainable pleasures of craft hobbies or music performance or serving others in charitable activities, we've allowed them to teach us that pleasures are exciting and exotic and always far different from the simpler pleasures our grandparents enjoyed in gatherings in the backyard or on the front porch or at the church or town community center.

The same can be said in the specific realms of politics and economics. Certain perverse men who have come to love the life of political intrigue and international crime of the sort glorified in so-called thriller novels have moved toward the centers of power and have distorted governmental actions in ways that would mystify the most greedy and ambitious of robber barons from the 19th century. By this, I mean that the Rockefellers and Morgans and others interfered in domestic politics or the governments of other countries for the purpose of making money and gathering power into their hands, not for the thrill of engaging in espionage and not to systematically reduce large regions of the world to unprofitable chaos. Various serious thinkers from about 1900 (W.E.H. Lecky, Henry and Brooks Adams in their different ways, Henry James, and so on) saw the American political class as the most corrupt in the world. We've gone on to corrupt much of the world. And it's no longer just the political class which is corrupt, morally disordered in a thoroughly ignoble way.

This is a large part of the reason for the extreme anti-government attitudes of some modern liberals, such as those who call themselves libertarians. They see American forms of government and political activity and those of other 'exciting' periods of history and see government as evil and inherently corrupt – for good reason – and conclude that governments and political activity are always evil and inherently corrupt. This seems akin to

labeling sex as evil because it's misused so often in disordered communities such as many in the modern West or those during the exciting years of the establishment of the Roman Empire. It's no different from those American muckrakers who labeled all businessmen as greedy and corrupt because of crimes committed by some in the Robber Baron generation. Some generalize unwisely from the crimes committed by politicians, some from the crimes committed by bankers, some from the crimes committed by warmongers in the aerospace industry. All good human activities can be corrupted, the more powerful the potential good, the more powerful also the potential evil. When we misuse our gifts systematically, we fall into, or perhaps rush into, a state of rebellion against the Creator. We refuse to play our proper roles in the story which the Creator is telling, the story which is this world. We try to play God, choosing to shape human societies rather than steering them toward better ordered forms. We choose to rise above morality, committing evil acts for the sake of some long-term and quite imaginary good.

The form of the modern American rebellion against God and His story is that of perverse and morally immature desires for exciting lives of intrigue and conquest and war. We have shaped our understanding of human history according to James Bond movies and science-fiction nightmares and *All in the Family* and the self-deprecating humor of our stand-up comedians who seem not to realize we have no substantial or morally ordered selves to ridicule gently or harshly. We don't really know the Bible or its historical setting, nor do we know the contents of the books written by Jaroslav Pelikan or Carroll Quigley or Jacques Barzun or Michael Grant. Nor do we know much about the lives and thoughts of Julius Caesar or the Medieval popes or Amadeus Mozart (though we know some of the historically absurd claims of an otherwise interesting drama about someone named Amadeus) or Thomas Jefferson or the Iron Duke or the great generals of World War II.

We live in a world shaped more by Disney and the strange mixture of lies and often decontextualized facts found in Coppola's movie *Patton*. We know about alien races meeting in bars in some far region of the galaxy and we know the distortions of the political activities of FDR and Eisenhower which were, more or less, shaped by our journalists and our movie-makers to the needs of our two major political parties.

The modern American in general has a very strange idea of the nature of history, largely centering around some view of the United States as some

sort of morally pure entity which is opposed by other nations only because those others are evil and have not yet seen the God-ordained goodness of the United States and its leaders. Individual leaders of the United States or leaders of allied countries often have more limited goals of more normal sorts of greed and ambition, but the system as a whole is so strange and so rebellious as to invite the claim that the United States have become some sort of corporate anti-Christ knowing what God should have made this world to be and in the process of making it so.

In the end, God will smash all those insane enough to think they can shape the world and design human beings and human communities to meet their own plans. And He will necessarily smash an awful lot of innocent men and women and children as well.

# 622 Man, Society, and the Body of Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1408>. It was finished and uploaded on 2012/09/25.]

## 622.1 Some Preliminaries

Human beings think and feel and act and do so in response to what lies around them. As various communities have advanced in the way of civilization, they've done so—thought and felt and acted—in response to some more or less plausible worldview covering created being in its abstract realms as well as this concrete realm. That worldview has to have not only some understanding of concrete stuff, such as human flesh and blood, and abstract stuff, such as geometric relationships, but also an understanding of the specific narratives in which human beings and human communities live, including that narrative of the entirety, the story of the world in which we live. Call it a cosmogony leading into an ongoing story if you will. At times, some of the abstract realms of being were, and are, brought in by way of mythical terms, such as vaguely apprehended forces personified as gods or spirits or daemons or as a story in which the meaning of human life and human lives are given a purpose and meaning at the very beginning of this world.

In my way of thinking and speaking, many myths are valid efforts of speculation given a limited set of tools and limited empirical knowledge. Myths become superstitions when they don't properly use the best empirical knowledge and the best thinking methods available to the participants. Let me write briefly about the subject of the world of the resurrected, Heaven

in traditional terms. The ideas of Heaven found in better quality works in the Middle Ages, most certainly the great poems of Dante, draw upon the best understandings of what we call the universe and was often called the Cosmos. There is a problem here, which I've perhaps aggravated by using the term 'universe' to designate one possible entity in the concrete realm of Creation. To Dante and others before and after him, the Cosmos was all that God had created; some even seemed to imply, by way of Heavenly thrones and the like, that God Himself lives in this Cosmos. In any case, Heaven, the home of the blessed, was seen as simply the 'highest' or 'purest' region of the Cosmos. Heaven was a real place. In principle, creatures could make the journey from Earth to Heaven though men were missing angelic wings. The point is that Heaven and Hell were part of the same Creation as Earth in a way that made sense to men accustomed to Ptolemaic models of the Cosmos—in fact, I'm sure most men thought in terms less sophisticated than a geometer but compatible with those models.

In Chapter 199, *Theories, Meta-theories, and Meta-etc*, I dealt with the correspondence between created being and human knowledge. In this context, 'knowledge' includes feelings disciplined to the circumstances and also proper activities. A human being is a microcosm, more so if he makes a morally guided effort to shape himself to reality as he best understands it given his abilities and those of his communities. Unlike creatures mostly limited to the concrete realms of Creation, including perhaps some small amount of abstractions in the case of social animals, men can encapsulate the more abstract realms of Creation. We can't go beyond on our own powers; thus are transcendental realms beyond our reach except for some small bits of knowledge revealed to us by God.

We human beings are creatures of empirical reality, in its directly perceptible concrete aspects and its abstract aspects as well. Our communities are no different in this regard, except perhaps for having a relatively higher proportion of abstract aspects. The Body of Christ as I conceive it will draw fully upon all realms of Creation, from the concrete realm of material objects to that of the truths as manifested by God as the raw stuff of Creation.

This entire line of thought has led me to reconfigure a book I'd been stuck on. I had planned for the entire book to be about the human mind. Now, I'll be dealing with the complete human being, mind and heart and hands. Moreover, I'll try to put my understanding of the individual human being into the context of the spectrum of created being (abstract to con-

crete) and also the context of the developing and evolving Body of Christ.

I'd been worried about that last and ultimate goal of understanding human nature in terms of Christian beliefs, that is, in terms of the promises Christ made to those He's chosen to raise from the grave that they might share His life for time without end. As I've interpreted it, in line with Christian tradition and also modern understandings of created being which tend to be both profound and incoherent, I've seen this resurrection into true life as an enfolding into the Body of Christ. In that body, the members will remain individuals while being truly the one Body of Christ as Father, Son, and Holy Spirit remain individuals while being truly the one God.

The goal is to be able to discuss all of this in a way that's rational and coherent. I realized I couldn't discuss mind apart from other important aspects of human nature when I read some of the works of Jacob Neusner and sided with him and the Judaic Sages he's studied so lovingly and written about so powerfully—see Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*. Mind, heart, and hands are the aspects of a human being which must be considered when we study what the modern students of those Sages would call a 'mensch', a true and God-centered man.

From a Christian point of view, we complete the work of Jesus Christ by first taking up discipleship as individuals and then working to complete the Body of Christ, the community which includes not only Jesus Christ as head but also all of His brothers and sisters as members. We do this in various ways, using hands and heart and mind. As a Christian, I'm particularly concerned with the formation of the Body of Christ, including the ultimate intellect, that is, the capitalized and communal live mind of that Body—in terms of Jacques Barzun's definition from his profound discussion, from a secular and cultural viewpoint. See my discussion of Barzun's book, *The House of Intellect* [7], in Chapter 127, *Intelligence vs. Intellect*.

The intellect hasn't been doing so well in the Christian Church for at least the past couple of centuries. Etienne Gilson made the claim that Catholic intellectuals had failed to come up with good, Christian answers to the legitimate questions raised during the early phases of the Modern Age and then, when some very bad answers had shown themselves in anarchy and the guillotine, those Catholic intellectuals had led the Church into an intellectual ghetto. Protestants did no better though the details were different. Nor do I see signs that secularists, Christian or nominally Christian or non-Christian, did any better in terms of an overall understanding though

they produced—perhaps—better individual works than those of Christians in the West. In this twentieth century after Christ, Catholic intellectuals continue to think, feel, and act as if we can inhabit a concrete realm of Creation described well by Einstein and Darwin and then talk about greater truths in terms given us by descriptions of this concrete realm from the 18th century and earlier. I'm suggesting that modern Christians, including the best of our intellectuals, don't even have an understanding of created being, in particular—human nature in its individual and communal aspects, which will support a view of the Body of Christ which is sufficiently rich and complex to seem plausible in light of modern human communities in this mortal realm.

Let me move on to a rough view of the human nature in its individual and communal forms, including the ultimate community, the Body of Christ.

## 622.2 A plausible description of individual human beings

I gave what I consider a good framework for a plausible description of individual human beings in the essay I referred to above: Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*.

[M]odern biological sciences including evolutionary biology support the idea that emotions aren't some sort of imperfection in the human being nor do they merely exist to give us epiphenomena to color our existence in a world which is 'just material', let alone 'only logical'. Most biologists who have had reasons to express opinions on the importance of emotion to thinking don't even consider emotions to be primarily short-cuts to conclusions we would reach by thinking if we had the time. There is that element in feeling but also in thinking and doing. They are different aspects of acts-of-being, more fundamental than even substance, and thinking can help us when our feeling is inadequate—as any Catholic would know from reading a guide to confession which will tell us an intellectual repentance suffices when we can't muster up the proper depth of feeling. Similar statements can be made about all these three aspects of human efforts to participate in God's acts-of-being: feeling, thinking,

and doing. They can each help the others along and perhaps a resurrected and perfected human being would become God-like in that he would no longer feel, think, or do without doing and feeling and thinking, all three at once and in each and every act.

We are given a sort of concrete human nature, including a very complex brain, which allows us to shape ourselves to encapsulate some relatively greater or lesser part of Creation. We understand Creation, created being, by these active responses, those of Fred Astaire and those of Vincent van Gogh as well as those of Albert Einstein—a viewpoint advocated by such prominent neuroscientists as Gerald Edelman and Walter J. Freeman, both of whom have written books which provide pleasure as well as wisdom to the truly literate reader. The neuroscientists Jerome Kagan and Antonio Damasio are but two who've written accessible and widely available books on the irreducible importance of emotions to human life.

If we are to understand Creation, spacetime and matter and all other components and aspects, then we'll understand by shaping ourselves to encapsulate Creation. We won't understand Creation if we start by misunderstanding ourselves and trying to fit created being into 'logical frameworks'. We have no such 'logical frameworks' in our brains in which to fit Creation and have no reason to believe Creation could fit into any such frameworks if they existed. In fact, even when we try in ways more proper to human nature, we're too small and too imperfect to understand much more than a vanishingly small bit as individuals and not much more even at the level of the community of the entire human race. But we're making progress in understanding some parts and some aspects of Creation, a surprising amount of progress given our small and imperfect selves.

Do those components of human understanding, feeling and thinking and doing, really respond to irreducible components or aspects of Creation? Let me first paraphrase Einstein in words he wouldn't use but I don't think he would object to the general thrust of my ideas: Our understanding of created being should be as simple as possible, but no simpler.

Reduce reality to its various components and aspects but stop reducing when you reach components or aspects which can-

not be used to fully explain or to ‘reconstruct’ each other. At that point in the process of analysis, it’s time to look for explanations which include all those seemingly fundamental components and aspects. You might be wrong and the next few generations might busy themselves taking your fundamental components and aspects apart to find still smaller particles. First, we searched for atoms, a search which had lasted for centuries and went through such strange paths as alchemy, but did result in the deep knowledge summarized in modern periodic tables of the elements. Then, we explored subatomic particles and discovered electrons and protons and neutrons and then strange hints of particles which didn’t fit into the simple scheme of things. Then we found out that there is a large zoo of particles out there and they seem to be broken pieces of more symmetric entities. [A still more complex process has started in which modern brain-scientists and evolutionary theorists are replacing the idealistic psychologies given us by St. Augustine and Freud and others.]

God acts and feels even as He does, and so forth. The Almighty is unified, and coherent and complete, in ways that aren’t possible to us—at least in our mortal lives. Why can’t we be unified in this way?

As noted above and in many of my essays on this blog, the concrete forms of being in this universe are the results of the fragmentation of more symmetric forms of created being, more abstract forms of created being. Physicists, in the Standard Theory of particle physics, have described an electroweak force which is the more symmetric entity which shattered into electromagnetic force and weak nuclear force as the universe expanded and cooled after the so-called Big Bang. The electroweak force can be described and understood in many ways but it’s electromagnetic force and weak nuclear force which are manifested in our concrete realm as particular forms of that more abstract force. In a similar way, we are concrete creatures who have evolved and developed from broken pieces of more symmetric, more abstract, forms of being. Feeling and thinking and doing are tightly related and can even help strengthen each other and can even cover for one another under certain circumstances.

As I said above: Reduce reality to its various components and aspects but stop reducing when you reach components or aspects which cannot be used to fully explain or to ‘reconstruct’ each other. We can replace ‘reality’ by ‘this concrete level of being’ and then we can understand, by analogy to modern physics, that we can construct plausible understandings of being in which feeling and thinking and doing are broken pieces of but one symmetric act-of-being, but those three components, again—in analogy to electromagnetic force and weak nuclear force, are irreducible components or aspects of minded [and social] creatures in this world of concrete being.

For now, I have nothing new to add to this plan for describing human nature.

### **622.3 What can we say about the forces which draw or force individuals into communities?**

We are drawn together not by the soft or squeamish emotions, not even fear, so much as we are drawn together by ties of dependencies, whether those ties are to those we like or dislike. Something tells me we’re relatively unlikely to form ties of dependencies to those to whom we’re indifferent, but that’s merely my speculation.

The ties of dependencies have evolved and developed, and will continue to do so, as the binding forces of human communities which have evolved over millions of years and developed over the centuries. I’ll not try to add to what I’ve written in the past about this issue. In an Chapter 410, *As the Ruins Crumble...*, first published on my weblog in July of 2009, I wrote about the bottom-up evolution and development of communities and paid a little bit of special attention to those who are currently pessimistic about the very existence of governments—truly, an understandable feeling within the context our unfolding political disasters. Recognizing the truer developmental and evolutionary past of human individual and communal nature will lead us in a different direction though not justifying any optimism about the current governments of the West. In that essay, I claimed:

Many are the classical liberals and libertarians who seem to think that we can solve our problems by getting the government off our back and getting back to work, unlikely as it is that Washington or Boston/Albany/Sacramento/. . . will shrink to more appropriate sizes. The problem is that, as I've discussed in a few entries, the human mind which is so important to our ability to function in a complex civilization has developed along with that civilization. If that civilization has decayed, or has never taken root in the case of the United States, that tells us that few are those who have minds well-formed enough to really understand themselves as individuals living in complex societies embedded in complex political structures. Few can even understand such abstract concepts as property rights or even rights over their own persons. It takes many generations to build a civilization that can be destroyed in a single generation, but that destruction reaches down into the minds and souls of the resulting barbarian children.

I've written of the contingent nature of the human mind, that is the aspects of a human being that work with abstractions – see Chapter 250, *Preliminary Thoughts on the Evolution of the Human Mind*. Simplistically, the human mind has evolved over eons at the species level though it doesn't seem to have shown itself until circa 600BC when Homer and the succeeding lyric poets had made philosophy and mathematics possible, when some unknown Israelites put together the complex mosaic known as the Books of Moses, when some unknown Vedic geniuses created Hinduism. No matter how poor or rich the social environment, the individual mind must develop over a lifetime. Clearly, there are going to be complications as a result of intermediary relationships and entities such as large-scale civilizations and smaller-scale societies, including towns and church communities and extended families. It takes centuries, and a lot of hard work on the part of butchers and bakers and poetry-makers, to build a civilization which can then be a home to those smaller-scale societies. In the case of the most recent cycle of Western Civilization, it has taken about five centuries of growth and then decay in literacy and reasoning skills to bring us to a sad point – see Jacques Barzun's *From Dawn to Decadence* for a powerful

narration of this most recent major period in the West.

We aren't those Glasgow Scots of the mid-1700s with their damaged but intact moral and social structures. We should be careful in applying Adam Smith's thought to modern Americans who possess little hint of the perhaps defective but certainly strong moral character of an eighteenth century Scotsman. And those Scotsmen lived in a society that demanded certain types of behavior from its merchants and professionals. Whatever one thinks of the specifics of that morality, it provided a good framework for freedom in the marketplace, that is, one merchant could trust another if only because he knew the price the other would pay for behavior seen as wrongful.

I'll go no further into those sorts of issues, preferring to make the more fundamental, and Thomistic, claim that we are intentional animals. Our moral natures and our minds develop in an organic manner producing physical changes including changes in external relationships. For now, I'll ignore the complication that our relationship to our Creator isn't quite external and deal with the other aspects of our lives.

Man is a particular creature, each of us developing by our responses to our environments – which sometimes include some representation of the entire universe or even some additional parts of Creation. But our environments and our readily available responses, our habits and customs, are the results of historical processes themselves made possible by billions of years of evolution. I believe man has become the sort of creature who can, in principle, encapsulate all of Creation within his mind, thus imitating by way of understanding what God did in creating this world and all else that is part of Creation. That implies there are some proper directions for our development. To transcend our immediate environments and even to understand the depths of our own human nature, we have to develop our abstract reasoning abilities. To move towards a state where we are truly images of God, we have to be like Jesus Christ, true persons who move with freedom yet do the will of the Father.

In Chapter 424, *What is politics?*, first published on my weblog in May of 2011, I continued my efforts to understand, and explain to others, the

bottom-up evolution and development of communities. In that essay, I claimed:

And we have to be careful about our thoughts. We think about a certain realm of human life in terms of engineering or bureaucratic system building when we should be participants in a narrative process which can't be guided if it's to remain healthy and strong. That is, we'd have to be careful not to 'guide' the process too much and certainly not to try to impose our favorite solutions upon an evolving system.

Healthy human communities evolve over longer scales of time and develop over shorter scales of time. As the historian Carroll Quigley claimed: "The truth unfolds in time through communal processes."

In my way of thought, this is an recursively entangled line of thought. You see, "Things are true," and "Truths are thing-like." This means that communities are true and not just ad-hoc arrangements. Moreover, communities are thing-like. The communities and the communal processes themselves unfold in time.

But entities like the United States and the so-called global economy are hierarchical structures imposed on masses of human beings and various human communities which would otherwise develop truer and more fruitful communities.

Perhaps we can say that the community evolves in time as true relationships emerge?

We haven't gotten it right yet and we aren't capable of fixing everything because we don't even know what we're fixing let alone what it's really supposed to be like. More than that, we're organisms, ourselves growing and developing towards futures we can help shape but can't plan in the way that modern bureaucrats once imagined they could plan for a safer and more prosperous and more aesthetically pleasing Harlem.

Rather than trying to design our various communities, we need somehow to regard them as being more like evolving and developing organisms than designed and manufactured machines. When we so regard them, we can research them and analyze them, not for the purpose of controlling what shouldn't

be controlled but rather for the purpose of understanding them that we might move along with their development in our own lives and with their evolution to the extent we can consciously live as members of one generation in that democracy of the dead, the living, and the yet unborn.

In conclusion, I think it relatively easy to define politics as the art, drawing upon some science, of bringing together different skills and other forms of memory for the purpose of forming a community, perhaps to serve God and perhaps to get in a good game of bridge once a week. It's harder to define even a vague range of legitimate actions on the part of the those who take on leadership roles with a 'political' aspect, but I strongly believe they should limit themselves to being actors who are part of more or less spontaneous processes, perhaps guiding them when a community begins to stray from all possible moral paths, but, even then, not trying to guide them down a specific path.

More recently, in Chapter 457, *Moral Order vs. National Welfare Systems*, first published on my weblog in February of 2012, I dealt once more with issue of bottom-up evolution and development of human communities, using the current American battles over healthcare as a good example of how we're doing a very bad job of dealing with the problems—and opportunities—of our modern, complex and densely populated, communities. In that essay, I wrote:

[T]he American Catholic Church and its leaders, Christian leaders in general, had no business in recent decades pushing for any sort of national health-care in a country where there is no consensus on moral issues affecting medical care, such as abortion, contraception, hospice care, or the care for children lacking some of the capabilities of most children. If anything, they should have been questioning many existing programs such as Social Security and Medicare. After all, the opponents of Social Security beginning in the 1930s have criticized more than the financial dangers of Social Security. Some have also claimed that such a program would weaken the bonds of families and would even cause an inter-generational war. And, as it turns out, weak families and inter-generational war over Social Secu-

rity and Medicare are among our greatest existing or imminent problems.

As we become more dependent upon medical systems which are certainly not under the control of individuals nor local communities nor even the larger religious communities, we'll be offered such poisonous fruits as drugs and techniques developed by experimentation on lab-grown embryos 'engineered' to have specific medical problems, growth of embryos who will never be born but will provide transplantable tissue or organs, engineering of babies to be brought to birth to provide transplantable organs – some of this is already happening quietly in major research centers. For example, this relatively old article from 2006, *Harvard to Create Human Embryonic Stem Cell Lines* found at [http://www.rxpgnews.com/stem-cell-research/Harvard\\_to\\_Create\\_Human\\_Embryonic\\_Stem\\_Cell\\_Lines\\_4400\\_4400.shtml](http://www.rxpgnews.com/stem-cell-research/Harvard_to_Create_Human_Embryonic_Stem_Cell_Lines_4400_4400.shtml), tells us, "After more than two years of intensive ethical and scientific review, Harvard Stem Cell Institute (HSCI) researchers at Harvard and Children's Hospital Boston have been cleared to begin experiments using Somatic Cell Nuclear Transfer (SCNT) to create disease-specific stem cell lines in an effort to develop treatments for a wide range of now-incurable conditions afflicting tens of millions of people."

Here's an article from the *Harvard Gazette*, talking about a meeting of some theologians who discuss some varying views on the allowability of using these embryos for research – the Catholic Church and more conservative Protestant churches seem not to have been represented: *Stem cells, through a religious lens* found at <http://news.harvard.edu/gazette/story/2007/03/stem-cells-through-a-religious-lens/>. Read the article and note the difference in moral teachings regarding the use of embryos grown from stem-cells even amongst theologians of monotheistic religions. How can Catholics participate fully in a health-care system with Muslims who allow the therapeutic use of stem-cells derived from 'surplus embryos' produced in fertility treatments? I don't feel the right or the urge to go on a nationwide crusade to stop all acts I consider immoral but I also can't benefit from such acts without

endangering my relationship to God, not even surreptitiously by way of medicines or techniques derived from research on those embryos. Nor do I even wish to be in a hospital which carries out what I consider to be immoral research or treatment. If we can't be sure the service or product isn't free of the taint of moral disorder, then we'll have to refuse it. The bishops have helped to create a situation where any morally well-ordered Catholic Christians might soon have to refuse all services and products of the American medical industry. The entire industry is on its way to being morally contaminated in a very deep way.

We should learn to think in terms of the general rule suggested above: Social systems which have a major moral component should be designed for and implemented within morally coherent communities. [I should have added that those morally coherent communities are themselves organically developing entities.]

Human beings with diverse moral beliefs aren't going to be able to agree on a wide variety of health-care issues or social welfare issues in general. A morally diverse group of human beings or a morally diverse gathering of human communities aren't going to be able to form a coherent community at a small or large scale. A falsely-justified attempt at implementing social programs with those who don't agree with your moral positions will result first in the moral corruption or confusion of human beings in the various communities, not just the community with the highest moral standards. In addition, such confused efforts will produce serious disagreements threatening any existing social coherence, however slight, and will endanger any chances of meaningful dialog on matters of fundamental moral importance. And they might even endanger the very existence of some of these communities reduced to dependence upon a government which pursues its own interests, probably more free to do so because of the lack of moral coherence along with the pretense that we are a morally coherent nation.

## 622.4 The Body of Christ

I was a little surprised to realize that though I mention the Body of Christ regularly in my essays, I've not written too much in the way of even preliminary exploratory analyses as I've done with other realms of created being. This is probably reflective of a deep uncertainty I've felt about the proper way to discuss the Body of Christ. As an example, perhaps the most important example, of a particular problem: the Catholic Church and the Protestant churches even more so have moved away over the previous five centuries or so from the idea that the Christian churches, as ecclesiastical or liturgical institutions, can meet all the legitimate and inherent needs and desires of human nature. Few, if any, really have any desire to spend all their hours for time without end in liturgies. We have needs and desires which are met in terms of this-worldly vocations and avocations of various sorts. Some are met in our economic activities, some in political activities, some in human-centered art and literature, and some in simple human gatherings—parties and picnics. In January of 2010, I published an essay on my weblog which is included in this book as Chapter 591, *The Reality of Perfection*, in which I made some very sketchy proposals about the Body of Christ:

So-called traditionalists and conservatives will often deny that real progress can occur in this world. This is a valid viewpoint for a pagan thinker but not a Christian. A Christian has to believe that progress is possible, at least in principle. The individual man can, at least in principle, develop towards a Christ-like state. The entire race, even including those men who will not be resurrected into Heaven, can develop towards the state we call the Body of Christ. We can't achieve such a state of perfection, even in principle, in a world where decay is a fact. This is the place to point out that decay, increasing entropy, isn't a law but rather a direct world of God's choice to produce a world particular in certain ways – the world has been advancing towards a more probable state since then. This particular advance results in an increase of entropy. In other words, 'increasing entropy' isn't a fundamental property of matter and energy but rather a result of the universe starting out in a very specific state, specific in a sense still being explored by scientists.

As a summary of sorts, I'll note it remains true to a Christian thinker that: "Grace completes nature and doesn't destroy it to replace it with something else."

If what we are is the rough beginnings of a completed man – that is, one perfected to a Christ-like state, then a healthy moral imagination can imagine moving towards that perfected state. The principle is established that what we are can be perfected into a Christ-like state. A similar though more convoluted statement can be made about human communities, families and political communities and economic communities and the Church, being rough—in fact, fragmented—beginnings of the Body of Christ.

The next month, February of 2010, I published an essay motivated by the American response to a major earthquake in Haiti. In this essay, included in this book as Chapter 415, *Why We Can't Build or Rebuild the Countries of Other Peoples*, I wrote:

We don't know where the world is heading. We don't even know what will happen to our families or countries, we who are Christians are bound to believe that the end result will be the incorporation of those who belong to Christ in the Body of Christ without loss of individuality. In fact, that individuality will be enhanced so that we can be truly Christ-like. Before I can further explore this idea of the Body of Christ – not to be done in this article, I have to say what should be obvious from the Bible, especially the letters of St. Paul. Individuals are unique and don't even all fit in the same general categories. The same is true of nations and other natural groupings of human beings. We won't fill the same role in the Body of Christ and we don't fill the same role in this mortal realm. Not every human being is suited for life as a rocket engineer at NASA and not every human community is suited to be a part of a high-tech society that sends rockets to the moon. Moreover, some individuals capable of living such a life, some communities capable of so forming themselves, have no desire to do so.

And, I added a warning about the complex way in which these processes work bottom-up but not exclusively:

Development of an organism, or the evolution of a family-line of organisms, isn't really something that works [entirely from the] bottom-up. The development of complex organisms is ongoing at multiple levels and perhaps at all levels of development currently available to that organism. One of the best examples involves only two levels – individual organisms develop over their lifetimes even as species evolve over longer periods of time. But individual development and special evolution overlap. As we develop as individuals reflecting one temporal stage of evolution of the human species, we remain part of the greater evolutionary flow, though there is reason to believe evolution might itself have evolved with the appearance of a rational and self-aware race. Moreover, we have other forms of evolution or development which overlap with biological evolution and the development of an organism. Life on earth engages in complex and recursive relationships with the atmosphere of the earth. There is also interaction at the level of DNA and soma between different species – such as that between viruses and their hosts. Viruses can implant their genetic coding inside the genetic code of other species. Viruses can also transport pieces of genetic coding from one species to another. Bacteria form a superorganism of sorts, being able to shed some genes and pick up others from a pool of bacterial genes flowing through the earth's biosphere and including genes for resistance to various antibiotics. An interested reader can download my dark comedy, *A Man for Every Purpose* at <http://loydfueston.com/downloads/aman.pdf>, which plays off some of these confusions caused by our willful misunderstandings of our human selves and our situation in this world.

A human community is one very complex entity. We should fear those who try to guide this development because they will deform the organism, just as if a child were to be fitted at birth with a brace to straighten the natural and necessary curve in his spine or to force his skull into the shape found in a different ethnic group.

## 622.5 Something Like a Summary

I'll end with an observation about the current political and economic arguments which are going nowhere, leading us to neither deeper understandings nor to a courageous movement into the future, even if the courage has to be faked at first.

I'm claiming the situation is different from those who are pessimistic about the entire idea of government because we haven't done it right yet and those who hold the delusion that we just need to fine-tune our existing governments and they'll be fine. Our existing governments have failed to do what they should as our human communities of various sorts have grown more numerous, larger, and more complex. Moreover, those human communities and most individual human beings have failed to take notice of our promising and dangerous situation. Our communities have increasingly been co-opted by the central governments and we as individuals have preferred to remain within our comfort zones, assuming those fine men and women in Washington are dedicated to doing right by the United States and its citizens and leaving us free to enjoy our gadgets. In any case, we can't do better by 'designing better governments' or by 'reforming our current governments'. We have to take a deep breath, admit we've failed for now, and prepare for the hard work of moving towards a vaguely seen but plausible future, step by step. Don't ask me how to do this in detail. If I knew, I could design that better government for you and just tell you how to build it. I'm here to tell you that's the wrong way to go about the task.

## 623 Not the God of the Gaps Nor the God of the Singularities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1416>. It was finished and uploaded on 2012/10/08.]

In, *Bangs, Crunches, Whimpers, and Shrieks: Singularities and Acausalities in Relativistic Spacetimes* [31], John Earman, a philosopher of science, warns believers of some errors in efforts to localize God in space-time. The first warning has to do with causation:

So for Craig [W.L. Craig, a theistic philosopher apparently attempting to use the Big Bang to prove God's existence] the principle "Whatever begins to exist has a cause" applies to these [Big Bang] models. However, on Craig's reading this principle is not an obvious "metaphysical truth"; in particular, it is not a consequence of the widely held principle "Every event has a cause", which is satisfied in the FRW's big bang models without any help from the theists. [page 209; FRW = "Friedman-Robinson-Walker"]

In other words, there are philosophically distinct forms of cause-and-effect and I'll use this point as part of my effort to redirect attention to the general issues of being and away from misdirected efforts to see God's presence in particular events of an unusual or spectacular sort. By the way, this doesn't mean there are no logically coherent ways to argue from being to a Creator, only that there are some logically incoherent ways and we should avoid such. Such great thinkers as Aristotle and Maimonides and Aquinas have provided such arguments—better regarded as tests of coherence or rationality but that's another story. Those arguments should

at least implicitly respect knowledge of being in its concrete forms but those arguments cannot proceed directly from or be fully founded upon empirical thought, not even those highly disciplined forms of empirical thoughts we label as 'scientific'.

More generally, it's necessary to the living spirit of a civilization to develop a coherent understanding of being, but more is needed than the type of analysis done by scientists and many sorts of philosophers. That type of analysis plays a role but not usually the dominant role in a larger understanding of created being, of all of Creation.

Things, the most concrete forms of created being, are true and truth is thing-like. In other words, what exists must be accepted to be understood but not 'explained' as Newton explained momentum by writing down mathematical equations. Brain-scientists and physiologists and optical physicists deal with problems in human beings gathering true information about our world. Philosophers and theologians should be paying attention to those scientists and what they discover about, for example, human tendencies to see patterns in the most disordered of data. They should be paying attention to those scientists, indeed to all empirical researchers including historians and language scholars, but the very fact that we can identify and correct specific problems tells us there is no general 'knowledge problem'.

Both philosophers and theologians have the responsibility to first learn about what exists before talking about what exists. Christians can only talk about existence as a gift, something given by God. This holds in general for all of created being and in particular for their individual selves.

We Christians need to learn how to properly use scientific knowledge along with all other sorts of legitimate knowledge in our efforts to understand Creation. This is my how I'd advocate dealing with this issue:

1. God is His own act-of-being, the supreme act-of-being, and also the source of being for all of Creation.
2. From a certain limited viewpoint, the Old Testament covenants are a pre-scientific image of a God who moves His Creation along by way of laws given before the fact, laws which can be seen as binding Him only because He chose them as adequate for His purposes.
3. God should not be excluded from the story He's telling but He tells the story which is this world as a Creator God, the source of being, and

not as some pagan God throwing thunder-bolts and leading armies into battle in a world which somehow exists independently of Him.

Professor Earman has more to say which is worth paying attention to in this world in which so many accept or reject the God they wish to believe in or disbelieve in rather than taking revelation, natural and special, in the way it is presented. Earman notes:

Speaking purely personally now, it strikes me as bordering on the sacrilegious to see God's creative force as able to operate only at a singularity or ideal point. It is more to His glory if He operates everywhere and everywhen, and if He operates independently of such contingencies as whether there is an initial singularity and, if so, what type it is. Those who want to find God in the big bang should beware of falling into the trap of relegating God to the diminishing interstices left by modern science. Once the trap is recognized it is easy to escape using God's supernatural attributes. If there is no first instant for the physical universe or no prior physical time to the big bang at which God can operate, no matter. The Creator "may be conceived to exist in a metaphysical time" and "to exist temporally prior to the inception of physical time". [Quotes are from Craig's article "Professor Grünbaum on Creation", *Erkenntnis*, 40, 325-341.] The constraints of physics cannot bind the Creator. But precisely to the extent that a supernatural cause of the beginning of the universe does not have to answer to the constraints of nature, scientists qua scientists are entitled to ignore it. [page 209]

We Christians have failed to achieve a greater understanding of Creation and we have retreated from any claims that such a Christian understanding is possible. We have retreated from the stances of the likes of St. Augustine, St. Thomas Aquinas, Isaac Newton, Blaise Pascal, and a handful of more recent thinkers who saw a true need for such a stance but failed to get even so far in the great work as did Newton and Pascal and certainly failed to follow Augustine and Aquinas in developing a more complete Christian understanding of Creation which was faithful to the Biblical and Creedal revelations while also integrating the best of empirical and speculative knowledge in a plausible way.

We endanger our faith and even endanger our relationship to God when we restrict the Almighty to being such at only points, such as singularities, where our understanding of reality seems to break down. He is Creator but He remains here as the most important character in the story and stories He's telling.

## 624 Why We Need a Christian Civilization?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1433>. It was finished and uploaded on 2012/11/13.]

I've made the claim that the Christian Church itself is but one organ in the Body of Christ, though the most important and potentially most powerful organ. I would supplement that claim with another: the true power of the Church is dependent not upon external force but upon proper execution of Her duties of teaching those who are at least nominally within Her doors and evangelizing those who are without. The Church prays and worships; She teaches how to pray and worship, Who it is that we worship, and why we pay Him such respect.

I'll ignore the great complication, but no more than complication, of the various schisms in Christianity, some being historically driven schisms at some level of hierarchy and some involving more serious differences in theology or in understanding of Creation and its relationship, and our relationships, to God. This makes it hard to understand the Christian confusion on earth in terms of a pilgrim Church with a direct relationship to God, but only hard.

I'll also mention a somewhat new complication. There has been some tendency, increasingly strong in recent centuries, to see Jews as being on the road to salvation despite not having accepted Jesus Christ as the Messiah. The real issue within my developing worldview is the communal nature of Judaism. After all, I see this world as being the story of the birth and development of the Body of Christ which is the completion of the work accomplished by the Son of God in sacrificing Himself to the Father as an oblation of love. It is the People of Israel and not some collective of

individual Jews who are truly moving toward God, the People of Israel who are—at least at the level of human perception and conception—the parallel to the Christian Church rather than individual Jews being some sort of parallel to individual Christians.

There are more open questions than certain statements in any interesting exploration and analysis of God's Creation and of our relationships to Him. This is good, not because such questions bring us knowledge which we can then integrate into our minds but because our minds are formed by our acts of restating those questions properly as thoughts manifested by the Creator in the various realms of created being. Our good questions about revealed knowledge, speculative knowledge, and various sorts of empirical knowledge lead to larger and richer human minds, especially in the communal form of the human mind—the intellect.

The ultimate setting for an intellect, the largest possible domain in terms of human culture and individual minds, would be a civilization encompassing all of humanity. Some would say, the prior sentence should have 'pilgrim Church on earth' rather than 'civilization', but I've taken the different position that the various aspects of human life over which the Church's human servants have renounced complete authority—moral and spiritual authority over all human institutions still belongs to Her—are manifested and lived in institutions which are part of the Body of Christ but somewhat independent of the Church. Nothing in the Body of Christ can be independent of the entirety of that Body or of each individual member.

Let me state the implicit conclusion I just drew: the perfect and complete human civilization in this mortal realm would be one which is a balanced, honest, and creative response to all of God's revelations and also the explorable aspects of Creation as it can be understood by creatures such as us.

Now I shift momentarily to social insects.

Ants and other social insects are quite plausibly described by scientists such as E.O. Wilson, a founder of the discipline of sociobiology, as slaves to their DNA, or perhaps to the family line whose characteristics are encoded in their DNA—in this restatement, I'm proposing that DNA is more a glue than a substance. It's mostly correct to say that this makes those insects non-individualistic members of a community which is, typically a domineering sisterhood of neuters or a sisterhood of neuters dominated by a fertile mother. In the first case, the fertile mother exists but, more or less, as a slave of her daughters. There is a genetic basis for these two different

ant societies which the interested reader can find in Wilson's books on sociobiology, such as *Sociobiology, The Abridged Edition* [151], or in articles over the years published in magazines such as *Scientific American*.

I will now switch to my preferred term 'community' rather than 'society' for describing human communal entities, just because it seems more usefully general.

There are examples of slave societies, such as the Mameluks of Islamic history. The Mameluks were non-Arab warriors purchased as slaves by Arabs. You can find a description of the Mameluks at <http://en.wikipedia.com/wiki/Mameluk>. They formed a warrior caste whose members were typically of higher status than free-born Muslims, but the Mameluks were in theory and to a large extent in fact subordinated absolutely to their caste as a whole. This can be seen, at least by me, as a human society resembling in some ways ant societies but far from completely because, while education and training would have inculcated the Mameluk-attitude, there was a necessary external pressure to conform rather than conformance being a part of the basic nature of the member as is true of ants and other social insects. More generally, the caste was defined by other than genetic relationships though most Mameluks were captured from a relatively small number of ethnic groups, typically Christians.

Recent science-fiction television series, and probably movies, have included such societies as a 1984-ish bogey. This is a very unlikely development of the human race, not because of some idealistic understanding of man but because of man's strategies and skills for survival and reproduction. We are individualists in a sense but mostly small-group creatures. By 'small-group', I mean simply that concrete, hand-to-hand, mouth-to-ear, relationships—based on genetic or gene-proxy relationships—are the foundation of any larger human communities. Human communities form from smaller units which are then formed from individuals who retain some of the good and bad characteristics of that implausibly free-standing individual of American myth and libertarian ideology.

I've grossly oversimplified by claiming "Human societies form from smaller units which are then formed from individuals." In fact, individuals and various communal groupings of human beings, such as teen-agers or young mothers or members of a crafts group or local politicians or lawyers, form various groups in all sorts of combinations of individual and group relationships. Larger-scale societies are complex networks drawn from this entire mess. The mess is certainly interesting and a mere hint as to why

E.O. Wilson rightly claims that understanding the biological and social nature of man is a problem orders of magnitude greater than those of physics.

The problem with sociobiologists is that they see men clearly in terms of the evolutionary past but have an understanding of men as they have now are and that leads to a serious misunderstanding of possible futures for the human race and a similar misunderstanding of men in their relationship to being or ‘created being’ in my usage.

What do I propose instead? In Chapter 472, *Why Does Time Move Only Forward?: Once Upon a Time...*, I wrote a highly summarized version of my understanding of human nature:

What is the relationship between a world [unified and coherent and complete] and a person as I understand them? A creature such as a human being is born a particular sort of physical animal and is more or less invited implicitly by his surroundings (and perhaps explicitly by his Creator) to start shaping himself by response to those surroundings. Human communities play an important role as the centuries go by, developing broader and deeper understandings of those surroundings, perhaps even coming to view that physical entity which we call the ‘universe’.

I also wrote:

The overall narrative by which this concrete realm, this universe, moves forward is what makes it a world, unified and coherent and complete. The overall narrative by which we concrete human beings move forward can make us persons, unified and coherent and complete.

The narrative, which is the movement into the future in our world, is as fundamental as the entities and relationships studied by physicists and other physical scientists. It cannot be reduced out of our understanding of this world. It cannot be explained by way of the field equation of general relativity or by Schrodinger’s equation in quantum mechanics. In fact, I would suggest that many physical laws, many physical entities, are what they are because of their role as the ‘stuff’ of a particular narrative.

Find the story of our universe, or at least a plausible story given our current knowledge. That is the world. At least to a

Christian who intends to be a member of the Body of Christ and perhaps to a Jew intending to be a member of Israel, that story is also him, her, us and—expanded properly—that story is the story of all of Creation.

A perfected and completed civilization would be the form and substance of a perfected and completed human race acting and thinking and feeling along with the Creator as He goes about His work. This is a description of the Body of Christ, at least to a sacramental Christian. It's the description of a human race at peace with itself and its members, individual and communal, and also at peace with Creation and with God Himself. It's an ideal but one which can guide us in forming communities which are morally and spiritually well-ordered as well as being appropriately rich and complex in cultural areas, artistic and intellectual.

It is Christianity, the religion in which God is both three Persons and also a community of perfect unity, the religion in which the Son of God is incarnate in His own Creation, which can give us such a view of a civilization, one which can be seen ultimately to be a view of the world of those resurrected to live with Jesus Christ for time without end.

## 625 What Would Madame Bovary Make of Heaven?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1462>. It was finished and uploaded on 2012/12/07.]

I read somewhere, in a far distant spacetime, that Medieval theologians had a one-line joke: Heaven and Hell are the same place. An inch-millisecond ago by cosmological standards, circa 1900, Albert Jay Nock left the Episcopal priesthood and later said it was partly because he couldn't see that many human beings had much in the way of life in them in this mortal realm and couldn't see how such creatures could possibly enjoy life without end. Need I add that Mark Twain claimed he couldn't imagine a Heaven consistent with Christian beliefs where Americans would be happy.

In terms of theology, I have a quibble or two with each statement but no substantial problem with the main messages, very much overlapping though I'm sure Nock and Twain would have put in their interesting two bits. God can save who He will but it's not so easy to imagine that everyone, even some very nice men and women, could be happy in Heaven according to Christian beliefs, or Jewish beliefs for that matter.

In various writings, I've made substantially the same claim by stating that Heaven isn't an everlasting DisneyWorld, a place where passive pleasure-seekers can enjoy just the right mixture of nice foods and nice shows and nice rides for time without end. To enjoy Heaven, a human being would have to be a member of the Body of Christ, the perfected and completed community of all human beings who are God-centered, though I admit to not being able to define that term since I know pious men and women who seem bereft of true love or any other passion but perhaps the desire to feel good about themselves and I know skeptics or atheists who

have a profound piety though seemingly directed to entities or communities in Creation rather than to the Creator.

I will not claim to be able to identify those who will enjoy Heaven but I will claim that merely entering into Heaven will likely be a frightening and disorienting experience even for those who truly love God.

As is my inclination, I was stirred by a current reading to write about thoughts which I've been playing with for months. *Madame Bovary* by Gustave Flaubert is a strange book to those not fully inebriated upon the modernist sensibility. The strangeness is fully embodied in the title character.

Madame Emma Bovary, wife of a country doctor named Charles Bovary, was born into a prosperous farm family and was apparently well-educated in a convent school to perhaps the pre-college level in some subset of the liberal arts. She could play the piano well, had some true literacy, and showed life only in response to events which are legitimate but quite optional parts of some human lives, such as a ball at the home of a rich aristocrat. She had no real appreciation for music, being almost literally a hairless ape who had been trained to strike skillfully at piano keys in certain patterns. She showed no more appreciation for literature. Even as a mother. . . She farmed her daughter out to a wet-nurse and was mostly annoyed by the young girl after taking her back into her dysfunctional home.

She was much like that morally insane American who so obsessed Hermann Melville, though he chose to write a book about a more courageous and honest version than the typical American or Madame Bovary. Captain Ahab knew he was in rebellion against Creation and he pushed forward in that rebellion to his own willful destruction. He knew he had an inside, a stew of desires and views of what was right and wrong, and he had no intention of surrendering to reality, to making peace with a Creation not to his standards, let alone shaping his thoughts and feelings and actions to accord with what the Almighty had created.

Madame Bovary, the younger, was different in that she seemed to honestly believe she could pursue desires in conflict with her moral character, her family life, her social life, and so forth, and attain those desires without doing great harm to herself or those she cared about, at least in an occasional and mostly self-indulgent way. (To be fair, she first took up her corrupt ways after being seduced rather forcefully by a country squire of sorts whose life seems to have followed the general pattern of Flaubert's.)

The book, *Madame Bovary*, ends sadly and a bit ambiguously, especially

regarding the state of Monsieur Bovary's moral and cognitive and spiritual state. At least ambiguity seems to have been intended by the author and probably seen by most readers. I don't think there is so much ambiguity in Madame Bovary's deathbed scene when she grabbed the crucifix from the priest's hand and planted upon the corpus of Jesus Christ the most passionate kiss of her life.

There is a romantic group in Christianity, those who believe that Heaven can be won with a single decision, a great flood of passion coming at but an instant. That flood can even occur on the deathbed after a life of systematic sinning, murdering, stealing, sadistic abuse of other human beings. Only God knows for sure, but I wouldn't count on that being a possibility after you've sinned to your greatest extent. If Hitler had surrendered and confessed to the errors of his ways, if he had promised a life of repentance, would we have believed him? Some take William the Conqueror's deathbed conversion, his repentance, seriously. After a life of killing and looting and even castrating his conquered enemies, he becomes God's good servant. As some would say, "Right." He might have convinced me if he had repented when he was still young enough and robust enough to act as he was truly inclined to do. It would have led to a gradual, long, painful process of reshaping himself.

Until we're in Heaven, if we are resurrected to be the comrades of Jesus Christ, we won't know, not about ourselves and not about William the Conqueror or Hitler or the lesser sinners such as the real-life Madame Bovarys. But, if we are to do our duty of guidance of our own selves and others around us, we must do our best to attain some serious understanding of this matter.

This all leads me to consider the meaning of that Medieval joke—Heaven and Hell are the same place—in light of my understanding of Creation and further leads me on to a claim I made years ago: the saved will be those capable of enjoying Heaven.

Who can enjoy Heaven? What could that mean? Wouldn't anyone wish to go to Heaven? Certainly, in the story told by most Christians, we're all gifted at our conception with some sort of immortality and we each go to Heaven or Hell. Given that choice...

But all such stories should be evaluated given not only the Biblical promises but also the best possible understanding of human animals, of living creatures in general, of spacetime and matter, of history and the other sorts of stories we tell about ourselves and our world, of music and the

ways in which we build houses and factories and temples. Theologians and philosophers should take on their vocations of firming up certain truths, however poorly we can state them, about revelation and being. Those stories have to be told in terms of the best, most exact, understandings we have of human beings and their world, even the entirety of Creation now that we have better knowledge and intellectual tools to start understanding the full spectrum of created being, abstract to concrete.

I'll quickly return to discuss the case of Madame Bovary and Gustave Flaubert himself, according to some quips he made and some of the events of his life.

The problem with Madame Bovary from the standpoint of a rational Christian anthropology is that she lived inside of herself, a sometime torrid stew of dreams and desires, though in her earlier years, her insides had been a somewhat calmer stew of 'rich-peasant' and Catholic-school dreams and desires. Even when Madame Bovary seems to have accepted grace, passionately kissing the crucifix on her deathbed, we have to wonder what was really happening. Was she all of a sudden embedded in God's Creation, acknowledging she was truly a creature of created being, a manifested thought of God? Or was she still a free-standing modern individualist looking out upon a world which existed to be used for self-defined purposes and to self-centered goals?

Let me use a method of argumentation which traditionalists use (properly in some cases) as much as Marxists use it (improperly in nearly all cases). Let me appeal to the words of men truly deserving the respect due to sages. Let me quote words both profoundly insightful regarding the current state of Western man and also prophetic. These two men come from the Jewish tradition but I think there to be much that is shared, especially in this matter, by Jewish and Christian traditions.

First, in response to those who take too seriously the passionate deathbed conversions of fiction and history (Emma Bovary and William the Conqueror), I'll quote Abraham Joshua Heschel from *God in Search of Man* [71]:

[T]he essence of religion does not lie in the satisfaction of a human need. As long as man sees religion as a source of satisfaction for his own needs, it is not God who he serves but his own self. [page 350]

On the same page, Heschel somewhat restates the claim: “The purpose of religion is not to satisfy the needs we feel but to create in us the need of serving ends, of which we otherwise remain oblivious.”

God doesn’t exist to serve us, though He offered to serve us if we enter His community—for my current efforts, it matters not if we understand that community as the People of Israel or the Christian Church and I tend to think both are part of the Body of Christ though some Jews might not like that way of putting it. In important ways, God truly serves the Body composed of His friends and servants; by so serving, God serves each of the members of that Body. At the same time, it’s also true that God, as Creator, serves in some significant sense all that He created—to His ends and for His pleasure. But God as Creator serves all the lilies of the field and the beasts of the forest. If you submit to God’s ‘servitude’ in only this way, you might be headed to the same permanent grave as those lilies and beasts.

I’ll quote another Jewish thinker of great insight and wisdom, Jacob Neusner from his book *Judaism in the Matrix of Christianity*:

In the Western Protestant tradition of Edwards and Schleiermacher we take it for granted that emotions speak for the private individual, not the nation. In the tradition of philosophy from the Greeks onward, moreover, emotions speak not rationally but irrationally. This other view, that of the ancient sages (a view that is also gaining currency in contemporary philosophy and psychology), sees the matter differently. It regards emotions as artifacts of culture and conceives that emotions lay down judgments. They therefore emerge as rational, public, and social, speaking not only for the individual but also to him or her. Feelings, too, define modes of symbolic behavior, as noted. When we examine the doctrine of emotions in the canonical writings of formative Judaism, we enter a world to which it is self-evident that feeling is subject to law and emotion is a matter of lesson and tradition. [page 51]

Red-hot passions, soaking in one’s own holy juices, can be a step toward God and toward a membership in the Body (Church and People) composed of those to be saved. As the individual human intelligence must be disciplined to an intellect appropriate to that Body, and appropriate to some

civilization of this mortal realm on this side of death, so our feelings and emotions must be disciplined to the forms of feelings and emotions which are—as Barzun said of intellect relative to (individual) intelligence—the communal and capitalized form of individual feelings and emotions. (See Chapter 127, *Intelligence vs. Intellect*.)

The issue is still greater than feelings and even wider than feelings and mind. Our actions also have to be disciplined to the law and the tradition, however we define those. I discussed this in another essay earlier this year: Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*

The conclusion is that Madame Bovary would be able to enjoy Heaven, she would be suited to salvation, to the extent that she could and would become a true member of the community of those who are true friends of God, a community that we Christians believe to include Jesus Christ, both man and God, creature and Son of Mary as well as God and Son of the Father. If God and Heaven remained objects of Madame Bovary's passions, Heaven would be Hell for her.

# 626 Losing Our Liberty by Losing Our Religion?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1537>. It was finished and uploaded on 2013/02/18.]

I don't think we ever had our religion in the United States, at least not a true Biblical religion. From an early period, immigrants to this country considered themselves largely freed of the traditions of their home countries, including their Christian traditions. They thought to retain the title of 'Christian' without letting anyone tell them what they had to believe or do as a Christian.

Jacques Barzun discussed a more general version of this American trait in *The House of Intellect* [7] by first acknowledging that:

We [in the United States] have in fact intelligence in plenty and we use it perhaps more widely than other nations, for we apply it with praiseworthy innocence to parts of life elsewhere ruled by custom or routine. [page 4]

But there is more to the human mind than our thoughts as individuals. In fact, none of us, not even an Augustine or a Newton or a Goethe, can accomplish much without a different form of intelligence which Barzun described in these words:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate

truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand. [page 4]

As Barzun tells us, and as I discuss a little more in Chapter 127, *Intelligence vs. Intellect*, Americans have far less intellect than individual intelligence. Most of us don't consider this communal form of intelligence to be very important and, as a consequence, have only partial human minds. Even those of us who have struggled to develop a truer intellect have a bit of strangeness about us: as a thinker, I'm in conversation with a lot of dead human beings, individual and communal, and a fair number of non-Christians or even anti-Christians through their books. Even as I try to redevelop a respect for community, especially that ultimate community—the Body of Christ, I'm isolated. I'm active in many ways in my family and my parish, but so far as my mental life goes: I'm a hermit of the sort I would preach against.

Our radical individualism, a disease in my view and one spreading across the world even as we become enslaved radical individuals, is an indication of the anti-Biblical views which underly American forms of religion, even those forms labeled 'fundamental Christianity' or 'Biblical Christianity'. The Bible speaks of the formation of a people, described as 'Israel' in the Old Testament and 'Church' or 'the Body of Christ' in the New Testament. Religions true to the Bible, Jewish or Christian, can't co-exist with that individualism which is so deeply a part of the American soul.

There are many concerned about the possible loss of liberty in the West as our central governments react to real and exaggerated and imaginary problems by building the pieces of police states. The critics of our political and economic systems might, and sometimes do, claim this loss of liberty has come about because the mass of citizens in the West have largely lost their ties to the Christian faith which was the source of so much good in the political history of the West. In a way, this is what has happened but the more clearly stated truth, as I've already partially stated, is: our ancestors developed a defective liberty in the United States even as they walked into the wilderness and left behind their Christian beliefs and any attachments they had to one or another cultures which were part of Western Civilization.

[I'm jumping over many rough spots in this essay. The reader wishing a deeper understanding of these issues should read or reread Ortega y Gasset's

*Revolt of the Masses* [60] where a coherent position is presented: the masses of peoples of Europe were freed from parochial lives and limited viewpoints during the years of revolution, French and Industrial and so forth, but were never integrated more completely into Western Civilization. This is a very complicated story which can only be told by way of iterations and complex loops over a variety of historical and theological and metaphysical and sociological and political analyses. And more.]

Having grown up in liberal Protestantism, the modern Congregational Church no longer of the Puritans, I knew little of the doctrines of traditional Christianity. Even the Trinitarian doctrine was sung once each Sunday and then ignored in sermons and Sunday School lessons as if a little embarrassing to an American with any common sense. So far as I could tell, the adults in the congregation were mostly good and decent men and women who were Christians by way of a momentum rapidly dying away. I suspect they thought Jesus was both holy and a good man and we should all try to be more like him. But he probably didn't walk on water and we shouldn't try that either, though it's as good a story as *Puss in Boots*. Few of those in my Sunday School classes remained practicing Christians once they were old enough to decide on their own. Having since entered the Catholic Church, I've come to realize that American Catholics are simply American Protestants who practice strange magical rituals and lag behind their Protestant brothers by a generation or so as we all march into the Brave New World.

American Christians, both Protestants and Catholics, have, to my observation, been accepting of the political and historical myths of this country but also have been quite skeptical about some major portion of the Gospel as understood and preached by traditional Christians. We accept that American leaders would never engage in criminal conspiracies against their own country and citizenry but we have serious doubts about the divinity of Jesus Christ. FDR was infallible in ordaining how this country was to care for its elderly but we Americans know it's absurd to claim that guy over in Rome could be infallible in any way. As for that Catholic and Orthodox business about bread becoming the Body of God and wine becoming His Blood, well, cubes of Wonder bread and shot-glasses of grape-juice are easier to swallow.

We take sides in the arguments about the orthodoxy of the Founding Fathers without having a clue about the true meaning of 'orthodox beliefs', but we're raised to walk to the fridge during commercial breaks and to

similarly exercise our wills by forming opinions which are then defended as if we did know what we're talking about. Americans have been, and are, quite dismissive of any understanding of the Sacraments which admit any objective, real-world effect. They tend to think of Heaven as a place for hordes of individuals to gather for worship of God and a generally good time of a well-behaved sort. The Body of Christ is no more than a term to designate that gathering of individuals. It isn't a real entity. Christ is head of that Body in the way the American President is head of a collection of 300 million individualists.

In between my youth as a Congregationalist and my entry into the Catholic Church, I was a practicing Evangelical Protestant in a very good church community in the Atlanta area. I took away the impression that even Baptism is a mere sign and the real act of becoming a Christian occurs when we accept the Lord Jesus as our savior. Despite an official position that we can be saved only by God's grace, American Evangelicals actually believe it is the public profession of our will to be saved that saves us. We Americans save our own individualistic selves.

In past essays, I've written about the tendency in the modern West to consider will as dominant over the mind. That tendency seeming to have begun with the radical Franciscan theologians at Oxford in the 14th century or so. Let me switch to the trio of mind, heart, and hands. As the Protestant rebellion against sacramental Christianity gathered steam along with similar rebellions inside the Catholic Church, mind and hands were both denigrated compared to heart, which would have been a disciplined heart in the thoughts of that radical Franciscan, William of Ockham, as well as in the thoughts of Calvin and Luther and various Catholic thinkers. In fact, mind and hands play a role in disciplining the heart. From my current view as a Monday morning quarterback, it's hardly surprising that the wills of Western men have become rather flabby things capable only of soggy sentiments and corrupt desires. By now, this is also true of American Catholics and certainly American Episcopalians and probably Orthodox living in the United States. Indeed, this spiritual disease, this metastatic growth of an undisciplined will, seems to be little more in practice than an acquiescence to whatever our leaders tell us to think and feel and do. That is what we choose to will. I don't think old George could have dreamed up the particulars of this Orwellian nightmare.

Without a well-disciplined Christian mind to shape itself and also guide the shaping of heart and hands, without Christian hands well-formed to

good habits to actually deal with what lies outside of us, heart becomes a dangerous thing. It can become a little demon in our chests, whispering or roaring the Satanic desire: I will to control what is me and what is not me. The more cowardly of us might just think: I'll eat and drink and smoke whatever appeals to me, and watch a lot of television.

In Chapter 219, *What is Freedom?*, I said:

In the modern world, we tend to think of freedom in terms of satisfying desires. To be sure, even many who live for that false sort of freedom seem to realize that we then become no more than our desires or, more horribly, the thwarting of those desires—a terrible and humiliating state in either case. Hannibal the Cannibal is the most free of all modern men because he has become his desires and he has gained the power to satisfy them. Hannibal the Cannibal is the role-model for our politicians and our lawyers, our investment bankers and our corporate executives, our athletes and our entertainers. He may even be a role-model for many clergymen.

We can restore Christianity worthy of the name only if we try to heal our entire selves, mind and heart and hands, with the mind of the creative trailblazers necessarily taking a primary and guiding role, but other parts and other human beings should be quickly joining in. In fact, I'm beginning to fear it will take the fresh minds of a new generation freed from our school systems and mass entertainment to follow any who might be trailblazers. [Be careful. We heal our selves only by shaping those selves by way of active responses to God's Creation, not by concentrating too much on our own selves or a human leader. We and our leaders are part of what we should respond to, but only part.]

It's hardly surprising to me that many in the United States have decided it's not worthwhile to even pretend they are Christians or Jews when the guy with the clipboard comes by to measure the American soul, but some, including insightful and learned scholars and critics, see more true Christianity in the American past than I do. *Liberty Fund* has published on one of its websites, <http://www.libertyfund.org>, this different take on this issue: *The "Nones" and American Liberty* at <http://www.libertylawsite.org/2013/02/17/the-nones-and-american-liberty/>. It is a highly intelligent perspective

worth the read even if my view is more plausible, as I believe it to be. Near the end of that essay, we find this quote from Tocqueville which, in terms of Eric Voegelin's critique of the modern world, recommends we turn and start crawling back up the slippery slope, maybe halfway up would be good:

So it is that every day it [American democracy which glorifies equality] renders the employment of free will less useful and more rare; it confines the action of the will in a smaller space and little by little steals the very use of free will from each citizen. Equality has prepared men for all these things; it has disposed them to tolerate them and often even to regard them as a benefit.

I have a great deal of respect for Tocqueville and we should remember he wrote these words as a young man in a Brave New World where he had to develop new forms of perception and new tools of analysis even as he was exploring the newly revealed landscape and soulscape. Yet, I don't see how a return to a Christianity based on a mutilated human nature, "Will is what will save us," can help much. Tocqueville in these words, part of a critique of democracy, was speaking of a will (a part of what I call 'heart') which had weakened exactly because it had been glorified over mind and hands and too much had been expected of that will. Even more important than the excessive expectations is the fact that the American understanding of Christian man glorifies a mutilated human being and such creatures could never establish stable moral order, the basis of other sorts of order in our political and economic and cultural lives. Nor can such creatures be comfortable with a truer form of Christianity, sacramental in outlook and Sacramental in liturgical practice.

This is the optimistic viewpoint: God is smashing what we've misbuilt and our grandchildren will have a chance to build a better Christian civilization. There is still the small chance, getting smaller rapidly, that we will stir up enough creative turmoil that we can revive and reform Western Civilization. I'm not counting on it though I'm ever hopeful that I'm only one of many who are beginning to work to that goal. I wouldn't think it possible to have any revival from inside the power structures or academic institutions or ecclesiastical institutions of the West. Individuals inside the power structures and institutions might participate but those structures and institutions will struggle to survive by suppressing reforms. At this point,

I can recommend Carroll Quigley's *The Evolution of Civilization* [119] for a discussion of these latter issues and for short narratives of two times when Western Civilization did manage to pull out of a collapse to become greater than it had been. Not entirely by coincidence, this book has been republished by *Liberty Fund*, a good organization if a bit biased toward an excessively individualistic viewpoint.

# 627 Grace Working Toward Christ-like Man by Way of Evolution

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1540>. It was finished and uploaded on 2013/02/20.]

I've claimed that we can see the world, at least after Jesus Christ's ascension to His Father, as being the story of the growth and development of the Body of Christ, including the evolution and development of the organs of that Body. We can read the main purposes of God as Creator out of this story, not just purposes regarding the physical stuff around us but even our moral obligations to each other.

To realize God's purposes for us, we need to more strongly intend membership in the Body of Christ, that is, we need to move toward that membership, making God's purposes our own as best we can. This sort of a Christian viewpoint complicates, even fundamentally changes, a Christian's movement toward salvation. The Body of Christ is the communal us in full union with Jesus Christ. That Body is alive in this mortal realm, developing and growing, sinning as well as working for the good.

We need to act as morally courageous individuals, but we Christians, Jews as well, are communal beings as well as individuals. We Christians travel together in the Body of Christ. Since we can't be sure who is truly in that Body, not even our own selves, then we must treat all human beings as being members or at least as being potential recruits before their mortal lives are ended. This doesn't mean we need to be squishy toward others, forgiving when we have no right to forgive. It doesn't mean we should give up our right to legitimate defense of ourselves or others under our care,

though there are some other and more plausible arguments for a radically non-resistant attitude in Christians.

Let me try to deal with a specific moral question: What responsibilities do we have toward those who can't care for themselves? Do we have any responsibilities toward those who seem to be missing some of the attributes of human nature, not being able to socialize or perhaps being stuck in a coma with few signs of brain activity because of an accident or because they were born without some major brain regions? Can we serve God by fighting against the mechanisms of evolution as God ordained them to be in this sometime nasty world? Do we want those with low IQs or the impulsive tendencies of criminals to leave behind children and grandchildren? If such human creatures survive to a long life in this world, can they enjoy their years in the way of a true human being? Should we be extending charity to those who have problems and may well produce children with similar problems?

I discussed the relationship between progressives and eugenics programs which sterilize those declared "defective" in Chapter 132, *Progressives as Typical Modern Thinkers*, but I didn't try to address the issue of natural selection. Are we fighting God's story when we keep alive those who clearly wouldn't be able to survive on their own in, say, a radically individualistic civilization? Not that I think such a civilization could ever form.

There are various lines of analysis which can lead to possibly consistent answers to this sort of questions. Some of those answers draw a line in the sand—on this side, human, but not human on the other side. Some of those answers, Christian or Jewish, find it difficult to exclude any creature which might be human. In fact, there is a rule at least as ancient as the first generation of Christians: we should treat any creature which might be human as if it were fully human. Even if the creature is missing much of a human brain and is incapable of even moving toward food, we should care for him and treat him with the respect we wish for our own intact selves.

I'm raising this somewhat complex question, which I've asked in slightly different forms before, only to say we should contemplate possible answers but realize there is no way to provide an answer which all men will accept. This is the story God chose to tell: that of the Son of God emptying Himself of His divinity to live as a creature, to enjoy life, to suffer, to die in a humiliating and painful way, and to be raised from the grave as a perfect union of God and man that He might ascend to the world of the resurrected to one day be reunited in the Body of Christ with all of those He chooses

to be His friends and companions, part of His own Body, for time without end. Suffering is part of that story. Some can't accept that an all-good Creator would create realms of being in which suffering plays a major and necessary role. Some have defective but seeming rational reasons and some have merely allowed their feelings to be deformed by a squeamishness masquerading as compassion. Most of these dissenters against the Christian position about the goodness of this world of both pleasure and suffering have good motives, however defective their reasoning or their feeling. We need to respect these Christians of wavering faith as well as the many non-Christians. We need to evangelize them properly and we need to start by realizing that we modern Christians as a community have no good story in which the sufferings of Jesus Christ, the sufferings of a child with inoperable brain cancer, biological evolution, and Christian beliefs come together as other than a pagan tragedy. We have mostly ungrounded assertions, largely drawn from past centuries when they might have been grounded in premodern understandings of this world and what might lie beyond it.

We are saved as members of that Body and not as individuals. We can understand a little better what that Body is by learning from the works of evolutionary biologists studying the social natures of living creatures, especially human beings: see Chapter 286, *A Christian Sociobiology*, for a very preliminary effort to adopt sociobiological concepts into Christian thought. After all, the Body of Christ first forms as a community in this mortal realm, a community of mortal men not yet fully in union with Jesus Christ.

Communities are real and have been made real by the processes described by evolutionary biologists doing sociobiological analyses. Communities are real and aren't just ways of speaking about gatherings of individuals, as I argued recently in the essay included as Chapter 178, *Are Communities a Form of Created Being?*, where I wrote:

We modern believers in a radical and incoherent individualism deny too easily our raw perceptions of communal entities. We ignore the underlying being which can't be explained to any significant extent by assembling our understanding of the constituent members and other parts. This is strange on the part of sacramental Christians; after all, some of the special bonds coming down to unite man and woman as a married couple, individuals as a Church, and mortal men as sharers of God's life

are brought about by those acts we call Sacraments. The more general, less special bonds are still knowable as the glue of a sacramental world.

Communities are for real, not just at the level of civilizations or of that ultimate community, a supernatural civilization of sorts: the Body of Christ. Marriages are real and not just contractual relationships; extended families are for real; towns and churches and synagogues and ethnic clubs and associations of scientists or lawyers are communities of real being and not just gatherings of individuals. We become members of communities, not just for defense against real or imaginary enemies, not just to sell pickup trucks and hamburgers to each other, not even just to form communities of worship. We become members of communities to become part of each other by becoming each the entire community in the small, so that the community can become each of us in the large. As God is three Persons in one God, we will ultimately be many human persons in one Body of Christ, billions of human beings in one perfect Man, made perfect because Jesus Christ is one of us.

Except for Jesus Christ, we men are all incomplete and defective. Not a one of us can claim to be more than a tiny and badly defective part of that complete and perfect man, but God will make up the shortfall for each and every man or woman or child He chooses to bring into the Body of Christ. We become complete and perfect by drawing upon each other in forming the one man, most of all by drawing upon our Lord Jesus Christ. Even Jesus Christ has chosen to be incomplete in a strong sense. He chose to become fully a member of a race of social mammals and will ever love those who are His own. He needs us, in a different way than we need Him, and He chose to need us. But He needs us to complete His Body in the world of the resurrected.

We are infinitely more defective than the human nature of the Son of God, infinitely less complete than is that divine Person. In context, a young boy with a severe form of Muscular Dystrophy that prevents normal paths of human development isn't so bad compared to the greatest of men. I don't know that little boy will be taken up to Heaven but I don't have a good reason to believe he won't. He is one of God's creatures, a member of a race of creatures adopted by God, and we should treat him as such. A human community extrapolated to some state of perfection and completeness looks an awful lot like a gathering of Christ-like men and women, perhaps

sheltering some who could never attain a mature state of humanity. It takes only a morally well-ordered Christian imagination to go from apes only a little reluctant to kill other members of their own species to that Christ-like man. After all, part of that imaginative journey lies in the past and is being actively studied by a variety of evolutionary biologists, anthropologists, archaeologists, narrative historians working with the scant evidence before the invention of writing, and others. We have those parts of the story to add to the Bible and more modern history.

Christians need to understand this mortal realm with all its pain and suffering. We need also to understand the strangeness of strong social bonds and moral behaviors developing in this world red of tooth and claw. Strange or not, it has happened and it's a more complete theory of biological evolution, a theory we can only see vaguely for now, which ties Christian moral and social thought firmly to God's Creation so long as we honestly deal with the fact that the man who is descended from ape-like creatures is the same man who is said to be the image of God.

After all, grace can be seen, in part, as the energy driving God's story toward the fullness of the Body of Christ. Christian thinkers need to reshape their minds to God's thoughts, their hearts to God's feelings, their hands to God's ways of doing things. Then, evolutionary biology and Christian theology aren't in irreconcilable conflict; rather are they two different views of God's acts as Creator.

I have come by an indirect path to one of the most important principles of Christian thought:

Grace doesn't destroy or replace nature. Grace perfects and completes nature.

This is, or should be, the goal of the Christian intellect, the capitalized and communal mind of Christians: to explain all that God has created in terms of what God has created, terms in principle accessible to the human mind which can shape itself to the manifested thoughts of God. We explain Creation, the thoughts God chose to manifest, in terms we learn by studying Creation in light of our small stock of revelations.

The perverse problem created by human thinkers, Christian and non-Christian, is that of explaining what we can explore and analyze and know in terms of supposedly more certain truths, maybe even absolutely certain truths. If we recognize abstract realms as also being part of the Creation

God has given to man, then we start exploring reality as reality and understanding reality becomes simply the problem of reshaping our minds to the reality which is, after all, the manifestation of certain thoughts of God.

As Christians understand this story, God wishes us to form communities on the way to the formation of the Body of Christ. Those who are “defective” by the standards of progressivists or others are to be brought into our communities and cared for if at all possible.

Yet, we should be aware that the laws of genetics and the processes of evolution aren’t to be denied in this mortal realm and we Christians need more than others to study such fields as sociobiology, at a professional level, that we might arrive at better, more technical, more exact understandings of what is really happening as the human race continues to evolve along with other species and within the context of the changing ecological environments and rapidly changing human communities.

Coming to an understanding of our moral duties as children of God doesn’t automatically tell us how to live our individual and communal lives. We do need to understand Creation, in its own terms, terms we can study as physicists and historians and novelists and theologians and carpenters and nurses.

# 628 Becoming Child-like in Our Thinking

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1543>. It was finished and uploaded on 2013/02/21.]

We were told by Jesus of Nazareth that we must become like children to enter Heaven. We must become ‘child-like’ and not ‘childish’.

As creatures of mind and heart and hands, how can we become child-like? Wouldn’t that mean we would think as a child, feel as a child, and act as a child? That doesn’t seem right. It would seem to be strongly opposed to my advocacy of a sophisticated effort to understand God’s Creation.

In the distinction I’m drawing, to be child-like doesn’t mean we’re to be like children in all ways, doesn’t mean we should be childish. Jesus didn’t command us to throw tantrums when we don’t get a desert after dinner every night nor did He command us to repeatedly try to understand modern empirical knowledge by the imposing traditional frameworks of knowledge upon a world described by quantum physics and evolutionary biology and a decidedly non-idealistic view of human history.

What in the world did Jesus mean by commanding us to be child-like if we are to be saved, if we are to enter the world of the resurrected? I’ve given the answer often in my writings with regard to our attitudes toward what God has created, what lies inside of us and also outside of us. I’ve generally written in terms of a Christian needing to deny epistemology as a legitimate philosophical specialty, though it’s certainly necessary for physiologists and brain-scientists and instrument designers to study these problems of knowledge denied to philosophers. And it is good for philosophers to be aware of the distortions and biases and weaknesses of the human visual system, also aware of the ways in which we can compensate.

Reading *On Certainty*, a collection of aphorisms by Ludwig Wittgenstein, has put a new light on this issue. As if trying to comment upon the commandment of Jesus, Wittgenstein expends some effort to make it clear that our knowledge starts in childhood with a naive acceptance of what adults tell us and what we see in the world around us. This is not a pure credulity but rather a form of naivetè which is a matter of trust. In fact, it seems to me that Wittgenstein systematically strips away the pretensions of doubt in modern philosophy and creates a photographic negative of what might be called 'naive realism' in a Thomistic context—at least as Gilson understood the thoughts of St. Thomas Aquinas. (This was the area where Gilson disagreed with his friend Jacques Maritain to the extent of claiming Maritain wasn't a true follower of St. Thomas Aquinas.)

This is the meaning of 'naive realism' in that Thomistic context: we are to be child-like in accepting what we perceive as being truthful. It may need some unraveling and some analysis, maybe we'll need to design some instruments, before we can make total sense of those perceptions, but the truth can be found by way of those perceptions seen in light of a small stock of direct revelations, and even those are given to us as the sounds and sights accessible to creatures with ears and eyes and no organs that see into transcendental regions.

A child explores the world directly around him but learns about the greater parts of the world from adults, directly or by drawing out the assumptions underlying the statements of adults. The essence of the adult's statement that the earth is round is accepted as being a matter of truth and the young boy destined to be a philosopher or theoretical physicist will, at some point, wonder at the claim and maybe stare at the globe he got for Christmas and ask why people in Australia don't fall off the earth. Even children with lesser talents in abstract reasoning will, as time goes on, learn that raw truth often requires some effort to be understood in a deeper way so that it can be integrated into the child's greater understanding. It might take many years before the child advances to a more sophisticated naivetè, but it usually happens.

What other option do human children really have? Those who try to honestly impose upon reality some inner scheme will be seen as mentally disturbed, maybe diagnosed as being psychotic in the way of schizophrenia. Yet, many of us modern people are schizophrenic in many of our ways of thought, including our teachers and spiritual leaders and writers and so forth. This is one reason for many throwing away their faith. They walk

away from Christianity when they realize that the sermons or homilies or Sunday morning instruction is in conflict with the knowledge underlying those machines and techniques in the local Medical Center, in conflict with the images being sent back to earth by NASA space explorers, in conflict even with the general concepts of mathematics they might learn as undergraduates in college. Few will be able to unravel this and build up a Christian story of reality on their own. Nearly all, including nearly all clergymen, will need others to build up a coherent story reconciling the Bible and Darwin's *On the Origin of Species*.

I've said often: created being, reality, is a manifestation of certain thoughts of God. We accept what we see as being true; "Things are true," as St. Thomas Aquinas claimed. We have no warrant for a belief that we human animals know something outside of what we are told by way of the thing-like realm of being and the abstract realms of being we can begin to detect by studying that thing-like realm in greater detail and with greater sophistication. We are children learning from the Creator and shaping our thoughts in response to His answers. We're not some sort of natural adults bringing schemes of truths to the task of understanding what lies around us. Any schemes we have are drawn out of our environments, concrete and abstract, by studying our traditions, and by that painful process of growing into a world, becoming truly part of it. We need to refound our Christian faith and we must do so by accepting on faith what is known of empirical reality and to move on to making sense of that knowledge in light of our Christian beliefs. As children take on faith the claims of their parents, we need to take on faith what God is telling us through His Creation.

# 629 Faith in God Gives Us Courage to Doubt All Else

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1549>. It was finished and uploaded on 2013/02/26.]

I'm going to slightly misuse a quote from the book of aphorisms, *On Certainty* [152], collected from notes of the philosopher, Ludwig Wittgenstein:

Doubt itself rests only on what is beyond doubt. [page 68e]

He was writing about knowledge inside of a 'language game', which I think to be something like the active use of a hypothetical dictionary and grammar of what I call a 'worldview'. To start up a game, language or baseball, you need rules beyond questioning, even if they're clearly arbitrary or might be wrong in some larger sense. Doubts arise in the game but doubts about the rules of the game bring it to a halt.

Wittgenstein's words made me focus on an idea I'd been holding at the edge of my mind for years. I think I've even expressed this idea in somewhat cloudy terms. My idea is: It's just because I have faith in an all-powerful, all-loving, and all-knowing Creator that I can feel safe to engage in radical doubt about what I've learned or can learn from entities which are not God. I write 'radical doubt' and intend not any sort of corrosive skepticism but rather the sort of doubt Einstein held about Newtonian ideas on the nature of simultaneity leading to doubt about Newtonian ideas on the nature of space and time. Einstein greatly respected Newton but felt free to question Newton's dynamics based upon knowledge gained well after the death of that great English physicist. (That knowledge was actually of electrodynamics as summarized in what we call Maxwell's Equations.)

And then Wittgenstein speculates:

But mightn't a higher authority assure me that I don't know the truth? So that I had to say "Teach me!"? But then my eyes would have to be opened. [page 76e]

If that higher authority were God? If we were to hold a Christian faith, a faith held in common with Jews so far as the goodness of God's Creation goes? To me, this goodness includes not only rationality but an openness to exploration and analysis and—in principle—understanding. It may take a lot of work over more generations than mortal man will have in this world, but—in principle—we can become truer images of God in our very efforts to encapsulate in our own beings an understanding of God's works as Creator. In simple terms, we enter a conversation of sorts with the Creator when we begin to explore His Creation and to try to understand what we discover. In terms of the quote above, we say to our Maker, "Teach me!"

If our faith is in God and not in any particular understanding of empirical reality—Creation, then wouldn't we be able to—in principle—move smoothly from Newtonian mechanics to Einstein's special relativistic mechanics and then on to a mixture, however tentative, of general relativity and quantum mechanics? Obviously, it's not quite a smooth journey. I commented upon John Polkinghorne's discussion of the difficulty that physicists and bright physics students have in accepting new understandings of reality in Chapter 90, *Shaping Our Minds to Reality*. Polkinghorne was a theoretical physicist and then an Anglican priest, giving him an interesting combination of perspectives.

Much of our empirical knowledge, even at the fundamental level, must be held contingently, waiting for unexpected evidence that, perhaps, matter isn't quite what we might think from our current versions of quantum mechanics, even that our own human natures might be based upon different foundations than we've thought. At the same time, some of our knowledge does come quite close to being absolutely certain, at least in the context of this particular Creation. Though the statement " $1 + 1 = 2$ " can be in doubt when we try to apply it to entities, such as nucleons, that combine in funny ways, it's not in any doubt as a formal truth. Even some of our higher level thought is pretty solid, such as the quantum mechanical explanation of the electrical charge—the accuracy of the calculation of the amount of the charge is extraordinary. General relativity also has a pretty well ver-

ified explanation of basic properties of spacetime. Our understanding of our own human nature is far less solid, though an intelligent evaluation of sociobiology and genetics and the modern social sciences gives us a picture very consistent with man as he has shown himself in history, including that included in the Bible. We need a better understanding if we are to be able to more fully understand human nature as it is likely to show itself in a rapidly changing world and we seem to be on the way to what Pope Benedict XVI called for—a more exact understanding of man, but not due much to the efforts of Christian thinkers. (There are Christians working in these fields but not working as Christians and not working to produce a Christian understanding of the results.)

Some of our knowledge of mathematical and physical reality, including parts of our own human nature, can be treated as fragments without leading to any obvious absurdity. Most of our knowledge is set into an understanding of some larger whole—sometimes even the entirety of what concerns us. Though discussed neither by Galileo nor by his opponents so far as I know, the real problem with Galileo's discovery that the moon and sun and other objects were more like earth-stuff than ideal, unchanging entities is that it cast into doubt the economy of salvation. Where were Heaven and Hell if the universe were made up of just entities of the same stuff as the rocks of earth? Not surprisingly, the pagan view of Creation, simplistically called Aristotelian-Ptolemaic, had been consistent with contemporary Christian understandings of man and of the world. For example, the celestial sphere architecture of the Cosmos allowed Christian thinkers to speculate that Heaven lay on one of the higher and more pure spheres. That pagan understanding had become intertwined with Christian understandings of salvation and no one in Galileo's age, including the great scientist and devout Catholic himself, knew how to understand in Christian terms this strange new world in which there seemed to be no place where Heaven could be.

Faith was needed that Christians had truly heard promises from God **and** that the same God had made this world as part of His plans for us. That faith needed to be of heroic proportions since it would be centuries before enough would be known to build a new Christian understanding of this universe, an understanding which allows also a coherent and plausible restatement of the sinful nature of man and the possible meaning of salvation to such a creature. Faith was too weak, or perhaps the right thinker was simply not in the right place at the right time. We have been missing

a plausible Christian understanding of Creation for centuries. There is a sense in which faith was found sufficient to part of the task: the traditional understandings of the world were retained in a rather jarring context. Christian intellectuals tend to hand-wave their way around the problems while some Catholics, and Protestants in a different way, have returned to what I would call a baptized paganism—a natural state in new missionary territories but a sign of great trouble to come in regions where Christianity had been established for a thousand years or more. We lack a plausible account of salvation, of integration into the Body of Christ, but many of us are sure that Satan has godly powers to drag us into Hell, wherever it might be.

We're now at a point where that new Christian understanding of all Creation can be built, an understanding which allows us to restore the economy of salvation to center stage in our thoughts, thoughts which are rational and make sense of the Big Bang and biological evolution and genes and the nature of communities and so on. Why is it not considered of greater importance to do so? Why is it that I feel so isolated when I'm trying to do what might be the most important task for Christians of our age: that building of a new understanding of Creation which accounts for modern empirical knowledge in the context of a Christian understanding of Creation? This understanding would give us renewed confidence we do live in a world which is a story God is telling of our salvation. That is the sort of confidence which can lead to the building of a new civilization or the reform of Western Civilization if still possible.

I can testify that a strong faith in God and His promises, a faith in the Real Presence of Christ on the altar and a faith in the corresponding sacramental nature of our embodied selves and all that we touch or see, allows me to doubt all the questionable and historically contingent teachings of the traditional Christian stories, allows me to doubt also that non-believers have it at all right when they tell us that modern science testifies to the lack of a purpose in this world.

I can strongly admire Plato and Augustine and Aquinas, Newton and Darwin and Einstein and Dirac. I can see what is truly good in their thoughts. But I can doubt their understandings of the world, even their understandings of their own valid insights. It's God and the small stock of revelations He has gifted to us that I can't doubt. Even when it comes to those revelations, I can doubt that Popes or Councils or the greatest of theologians got it absolutely right. It's awfully easy to distort even the most important of truths, if only by imprisoning those truths in historically

contingent ways of expressing and passing on those truths. Truths can become lies when stated in words and concepts which have changed.

# 630 Nietzsche, Darwin, and Jesus Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1573>. It was finished and uploaded on 2013/03/26.]

I'm going to take a quotation from Nietzsche's *On the Genealogy of Morals* [101] somewhat out of context:

The bad conscience is an illness, there is no doubt about that, but an illness as pregnancy is an illness. [second essay, section 19 from the translation by Walter Kaufmann and R.J. Hollingdale, Vintage Books, 1989]

What is the 'bad conscience' to Nietzsche? It's associated with self-denial, selfishness, self-sacrifice. It's a slavish sort of illness allied closely to Christianity. It casts a morbid coloring over the entire being of those infected with this 'bad conscience'.

Nietzsche's concept of the 'bad conscience' arose from his analysis of the aristocratic view that 'bad' is what we should fight against; the Christian view that 'evil' is what we should fight against. In Nietzsche's view, seeing the world in aristocratic good vs. bad is far preferable to the 'slavish' good vs. evil. Sort of. He actually considered both to be defective and the 'slavish' view to be the one which might prove to be a temporary illness from which a better moral view could be born, that is, the slavish moral attitude is "an illness as pregnancy is an illness."

A 'bad conscience' is what I might call unmoored guilt, a general guilt which comes from feelings that I am inherently defective. In my Christian viewpoint, one which might have fascinated and annoyed Nietzsche, a 'bad conscience' or guilt is a gnawing of the insides, a useless activity for a

creature created as a clever ape. We are what we are and shouldn't worry so much about our defects but should rather deploy our energies to look at Creation and the Creator, to imitate God by way of understanding His work in Creation, a work which can be explored and analyzed and about which we can speculate. In more spiritual terms, we should aim to replace our bad consciences, our guilt, by a burning desire to become like Christ, to achieve a proper union with God, by way of enfolding ourselves into the Body of Christ. If we do so, we will be accepting God's offer to bring us into the Body of Christ, to complete and perfect us as individual human beings and also as communal human beings. This could be called a rebirth of sorts, though certainly not the birth anticipated by Nietzsche.

Still, as is often the case, Nietzsche saw into the world, into modern human societies, into the modern human soul, more deeply and more clearly than did his opponents, Christian and otherwise. He was, in my opinion, a doctor of the soul who was brilliant at diagnosing the disease and somewhat askew in seeing and recommending a cure. He himself had a variety of the disease and never saw his own way out of his illness. I also have a variety of the disease and have recommended a real cure above and will discuss it a little more at the end of this essay.

There is a blindness in the aristocratic view of the world as being a battle between 'good' and 'bad', in simplistic terms: think of a battle between warrior courage and any type of cowardice. There is a similar blindness in the 'slavish' view of the world as being a battle between 'good' and 'evil' where evil is some sort of demonic force; in some but not all infected with a 'bad conscience', this shows up in a feeling that sexual activity is inherently evil in some sense, a compromise that 'good' makes with the 'evil' of this mortal realm. A better view, and one in line with modern empirical knowledge of men as well as the moral theology of St. Thomas Aquinas, is that sexual love is a legitimate part of a more total marital love and lust is a distorted, and often exploitive, form of sexual love.

As I currently view history, ancient ideas of being would lead to a radical dichotomy between good and evil. (Despite Nietzsche's claim, at times, that ancient Greeks all had an aristocratic understanding of morality.) Women are virgins or whores, leaving most women in an ambiguous state. Men are celibate or consumed by their desires. Any virgin woman or any celibate man is always on the edge of falling into lust.

Let me continue mining that vein of thought. Reproduction involves us in efforts some of us have avoided. This isn't good, not something I'm

proud of as I head through my sixth decade of life. Yet, there were times when I was almost driven by sexual desire to start a family though I had rational and utilitarian reasons not to do so. A more common reason to avoid starting a family is a poverty in which it would be stupid to have children, at least by modern utilitarian standards. Yet, children were born in the worst periods of history and often as a result of strong sexual desire even unto lust.

Our clearer thoughts are often clouded and even overwhelmed by ordered or disordered desires which force us to have children when it hurts, to rush into a burning building when we hear someone screaming in terror and maybe pain. It's our emotions, we can hope disciplined emotions, which often send us to our heroic acts of self-sacrifice, which despite the thoughts of Nietzsche and his opponents, is often justified by reason deployed over the time-scale of a family-line or the space-scale of a community such as a nation.

We are all imperfectly ordered, even so saintly a saint as Francis of Assisi. How do we head toward a better state of order? How do we heal our outright disorder as well as our ambiguously undordered state?

I don't think it's hard to imagine good Christian leaders thinking to lead their followers toward a state of Christ-like order by teaching them to be ashamed of their natural state of fragmentation and incoherence and incompleteness, to think of this state as being a matter of sin, of rebellion against God. After all, even so clearheaded a thinker as Augustine ended up endorsing the claim that we were created in some state of creaturely perfection and purity and fell by way of a bad decision by a distant pair of ancestors. This despite the fact that Augustine considered a conflicting theory that human beings arose in the same natural world as other animals rather than by way of a special creation. He knew those two theories were in irreconcilable conflict. Modern Christian theologians seem not so clear-headed about the implications of the modern theory of evolution, accepted by the Catholic Church, most Protestant churches, and—I believe—by most Orthodox churches as well.

So, we're clever apes driven by 'imperfectly implemented' emotions which often force our best acts but also force some of our truly despicable acts. In addition, our minds and hands are also disordered in ways that also affect not only the heart but each other. How do we get to a better state of order? Can such a better state exist in this mortal realm?

I do think we could have done better but what happened in Christian

history was good enough to get us to a point where a man with strong faith and an openness to Creation can see the better man in terms of an image from James Joyce's *The Artist as a Young Man*: with left hand on Darwin's *Origin of Species*, we can say, "This tells us how we got to be what we are"; with right hand on the Bible, we can say, "This tells us what we can be and what God calls us to be."

Whether the best way or not, the path taken by the Christian mainstream was the 'bad conscience', feelings of shame and unmoored guilt. Nietzsche clearly saw this path and was optimistic it could lead to a better state of moral order in the future. "Beyond evil and good" where "evil and good" is the view allied with the 'bad conscience'. The birth of a better man. Though having rejected Christianity, Nietzsche probably wouldn't have been too upset if a Christian described that better state as "Christ-like."

## 631 Lost in a Sexually Polymorphous Cosmos

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1590>. It was finished and uploaded on 2013/04/11.]

Rod Dreher has published an essay on the Internet, *Sex After Christianity* at <http://www.theamericanconservative.com/articles/sex-after-christianity/>, which gives us a sketchy story of the loss of Christianity in the United States (probably the entire West), a story which might be sketchy but is more plausible than what you might gather from the way most Christians speak and far more plausible than the Nixonian gibberish about the “moral majority.” Mr. Dreher points to some standard scholarly studies of American social views which showed we were a sexually ‘liberated’ people even back in the decades before the 1960s. A strong version of this claim was recently raised by a scientist’s discovery that *Penicillin, Not the Pill, May Have Launched the Sexual Revolution* (see <http://www.sciencedaily.com/releases/2013/01/130128082906.htm>). Once the dangers of syphilis were thwarted, Americans were hitting the sack with a variety of partners not their spouses, and this by the 1950s, not the 1960s. See Chapter 479, *A Medicine Which Saved Lives and Destroyed Moral Order?* for my take on this situation.

Even mainstream histories of the United States, more than a little white-washed, will tell the tale of Americans being radical individualists, making their own moral and social rules, by the 1700s or so, as soon as a little prosperity freed them from traditional dependencies. From the beginning, we Americans have been willing to give much, our freedom or our souls, in return for a good paycheck and benefits but we don’t readily bow to the authority of family or other human communities, not even Church. Heck,

God Himself has no right to tell us how to think or feel or act, unless He sends us lots of pennies from Heaven and even then. . . In other words, we Americans, and others in the modern West, are little different in our raw moral characteristics from other human beings for all our feelings of being special.

In Mr. Dreher's essay, we can read:

[I]n the modern era, we have inverted the role of culture. Instead of teaching us what we must deprive ourselves of to be civilized, we have a society that tells us we find meaning and purpose in releasing ourselves from the old prohibitions.

How this came to be is a complicated story involving the rise of humanism, the advent of the Enlightenment, and the coming of modernity. As philosopher Charles Taylor writes in his magisterial religious and cultural history *A Secular Age*, "The entire ethical stance of moderns supposes and follows on from the death of God (and of course, of the meaningful cosmos)." To be modern is to believe in one's individual desires as the locus of authority and self-definition.

I would rephrase things, would write of civilization requiring us to shape ourselves to certain habits of mind and heart and hands rather than speaking of deprivation, but the analysis is basically spot-on and the entire essay is good as an analysis of our loss of respect for Christian views of marriage. Yet, there is something amiss. I'll concentrate on the strange gap: the acknowledgment of the loss of a "meaningful cosmos" with also an apparent loss of Christian initiative resulting in the failure to even try to find a newly meaningful cosmos. The best our Christian intellectuals seem able to hope for is to patch-up the old "meaningful cosmos." Why bother with the inconvenient fact, as one example, that our Christian view of human nature in the West comes from St. Augustine's endorsement of the "fall from a state of grace" understanding of the story of Adam and Eve, an understanding he knew and presented as being in conflict with his alternative speculation that men arose within the natural world, not as a special creation in a special state of grace. In this other view, men arose from lower species. We now know men did so arise and we apparently have few thinkers so smart as Augustine as to see we need to radically rework our understanding of human nature. Fr. Stanley Jaki, the polymath scholar, labeled Augustine's

decision to go with “fall from state of grace” as the most damaging and most cowardly intellectual act in history; and Fr. Jaki was mostly a big admirer of Augustine. We Christians did our best to move out of this cosmos a long time ago; we are perhaps only now learning we have to live in the cosmos as God made it and not as we would like it.

Mr. Dreher sees that we Christians must struggle on cosmological grounds rather than moralistic grounds. So there are some other Christians who agree with me on that issue but there are, so far as I know, none who are willing to actually engage my efforts to so struggle, to join with me in assent or respectful debate aimed at some better view. The readership of my blog grows slowly and there are increasing numbers of downloads of my books, even into countries where Christian writings are, shall we say, frowned upon, but I see few signs that others are actively agreeing with my way of carrying out this struggle or trying to develop other ways. Yet, it’s early in this sort of struggle, a sort which is carried out over centuries of seeming peace interspersed by open conflict. In a manner of speaking, God began seriously irritating me about 30 years ago and forced me into a desert 25 years ago. I shouldn’t expect others to be able to re-turn toward God’s Creation any faster than did I. And the initial stages of looking into a blinding light, of learning to tolerate it and responding to it in such a way as to reshape your own self, are—shall we say—painful in ways described well by my confirmation saint, St. John of the Cross.

We have no meaningful cosmos and we have plenty of analyses which tell us this, all from a group of viewpoints describable as baptized paganism. See Chapter 69, *Hellenistic Metaphysics is Too Small*, and Chapter 25, *Broadening the Horizons of Reason*, for my analyses of speeches by Pope Benedict XVI, a man who was far too good for our age just because he had shaped himself to the task of helping us to leave the Christian “intellectual ghetto” as Etienne Gilson, a man of similar outlook and temperament, termed the places where we hide from God and His Creation. In the speech which is the subject of the second essay, Pope Benedict XVI told us: “Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man.” In any case, Joseph Ratzinger, as Pope and before that, has failed to accomplish much in this area during his own public career. We can only pray he planted many seeds.

In the above referenced essay, *Sex After Christianity* at <http://www.theamericanconservative.com/articles/sex-after-christianity/>,

Mr. Dreher writes, “You don’t behave this way and not that way because it’s good for you; you do so because this moral vision is encoded in the nature of reality. This is the basis of natural-law theory, which has been at the heart of contemporary secular arguments against same-sex marriage (and which have persuaded no one).” Of course, natural-law theory convinces no one; it’s based upon an understanding of nature, of created being, of God’s way of telling this story which is our world; but our current natural-law theories are based upon an understanding which is centuries old and which ignores modern empirical knowledge—knowledge of nature, an understanding which sounds like gibberish to young men and women in our society, young men and women who’ve been watching documentaries about genes and evolution as well as historical documentaries which present a bad image of Christian civilization by telling the truth. That these documentaries, and much of the teaching in schools, are out of context is not the fault of the modern secularists and pagans but rather that of the Christians who had a great civilization and failed to protect it and nurture it.

Apparently, we Christians had better things to do than preserve the Christian civilization which was the work of multitudes of our ancestors over many centuries. Or maybe there have simply not been enough Christians in recent centuries to form a viable cultural mass. In any case, most human beings, other than speculative thinkers, are not to be persuaded. They are usually to be raised to be part of a story, whether the creation myths and heroic legends of a tribe or the more fact-based, but often ideologically deformed, histories of the modern West or any of its major regions. What’s shocking from this angle is the ease with which such thinkers as Locke and Kant were able to deform a Christian viewpoint into a de-communalized and, consequently, secularized viewpoint. The struggle for salvation became the journey toward the Big Rock Candy Mountain, at least in the United States.

In earlier writings, Joseph Ratzinger wrote of moral irresponsibility on the part of modern Christians who had inherited a treasure of a civilization and then failed to care for it. Etienne Gilson had written of a failure to provide Christian answers to the modern questions (circa 1800) followed by a retreat into a Christian intellectual ghetto. In a similar vein, though it might appear different at first, Hermann Melville spoke of a streak of moral insanity in the American character, an insanity which was a rebellion against God and His Creation not quite good enough for us Americans.

Melville was seconded by Nathaniel Hawthorne and Henry James, Sr. at least so far as Emerson and Thoreau were concerned; these oh-so American philosophers despised communal human nature, that of—ultimately—the Body of Christ. Again, Americans had already turned away from the God of Jesus Christ more than a century ago and perhaps well before that. How many ways can I point out that this was never a Christian country?

In my freely downloadable book, *A More Exact Understanding of Human Being* [53], I propose a general Christian understanding, more exact as well, of human being. This understanding pays no attention to metaphysical categories such as those of vice and virtue, concentrating instead upon the effort to develop a moral order which builds upon our stuff as understood through our best empirical knowledge but disciplines it to our best understanding of God's story. This understanding also assumes that we were born and live to participate in the growth and development of the Body of Christ. It may or may not prove another charge against Christianity that I found myself relying upon insightful analyses of the communal nature of Biblical religions made by the Jewish thinkers Jacob Neusner and Abraham Heschel; Martin Buber also is in the background though not explicitly mentioned.

Let me head in a truly positive direction. . .

Christianity is imperialistic. The human race needs a Christian civilization, not because any Christian institutions can be said to be objectively superior to other human institutions but rather because the Body of Christ is the entirety of what is worthwhile in individual and communal human being, what is to be saved into everlasting form. The Church Herself is an organ in the Body of Christ, the organ of worship and moral conscience. She must serve God's story primarily, serving even the poor not in some knee-jerk, bleeding-heart way but in the way dictated by that story. Politics must play its proper role as well as poetry, the deployment of technology as well as the esthetic aspects of architecture, our worship and the management of our religious communities as well as our ethnic-cultural activities, should be the best they can be by serving God in His freely chosen role as Creator and story-teller. The Body of Christ is so complex a 'network' of individual and communal human beings as likely to be yet beyond the descriptive capabilities of our best modern sciences. Christian theology and philosophy have yet to respond to God's Creation as we now see it and, consequently, have yet to join ranks with 'modern sciences'. When this happens, Christian thinkers will be able not only to make sense of what we

have learned about Creation; they will be able to help shape and direct the future explorations of Creation.

Modern empirical knowledge of human beings plain and simply doesn't seem to fit into our inherited categories. Vice and virtue, emotion and feeling and thought and act, don't seem to provide good structures for a proper understanding of human nature. (Once again, see *A More Exact Understanding of Human Being* [53] for very preliminary discussions of this and related issues.) It's certainly relevant to discussions of any plausible understanding of marriage that modern scientists have found 'male-ness' has more to do with brain structure and brain processes than with bulging muscles or even the penis, but there's nothing in Christian anthropological theories that could make sense of the humorously serious comment a brain-scientist made decades ago: the brain is the primary human sex organ. To Christian intellectuals, a certain human being is male and, thus, God put a male brain in his skull. Very simple. Makes no sense in the context of modern knowledge of individual and communal human being, but it's very simple.

We like simple and don't care for all the evidence that God shaped a world in which time and space are best described by differential geometry rather than the straightforward Euclidean geometry which generated such simple views of eternity and of the physical relationship of Heaven and Hell. We like simple and don't care much for the evidence that God shaped human being out of nonliving matter by way of sometimes violent and bloody evolutionary processes rather than putting the life in Adam by way of an act of magic.

This all does matter to all aspects of a Christian understanding of Creation. I wrote in the previous paragraph about our preference for the simplicity of Euclidean geometry over that of differential geometry. We should note that a Ptolemaic, Aristotelian, Euclidean view of Creation allowed Dante to write his *Divine Comedy* and that view was the best available at the time, accepted by scientists and philosophers as well as theologians and poets. We can no longer speak in coherent or explicit terms of Heaven and Hell—modern Christians are great hand-wavers—just because any efforts to speak thus would lead to absurdities until we learn how to speak of God's Creation in terms compatible with what we know of our Universe, that realm of His Creation which has been explored and analyzed with such courage and honesty and energy in recent centuries. When those who try to proclaim the Christian truths have no way to speak of Christian Heaven,

the world of the resurrected in my terms, is it any wonder than many are losing their faith in the main Christian story of the resurrection of Jesus? How can they believe in their own possible resurrections as part of the Body of Christ? If Christ has not risen from the dead, our sacrifices of sexual pleasures are in vain. If Christ has risen from the dead, where could He possibly be? I have a tentative answer which is more than hand-waving, but no one seems interested in exploring that answer with me, and I have only 24 hours in each of my days.

We Christians have not done our duty. We have not kept that Easter message alive in the language and concepts of the modern world and we can no longer say that Christ rose from the dead, literally, in the flesh and in His divinity, without sounding like actors in a toga movie or outright lunatics. This is our fault and not that of the enemies of Christianity and certainly not the fault of the young men and women who have left the Church in recent years.

# 632 Privacy and the Body of Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1651>. It was finished and uploaded on 2013/07/23.]

Bruce Schneier, a prominent expert in cryptography and other areas of security, regularly provides interesting commentary, sometimes technical in nature and sometimes philosophical or sociological. In his blog post of 2013/07/09, *Another Perspective on the Value of Privacy* at [https://www.schneier.com/blog/archives/2013/07/another\\_perspec.html](https://www.schneier.com/blog/archives/2013/07/another_perspec.html), Schneier merely provides a short quote from and link to an opinion piece by Michael P. Lynch at the website of the *New York Times: Privacy and the Threat to the Self* at <http://opinionator.blogs.nytimes.com/2013/06/22/privacy-and-the-threat-to-the-self/>.

This opinion piece explores some aspects of what it means to be a person and asks, “What makes your thoughts your thoughts?” after telling us, “[T]he concept of privacy also matters for another, deeper reason. It is intimately connected to what it is to be an autonomous person.” To a traditional Christian, this is actually a contradiction in terms. The true persons, that is—Persons, are Father and Son and Holy Spirit. We can only hope that we will one day receive as gift a more complete nature which will be more truly a state of personhood. Yet, Father and Son and Holy Spirit aren’t autonomous Persons, but rather Persons who fully share all thoughts and feelings and acts. They are one God in the belief of traditional Christianity and yet are truly individuals. Individuals, not autonomous individuals and not individuals who voluntarily become one God by accepting a contractual relationship of sorts. Not by coincidence, this is the older understanding in the West of marriage, to choose one important

example. Under that older understanding, though not always explicitly acknowledged, a man and a woman change by the very act of marrying (not always having a ritual basis in Christian history) and take on a new dimension to their communal human beings. In the modern understanding, the bride and the groom remain what they are and only voluntarily enter a contractual relationship which leaves them what they were before.

See Chapter 156, *Einstein and Bohr's debate on the meaning of reality*, for a short discussion of Einstein's position that things are what they are and are not altered by relationships against Bohr's belief that relationships are primary and shape things. Bohr has won in quantum mechanics but modern advocates of autonomous individuality tell us that human beings are less likely to be changed by relationships than protons and electrons. I could say, only partly tongue-in-cheek, that Bohr belonged to the school of thought founded by St John the Evangelist who taught that we exist because God first loved us.

I'll be proposing an idea I've developed over a number of writings in recent years: those who will become part of the Body of Christ will remain individuals while being truly part of that complete man, as St. Paul expressed matters according to some translations. The saved will be persons analogous to the divine Persons while the Body of Christ will be one as God is one.

Having told the reader what my main point is, I'll move toward it.

Lynch goes into greater detail in his essay, *Privacy and the Threat to the Self* at <http://opinionator.blogs.nytimes.com/2013/06/22/privacy-and-the-threat-to-the-self/>, playing off of Descartes' strange mixture of insights and outright errors:

[W]hile Descartes's overall view has been rightly rejected, there is something profoundly right about the connection between privacy and the self, something that recent events should cause us to appreciate. What is right about it, in my view, is that to be an autonomous person is to be capable of having privileged access (in the two senses defined above) to information about your psychological profile—your hopes, dreams, beliefs and fears. A capacity for privacy is a necessary condition of autonomous personhood.

This is insightful but also mostly false from the traditional Christian

viewpoint, at least as I understand it and have restated and enriched it in light of modern empirical knowledge. Traditional Christians should fear to be caught up in a discussion of personhood limited to modern theories of the individual, theories which can be seen in light of the speculations of Descartes or Calvin or the American follower of Calvin—Jonathon Edwards.

We are called to complete ourselves, ultimately, by entering fully into the Body of Christ, though we do this best, at least in this mortal realm, by developing our unique characteristics and talents and then contributing them to that Body. There is some serious uncertainty in some of the speculations of sociobiologists in the early years of this field of research, but it seems certain that many of our ways of perceiving, of feeling, of thinking, of acting, work to the needs of our family lines and not to the needs of any imaginary autonomous individuals. I wrote about the biological foundations of human social ties in Chapter 281, *Social and Biological: Being Honest About the Basics of Human Nature*, and expanded the discussion in Chapter 282, *Do We Need Heart and Hands as Well as Mind to Understand Reality?*, where I quoted Jacob Neusner, who proposes similar ideas about the communal aspects of human being but from a Judaic viewpoint. In his collection of essays, *Judaism in the Matrix of Christianity* [97], Neusner tells us:

The doctrine of emotions in the view of the sages who created Judaism remained always the same. The reason derives from the social realities that give meaning to emotion and definition to the possibilities of feeling. If we begin with feeling, we end up in society. [page 51]

In response to Neusner's claims, I pointed out, "In this way of thought, emotions are produced by ties or relationships and then help to strengthen and shape those ties, shaping them to what might be called a communal heart but also helping to give birth to a communal mind, an intellect." Human communities aren't nominal entities in general, though some might be the sorts of voluntary, contractual relationships possible to truly autonomous individuals. Our brains themselves, some of our strongest desires and most common instincts, tie us into communities existing over the generations of a family-line of organisms, as sociobiologists have pointed out. In various writings, I've speculated that these desires can be turned, and have been turned, towards the creation of communal bonds of a sort which

aren't strictly dictated by biological needs, not even the long-term needs studied by various sorts of evolutionary theorists. We form scientific societies, Moose and Elk clubs, and sports leagues, as well as chess clubs and cruiser car clubs, as well as political communities rising to nearly continental size. This is little different, in principle, from the turning of our general mental skills to abstract mathematics or metaphysics or the composing of symphonies.

In fact, the formation of our selves is an open process of sorts, strongly oriented toward the formation of aspects corresponding to an autonomous individual and to a communal being and also to a being who is a mixture of organism and tools. In recent generations, thinkers starting at least with Michael Polanyi (though Bishop Butler had some insights about this in the 17th century) realized that our tools and our prosthetics can become parts of our bodies in a more constant way. I wrote about this in Chapter 292, *Creation Is Us, It Also Are Us*. In an earlier essay included as Chapter 613, *Does the Body of Christ Have Non-human Components?*, I had raised and discussed the question: "Is it possible that as we form the Body of Christ, we integrate human technology such as the Internet viewed as a fancy memory device?"

Our minds leak out into our tools and our prosthetics, including the printed reference books and the databases we access and the software we use. The more powerful and more reliable parts of our minds are largely shared across communities; see my discussion of Jacques Barzun's insights about this in his book, *The House of Intellect* [7]: Chapter 127, *Intelligence vs. Intellect*.

There is a lot of obscurity in the discussions of the Body of Christ in the New Testament; none of the Christian authors, not even St Paul, seem to have been able to develop this concept very well. In various writings, I've made an attempt to develop underlying concepts and language to start a better conversation on communal human nature. For example, in Chapter 178, *Are Communities a Form of Created Being?*, I write:

Being is at least what we can touch and point to and study by the methods of physics and chemistry and other empirical sciences. I've claimed, partly upon Biblical grounds and partly upon my experiences as a creature, that being is also what moves and interacts and forms relationships and various sorts of narrative streams including the morally ordered narratives which

we can call stories. I've claimed that relationships are primary, not concrete and thing-like being and not even some general sort of stuff. Thing-like being comes into existence as a result of relationships and can be further shaped by relationships. See the Gospel of St. John or the letters attributed to him or his followers. See Chapter 156, *Einstein and Bohr's Debate on the Meaning of Reality* for a debate on this important aspect of being from the viewpoints of two prominent physicists. Chapter 169, *From Abstract Being to Concrete Being and Narratives*, is a more extensive, more recent, more complete discussion of various aspects of being; perhaps it comes closer to a good understanding of created being. I write in a different and perhaps more accessible way of what I mean by 'abstract being' in three shorter essays found in:

- Chapter 172, *Frozen Soul and Other Delicacies*;
- Chapter 173, *Studying Steam When All You Have is Ice*;  
and
- Chapter 175, *More on Matter as Frozen Soul*.

In other words, I think we Christians can't possibly tie our defenses of privacy against government intrusions to a radical individualism and we aren't going to understand human being before we have a better understanding of created being in its concrete and abstract forms.

Let me quote Lynch on his claim that privacy is necessary to our existence as individuals:

[I]magine that I could telepathically read all your conscious and unconscious thoughts and feelings—I could know about them in as much detail as you know about them yourself—and further, that you could not, in any way, control my access. You don't, in other words, share your thoughts with me; I take them. The power I would have over you would of course be immense. Not only could you not hide from me, I would know instantly a great amount about how the outside world affects you, what scares you, what makes you act in the ways you do. And that means I could not only know what you think, I could to a large extent control what you do.

I'll return to the theological issues before claiming a more plausible Christian argument against our government's current abuse of our privacy.

Christians believe Father and Son and Holy Spirit to be truly Persons, remaining individuals even while being one God. They share thoughts and feelings and actions in the most intimate way and yet they remain three Persons, Individuals but not Autonomous Individuals in any meaningful sense. The concept of divine Personhood is manifested in Creation in terms of the incomplete and immature personhood of human beings. Christians cannot accept Lynch's line of argument though we are bound, for other reasons, to take a position similar to his against government invasion of our privacy. In fact, I'd go so far as to claim that neither the President of the U.S. nor the American intelligence agencies have any plausible claims to the authority or right to shape the Body of Christ in the ways implied by the powers over us that they have tried to grab; they haven't just committed crimes against the U.S. Constitution, they have become enemies of God.

Any arguments for privacy, or other goods, based upon autonomous personhood, would bias us strongly toward thinking that God is different from the Trinitarian God of Christian belief, if He exists at all. We would probably rediscover all sorts of philosophical and theological heresies in a more or less natural way once we fell into this false belief that the term 'autonomous person' has any meaning in this world. In this strange age, sociobiologists and other evolutionary theorists who are non-Christians argue against this false belief more strongly than Christian clergymen, but this merely means that empirical science caught up to St John the Evangelist and St Thomas Aquinas just when Christian thinkers and leaders turned onto other paths.

In this modern way of thinking about individuals as being autonomous, the Body of Christ would be only a voluntary gathering of autonomous individuals, busily negotiating their contractual relationships. Communities would have only nominalistic existence, being the result of always revocable, voluntary, more or less contractual, agreements between individual human beings, those truly existing entities. This is, in fact, the way many modern human beings view their marriages and their memberships in all communities, even their Christian church or other community of worship. Neusner in the already referenced work reminds us that salvation in the Jewish and Christian Bibles is in terms of a community. We aren't saved as autonomous individuals but rather as the People of Israel or the Body of Christ. Or both.

Should Christians be strongly opposed to the State's invasion of our

thoughts and feelings and most intimate acts? I would most emphatically agree with Lynch on this practical matter and say, “The Federal government and its agencies should stay out of our private communications.” I’ve speculated about Christian civilization being the true Body of Christ, inclusive of the Church but not only the Church and not subordinate to the Church, though bound to be guided by the Church in analogy to the human being who is guided by his conscience and his religious beliefs. That Body greater than just a hymn-singing choir, that is—that Body which meets all legitimate human needs and desires, would have political aspects but, if there is a political organ, it would not have any right to invade individuals or other organs for the purpose of controlling them or for any other purpose. It would be the human members of the Body of Christ who would share all thoughts and feelings with each other while remaining individuals. Each of those members would also share in the worship activities and political activities and artistic activities of the entire Body. We would all share the thoughts of the most brilliant of mathematicians or theologians as well as the skills of the greatest musicians and furniture-makers but there would be no educational institutions with the power and right to invade our privacy for the purpose of making sure we all think properly.

We can think in terms of dependencies, the true bonds of human communities. The trick is to form the proper relationships of dependencies, as I discussed in a few chapters of this book:

- Chapter 420, *What is Conspiracy?*;
- Chapter 424, *What is Politics?*; and
- Chapter 426, *Who Do You Choose to Be Dependent Upon?*.

There is a pattern here. Conspiracies in the government are a misuse of politics and such are made possible when we are dependent upon the government in ways which are not proper. Improper dependencies make some sense of the information indicating that our governments, or more accurately—gangs inside our governments, have engaged in some large-scale criminal conspiracies against each other and also against American citizens.

In a couple of chapters written in 2012, the year after the ones above, I returned to the more particular issue of the illegitimate expansion of governments into various activities, some outright criminal and immoral in all important ways. The two chapters are:

- Chapter 463, *Prosperity that Never Ends... Oops* and
- Chapter 464, *Why Are the Parasites Killing the Host?*.

The invasion of our privacy by the American national government through various agencies is illegitimate, but so is its effort to make Americans and others dependent upon it for medical care and for education and for a variety of regulatory activities more properly done by other institutions or communities. Many of these efforts to make us inappropriately dependent upon the American government, or other governments, have been strongly supported by leaders of other institutions or communities, including the leaders of the Catholic Church and other Christian churches and Jewish congregations, all of whom should have known better.

In my freely downloadable book, *Four Kinds of Knowledge* [43], I argue, however inadequately at times, for the ultimate unity of created being and, hence, of our knowledge of created being. An overview of my understanding of human being, including a discussion of what we should be aiming to be, can be found in a book I recently released for free download: *A More Exact Understanding of Human Being* [53]. The title of that book was taken from words spoken by Pope Benedict XVI:

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man. [Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: “Broadening the Horizons of Reason. Prospects for Philosophy”.]

More of my writings, including some novels, can be found in *Catalog of Major Writings by Loyd Fueston* [52] which includes descriptions and also links for any books available for download.

## 633 Cafeteria Catholics and Ghetto Catholics

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1677>. It was finished and uploaded on 2013/08/23.]

From a simple intellectual viewpoint, the problem with “cafeteria Catholics” is that they don’t think in terms of a God of reason, in terms of a Creation which is a well-ordered multitude and unity of manifestations of divine reason. Of course, if they were to place their thoughts and feelings and behaviors in better order, they might choose a set of consistent doctrines which are not Christian.

From an intellectual viewpoint also simple, the problem with many traditionalist Catholics is that they don’t think in terms of a world in which new facts and knowledge emerge over time, forcing our understandings to develop over time in a “communal process” as the historian Carroll Quigley noted. They think the important truths about God’s work are already in their textbooks. Those traditionalist Catholics continue to place their full trust in their textbooks; how could we possibly come to a better understanding of Creation than what those dead guys left us? Because we now know they had wrong or incomplete ideas of life, matter, space and time, and mathematics? Phooey.

Why would new knowledge of Creation affect our inherited understandings of Creation? Then again...

Could it even be that new forms or properties of created being are emerging as God’s story advances or at least new forms are coming into view as human beings explore Creation more deeply and more widely? Nah!

As the so-called “cafeteria Catholics” prefer to adopt some modernist beliefs (or sometimes modern versions of ancient heresies) to mix with the

Christian beliefs they like, so traditionalist Catholics prefer, for example, natural law doctrines which were developed prior to Darwin and Mendel and Golgi, to name just one early pioneer in each of evolutionary theory and genetics and neuroscience.

In a recent book I made available for free download, *A More Exact Understanding of Human Being* [53], I used this quote as an epigraph:

Modernity is not simply a historically-datable cultural phenomenon; in reality it requires a new focus, a more exact understanding of the nature of man. [Pope Benedict XVI, in a speech given on 2008/06/07 to participants in the sixth European Symposium of University Professors, which was held in Rome from 2008/06/04 to 2008/06/07 on the theme: *Broadening the Horizons of Reason. Prospects for Philosophy*].

We need to develop what Pope Benedict XVI called “a more exact understanding of the nature of man,” a more exact understanding based upon the more exact knowledge of our age. That knowledge will include our traditional knowledge in a corrected and enriched form, also historical and literary knowledge and laboratory knowledge; it will be a framework of knowledge which will be Darwinistic and Thomistic and Shakespearean.

Note the name of that Pope Benedict’s talk was *Broadening the Horizons of Reason. Prospects for Philosophy*.

See Chapter 25, *Broadening the Horizons of Reason* for my discussion of the talk, and note that Pope Benedict XVI, for all those who think of him as a crusty reactionary, has repeatedly called for a fresh engagement with the world—against the thought of most traditionalist Catholics and, in fact, most traditionalists of our age. He also has called for disciplined use of human reason in this engagement, and this is where he’s quite opposed to many who would be labeled “modernists”, including those who can be labeled “cafeteria Catholics.”

I’ll be providing a reference to an essay by a traditionalist Catholic who writes a short and insightful critique of “cafeteria Catholics.” Otherwise, I’ll concentrate on a critique of Catholics who consider themselves to be traditionalists, but achieve that state by freezing their minds into the shape of an understanding of Creation once valid but no longer. The first goes out enthusiastically to adopt modern ideas, most of which are at best questionable as is true of most new ideas in all ages of rapid change, and the second tries

to stand in the intellectual ghetto of traditionalist Catholics while criticizing the untoward behavior of the undisciplined or paganistically disciplined modernists.

God's story, which is this world, indeed—all of Creation, is dynamic. Entities and relationships evolve and develop. Surprises occur regularly—wouldn't we expect God to have a richer and more powerful imagination than any of us or all of us together? Wouldn't we expect that divine imagination to provide surprises beyond the expectations of Aristotle or Augustine or Aquinas? Wouldn't we expect such surprises for so long as men live in this mortal realm and explore it?

It's not a world comfortable for those who wish to think in categorical terms, including terms of static relationships. It's a world in which those with conservative tendencies, "I plead guilty," will tend to stick with old ways even when there is a true need to move on to new ways not for the sake of progress but rather for the sake of new truths which are coming into view and also for the sake of the known truths which are deformed when we try to keep them in the forms allowed by our inherited words and concepts.

When we learn of God's work as Creator by way of studying genes or the fossil record or the background radiation of the universe, we Christians can call that "natural revelation," if our faith and courage is strong enough; in any case, we can speak of "empirical exploration and knowledge-gathering." For all practical purposes, all humanistic studies also fall into this category of natural revelations, though we often see those revelations wrongly.

Empirical knowledge can be very certain but can also have a large component of speculation—see my freely downloadable book, *Four Kinds of Knowledge* [43], for more discussion of human knowledge within the context of a unified Christian understanding of Creation. Putting aside those details for my current purposes, I claim there are a variety of Christian knowledge claims covering, for example, human being. To understand ourselves in a more exact way, as Pope Benedict XVI called for, we need to deal with Biblical revelations, a small stock of revelations coming to Christian communities over the previous 2,000 years; we also need to consider the entirety of natural revelation in its best and most plausible form. We need to acknowledge all that we have learned about man from empirical studies in the fields of history and literature and certainly biology, genetic and evolutionary studies and more. We also need to learn from physics because we are made of and for the created realms made from the matter studied by such as quantum physicists and the spacetime studied by gravitational

theorists. As I'll claim repeatedly: the world of the resurrected, heaven if you wish, will be a completed and perfected version of this world and not something entirely different.

Essentially, we need to understand life, the universe, and everything to understand the smallest part of Creation. In particular, and as I noted above, we need to understand all in order to understand human nature—however incomplete and imperfect that understanding might be.

A recent essay spotlighted one of the problems inflicted upon and caused by modern Catholics, but it's been a problem for any group devoted to a well-defined core of beliefs. That essay, *On Faith and Cafeteria Catholicism* at <http://www.thecatholicthing.org/columns/2013/on-faith-and-cafeteria-catholicism.html> by David G. Bonagura, Jr., claims:

Cafeteria Catholicism is one such myth [as discussed by St Paul in 2 Timothy], a product of an age that has made the individual the ultimate magisterium, especially of beliefs and morals. Teachers of this brand of relativism are easily found wherever we look; there are even quite a few within the Church.

Because of the prevalence of this way of thinking, many “cafeteria Catholics” are unaware that this stance is intrinsically self-centered and contrary to the nature of faith. For at its root cafeteria Catholicism strikes at the heart of Christ, his teachings, and the Church that he founded as the means of imparting his grace to us.

If cafeteria Catholics are too individualistic, a trait I've often criticized in modern men of the West, traditionalist Catholics tend to stay together and repeat the well-established ways of understanding Creation which came to them from parents and pastors and teachers.

Bonagura goes on to tell us:

Cafeteria Catholicism, therefore, rejects the unity of faith, the oneness of divine truth, and the fullness of God's revelation. Faith is a free response to the loving God who calls us into a relationship with him. Cafeteria Catholicism seeks to dictate to God the terms of the relationship: I will believe these things about you, God, but first I declare some of your truths and laws null and void in my life.

True enough though I'd say that traditionalistic Catholics tend to say to God, "Please don't confuse us with new knowledge of what human beings are and what space and time and matter are. What our grandparents heard you saying is good enough for us." This doesn't really mean that they will always reject, say, new insights from genetics that might lead to a new cure for a terrible brain disease. It is to say they refuse to build a new understanding of man the moral creature in which his origins lie in the natural world rather than a mythical garden, in which man's sinful state is a result of an apish creature being offered a true friendship with God rather than a result of an act of rebellion by a couple created in that friendship.

Bonagura dealt well with the "cafeteria Catholics." Is he one of those who shy away from our responsibility to enrich and correct our knowledge of even the most absolute truths? Is he one of those who think that our world so well described in some of its important aspects by Einstein and Heisenberg and Darwin is nevertheless bound by understandings consistent with a different sort of world? I don't know. Certainly, in 25 years of frustrating, and increasingly rare, contacts with Catholic intellectuals, I've no reason to believe there are many traditionalists who have the proper, guarded sort of openmindedness as opposed to being closedminded dwellers of the Catholic intellectual ghetto.

The answers to our problems are not always to be found in what we have nor in what lies behind us. Our understanding of stuff and relationships and space and time have changed. For example, too many Christians act upon the Platonic and Neoplatonic understanding of stuff and respond strongly in favor of Einstein in his famous debate with Niels Bohr where he decided that quantum physics must be 'incomplete' if not outright wrong. He had no scientific ground to stand upon but he seemed to be supporting a common-sense view of reality in his claim that things had an existence well-defined by their own substance. In fact, Einstein was defending a mainstream view of Platonists and Neoplatonists, one at odds with Thomistic existentialist views and what might be called the relationalism of the school of St John the Apostle. From a Christian viewpoint Niels Bohr had the far better position.

That school of St John taught, openly in their contributions to the Bible, that relationships create and shape things. The world and each entity in it exists because God first loved it. We can help to shape or reshape ourselves and others by proper relationships, ultimately of love. We can misshape by hate and lust and greed. The strangeness of quantum physics is largely due

to the ways in which substance is created and then shaped by relationships defined by Heisenberg and Schrodinger and by St John long before them.

The traditional Christian understandings of Creation need to be updated as was noted by Etienne Gilson and Flannery O'Connor as well as by Joseph Ratzinger (Pope Benedict XVI). Those understandings need to be enriched and even complexified. Augustine of Hippo did this with respect to both the understanding of human history and also of the psychology of the human animal. Aquinas took on the issue of being and of the relationship between philosophy and theology. If he had lived long enough to have turned to what seems his true calling, Pascal might well have produced a better understanding of abstract being through his mathematical explorations. John Henry Newman expanded the already rich Augustinian understanding of history and tried to teach our deaf selves that when we continue to speak even the greatest truths in terms of older words and concepts, we can weaken those truths or even turn them into falsehoods.

Some might think it a shame but God didn't pay attention to their desire for simplicity. Many aspects of the world are described by way of complex equations and by the complex developments of simple equations. Many aspects of human being have been shaped by the needs of our ancestors to respond, in ways originally described by Darwin the biologist, to a world changing in ways seen quite vaguely by Darwin the geologist.

We prefer simplicity and we prefer the comfortable and well-organized ideas we were taught by the textbooks of our youths. So it is that thinkers defend both the truths and the speculations which have come down through the many traditions of mankind, including the Catholic traditions and the earlier traditions which were used by the Fathers of the Church. They defend by using arguments and exhortations drawn from the powerful works of Augustine and Aquinas, John of the Cross and Francis de Sales, without realizing fully that those arguments and exhortations were developed within understandings of Creation no longer fully plausible, though still plausible in light of a proper historical analysis. The correction of prior understandings can be seen in the development of the Christian mind over the centuries. In fact, Augustine's understandings of many specific matters were corrected or enriched or simply set in a new overall understanding of Creation by Aquinas. Surprisingly, most traditionalist Catholics know history well enough to know that many of the great thinkers of Christianity, including Augustine of Hippo and Thomas Aquinas, were attacked by the traditionalists of their own ages for being heretics but don't seem to have

learned a certain humility from seeing what happens to the work of even the greatest of thinkers. We build monuments to the prophets of past centuries even as we persecute our own prophets—though modern institutions seem to prefer to persecute by simply ignoring any prophets, serious thinkers who have moved away from the herd in response to what interests or bothers them in God's Creation. (Aquinas is said to have understood prophecy to be a process of coming into a certain alignment with God's thoughts rather than a process of listening to dictation from the Almighty; in any case, that's how I understand prophecy.)

Many centuries ago, some coherent views of the 'geography' of Creation were developed according to the best available thoughts of human traditions and one of those views provided the settings for Dante's great poems, *Inferno* and *Purgatory* and *Paradise*. Why is it that no one in the mainstream, certainly not in the traditionalist communities, has bothered to produce a new understanding given all that we know about our mortal world and all that could be extrapolated about the world of the resurrected? More strongly still: Why is it that no one in the mainstream, certainly not in the traditionalist communities, has bothered to produce a new understanding, as did Dante in his day, given all that we know that is wrong in the old understandings of even the most concrete and directly perceptible forms of created being. It is those old understandings which once provided concepts used in our discussions of heaven and earth and hell, of the 'location' of God. We have no corresponding new understandings, only a desire to stick to some grand understandings of Creation without being able to actually discuss any matters outside of the secularized interests of our overly politicized age. If your noblest goal is to be respectable or regain respectability in the public squares of a paganized world, if you don't think it necessary to talk of Creation and salvation in your ideas of politics and law and economics, then you've become the enemy you think to be fighting.

A little thought will lead to the fear that young Christians listen to vague, handwaving talk of heaven and pay attention to the more disciplined efforts their elders make in the more important matters of politics and technological development and financial matters. Those children learn about the hard facts being gathered by scientists and space-explorers and quickly learn who has hard-edged, verifiable facts. They see medical miracles based upon the principles of genetics and sometimes evolutionary biology and learn man is a natural creature.

We and those children need a story which will make good Christian sense

of all this and provide a setting for valid elements of traditional thought and maybe for some thoughts we'll pass on as parts of a new tradition. Heaven is only mentioned and never described or at least intelligently discussed as part of the same Creation as this world. Dante provided a brilliant artistic view of the Medieval understanding of hell and purgatory and heaven by simply taking advantage of the thoughts of scholastics who had dared to challenge the traditions they had inherited. We have turned heaven into a ghostly sort of region, a land of fairy-tales. We realize at some level the old ways of talking about Heaven are wrong and yet we make no efforts to produce new ways; we retreat into ghettos and seem to hope that God will just act as we wish and stop surprising us.

True it is that mortal men can never speak with certainty of heaven but true it also is that we have a duty to speak with the most plausible speculations, allowing for the hints in the Bible and for the chaotic materials and relationships of this world. The Catholic principle is that grace completes and perfects nature rather than destroying or replacing it. This means that we can speak, we are duty-bound to speak, as heaven as being a completed and perfected version of this world. We are also bound to speak in terms of our best knowledge, our best empirical understandings, of this world and its mortal creatures. See Chapter 191, *What are the Thermodynamic Properties of Heaven?* for an early, somewhat playful, and somewhat unreliable discussion of one aspect of this issue.

When it comes to our Christian beliefs, we are lazy and prefer the understandings or stories built up in past centuries by men with greater faith and far greater courage than we have. If we are child-like, it is in the way of a barbarian child bereft of a higher imagination.

## 634 Trying to Get the Story Right

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1687>. It was finished and uploaded on 2013/09/04.]

Chapter 633, *Cafeteria Catholics and Ghetto Catholics*, and Chapter 52, *Reality Bites Back but Maybe It Started Nibbling Many Years Ago*, provide an understanding of the nature of reality which is the background of this article along with my understanding of the nature of human rights. That latter understanding will be developed in this chapter in the course of responding to some recent, well-argued essays by the political philosopher Hadley Arkes—see [https://en.wikipedia.org/wiki/Hadley\\_Arkes](https://en.wikipedia.org/wiki/Hadley_Arkes) for some basic information on this important Catholic thinker, a recent convert from Judaism. Professor Arkes writes often on moral issues such as contraception and abortion and sexual norms. The four essays I'm responding to are:

- *Hobby Lobby: A Victory, So Far* at <http://www.thecatholicthing.org/columns/2013/hobby-lobby-a-victory-so-far.html>,
- *Religious Freedom in Search of Its Argument* at <http://www.thecatholicthing.org/columns/2013/religious-freedom-in-search-of-its-argument.html>,
- *Religious Freedom in Search of Its Argument—Abroad* at <http://www.thecatholicthing.org/columns/2013/religious-freedom-in-search-of-its-argument-abroad.html>,  
and

- *Another Disaster for Religious Freedom in the Courts* at <http://www.thecatholicthing.org/columns/2013/another-disaster-for-religious-freedom-in-the-courts.html>.

In the first of those essays, Professor Arkes speaks of the confusion about the state of the embryo from the earliest stage:

But if this was a victory, it was a melancholy win, revealing also the edge that cuts against the religious in this country. According to Judge Tymkovich and his colleagues, the Greens assert, among their “sincere beliefs,” a “belief that human life begins when sperm fertilizes an egg.” A “belief”? That would surely come as news to the authors of all of the texts in embryology, who report that point as one of their anchoring truths.

There is certainly a major problem with a judge who can’t see a simple fact, even if that judge might well argue coherently that that particular fact doesn’t generate a “right to life,” but I’m not an activist as such but rather a Catholic thinker working on a long-term project to produce a greater understanding of all of Creation. I’m writing this essay to argue for that need for a greater understanding as a setting for all our lesser understandings, including those of human being in all its aspects. In other words, we need to come to new understandings in light of modern knowledge as well as the truths from traditional Christian thought of life and the universe and everything before we can speak coherently of the value of human life or of human rights in general.

I’ll start with an inconvenient insight of the same general field of study as those books on embryology which Arkes points to. Those books do let us know that a human life begins at conception but they also place that life in the context of evolutionary and developmental processes which have not yet been integrated into the Christian story. As a consequence, they haven’t been integrated into any Christian political thought of our age though these unresolved questions have entered the minds and souls of many in the form of a rather cloudy sort of skepticism. That sort of skepticism, as opposed to an honest and well-formed skepticism, can readily become a disease of mind, of heart, and of hands.

I'll ignore that ugly aspect of our age in this essay, though you should keep it ever in mind when thinking about these issues of what might seem merely intellectual arguments.

Who was the first man or first woman? For simplicity, I'll write only of the first man.

Assume, for argument's sake, that we can identify an Adam, a first man. What biologically based argument is there for saying that Adam had 'human rights' now that we know his parents were not modern human beings and had no such 'human rights'? Surely, we can't extend human rights back to all apish creatures who were our ancestors; we wouldn't even know if we should keep going back to our other ancestors—rat-like animals, reptile-like animals, and back to membranes filled with self-reproducing chemicals. It's obviously absurd to think human rights can be traced back before that first hypothetical human being, who almost certainly didn't exist. But if he did exist: by what process did he receive such rights? He had parents who weren't fully human, cousins who weren't, maybe siblings who weren't. Could we claim his parents had, perhaps, 75% inalienable rights, 75% of a right to life?

If there was no true Adam, what is the source of our rights? From a natural standpoint, the source of our rights seems to be our reluctance, far from absolute and weaker than that of wolves and other creatures, to kill members of our own species. Even if our instincts against killing other members of the human species were stronger, it wouldn't provide much of a justification for placing absolute value on human life, certainly not from conception. It would provide a strong justification for placing very high value on human life, but not absolute. Something has to provide a bridge from "very high" to "absolute". Such claims can't be justified by either the actual real-world relationships between human beings nor by anything that could conceivably be discovered about our state as unique animals descended from ancestors common also to apes and then from ancestors common also to rats and raccoons and ultimately from some sort of ancestor common also to bacteria, slime-molds, and a lot of critters not giving much sign of being possible ancestors of creatures with Lockean rights.

Arkes provides a quote from Pope Francis' recent encyclical, *Lumen Fidei*:

faith was. . . understood either as a leap in the dark. . . driven by blind emotion, or as a subjective light, capable perhaps of

warming the heart and bringing personal consolation, but not something which could be proposed to others as an objective and shared light which points the way.

Notice that Pope Francis doesn't claim we have rigorous arguments that can't be denied by this-worldly arguments. Rather do we have "something which could be proposed to others as an objective and shared light which points the way." More specifically, I'd say we have a story based upon facts though necessarily disciplined to some preliminary understanding, itself to be clarified as the story emerges. The story which we modern Christians inherited is in bad shape. It was a story which, when it was healthier or at least more robust, was in some deep sense the foundation of Western Civilization, the Christian civilization which was the greatest of all works of mortal man. In some sense, that Christian story, that understanding of God's Creation, **was** Western Civilization.

Is there a version of this story we can tell which is built only from empirical knowledge without Christian beliefs? I don't know. If there is such a story, it might not be clear about the role of human rights or the path they'll take in the future. Will they move closer and closer toward becoming absolute rights we should honor in all other human beings? I don't know. I do know that it's not possible to justify much of anything by simply taking convenient facts from modern empirical knowledge and joining them to premodern Christian understandings of Creation. Well, maybe you can join them in some sense but it could be pretty ugly. See my freely downloadable book, *Four Kinds of Knowledge* [43], for my understanding of how Christians, and maybe others, should view these issues of knowledge.

This is, as I noted in Chapter 52 , *Reality Bites Back but Maybe It Started Nibbling Many Years Ago*,

a world where stuff is ephemeral, is created by relationships and can be shaped or reshaped by relationships. This is where quantum physics meets the school of thought associated with St John the Apostle.

We have fallen from a world of tightly defined categories subject to syllogistic reasoning or any other forms of classical logic. We have fallen into a Darwinian and Einsteinian world in which reality tells us what reality is and we have to understand it in various ways. First, we must try to understand

the stuff and space and time and concrete entities and relationships. Then, we must make some greater sense of it in light of all the developmental and evolutionary processes which dominate, that is, we must try to tell a story of the universe and a story of life on earth which includes a story of the human species.

We need to see rights evolving and developing over time, probably parallel to the evolution and development of complex social and political relationships mediated by common stories, such as the Homeric stories. Such a story can be found in my freely downloadable book, *Human Rights: An Evolutionary and Christian Perspective* [47], but it is in the context of Christian beliefs. I'll reprint the entire short chapter, *Introduction*.

I want others to respect me by not taking my life and by not placing constraints upon my other rights as generally recognized in the Anglo-American traditions. I certainly want powerful institutions to also honor those rights won by historical accident but also by hard work and sacrifice on the part of our ancestors, some of whom were working for other purposes—such as the noblemen who sought to secure their own rights when they forced King John to sign the *Magna Carta* which was gradually extended to all Englishmen.

I want to be safe not only from attacks mounted by American and foreign criminals but also from attacks mounted by American politicians and government employees who would gain prestige, power, and money by restricting my rights and those of my fellow-citizens. I want to know that if I'm accused of a crime, I'll be treated with respect by police and court officials, that I'll be allowed competent legal counsel, that I would get a fair trial if it came to that. I would like to think I could receive justice if I were wronged by even the richest of financiers or the most powerful of corporations.

I would like to have my rights to life, liberty, and property guaranteed against the inroads of greedy bankers, ambitious politicians, or self-righteous religious leaders.

I also believe this world to be a narrative, a rich and complex story being told by God. As a Christian who has tried to respond to God's Creation in the context of the most basic Christian beliefs as summarized in the various versions of the

traditional creeds of the early Christian Church, I think this world to be centered upon the Crucifixion of Christ, the willing self-sacrifice of the Son to His Father. The story is so complex because of the creaturely nature taken on by the Son of God—human by accident though not by necessity nor was this foreordained in any way understandable by the mind of a creature. Being human as well as God, Jesus Christ has a creaturely nature, a nature of a social being, an apish creature made for life in an overlapping complex of human communities.

Some human beings will be resurrected to part of the complex of human communities which we call the Body of Christ, the home or social environment, if you will, for the Son of God. This Body of Christ is not something that will form only in the world of the resurrected, just as the members of that Body will not form only in that world of the resurrected. Where will those members come from? They are us, at least some of us, members of the human race in this mortal realm. In parallel with that, I conjecture the entire Body is under formation in this world and that raises some interesting possibilities for the members of that Body.

In Part I, *Natural Human Rights: Reality or Dream?*, I develop a sketchy view of man as a mere creature, and mere as well as creature is what man is, what he is born to be. I deny that human rights can be well-founded by the usual ways of modern liberalism, including the loose, question-begging language found in the American *Declaration of Independence*.

In Part II, *Can We Find a True Foundation for Human Rights?*, I move on to claim that we, at least we Christians, are warranted in speculating about rights appearing as the Body of Christ develops in this world of evolutionary and developmental processes.

In Part III, *Created Being and the Foundations of Human Rights*, I provide some of my weblog essays. These are but a sampling of the work I've produced to establish a new understanding of created being, a foundation which allows me to speak, in the way of radical understandings of quantum physics and St John the Apostle's understanding of God the Creator, of relationships being primary over substance, of relationships

bringing stuff into existence and shaping it. This provides the justification for speaking of the Body of Christ as forming in this mortal realm and of developing the sorts of relationships not to be perfected nor completed on this side of the grave. Human rights are one aspect of those relationships proper to the members and organs and entirety of the Body of Christ. . .

The task for those who think it possible, or at least desirable, to treat human rights as being absolute but not founded upon “beliefs”, is to secularize these or similar arguments, which means they become indeterminate, ‘scientific’ arguments. This is to say, we can extrapolate from what has happened so far inside of this world, but I don’t see how we can extrapolate far enough to reach absolute truths, absolute prohibitions against killing other human beings as one example. I’m not sure there would even be any absolute truths to reach if this is a world fully understandable by secular thought. Any effort to secularize our arguments so that they can be fully acceptable to non-believers would likely lead to a repeat of a cycle from robust believer to deist to pagan or atheist. We’ve done that once, and one reason we went through it, was the failure of Catholic intellectuals and Church leaders to courageously deal with the many questions raised by all this new empirical knowledge. It’s about time to deal with those questions and move on with a new Christian understanding of Creation.

As I see matters, natural law theories of human rights were set in the context of Western Civilization. This was, so to speak, a Christian sea and even the Deists such as Locke and Jefferson were like fish swimming in a water which was invisible to them. They, and far too many Trinitarian Christians then and now, thought their beliefs to be truths of a world transparent in such a way that truth and values can be seen without the aid of what I call a story, a morally purposeful narrative understanding of this world or even of all of Creation.

And so came the true fall of man, the acceptance of the illusion that human rights could be stated in a way that depended upon human reason independent of the influence of human beliefs.

# 635 A Small Suggestion that We Return to an Important Thomistic Concept and Word

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1704>. It was finished and uploaded on 2013/10/02.]

In his catechesis for the general audience of 2013/10/02, Pope Francis had this to say:

The Church is holy because “she comes from God Who is holy, Who is faithful to her and never abandons her to the power of death and evil. She is holy because Jesus Christ, Saint of God, is indissolubly united to her; she is holy because she is guided by the Holy Spirit which purifies, transforms, and renews. She is not holy by our merits, but because God makes her holy”.

Everything comes from God and is holy to a significant extent. The Church is holy by intent, ‘intent’ being used in the Thomistic sense of a purposeful, goal-oriented, growth process. An acorn intends to the state of ‘oak tree’ and a man may intend the state of sainthood. This is to say that the Church is holy because She intends to (purposefully grows toward) the state of being the central organ, the organ of worship and of moral conscience, of the complete and perfected Body of Christ in the world of the resurrected. Clearly, this sort of growth process is consistent with various developmental problems, even cancerous growths within the Church. This sort of growth process can also chew up many of the individual ‘cells’ of the communal organism at one time or another. We might well be able to understand the problems of the Church over the years simply by

remembering our own growth problems and diseases. At times the Church can be infected by horrible diseases, as is truth of any other living, growing entity, even one growing toward such a glorious state.

# 636 We Christians Don't Do Truth But We Do Poor People and Immigrants

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1713>. It was finished and uploaded on 2013/10/07.]

Whatever he means to be saying, Pope Francis sometimes seems to be strongly implying exactly the title of this essay: We Christians Don't Do Truth But We Do Poor People and Immigrants. He's in line with a good number of Catholics, including many of the bishops and Cardinals of the West and most certainly the leaders of most Western Catholic organizations in fields of corporeal charity and social justice. There are perhaps a still higher percentage of non-Catholic Christians who speak and act to devalue truth in various ways. And I'm sure most of those Catholics and other Christians of similar viewpoints do value the truth in some far region of their hearts; I'm also sure that they are at best only barely aware that they can't speak coherently to that truth.

We are in a bad situation. We have no truth to witness because we, as a Christian people, haven't valued the truth enough to have kept hold of it. We have chosen not to go through the difficult task of re-understanding God's Creation in terms of all that has been learned about this concrete realm and all that has been discovered about abstract realms from which, in my way of speaking, the concrete realm has been shaped.

We are, in fact, missing a great opportunity. A radically honest understanding of our new knowledge about Creation is in line with the understanding of Creation by St John the Apostle and those who followed him, listened to him, and helped him to produce the Biblical works attributed to

him. This is what modern physics and mathematics tells us: relationships create and shape stuff and things. Evolutionary biology adds: relationships shape living things in very complex ways.

God didn't create the world and then decide to love it, or at least parts of it—as we would gather from nearly all Hellenistic thought and also the thoughts of Einstein and those modern Christians who accept his rational, pagan thought as simply “common sense.” God first loved the world, all of it and all things within it, and the world came into existence.

God didn't create complex things and living things which fit cleanly into categories of the sort which can be listed in clean, schematic ways. God created simple relationships which gave rise first to simple things; complex relationships and things, including those of living things, came by way of evolutionary and developmental processes.

None of this is the dreams of philosophers; the deepest beliefs of our culture show up in our most basic understandings of reality and can be found in the plot-lines of television shows and the assumptions about, say masculinity and femininity, which drive the ‘meaning’ of books used to teach children how to read and, hence, how to think in terms which might mature into abstract reasoning. As a result of Christian refusal to deal with these very basic issues, modern culture has become so many alien regions to those who believe in the Bible and the Christian Creeds.

We feed the poor and we speak gibberish to our own children when we try to explain to them why the Bible teaches the ultimate truths, despite all those regions of space so empty of angels and all those disconcerting facts about human sexuality which show up in the science news. After all, we preach sexual morality from a Medieval and Hellenistic stance that men and women are categorically such when most modern adolescents, if not always their parents, are aware of scientific evidence that such isn't true: see Chapter 299, *Sex and Categorical Reasoning in a World of Evolution and Development* and Chapter 304, *What Makes a Male, Genes or Developmental Accidents?*. We preach resurrection and don't try to develop any images of what this could mean in terms of modern understandings of those realms of Creation we can explore: see Chapter 52, *Reality Bites Back but Maybe It Started Nibbling Many Years Ago* for one of my many discussions of this issue. We should learn how to bring the truth to a more exact form in this mortal realm of evolution and development and then we can preach the truth in a coherent manner. See my freely downloadable book, *A More Exact Understanding of Human Being* [53] for a discussion of one sort of

created being where we need a more exact understanding based upon the more exact knowledge we have of empirical reality.

The God who allowed Himself to be nailed to the cross didn't teach us to expect religious liberty or tolerance and He never led anyone to believe that poverty and suffering can ever be eliminated in this mortal realm. He did teach us to help our neighbors and also to preach the truths He gave to us in terms of Jewish culture of 2,000 years ago. Over the previous thousand years or so, Jewish belief had developed out of the paganism of the Semitic peoples, a paganism which I understand as having some monotheistic tendencies. It was not a case of God revealing a schema of truths for all time although He did give a couple of absolute truths; it's even a bit of a puzzle as to what God revealed to Moses about His own nature and more of a puzzle as to why more polytheistically inclined forms of Semitic religion continued to survive for centuries, showing up in the early books of the Bible in terms of mixed theological language as well as a struggle for power between priesthoods which developed into a split between the 'Samaritans' and the followers of the cult in Jerusalem. (The winners in Jerusalem may well have unfairly attributed polytheistic tendencies to the losers in the northern territories.)

It's a puzzle, not because of any skepticism imposed upon a clear story of God vs the idols, but rather because the events of those centuries leading up to the birth of Jesus of Nazareth were as confusing, as chaotic or factual, as more recent centuries have been. God as a storyteller hasn't gotten more sloppy over the years, but it is true that the world has changed. Men have changed; the environments to which modern men respond when shaping their own selves have changed; human acts and thoughts and feelings over the century have left their very particular marks in human traditions and cultures. Our minds are different from the minds of those who lived with Moses or with Jesus of Nazareth or with Thomas Aquinas; our minds are not just ahistorical human minds which happen to be attached to men who live in the 21st century and which are filled with more modern facts.

Those 2,000 years of Christian history are a narrative of the Body of Christ emerging, in its aspects of mind and heart and hands. It is a story being told by God in His freely chosen role as Creator. Men of the caliber of Augustine and Albert the Great and Thomas Aquinas and John Henry Newman and Pierre Duhem and Stanley Jaki have tried to teach us respect for the thoughts God manifested in Creation, thoughts we now know a little better than did the contemporaries of Jesus of Nazareth. It is by responding

to those manifested thoughts that we shape our minds to accord with the mind of God, that we learn to understand Creation as the manifestation of thoughts of its Creator, that we shape our own minds as being participants in the greatest of all human intellects—that of the Body of Christ. This process of understanding Creation is part of the growth of the Body of Christ, part of our efforts as individual human beings to be better images of our Lord Jesus Christ, part of our efforts as communal human beings to be better images of the Creator who is Father and Son and Holy Spirit.

First, the thinkers with powerful intelligences and courageous spirits strike out into Creation, responding to all the wonderful and dangerous things and relationships. Then, the universal teachers begin to put the findings, the firm knowledge and speculations, of those great-spirited men into forms where the teachers at ordinary colleges and seminaries can begin to teach those who will in turn teach at high schools and at the individual communities of worship. The preachers and popular book-writers and poets and novelists, the musical composers and sculptors, the architects and urban-planners, the parents and uncles and aunts, can then begin to do their work in helping the youths to properly shape their minds. This process is suffering from logjams at every step; as a consequence, even some of the greatest and most absolute of truths is stated in terms of human knowledge which is implausible and sometimes downright false.

I've done my best to blow some of those logjams apart but the dangerous thoughts of a truth-seeker don't register on the minds of modern men. Apparently, we modern Christians are the images of a God with a poorly developed mind and a great indifference to His own Creation including the truths which are the raw stuff of that Creation. I doubt that to be the God of Jesus Christ, but what do I know: I'm convinced Francis of Assisi would have lived out his life as a playboy if Augustine hadn't struggled so hard in his studies of human history to find God's teachings. If somehow, a faltering Western Civilization had been re-energized while Francis was partying, then it would have still been a pretty paltry revival if not for the efforts of Aquinas and Galileo and a host of others who struggled to better grasp what was in the things and relationships of Creations, things studied by philosophers and physicists and composed by musicians and erected by architects.

I don't mean to denigrate St Francis for it was he, even more than St Dominic, who did re-energize European Christian Civilization, making possible St Thomas Aquinas among many others, architects and political

actors as well as philosophers and theologians. But I would suggest that Christ is mind as well as heart and hands. Aquinas is as much a true image of Christ as is Francis.

We who have inherited such a magnificent civilization and have failed to even try to protect and nourish and advance it have much to answer for. I equate human civilizations with early versions of the Body of Christ as it develops in this mortal realm. If we don't care for our human communities, most certainly that magnificent entity of Western Civilization, then we are failing to do our duty to Christ and to our fellowmen. Far too often, we modern Christians starve and stunt the Body of Christ and think to be doing the entirety of our duty by feeding the poor from the four corners of the world. We truly are the products of an age of textbooks filled with glossy images as well as numerous guides for the idiots and the clueless who are us by our own choice.

We failed to keep Western Civilization healthy and flourishing. We fail to give our children a reason to believe, have failed to build the structures of behaviors and belief and feeling, the physical and intellectual and spiritual, which would support a robust Christian civilization.

From at least the latter stages of the Enlightenment, we Christians of the West have used up the resources of our civilization by way of morally irresponsible acts and failures to act. The bank accounts are now almost empty.

I'm stuck between a rock and a hard place. On one side are alleged conservatives and traditionalists who seem to have forgotten that they're supposed to be listening to the Creator and the vast majority of the Lord's words come in the form of His acts-of-being in Creation, His creation of a world in which time and space are best described for now by Einstein's General Theory of Relativity, matter by the quantum physics of Schrodinger and Heisenberg and Dirac, human being by Darwin. Choose your favorite empirically oriented literary exegetes, historians, musicians, and painters and the picture is reasonably complete.

And the hard place? Well, there are the liberals who will to go to Heaven and to take everyone with them. Except for the good feelings they seem to feel at the very mention of Heaven, or other words, they often seem embarrassed by the very suggestion of a salvation granted by God; they seem to prefer the generosity of goodhearted men who have outgrown that tribal-god stuff. This mortal realm is as much a mystery to them as is any other realm, including Heaven. Surely, God made a mistake in putting us

in a place of such suffering because He's going to be merciful and save all of us in any case. Why? Because it's too painful to think of other possibilities, often too painful to think. So it is that they join with somewhat like-minded conservatives to preach the simplicity of it all—remember all those guides for the idiots and the clueless. The liberals of Christianity watch God walk a tight-rope, not a step allowed to left or to right, that we might have the freedom to treat the world as being what we wish it to be.

In the end, my main criticism of Pope Francis and many other modern Christians, including the American bishops and the Catholic charitable workers, is that they know darned well that each and every member of their flocks has a duty to feed that poor child in Haiti or New York City but don't seem comfortable with any claims that child's mind should be shaped to accord with Christian truths; he'll have too many rap lyrics to memorize and too many complex sports to understand.

We have religious liberty to protect us Christians from the refusal of governments to do poor people our way, from its apparent refusal to protect all men from any excessive claims of God. Maybe we went overboard when we protected ourselves and others from fanatic inquisitors? Maybe we protected ourselves from all claims to truth? Especially when those claims were, rightly or wrongly, made on behalf of the God of Jesus Christ?

In Chapter 494, *When a Government Oversteps Its Proper Domain*, I dealt with some of the very serious problems created when modern Christians began to misunderstand modern politics and their relationship, as one particular example, to the government of the United States. I believe American Christian leaders were and are deeply irresponsible in teaching their sheep to accept dependence upon governments which have taken on the characteristics of parasites and cancerous tumors. Yet, my still stronger claim is that it was truly unwise to support any government programs in areas where there is substantial moral differences within the population being served, those differences being more explicit in our time largely because liberty developed in the Christian West at the same time that various sorts of Christians turned away from strong versions of their own faiths.

For another but overlapping view of the problematic impressions made by Pope Francis, see the article, *What Is Pope Francis Saying to the Right?* at <http://www.theamericanconservative.com/what-is-pope-francis-saying-to-the-right/>, by John Zmirak, a Catholic writer of traditionalist tendencies. For a recent interview in which Pope Francis states his goals in his own

words, see *The Pope to Repubblica: How the Church will change under my watch* at <http://rorate-caeli.blogspot.com/2013/10/the-pope-to-repubblica-how-church-must.html>".

## 637 What Christ Was Lacking

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1719>. It was finished and uploaded on 2013/11/07.]

In Colossians 1:24[141], St Paul writes: “Now I rejoice in my sufferings for your sake and in my flesh I complete what is lacking in Christ’s afflictions for the sake of his body, that is, the church. . .”

I suspect, partly on the basis of my own few experiences, that most modern efforts to understand these difficult words of St Paul are within the modern way of thought which sees salvation as individual rather than as communal. The Bible presents matters differently. For Jews, salvation comes to those who are members of the People of Israel; for Christians, salvation comes to those who are members of the Church. Modern Christians, most certainly those who are Americans, both Catholic and Protestants, have fallen strongly under the influence of a radical individualism even to the extent that some Catholics and many Protestants think it possible to be a Christian and a libertarian—I admit freely that there is a proper part of Christian political thought which could be labeled libertarian but the entire way of thought called ‘libertarianism’ assumes a view of human nature, and of the nature of created being, in opposition to Biblical teachings that man is both fully individual and also fully communal.

We continue to exist as individuals in these communities of salvation, but we take on the communal being of the People of Israel or the Body of Christ, a term I prefer to ‘Church’ because I think the Church in the sense of an ecclesiastical organization is but one organ of that Body though the most important organ in some ways.

We Christians can understand this in terms of Trinitarian theology. As Father and Son and Holy Spirit remain individual Persons even as They are one God, so we remain individual human beings even as we come together

to form one Body of Christ in which we are united with the Christ as the perfect and complete man. Each human being who goes on to share the life of God is the Body of Christ in a true and absolute sense just as the Father is God in a true and absolute sense and so are the Son and the Holy Spirit.

See Chapter 477, *What is the Role of the Christian Church in the Public Square?*, for my early views on the relationship between the Church and the entirety of the Body of Christ. I've continued to explore this topic of the true nature of the Body of Christ and will continue this exploration for a while.

What Christ was lacking and is lacking, in His suffering and in other ways, is His brothers and sisters. Christ was complete in His own individual human nature allied with His divine nature and divine Person, but He became one of us and took on our needs and desires. Without us, He is somewhat like a human being with some of his limbs torn off, bloody and mutilated; less graphically, He is incomplete in His communal human nature.

The Son of God chose to be dependent upon other human beings, chose to take up a human nature incomplete in its communal aspects during life in this mortal realm. He took upon Himself a human need for human community—for us, at least for many of us.

We perhaps fill up what lacked in Christ's affliction in various ways, but certainly by becoming members of human communities and, most especially, of the Body of Christ. We become the friends of Christ, members of the greatest of all communities and one in which the Son of God is Himself a member.

# 638 We Need to Act in the Spirit of St Benedict, Not Just to Mindlessly Repeat His Acts

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1745>. It was finished and uploaded on 2013/12/17.]

Folks who would be conservative, who would preserve what is good and even holy in the heritage of Western Civilization, still don't get it. At least not fully, but some are trying hard to figure out what to do in a decaying and possibly collapsing West and some of those are risking their futures in experiments in ways of living which might allow them to provide a greater moral order for themselves and their children.

It's certainly true that things are going badly in the West, in a multitude of ways including the sacrifice of traditional truths and beliefs and behaviors to political scheming and mere, mindless change-mongering labeled self-righteously as 'progress'. Parents and others feel a need to protect the children though few claim that or act as if a complete separation from the mainstreams and centers of human life would be good for those children or the world they will eventually inherit.

In the article, *Benedict Option* at <http://www.theamericanconservative.com/articles/benedict-option/>, Rod Dreher tells us that:

Christians have been here before. Around the year 500, a generation after barbarians deposed the last Roman emperor, a young Umbrian man known to history only as Benedict was sent to Rome by his wealthy parents to complete his education.

Disgusted by the city's decadence, Benedict fled to the forest to pray as a hermit.

Dreher summarizes the historical mess resulting from the collapse of Rome:

Rome's collapse meant staggering loss. People forgot how to read, how to farm, how to govern themselves, how to build houses, how to trade, and even what it had once meant to be a human being. Behind monastery walls, though, in their chapels, scriptoriums, and refectories, Benedict's monks built lives of peace, order, and learning and spread their network throughout Western Europe.

We have to be a little careful here because the more immediate change brought about by the collapse of Rome was the loss of contact between communities as barbarians began to control major regions and much of the roads just as we can still see in some countries such as Afghanistan and some countries in Africa. Initially, a lot of knowledge and skills remained intact. The more general damage, where knowledge and skills became quite local and often restricted to monasteries and maybe communities clustered around cathedrals or royal estates, came afterward and probably—at least in my opinion—as a result of the global breakdown, that loss of safety on the roads connecting the somewhat intact Italian cities to those of Western and Central Europe, as well as points east and south. Even at the beginning of the development of great trading enterprises as Europe started slowly to increase wealth and standards of living, the roads could be guaranteed as safe only in small regions where the king's men or the duke's men held sway. Early capitalism (pre-industrial) began to explode when the kings and other men of arms were able to guarantee safe movement through much of the Western and Mediterranean regions of Europe so that the merchants were able to move the English wool, perhaps already processed into raw cloth by craftsmen in the Lowlands, to Italy in exchange for silks and spices and even aesthetic objects.

In other words, fairly extreme localization was a result of the breakdown of Rome and, by the grace of God, St Benedict and his followers were able to retain much knowledge and skills in their communities, holding them in treasure for return to better times when Europe began to re-form, eventually

on a greater scale than the Roman Empire though never so centralized. The Benedictines also advanced knowledge, certainly in the production of spirits old and new, and those monkish fellows and the laity who lived in partial community with them played a major role in teaching and guiding Europe in the great project of building a Christian civilization which we know as the West, a synthesis of Jerusalem and Athens and Rome, but also including the peoples and traditions from barbarian Europe—Germanic and Celtic and a few others. That true prize, a civilization making it possible for the many to be at least tentatively part of the Body of Christ and also making it possible for various creative thinkers and doers to advance that Body in its mortal form, could be gained only with the communications, even communions, which started to connect various regions of Europe into something describable as a whole, a very complex and often self-destructive whole.

Civilization is built upon foundations and with bricks which come from created being, from human responses to the thoughts God manifested in this thing-like world. Increasingly, as the human race has advanced, civilizations—especially that of the West—have drawn upon the abstract being from which thing-like being was shaped, the abstract being which we can come to know and understand because of that advance. The foundations and bricks of a civilization are the human individual and communal minds and hearts and hands which are the manifestation of human responses to Creation over the course of true (conscious and recorded) history as well as the preceding eons of biological evolution. Our civilization is us and our decay is really the decay of our individual and communal selves in the West, not the decay of some ‘civilization’ out there and independent of us.

The material aspects of Western Civilization are manifestations of our inner selves, increasingly barbarian and—not coincidentally—increasingly incompetent no matter how much shock and awe can be generated by our armies which can no longer defeat a determined and intelligent counterforce of desert nomads armed with rifles left over from the Korean War period. Those teenagers walking down the street with smart-phones glued to their ears are a sign of exploitation in a collapsing West, not a sign of good technology wisely used. I’m enough of a nerd to wish I’d had time to learn a bit more about the intelligent use of computers (especially the use of that gray-haired language, LISP, to write self-editing programs) and modern metal-working equipment, but this smart-phone stuff just leaves me cold, leaves me wondering, “Why bother?” Much of our technology is

just more grease for our slide down the ramp, stuff to help us become more complete barbarians who are somewhat clever at using advanced technology we no longer understand—chimpanzees are capable of some levels of such cleverness.

If we retreat from Western Civilization, we can carry a far smaller chunk of that civilization than Benedict and his followers were able to do. We lose far more than Benedict and his earlier followers did because there is more to lose and it's interconnected. The reclamation effort would be far greater than it was during the early Middle Ages (after Augustine and Gregory the Great and Benedict and up to 900 or so). We in the modern West no longer work only with stone and wood but rather with engineered materials, no longer work only with pen and paper but with computers, no longer work only with horse and wagon but with planes and trains and submarines. Like it or not, this technology and the cultural uses of that technology and even our attitudes toward it are part of us, part of the man of the modern West. There is no road back to, say, early 19th century man so that he can begin a wiser movement forward—if you believe that he would even be likely to be wiser in that situation. Without modern technology, billions will die, others will be enslaved or at least reduced to primitive farming and handcrafts.

Much will be lost, even much of the internal richness of life possible to a civilized human being. We may well have misused much of our technology but that technology and our misuse of it was a reflection of our misshaped minds and hearts and hands, themselves misshaped by inappropriate responses to Creation; in a sense, we've already lost much of that internal richness I referred to above. If at all possible, we would be better off struggling to reform and recover, however impossible the task might seem. We would even be better off helping along the processes by which the center of the Body of Christ might shift, as I think it will, to the Pacific Rim or perhaps to Russia, that a greater Body might begin to grow. Yes, I do claim that the Body of Christ in this mortal realm is the greatest and most inclusive of civilizations, of which the Christian Church (as an ecclesiastical organization rather than a home for the Christian's complete life as it was for St Paul) is only an organ though the most important organ, the organ of worship and of direct communion with God and the organ which gives the rest of the Body of Christ a focus for fulfilling the purposes God gave to us. I would interpret the current events and trends as indicating it be time to allow the various great and simple peoples of Asia to integrate themselves into the Body of Christ; I would fear and hope they will come to dominate

over Western Christians become fat and lazy and stupid. I would rather an alliance but we're doing little to make our Western selves attractive allies or partners.

I realize, and Mr Dreher stated this, that many of these modern followers of St Benedict are trying to remain in contact with the greater part of modern Western Civilization and plan to let their children come into such contact when old enough that their moral characters have been properly formed. That's not good enough, though some might have to choose such a path. Benedict's true children will be trying to restore the greater part of the Body of Christ to health and not just moving out to the outer regions of that Body, however much they try to remain in contact with that sick Body. Again, as that Body of Christ returns to health and begins to grow and mature, it may well move beyond the West. We would be wise to cooperate with God if He wills this or something else we might find disturbing to our pride (hubris?).

The spirit of St Benedict would have us serve God in forming the Body of Christ rather than struggling to protect our individual selves, though children—to be sure—must often be protected from harsh realities.

# 639 God is Three of the People Around Us

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1754>. It was finished and uploaded on 2013/12/27.]

*Scientific American* published an article about research on the relationship between prayer and cure of diseases: *Scientists Find One Source of Prayer's Power* found at <http://www.scientificamerican.com/article.cfm?id=scientists-find-one-source-of-prayers-power>.

The results seem plausible and the interpretation of the results emphasize the natural but don't deny the possibility of the supernatural. I'm probably more inclined to deny the supernatural when it comes to cures of diseases than is the average agnostic or atheist who is trying to respect the beliefs of others. I deny the supernatural mostly because my view of God as a Creator who works through acts-of-beings makes unnecessary the view that God sits on His throne watching us and occasionally choosing to intervene by way of a divine invasion of our mortal world.

The first paragraph of the article tells us:

The religious find strength through God; this we know. But a new study conducted by Prof. Malt Friese and Michaela Wanke suggests that even non-believers can get in on the action. In a forthcoming issue of the *Journal of Experimental Social Psychology*, they present evidence showing how and why prayer might increase anyone's ability to resist temptation. Though we can all agree that to do so requires self-control, the authors propose that the source of such control might not be supernatural. Instead, it might come from something more

earthly. Something accessible to even the most devoted atheist: social connection.

I agree, so long as this last sentence is not taken in a reductionistic sense. The last paragraph of the article does provide some qualification against the necessity of such a reduction:

This does not rule out the possibility that prayer has other effects on resisting temptation, and the spiritually inclined could see the hand of God as another causal factor here. But as the holidays approach, it reminds us all of where we derive so much of our day-to-day strength. Interacting and connecting with the people around us.

I still largely agree with this statement and would even support the idea that we who are practicing Christians connect with God as much through our community connections as by way of personal prayer and worship. Even the lukewarm, or outright non-believers worshiping because of spouses or parents or children might well connect with God through their fellowmen more than some of us can imagine.

To a certain extent, this article in its efforts to be fair to those who truly believe in God makes a mistake also made by far too many Christians in the modern world. It seems to assume God is out there somewhere, perhaps Jove or Jupiter sitting on His throne and watching as things happen on Earth. In Christian belief, God is everywhere including the ‘insides’ of every human being. As Augustine of Hippo said 1500 years ago: God is more deeply inside of us than we can ourselves reach. He is a Creator, immanent as well as transcendent, inhabiting—in a manner of speaking—each bit of created being. He creates, from nothing and also by shaping what already exists into other created entities.

Mostly, this line of thought should lead a Christian, or those seeking to understand Christian thought, to meditate upon the Body of Christ, the ultimate community of those who will be resurrected to share the life of God through full communion with Jesus Christ. In this community, the resurrected will be like the God of Jesus Christ in an important way: each member of the Body of Christ will remain fully an individual and yet also be fully Christ, the perfect and completed man.

I’m not attacking the work described in this article, nor am I attacking the article as a summary. [This underlying research] “reminds us all of where

we derive so much of our day-to-day strength. Interacting and connecting with the people around us.” This is true from a Christian perspective though we are bound to add: “And Father, Son, and Holy Spirit are three Persons who chose to associate Themselves with all of us mortal human beings.” Moreover, we are also bound to add that each man, woman, or child who accepts the invitation of God (and maybe some socially bound to those who do so accept) will be members of a human community which is also divine by way of perfect communion with God.

# 640 The Decentralization Necessary for Solving Profound Problems in Christianity

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1757>. It was finished and uploaded on 2014/01/04.]

From a *Catholic News Service* article, *Pope orders new rules on relations between bishops, religious orders*, as published on the website of my diocese (Springfield, MA), <http://www.iobserve.org>:

Pope Francis said he has ordered a revision of what he called outdated Vatican norms on the relations between religious orders and local bishops, in order to promote greater appreciation of the orders' distinctive missions.

Further on, the article tells us:

“I also know that the bishops are not always acquainted with the charisms and works of religious,” he said. “We bishops need to understand that consecrated persons are not functionaries but gifts that enrich dioceses.”

In passing, I'll note that part of the reason for the Pope wishing to take away control from local leaders, bishops, is the claim that some 'foreign' religious orders are conducting a “novice trade” in countries such as the Philippines. This implies that there will be greater controls of specific sorts at the level of the Vatican; I'll ignore this complications to make my main point, one not explicitly made by Pope Francis, yet implied by his general

position: centralized controls, at all levels of a complex institution such as the Catholic Church, must be relaxed if we are to encourage the sort of explorations and thinking processes which will lead to solutions of the current deep problems of Church, the separated Christian churches, nations, Christian civilization, and the entirety of the human race.

In optimistic terms, our current deep problems are related to changes being forced upon us by new knowledge of Creation and the closely related development of extraordinarily complex human relationships; truly are these problems also opportunities though the current generations aren't likely to see the emergence of benefits from taking advantage of those opportunities.

Well-ordered freedom is necessary for the individuals and communities of the human race to move forward in a way compatible with 'progress', a movement I interpret as being the formation and maturing of the Body of Christ.

We need order, so there have been times when the bishops have needed to gain a greater control over institutions including religious orders ideally left to move with a great deal of freedom.

We need freedom, so those bishops including the Pope, should be wise enough to relax controls when appropriate and to the extent which is appropriate.

We should think through and generalize from this situation. This movement between establishing control and relaxing control relies upon the sort of judgment not always found in the leaders of centralized institutions, especially when those leaders are from countries or classes climbing out of barbarism or sinking into it or when they—take notice, my fellow Americans—are from a political class which has been corrupt and incompetent for generations.

# 641 Enriching Our Moral World: Simplicity Is Digested Complexity

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1762>. It was finished and uploaded on 2014/01/06.]

It's natural for most human beings to seek simple understandings. They correspond at least roughly to the simple (or elegant) understandings which are a goal of many theorists in the sciences which have a large mathematical component. Einstein pointed out that a theory should be as simple as possible but no simpler. Closer to ordinary sorts of common sense, these sorts of simplicities correspond to the rules and aphorisms which can guide us in our efforts to understand our world and our own selves, in our efforts to make our moral decisions, in our efforts to help shape the characters of boys and girls, in our work as carpenters or engineers. Simplicity can be real in this way, so long as stability reigns in social structure and technology and scientific understandings of men and our world, and so forth.

We can glide through much of the day and through the years, not having to constantly expend large amounts of mental and emotional energy. The world outside our own country becomes such a simple landscape of white and black; those who act as Americans wish them to act are good and the others are bad and we might have to invade them or at least refuse to do business with them.

The world doesn't always seem so simple and, in reality, isn't so simple to those who need to go below surfaces and behind the customs and prejudices of a particular people in a specific age. Euclidean geometry and Newtonian physics had been domesticated in our machine shops and our classrooms

and our technology and even our literature and, then, along came technology and popular knowledge at least touching upon the non-Euclidean geometries of Gauss and Lobachevsky, the curved space of Riemann, the curved spacetime of Einstein. That would have been bad enough, but our very understanding of matter was upset by Planck and Einstein and Heisenberg and Schrodinger. This was actually part of various turbulent waves disturbing poetry and creative fiction as well as understandings of history, including that of the Bible and the great religions of mankind. The physical and social worlds of humankind were suddenly beyond our understandings in those years leading up to the Century of World Warfare. The creative scientists and artists had been dealing with this turbulence for decades before others were forced to deal with it.

Truly had the world been turned upside-down and it has remained a complicated and complex place filled with strange entities. Man returned to being a stranger in a strange land.

I'll dare to be repetitive: the world isn't really simple, nor is matter or space or time, living creatures or the creatures we call stars or planets or volcanoes.

Yet, I'll go on record predicting the world will once again be simple, but only after generations of work by scientists and mathematicians, historians and poets and novelists, composers and sculptors and painters, theologians and philosophers and spiritual masters, teachers and politicians and inventors of games and amusements. They will simplify by drawing forth schematic understandings and well-defined behaviors and wise aphorisms from all this blooming buzzing confusion. Things and relationships will fall into place, symmetries will seem to arise by magic, patterns of various sorts and various levels of complexity will be assembled from the symmetries and even the remaining bits of confusion.

The simplicities, the symmetries and patterns, which allow us to make sense of a very big and messy world of evolutionary and developmental processes, which allow us to live our lives without constantly having to engage in lines of moral reasoning or mathematical calculations, will once again dominate. That might not happen for a few centuries, and it be possible that it will never happen. That is, it be possible that we've destroyed mankind's last chance for true moral and intellectual and cultural order in this mortal realm, though that is unlikely to one, such as me, who believes this world is the story in which the Body of Christ develops and matures as much as He can this side of the grave.

Simplicity of the sort I discuss is best seen as communally digested complexity—deep and dense knowledge encoded in various symbols and words and ways of speaking. Deep and dense but elegant and sometimes even beautiful in some of the structures, such as the music of Mozart or the confidence-game of plain language in the works of Mark Twain.

I already noted that Einstein told us a theory should be as simple as possible, but no more. One example of Einsteinian simplicity was an elegant equation governing the possible forms of his theory of gravity, the General Theory of Relativity. Aesthetically, that equation can be typeset to be as beautiful as a line of Egyptian hieroglyphics or a painting by Rembrandt of some respectable Dutch citizens just sitting around in highly tense leisure. To understand the hieroglyphics, we must know not only a straightforward translation but also a good bit about Egyptian life, perhaps commercial or political or military or liturgical aspects of that life. To understand the painting by Rembrandt, we must know a lot about his reasons for arranging the men and the objects as well as a good bit about Dutch life, perhaps commercial or political or military or liturgical aspects of that life. To understand Einstein's simple equation, a few symbols telling us much about a highly plausible and well-tested encoding of the structure of spacetime and the ways in which matter shapes that spacetime and moves in it, we must know a bit about Riemannian geometry and the tensor calculus, partial differential equations and the nature of gravity. That knowledge was itself based upon several layers of modern mathematical knowledge, the calculus and the very rigorous 'analysis' which justified the calculus, Newtonian dynamics, Maxwell's partial differential equations which described static and dynamic electromagnetic fields, and still more. All of this is expressed in forms made more elegant, more dense and more symmetric, by way of reasoning drawn from a variety of fields of algebra and other fields of thought going out so far as the mystical and obscure ponderings of ancient Greek philosophers. Simple? Yes, that is, it's simple once you've reached maybe the third or fourth year of graduate school in mathematics or a physical or engineering science which is highly mathematical. Similar statements can be made about understanding Egyptian hieroglyphics and Rembrandt's paintings, the Bible and American history.

The situation is little different in other fields, some in which the mathematical concepts of simplicity or elegance apply and others in which well-defined symmetries might not apply. Knowledge of history and other social sciences and various fields of literature and literary studies won't allow the

greatest of human thinkers to construct always valid rules or theorems or models, but the elements of the structural understanding of human being which never comes together will give some understanding that allowed, for example, a Carroll Quigley to see signs of another decline of Western (Christian) Civilization back in the 1930s, a Jacques Barzun to predict, back in 2000 (see *From Dawn to Decadence* [9]), the imminence (though not “tomorrow-ness”) and depth of one phase of that decline (the coming closing of public schools as this country because we Americans will need to send the children back to work and because they’ve been rendered ineducable by the ways in which they are raised). These were hardly lucky guesses. Read political commentators from the 1800s about how the sorts of leaders Americans prefer are incapable of dealing with complex reality or the more explicit predictions of collapse first into barbarian mentality and emotions by the likes of Jose Ortega y Gasset (see *The Revolt of the Masses* [60], published in 1930). I also take very seriously the sad joke from the early 1900s (found in an anecdote of Albert Jay Nock) that the United States is the first country in history to pass directly from barbarism to decadence without ever passing through a stage of civilization in between; this is important as the United States was the prosperous frontier region of Western Civilization which seemed to have inherited the mantle of leadership of that civilization. Think about this in the context of human history, of human failings as understood in various ways.

We Americans clearly had better things to do than to advance or even just maintain Western Civilization; more accurately, few are the Americans who rise above Ortega’s description of a barbarian child growing up in the city: we simply accepted all this technology as well as the boring stuff in books as being part of our environment; we don’t understand it and aren’t capable of fixing it if it breaks, let alone advancing it. True to our barbarian selves, we would never put in a major effort to even learn the history of mankind, certainly not the effort that we would put into or have our children put into sports.

I’m not attacking sports which is also an important part of human civilization, but I am mounting an attack upon an unbalanced, ‘barbarian’ life. Tribes organized to develop their boys into hunters and warriors have sports and certainly great athletes even if they don’t have a Superbowl. Those tribes may even have some impressive poetry and music but not at the level of Goethe or Beethoven; nor do they have more than primitive theology or philosophy or engineering—though it is remarkable how quickly

conquering barbarians pick up sophisticated understanding of military engineering after conquering a people with siege-machines and catapults or other throwing machines.

On a personal basis? I grew upon in a neighborhood where there were almost daily pick-up games of baseball or football or basketball or ice-hockey. I'm happy about that though I wish I'd spent less time watching professional sports on TV in my late-teens into my early 30s.

Simplicity, of a legitimate sort—the elegant symmetries of mathematical sciences and also the general ‘lessons’ of history and literature, is digested complexity. Generally speaking, if there is a pattern, there is a symmetry, though not necessarily one meeting the standards of abstract mathematics. In fact, some dictionaries define symmetry in terms of “fitting together” or similar concepts. Being more objective rather than speaking as if the world exists to be processed by our minds: symmetries allow an organism or a larger eco-system or an entire universe to come together. The liver doesn't devour the heart but rather has (mostly) mediated relationships of a well-ordered sort, symmetries of exchange and of mutual support. Similar comments can be made of healthy economies and polities—more generally, of human communities and parts or aspects of those communities.

We can even ponder a plausible evolutionary reason for the human inclination to seek ‘simplicity’ of various sorts, a reason true to the nature of created being: it takes too much effort to think every thing through, certainly to think every thing through from scratch. We need manners to make it easier to deal with each other, rules of thumb to deal with basic plumbing or electrical repairs, rules of thumb to set-up experiments on a Martian rover so that we can get quickly to the interesting and important issues of a ‘higher’ sort.

Some generations of men are called to create simplicity out of complexity; this can often be the building or expansion or re-formation of a civilization or a part of a civilization, such as a culture or a major activity such as banking or manufacturing or researching the nature of life. Before this process can occur, before complexity can be reduced to simplicity, that complexity has to be recognized, explored, raised higher and broadened and deepened. Before Einstein could create a greater and more symmetric system of dynamics, Maxwell had to produce equations describing electromagnetism which pointed to a great problem: there was a constant which seemed to say electromagnetism had a maximum speed. In addition, various contradictions coming from the study of inertia and an ether which could

carry the electromagnetic waves and there was an older insight that an infinite universe of a static Euclidean structure would be bathed in dangerous radiation and would be a giant fireball rose again.

Darwin started a process which has recently led to a possibility of understanding man as God created him, of seeing man as necessarily a true citizen of this mortal world if he is to be a true citizen of the world of the resurrected. This should have been obvious to traditional Christians who have, mostly, claimed that grace doesn't destroy or replace nature (the world), it completes and perfects nature (the world). Even the nasty aspects of this mortal realm likely correspond to some harshness in the world of the resurrected, a harshness by the standards of soft mortal men, a harshness which comes from the sheer dynamic nature of the God whose life we must share if we are to live with Him.

My work has been an effort to provide a coherent narrative of God's Creation, to simplify the complexity which surrounds us in the 21st century, to deny the possibility of simplifying by simply declaring, "It's all so simple." To even pretend this is so in the early part of the 21st century, we have to hold one set of beliefs while we're in church, another when we're in philosophy class, another in physics class, another when we're in evolutionary biology class, and radically different sets of belief when we work or purchase, when we vote or go off to war.

In *The House of Intellect* [7], Jacques Barzun tackled this issue from a viewpoint different from but compatible with the viewpoint of evolutionary biology, explaining why and how we 'simplify' our understandings and our responses to our surroundings. He told us:

Intellect is the capitalized and communal form of live intelligence; it is intelligence stored up and made into habits of discipline, signs and symbols of meaning, chains of reasoning and spurs to emotion—a shorthand and a wireless by which the mind can skip connectives, recognize ability, and communicate truth. Intellect is at once a body of common knowledge and the channels through which the right particle of it can be brought to bear quickly, without the effort of redemonstration, on the matter in hand.

This simplification covers not only intellectual matters and manners. Carpenters, child-bearing and child-raising mothers, nurses and doctors,

water-pipe layers, all inherited the past in customs of the heart, habits of thought and feeling. Much knowledge is encoded in those customs and habits, both knowledge which has been systematized and knowledge which is entirely in the form of experiential rules.

Knowledge which is so well-organized is simple; we don't have to think about most of what we do, which is a good thing for the most part. Some will learn to avoid thinking even when proper and some will be missing or will fail to develop the skills of thinking. Others will move along when dealing with settled situations and will stop, pay closer attention, and think about those situations which don't seem to be covered by all those simple rules.

The Christian may, quite unwisely, 'know' the world is simple because all the complexities of the ancient creeds and modern confessions or other dogmatic statements can just be taken as what our fourth-grade Sunday School teacher or eleventh-grade confirmation teacher or preacher said they were. 'Consubstantial' means what our teachers explained it to be: "one in being." At this point, anyone who's read any competently written history of the concept of 'being' will wait with bated breath, knowing we approach very complex messes; Christian theologians, as one example, have often held a pagan understanding of 'being' which is in conflict with the Christian belief that God is not only Creator or source (oh-oh) of being, but perfectly free to have created or not and to have created a variety of worlds and—as I would say—even a variety of Creations. God is not 'being' in the same sense as we are; Aquinas most clearly but other philosophers and theologians in vague ways have claimed God is a pure act of being and **not** substantial being Himself.

Similarly, politics was very simple, certainly in the small New England town where I grew up. There were ways things were done, even ways in which dishonest politicians would act if they won an important office. Enemies, inside the United States and in foreign lands, could be easily identified—they were just who they were and they were obvious, at least by the time our leaders called us to enlist that we might save freedom and truth and justice, surrogate mothers and Apple electronic gadgets.

The incompetent use of overwhelming advantages of American wealth and power led to little good and much harm as if the real goal of the Cold War was to keep it going so some could have exciting careers and others could make lots of profits.

Korea.

Vietnam.

Latin American.

Iraq.

Afghanistan.

Terrorism—see Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*.

Libya.

Egypt.

Palestinian hellholes.

Numerous countries which can't feed themselves and are just one crisis, perhaps a petroleum shortage or price-rise, from humanitarian disasters which might equal the great wars of the 20th century.

These disasters, and others—including the American economy and educational systems and . . . , are the result of thinking the world to be so simple. Just feed the hungry and build hospitals for the sick and soon any random country in Africa would become settings for so many cities resembling Paris and so many suburbs resembling those of Orange County in California.

All we have to do is strive to make those stupid or evil people into middle-class Americans and the world will be such a wonderful place. Or a collection of disasters and hellholes.

All we have to do is declare that, for example, evolution is just so compatible, just **is** so compatible, with Christian teachings, and we'll understand it all and know it all. Or we might drive many young people away from Christianity and isolate ourselves from the most glorious of civilizations, one built by Christians as a home for Christians and their Church.

The world isn't simple, though it might be simple in many ways in a century or more if we Christians do our duty by God and man.

## 642 A God Intelligent Enough to Design Isn't Kool

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1765>. It was finished and uploaded on 2014/01/13.]

I wasn't surprised that Roy Spencer wrote this blog entry, *Science and religion: Do your own damn Google search* found at <http://www.drroyspencer.com/2014/01/science-and-religion-do-your-own-damn-google-search/>, expressing his feelings at being treated shabbily in an article, *What Catastrophe?: MIT's Richard Lindzen, the unalarmed climate scientist* found at [http://www.weeklystandard.com/articles/what-catastrophe\\_773268.html](http://www.weeklystandard.com/articles/what-catastrophe_773268.html), which describes "less credible skeptics, such as climatologist Roy Spencer of the University of Alabama (signatory to a declaration that 'Earth and its ecosystems—created by God's intelligent design and infinite power and sustained by His faithful providence—are robust, resilient, self-regulating, and self-correcting')". I'd already read that article at *The Weekly Standard*, having been referred there by some link out there in the World Wide Wilderness.

I have problems with the viewpoints typically labeled as "intelligent design," but—a big but—the real crime committed by Professor Spencer is likely—he thinks certainly—that he is audacious enough to actually believe in a world created by an all-powerful God who remains active in His own Creation. I stand on that common ground with most Intelligent Design advocates, while feeling that God as Creator of all that is not Him doesn't need to play the role of a Zeus to tell the story which is this world; at the same time, I also don't think a true theist could ever rule out the possibility of the Creator acting more directly in this world. A Christian has to believe

He did act directly in the Incarnation and Resurrection of Jesus Christ.

In any case, notice there is no indication that Spencer's scientific work has been at all affected by his acceptance of some set of beliefs labeled as 'intelligent design' in a statement he signed. His scientific arguments against any certainty, but not against any possibility, of man warming the atmosphere with greenhouse gases have to do specifically with lack of direct cause-and-effects and the poorly understood but very important role of cloud cover (the IPCC models 'warm' the earth's atmosphere largely by way of cloud cover being changed by greenhouse gas levels). I'm not trying to make any independent scientific argument but only pointing out that the IPCC models are efforts to encapsulate a complex and chaotic system or set of systems and, having recently read several books on modeling written by experienced mathematicians, there is great reason to be skeptical on very fundamental principles of such models and some reasons to be skeptical on the grounds of specific known details of the IPCC models.

Let me switch to talk a little about what the Intelligent Design community gets right. First, I'll repeat a claim I, along with many others, have often made: Western Civilization and all its great accomplishments rest upon Christian belief in an all-powerful God who chose freely to create this universe and all else which might exist in Creation. Those great accomplishments include science and historical analysis and modern technology and other fields of human endeavor which have stressed greatly the Christian faith of Westerners, a faith apparently far weaker than might have been thought even a century ago. God clearly seems a bit far from His own Creation even to many who still actively practice their Christian faith; many others have simply decided that modern knowledge and modern human attitudes have at least made the God of Jesus Christ, maybe all possible Gods, implausible.

To be sure, Newton himself made it possible for his followers to believe in a God who created a world which mostly worked without His involvement—this view of God sends the Almighty to some distant realm but allows Him to operate in the gaps or interstices of a world largely determined by laws which can be expressed in mathematical form. (It's far from clear, from what I understand, that Newton really advocated a "God of the gaps".) More recently, the God of the gaps has moved on to the frontiers of modern cosmology and become the God who operates at singularities—see Chapter 623, *Not the God of the Gaps Nor the God of the Singularities*, for my discussion of this issue in the form of a favorable response to *Bangs*,

*Crunches, Whimpers, and Shrieks: Singularities and Acausalities in Relativistic Spacetimes* [31] by John Earman, a philosopher of science, who wrote, “Speaking purely personally now, it strikes me as bordering on the sacrilegious to see God’s creative force as able to operate only at a singularity or ideal point.” More importantly for this line of discussion, and stated in my words from that essay, “There are philosophically distinct forms of cause-and-effect,” and God can act by way of cause-and-effects well beyond the possibilities of God as conjectured in Intelligent Design Theory.

As much as I disagree with some of the tenets of Intelligent Design as currently understood, I’d say that its advocates hold far lesser errors than many of their opponents, including many who formally—and perhaps only formally—hold a version of the Christian faith closer to what I support. That is: it is a far lesser error to misunderstand the relationship of Creator to Creation than it is to advocate, or act under, the view that God has been aloof from His Creation since that instant (or non-instant in my view) when He brought something into existence from nothingness, that something being Creation. It is certainly far less an error, even in the secular streams of Western Civilization, to propose or to even speak as if God doesn’t exist or as if He were not all-powerful. Many who attack advocates of intelligent design, including those such as Professor Spencer who don’t seem to have any improper behavior in their scientific work, are some variant of atheist, and not always an intelligent variant.

Let me address the issue of Intelligent Design by first pointing to the common beliefs of all Christians, beliefs which in their specificity have to be suspended at times when biologist or Biblical exegete does their work. I would say they have to be suspended, not because we can or should, suspend at any instant our belief in the God of Jesus Christ, but rather because any specific form of that belief is conditioned by empirical matters of culture and personal thinking styles and so on. We should realize this is an age when nearly all Christian understandings of Creation rely on such rags as pagan views of a decline from a Golden Age, Medieval physics and biology, and ancient understandings of infinity.

A Christian believes in the teachings of the Nicene Creed even if restated by a later tradition; those teachings are necessarily expressed in terms of human words and concepts which change over time. A Christian most certainly cannot believe in a God who is somehow apart from His Creation, who is uninvolved in the workings of that Creation. That leaves open a lot of possible territory for beliefs, though I’d say that some Christians, in-

cluding most Catholic theologians and philosophers over the past 500 years or more, nearly all Protestant theologians and philosophers, have developed metaphysical views and sometimes scientific overviews of God's work in Creation which are more compatible with pagan beliefs in a God who is effectively co-existent with that Creation, however much the first chapter of Genesis or the scientific story of the Big Bang are glorified—quite falsely—into a creation from nothingness. This error is likely one of the errors, along with the nearly universal misunderstanding of the human mind and how it forms, which have led to the lesser errors of the sort of Intelligent Design and the greater errors which limit the work of God to what is convenient to a particular ideology (or corrupted worldview), including that of, for one example, liberalism and its belief in a truly freestanding individual, standing free of all but voluntary and contractual relationships with other men and with human communities and sometimes even with God.

Let me break this flood of ideas down just a little by first referring to Chapter 162, *What Do I Mean When I Say, "God Creates Truths"?*, where I wrote, "My claim is that the fundamental stuff of Creation is what I call the Primordial Universe, the manifestation of the truths God chose for Creation. It is the Primordial Universe which the Almighty brought into existence from nothing and other phases of Creation, including particular and thing-like phases, are shaped from that Primordial Universe," and I went on, essentially, to argue that we have not transcendental minds which can ascend to transcendental truths. We can only know what we can learn from the thoughts which God manifested in Creation. If God hasn't put it into Creation, sometimes by way of revelations to our eyes and minds, we don't know it and can't know it.

We should not underestimate the effort needed to figure out the thoughts of God in His freely chosen role as Creator whether we are theologian or philosopher or physicist or machinist. See my freely downloadable book, *Four Kinds of Knowledge* [43], where I explain there are only two kinds of knowledge: knowledge of God in His transcendence and knowledge of God in His freely chosen role as Creator of this particular Creation.

In Chapter 580, *Restricting God's Thoughts to Freshman Mathematics*, which I originally published back in 2008. I criticize certain arguments presented by the Intelligent Design community:

Do these thinkers imagine God's thoughts and the possibilities open to Him as a Creator to be so limited? Math is hard.

Physics is hard. Philosophy and literary studies are hard. Understanding God's acts of Creation is all of that plus one hell of a lot harder. Anyone who thinks the Creator's thoughts and acts can be understood by simply applying a few equations from Probability Theory 101 is deluding himself and insulting God.

In other words I used above: "There are philosophically distinct forms of cause-and-effect," and God can act by way of cause-and-effects well beyond the possibilities of the God (a Zeus of sorts) as conjectured in Intelligent Design Theory.

The immediately relevant point, drawn out of a complex mixture of points, is that belief in the God of Christ is a fundamental part of the same Western Civilization which has led to modern science and technology and the promises of better human communities which underlie the past 1500 years of history in Europe and in regions influenced strongly by Europe; yes, even those regions exploited, sometimes brutally, by Europeans or their offspring such as Americans. And the promises remain alive, though largely rejected by mainstream thinkers and leaders of the West and largely ignored by the United States which was the most plausible region for a new center for that civilization.

# 643 Repeat After Me: The Church Has Accepted Evolution and Our Ancestors Were Sex-Crazed, Killer Apes

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1782>. It was finished and uploaded on 2014/03/01.]

I distort for the sake of modern men who have trouble focusing upon reality. Apes are our cousins, not our ancestors; the terms used for the common ancestors of men and apes seem to change every few years or so. And those ancestors were only killers part of the time, perhaps less often than modern Americans would desire for themselves—see Chapter 495, *Quietly Charitable or Quietly Murderous But Always Quietly American*. The sex-crazed business is perhaps less of an exaggeration for us and for our ancestors.

Sin is a part of this mortal reality. The Church has admitted evolution is a part of this mortal reality. Our ancestors weren't pure creatures born in a state of grace but rather had the usual bundle of traits for a morally aware creature: some noble and some useful and some despicable and well-described as 'sinful'.

What sense are we to make of this statement from an article at the *Catholic New Service* website, *Cardinal outlines possible paths to Communion for divorced, remarried*, and found at <http://www.catholicnews.com/data/stories/cns/1400852.htm>:

From the first moments of creation, the cardinal [Walter

Kasper] said, God intended man and woman to be together, to form one flesh, to have children and to serve him together. But sin entered the world almost immediately, which is why even the Bible is filled with stories of husbands and wives hurting and betraying one another, he explained.

Let's try this one again.

We are the products of messy and often bloody processes of evolution and development. There was no time in this mortal realm of Creation when there were any human beings in a state of grace such that they had a choice to first sin or to remain sinless. In other words, specific sins were always options from the first morally self-aware human but sinlessness was never on the table. Moreover, our last common male ancestor most likely lived thousands of years, or more, apart from our last common female ancestor.

When our ancestors became aware of sin, they were in a state of sin because it was the state of a human animal. Our ancestors didn't fall so much as they entered into a long communal process of listening to . . . Spirits? No, gods. . . A God. An incarnate God who offered a share of His life, a life which promised sinlessness.

The invitation came to share a life which was outside of the struggles of this mortal realm where we, in fact, often face the need to risk sin to do our duty to others or to remain truly alive. This world is preparation for an everlasting and sinless version of . . . this world. It is not a place where the peace of sinlessness was ever a possibility.

Heaven may well have many who were quite the sinners on earth, not hateful sinners but rather sinners pursuing the good things of God's world too aggressively or too often or simply in the wrong way.

Heaven may not have many honest-to-God Puritans because the sheer abundance of a life shared with God would be repulsive to them.

I have to admit I can't understand the state of mind of someone who can accept evolution as the story of life and of the origins of human life and then talk as if there were a story of a fall from grace into sin of the same but different human race which had evolved and which lived in a messy and bloody world. There is but one human race: the sex-crazed, killer apes, so to misleadingly speak.

But I did write a novel about a modern man who was quite divided in mind as he attempted to meet all the irreconcilable expectations of his life: *A Man for Every Purpose* [37].

Convinced to the depths of my mind that there is one created reality, though awfully complex and multi-layered, and, hence, one story of the human race which includes the truths of the Bible and those of empirical knowledge, I can only work to produce a draft version of that story. As it turns out, I produce only some commentary and a few stories which end up being no more than snapshots of these complex processes of development of a species at a certain stage of evolution and mostly in a state of civilizational decay.

## 644 Is the Invisible Hand Really the Hand of the Body of Christ?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1798>. It was finished and uploaded on 2014/04/03.]

Is the invisible hand justly celebrated by Adam Smith really the hand of the pilgrim human community, of the Body of Christ forming—however imperfectly and incompletely—in this mortal realm?

Yes, though the language is far from optimal and that language can lead to improper concepts regarding the Body of Christ and its relationships to human beings in this mortal realm, this empirical realm of facts which we Christians can't continue to accept when we go to the hospital to be scanned for cancers and then ignore in our worship of God and our efforts to understand God in His freely chosen role as Creator. The Invisible Hand is actually Invisible Mind and Invisible Heart as well as Invisible Hand(s) of the Body of Christ at work on forming itself, something like the self-organizational processes which seem to bring brute matter to life and to organize some brute matter (say stars and other objects as well as gaseous matter) into galaxies and into various complex groupings of galaxies.

The formation of the Body of Christ in this mortal realm is mostly a natural process though it has its aspects which could be labeled 'mystical' without too much damage to human understanding of Creation, of the actual work of the Creator as opposed to fairy tales and dreams preferred by far too many Christians—in recent centuries, even including theologians and philosophers and ecclesiastical leaders. Once those fairy tales and dreams were something different, corresponding well to the best understandings of empirical reality. We've kept them too long, like an eccentric lady who keeps threadbare curtains up and rickety unsafe furniture in her house when she

could do better, at least repairing the old stuff which is no longer suiting the purpose of a human habitation; a complete refurnishing is often the better course of action, but a refurnishing which respects the context of that particular house.

The Body of Christ, in its preliminary forms in this world of evolution and development, is all of our communities even though many of those communities wage various sorts of war against each other and exploit each other in less violent ways. For now, the Body of Christ is somewhat of a colony of organisms rather than itself an organism, as jellyfish and some other creatures are also colonies of organisms, though amazingly well-evolved and well-developed for life as if truly cells or organs in an organism. As I said, the pilgrim Body of Christ doesn't form in a smooth way, not even so much as does a community which is a jellyfish. Human beings and smaller human communities are too ornery and contrary for such processes of aggregation to proceed smoothly.

I've claimed before, and still claim, that the fullness of a good human life will be found in the world of the resurrected and, thus, the Church, the center and source of our direct relationships with God, is Herself an organ and not the entirety of the Body. Our activities as actors in the economy and the political realm, in music and other arts, in scientific and literary pursuits, in farming and woodworking, are legitimate parts of human life; we would be mutilated creatures if this were all torn away from us; if we were to sit in choirs in heavenly churches for time without end, we would soon be so bored as to be praying for the end of time.

As the Body of Christ forms in this mortal realm, however incompletely and imperfectly, all of its organs and other parts form in a way that suggests a bit of independence of parts and whole—at least in this mortal realm. We Christians have had to admit the incompleteness and imperfection of our organs of worship, our churches, even the Mother Church in Rome and the equally ancient sacramental churches of western Asia have sinned greatly and erred greatly as communities and as gatherings of individuals. Protestant and other Christian churches have done no better. The pilgrim Church moves through this world, advancing at times in Her reluctant and unsteady obedience to God and regressing at other times; at times, the Church in Rome and all other Christian churches I know of have been no better than filthy images of the Church in Heaven. The same can be said of the other developing parts of the Body of Christ, organs and other parts which are the communal analog to the various parts of individual human

being. Our political and economic systems also decay to exploitive class-based systems. Our local communities in the modern world seem to vaporize as soon as one generation decides to seek something more exciting, such as a country-club and night-club life.

The economy, the realms in which we make our livings and—for many—act in the most meaningful ways is a central part of our lives, even if our economy is restricted to a family farm. Even an impoverished writer such as myself, is still working as if living in a world with a better publishing industry and more demanding readers. Like the butcher, I don't write out of pure benevolence but rather because, perhaps with God's help, I worked myself into a state of being where I'm a thinker and writer, paid or not. Whatever comes of, or from, the works I'm publishing for free on the Web, I'm fulfilling a role which is at least potentially as important as the great public roles of our day.

We human beings are forming various communities in this mortal realm. Some human beings are not obviously God-centered and many seem to be actual enemies of God, at least enemies of any God compatible with the teachings of Isaiah and Jeremiah or the very Person of Jesus Christ, the incarnate Son of God. Those human beings also are playing a role in the formation of the Body of Christ, even if they are playing a seemingly negative role; the biological world has plenty of parasites and microbial invaders of other life-forms. I have discussed the issue of human predators before, especially in Chapter 448, *Predators, Producers, Sheep, and the Love of Liberty* and in lesser detail in other chapters and other writings not or not yet included in this collection.

Rather than trying to justify either HIV or government-employed professional murderers, rather than even wishing they not exist, we should recognize they are part of the story as much as a pretty songbird or a dedicated nurse. Sad, but the story has sad aspects. If the story were radically different, the creatures in the story would be different—human beings are the result of evolutionary and development processes in a world with pirates on the high seas and pirates on Wall Street as well as medical and religious missionaries around the world. We wouldn't exist if the world had been either one where human beings were a special creation beginning with Adam and Eve or if it were a place without disease and famine, war and crime.

What's amazing in this world of brutal struggles is the good that emerges, even from great nastiness. The persisting good is order, in the

physical things and structures of this universe such as galaxies, in the environment of earth where multitudes of living organisms and physical things all shape one another. There is no need to assume any changes in human moral character, either in its makeup or its strength. The forms of imperfect and incomplete order within the evolving and developing communities of the Body of Christ are sufficient to help us modify our manifested natures, though we might remain potentially murderers and adulterers in our dreams. They are also sufficient to sometimes gather us into armies serving criminal governments or into hateful and perhaps genocidal mobs.

We may not be able to build Heaven on earth, but a productive and morally well-ordered barbarian village is nothing to sneer at; a civilization, however minor, is a great wonder. We must keep alive the awareness of the imperfections, cruelties and outright crimes, of those villages and civilizations, whether communal or individual, but we court disaster if we forget the good that was found even in Rome with its gladiator contests and its brutal conquests. I speak mostly of long-lived communities because truly perverse communities, such as Nazi Germany, will self-destruct because they don't honor even our basic needs and most primitive moral instincts of the sort discussed in some of our great literature and certainly in the Bible.

Human communities are for real as they move toward order as part of a general movement within this universe. These communities aren't just voluntary, contractual gatherings of freestanding human beings. We human beings remain individuals even as we become truly communities; think of this as analogical to the Christian belief that God is Father and Son and Holy Spirit, each of whom remain individuals while also being one God. We remain individual human beings while also becoming one Body of Christ.

This shows in Adam Smith's great example though I'll rephrase it in terms of a more fully Christian morality rather than using language consistent with Adam Smith's Deistic outlook: the butcher doesn't provide you with meat out of his benevolence but rather because he has taken on a role in which he makes a living and provides certain products and services for others within his community or other nearby communities. Though there are some exceptions, individual human beings nearly always feel most complete and best satisfied when fulfilling such a role with some competence.

We are tied together by our human natures, individual natures which are made to be part of certain types of communities. We are first tied together by bonds of dependency before those of love. To be stable and satisfying, those bonds of dependency must meet our basic needs and the

desires which lead us to satisfy our needs. Bonds of love might develop or might come to be before or at the same time as bonds of dependencies, but it is those latter bonds which are more important and must be accepted before we can form true communities, before we can become the Body of Christ.

As sociobiologists, such as E O Wilson, have told us, our desires for forming certain basic sorts of communities and capabilities of doing so exist in the genes of the individual human being, though I would add soma and environment to make a more complete picture. We desire to form communal relationships. We engage in tentative relationships, often the accepting of dependencies upon others, and grow in communal being, communal mass, communal muscle, communal intelligence or intellect. For a variety of reasons, most of which have to do with the human brain and the mind it can make, we human beings form ever more complex communities, sometimes as a result of lesser activities which include not only economic and political activities but also those involving sports and music and stamp-collecting.

We desire communal relationships. If we succeed in forming good relationships, we begin to create communal stuff and to shape it. As the perfect and completed man is Christ, so the perfect and completed community is the Body of Christ. This way of discussion comes from the ancient Christian principle that grace does not destroy or replace nature, grace perfects and completes nature. What we are in this mortal realm tells us much about what we shall be in the world of the resurrected; in principle, it would tell us the entirety if our minds were powerful enough and if our hearts were pure enough to properly guide our minds.

So it is that when we see complex and well-ordered human communities form as if by magic, we're really seeing the natural side of a process by which the Body of Christ is developing.

I'm going to step back a little and explain part of what is going on behind the scenes when I write my books or essays. It's something to be found in my writings as both side-comments and as major statements. The entire small book of select writings, *Making Peace with Empirical Reality* [49] and Part II, *Making Peace with Empirical Reality*, from which that book was drawn deal with some of the basic issues of accepting empirical reality as the manifestations of a lot of thoughts of God, some of those thoughts being mathematical, some being story-telling, others being analogous to other categories of human activities. See my book, *Four Kinds of Knowledge* [43], for an overview of my understanding of the necessary, but dangerous and ulti-

mately untrue, fragmentation of human knowledge, a fragmentation which can deform our human beings if we accept it as literally and necessarily true.

Our ways of thinking and speaking, if only concessions to the weakness and smallness of the human mind, work their ways into our hearts and minds, become our attitudes and thoughts. If we use radically different knowledge for our ways of speaking of our Christian beliefs than we use for speaking of the universe, then the universe is no longer part of God's Creation in our thoughts. We will have bracketed our religious beliefs and will only think inside those brackets on Sunday morning for an hour or so and maybe during our weekly Bible readings and daily prayers. We need technical language for theology and Bible study as well as for economics and physics, but there has to be a bit of overlap and bridges which, at least for the philosophically minded, allow smooth movement from one realm of human thought to another. Modern men have built more walls than bridges inside their minds.

We need a Christian civilization which is a rich variety of compatible cultures; we need such a group of cultures each of which teaches us to speak about the empirical world in such a way that it is part of Creation. We also need a rich variety of understandings of the ancient creeds (and their Biblical foundation) and corresponding practices; we need these varied ways of speaking and thinking of the transcendent God in such a way that He is not only Father and Son and Holy Spirit in one God but also, by His own free-will, the ever-present Creator of this world. This means that we must think and speak of God in His freely chosen role of Creator in such ways as to recognize He works through processes described by modern empirical scientists, through social and cultural and political processes described by modern empirical scientists and exegetes of traditional literary works, theorists and experimenters and practitioners who are firmly planted in empirical reality.

From the time of at least Augustine and Jerome, through Anselm and then Albertus Magnus and his student Thomas Aquinas, there were important thinkers whose works embodied an open and honest recognition of empirical reality—though necessarily within the context of their times. Now it is easy enough to re-interpret some of these works in ethereal ways, but that is not how they were written. With the persecution of Galileo, who was actually an orthodox Catholic thinker of an Augustinian sort, the hierarchy and intellectual mainstream of the Western Church began to sep-

arate themselves from an honest and courageous and faithful respect for God's Creation. It seems odd at first but makes sense upon contemplation that the Church soon lost the skills of speaking of Heaven, the world of the resurrected, in ways other than vague dreams or gushing allusions which make no sense in terms of the only part of Creation we know or can directly explore, the part in which we are born and are shaped, the mortal world which is the embryo of the world of the resurrected.

In general, theological talk in its academic forms and its more accessible forms deals with creatures and worlds which have little or nothing to do with the only part of Creation we know. Human sin is explained in sermons and homilies and spiritual works as the result of acts by a human couple which never existed—it is likely the last common male ancestor and last common female ancestor of the human race lived tens of thousands of years apart. Matter and time and space are discussed in ways drawn from pre-modern thought, much of it originating in ancient Greece. What saves the Catholic Church from utter disintegration are the large number of priests who exercise greater sense and wisdom than could come from the very defective scripts they are taught in seminary. I would imagine similar comments could be made of other Christian churches.

The invisible hand is a rather misleading way of speaking of some aspects of the formation of the Body of Christ, ultimately a community of friends of Jesus Christ which is well-ordered in various ways, some moral and some seemingly having little to do with morality, but all the order works toward both moral and utilitarian purposes. The mind of the Body of Christ forms by encapsulating this order. It is the mind of that Body and the objective relationships which arise in this moral realm which are of concern. The hand of the Body can only act by instinct unless guided by the mind in developing proper habits and customs, moral and otherwise. This most certainly does not often mean a group of experts gathered in the conference room of some resort hotel nor in the meeting room of some bank or government agency. It nearly always means businessmen planning expansions during a period of growing populations or a group of parents organizing a baseball league for young boys or girls or an international and loose-knit community of scientists pursuing an understanding of some interesting phenomenon which might or might not have commercial application. These are purposeful activities but not attempts to plan from the top down.

Most especially in the past century or so, we've seen how much harm can be done by those sorts of planning processes and the subsequent efforts

to control a seeming chaos as it organizes itself. We saw that harm in the devastation which was Russia after the Bolsheviks had ruled for decades and we saw it in the design and construction of the national highway systems of the United States and other countries, using taxpayer monies to benefit the military-industrial complex but also large corporate employers in general and also mall developers. This led to massive damage to an admittedly inadequate Main Street, where many of those taxpayers lived and worked and purchased goods and services. It's true that Main Street was likely inadequate to modern needs, but it was crucial to the lives of so many small towns and so many neighborhoods of large cities. We would probably be a country with less junk filling our garages and basements, a country more stable, a country filled with happier and stronger families and church communities, if we'd let Main Street grow and change to meet new needs. That mall down the street and the huge aerospace factory in a nearby town are not the result of any Invisible Hand but rather the result of the velvet-gloved Iron Hand of would-be tyrants, small or great.

# 645 Sainthood as a Popularity Contest

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1813>. It was finished and uploaded on 2014/05/05.]

In his spiritual biography of John Henry Newman, *The Spiritual Journey of Newman* [74], Fr Jean Honoré (a future cardinal and Archbishop and member of the committee which supervised the writing of the *Catechism of the Catholic Church* [121]) told us that Newman had seen the problems the Church was having in dealing with the questions raised in the modern world—along with all Christian churches in my opinion. And he thought, as do I in a more qualified way, that Newman knew how to address those questions.

So there is reason to believe that Newman had responded more openly and more truly and more honestly than other modern Catholic thinkers to God's story which is this world. I raise the question:

Why hasn't John Henry Newman been yet recognized as a saint?

I know the standard answer: the miracles haven't yet come about. I also know enough statistics to know the canonization process has very likely become a popularity contest, unless one accepts as a matter of non-revealed faith the strange theory that God performs miracles as some sort of indirect message that so-and-so is a saint. Spontaneous remissions of cancer and spontaneous healing of decayed joints and the like seem to occur at random, unless we make a lot of assumptions that few—if any—competent Christian theologians would support in any but a highly qualified, hand-waving argument. The God who causes the rain to fall on the fields of

good men and bad men may or may not intervene directly in response to prayers for healing by the pious who adore the—pardon me—rock stars of the Catholic Church. Or—far more likely under Christian beliefs as well as those of modern scientists, those healings might be just as random as the similar unexplained recoveries which occur to the best and the nastiest of human beings of all sorts, even to those who hate God. Who's to say? We can say the pious, especially those who have the piety of superstitious peasants, will pray to a dead rock star more often than the typical admirer of Augustine and Aquinas and John Henry Newman. And there are far more of that first sort of pious Catholic than there are of those who value reason, perhaps even overvalue it.

I can't find the quote with simple Google searches, but, sometime in the past few decades, a modern thinker not friendly to Christian beliefs somewhat famously noted that Newman was unusual among Christian thinkers for sounding sane even when discussing and supporting the strongest of Christian beliefs. Those who believe that the God of Jesus Christ is truly the "God of Reason" who created this world have to see much good in that. There was once a time when Christianity produced great thinkers who were taken seriously by non-Christians; in recent centuries, the number of Christian thinkers in such a position is small and includes Etienne Gilson, Jacques Maritain, Joseph Ratzinger, and not many others. This might be partially a sign of anti-Christian bias but it's also a sign that Catholics and other Christians rarely go forth from their intellectual ghettos without leaving their minds behind and presenting only hearts and hands to the larger human world. Or else, if they take their minds and express opinions, they sound like lunatics.

So, the possible saints who appeal to the pietistic, often the baptized pagans—to be both cruel and fair, attract a lot of prayers for healing and some of those who are the intended beneficiaries have certifiable remissions of an unusual but far from unknown sort. I'm not arguing against the canonization of John XXIII and John Paul II, though I think it was too early to have definitively decided if both men, or either one, really was a proper exemplar for the Church as She moves forward, independent of any personal holiness found in them. I am arguing against the system which raised John Paul II so quickly to recognized sainthood while the cause yet lingers of the man who tried to warn the Church about how and how not to respond to the modern world.

Let me make very general statements under simplifying assumptions of

the statistical nature of extremely unlikely medical recoveries. Most controversially, I assume that extremely unlikely (but not impossible) medical recoveries happen and there are no doctors or parents or spouses or Catholic Curia bureaucrats who can determine if God intended a particular such recovery to be an endorsement of a particular cause for sainthood. I do tend to believe it morally irresponsible and blasphemous for those Roman functionaries to pretend to be able to determine such a matter. If they could do so, they would be able to explain why God typically doesn't bring about such recoveries and why it is that unlikely events of all sorts inflict so much suffering on the innocent and guilty alike. To put it in other words: it is the height of dishonesty to think I or any Roman functionary can go through descriptions of unlikely events and take credit—in God's name—for those which meet with our pietistic approval. Being willfully dishonest about God and His relationships with us or any part of Creation is blasphemous.

I'll suggest that our better and more truly pious strategy for recognizing sainthood is to look for signs of one who was in some special communion with God and fellowmen and was also serving God and fellowmen, probably restricting such to those who will be good public exemplars. Such a strategy would use knowledge which human beings can gain with an appropriate effort and wouldn't allow any hubristic claim that we can accept any events in God's Creation which meet with our approval and ignore any which lead to that yucky suffering stuff, unless the person suffering is a would-be saint of masochistic tendencies—and there seem to have been more than a few true saints with such tendencies as well as nearly all other admirable and undesirable human tendencies. Even Newman, hyper-rational by current standards of Catholic thought and most Christian thought, was a self-flagellant for some (probably short) period.

Let me take the issue of a Catholic "rock star" who is generally popular but especially among those with what has been labeled an "Italian peasant piety"—by many including Jean Honoré when speaking of Newman's followers who turned on him because of his commitment to human reason. The "rock star" is being investigated for sainthood as the investigation of John Henry Newman, who died more than a century ago, lingers while they wait for miracles. If there are, say, a hundred extremely unlikely medical recoveries among pious Catholics each year and the photogenic pope has 15 million praying to him while Newman has 15,000 praying to him, then there is, with simplifying assumptions I won't state, a  $(15,000,000/15,000 =)$  1,000 times as great a chance of any extremely unlikely medical recov-

eries occurring to the photogenic pope. In most years, none of those cures will be attributed to a fellow such as Newman and that for reasons having doubtful connection to his holiness or his importance to the Catholic Church, to Christianity in general. I think the ratios are worse than that and the odds still greater for various reasons having to do with the difference in those inclined to be sure that the popular pope is a saint vs those inclined to be sure Newman is a saint.

I'll be uncharitable and claim that those inclined toward some form of piety are inclined to emphasize the human heart and perhaps concede a great importance to the human hands while downgrading the importance of the human mind. Human being, most especially human communal being which is ultimately the Body of Christ, is truly God-like only when there is a proper development of mind and heart and hands—at which point there will be no distinction between thinking and feeling and doing as is true of God. It is, in fact, the mind which works more in the future than the present and thus guides the processes by which individual and communal human being is incorporated into the Body of Christ. It is the heart which points in that direction but the current confusion has led modern Christians, Catholics and others, to ignore the importance or the very existence of communal human being and so it is that so many see Heaven as some sort of perfected amusement park in which individuals go about seeking pleasurable experiences for time without end. This has given us the extremely confused idea that Heaven is a place which any human being could enjoy if he were put there. Following Newman, as historian even more than as theologian and spiritual guide, would have helped us to avoid these mistakes which will take many generations to work out of the thoughts of Christians—many generations once the cleansing of thoughts begins and I see no reason to believe it will begin any time soon.

“Is so-and-so a saint?” Should this be decided by a popularity contest? Should it be decided by a multi-generational effort to determine if someone was not only personally holy but was truly serving God in an important way or was maybe in a conversation with God which is of public importance? Suppose that conversation with God involved a movement toward special knowledge of how Christians should respond to a complex and turbulent world of opportunities and problems? If some of those opportunities would turn into problems if Christians didn't respond properly?

Perhaps I'm missing something, but it seems to me that someone who had insights which could have guided the entire Body of Christ to develop

properly, to have matured, to have traveled toward a state of completion and perfection, just might have been a true saint, one in a communion with God which was more direct and deeper than what the rest of us experience in this mortal realm.

I'm raising this question not so much to question the canonization process—that is a purely secondary consideration.

My primary aim in raising this question to try to put a stop to Christian pep-rallies in a world where we've utterly failed to properly deal with the problems which have been eating into the Catholic Church and all other Christian churches and has demolished Christian civilization. John Henry Newman proposed a general attitude toward Creation which would have allowed these problems to have been avoided or at least greatly mitigated. To be sure, the very inclination of Church officials and the bulk of religious and priests and laymen to participate in these pep-rallies celebrating themselves as much as they celebrate the alleged saints leaves me wondering if anything but a century or more of harsh experiences will wake the leaders and teachers of Christianity up so that they can begin to do their job. Almost all that we have done in shaping hearts and minds and hands of the younger generations, almost all of our cultural stuff we have bequeathed to them, will need to be purged, burned out of them, during the process of re-establishing Christian civilization. We have little reason to feel good about ourselves.

At this time, I'll just claim that there is plenty of evidence that Newman did his job as an historian of Christian doctrine, as a teacher, as a writer. If the leaders of the Church, or even a number of local leaders, had truly paid attention, they could have truly solved, to some significant extent, the problems emerging in Newman's time, problems he addressed in the specific ways of such a historian. His work could have been expanded and corrected so that we could have paid proper respect to modern biology for what it can tell us about what God is saving and to other modern sciences for what they can tell us about Creation, including what "What does it mean to be saved?" and that question I once proposed: *What are the Thermodynamic Properties of Heaven?* which is the title of Chapter 191. Such questions must be asked for us to make proper progress in the maturing of our own minds and our communal mind in the Body of Christ. There is even a psychological reason for such speculations: it keeps in our mind the truth that there is but one Creation and one Creator and the truths of Heaven are perfections and completions of the truths we can discover about this

mortal realm.

Historians have a major role in the reformation of Christian civilization or perhaps a long, painful process of building a new Christian civilization from new foundations. Philosophers, poets, novelists, physicists, biologists, politicians, teachers, parents, and so on have other roles. Popes have still other roles and their greatness as popes, which is certainly part of sainthood for men in that role, can only be determined over a long period of time. I'd suggest that, at this time, we have only hints going either way as to whether John XXIII and John Paul II were great popes in the same sense as Gregory the Great and Leo the Great. Each came into the papacy during times of trouble and met more problems emerging. We now know what Gregory and Leo accomplished. We know those two men and John and John Paul were all holy men. So were most popes, including those **not** canonized. Most weren't considered for sainthood not because of lack of holiness but rather because they lacked the courage or toughness or perhaps the proper understandings to do the needed job.

We know that John Henry Newman, John XXIII, and John Paul II were holy men. We know that Newman did his job, and we know that the problems he saw continued to develop because of a failure of Church intellectuals and teachers and leaders to understand or act upon his insights which he largely derived from his studies of the development of Christian doctrine (among other accomplishments). We do not yet know if John XXIII and John Paul II did well at the jobs they took on, though we know that John XXIII was revered for daring to try to bring the Church back to the world God has created and similar comments can be made about John Paul II as well as comments about his efforts to reunite Christian churches, starting with Western and Eastern Sacramental churches. Yet, as I noted, the Catholic Church is dealing with great problems at this time and it's far from clear we've found the way to deal with those problems. Newman, and others, pointed in the right direction but we're—at best—wandering off to the side and through brier patches while celebrating how wonderful we are. And we like photogenic popes as much as we like to build memorials to dead prophets.

## 646 Maybe the Catholic Church is Part of Creation?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1822>. It was finished and uploaded on 2014/05/13.]

The Body of Christ is the entirety of human being, the entirety of a community including both individuals and lesser communities which is Christian civilization, I also claim the Catholic Church to be the central organ of the Body of Christ, not the whole ball of wax. To all appearances, the various Christian churches participate to various extents in this organ, but I'll not go into any detailed speculations here on the specific natures of the Orthodox churches, the various Protestant churches, and those few which don't fit into those standard categories.

Why would we think the Catholic Church came into existence in some sort of complete and mature state if the Body of Christ, the fullness of Christian community, is evolving and developing in a complex and seemingly chaotic manner? Why would we think the Catholic Church came into existence in some sort of complete and mature state if Jesus Christ Himself grew and developed in His human nature?

As I've pointed out again and again, as an echo to plenty of thinkers over recent centuries and a few from earlier centuries: we live in a world of evolutionary and developmental processes. All creatures in this world grow and develop, most certain is this true of complex human communities of all sorts.

Jesus of Nazareth, the human nature of the Son of God, was born a human baby, one who would grow and mature by way of specific responses to the world around Him. The Church was also born at an early stage of maturity, far from Her adult state, and has gone through various phases

more distinct than the changes human beings go through from infancy to the states of toddler, child, adolescent, and so on. The Bible tells us the Church was granted certain, mostly limited, powers but powers which might well expand with Her knowledge and understanding of Creation, that very peculiar group of manifestations of divine thoughts. The Church has to change and mature in various ways just to Herself discover or learn from explorers the deeper and richer understandings of created being. History is consistent with these claims I'm making: the Catholic Church grows and develops *mostly* in the way of other human communities; this applies also to all of the separated children and brethren of the Church.

History tells us the Church has changed, has developed in various ways, just as history told us through John Henry Newman and others that Christian doctrine has developed over the centuries. Christian doctrine in its revealed core content hasn't changed but the totality of doctrine has been enriched and complexified. Even the core doctrines have changed in the way of understanding just as a man's understanding of moral principles change, are enriched and completed, as he grows toward adulthood and—fallible creatures that we are—can often need more enrichment and completion even after that.

Yet, there are ever those who wish to freeze the Church, prevent Her growing and maturing, so that She be some sort of image they idealize as the true Church. One particular distortion is the exaggeration of the infallibility of the Church and the far lesser infallibility of individual popes. As I implied above, the Church's developed faculties for finding or even seeing new truths is rarely up to the task when the world around Her changes in fundamental ways, perhaps because human beings have developed new ways of living or perhaps because human beings have discovered something unanticipated in the modern world. Sometimes the first possibility was forced upon Christians as when the Roman Empire fell and a long, slow process of developing Western Civilization began; sometimes it happened as a result of more open-minded and enthusiastic responses to new opportunities as has happened in the modern world with the freeing of so many from lives limited in ways not good. We've also seen changes come upon our world in recent centuries because of discoveries about the earth in regions formerly largely unreachable from Europe and because of discoveries about the nature of time and space and matter and also about human origins.

The Church hasn't responded well to the world as it has shown itself richer and more complex with each passing year. Sometimes the world and,

indeed, all of Creation seems to be changing with each passing day, in the reality of human communities or in improved human perception and conception of created being in its fundamental aspects or sometimes in aspects of complex, higher-order non-human entities.

Maybe the Church had, and has, no power to declare herself infallible in a more general sense? That is, maybe there is much that the Church and the clergy and other servants of the Church must learn by proper responses to God's Creation? The Church moves through spacetime in this universe, responding well or not so well to the entirety of Creation, or perhaps trying to not respond at all. All the while, the Church and other human communities and individual human beings are changing as is our understanding of Creation.

My view of the Church is far from being entirely new, as I implied by my reference to Newman's historical works on the development of doctrine. In a positive way, I can pull up one of my favorite quotes: The truth emerges in time through a communal process [Carroll Quigley]. I would suggest the more positive statement leads us to believe that the man is already showing in the child, but also leads us to realize the process isn't so predetermined as we might think. That is, the Church will mature into certain powers as does a human being, but there is still much of great importance that is to be determined, some of which might well be determined by human choice. More importantly for now, the 6 year-old has not the powers of understanding that the 12 year-old has and both are short of those and other powers of their 55 year-old self.

The pope or any bishop or, indeed, any Christian leader who seems to have any legitimate authority should be regarded as an historical character, as a man and a woman playing a role in a complex story being told by God. The Church, as I've said above, should be seen in the same light as the entirety of the Body of Christ, Christian civilization: as an entity yet being formed. We can only struggle to understand what emerges to view or to sometime anticipate the glorious reality of the Body of Christ and its central organ the Church when the maturing is complete, when the Body of Christ is perfect and complete.

We Westerners (and probably most modern peoples) of the early 21st century are out of sorts with reality. We can't make any progress in solving our various problems nor can we recognize opportunities. Our institutions, being rigid and bureaucratic after generations of successful growth and then irrational growth, are in worse shape than we are as individuals. Our com-

munities in general are in bad shape—and that includes the Catholic Church and other Christian churches and probably nearly all major religious communities.

We got into this sort of condition by not responding to reality, to the thoughts of God manifested in His Creation. Hubris set in as it always does to some extent in temporally successful peoples. We believed our own worldly fables, including those told by Catholics and other Christians. And we had become dependent upon institutions, some being true communities at one time, which had grown rigid and bureaucratic. Many of our institutions are self-serving and no longer do their job.

We Christians know the Church will survive, and likely many of Her separated children as well. We don't know what She will look like, though She will remain an organ or member of a Christian Civilization embodying and allowing something like the fullness of good human life. Since we don't know what the Church Herself will be in a generation or more then we also don't know what role the Pope will take on nor the role that God wishes the Pope to take on, which often seems to have differed from the role preferred by popes of a given age.

The Church isn't some sort of eternal neo-Platonic entity set into this world of evolution and development nor is the Pope the only human being (other than Jesus of Nazareth) with a fully predetermined role. The Catholic Church and all Her separated brethren and also the People of Israel and other peoples are living a story, a series of events which could be labeled random when we look out the front window or a mixture of random and factual when we look into the (sometimes very distorted) rearview mirror.

# 647 Does the “Real Presence on the Altar” Make Sense or Is It a Mystery Beyond Human Thought?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1916>. It was finished and uploaded on 2014/12/04.]

## 647.1 An Overview of What I’m Up to

I’ve tried to concentrate on the general speculative, or ‘metaphysical’, task of making sense of created being, abstract as well as concrete, in light of Christian beliefs. I’ve tried to avoid too much in the way of theological speculation and certainly have and will avoid questioning the basic truths of Christianity—they are the basis of true human thought and of all possible true understandings of Creation. Since there are contexts in which histories and texts are understood, as well as languages and speculative systems in which those histories and texts are stated and then understood, this doesn’t mean a slavish acceptance of, for example, the traditional understanding of the Christmas story as being history in the same sense as the story of the missionary activities and death and resurrection of Jesus Christ; the Christmas story seems, to this author, to have the literary feel of myth whereas even those stories of the mission of Jesus which raise questions of detail have an earthy, historical feel to them.

Since my work has led to much effort in understanding the Body of Christ, I’m being forced to deal with the Sacraments which are the most

important human means of forming that Body and working toward salvation.

I’ve spoken often in sometimes vague terms of the need to understand the way in which we have both individual and communal human being, as images of the one God who is Father and Son and Holy Spirit. The Sacraments, as well as the sacramental relationships of mundane reality, would seem to be one of the glues by which the local (the individual) is bound into the global (human community and ultimately the Body of Christ) while continuing to exist as an individual.

Consider this essay as an effort to provide another part of the general framework by which Creation, at concrete and abstract levels, can be seen and understood as a work of the God of Jesus Christ.

## 647.2 The Real Presence in Light of Modern Knowledge

In a world where Christians respected God’s Creation, this should be a primary test of a particular form of theology: can the revealed truths of the Bible be stated in terms of that Creation and, in particular, in terms of what we know of the world in which we live, the world into which Jesus of Nazareth was born, the world in which that same Jesus spoke of His own divinity and spoke of the bread and wine He was sharing with the Apostles being His own Body and Blood.

Does it all make sense in Christian terms? Is Creation unified in its basic being or are there some truths for this mortal realm and other truths for the world of the resurrected? Could there then be an infinity of worlds with an infinity of different bodies of truth?

Maybe we should treat Christian revelations as fairy-tales which are somehow more true than the concreteness of this world? Or maybe we should be more consistent Modernists and treat those revelations as being fairy-tales in a more complete sense, communicating only some vague, abstract truths?

The path I’ve chosen is to respond to reality as revealed by modern empirical knowledge, that of physics and chemistry and biology and also that of history and creative fiction.

The Council of Trent taught (with some proper qualifications) the language of a substantialist transformation of bread and wine into the Body and Blood of Jesus Christ—‘transubstantiation’ was the term they approved. Apparently, Aquinas himself used such language while teaching that God isn’t substance but pure existence, a claim made even earlier in human thought without the supporting network of ideas which Aquinas created in his *Summas*. There is a deep inconsistency which became a great problem when modern science, especially quantum physics, cast some doubt upon the understanding of matter as substance.

It can be said of the *Summas* of Aquinas that the *Summa Contra Gentiles* (or lesser *Summa*) was a system which began with created being and moved toward God while the *Summa Theologicae* (or greater *Summa*) began with God and worked its way down to created being. This isn’t a situation where we can envision a God who sits on a throne and looks down upon a world of substance which He rules externally, Zeus squeezed into a Biblical form. (See Chapter 574, *Proving the Existence of Zeus*.) To move forward, we need to recognize that modern empirical sciences have provided views of spacetime and of matter which are fully consistent with the radical understanding of St John the Evangelist: the world exists because God first loved it. Or: relationships are primary and stuff (substance) comes from relationships.

Whatever happens when bread and wine become the Body and Blood of Christ, it shouldn’t be described primarily as a change in substance, transubstantiation is the word chosen to bear such a heavy burden. What happens when bread and wine become the Body and Blood of Christ is a change in God’s chosen relationship to stuff in which the Son of God is already present. All things were made through that Son and, since relationships create stuff (in the sense of “creation from nothingness” and also in the sense of shaping some stuff already existing), then all things come into existence as the result of the relationship of Father, Son, and Holy Spirit and the relationships God chooses to have with contingent being—what He chose to create. We are told by St John that all things are made through the Son of God and are thus of God.

Creation is shaped from truths God manifested as the very abstract being which I often refer to as the ‘raw stuff’ of Creation and, as such, is something of an image of the Almighty. Seen as thoughts, these basic truths are an image of the mind of God though not the entire mind for sure; seen as love, these basic truths are an image of the heart of God though not

the entire heart for sure; seen as acts of creation, these basic truths are an image of the hands of God though not encompassing the entirety of what His hands be capable of.

From the abstract realms of Creation, God created a world sufficient to be the home of a creature with which the Son of God could share a nature, emptying Himself to become one of us.

So, by the Holy Spirit, the Son of God was incarnate of the Virgin Mary, and became man.

The Son of God was already, in a sense, the entirety of man, already the perfect man or Body of Christ—at least in the sense of ‘nature’ as used by Christian metaphysicians though not the entirety in that He chose to have, even to need, companions born into the mortal realm. In a similar sense, He had been that perfect man or Body of Christ before (ontologically or temporally) God laid the foundations of Creation. I write with some qualification, “in a sense,” to communicate that we are on dangerous grounds here. Some ways of writing and speaking will prove ever dangerous and some will prove to lead to outright heresies. We should not avoid dangers because following God’s thoughts through exploration and analysis of created being isn’t an activity for those seeking security and certainty—those can be found more readily in the over-simplified pietistic or heretical versions of Christian thought.

When Christ was conceived, “was incarnate of the Virgin Mary, and became man,” He took on a particular nature, entering the strange state of being one Person but having two natures, divine and human.

Christ took on a particular created nature and yet remained God and Creator, remained the Son of God and retained His divine nature; the manifested thoughts constituting the raw stuff of Creation were yet His thoughts as well as the thoughts of Father and Holy Spirit. Since God is a unity and so is each of Father and Son and Holy Spirit, the raw stuff of Creation is also divine heart and divine hands as well as divine thoughts.

We’re now in position, if somewhat a sketchy position, to *describe* the Real Presence of Christ in the consecrated bread and wine. In fact, under my understanding of knowledge as itself being an encapsulation of some greater or lesser part or aspect of reality, an ‘explanation’ isn’t possible and it isn’t desirable to be seeking such an illusion in this age when we know from modern neurosciences that St Thomas Aquinas was correct in saying that human nature in its higher form, mind or soul as you will, has innate properties and components but those are in a primitive state and

need to be better shaped by responses to the external and internal realities in which we live. We are not born with immaterial organs named ‘mind’ or ‘soul possessing a grasp of mathematical truths and logical truths and moral truths.

The Real Presence is a more open communication between Christ as yet present in all of Creation including the bread and wine as offered by men to God. As Christ took up a human nature, so He takes up human food as His own, food already incorporated as His Body and Blood and to be shared with all those who come to His table, even those who come in faith and hope and love but can’t directly share because of one problem or another. We who receive communion as individuals are being bound more tightly into the Body of Christ; our communal human nature is being strengthened as we eat what we are becoming and what is increasingly us.

### **647.3 What Have I Accomplished?**

The above is far from ‘radical’ or ‘modern’ enough to satisfy me as being a fully acceptable and plausible restatement of a modern Christian understanding of the Real Presence of Christ, yet it is a movement toward an understanding in terms of modern empirical knowledge and speculative understandings of at least this particular world, this concrete level of Creation. This is to say that the above explanation indicates something about some ‘glue’ which can bind the local (individual) to the global (communal or even ultimately Body of Christ) without obliterating or obscuring the local. Much more needs to be thought and said and done, but that will be the work of a multitude of thinkers, including poets and musicians and artists, over a number of years. When this work seems to be reasonably complete and when Creation seems to be simple after all, it will undoubtedly be time to start developing a still richer and more complex way of understanding Creation.

# 648 Body-killing Men and Soul-killing Men

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1946>. It was finished and uploaded on 2015/01/09.]

Some young men who think to solve problems with machine-guns killed some men, of ages unknown to me, who think to advance human enlightenment by sneering at all things of which they don't approve. They don't approve of God or those who claim, falsely or truly, to serve God. The intellectual and moral midgets at the French magazine, *Charlie Hebdo*, published cartoons insulting to Muslims, others insulting to Jews, and still others insulting to Christians. Some Muslims killed some of the midgets. Just as would be true with the murders of pimps or drug-dealers or child-abusers, the French police should investigate with energy and others in the judicial system of France should prosecute with proper aggression. To be sure, there were at least two innocent victims that I'm aware of: a security guard and a policeman shot execution style as he lay injured on the sidewalk, perhaps trying to surrender.

On the whole, I consider men who murder bodies to less my enemy, less the enemy of anyone wishing to be a friend of God, than those who murder souls and minds.

I can't speak for God but He might be inclined to favor those who have a deformed understanding of the Almighty over those who commit sophomoric blasphemy under the Modernist delusion that it is intelligent commentary. Nowadays, there seem to be a lot of people of no great intelligence or other talents who have been encouraged to believe they are creative or insightful. They think to lead mankind on a better path by application of the principle of the corrupted, secularized, surviving strain of the Enlightenment:

We tolerant intellectuals of the modern West are what human beings should be and we'll do our darnedest to make every human creature into our images.

Some of those moral and intellectual midgets work by way of nasty and sneering cartoons. Some make blood-filled movies or movies depicting moral commitments as jokes—except those moral commitments which serve the needs of our political and financial elites. Others worm their way into power in the United States government or one of its international agencies and use military and financial weapons to destroy those who seek to defend their own traditions, especially if those traditions are from the earlier, Christian phase of the West.

## 649 Was Dante a Pioneer of Radical Individualism?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1959>. It was finished and uploaded on 2015/01/26.]

Ten years ago or more, I read *Inferno* [1], the first volume of Dante's *The Divine Comedy*. It didn't make too much of an impression on me, seeming to be at least in part a matter of Dante taking shots at some of his enemies, a lot of people he didn't admire (often, for good reasons), and a few friends who led disordered lives and didn't even try to repent or reform.

After the past 9+ years of working out my worldview, a Christian understanding of created being, which necessarily included an understanding of human being, of its relationships to God, and, hence, of salvation and damnation, I wished to read all of *The Divine Comedy*—Singleton's prose translation with heavy annotations. In a not so short sentence: I wished to see how much sense Dante's theory of salvation and damnation made from the viewpoint of one who had struggled with both Christian teachings and with modern empirical knowledge and had produced a worldview which makes sense of both as compatible and mostly overlapping descriptions of the same world.

Dante doesn't seem to have believed in the main teaching of the Bible: the Old Testament teaches that the members of the People of Israel will be saved as members of that community and the New Testament teaches that members of the Christian Church will be saved as members of that community. In Dante's *Paradiso* [2], even those saved to live on the outermost realm of Heaven live as a gathering of individuals who are not in communion with the other souls who made it to regions closer to the center of Heaven; they are gathered together as they might have been at the hearth

of a warm and well-run tavern. (That outermost realm is the everlasting home of souls who lived good lives but didn't live up enthusiastically to their vows or presumably other serious commitments.)

Looking back, I can see that Hell and Purgatory were little different in the presentation of human beings as individuals—though I could appreciate a presentation of the damned as those who refused to properly engage with their communities and are bound not to ever do so. In any case, Dante's poetic masterpiece doesn't so much as hint of that ultimate community which is the Body of Christ, or rather it presents communities as mere gatherings of the 'true' human beings who are individuals.

On the other hand, I teach that we human beings, at least those who will achieve full membership in the Body of Christ, are like the three Persons of God and that Body, as I said, is like God. This is to say that, as true images of the Trinitarian God, individual human beings remain fully so while being also fully the Body of Christ. Each and every one of those who are saved to share God's life for time without end. Dante has no such sense. Certainly, he can't be blamed for not seeing much that history and modern biology and other sciences has brought into view or into more clear view in the past few centuries. Evolutionary biology and history and sociology supports the idea that we have a strong communal component to our human being—we aren't just individuals who travel in groups or enter into voluntary relationships of a contractual type, though perhaps tinged with deep feelings.

Dante seems to me to be someone already on the path toward Hobbes and Locke and Jefferson and Nock—all admirable men, but dangerous men whose ideas are worth investigating and contemplating and whose ideas on human being must be rejected by any who have a Biblical faith or who are making sense of modern empirical knowledge of men and their various communities.

I'd even say that it's pretty clear an individual human being of the sort found in Hobbes and other Liberal thinkers, finite in many ways and only displaying some of the virtues and gifts of human being even as we know it in this mortal realm, couldn't tolerate life without end. We don't have enough to draw on and would soon enough be praying for an end to time.

Dante is simply wrong that an individual human being could forever be satisfied, let alone in a state of bliss, by adoration of God—when that worshiper has to rely on the stuff of an individual. We can see the way to a solution when we posit a rich and complex Body of Christ in which we all share in the gifts and accomplishments of St Paul and St Augustine

and Alfred the Great and St Thomas Aquinas and Blaise Pascal and John Henry Newman and Leo Tolstoy and Flannery O'Connor. But that's still not enough. Not to fear. The Body of Christ has more—Jesus Christ, Son of God and true God. We can share in the fullness of God's own Being and live God's own life along with the Son and, through Him, the Father and the Holy Spirit.

As individuals standing outside of God and adoring Him, we would not be able to tolerate life without end. It is only by sharing God's own life that we could enjoy life without end and we could share that life only through full membership in the Body of Christ and full communion with its Head: the Lord Jesus Christ.

At <http://www.unz.com/author/peter-frost/>, we can read some of the articles and essays of Peter Frost, a paleoanthropologist who is well-versed in genetic issues. Frost has been writing for some years of the ways in which ethnic communities have characteristics which reflect their unique histories. One of the strong findings of modern research is that the ethnic groups which have inhabited much of Europe in recent centuries have personality characteristics consistent with their political and economic and cultural systems; these characteristics, especially a stronger sense of individual self which can be extreme in some, are said to be especially strong in northwestern Europeans, but seem to exist throughout Europe, possibly because of migrations of related peoples into all regions of Europe over the recent millenia.

The more recent immigrants from Asia and Africa to the countries of Europe and North America seem to have different characteristics, sometimes consistent enough with 'Western' characteristics that assimilation is possible at least in the public marketplaces, economic and political. Many of the more recent immigrants from eastern Europe and some from east Asia and southern Asia exhibit behaviors consistent to some major extent with the political and other systems of Europe, even the most Liberal (collectivist or classical) of countries. Even European styles of collectivism rely on pulling together mobs of individuals rather than the long-term development of complex, often kin-based relationships—Marx and Dante have similar assumptions about human communities so far as I can tell, though I admit I haven't studied either writer too much and have no interest in doing so. Combining ethnic groups which have evolved in radically different environments can work but problems might develop between Europeans and even those groups of Chinese and Jews who have more respect than

most Europeans for the accomplishments of Newton and Shakespeare and Mozart. (“Damn it, there’s some guys in tuxes playing crap music. Somebody must be broadcasting the national championships of the Women’s National Mud-Wrestling League (WNMWL).”)

In other words, as I stated above, there is now even scientific information that all that shallow speculation found in Locke and the classical liberals of the 19th century and forward is wrong but was worth pursuing but only with regards to some human beings at the extreme end of the spectrum for northwestern Europeans, themselves seeming to be at a fairly extreme end of the spectrum for mankind in general. Other peoples with equal or better accomplishments in politics and economics and culture and science aren’t even interested in the ways of the West. And they shouldn’t be.

And these wonderful northwestern European traits in their more moderate form showed up at least by the time of Dante, as did a blindness to their uniqueness and also the contradiction between an unqualified acceptance of those traits and the Biblical teachings on salvation as well as modern; the contradiction between radical individualism and the modern scientific understandings of human being are just as strong and perhaps more clear. Those northwestern European traits are Wonderful so long as we realize we are at the extreme end of certain human characteristics and then go on to understand, and act as if, other ethnic groups can be much different. We should also remember that many from that northwestern European population, or the European population in general, have far weaker individualistic traits. A Libertarian or even less extreme Classical Liberal society will suit only a small percentage of those descended from northwestern Europeans. I imagine most would rethink their commitment to Libertarian or Classical Liberal doctrines if they were to find themselves on a planet or even a continent populated only by Libertarians and Classical Liberals; in fact, I think they would find it hard to build a free marketplace in a human gathering bereft of the sorts of communitarian commitments and constraints they mostly despise.

This evolutionary stuff, including gene-culture co-evolution, is for real. The Bible is for real. Neither evolutionary thought nor the Bible should just be mined for verbal bullets to shoot at our enemy of the moment, only to be put back in the closet until another such opportunity. Both evolutionary knowledge of human being and Biblical knowledge of that same human being have to be fully accepted in understanding the fullness of human life or fully rejected. We ignore at our own peril the Biblical and

Christian-theological teaching that persons are individuals who are also their community, fully individual and fully their community.

See my freely downloadable book, *A More Exact Understanding of Human Being* [53], for a little bit more on human being as I understand it. More will be coming, God willing. See Chapter 516, *The Struggle Between the Individual and the Community in the Body of Christ* for one of my recent efforts to move beyond that book.

# 650 Individuality, Freedom, and the Real Conflict Facing Modern Christians

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1981>. It was finished and uploaded on 2015/02/26.]

The modern man of the West knows in his bones that he is an individual, born an individual, a clearly defined entity which stands in some sense above not only the confusing and often chaotic world around us but also above our bodies, our organisms which are also confusing and chaotic at times. An individual human being can be a chimera with the DNA of multiple human individuals—twin embryos can merge in the womb. A woman can be a genetic male because of a faulty switch which is supposed to begin the masculinization of the embryonic body. Statistically, men are more likely to have homosexual desires if they have older brothers—speculatively, the mother’s womb develops some sort of resistance to the masculinization process.

One of my favorite problems of this sort, because it shoots down the modern form of ‘free-will’ is the well-established fact that, when we move a finger or leg, the movement control regions of the brain begin to act before there is any activity in the regions of the brain associated with conscious thinking, including conscious planning. This is not an argument against our freedom, including our moral freedom, though it is an argument against free-will as usually imagined. That is, it’s an argument against the delusion that a human organism is controlled by some self-contained, subsistent entity that is the real us, an entity which rules our bodies.

Our individuality, which is clearly tied to our various sorts of freedom,

cannot be associated with our DNA or with the conscious regions of the brain. Our individuality is a matter of our entire being, which starts with our bodies, our physical being but extends out into what seems to be not-us, human communities—past and present and future, as well as the non-human regions of Creation. We are free as being certain types of organisms, as are nearly all living creatures—viruses are almost mechanisms rather than organisms but even bacteria move with apparent freedom. To be sure, the human capabilities for certain sorts of awareness, including an explicit awareness of past and present and future, and for planning give us the possibilities of greater freedom though there is a lot of anecdotal evidence that many human beings don't have, or at least don't exercise, the sort and level of freedom which would allow them to be self-governing as citizens or as full participants in the marketplace or even as parents.

We're creatures embedded in a particular universe and in very particular and very small environments inside that universe. We're strange creatures by most traditional understandings, at war with ourselves as taught by the Biblical prophets and St Paul and the Jewish sages of the early Christian era, yet the details of DNA and sexual battles (mostly unconscious and sometimes fought at the level of parental DNA) are eerie. Some of our DNA and some of our body mass comes from bacteria and even viruses. To a pure Platonist (not a description applicable to Plato himself), there doesn't even seem to be any 'human being' which could be part of any realm of the Real.

And that is the sort of problem that everyman faces. We have a self-understanding, and an understanding of our world, which doesn't look plausible in light of modern empirical knowledge and we try hard to hold on to those understandings as we face up to those bits and pieces of modern empirical knowledge which come to our attention.

It won't work. As a result of our indifference toward or rebellion against what-is, we have become confused and fragmented creatures—see my novel, *A Man for Every Purpose* [37]. Those under 40 or so are in a still worse condition. They have been raised under conditions where few adults even held an inherited and defective understanding of their human self or of the world. The young of the early decades of the 21st century seem unformed, somewhat in the way of a two year-old who is just beginning to explore her environments, but there is no sign they are so exploring. They accept the condition of an unformed human being in a chaotic world and just turn to video-games or cellphones.

There is no readily available understanding of human being or of our world. It can't be found in television shows or movies or popular music. It can't be found in the bare facts of science documentaries, bare facts presented as if that's all there is of human being and the world—just bare facts. It can't be found in the fairy-tales of Catholic CCD or Protestant Sunday Schools, teachings which are fairy-tales not because they speak of the Creator and His purposes for us and for the entire world, teachings which are fairy-tales because they come from understandings of the world which were once the best the human race could do but no longer make sense.

We can read a very confused, and seemingly honest, man on this issue: *We're All Zombies* at <http://www.unz.com/rbonomo/were-all-zombies/>. Robert Bonomo tells us:

As the Christian myth begins its third millennium, is the zombie meme telling us that this religious story is no longer viable? Are billions of "zombies" eating flesh and drinking blood but finding no nourishment? The vast majority of Western people have a profound belief in science and science tells us that the story of Jesus is not to be taken literally, yet our churches insist that the "myth" of Jesus is historical. The Christian software no longer works as the science "virus" has rendered it useless.

Myths are other people's religions and for Westerners in need of spiritual "food" the Eastern systems of yoga and Buddhism, which don't depend on dogma that contradicts science, seem to be more palatable to their scientific worldviews. Unfortunately, those "programs" were written for a machine other than modern Western man.

And again:

Science can give us answers to almost all our questions, yet in the end its meaninglessness is disquieting. Science gives us technologies and deep understandings of the mechanics of the universe, but it's unwilling to breach the topic of meaning. We are asked to live for clichés, consumerism, hedonism or fundamentalism. Rejecting science is absurd but embracing it is deadening.

If we were able to understand our own religions in the same spirit that we decipher the religions of others (myths) while embracing science (with its limitations), than maybe we could find our way to a new myth that would shed meaning on our cold world. But myths emerge, they are not consciously created, and for the moment we wade in the void of knowing how but not why. We consume but are never filled, we seek but we do not find.

We are all zombies.

No, we're not, but we are victims of some number of generations of cowardly, faithless, dishonest leaders, priests and ministers as well as philosophers and theologians as well as businessmen and local political leaders as well as politicians and doctors.

I can imagine the pain of the inhabitants of the Mediterranean region in the fifth century who saw all meaning decaying along with the stability and nobility of Rome. I can also imagine one man, Bishop Augustine of Hippo, setting out to make sense of that decay in light of his Christian faith and then dying not even realizing he'd made such good sense of it as to provide a narrative for a still greater civilization than even the Roman. Yes, the West was founded by one man setting out to counter claims by pagan thinkers he admired, claims that Rome was falling because it had become Christian. In doing so, Augustine made such good sense of it that his basic narrative lasted for nearly 1500 years.

We need a major effort by Christians to address the claims not of those who would be our enemies but rather of those who were and are simply good historians and physicists and biologists. We need to make sense of their claims in light of Moses and Jeremiah and, most of all, in light of the man-God who walked the earth and whose story is told in the Gospels.

We of the modern world can't possibly understand ourselves without serious knowledge of not only human history proper (disciplined writings of facts and narratives) but also our species history. We have to be inspired by Augustine of Hippo, historian and theologian, and we have to be strong where he was weak—in science and metaphysics.

We can even come up with a coherent and morally well-ordered understanding of the freedom we enjoy, not the false freedoms of a subsistent individual somehow independent of his proper and improper desires and not the false freedoms described by reductionists, such as advocates of the selfish-

gene viewpoint. Even when it comes to the biology of the human being, for example our tendencies to seek relative independence from communities or to naturally subordinate individual self to community are largely found in our bodily based feelings and emotions and those bodily based human traits are not uniform across the human species; each of us has a history of particular ethnic lines within that human species. Each of us also has a cultural and family and personal history. We are individuals but not made for standing free of either our communities or our environments.

We, as individuals or as communities, have no freedom to change much of this, some freedom to change some of it; little of true importance can be changed in the short-run. We do have the freedom to act according to our customs and the habits and thoughts we've developed through our own efforts and the efforts of our parents and other teachers and guides. This is where human conscious types of moral intelligence are truly important: we can form habits and shape our future selves. Otherwise we remain dependent upon either inadequate habits and ways of perceiving reality or else force ourselves to attempt the heroic effort of deep analysis for each and all of our difficult moral decisions and many of our less difficult moral decisions.

Our freedom comes as a result of proper formation of self, a self which is both individual and communal. Our freedom comes when we act as that properly formed self. Our moral habits, as well as other good habits, are encapsulated in those movements of finger or legs which begin before we consciously think about that scream of pain toward which we move or about that drink too many which has been placed in front of us by a generous buddy at the bar. This is true also in our vocations and our avocations and our daily activities of the most casual sort.

Freedom can't be found by pursuing the false dreams of radical individualism which don't correspond to true human being, other than perhaps to that of some extreme individuals, most of whom are probably found in the extreme ethnic groups of northwestern Europe and the descendant populations mainly in the Anglo- regions of the world. Freedom won't be real and certainly won't be stable if it is, in fact, a freedom to pretend to be something we really aren't. No wonder we are so confused and fragmented, so many in the younger generation are simply empty.

We have given up our particular cultures, especially those of us who are the mush produced by the melting-pot called America. We have no greater civilization which can provide us with a narrative that tells us what it all

means, where 'it' includes our own human beings. Western Civilization has decayed, almost gone away. Christ remains as Lord of Creation but His Church is in ruins and its leaders are without clothes. We are free individuals, that is, we are atoms being freely slammed and banged about by forces and even the most social of those forces are external to us, enemies.

After all this talk about individualism and freedom, I'm going to retreat to a basic, Socratic question: What is freedom? I wrote this essay under the assumption we best seek freedom as if answering the question: how can we better shape ourselves to be what we should be. We start with what we already are: poorly integrated organisms with both individual and communal being. I should stress that it is both individual and communal being which is poorly integrated.

We gain freedom by shaping ourselves properly to what lies outside of us, the objective reality which is typically, and properly for the most part, perceived as opportunities and problems. But, that by itself, should make no sense to modern men, including most Christians trying to be faithful to the traditions of their faith for they are bound to think and feel that, at conception or at least some time before adult awareness, there will be that subsistent entity which is a human being, an entity defined as a self-aware individual. It is that subsistent, self-aware entity which desires the good or what gives purely physical pleasure or something else. It is that subsistent, self-aware entity which is an atom, a plaything of a hostile world, a world in which we are aliens.

I stand against all this confusion and all this failure of Christians and others to resolve this confusion, to give us a meaning, a narrative which brings all this horror, as well as all this beauty and pleasure, into moral order. I'm advocating a worldview, an understanding of all created being and its relationship to God, which is Christian all the way down. What is good and beautiful and true, what is conducive to good order, is found in all of Creation and is there because Creation and all that is found in it is the manifestation of certain thoughts God chose freely for the very specific Creation and this still more specific world He chose to create, to create from nothingness and then to create in the way of shaping. Some of this goodness and beauty and truth is in human being in partial and imperfect states, but most of it lies outside any individual human being, outside of any communal human being—even the pilgrim Body of Christ. Ultimately, the goodness and beauty and truth are found in God, but we find them in each thought and all thoughts the Almighty has manifested as created

being.

We move toward the completion and perfection found only in the world of the resurrected and we move as individual members of the pilgrim Body of Christ and as that Body in its entirety, but we move as beings existing as acts-of-being of the Creator, as objects of His attention and of His love.

That places a heavy burden upon Christians who would carry the Good News to all men. We have no Good News because our Jesus isn't true to the universe of evolution and genes and curved spacetime, which means our Jesus isn't the true Jesus Christ. Christians have no plausible understanding of the universe, no narrative telling other men or even our own selves what it all means. Our main failure is not that of not reading the Bible or not praying, though we may be also failing in those matters. Our main failure is not reading the revelations found in our own human beings, in the stars, in the strangeness and the beauty of modern mathematics. We don't understand created being in this universe and we think we can jump to the meaning found in Christ who is God but also perfected and completed man, man as found in reality and not in our imaginations.

Here is what St Thomas Aquinas had to say about the importance of knowledge of Creation, empirical knowledge of created being:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures [God] made... [Page 17 of St Thomas Aquinas' commentary on 1 Corinthians. Translated by Fabian Larcher, O.P. in unknown year and originally made available at website of Ave Maria University. It is now available online at <http://dhs priory.org/thomas/SS1Cor.htm> and in print at <http://www.theaquinasinstitute.org/in-print/commentary-on-the-letters-of-saint-paul/>. Both of those are edited and corrected copies unlike the one I had downloaded and lost which was Fr Larcher's final draft at his death.]

Some Medieval Scholastics were said to phrase it: "Most of what we know about God comes from knowing His effects in Creation."

Radical individualism and some other defective lines of thought in recent centuries developed and spread so widely because of a vacuum of

sorts. Western Civilization was deeply, if quite incompletely and defectively, Christian. Western Civilization was founded upon what might be labeled the Augustinian understanding of human history and its relationship to the more specialized Christian understanding of human origins and human moral nature and much else culminating in an understanding of salvation, of the relationship of this world to its Maker. This last understanding, once rethought in terms of those lesser understandings, had then re-absorbed those lesser understandings.

Earlier men of Western Civilization were individuals with some substantial freedom and also members of various communities with their own sorts of freedom. Ultimately, individuals and communities were part of the Body of Christ.

No longer can we provide meaning by an appeal to our inherited understanding of what-is, not because it wasn't true. It was true and is true, but the individuals and the various communities have to be understood in terms of reality, in the best terms available to men of any given age, not in textbook terms drawn from prior and less adequate understandings of created being.

Any understanding of "what it all means" in the mainstream of the Catholic Church or any other part of Christianity is centuries out of date and can't be taken seriously—one of the reasons so many no longer take the Catholic Church or other Christian churches seriously. Christian theologians and philosophers attempt to speak about human moral nature or—somewhat equivalently—about human origins by, at best, squeezing selected bits of knowledge about genes and evolution into old frameworks of knowledge. (The totality of any such consistent frameworks would constitute what I call a 'worldview'.)

We hear of one view of human origins and human moral nature in homilies and sermons and theological or spiritual books. We hear of other views in popular or academic works about science and history. Too many will wave their hands spasmodically and claim, "There is no conflict." There is, though it isn't a conflict between religion and science but rather a conflict between science of past centuries and science of our own time—using the term 'science' in the broader sense of "disciplined study of facts" and including history and some philosophy as well as physics and biology. Mainstream Christian worldviews are based upon the best of human empirical knowledge as of, perhaps, 1800 in Etienne Gilson's quite knowledgeable and intelligent understanding of the history of Christian thought. (I would tend

to put the break nearer to the persecution of that orthodox Augustinian theologian Galileo, the early 17th century though the rebellion of Christians against God and His Creation had been developing for some time before that.)

I think I've laid a good foundation for a new understanding of Creation in my various books and other writings, but few seem interested. Some prefer to join in the fun as barbarian children party in the ruins of Western Civilization. Some prefer to watch in horror and to write learned commentaries of the decay in light of the inherited understandings which no longer work. And others, such as the blogger I quoted above, Robert Bonomo, simply express their confusion and perhaps their pain.

Readers, learn from what I've done and spread the word. Perhaps you can do better or perhaps join in the work to which God has called me.

# 651 We Must Understand Matter in Empirical Terms to Understand the Christian Sacraments

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1989>. It was finished and uploaded on 2015/03/17.]

Matter, your own living flesh and blood or the bread and wine brought to the altar, is an essential element of any Christian Sacrament. More than that, it's the most concrete part of a sacramental world. Even non-sacramental Christians accept baptism as a Sacrament though perhaps refusing to use the term, but I'm going to write about one of the Sacraments they don't accept—the Eucharistic Rite.

In a Sacrament, God operates upon matter, sometimes through an ordained priest and, in the case of baptism, through any human being who uses water and the proper Trinitarian formula. Under Catholic teaching, no minister and no Rite celebrated in a church is even needed for a wedding since it's only God and the man and the woman who are parties to the formation of a marriage bond—a formal wedding is no guarantee the bride and bride-groom made the proper commitment to each other and the lack of a formal wedding doesn't necessarily weaken any such commitment which forms a wedding bond.

But it's that Eucharistic Rite I wish to discuss with Holy Week approaching. The Bible tells us that, on Holy Thursday, Jesus Christ changed bread into His own Body and wine into His own Blood. In addition, the Lord instituted a sacramental priesthood to celebrate this Eucharistic Rite

(and to do much else) after He ascended into Heaven.

That much is clear, but the question remains: How was it possible for even God to have changed bread into the very Flesh of God incarnate and wine into His very Blood. Such an act would seem to be more magic than what we might expect given the work of Darwin and Einstein and the like. On the other hand, Catholics claim to have a doctrine of transubstantiation, but that's really just a pointer toward a Platonic way of looking at the world as made of substantial entities which form relationships with each other or with God. Or fail to form such relationships. This is a viewpoint in which God is seen as acting upon substance in the way of a Zeus, a God who resides upon Mt Olympus, or in Heaven, and looks down, sometimes choosing to carry out some sort of magical act, to heal someone or to turn bread into the Flesh of Christ, wine into the Blood of Christ. Transubstantiation once made sense in terms of Christian understandings of Creation and was developed for that purpose. It no longer makes sense and can only be held as a superstition, however much sense transubstantiation might have made or seemed to have made.

Consistent with my teachings about what it means to understand Creation, I look for an understanding of the Real Presence on the Altar, the bread has become the Flesh of Christ and the wine His Blood, in terms not necessarily consistent with any existing human schemes of knowledge but rather in terms of an understanding of Creation which reflects the best empirical understanding of that Creation and also in terms of Christian revelation. We have to take what empirical science tells us and what the Bible tells us, dropping speculative theological theories which no longer work and going beyond the limited speculative scientific theories. We have to develop new speculative theories more appropriate to our current understanding of Creation, including our understanding of the mundane, thing-like being which presents itself to our eyes and ears, our noses and our fingers.

Aquinas had this to say about our efforts to understand "God's wisdom":

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures [God] made... (Page 17 of St Thomas Aquinas' commentary on 1 Corinthians as translated by Fabian Larcher, OP and now available as an online document at the website, <http://dhs priory.org/thomas/english/>, of *Priory of the Immac-*

*ulate Conception*, which is a Dominican House of Studies in Washington, DC. It might still be available as a downloadable pdf if you search the Internet.)

Most certainly, if we are to understand Creation and God's relationships to individual creatures, we must understand the matter of this world, this very concrete realm of Creation. We must examine "the creatures [God] made." We must understand what physicists have discovered about protons and pions and neutrinos and we must eventually move on to a more exact understanding of what the biologists have discovered about living flesh and blood and the evolutionary/genetic foundations of that living stuff.

Yet, modern sacramental Christians, even many priests or other theologians, go to Mass seemingly unaware that they have a fundamental lack of understanding about the sacraments they celebrate because they have an inherited understanding of matter at odds with modern scientific discoveries but also at odds with Biblical revelation. Matter exists and then forms relationships. Can that be, from a Christian viewpoint? Are we conceived and then God chooses to love us? Do we develop into specific human beings and then our mothers choose to love us? No, the love comes first and works to create from nothingness when God initially acts and to create in the sense of shaping when God continues to act upon us and our mothers also act upon us.

So, what happens upon the altar when the priest calls upon the Holy Spirit to consecrate bread so that it becomes the Body of our Lord Jesus Christ and wine so that it becomes His Blood?

Catholic theological works, and undoubtedly those of other sacramental Christians, will teach that sacraments involve God working in a special way upon matter, possibly matter which is a living human animal. So, again, we need to have some plausible and coherent answer to the question: What is matter? I've given the answer by discussing the love which God and our mothers feel for us. Having given the answer in an intuitive form, I'll provide links for more explicit and (somewhat) more disciplined discussions.

See two of my early blog essays included as chapters in this book: Chapter 156, *A Christian's View of Einstein's and Bohr's Debate on Reality*, and Chapter 157, *Quantum Mechanics and Moral Formation* for short discussions of the primacy of relationships from the viewpoint of modern science and philosophy recognizing the discoveries of modern science and also—quite consistently—from the viewpoint of St John the Evangelist.

In Chapter 74, *Rules or Context?*, I deal with the issue from the viewpoint of the human mind and how it's formed—as an encapsulation of those relationships we discern behind or beneath the concrete stuff we can directly perceive.

In Chapter 256, *Evolutionary Thomists Don't Do Ontology*, I discuss the issue in responding to the somewhat conflicting thoughts of the theologian Metropolitan John Zizioulas of the Greek Orthodox Church who sees the change of matter into the Body and Blood of Christ as occurring as a result of a point-like, Platonic change of the ontological status of that bread and blood. I present it as being the result of a change in the relationship of God toward that bread and blood on the altar, a way of thinking that allows us to see that matter—bread and blood—in terms consistent with modern understandings of matter. The major difference between my answer and that of Zizioulas is that my answer recognizes the modern discovery that we live in a world of what might be called 'existential relationship', a world of evolution and development and not one where Platonic Forms or Reals are shadowed in pre-existing chaotic forms of matter. Rather than our world being populated by entities which are feeble shadows of ideal entities, Forms or Reals, our world and the entities in it are the result of God acting through evolutionary and developmental processes working over multiple levels of reality and all grounded upon the "raw stuff" of Creation, a realm in which God manifested the truths He chose for Creation. It is the Word of God, Christ, who gave that raw stuff from Himself and it is that raw stuff which is still present in all created matter, including the bread and wine on the altar. That bread and wine becomes subject to a new relationship, to a re-creation to become the Son of God Incarnate in a more direct way than other matter. Essentially, that Body and Blood is loved by God in the way that Father and Son and Holy Spirit love each other in their one Divinity. Or so I would speak to make greater—though still provisional—sense of the Real Presence on the altar in this year of 2015.

# 652 The Body of Christ: Churches and Political Communities

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=1998>. It was finished and uploaded on 2015/04/07.]

Based on greatly expanded knowledge about human being, individual and communal, even Christian churches which have passed through periods of excessive claims to authority have come around to acknowledge there are many realms of a complete and perfect human life which lie beyond their institutional understanding and authority. I've discussed this in various places in my writings—download *A More Exact Understanding of Human Being* [53] for a discussion of this issue. Since I consider salvation to be a full and perfect human life (individual and communal) lived with God, I have concluded that the Body of Christ is more than the Christian Church, though it remains the central organ of that Body. The Body of Christ, as I see things, is more in the nature of a completed and perfect human civilization with the Christian Church as the central organ, but not a central organ which controls the rest of the Body.

The Body of Christ also has organs corresponding to the political and economic activities of men, the musical and literary activities, and so on; I would even propose that the activities which we know as the empirical exploration of this world and more (all of Creation, in my opinion) will continue in some completed and perfected form in the world of the resurrected. We will be sharing God's life and learning to participate as He continues as Creator and shaper of all and all of our knowledge-gathering pursuits, all of our most active pursuits, all of our empathetic and compassionate

moments, will continue and will be perfected and completed as we learn to join the Almighty in His dynamic existence, His true life. Creation will not end with us magically joining God in some other realm of divine being; rather will this world be completed and perfected to be the fullness of Creation. Will we even expand beyond that so that we could share in the divine freedom which could have created a different Creation? Who knows?

My way of thinking would invalidate nearly all existing Western understandings of the relationships involving religious and political thought as well as the more concrete relationships involving religious and political institutions; this includes all of our inherited understandings: secularist or providentialist, Christian or non-Christian or anti-Christian. I don't claim to know what the proper relationships and understandings are; my respect for God and His freedom as Creator, as well as my respect for the complexity and richness of Creation, leads me to believe that we have to discover those proper relationships and understandings by way of living our lives, sometimes experimenting with changes to our ways and sometimes being forced to take on changes. (The dual of secularist and providentialist will be explained below in a discussion of a learned article about a learned book about the way the Founding Fathers probably intended to treat the problems of "church and state.")

Narratives of those complex relationships remain valid under my way of thinking, those from the Bible or other historical or partly historical narratives including those from peoples different from us or societies different from ours. Not only the Bible and other religious works but the more serious sorts of novels remain valid, if valid in the first place—such as, for example, O E Rolvaag's novels which tell of the weakening of Lutheran faith as the Scandinavian immigrants to the Dakotas made their peace with a country where Lincoln is a greater prophet than Isaiah and also a greater source of revelation than Jesus Christ.

In Chapter 320, *In a Complex World, the Community Must be Smart for the Individual to Be Smart*, I claimed that much of our more profound and more demanding thinking takes place at the level of communities; in the case of a solitary thinker and writer such as myself, this might mean a conversation of sorts with thinkers over the centuries including a few living thinkers I'm not in direct contact with. If you manage to tear anyone out of his greater communities and force him to take on the role of some sort of pure individual, you will have a very vulnerable and manipulable creature, especially in recent decades when parents and other adults have allowed

this to be done to their children.

Over the years, I've contacted serious thinkers about my thoughts, most of those contacts being made when my ideas were very primitive, to be sure. Those contacts sometimes resulted in some initial success but I'd soon find that nearly all of the best of these thinkers were actually scholars, speaking a bit unfairly—derivative thinkers wishing to restore a respect for Edmund Burke as they understood him or for some other thinker(s) they had studied in a disciplined (and usually highly constrained) way. A couple of those thinkers had no interest in me when they realized I felt driven to develop my own ideas—they just wanted pliant disciples to build up their reputations or to serve their journals or other organizations. The major exception was Stanley Hauerwas, the Episcopalian theologian, who appreciated the sort of effort I'm making though he was not fully sympathetic to my inclinations to what he perceived as “natural theology.” That's actually a misunderstanding of what I was up to but it was the same misunderstanding I held in a less coherent form at that time—circa 2006-2008. And it was Hauerwas who gave me some bits of good advice, especially that I should have greater respect for metaphysics and especially for the work of Aquinas. (It was, in fact, my process of “making peace” with Aquinas which led to the maturing of my ‘empirical’ bias, that is, my respect for the freedom of God as Creator.)

The publisher Jon Stock of *Wipf & Stock* (at <http://wipfandstock.com>), acting upon the advice of Professor Hauerwas, also published two of my early books with early versions of my thought and those books flopped completely; the largely academic customers of *Wipf & Stock* weren't at all interested.

I've been forced to strike out from an impoverished Christian base-camp to explore interesting and important realms of God's Creation and my fellow-Christians aren't much interested in my particular activities or, far more dangerously, aren't much interested in those realms.

After entering the Catholic Church, I learned quickly but had to constantly re-learn that the members of that Church—including its ecclesiastical and intellectual leaders—have no interest whatsoever in Creation, that is, they have no interest as Christian thinkers. True it is that they have some shallow, modernist interest in the more colorful discoveries of science but such an interest is pagan, that is, it treats the universe as something shallow and transparent rather than as a complex and rich manifestation of certain thoughts of the Almighty.

When we split Universe from Creator, science from theology, we deny the greater unity which Christians must acknowledge. We are left with only a sort of loose, almost flabby, collaboration which is hardly even that on moral issues. ‘Is’ has been split from ‘ought’ and mathematical truths have been split from empirical facts.

All of this background is necessary because Creation is what it is and not something which can be ‘reconstructed’ in our minds by way of some simple human schemas or sets of axioms. I’ll move to a somewhat more focused discussion of the issue of religion vs science, God vs Creation. (Both uses of ‘vs’ are deceptive and ultimately wrong, as I pointed out above.)

So, I’ve denied that Christian churches have the competence or wisdom to rule over all the domains of human life and yet I’ve claimed that those domains are ultimately unified in a very deep sense. Political institutions have even less competence than religious hierarchies have over any significant range of human possibilities—governments can help make possible advances in prosperity, in literacy, in aesthetic quality, but mostly governments can do this—in traditional Anglo-American terms—by fulfilling their limited responsibilities to maintain a well-ordered society with the sorts of freedoms appropriate for good men and good women. I think similar comments can be made on the limited, though real, good which is possible through political clubs and political parties.

Most of the good in human life develops from the efforts of creative individuals, including those nearly invisible efforts which can take place over generations as farmers and metal-workers and physicists and medical doctors and supervisors of local public works departments learn to better and more efficiently take care of the needs of their clients, patients, taxpayers. The list of those who can be creative in the way of individuals or as members of communities can go on and on: philosophers and poets and novelists and musicians and architects and athletic coaches and all sorts of entrepreneurs, farmers and plumbers and parents.

One possible model for discussing all of this is the public square, a square into which Christians and Jews and skeptics or even atheists can step but their institutions cannot—though the individuals bring their communal human being along with their individual human being. Those men and women are also members of various sorts of communities, including political parties, clubs advocating forms of localisms or centralisms, informal groups pushing for social welfare programs, and so on.

The problem with this model is that it stopped working in many ways

when men stopped being deeply Christians and deeply Jews; the only ones who still carry their beliefs and their particular forms of moral character into the public squares of the West are the skeptics and atheists. Even before there was outright hostility toward religious groups which refused to adopt the latest and most progressive beliefs, Christians seem to have quite willingly agreed to enter the public squares in an attitude of skepticism if not quite atheism.

What is to be done?

Gerald J Russello has written an article, *Country Before Faith* at <http://www.theamericanconservative.com/articles/country-before-faith/>, which discusses the viewpoint of Walter Berns, a political scientist and practicing Christian who probably pushed secularism too far, yet, I sympathize with his efforts though thinking he was, like too many unimaginative statesmen and generals, fighting the previous war. He was part of a body of classical liberals who yet feared the *Thirty Years' War* (see [http://en.wikipedia.com/wiki/Thirty\\_Years'\\_War](http://en.wikipedia.com/wiki/Thirty_Years'_War)) of 1618-1648 more than they feared the modern educational and entertainment systems which were already doing so much harm to the minds and moral characters of the youth and adults of the West, all to the benefit of the politicians and businessmen and cultural nabobs who wanted genial and pliable cattle. Perhaps it was a genuine fear of the bad behavior of many Christians which led to a willing bargain to adopt skepticism in the public square?

Russello tells us:

Among the most vexing problems Berns addressed over his long career was that of religion in the American polity. An Episcopalian of the old school, Berns thought religion important but something that, in James Madison-like fashion, must be kept under control for fear of causing "faction." In 1963, writing in *National Review* on "School Prayer and Religious Warfare," Berns chided the Supreme Court for delving into religious controversy when it did not have to do so.

A Roman pagan, bureaucrat or philosopher, from the early centuries after Christ would have supported Berns on this, which certainly doesn't automatically mean the position is wrong. There is, in fact, a good deal of practical wisdom and an all-too-rare humility in such a position. It hits the target, though on the edge and a bit away from the bulls-eye.

In 1997, the sometimes feisty magazine, *First Things*, held a symposium on the state of the ‘public square’, where we all meet in our larger-scale political activities and economic activities. Some thought the American government had gone way too far in the program of secularization, even questioning the legitimacy of that government in light of the Christian traditions of the West. Russello tells us that:

[Berns’] reaction to the symposium is informative. The Supreme Court’s extension of its religious “logic” had created too many holes in the fabric of the polity. While other religious conservatives, myself included, rejoiced in the resistance to the “naked public square,” Berns lamented that it also meant the disintegration of a nation founded explicitly on the laws of Nature and Nature’s God, with religious freedom coming second to citizenship,

There is a big problem here. Why is a Christian scholar talking in terms of “Nature’s God”? It’s “God” and “the nature and natures created by God” and “the laws God enacted to regulate Creation”. I hope it was just philosophical shorthand, but it is the sort of talk which leads the children to believe the adults don’t fully believe in what they teach. To the extent that Berns was right, that the United States was “founded explicitly on the laws of Nature and Nature’s God, with religious freedom coming second to citizenship[,]” it was an ill-founding from the viewpoint of anyone who actually believes in the Creed and the Bible. The political systems of the Anglo-American regions, secularized and tolerant as they were, were founded in the context of a Christian civilization, but it’s certainly true that even some of the Founding Fathers, and many since, have thought to tame that Christian civilization to the needs of men more Enlightened, more recently to totally subjugate or even eliminate Christianity and other substantial religions.

A digression is necessary, one drawn from the ideas mentioned earlier and discussed in many of my essays as well as my book: *A More Exact Understanding of Human Being* [53]. Human being is a complex entity with local manifestations in individuals and global manifestations in communities. The Bible itself teaches that salvation comes to us as members of communities (the People of Israel or the Christian Church). With the coming of what might be generally labeled, ‘liberalism’, and the strong tendency

of first Protestants and then Catholics to adopt the radical individualism of that way of thought, men were taught they entered the public squares as individuals to do their public duties. At first, the general decay of the Christian West was mild enough that those individuals carried, perhaps, a strong version of their full faith in its communal form; then, they were like those who appear in the writings of Adam Smith—individuals of vague belief who were yet formed to the moral order of the Christian societies of their grandparents. More recently, men have been allowed to enter the public squares only if they agreed to pretend they had neither creedal beliefs nor an excessively strong attachment to the moral teachings of Christian societies or those which used to be Christian. Of course, there's not a test before you go into the public square so much as there are rules which are understood; break the rules and you are about to be treated as a pariah or even to feel the lash of modern liberalism.

Russello sees this and concludes:

If [Berns] did not predict that a secularized Lockeanism could itself disrupt the constitutional balance that relied on a certain Christian understanding of self-government, he nevertheless defended that balance against the enemies of his time. May he rest in peace.

Berns hit the target, arguably a big one, but was far from the bulls-eye.

Russello seems strongly and honestly inclined toward the right sort of conservatism—one which respects but doesn't blindly worship our traditions, but far too many such thinkers seem to know a lot about the trees and even large groves of trees but they no longer have that greater—global—understanding of Creation which is necessary for a true Christian worldview. Etienne Gilson said the Catholic intellectuals failed to answer the questions which had been raised in the Enlightenment as of 1800 or so—that is, they failed to produce a Christian understanding of Creation which encompassed both revealed truths and also the empirical knowledge which came from Newton and Euler and Columbus. There were no Christian organizations other than Catholic universities and houses of studies which were up to that task, and so Christendom as a whole began to show signs of psychosis, claiming to know the ultimate truths while being increasingly clueless about this world—including even human being. But there are degrees and Russello and other members of the “Russell Kirk” crowd, are at least a little bit

less clueless than was Berns. In a strong sense, we're all clueless, unless we isolate ourselves from the modern West.

Kirk and his followers had a different strategy, one more in line with the stereotypes of conservatives. They set up "permanent things" and turned to some sort of Platonism which gave us a set of truths knowable, in principle, to early men in their fullness. They essentially denied the greater dynamics which is so disturbing in modern science and history and other activities but was also present, though not continuously, in any time of great change. In the full sense, the "permanent things" so beloved by Kirk are still being revealed as God's thoughts, manifested in Creation, are still showing themselves. Human being is becoming richer and more complex as human relationships and human knowledge of Creation deepen, become richer and more complex. When we participate in this process, we are being creative along with God—we're not just observing an emergence of things already existing in some embryonic form and we're certainly not just holding onto "permanent things" known to Augustine and Burke and even Plato and Aristotle to some significant extent.

Let me claim to be a meta-conservative against both the conservative tradition of Berns and that of Kirk. This is to say that self-proclaimed conservatives try to preserve traditional understandings of our last century's understanding of the story God is telling, the story which is this world, and also the greater sort of story which is all of Creation while I try to follow along with God's story-telling, respecting the past chapters and living in the present chapter and trying to anticipate future chapters. I seek to conserve for human understanding and human use not one stage of God's story but rather His storytelling in all its dynamic confusion.

Let me move to another article, from the same website which published Russello's article. This other article, *Secularists vs. Providentialists* at <http://www.theamericanconservative.com/articles/secularists-vs-providentialists/>, also deals with this issue of religion in the public squares. It was written by Richard Reinsch II who is a fellow at *Liberty Fund* (<http://www.libertyfund.org>). Reinsch is reviewing the book, *The Rise and Decline of American Religious Freedom* by Steven D Smith. Following Smith, Reinsch tells us:

Our legal mandarins have constructed a self-congratulatory narrative about their vindication of the First Amendment's religion clauses. Supposedly, until the day in 1947 when the

Supreme Court announced in the *Everson v. Board of Education* case that a “high and impregnable . . . wall of separation” must be maintained between church and state, religious entanglement prevailed throughout the land. *Everson*’s principle that government was to provide no aid to religion was subsequently re-grounded in the early 1960s prayer cases, *Engel v. Vitale* and *Abington School District v. Schempp*, which proclaimed that legislation must be neutral toward matters of religion and secular in its purpose. Other victories for “secular neutrality” followed. We now call this the standard version of American religious freedom. Some, apparently, don’t find it convincing.

I certainly don’t find this version desirable though I don’t claim enough knowledge of the history of this issue to be able to find this version convincing or not convincing in the fullest sense. What I, or other Christians find desirable, might not be what fits in with American beliefs and American practices. That is, I don’t assume the United States to have been so Christian as some do, and I often feel it was usually a Christian country only in a self-serving and self-righteous way.

Reinsch also tells us:

Smith begins with Augustan Rome, noting the confrontation that occurred between Christianity and polytheism. No less a figure than Edward Gibbon noted that Rome’s polytheism led it toward a tolerance and ease with varied religious practices that precluded the type of legally enforced religious conformity that would later mark European Christianity. Smith credits Gibbon’s limited point here, but he does so to illuminate what Gibbon misses about Christian belief and its contribution to religious freedom. Roman polytheism had not produced a principled case for religious tolerance: the devotions paid by Roman citizens to their chosen gods rarely caused sectarian strife, but as Smith shows, polytheistic toleration was merely pragmatic, and it could be and was dispensed with whenever religious practice posed a threat to state power.

While later Christian intolerance, particularly if allied with state power, could be vicious—an attempt to enforce an inte-

rior belief in the authority of divine revelation—Christianity developed superior rationales for religious freedom and political freedom alike. If interior belief is primary, then commitment to revelation must be freely given for it to be valid. That coerced belief was illegitimate was a concept taught by Lactantius, an advisor to Constantine. Smith examines this intellectual lineage to stress its evolution and continuity in Christian thought. Lactantius’s reflections are, in part, similar to John Locke’s case for religious toleration. Likewise, the idea that belief must be freely given is precisely Thomas Jefferson’s explicitly theological rationale for religious freedom in the Virginia Statute of Religious Freedom.

I find this unconvincing if taken out of a limited context. The reason is the ‘mixed’ nature of human being: individual and communal. In fact, the communal nature of human being tells us, if we listen, that the liberal ideas of Locke, at least partly taught to Americans through Thomas Jefferson, are “coerced.” How can it be otherwise? Is American history taught to 14 year-olds who come to their duties as students already disciplined in the way of philosophers, already skeptical in the way of modern scientists or in the different but similar way of Medieval Scholastics brought up on the need to discover truth through debate? The problem is not that the State should be preferring specific religious dogmas but rather that the teaching of any view of history or of the nature of matter and time and space, will carry with it a viewpoint. Even when we deal with knowledge disciplined to formal standards, the book-publishers and educators will get around such elitism—many men and women of high general literacy skills have learned something of quantum mechanics from those bestsellers which teach it as a Zen koan but few there are who take on books teaching quantum mechanics by way of the mathematical formalisms which are the subject itself and not many more who will read a tightly reasoned metaphysics book on the subject. (Yes, I did say the precursor **relationships** which collapse to matter are the mathematical formalisms—we might eventually have better ways to speak but I know of no such better ways. This is an important concept for an understanding of all concrete, thing-like forms of being. See Chapter 156, *A Christian View of Einstein and Bohr’s Debate on the Meaning of Reality* and Chapter 157, *Quantum Mechanics and Moral Formation* for short discussions of the primacy of relationships from the

viewpoint of modern science and philosophy recognizing the discoveries of modern science and also—quite consistently—from the viewpoint of St John the Evangelist.

But there are few interested in a way of making good Christian sense of the world because even Christian leaders have learned from one of a few streams of thought about such issues as freedom or the role of religion in public life. How many high school students go on to explore the subjects, or many other subjects, from other viewpoints? Even if they become journalists or priests or teachers? What was taught to most when they were young will provide the limits of what they are willing to think, and perhaps of what they are capable of thinking.

So it is that the modern State defines freedom in its negative and positive forms in public schools and Catholic schools and Lutheran schools alike. Mostly, even in religious schools, history and related subjects will be taught to the standards of the State, of the Federal government in the United States. Anything taught by the families or communities of worship have to be fit inside the greater viewpoint they learned in public schools and maybe in reading newspapers or magazines or the websites of (mostly) mainstream organizations. Christian dogma becomes those weird ideas which don't really fit into the general understanding you hold of reality. To reform a Marxist teaching to a more perfect truth: anything which is said is always said in the context of greater belief structures. Educators of the better sort have known this since the days of Plato or probably earlier.

The human mind, at least in some of its aspects, will be—so to speak—shaped by its greater understandings, however implicit, of reality. As our general understandings have become so many fairy-tales about how the United States is so exceptional, we end up with holes in our understanding. An hour each Sunday doesn't generally do much to fill in the most important hole, largely because it is the greater part of the understanding of the world—but it isn't there. Our minds are like unto a few upper levels in a building which is otherwise air; the very foundation is but an empty hole in the ground. By eliminating our particular Christian understandings, we Americans have left ourselves and our children vulnerable to whatever promises to fill in those empty spaces and, in some cases, to ease the pain of that emptiness. And so we absorb good stuff and bad stuff but can't make sense of any of it, not the leftist but admirable and humane viewpoint of a Capra nor the fairly straightforward (and far from totally wrong) viewpoint of a mainstream public school history text nor, most certainly, the nihilistic

viewpoint falsely read out of Nietzsche's books by many under-educated teenagers and far too many of those who are legally adults.

Yet, I find Reinsch's claims (or his exposition of Smith's claims) to be convincing, even profoundly wise and also pragmatically wise—at least from the viewpoint of one who thinks we find truth partly by experimenting with our thoughts and feelings and ways of life. I find Smith's claims, as discussed by Reinsch, to be quite convincing in this way when Reinsch tells us:

The significance for law and religion, writes Smith, is that our country has been in a great conversation throughout its history about the interplay between these two subjects. Squaring off from the beginning have been the "providentialists" and the "secularists." Secularists have advocated the near total separation of religion and government, while providentialists have said that public acknowledgment of God by the state is warranted. Both groups have had their "eminent representatives: Jefferson and Madison (and, a bit later, Andrew Jackson) on the secularist side; Washington and Adams (and later Lincoln) representing the providentialist position." Until the mid-20th century, the meaning of our Constitution's religion clauses was "the product of the ongoing competition and collaboration between the providentialist and secularist interpretations of the Republic."

There is a sense in which the pilgrim Body of Christ guides its own evolution and development in this mortal realm, but there is no individual organ or other part of the Body which is in charge. Going along with such processes requires humility and wisdom, patience and openness to reality—qualities not always to be found in those who seek and gain power and wealth. Supposedly, Christians and others in the West have learned not to trust churchmen to have too much power over human communities as those churchmen are themselves human with all that the human condition entails. But I would argue there is nothing reasonable, let alone necessary, about the idea that governments, or other political institutions, should have general powers over human communities as opposed to well-defined powers to, for example, administer an ideally neutral and unbiased judiciary system. If I'm right, it would seem likely that governments will be brought under

control by future generations as was the Roman Church hierarchy and the Scottish Calvinist synod and other abusive religious hierarchies.

Unlike some, I consider the political organs to be evolving and developing toward being part of the perfected and completed Body of Christ. Political activities, and many other human activities, will take place in Heaven; we will not spend time without end in Church choir stalls.

Unlike some, I believe that the political organs should have far lesser powers than they have in this year of 2015.

No one organ should regulate its own behavior or that of other organs.

And, yet, each organ of the Body must regulate its own behavior and that of other organs and even of the entire Body.

The Body of Christ is developing and evolving in a world of self-organizing and self-regulating processes. Our ways of speaking don't suffice to describe such processes; even the formal mathematics is yet under development.

I recommend we accept reality: "Ye gads, what other choice do we have," to slightly paraphrase a comment of Thomas Carlyle. Reality is chaotic and complex, it is yet evolving and developing. In fact, biologists and anthropologists tell us the human race, as a collection of individuals and as a network of individuals and communities, is evolving and developing faster than ever.

As power and wealth grow, there is ever more temptation to take control, especially for those who seek power and wealth, and to control all of human society. Military conquerors and kings and other rulers have been this way as far back as we can trace. Popes and Protestant synods and elected representatives and appointed bureaucrats also tend to aggrandize their offices and sometimes their persons, sometimes to seemingly good purposes and sometimes to criminal purposes.

And so it is that, from an explicitly sacramental Christian viewpoint, I'll endorse the position stated clearly by Reinsch and (I think) stated a little more weakly by Russello.

The position stated clearly is that we need a certain looseness and vagueness in our public squares, a bit of uncertainty as to whether we are a country of secularists or a country of providentialists and also a bit of uncertainty as to whether the political leaders and bureaucrats and judges or the religious leaders call the shots on matters of church and state relationships. This makes sense from the general viewpoint of human beings who should fear the corruption which comes with having power over others

or the privations which come when others have power over us and it also makes sense from the viewpoint of any Christian who believes in the Body of Christ and is willing to view that Body in God's terms as we can read them out of Creation.

## 653 Why Did Peter Go to Rome?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2058>. It was finished and uploaded on 2015/05/26.]

A good question: Why did Peter, the shepherd of the flock of Christ, go to Rome, the center of earthly power in its most centralized and most brutal manifestation yet seen. [In fact, we shouldn't forget that China was at a similar level of power and wealth, but no higher so far as I know.]

Roman Civilization was pagan. Its military and political power was at an extremely high level and so were its various forms of culture and human development in general. Peter wasn't pagan but he was a barbarian by Roman standards. He was uncultured in a strong sense. And he was even something of a clownish figure in Roman eyes. But his successors would one day share in the power and wealth and cultural riches of a Rome which remained a significant city in the West for some good part of two millenia. Was that power and wealth, were those cultural riches, truly important to the mortal Body of Christ?

Yes. In a sense, Roman Civilization was taken over as the main part of that Body and Peter moved into Rome itself to set up a new central organ for that Body.

In making this claim, I point to some of my writings which culminated in a claim I made a few years back: The Body of Christ is the completion and perfection of human life, a completed and perfected human civilization. The Christian Church is the central organ, but not the entirety of the Body—which is the same as saying that human life in the world of the resurrected will include all legitimate human activities in some completed and perfected form and not just the activities of life in a community of worship. After all, we are said to be images of God and some of us will share the life of God in the world of the resurrected. God's life is not restricted to just those

acts of human worship, whether as Son worshiping the Father or as Father and Son and Holy Spirit being worshiped. God's life is the fullness of life. See Chapter 624, *Why We Need a Christian Civilization*, and Chapter 477, *What is the Role of the Christian Church in the Public Square?*, for more discussion on this topic.

So, we currently have Orthodox Christian churches which are not part of any viable or dynamic civilizations (though the Russians might be on their way) and a Catholic Church domiciled in Rome of Italy—more of a joke from the viewpoint of civilization than most countries of the modern West. Rome, Italy or even all of Europe, has some wealth and little power and little in the way of living cultures which promise anything at all for the future. Even fifty years ago, it might have made sense to speculate Peter would move to the new center of Western Civilization—the United States, but Americans had plans other than reviving and nurturing a mighty and wonderful civilization from which our country had sprung. Americans had plans other than serving God even by way of being rational and morally well-ordered pagans providing good stuff for the Body of Christ. Americans most certainly weren't about to humble themselves to become willing servants of that Body, however much the promise had been made that the servants of that Body would also be sons of God.

So it is that I note that the Roman Catholic Church seems to be dead man walking and predict that Peter will soon—in historical terms—be packing his knapsack and heading out onto the road, most likely heading into the new complex of civilizations developing on the great Eurasian landmass, though he might still settle for at least some centuries some place on the western coast of the Americas or some other location in the Pacific Rim. (Much of the Americas is looking to be a potentially interesting and very promising mixture of North American, South American, and Asian culture. Perhaps the United States itself can eventually be rescued by that process of mixing with Mexicans and Chinese, but such processes tend to be ugly and bloody for a long time before bearing fruit.)

Before too many decades go by, Peter is more likely to be a bishop on the Pacific Rim or in Asia or the Bishop of Moscow than he is to be the bishop or Rome or the bishop of any other city in the West—other than a city on the western coast of one of the Americas.

The people and peoples of the West have truly destroyed much that was good, much that was from God, much that was given to them for safekeeping and for proper nourishing.

## 654 Science and Naive Anthropocentrism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2062>. It was finished and uploaded on 2015/05/28.]

Razib Khan, is a geneticist who is an atheist but not a naively anthropocentric atheist nor one blind to the reasons why others hold or seek a faith he doesn't hold and doesn't desire. He has published an essay, *Can a Religious Person be a Good Scientist?* at <http://www.unz.com/gnxp/can-a-religious-person-be-a-good-scientist/>, in which he says:

In the culture of science you occasionally run into the sort of person who believes as an apodictic fact that if one is religious one can not by their fact of belief be a good scientist. You encounter this sort of person at all levels of science, and they exhibit a range of variation in terms of the volume of their belief about beliefs of others. I don't want to exaggerate how much it permeates the culture of science, or at least what I know of it. But, it is a tacit and real thread that runs through the world-views of some individuals. It's a definite cultural subtext, and one which I don't encounter often because I'm a rather vanilla atheist. A friend who is now a tenure track faculty in evolutionary biology who happens to be a Christian once told me that his religion came up nearly every day during graduate school! (some of it was hostile, but mostly it was curiosity and incomprehension)[.]

Khan briefly discusses some believers among well-known evolutionary biologists and mentions a historical study of a "a movement in early 20th

century Britain to accommodate and assimilate the findings of evolutionary biology to that of mainstream [Anglican] Christianity,” and then mentions the computer language designer Larry Wall (he might prefer “computer linguist”) and the polymath (mathematics and computer science and typography) Donald Knuth as scientists well known for strong Christian faith. Then he tells us:

To be fair, I don’t think it’s a coincidence that there’s a correlation in the aggregate between secularism and science. But this issue is complex, emerging at the intersection of cognitive science, sociology, and history. These subtleties can’t be waved away airily with a reference to facts that everyone knows which happens to reflect one’s own personal prejudices. That reminds me of things besides science.

The reason so many Christians seem befuddled in the face of evolutionary biology, quantum physics, and modern mathematics adds to the understanding Khan already expresses from the viewpoint of a non-believer. More than that, it can be taken as a warning by scientists, believers and non-believers, and points to something which Khan misses as do most modern Christians and other believers. What they miss is a greater understanding of human being which places the human mind (and heart and hands) into the greater context of this concrete (empirical) world as well as the still greater context of Creation.

There are different realms of being, multiple realms of created being and one realm of divine being in the worldview I’ve built up, but the divine realm mostly plays a role in my worldview as being the source of what I call the “raw stuff of created being”; from there, all of Creation can be seen for most purposes—practical and scientific and philosophical—as being freestanding. There are also multiple ways of human knowing and they don’t correspond in a neat way to realms of being.

I wrote a freely downloadable book about the different kinds of human knowledge: *Four Kinds of Knowledge: Revealed Knowledge, Speculative Knowledge, Scientific Empirical Knowledge, Practical Empirical Knowledge* [43], the full title indicating what is going on. Scientific empirical knowledge and practical empirical knowledge are but two of four kinds of knowledge in this particular way of making sense of human mental activities. Speculative knowledge, using all kinds of knowledge, provides what

I call a worldview and also lesser types of what might be called structures for such purposes as categorizing and otherwise organizing empirical knowledge of things and relationships, of concrete and abstract realms of being. Speculative knowledge also provides a specialized sort of structure: narrative. It's in these forms of speculative knowledge that we find what I think to be needed in Khan's position, not that I'll argue that he should believe in God but only that he should recognize there are non-empirical forms of knowledge involved in understanding empirical knowledge, even the bluntest facts, and non-empirical ways of conceiving a Creation—unified, coherent, and complete. In these three characteristics, Creation and the lesser part of it we know as our concrete world are like persons, even like divine Persons—a similarity seen as an “image” in Christian tradition. By a successful building of a speculative understanding of empirical reality in these Christian terms, we can see this universe as a world ordered to the purposes of its Creator, Creation still more so. A human being, individual or communal, can be seen as a person, an image of a divine Person.

Scientific worldviews differ in type from the one I've presented briefly only in being stripped down, skeletons and not en fleshed living creatures. Because of this, scientists can delude themselves into thinking that they bring an existing mind of great power and insight to the task of understanding this world they explore so well, this world they even understand so well in some of its parts and aspects. This is better, even grander than, but not so much different from, the worldviews of those Christians who see this world as if it were a bleeding and tortured heart; they also can delude themselves into thinking they understand. (I have to admit I would prefer the scientific viewpoint to this bleeding-heart viewpoint if there were not a better choice.)

In my title, I use the term ‘naive anthropocentrism’ to refer to any attempt to set up part or all of human being as an impartial and external judge of empirical reality. Many scientists are more like Galileo's inquisitors and not so much like the master scientist himself. Stanley Jaki—the Benedictine scientist (PhD in physics), theologian, philosopher, and historian—considered Galileo to be a better Catholic theologian than his inquisitors and better than St Robert Bellarmine (not an inquisitor in the brutal sense of the word). Galileo himself didn't separate his faith in Creator and his trust in the truthfulness of Creation; in fact, Galileo's defense of his position (in his letter to the Grand-duchess of Florence) drew upon a line of thought going from St Augustine and St Jerome through St Anselm through

St Albert and his student St Thomas Aquinas. Even with respect to evolutionary biology: Augustine believed that more complex species came from simpler species and, oddly enough, went against his own better instincts in choosing to see the human species as a special creation. St Albert was a great enthusiast for the idea that new species form all around us and, in a similar way to other enthusiasts including some modern scientists, went overboard and saw the grafting of a domestic rose stalk onto a wild rose root system to be the creation of a new species—he had a list of species transformations and got some right but certainly got the whole idea almost as right as he could have in the first half of the 13th century.

It was, and is, bad Christian thought and not Christian thought which targeted parts of science as an enemy. Some Christian thinkers and many ecclesiastical leaders made bad choices and led the Christian Church into a wasteland of superstition in which human schemes were seen as more important than the facts of God's own Creation. Scientists are not themselves immune from the construction of human schemes which are then treated as superior to reality.

Somewhere—I believe in *The Perfectibility of Man* [108], the philosopher, John Passmore, points out the real problem with belief in an all-powerful God: such a God is consistent with any conceivable world. Only sloppy and ill-disciplined thinkers could seriously believe that the existence of a coherent, unified, and complete empirical reality argues against the existence of an all-powerful and all-knowing God.

Yet, my main argument isn't along theological grounds but rather toward an understanding of human being. Recognizing the objectivity of empirical knowledge, we can yet see the true nature of science in the true nature of human being in which the scientist shares. The trick, if that is the right term, is to realize that human being truly is part of the world in which it came to be and in which it lives its mortal life. There is an inside to human being but it's an inside which is shaped in its fundamental, species level by our evolutionary history and shaped in other ways by cultural and individual development. In Christian terms, we Christians are images of God by way of being images of our environments and the environments of our ancestors going right back to self-sustaining and self-reproducing blobs of chemicals.

This is almost a gimme for one who holds a more complete belief involving hands and heart as well as mind as well as a sense of gratitude or at least a sense of justice (see *Justice: The First Step Towards God* [40]; it

can be a problem for one who approaches the ultimate questions from the perspective of traditional philosophical thought in which the thinking organ and its thoughts are as if from a different realm of being than empirical reality or from the perspective of traditional Christian piety of a peasant sort in which the heart is from a different realm. There are also problems for those who think of the world as but a playing field for social work or wealth acquisition or political gamesmanship.

The human being is a dynamic entity formed by various processes involving all three ‘parts’, heart and hands and mind, and each of these parts responds to objective, empirical reality in a different way and is shaped by those responses in a different way. In action, those processes produce a rather chaotic stream—at least that is true of those with a greater sort of life in them. I’ll try not to push this metaphor too far but it can be useful for early thoughts on the wholeness of human being and of the way that a specific human being, individual or communal, is shaped from raw human stuff. Each of us is constrained by the particularities of place and time but we move with some freedom in that streambed set in a particular forest or meadow. In a simple way, we can think of those three degrees of freedom, heart and hands and mind, and realize—at least intuitively—that it is hard to keep a balance of constraints upon those three and it is easy to distort the movement of the stream or to bring it into a state of disorder. I’ll move away from that metaphor by claiming, more or less in line with the traditions of all human civilizations, that the goal of that movement of that stream is a properly rich human being which is true to this world. Take that goal for little more than an ideal in a non-idealistic world but it does capture an essential aspect of the movement of those human streams, as understood in the West by pagans and Christians and modern atheists alike.

The modern world is something of a battlefield among the three groups who define human being, and the human understanding of reality, in limited terms:

- those who judge the world from the viewpoint of a giant and badly bleeding heart,
- those who judge the world from the viewpoint of hands always in motion to make the world an allegedly better place, and

- those who judge the world from the viewpoint of a mind which is seen as capable of direct understanding, unmediated by the shaping forces of evolutionary and developmental events.

Some of the modern atheists, and allied skeptics and agnostics, have used evolutionary theory to pound away at religious faith without accepting themselves what a truly empirical theory of evolution would say about those minds they use in such acts of vandalism. Truth is attainable only if found in this world they reduce to a collection of facts, this world which too many Christians dismiss as a realm of Satan—the father of lies. There are those who have honestly confronted that question: what is the mind which arises from the physical brain? For example, the brain-scientist and philosopher, Walter J Freeman (see [https://en.wikipedia.org/wiki/Walter\\_Jackson\\_Freeman\\_III](https://en.wikipedia.org/wiki/Walter_Jackson_Freeman_III)), presents a clear and accessible theory of the human mind in *How Brains Make Up Their Minds* [35]; that theory is a modern version of the understanding of mind found in the work of St Thomas Aquinas, one of the most insightful of empirical observers and thinkers—no matter the angelic decorations which sometimes obscure his empirical thought. The human mind arises from the brain shaped by evolutionary history; the human mind is itself shaped by active responses to its environments. (Remember that those environments include not just physical places but also the abstract environments of, for example, mathematics which are conceived in the human mind as it seeks to understand the abstract realms of being underlying this world of things.)

From a book written by Gerd Gigerenzer, *Adaptive Thinking: Rationality in the Real World* [61], I learned a basic principle: in understanding the human mind, we should take care to first understand how it does its job of helping the human being to deal with the world around. For example, Gigerenzer disproved the idea which underpins a truly wrongheaded idea spread by certain sorts of skeptical empiricists from the fields of psychology and economics and business: human beings don't know how to think properly under conditions of uncertainty. It turns out that psychologists and economists and business theorists don't know how to design experiments in the real world in which human beings evolved. In short, human beings—even those with little education in mathematics or statistics—can deal with uncertainty so long as it's presented in the way found in the real-world, that is, in terms of frequencies and not abstract percentages or probabilities.

It's reality that judges us, no matter how some think to judge reality by way of heart or hands or mind. It's far more accurate to claim a human being is shaped properly when shaped in active response to that reality outside of him, including the abstract realms of being which have become increasingly important in human life and have become increasingly real since we discovered that matter itself is some sort of condensation of some strange and abstract being we can describe only in terms of mathematical equations. In fact, I've proposed that these mathematical relationships are a fundamental form of being, a realm of abstract being from which this concrete realm is shaped. I see no intelligible alternative to speaking directly of 'quantum relationships' as a form of being just as much as things are a form of being.

The mind isn't something given to us at conception or any other point in our lives. The mind isn't something which rises above empirical reality so that it can just gather in data and produce lists of true conclusions or even a grand theory. To set up the mind as something which can judge reality from a neutral stance is the original sin of modern thinkers, including scientists, just as pietistic Christians sin in glorifying the heart and others sin in glorifying the hands (acts) of human beings. These errors, as I have noted, are a form of anthropocentrism but are far more erroneous than the anthropocentrism which Medieval and Renaissance Christians inherited by readings and misreadings of the writings of the ancient pagans.

The mind, as Aquinas told us centuries ago and as Freeman and other neuroscientists have been telling us more recently, is formed by way of active responses to the environments of that human being. In addition, we have to realize that the brain as a purely physical organ is predisposed to certain responses to some wide but not infinitely variable range of physical environments. In other words, much of our mind-shaping has taken place on a species level during the processes of biological evolution. To complete this picture, we would also have to consider cultural evolution, but I'll leave that to the reader for now. See Chapter 272, *Human Moral Nature: An Overview*, or download the book, *A More Exact Understanding of Human Being* [53], for a little more development of these ideas.

The major point for residents of an empirical world is that there is no 'I' in here to bring order to or to judge the world or the greater realms of created being from which it is shaped. We learn order by finding it in the seeming disorder of physical reality. So it is that there is an 'I' which achieves its appropriate richness, its completion and perfection, by way of

encapsulating what lies out there, encapsulating by way of active responses and not in the way of computer-like knowing.

Truth is truly out there, in the realm of created being which can be objectively explored, studied, and subjected to speculation by this 'I' which is less a super-scientist—part scientist and part god-like judge, and more a willing participant in created being and perhaps in divine being if we Christians or some other believers are right. To understand isn't to apply to data some transcendental rules of thought which we can magically access; to understand is to work with the ways of thought selected for purposes of survival and reproduction, to refine those ways of thought, and to develop further ways of thought as we explore the various realms of created being which we can reach by heart or hands or mind.

# 655 To Misunderstand Our Human Understandings

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2069>. It was finished and uploaded on 2015/06/02.]

We modern human beings have illusions of control; as a consequence, even our ways of approaching human freedom look not so much different from the ways of implementing systems of hierarchical control, even totalitarianism. We think to have some sort of great power over reality, if only in ways of thought and attitude. On the other hand, in many ways, human beings are well-adapted to the real world. We can be said to be an empirically-oriented species in that, for example, our morality is manifested—if quite imperfectly—in our physical selves, in our instincts to live according to such rules as “Thou shall not murder” in our social relationships. (Scientific understandings, as of two or three decades ago, indicated wolves have stronger instincts not to kill members of their own species than do human beings, but our corresponding instincts are clearly good enough for human survival and reproduction and our abstract reasoning ability leads to complex societies and complex moral behaviors and beliefs well beyond those of any other known species.)

In a sense, I continue to beat the dead horse which is traditional human understandings of reality at various levels: our own individual or communal selves, our environments, the entire earth, the universe, or the world which I see as a universe seen in light of a proper, moral ordering. I addressed the same general issue in Chapter 61, *Imposing Ideals Upon Empirical Reality is Insane and Not Noble*, in which I claimed this world to be worthy of the highest respect and as needing study just because it is the work of the Creator, a manifestation of specific thoughts of the Almighty.

Here, I wish to emphasize the need to regard all of our speculative understandings as provisional but also necessary to our further progress even in the seemingly mundane work of gathering further facts about empirical reality and in the mathematical work of building systems of thought which account for aspects of that empirical reality. We also need provisional understandings to guide us in our ways of living and that includes the formation of our institutions, ecclesiastical and political and economic. In the previous two sentences, we can notice a convergence between knowing and doing. To know or to do in this empirical reality, we experiment; we try new ideas, new ways of doing things when we run into new situations or when problems develop even when it seems little has changed in the basic situation. Mathematicians and philosophers and others have explored even mathematics as an empirical field and have produced some interesting results (such as the proof of the four-color theorem—generated partly by computerized examination and elimination of pathological results) though it's far from settled as to whether some mathematics can only be done by way of experiments, including the 'accidental' experiments in which physicists have been known to produce important new mathematical results by solving a physical problem by way of seemingly illicit mathematical techniques. In the case of the *Dirac Delta Function* (see [https://en.wikipedia.org/wiki/Dirac\\_delta\\_function](https://en.wikipedia.org/wiki/Dirac_delta_function)) mathematicians accepted the 'non-function' of Paul Dirac (see [https://en.wikipedia.org/wiki/Paul\\_Dirac](https://en.wikipedia.org/wiki/Paul_Dirac)) by accepting the idea that such an entity could be integrated though not a real function—read the article for a more extensive and less simplistic explanation.

As a Christian, I would say that when we experiment and test against reality, we are learning thoughts of God we might not have been able to otherwise reach.

We aren't inclined toward innovation so much as we pretend, at least not in the short-term and, again as a Christian, I think we would do better if we tried to work directly in response to God in His role as Creator—He has a much richer imagination than any of us have. In any case, there is a fundamental conservatism which is embodied in the very thought that there is such a thing as a 'best' way to understand or to live, a 'best' set of institutions, that is, a best way we can derive as if adding a column of numbers. We want to return to a stable region, an Eden—itself deformed by way of a general-purpose ideological understanding of the Biblical story, and we want to do it by way of fundamental truths we think to already

possess as a basis of all knowledge.

At any given time, we—as individuals and communities—will have some general understanding of important aspects and realms of being which is stated as a worldview and it might be well-enough structured to include an understanding of physical reality, an understanding of moral-order, an understanding of abstract mathematics, and maybe an understanding of how all of this is one greater reality, a Creation to a Christian or Jew or a Cosmos to a pagan. Or it might even be an understanding of what-exists as not really fitting together.

I'll not claim pagans or atheists or others can't provide a good-enough understanding of a universe which is on a trajectory of evolutionary and developmental paths—paths in a general sense of connectors between 'states' or 'phases'. (See the short Wikipedia article [https://en.wikipedia.org/wiki/State\\_space](https://en.wikipedia.org/wiki/State_space) and [https://en.wikipedia.org/wiki/Phase\\_space](https://en.wikipedia.org/wiki/Phase_space).) Yet, pagans at least tend strongly (perhaps not necessarily?) to believe that the realm of being which we see as this concrete world is what it is and has to be; it exists alongside of the divine world, even the God himself.

All human beings, not just pagans, have similar thoughts about any mathematical system once it can be expressed in an axiomatic form, so that—for example—Euclidean Geometry had to be the one and only true geometry once so expressed; we had returned to Eden until modern mathematicians ate again of the fruit of the tree of knowledge. In effect, human beings, even Christians and Jews who should know better, tend to see the possible configurations, states or phases, of this world and all else that exists outside of the gods as being contingent but the basic stuff and the currently expressible relationships between entities formed of that stuff are seen as having necessary existence.

By a way of reasoning which might be essentially the same as that underlying the natural (animistic pagan) beliefs of men, modern scientists as well as political theorists through the ages have assumed or somehow concluded that there is a secret which 'explains' all possible being in their particular field of study and a powerful enough abstraction from this world, by way of philosophical contemplation or theory construction, will be that secret. All possible being, or its lesser part in human political institutions, will be found in that secret. Though, as a Christian thinker, I have conjectured that God manifested some truths as the raw stuff of created being, I don't pretend to know if those truths are building blocks or something

totally different and perhaps even inexpressible until we can explore various ways of ‘returning’ to that raw stuff through realms of increasingly abstract being. As matters stand, we can ascend one realm of being above matter—the realm of abstract being which is studied as the equations of quantum physics and which I believe to truly be those mathematical relationships. We have also ascended to other abstract realms by way of mathematics and philosophical contemplation in all disciplined fields of study, but we can’t really put those realms into their proper relationships with each other and with Creation, the totality of created being. The following three chapters are just three of many in which I’ve tried to better understand being from the viewpoint of a concrete, thing-like creature who starts from empirical knowledge:

- Chapter 169, *From Abstract Being to Concrete Being and Narratives*,
- Chapter 177, *What is Created Being? Really, what is it?*, and
- Chapter 181, *The Basic Stuff of Created Being*.

I most certainly don’t think we’ve yet seen the limits of God’s imaginative powers, or those of Nature if you prefer. We have a lot to learn and what we need to learn includes the ‘tools’ of understanding; in fact, there isn’t quite the barrier between tools (of knowing) and being as we are often inclined to believe. We think there is a true ‘inside’ to our individual human selves or perhaps to our more complete individual and communal selves, but there is no such inside as I discussed somewhat in Chapter 654, *Science and Naive Anthropocentrism*.

What some physicists think to accomplish with a “Theory of Everything” is but a grander-scale version of what many biologists think to have already accomplished with Darwinian theories of the expanded sort (including genetics). This is also what some political scientists and philosophers think was already accomplished by Aristotle and his followers with their claims that all possible political relationships, and thus all possible political communities, fit into a small number of categories knowable to a great thinker living circa 300BC. We have a square hole and a circular hole and a triangular hole and we might be ignoring evidence that there are star-shaped pegs. More than that, we might be ignoring evidence that the shapes of holes and pegs might be evolving and developing and even being deformed by forces external to those specific systems. It might even be the case that

there are times when there are no pegs shaped right to fill some important holes, no holes shaped right to hold some important pegs. And it might be the case that the true ‘geometry’ lies far beyond a peg and hole analogy.

I’m not taking a relativistic view of being and of truth but rather taking the position that we have not yet penetrated to truly fundamental levels of being and truth. I’m also not claiming that there is something incoherent or otherwise wrong with reality. That is a far stronger claim and one I most certainly wouldn’t make, believing as I do that God created ordered relationships which then produced stuff. I am claiming that we tend to see our provisional understandings, provisional knowledge of all sorts, as being absolutely true once they work well in helping us to survive or reproduce—as individuals and as communities—in a particular context, such as the world of Greek city-states or of modern nation-states. In other words, I am claiming there is something wrong with our understanding of our own human being and of other forms of created being. That’s all right. There’s bound to be many things wrong with our understandings, in the sense of incompleteness and of imperfection. It’s when we misunderstand our human understandings, when we don’t have the proper meta-understanding of our understanding, when we think that a good and elegant scheme is necessarily true, that we deform our relationships of mind and heart and hands.

A true understanding is a rich and complex body of knowledge which can be described from one angle in terms used in my book and its title: *Four Kinds of Knowledge: Revealed Knowledge, Speculative Knowledge, Scientific Empirical Knowledge, Practical Empirical Knowledge* [43]. From another angle we can consider various elements which are narrative, others which describe the characters and non-living things in quantitative and qualitative terms. The end result is a worldview, an encapsulation of reality, what we can see and touch and smell but also what is derived from concrete reality through efforts of our minds and hearts and hands.

The act of understanding is an act of acceptance and, at least to saints of the mind or heart or hands and who are not all Christians, it is an act of offering gratitude. It is an act which requires the participation of one’s mind and heart and hands. It is an act which is more complete and a little closer to perfection when done as a human community and truly complete and perfect only when done by the completed and perfected human community which is the Body of Christ. (Translate or limit appropriately if you wish to have a non-Christian statement of this critique of our misunderstanding of human understandings.)

# 656 Toward a Better Understanding of Our Human Understandings

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2072>. It was finished and uploaded on 2015/06/18.]

Our delusions about the world being subject to understanding by an out-of-the-box human mind and our allied delusions about human control over that world lead us into various specific errors. We ignore what doesn't fit into our favorite schemes, that is, we are blind and deaf to what doesn't fit into our delusionary schemes of understanding. We think we and our children are born with preformed minds and try to understand that world and to teach those children by pushing knowledge into those preformed minds; in the modern West and most certainly in the United States, the duty of teachers is to push knowledge into those minds rather than realizing that the mind needs to be shaped by immersion in a subject, even if the subject were the vaguely defined study of how to be a good citizen. It's of some interest that athletic coaches and military trainers train and educate those under their charge by more penetrating techniques, even deliberately driving those under their charge into states of exhaustion to destroy their reluctance to take on their new roles. In fact, the mind shapes itself in active responses to what lies outside of itself—the true insight expressed in a strange way in the Zennish claims that there is no difference between knowledge and the knower, between subject and object.

So we have distorted our own mental development and that of our children and, most obviously, that of our communities. Rather than responding to a world of evolutionary and developmental processes, we think to be

building first huts of mud and grass, then wooden huts, then stone structures right up to pyramids, then concrete coliseums and temples and aqueducts, then stone cathedrals. . . right up to steel and concrete skyscrapers. And we don't get the point, at least not the bulk of human beings including most of the members of the political and economic elite. That is we don't get the point that the minds of people who build mud and grass huts, those who build pyramids, those who build steel and glass skyscrapers, are minds suited to a world in which those were real possibilities available to and created by human animals responding actively to their environments. They were not just foreseeable stages in the progression of a species fated to build steel and glass skyscrapers from the time the first apish man learned how to use fire to light and to cook and to create grasslands; they were not just learning stages for a species set in this world to exploit it.

We fall into such errors partly because of the 'intuitions' built into our brains by the processes of evolution. Even the most brilliant of mathematical physicists first learned to count as an infant because he has a brain inclined to count due to the survival and the reproductive success of his finger-counting ancestors over the previous hundreds of thousands of years. And that great mathematical physicist named Einstein was a man born near the end of the 19th century and had a brain shaped by his active responses to a world which knew of Archimedes and Newton and Maxwell and also knew of Homer and Shakespeare and Goethe.

We also are fooled because we, as a species have learned to summarize some sorts of knowledge in axioms and rules which work with those axioms, using that axiomatic system to organize our more complex knowledge and to create various short-cuts which prevent us from having to repeat the messy trial-and-error processes which led to the physics and engineering knowledge which can build skyscrapers.

We create our own opportunities and our own problems by way of our very power to think abstractly, to set up—for example—geometric systems. We can somehow rise above our individual and communal selves to judge those selves and the world in which those selves exist—download my book, *Four Kinds of Knowledge: Revealed Knowledge, Speculative Knowledge, Scientific Empirical Knowledge, Practical Empirical Knowledge* [43], for a still preliminary account of what is involved in human 'knowing'. In fact, a 'world' is a speculative construction of accessible and mundane environments, up to the entire 'universe' as defined in modern physical cosmology and beyond. Call this construction a 'worldview' and we can free

the word ‘world’ for referring to the objective reality which we see imperfectly and incompletely—often in a downright distorted way. I go at this and other issues again and again in my writings, trying to draw out the subtleties and nuances because of the underlying complexity often masked by the view that things are really so simple. (I lightly address this issue in Chapter 641, *Enriching Our Moral World: Simple Is Digested Complexity*.)

In a simple analogy: the construction of a “Blocks World” (see [https://en.wikipedia.org/wiki/Blocks\\_world](https://en.wikipedia.org/wiki/Blocks_world)) led to a lot of good work in artificial intelligence research in which a very simple concrete world was abstracted so that it could be manipulated as if a well-defined mathematical system. The term ‘well-defined’ points to the problem. For example, once topology was seen as the study of continuities of certain types of systems, by the way of simple set operations, it could be well-defined in remarkably simple ways as the study of sets which behaved in certain ways under basic set operations; a continuous function was then defined as one which has an inverse which maps open sets to open sets. (Very roughly, an open set is a general concept whose simple manifestation is a line which doesn’t include its endpoints.) Modern mathematics is so powerful just because it has ‘fragmented’ into these well-defined fields of study which are interrelated but separated in important ways. It is also so powerful because mathematicians learned to live with a situation confusing to outsiders: some fields, such as number theory, are strictly quantitative while other fields, such as topology, are mostly qualitative and are often greatly concerned with existence proofs. And its also so powerful because a rich field such as topology (originally and even now dealing with continuous deformations which tell us a doughnut and a tea-cup are the same ‘shape’, as are a filled-in square and a filled-in circle—by some rigorous understanding of ‘shape’) can be reduced to some simple sets of axioms about sets. The original power of topology is retained but it can also deal with problems which weren’t even possible to imagine before those simplifications which are actually great abstractions.

Much work in trying to understand our complex world, say the genetic aspects of terrestrial life or the economic or political aspects of human being, seems to involve the implicit construction of blocks worlds and then the direct (naive?) analysis without proper understanding of the need for qualitative analysis of those assumed blocks worlds to determine if the solutions or understandings they seek even exist or—still more basically—to determine by playing out scenarios if those blocks worlds even correspond to reality in the desired ways. Reality might not be cooperative. For exam-

ple, artificial intelligence researchers discovered early on that a robot which relied on pure logical reasoning could freeze for hours while trying to prove it possible to get around one or more obstacles between it and its goal. Obviously, there are better ways to plan moves even in fairly simple physical situations. A hawk won't eat well if he takes hours of analysis to determine if he can get to a squirrel running through a field with the protection of scattered trees.

The trick, for at least those responsible for scouting out the future and forming understandings about futures suddenly become radically different today, is to jump to a higher level of abstraction while always staying within the constraints of concrete reality. This last statement might seem contradictory but it's not—we've found in recent centuries that higher level abstractions in mathematics might be found by exploring concrete reality or they might be found by developing further the abstractions already developed. In either case, there is an admittedly vague sense in which we might say that mathematics as a whole is found in concrete reality—any alternative statements will also be vague or downright false.

Let me consider a few problems seeming far from the reach of abstract mathematical reasoning:

- Is there an qualitative description of human being which is worth much?
- Can such an abstract description, if it exists, help us to provide further descriptions of our possibilities, the ways in which we can shape ourselves?
- Can such an abstract description, if it exists, help us to understand the true relationships of individual and communal human being?
- Is there a coherent understanding of personhood other than as a synonym for nature?
- If personhood is a coherent concept subject to disciplined discourse: are all human beings persons?
- What is a community, really?

Though I have my own still developing answers to some of these questions and a few ideas about all the rest, I don't intend to propose definitive

answers to any of them in the initial batch of the essays and books I can hope to write, only to explore the possibility of developing a more disciplined way to speak about these 'qualitative' issues by borrowing tools from qualitative mathematics. After I succeed, or someone else succeeds, in this initial project of providing a more complex and sophisticated framework of analysis for the complex human relationships of complex communities, then that framework can be used to express, say, Christian or Jewish moral and even theological ideas, perhaps a variety of ideas from other stances.

In any case, there are more such questions which I think can best be dealt with in an intelligent and non-ideological way by proper use of 'qualitative' forms of reasoning which have led to deep and important results in mathematics and mathematical physics and computer science and other fields of human research.

In closing, I'll confess that my efforts in this general vein are powered by a great and optimistic faith that the qualitative forms of reasoning discovered by mathematicians and some other mathematically inclined scientists can be abstracted to provide ways of reasoning appropriate for understanding human being, individual and communal. This is a continuation of the use, for example, of paths crooked and straight in moral thought. The moral realms of this world have grown opaque to much of that thought and we have no tools to rebuild our thought. If being is one and knowledge about being is ideally one then any powerful reasoning processes developed for use in, say, moral issues might well prove useful to mathematicians and physicists and engineers and others.

## 657 God as Judge, God as Creator

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2075>. It was finished and uploaded on 2015/06/29.]

We live in a world driven by processes of evolution and development. Our human beings, individual and communal, have been created and shaped by more specific processes of evolution and development. In particular, our minds are shaped as we respond actively to reality in its concrete and abstract realms and aspects.

Some Medieval thinkers made a claim I would support wholeheartedly: most of what we know about God, we know through His effects in Creation. I would say: most of what we know about God, we know through His acts-of-being so far as we can see them; we respond to these acts-of-being and encapsulate them in our minds, making them part of our minds.

And, yet, we pray to God, think of God, teach and preach about God, in terms of ancient Semitic ways of knowing their world. To oversimplify, but not really distort: we pray to God, think of God, teach and preach about God, as if He were a human judge raised to an infinite size and to a level of infinite power. We should be responding to God as a Creator of all, the Source of all being.

“God as judge” makes no sense to the modern human mind, not because the modern mind has become weakened or corrupted in some ways—though I think that to be true, but rather because of the very strengths of the modern mind coming from the accomplishments of human beings in dealing with empirical realms, including the more theoretical or abstract branches of mathematics and physics and other such sciences. The modern mind sees no courtroom in which actions in fields of trial are judged; the modern

mind sees those realms of concrete being shaped from more abstract forms of being by processes of evolution and development. In Christian terms, we see no courtroom but rather a Creation. It must be said we also see no factory designed by human engineers but rather a Creation, but “God as Engineer” seems an ephemeral mistake as opposed to “God as Judge” which is quite long-lasting.

As I’ve pointed out numerous times, Christians—including their leaders—have no problem accepting the world as seen by Darwinians and by modern physicists when they wish to be scanned in a search for cancer or when they wish cancer or other problems to be treated. They accept the world as one where order is evolving and developing in the economic and social realms: the Invisible Hand in Adam Smith’s terms. They have learned to be skeptical of efforts to regulate an economy or society as one might still regulate traffic on the street—robotic vehicles might eliminate the courtroom model from the streets as well. The more complex and complicated a system is, the better it is if allowed to evolve and develop, perhaps within guidelines. See Chapter 656, *Toward a Better Understanding of Our Human Understandings* for a short discussion of the discovery that this is so by the engineers and scientists in the first decades of work in “artificial intelligence”.

Let me close by quoting one form of the *Jesus Prayer* (see [https://en.wikipedia.org/wiki/Jesus\\_Prayer](https://en.wikipedia.org/wiki/Jesus_Prayer)):

Lord Jesus Christ, Son of the living God, have mercy on me,  
a sinner.

The above version is the one I usually pray in front of a Tabernacle holding the Body of Christ, in front of a crucifix, when entering a place of special holiness, or when I feel especially troubled.

Let me suggest a first draft of a *Jesus Prayer* more oriented to modern understandings of the explorable realms of our world:

Lord Jesus Christ, Son of the living God, have mercy on me,  
a human animal born in the natural world as a member of a  
species evolved from lower species and yet hoping to unite my  
humanity to Your humanity and my humanity to Your divinity  
in the World of the Resurrected.

[Readers interested in a little more detail about how I understand human knowledge can download: *Four Kinds of Knowledge: Revealed Knowledge, Speculative Knowledge, Scientific Empirical Knowledge, Practical Empirical Knowledge* [43]. Many other essays as well as other downloadable books are available on this website: *Acts of Being* at <http://loydfueston.com/>.]

## 658 Can We Understand God by Studying His Creation?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2083>. It was finished and uploaded on 2015/07/21.]

In Chapter 654, *Science and Naive Anthropocentrism*, I wrote:

Somewhere—I believe in *The Perfectibility of Man* [108], the philosopher, John Passmore, points out the real problem with belief in an all-powerful God: Such a God is consistent with any conceivable world. Only sloppy and ill-disciplined thinkers could seriously believe that the existence of a coherent, unified, and complete empirical reality argues against the existence of an all-powerful and all-knowing God.

The world is rich and complex, the entirety of Creation still more so. As part of my updated Thomism, I claim that the human mind is a set of relationships with all that lies around us and also inside our own bodies, which relationships form as we actively respond to all that stuff and those relationships. Also, over time, our understanding and recognition of what lies around us and inside us becomes more complete and more perfect. Our minds encapsulate some significant part of our environments whether we be nomads in the jungles of the Amazon basin or Jewish philosophers or atheistic physicists or Christian carpenters. And this is why the truth in Passmore's claim is only part of the truth and only from one viewpoint. We inherit some prejudices in the form of instincts selected over the history of our species and we learn some truths of various levels of contingency as our communities and our individual selves develop in response to the world. Our natures as self-aware, featherless bipeds with some substantial

reasoning abilities don't give us any direct access to transcendental realms of truth; our natures give us only the chance to engage in struggles to attain some truths which can be found in Creation—just where the Creator put them so that we can engage in those struggles.

Yet, the belief survived that there is a body of absolute, transcendental truths which can be grasped directly by a human animal otherwise a creature born into nature. Passmore thinks to be able to reason from “absolutely powerful God” to the conclusion that “any world is possible.” And, yet, Jews believe God to be one Person and Christians believe the Almighty to be three Persons. These beliefs arose in history as the result of different understandings of events perceived (or not) as revelations, but the concrete facts of history—as is true of any fact—can't nail down an abstract truth but they can point to such a truth. And such a truth about God's personal nature arises not directly from raw facts but rather from long-term analyses and contemplations of those facts and from efforts to live accordingly. That we can see the history of the Israelis and/or the biography of Jesus of Nazareth as pointing to truths about Creation and Creator is no less plausible that the idea that we can see the expansion of the universe by way of other raw facts subjected to different sorts of analyses and contemplations and—yes—efforts to live accordingly. Can it be true that “any world is possible” to a Creator who is a specific Person or a particular Community of three specific Persons?

One understanding of a mortal animal developing as a person is: a creature willingly (at least in potential) and knowingly (also at least in potential) living a story in which he can develop as he responds to various sorts of challenges, moral challenges playing a particularly important role. If God is a Person (as Jews believe) or three Persons (as Christians believe), then our world is one sort of a world we would expect Him to create—a world of evolution which can produce moral species, including a moral species of higher potential for understanding, a world in which at least some members of such a species can develop into the state of ‘person’.

It isn't legitimate for Jewish or Christian believers to engage much in theology which considers God as other than a Person or three Persons. Such ways of thought are a false form of openmindedness, equivalent to a claim that the Personal nature of God is a matter of chance—God is some kind of generic god-stuff and the personal stuff could have been different. Why would Jews or Christians wish to engage in theological thought in the way of pagans who think of the divine source of being as being that

generic god-stuff? (This points to a need for Christian thinkers to develop proper ways to speak of the Nature and Persons of the Triune God—I have no proposals at hand but acknowledge the legitimacy, given this lack, of sometimes engaging in some sorts of theology as if God’s nature were generic god-stuff.) Why would philosophers who are the residents of what was once a Christian civilization not realize that many residents of the West would be bound to think of God as one Person or three Person(s) and would be bound to think of Creation as one which would reflect in some way the Personal (including moral) aspects of such a God? And those aspects, not being contingent, can’t be assumed away in any meaningful philosophical or theological discussion. A Creation which is one of evolution at some level and of development at all levels, especially that of individual creatures, seems quite plausible given a Personal Creator and not just one formed to characteristics randomly chosen.

Such a world points back, not by way of rigorous logic but by way of a narrative and moral reasoning, at a God who is Himself Personal in some fundamental and non-contingent way.

True to Thomistic principles, we start with the world and ascend to an understanding of God (see the *Contra Summa Gentiles*, sometimes called the little Summa) or start with God and descend to an understanding of Creation (see the *Summa Theologiae*, also known as the *Summa Theologica* or simply the *Summa*).

# 659 What is Understanding? Again and Once More But Likely Not the Last Time

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2091>. It was finished and uploaded on 2015/09/15.]

Let me oversimplify in a useful way:

- Facts are local.
- Understanding is global.
- Knowledge is something of a bridge from facts to understanding.

And, yet, we should not imagine that facts and knowledge exist only to serve understanding. Nor should we imagine that understanding is fully, or even mostly, what can be found in a (pseudo-)Platonic scheme.

We live in a dynamic Creation, one driven forward by evolution and development. The trick for a Christian, for one who believes in an afterlife in the world where the resurrected share God's life, isn't to develop a set of schemes which can be applied to all things and situations to understand—such is a false understanding of understanding. The trick is to understand the story and not to reduce it to just some things that had to happen to compensate for a fall from a state of perfection.

When we have a story which works—and we currently don't, we work to integrate into that story new events and new knowledge of things and their relationships. When the story breaks down, we have to pick up the pieces, Biblical revelation and human traditions to the extent they remain

valid, and then we have to create a new story as did Christians from the time of Augustine (call it the Fall of Rome if you wish) to the High Middle Ages (1150-1300 or thereabouts).

In the succeeding centuries, Christians fell down upon the job. They fought Galileo, a man who was an orthodox Augustinian thinker and even more consistently empirical than was the great African. That was the problem. 'Empirical' means having to pay attention and respond to events and natural revelations which might be very disturbing. Most human beings, including Christian theologians and even saints, prefer to have a set of canned truths by which they can understand and even judge all of Creation. That's not real understanding. Even in mathematics, axiomatic systems aren't created from nothingness but rather distilled from years or even centuries of exploring specific areas of mathematics. Even this seeming ideal of idealistic thought is no such thing—great advances in mathematics have often come when a scheme of thought produced results which indicated the scheme needed to be expanded or enriched or changed in fundamental ways. I don't agree with those who see mathematics as a cultural activity but I do agree with a similar but grander view of mathematics being one area of activity of the human communal mind as it expands, enriches and complexifies itself—first of all, in response to reality, but then in response to the internal developments of that mind and the communities of which the mind is a part.

So, those thinkers such as Reuben Hersh and Raymond Wilder who see mathematics as a cultural activity, and argue intelligently for that view, are more right than wrong but not right enough. They aren't right enough because they have no reason to pursue a grander vision than simply understanding the community of mathematical thinkers—a noble task in itself but only part of the greater task of understanding all human communities as they enrich and complexify themselves in response to what lies around them. . . and then inside of them. Human understanding is the story of human individuals and communities shaping their selves in honest and faithful response to God's Creation.

As I see it, a higher level understanding which is the setting for all lesser understandings, comes from a proper perception of the world as a story, the world as being the universe and all creatures living, evolving and developing, according to the moral purposes of its Creator. This obviously can only happen if we pay attention to the universe, to God's creatures. As Aquinas told us:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures [God] made. . . St Thomas Aquinas' commentary on 1 Corinthians [3], according to a translation by Fabian Larcher, OP, and now available in hardcopy at the website of *Priory of the Immaculate Conception*, <http://dhspriory.org/thomas/english/>, which is a Dominican House of Studies in Washington, DC. It might still be available as a downloadable pdf if you search the Internet.]

Examine the creatures God made if you wish to understand the thoughts of God in His freely chosen role as Creator of this particular world in a very specific Creation. And then make sense of it in light of your understanding of the Creator God of Jesus Christ or another God or even Reason if you wish. In any case, the idea is to wrap the best available knowledge of your day and age in a narrative, purposeful and even morally purposeful to many of us.

# 660 We Need Moral Order, Not Self-satisfying Compassion

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2105>. It was finished and uploaded on 2015/10/28.]

One of the main themes of my writing has been a tripartite understanding of the human being, individual and communal, as mind and heart and hands. We think and we feel and we do.

The triad of mind and heart and hands is like the Real Presence in being somehow a way of speaking of a fundamental truth, a way of speaking which must be retained and kept in mind even as we learn more and speculate upon the deepest mysteries of Creation and the Creator. Speaking of specific ways of understanding “thinking and feeling and doing” (in Aristotelian terms or in modern neuroscientific terms) brings us a greater abstract understanding but does so by taking us a necessary distance from the more raw truth, perhaps the raw experience of created being in its relationship to its Creator. Speaking of some metaphysical understanding of the Real Presence such as the obscurity of Transubstantiation or the much more clear concept of the primacy of relationships over stuff is also to bring us to a necessary distance from the more raw truth. (A Christian may well believe that, when we share God’s life on the other side of the grave, it will be possible to experience being in its most concrete manifestation while simultaneously understanding that being in an abstract, detached way.)

If any part of the human being gains dominance over the others, there is likely to be trouble. To be sure, there are many individuals who are at least somewhat dominated by mind or heart or hands. That often isn’t a problem, though it would always be a serious problem when a major community is dominated by one of these at the expense of balanced human being. There

are signs in this year of 2015 that the major Christian communities and many other human communities, especially in the West, are becoming as gigantic, bleeding hearts—perhaps united to hands but not to minds.

It's the mind which anticipates, much more than thinking on the fly when the action happens. When a human being, individual or communal, is shaped properly by way of direction of a properly formed mind, heart and hands will do what is right or at least what is most clearly seen to be right. This right feeling and right doing shouldn't be simply a knee-jerk reflex to, for example, allow unrestricted migration at the expense of future generations and at the expense of a civilization. In addition, unintelligent charity might well put would-be beneficiaries in a worse position, such as the EU admission of refugees through Turkey—those people are living in tents in northern Europe, without adequate food or clothing, with northern European winter approaching.

And so I diverge to discuss a bicameral mind of sorts. In both the individual and the community, stability will often, and properly, lead to a dominance of a relatively rigid mind, one of rules. This mind will see the future as being essentially the same as today. Perhaps the village is growing and perhaps the kingdom is dealing with other realms which are hostile; yet, things are pretty much moving along a straight path. Until they aren't; until the wise men of the village grow lazy or morally irresponsible or until the village or kingdom moves straight while the path is curving or until the path disappears and a new one must be cleared through a wilderness. Then a more flexible mind is needed, one which looks outside of what is known and responds, well or poorly, to new conditions or even new understandings of old conditions.

During transitional periods of any sort, creative sorts of minds should be encouraged to come to the forefront. We should understand before we act or even before we unleash our bloody hearts upon innocent victims, and certainly before we try to restructure human communities in blind obedience to some sort of rules, even those of charity. Understanding during periods of great change might mean a re-understanding down to the very foundations of human understandings of created being and of its relationship to its Creator.

For example, most traditional moral thinkers, philosophers and theologians and the better sort of political thinkers and so on, think of morality in terms of pre-existing virtues and vices though the positive (at least partly 'mathematical') sciences have shown human beings are born with traits

arising from physical structures or flows of chemicals in the body. The love generally considered purest, maternal love, is largely mediated by physical interaction between the body of mother and embryo and then strengthened further by, for example, the flows of hormones as the baby is first put to the breast of the mother. Both the lust of the sexual predator and the love of devoted husband and wife are driven by sexual passions arising from hormonal flows and the complex and as-yet poorly understood actions of various brain regions.

None of this corresponds well to abstract schemes of virtues or vices, though something like a scale of virtues could be used as a way of training the young in moral behavior; yet, we must realize that even a simple scale will vary according to a lot of factors including the different levels of raw passions and inclinations of different peoples who have evolved in response to different problems and opportunities.

It would be desirable to apply creative mental energies to our situation, to a re-understanding of human being and its relationship to Creation and Creator. It might even be said to be necessary. In such a complex world, one where even moderate collapses can lead to great damage and a huge number of deaths as well as a loss of good standards of living for generations, we shouldn't just go off half-cocked on various military adventures or on the opening of the borders of complex human communities to people with drastically different behavioral and other traits. But we Americans have done such, thinking to protect ourselves by irrational attacks on some community defined as enemies by well-meaning leaders or by the all-too common scoundrel-leaders or by both in alliance. We have done such by opening the borders to those who seek a better life in highly developed countries rather than developing their countries as well as those suffering from unwise growth when their food supplies were dependent upon weather cycles and—this is a tough one—as well as those who are fleeing the chaos caused by utterly stupid and morally despicable behavior by war-profiteering parties in the West.

We in the West should feel ashamed of ourselves, even those who tried to stop some of this criminal behavior, for what we've done to various parts of the world—in a much more intense way since profiteering scoundrels and nutcases started directing American foreign policy following World War II. It's not that we Americans were morally pure before that, but even the crimes against the Amerindians were understandable in the abstract when set in the context of the sometimes peaceful and sometimes violent strug-

gles initiated by the beginning of agricultural and the resulting complex communities and inter-community relationships from the time of the “first farmers” (northern Syria and bordering regions of Turkey about 12,000 years ago). Nearly all Amerindians in North America were nomadic or semi-nomadic, that is, in the same situation as the hunter-foragers of Europe who were gradually pushed into oblivion or forced to adopt the new ways as small numbers of those “first farmers” came out of northern Syria and adjoining regions of Turkey, bringing domesticated crops and animals and ways of life which allowed great reproductive success—the creation of dense populations which came to dominance in acre after acre all the way to the North Sea and to the Atlantic. In putting our own country of the United States in historical and moral context, we could also consider conscious, immoral use of the advantages of more advanced development, such as the banana wars when the Wall Street financiers used the US Marines as a labor negotiation team; see the article on Smedley Butler at [https://en.wikipedia.org/wiki/Smedley\\_Butler](https://en.wikipedia.org/wiki/Smedley_Butler); Butler was the Marine Corps general who wrote *War is a Racket*, available for free download at various Internet locations. On the whole, the United States was acting the part of an immature country which had too much wealth and power for such an early stage of development, a juvenile delinquent of a country and still one nearly a century later.

As many Christian do-gooders follow the spurts of blood from their enlarged hearts, so did many Americans and most of the powerful and wealthy reach out with their hands for the goods of this world—including the goods belonging to other peoples in Nicaragua and Mexico and the Philippines and then Iran and so forth. Even such intelligent men as Teddy Roosevelt and Woodrow Wilson and John Kennedy, as well as Pope Francis and other current do-gooders, would have been far better leaders if they had learned the importance of good knowledge, of calm and orderly thought, of the appreciation of tomorrow. Much that is good has been destroyed over the past couple of centuries by a pursuit of what is allegedly perfect or would be more perfectly used by those with superior greed or higher self-esteem.

[Those who have followed my blog or have downloaded and read any of my books will know that I have been working to produce a Christian re-understanding at a fundamental level of human being and of all of created being. My available works along with download links are found in *Catalog of Major Writings by Loyd Fueston* [52].]

# 661 Turning Compassion into a Heresy

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2108>. It was finished and uploaded on 2015/11/09.]

Once again, I'll state a standard Jewish and Christian view of man: man can be usefully and truthfully seen as a creature made of mind and heart and hands. This points to state of unity which is not achieved by men in this mortal realm but might be achieved by the resurrected who share the life of God; after all, God, acting in His transcendence, is not separate in this way—His thinking and feeling and doing are as one and all that God does can be described, at least roughly—and in Thomistic terms—as acts-of-being. This theological claim of Christians (and perhaps Jews) is in agreement with the ways in which some neuroscientists speak of our bodies thinking, of our emotions and thinking and memory-formation being intertwined, and so forth. It is almost a cliché in popular or philosophical works by neuroscientists and others who study the human brain and mind that our thinking is distributed throughout our bodies—as certainly seems true of some athletes as well as dancers. Leave this enriched and complex way of viewing human being aside in the interests of making some valid points by thinking as if mind and heart and hands were well-defined and mutually exclusive 'parts' of a human being.

Those who have read any of my writings on human being will probably realize that I consider human beings, individual and communal, to be creatures of action at the point of the now—that is, creatures of acting hands. Heart, emotions and feelings to speak roughly, motivate us towards a state of moral order. Mind can be seen as living in anticipation of the future, guiding the development and shaping of mind and heart and hands. On

a minute to minute basis, we rely on thoughts already formed and encapsulated in habits of various sorts though those who do individual thinking as opposed to those who are smart by proper participation in communal thinking have to always be re-evaluating those habits or preparing to think new thoughts. In any case, a well-formed human being participates in the now by way of what I call, following St Thomas Aquinas by way of Etienne Gilson, acts-of-being which are complex acts partaking of mind and heart and hands.

Many Christians of the modern era, including Pope Francis, distort Christian beliefs, as well as empirical knowledge of individual and communal human being, by claiming we should always act to immediately relieve suffering—even when that suffering is self-inflicted and will continue for centuries if we act to relieve it, even when our acts of relieving the suffering of those far away will do further damage to a badly injured pilgrim Body of Christ. They rely on “God is love.” Yes, God is all-loving but He is also all-knowing (mind) and all-powerful (hands). To take part of our belief out of context and push it as if it were the fullness of revelation is to fall into an old trap: any truth taken out of context and stated too strongly or too consistently becomes a heresy.

Let me move to a practical discussion and use as an example the part of Europe’s immigration crisis caused by Africans from the Sahel, the belt just south of the Sahara. The Sahel is fertile most years but suffers through famines which kill humans and cattle when the monsoon rains fail on a partially predictable basis—predictions can be off by a year or two. Yet, the residents of the Sahel take advantage of the good years by reproducing and allowing their cattle to reproduce without constraint. In recent decades, they have learned that they can head to Europe to take advantage of the more rational individual and communal human beings of that region—when the bad years come. Pope Francis and likeminded folk think it wise and good to extend the welfare systems intended to cover disabled and unlucky human beings of established nations to the unwise or unlucky of all the world.

Unbalanced human being is dangerous—glorifying the absolute or even large-scale dominance of mind or heart or hands create different problems but all such distortions of human being lead to serious problems. The point I made in my title and which I wish to emphasize is:

A distortion of human being so that it doesn’t accord with

any of the major traditions of understanding the Bible and natural revelation is a heresy in the sense of being a rebellion against the Creator, a refusal to accept some aspects of what He created and of what He is teaching us about what He created. It's an act of rebellion.

In ending, I'd also like to point explicitly to something I've always implied and sometimes stated in one way or another: to a Christian or anyone else who believes in an all-powerful and all-knowing and all-loving God, there can be no real separation between what is real and what should be. At most, human being as it is in this mortal world of evolution and development and decay and death can be demoted to an imperfect manifestation of the human being which is truly an image of God, but it is a manifestation. There is no real separation between is and ought. God created a world in which innocent human beings suffer, often because of their own unwise acts or those of others, often because of evil acts by others. In Jeremiah and Lamentations, we read of God inflicting punishment (directly or by way of the 'rules' of His Creation) so that the most tender of mothers is driven to eat her own children. We can do much to improve this world—when we act in unison with the Creator and His Creation. We can do much to damage an evolving and developing world when we act against either mind or heart or hands, often that damage inflicting suffering, famine and disease and poverty, upon our own children.

# 662 Compassionate Christians or Enemies of Christian Moral Order?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2111>. It was finished and uploaded on 2015/11/10.]

I'll beat again on a drum, though perhaps a different region of that large and complex drum.

Let's imagine a Catholic confessional booth with a sign over the entrance:

If you feel good about it, it's not a sin. Don't bother to enter.

This is one of the possible sins against the Holy Spirit: To be willfully blind to your own sins and other wrongful acts and improperly developed traits. It would seem that some leaders of Christian churches see this as a proper attitude, or perhaps they're simply willing to define away any sins which cause anguish to human beings.

I'm not much of a rigorist and I think that there are great stretches in most lives when people should go pretty easy on their erring or sinful selves, sometimes stretches when a friend or uncle with a gentle manner can be a good guide or conversation partner. I think Christian thinkers and spiritual leaders have often been almost pathological in their obsession with sexual issues, condemning sexual passion in the undisciplined youth or others in a morally disordered age while wanting marriages to be fertile in all proper forms of love and also fertile in children; this isn't a realistic way to approach matters though I can't give any simple recipe for a better way.

Few can successfully pursue the way of perfection in the way of a cloistered nun headed for sainthood, not when the world is so messy and the true goods of the world can be so easily misused.

Yet, and yet again, we should hunger for perfection even when our accumulated habits and our moral responsibilities get in the way. Yes, I am saying that moral responsibilities, such as those of a parent, can often prevent the pursuit of greater moral growth. Yet, and yet again, we should hunger for perfection. And we should remember that God wants us to so hunger and to follow the way of perfection to the extent possible in our given lives.

Why is it that such a prominent leader of the church as Cardinal Walter Kasper, apparently with some significant support from other prominent leaders such as Pope Francis, can seriously suggest that human beings living in a state of sin (sometimes as a matter of certainty and sometimes as a matter of fallible human judgment) and not receiving a clean absolution should feel free to receive communion on the strength of their own feelings: I feel right about freely engaging in (fill in the blank) behavior though it has been consistently declared a matter of serious sin by the Christian Church and—usually—by the authors of the Hebrew Bible as well.

Let me be clear: despite some wrongfully formed attitudes and beliefs, Catholic leaders and other Christian leaders aren't infallible except on some very specific matters and, it would seem to me, that most of that infallibility is used up in comments upon the Creeds and a few moral issues and isn't exercised properly in updating understandings of those core truths of Christianity—see *An Essay on the Development of Christian Doctrine* by John Henry Newman. And, in fact, as a Sacramental Christian currently in communion with the Western Catholic Church, I largely agree with the moderate Orthodox claims that the Pope's infallibility is that of an arbiter who settles disagreements within the full community of Sacramentally consecrated descendants of the Apostles. As a specific and concrete example, the Western Sacramental Christian Church, which calls itself 'Catholic', teaches it's a witness to a marriage which involves only three parties: the man and the woman and God. The Church, through some fourth party approved by a bishop, can't be sure at the time of a wedding or at the time of a request for an annulment that any valid marriage took place or didn't take place. Some men and women who didn't receive an annulment and think they should have might be right. Some who received an annulment maybe shouldn't have received it. This is all greatly complicated by the

different understanding of the formation of a marriage held by the Eastern Sacramental Christian Church, which calls itself ‘Orthodox’. To some extent it doesn’t matter so long as all involved members of the Christian community act in good faith, but it’s the community which is always involved even when it isn’t a party to a specific act, sacramental or otherwise. Some accept this and don’t receive communion if they enter a marriage they think valid but isn’t approved by their branch of Sacramental Christianity.

On the whole, we have a muddle in which many suffer, unavoidably or otherwise. Cardinal Kasper, explicitly, and Pope Francis, implicitly by way of supporting church leaders sometimes even more radical than Kasper, propose that we declare God to be so ‘merciful’ as to discard all claims of justice, all demands of the rules which are part of Biblical or natural revelation. This is said to be a way of easing pain, as if neither man had ever known of the claims of Christians and others that the pains of a well-formed, or even partially formed, conscience in a sinful man or woman can be greater than even the pains of desires denied; and those pains of conscience might well be the salvation of many a sinner. Jesus didn’t say to the woman accused of harlotry: “Go and feel okay about your behavior.” He said: “Go and sin no more.” Jesus offered mercy to sinners who repent, not affirmation of their sinful behavior.

If God had wanted us to be perfect in this world, He would have created a different world in which creatures other than human beings would have lived. Instead, He created a world of evolutionary and developmental processes in which human beings have evolved and developed, and still do so. We typically struggle with the various sorts of imperfections inherent in such processes.

For the most part, we should aim at a moral state which properly integrates us into the human communities which we wish to ultimately be part of. The description of such a state would be described by mathematicians as “global” while individual traits contributing to that global state would be “local”. This entire way of understanding complex entities in local and global terms needs to be properly re-formed to the purposes of more qualitative analyses (which re-formation has been partially done by mathematicians and others). For now, take “global” and “local” in an intuitive way and consider that they might seemingly conflict. Think of a literal globe. Each point on the surface of that globe lies on a tangent plane which is describable in Euclidean terms while the surface of the globe as a whole follows an *Elliptic geometry* (see

[https://en.wikipedia.org/wiki/Elliptic\\_geometry](https://en.wikipedia.org/wiki/Elliptic_geometry)). We are left with interesting mathematical problems, quantitative vs qualitative, which might hint of more general problems: one such problem being the joining of each of point, or probably small region, to neighboring regions. Unity of the sort found in Jesus Christ is our goal and not just piece-wise perfection.

This way of reasoning has frightened some mathematicians because of the implication of qualitative reasoning (in my terms: abstract being) which lies behind the quantitatively rigorous reasoning of traditional mathematics. We should not be afraid of what might be the most important revolution in human thought since the development of empirical reasoning, reasoning conditioned—though not imprisoned—by empirical reality.

The above are the issues raised by that ultimate constraint on what human beings, including popes and bishops and other religious leaders, might wish to believe: The Word of God is truth. God has spoken in the Ten Commandments and He has spoken in His actions as Creator. (To God, thoughts and feelings and acts are but one and indivisible.) It is reality which properly constrains us; we shouldn't let ourselves be imprisoned by limited or defective human understandings of that reality, but we should honor tradition as being some sort of plausible understanding of that reality and possibly a fully valid understanding of some parts or aspects of that reality. If we modify tradition or reject parts of it, we should do so very carefully and for better reasons than to accord to the standards of a no-longer Christian civilization in decay or to avoid speaking difficult, pain-causing truths.

# 663 Sacramental Evolutionary Theory

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2116>. It was finished and uploaded on 2015/11/17.]

Sacramental Christians need to have an understanding of this world which is compatible with sacramental Christian beliefs. You can't believe the Creator is present, let alone Present on the altar, when you have an understanding of the physical world which is inconsistent with such a Presence.

A particularly important part of the physical world is life, which evolves and develops. Christian understandings, theological and philosophical and empirical, should be not just vaguely (and falsely) "not in conflict" with science—empirical knowledge in general. Empirical knowledge concerns matter and the various relationships of raw forms of matter and complexly organized matter. Matter, that is objective stuff which can engage in relationships of a creaturely sort, is one of the necessary components of Sacraments as we know them, as well as the sheer stuff of a sacramental world, the world created by a God all-powerful and all-knowing and all-loving and the world glowing with His presence.

Christian understandings of a sacramental world and of Sacraments should encapsulate evolutionary and developmental understandings of life including human being as well as relativistic understandings of time and space, quantum physical understandings of matter; Christian understandings should encapsulate all relevant understandings of being, concrete and abstract.

Peter Frost, the Canadian anthropologist, has written an essay, *The Fellowship Instinct* (found at <http://www.unz.com/pfrost/>

the-fellowship-instinct/), in which he discusses the emergence of human religions within a general Darwinian framework. As a believing Christian, I think his analysis is spot-on so far as present knowledge goes and, yet, I also think he comes to the wrong conclusion:

In short, Man has made religion in his own image, but religion has returned the favor. In a very real sense, it has made us who we are.

Frost is apparently an ex-Christian and perhaps was never a sacramental Christian, a believer in the fundamental sacramental presence, that of God in His Creation, including the processes and results of evolution and development. But few Christians are such believers; I guess Frost can at least claim a consistency between his (non-?) beliefs and empirical reality as (naively?) described by well-established facts and plausible theories about physical phenomena. Do phenomenological understandings of facts exhaust the possibilities? I guess they can if one accepts a simple and positivistic version of Occam's Razor. Occam's Butcher-knife? In joking a little, I don't mean to show disrespect since I strongly believe, as a flesh-and-blood man and as a sacramental Christian, that physical reality has to be fully accepted as a part of God's Creation. I part there with Frost and some other empirical thinkers but I part in many ways and at many places from others who claim to be Christians, even within a sacramental tradition.

Where is it that I part with Frost? He accepts empirical reality and so do I, but I consider it part of a greater Creation, a greater Creation which shows even in the possibilities of richer narratives making sense of this empirical reality. My reasons for this viewpoint are as much shaped by my understanding of abstractions, mathematical and philosophical and other, as by my understanding—and acceptance—of Christian revelation.

Anthropology would perhaps incline a thinker to see religion in terms of what it does for men, as a way of understanding the world so to increase one's chances of survival and of successful reproduction. I agree that these are deep and valid truths, but I fail to see how such truths tell us there are no other truths and no greater truths; I fail to see how survival and successful reproduction are in conflict with the God of the Hebrew patriarchs. In particular, the possibility of truth-bearing and truth-revealing narratives arise from an honest effort to deal with reality in its pleasing and cruel

aspects alike. I could even propose the insight that men began to tell stories in his image and those stories shape us.

Things exist and one thing is here and another is over there, but those simple factual truths don't argue against the higher truths of geometry and other forms of abstract reasoning and that raises the question: What is an abstraction? I've argued in various ways against the separation of concreteness and abstraction, considering such a separation to be a more general form of the dualism between brain and mind, body and soul, city and human being of a communal sort. A brain makes its own mind, but in an odd way—by creating mind-like relationships within itself and with its greater body and with all that exists in its environment; thus it is that I would say a mind shapes its own brain. A mind is the evolving and developing relationships which bring the brain into order; a mind is the story of that brain and is as real as the brain-cells themselves. Relationships create stuff (almost straightforward restatement of quantum field theory) and that stuff creates new relationships which. . . Evolution and development are aspects of a greater narrative of reality which we see as through a glass darkly.

So it is that I can accept the fullness of evolutionary biology in my understanding of human being while keeping my sacramental Christian beliefs. I don't see a conflict. If Christ is more fully and more perfectly present in the bread and wine on the altar after they are consecrated by a validly ordained priest, why should He not be present in His brothers and sisters, in their genetic and somatic stuff as shaped by evolution and development? Why would we expect religious belief to somehow be brought about as truths descend from another realm of being and enter a human being of some generic stuff barren of religious inclinations? Or should we expect flesh-and-blood human beings to have brains which function in the way of machines finding truths of a logical sort? It be doubtful that God be an idea discoverable, computable?, by a Boolean machine.

Why should we expect that God can exist and some form of higher religion can be true only if Creation reflects dualities originally proposed by those who, as one example, thought matter was inert? It was those dualities which needed to be eliminated in the interest of a greater unity of created being, one which can—if only very speculatively for now—be produced by a simple acceptance of the principle of modern physics that relationships are primary and generate stuff.

Now the punchline: such an insight is hinted at even in the Old Testa-

ment and stated clearly from one particular perspective in the writings of the school of St John the Evangelist. Creation exists because of the active love which God has for it. God didn't create the world and then choose to love; the world came to be because God first loved it. And once creation existed as a result of divine love, it began to form all sorts of relationships with itself and with its parts and with its Maker. Once the brain exists as a result of the love of self which needs to identify what is not self, it begins to form all sorts of relationships with itself and with the other parts of the greater organism and with all the things around it and with its Maker. Spirit is to be explained (not explained away) by an understanding of the dynamic nature of matter and the relationships which had created stars and the planets which orbit stars. Soul is to be explained by the dynamic nature of the stuff of a human individual. Mind is to be explained by the dynamic nature of the stuff of a human brain.

Relationships are primary to stuff and create and shape stuff. That stuff forms relationships and new things can come to be. The inclination to worship the gods or the God is the result of evolutionary and developmental processes working to produce individual and communal human beings adapted to a world in which the relationships are such as to imply, strongly in my opinion, the existence of divinity of some sort, quite plausibly a Creator who is a different sort of relationship, one which is a supreme act-of-being in Thomistic terms, the ground of other acts-of-being, of all other relationships as well as created stuff.

Why do we Christians try to see what is 'pure' and 'perfect' in our relationships with God and in our thoughts about God or even about mathematical truths? Is this any different than an evolutionary biologist rejecting God because evolutionary processes have shaped the human being who speculates about God or longs for God? What can be better, ultimately more pure and perfect, than what God has created for His purpose of providing companions for His Son? If God were to create a world of evolution and development, why wouldn't we expect the inclination to be religious, the inclination to see the divine, to be the result of evolutionary and developmental processes? In a sense, nothing has really changed from the theological and philosophical arguments in ancient Greece or Medieval Paris, but we do have far better knowledge of empirical reality, knowledge which allows us to make some greater and better sense of it all, whether we choose to make atheistic sense or pantheistic sense or Jewish sense or Christian sense of it. I would argue that sacramental Christians with the courage

to be open to empirical knowledge and the reasoning power to make sense of it have perhaps gained an advantage in a world of evolutionary biology and quantum physics.

Christians should, and easily can, accept what is impure and imperfect in this world in light of evolution and development. It's not a world of devolution from a pair of ancestors living in a state of grace but rather a world of evolution from a confusion of ancestors climbing down from trees and then rising from their knuckles. It would seem to me that a sacramental Christian is bound to see empirical reality in this light; after all, don't we sacramental Christians claim to see Christ as truly present in the consecrated bread we chew and the consecrated wine we swallow? We are rising above our evolved animal nature, not in the sense of becoming something different but rather in becoming what is potential in the animal life of this world—a creature sharing the life of its Creator, a Creator who has created us and sustains us.

We claim to see wheat and grapes as becoming the Body and the Blood of the Son of God. Why can't we more readily see body and blood, including genes, as being part of the fundamental stuff, the "only" stuff of a Christian believer? It's really not the stuff that matters but rather the relationship of God to the stuff, though that relationship probably requires certain types of stuff. Still, the stuff can be seen as a focus of that relationship and not as something existing independently of its most important relationship. God can raise sons of Abraham from the rocks of the field. He can make bread and wine the stuff of the human body and the human blood of His own Son. He can create true believers, friends of God, by evolutionary processes working through our DNA and RNA shaped from the strange matter described by quantum physics and inhabiting the strange spacetime described by general relativity.

# 664 Christianity and the Elites of the 20th Century and Beyond

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2124>. It was finished and uploaded on 2015/11/24.]

In *The Barbarian Conversion: From Paganism to Christianity* [34], Richard Fletcher writes of the very prominent role played by aristocratic families, even royal families, in the conversion of the European barbarians to Christianity. The missionary monks and bishops and priests were often from powerful and wealthy families of Ireland and England and then Francia (modern-day France) and the various kingdoms in other parts of what became Catholic Europe—I don't know what the story was in Orthodox Europe. The royalty and aristocracy of Western and Northern Europe supported the various saints—often their brothers or cousins. Some of those saints of aristocratic (warlord) blood were among the roughest and most dedicated missionaries in Christian history. It is important to realize those aristocratic evangelists were very well-educated, an aristocracy of the mind as well as of the blood. Commoners would not have often had access to education at the level of those of the nobility, but it's important to remember that the likes of Boniface, Apostle to the Germans, made the most of their opportunities; there aren't so many modern Christians, from any backgrounds, who make a serious effort to acquire the best learning of our age.

In at least their public behavior, the peoples of Europe followed their kings and counts and dukes, and their monastic and priestly relatives, into the Christian Church, though often continuing many of their old ways of belief and behavior. While there was a lot of brutal politics and ambition involved in the decision of, say, Saxon warlords to adopt the religious

faith of the powerful and wealthy Franks (such as Charlemagne), much of what happened involved deep and strong conversions on the part of sons of kings and earls whose sons and nephews were often very well-educated and became monks or priests or very devout rulers. These men had a great influence on the men of the surrounding barbarian tribes. The common peoples, simple farmers and wealthy merchants alike, followed their Romanized or barbarian rulers into Christianity, but even in areas where most accepted baptism with indifference or out of purely materialistic desires, those conversions would often result in strong faith in a generation or two.

I hope I haven't distorted a very complex history too much by the above brief telling, but I'm going to use it as background to speak of the situation of Christianity in the modern world, a world where the wealthy and powerful and famous can have great influence over the minds and hearts and hands of the other people and peoples in their communities, a world where that elite is decidedly non-Christian if not actively anti-Christian.

The situation is now very complex. We now have a variety of writers and commentators and athletes and politicians as well as different sorts of teachers who can help shape the beliefs and feelings and behaviors of those they touch in any way. Our modern elites, in the sense of those having some sort of serious influence over others in their communities, include even popular musicians, though it would seem that religious leaders have little such influence and this may be true also of the local sorts of leaders labeled as "town-fathers" (or their maternal counterparts). We look to 'stars' who shine worldwide or at least nationwide.

Not many among these elites of political leaders or entertainers or the few among religious leaders act or speak to endorse Christian ideas, other than the occasional—and usually despicable and sometimes blasphemous—attempt to claim God has endorsed American hegemony and exceptionalism. This is particularly strange when American hegemony and exceptionalism are pursued despite all damage to other countries and peoples, even the peoples of the ancient Christian communities of the Middle East. Rather than the devout, semi-barbarian Charlemagne or even saintly kings such as Alfred of Wessex or Louis IX of France, we have the Bushes and Clintons and Obama; even Cheney and Baker and Albright and Kerry. We also have the pop-music queens and kings; the wig-stands of the so-called news-programs; the stars of movies about comic-book characters I left behind at the age of 12. We have Stephen King with his retro-paganistic and demonic view of evil in an age when mainstream Christians have not made

peace with Darwin and Einstein and are susceptible to corruption by such mental and spiritual trash; authors of thriller novels in which brave young men and women take wild risks with the lives and property of many to save the world from some implausible danger—and earn fame and promotions in the process. We have teachers and school administrators who disdain memorization so as to leave plenty of mental space to be filled with pop-music lyrics and sports statistics. These are the elite who have shaped and misshaped and refused to shape the minds and moral characters of a once Christian people of the West; the members of this elite are also the main representatives of that West to the other regions of the world.

Western Civilization and Western Christianity are tied together, bound as perhaps body and soul but more plausibly the greater body and its central organ. When the Western elite went rotten, Christianity was in trouble—at best it became soft and submissive to the corrupt elite as they sought wealth and power and often seemed to be deliberately working to cut all ties to Jesus Christ and the churches which carry forth his teachings, but Christianity hardly needed enemies when it had leaders and other adherents who seemed to have trouble separating God's commandments from the push for great expansion of Western political and economic power over all peoples in the world. In other words, the religious leaders—Popes and priests and ministers and lay authors—were part of that elite of Western Civilization which did so much damage to the Christian peoples they were claiming to serve. My particular mission has been largely directed to one of the great failures of the leaders of Western Civilization and its primary organ, the Church: the failure to update Christian thought, indeed all Western thought, to properly reflect both inherited truths and and new, fact-based understandings of this world.

American Christianity, in particular, is a simple version of the faith; even sacramental Christianity (Catholic and Orthodox and perhaps a few small communities from ancient churches in the Middle East) in the United States is presented to its members and to the general public as generic Christianity (whatever that might be) with priests in fancy dress and some strange rituals which seem to involve magic. As Rabbi Neusner, a reliable and friendly outside observer of American Christianity, has noted: Protestantism involves an extreme individualism incompatible with Biblical teachings about salvation as a member of the People of Israel (for the Jews) or a member of the Church (for the Christians) and American Catholics are essentially Protestants. The universe has never been re-understood as the

Darwinistic and Einsteinian stuff of a sacramental world; human being has never been re-understood as an individual nature and a communal nature which have evolved and developed in this physical world. This is a task which would require the efforts of a true elite, scientists and philosophers and poets and novelists and film-makers and musicians. And, to use the last as an example, we don't need elevator music but rather music grand enough to lift the soul, lift us not from a fallen state but rather from a state of tree-climbing or crouched knuckle-dragging.

I most certainly am not denying the validity of the sacraments in American Sacramental churches, Catholic or Orthodox or otherwise, but I am denying there be any richness of belief in the Real Presence on the altar or in the hymns which leave the mind and heart uninspired. When I write of "richness of belief," I'm not denying that many believe: I'm a Special (Lay) Eucharistic Minister and I can testify to the belief showing in the facial expressions and bodily postures of at least a substantial minority of those who receive communion in my parish, an ordinary parish with a typical American population (carpenters and machinists and small businessmen, teachers and engineers and doctors). I'm not denying that there are some hymns being sung which truly praise God as He should be praised. I am denying that there is that richness which comes from a basic substance of thought and art and music which speaks truly of God and His Creation, as does the Bible and the writings of the early Church Fathers used by the Medieval evangelists of Europe—though it be likely it was the evangelists who understood (and misunderstood) those sacred writings and their audiences took on faith the testimony of those impressive men. Similar comments can be made about most fields of human endeavor: architecture and sculpture and even home decorations.

Some Christians can develop a deep and rich understanding of Sacraments, especially the Eucharist, which is based upon not only the Bible and traditional teachings of Christian churches but also upon a plausible understanding of God's Creation: time and space and matter, including matter come to life, understood in terms of rich Christian thought and art. Others, probably the vast majority, need to trust in various elites who have such a facility or least a convincing facility with statements of such an understanding.

We have no such understanding and no such elites to develop and advocate and teach newer and richer understandings of Christian teachings. In particular, we obviously have no elites who can plausibly set the Eucharist

in the context of the reality we know and which is well-described by the descendants of Einstein and Darwin, a reality which is seen as part of a greater reality, our world as part of Creation. If we have no way of thinking or speaking of those asteroids and planets being visited by space probes as part of the Creator's story which is this universe as a morally ordered narrative; if we have no way of thinking or speaking of viruses and rattlesnakes as well as pretty little girls and energetic little boys as being creatures of that Creator and characters in His story; if we have no way of speaking or writing of God's relationship to bread and wine and the changed relationship which occurs when a validly ordained priest consecrates them as the Body and Blood of Jesus Christ; then we can do little better than wave our hands spastically as we claim, without any rational justification, there's no conflict between 'science' and 'religion'. We have no worthwhile Christian literature or art to set against the non-Christian or anti-Christian works of recent centuries in the West. (Would such works have been produced if the Christian leaders and intellectuals and artists had been doing their job as was true of the generations of Christians from the Apostolic Age to the Medieval period when German and British-Celtic and Slavic barbarians were evangelized by those fluent in a rich and substantial Christian thought and language?)

We have, in fact, split what is studied by 'science' and even is created by architects and painters from the beliefs and acts of Christianity, which is to say we've split what is united in a sacramental universe. Sacraments, with a capital 'S', aren't acts of magic which unite metaphysically distinct stuff and spirit. Such Sacraments enrich and deepen relationships already existing, the relationships between Creator and what He has created. In traditional terms: Grace doesn't destroy or replace nature, grace completes and perfects nature. Sacraments with a capital 'S' complete and perfect a sacramental nature which is the proper study of evolutionary biologists and the proper matter of chemical engineers and road-builders.

The problem lies with the need for intellectual sophistication, a sophistication dependent upon both knowledge and a well-disciplined mind—not necessarily a creative or brilliant mind. Creativity is needed as well, but not in the large—a few creative thinkers can guide all of Christianity in integrating reality (such as Darwinian ideas of the origin of human beings and Einsteinian ideas on spacetime and quantum ideas on the nature of matter) into a Christian worldview.

Christianity may well have started out partly by way of appeals to the

simple of mind and simple of heart and poor of hands—‘simple’ doesn’t mean ‘stupid’ though it might mean ignorant in the sense of uneducated. This simplicity was more a reflection of the communities of the time and place of Christ’s Incarnation. As the world of men became richer and more complex and the natural world was investigated and found to be also richer and more complex than was thought, as human communities came to include ever more thinkers with well-developed minds, as those communities and thinkers built upon past achievements, Christians needed to adjust according—after all, we claim this complex and rich world to be the work of the God of Jesus Christ. Why shouldn’t we try to understand it and communicate it in words and pictures? Why shouldn’t we feel a need to properly evangelize the citizens of such a complex and rich world.

# 665 We Modern Christians Destroyed the Concept of Truth Along with Our Children's Minds

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2199>. It was finished and uploaded on 2016/03/25.]

Rod Dreher posted an interesting essay on March 23, 2016: *Millennial Landslide* at <http://www.theamericanconservative.com/dreher/millennial-landslide-religion-secularism/>.

I'll start with a snippet of a quote he provided from another source:

The percentage of Americans who prayed or believed in God reached an all-time low in 2014, according to new research led by San Diego State University psychology professor Jean M. Twenge. [From the short article, *Fewer Americans Now Pray*, found at [http://newscenter.sdsu.edu/sdsu\\_newscenter/news\\_story.aspx?sid=76091](http://newscenter.sdsu.edu/sdsu_newscenter/news_story.aspx?sid=76091).]

A few paragraphs down in that same article from the San Diego State University newsletter, we read:

This decline in religious practice has not been accompanied by a rise in spirituality, which, according to Twenge, suggests that, rather than spirituality replacing religion, Americans are becoming more secular. The one exception to the decline in religious beliefs was a slight increase in belief in the afterlife.

"It was interesting that fewer people participated in religion or prayed but more believed in an afterlife," Twenge said. "It

might be part of a growing entitlement mentality — thinking you can get something for nothing."

Dreher discusses this study and some other studies as well as a book he'd read recently and begins to come to a conclusion by claiming:

The point of the book [*Lost in Transition: The Dark Side of Emerging Adulthood* written by Christian Smith, et al. and published by Oxford University Press] is not that Millennials are bad people, but rather that they have not been given any clear way to determine what is right and what is wrong, and how to use their reason. So they fall back on what feels right in a given moment. We have thrown our kids into the deep end of a pool, but failed to teach them how to swim.

Dreher's essay ends with these paragraphs:

This is who we are. This is who we have raised our kids to be, whether we intended to or not. Smith et al. warn against "doom-and-gloomers," though I'm not quite sure why, and they also warn against older adults who say, "Aww, that's how kids are, they'll grow out of it." That's a dangerous complacency, they say. And they also warn against drawing firm conclusions based on anecdotal data. They say there's a lot of bad journalism out there that sees, for example, young people volunteering for political campaigns, and concludes, "See, the kids really are all right. They're engaged!" The sociological data do not remotely justify that conclusion.

It is not going to get any better in the foreseeable future, only worse, and more difficult. This is why we orthodox Christians who want to resist the spirit of the age, and who want to raise kids able to be resilient, need the Benedict Option. Church youth group, parochial or religious school, and church on Sunday is not enough. Not remotely enough.

I'd suggest that all of us who call ourselves 'Christian' should look into the mirror if we wish to see the real malefactors in this problem of confusion of the very concept of truth. There is a clear case of a particular issue where we Christians have fudged the concept of truth to avoid facing up

to a difficult and necessary re-understanding of God's Creation. And all of this distortion of truth by Christians began when the West was truly Christian; any related distortions of truth by post-Christian secularists is only a continuation of errors and crimes began by Christians.

In *The City of God*, Augustine of Hippo discusses the origins of the human race and makes a point which seems obvious. I'll state that point in my terms: Either man arose as a creature by natural processes within this concrete world which is part of God's Creation or else he was a special creation inserted into this concrete world.

Augustine, who had also noted that the earth was immensely old—far beyond the number of years in a literalistic Biblical chronology, chose to go with the idea of a special creation. Stanley Jaki, Benedictine priest who was a physicist as well as theologian and Bible scholar and historian of human thought, said that Augustine's choice was the most important and most damaging act of intellectual cowardice in history. I would add, though I don't know if Jaki would agree, that Augustine made a choice for multiple truths, one truth for the moral and religious dimensions of human life and one truth for the concrete and practical dimensions of human life.

We speak of decisions about sexuality in ideological (not truly 'idealistic') terms while scientists, not villainous in any way, are nibbling away and connecting sexuality and other aspects of human being to their biological foundations. For example, as I discuss in Chapter 316, *The Demonology of Sexual Behaviors and Preferences*, infectious agents can alter our intelligence levels, change some of our personality characteristics, and—likely—change our sexual habits and behaviors.

In general terms: Are we a race trying to recover from a great fall from a state of angelic grace? Are we a race trying to balance ourselves as we rise from our knuckles?

Our ancestors had chosen the first option but masses of empirical facts have pointed to the second option as the truth. But our understandings of our own selves, individual and communal, as well as our hopes rested upon that first option. We have tried to resolve the resulting tensions not by facing up to the factual nature of God's Creation but rather by claiming to have access to a realm of truth which somehow is disconnected from the world in which we live. In this realm of the spirit or something of the sort, we see purposes and futures which are impossible to reconcile to human history and to the factual reality of our bodies.

After generations of self-delusion and hypocrisy, we have reached such

a bad state that the young people of the West are paying the price. They know not truth; they are vacant in their moral selves to a far greater extent than even Pontius Pilate. And all we Christians can do is lament their unwillingness to accept our irrational and hypocritical resolution of the conflict between our claimed beliefs and the facts of this world we claim to be the work of God. Clearly, an awfully botched work because God's choice of evolutionary and developmental processes is in conflict with our claims to the real truths of God's Creation.

The young people of this age are left with no understanding of truth because they've seen through our lies, our hypocrisies, our acts of cowardice, but they have no resources to rely upon to develop a better understanding of truth and, as a result, they have no chance to develop a better understanding of Creation including that small but important work of God which is human being.

# 666 Adaptation as Truth Discovery in Creation, the Christian Viewpoint

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2210>. It was finished and uploaded on 2016/04/22.]

What is truth?

Where is truth to be found?

There are a few starting points for a Christian willing to consider the opinions of Thomas Aquinas and all the great thinkers before him as well as opinions derived directly from the works of the modern scientists including sometimes just their empirical or mathematical findings and sometimes their opinions as to the meanings of those findings.

- We must hold to an intelligent understanding of the Bible, including some generally agreed-upon ways of re-understanding the Bible in the event of new historical or scientific knowledge indicating a problem with our initial understanding.
- We must hold to some creed with the substance of the *Apostle's Creed* or, roughly equivalent, the *Nicene Creed* which is a distillation of the meanings drawn from the Bible regarding some very important theological and anthropological issues.
- We must center our attention, that of historians and physicists and sculptors and musicians and many others, upon God as Creator, which means we must center our attention upon God's acts in Creations (His effects in Medieval terms). From Einstein and Darwin, as well as from

Tolstoy and Newman, we can learn how to think the thoughts of God in His role as Creator.

I haven't put a lot of time or effort into the above list, though I've been writing for years about the individual items and the entirety of belief and thought which is implied by the last item, but I'm sure it provides a pretty good foundation to the claim I'll make without being able to fully justify it for now: knowledge, including those bits of knowledge called truths, are not discovered by some sort of pre-existing mind nor do they flow into such a mind from some realm of transcendent truths. Knowledge comes as a result of a process of mind formation, a process by which neurons and networks of neurons adapt themselves to what exists by responding to it—'responding' being an active and sometimes aggressive process.

We shape our minds to what happens in the physical and social and political realms. We learn how to do this, we take the shaping to a new level, by studying what Heisenberg and Dirac taught us about the true nature of matter for various reasons including the construction of a better understanding of the Eucharist and other Sacraments; by studying what Robert Nisbet taught us about the importance of (traditional and not 'imposed') authority in forming healthy and sustainable and non-exploitive societies that we might better form the communities which are the parts and whole of the Body of Christ; by studying what the writings of the Fathers of the American Constitution and their opponents—especially the Anti-Federalists—taught us about the nature of government that we might understand what has gone horribly wrong in the United States; and—of direct relevance to my current efforts—by studying what Riemann had to say about seeing the 'shape' of complex entities in terms of abstractions of geometry and algebra and analysis (calculus).

All the things of this world are thoughts manifested by God so that they might attain a creaturely sort of freedom. But we shouldn't think that God just thinks of individual entities and brings them into existence as freestanding. The objects of this world are the results of active thoughts of God and those active thoughts are part of a coherent, complete, and unified group of thoughts which are this world and, in a still grander way, are part of a coherent, complete, and unified group of thoughts which are all of Creation.

Let me engage in a very preliminary case study, one I'm now working to greatly expand in a book I hope to publish before the end of 2016; the

title, for now, is *The Shape of Reality*.

Webster's 1913 tells us that manifold means, "Various in kind or quality; many in number; numerous; multiplied; complicated." As the Psalmist proclaimed in praise, "O Lord, how manifold are your works." Mathematicians along with scientists and others have to borrow words and they have borrowed 'manifold' for a well-defined technical concept:

In mathematics, a manifold is a topological space that locally resembles Euclidean space near each point. More precisely, each point of an  $n$ -dimensional manifold has a neighbourhood that is homeomorphic to the Euclidean space of dimension  $n$ . [See *Manifold* at <https://en.wikipedia.org/wiki/Manifold>.]

Don't worry about the mathematical details. The above quotation gives a summary of a disciplined and useful definition similar to the idea contained in the praise of the Psalmist. As an analogy to that mathematical definition, a community is a manifold and the members are the point-like regions which have certain well-defined properties of their own. More simply, the surface of the earth is that of the sphere and, for example, demands use of some elegant and difficult analyses to discover the shortest path between New York City and London. Yet, small regions, such as the town in which I sit, can be accurately represented by maps of a plane and the shortest distance from the clock tower at the Ludlow Mills to the upcountry Congregationalist church can be accurately determined from one of the maps with a simple calculation reducible to drawing a line along a straight-edge. [In fact, you can find the shortest distance of the surface of a globe by stretching a string between the two points, but this isn't of much use in most situations.]

End of case study, sort of. Now I'll explain how it is a case study which supports a Christian understanding of adaptation as truth discovery in Creation.

Christians believe in order though there is no Biblical or Creedal dicta limiting the forms of order in this world nor they ways in which they are established.

Some thinkers believe that order must be present and have always been present. It must have been explicitly created by God. Mind and moral character, maybe the human being in his entirety, must be a special creation. The higher Pagans, as you could label the likes of Plato and Aristotle, had a similar set of beliefs though many pagans followed what is probably the

natural instincts of men from the time that someone first tried to make greater or global sense of it all. The world stands on its own even in traditions where it was, for example, made from the body of the Father of gods murdered by his own children. God has to interact with the world, with all that exists in any other possible realms, in the same way as creatures, though Zeus had more power than the lesser gods, even Athena, and much more power than mortals.

Christians think of God in His relationship to the world as primarily Creator, the active source of being, and only an actor in the mortal sense by His own free will. (Of course, God could have created or not by His own free will but, having created a particular world, He was bound by His own initial acts, an insight slightly deformed by ancients as an after the fact covenant in analogy to a human agreement.)

We now know, by way of quantum physics and other physical sciences, that God created a world not fully contained in the realm of concrete being, a world in which concrete being seems to be somehow shaped from a strange and abstract form of being.

We now know, by way of evolutionary biology and related sciences, that God created a world subject to evolution and development and not fully contained in any neat scheme such as a tree of life.

We now know, by way of modern mathematics, that God created a world which is in a strange state of interaction with and of dependency upon abstractions beyond any currently conceivable human schemes.

By exploring God's Creation in its various realms containing concrete and abstract being, by responding properly to what we find, we are shaping our minds to those thoughts of God. If we think of our minds as our relationships to God and His Creation, then we can say we are shaping our entire selves by way of shaping our minds. This process of shaping is an adaptation which has been, and may continue to be predominately, one of natural selection. He who shapes his mind best to reality has better odds of survival and successful reproduction. The claim in the prior statement is still more true of human communities, especially at the level of civilizations or proto-civilizations which are, in my opinion, largely defined by a worldview, an understanding of this world and all else which might exist.

Most modern Christians would agree with secularists that there are facts about human nature and about other parts and aspects of this world, facts which are gathered by way of active exploration leading to efforts to develop empirically grounded theories as well as more wide-ranging speculations as

well as—most importantly of all—technologies to make our lives safer and easier. What Christians have not realized too clearly, at least not until recently, is that there are no clear boundaries between realms of is and ought, no clear boundaries between a shuffling ape trying to rise from his knuckles and a creature made in the image of God. In fact, the phrase “made in the image of God” should be understood in the sense of “evolved and developed into some rough approximation of an image of God in His freely chosen role of Creator and shaper of this particular world.” Not a good sound-byte, not a phrase which rolls smoothly off the tongue. More importantly, it communicates—however imperfectly—an important truth about human relationships to truths in this world of evolution and development. We find truths, empirical and abstract and—maybe—absolute by way of adaptation, of adapting our individual and communal selves to what God has created. In this way, we learn to think and act and feel along with the Creator as He goes about His work.

# 667 The Failure of Modern Philosophy and Theology and How to Fix the Problem

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2222>. It was finished and uploaded on 2016/05/24.]

Let's do a Plato-update. Mathematics is the key, as it was for that heavyweight wrestler (according to some rumors which even hint at championships). Very roughly speaking, philosophy to Plato was a generalization of the thinking done in geometry and arithmetic. It may not be true that Plato's school, the *Academy* (see [https://en.wikipedia.org/wiki/Platonic\\_Academy](https://en.wikipedia.org/wiki/Platonic_Academy)), had a sign above the entrance which said: "Let None But Geometers Enter Here," but that seems to be the spirit of Plato's way of thinking—at least after he'd absorbed some of (much of?) the seemingly qualitative (more informal?) thoughts of Socrates.

Plato, his predecessors and his successors, used mathematics as a form of training and also as a source for thinking tools capable of handling abstract realms of being—as I would put it. Those creative borrowers, call them clever burglars if you wish, were able to produce higher level understandings of various aspects or realms of created being.

This business of speaking of moral and even divine matters by using the relationships, geometrically considered, of material things was natural and even necessary for all those trying to discern the abstract relationships in all of this stuff in flux. It certainly seemed natural to the ancient Judeans to press their argument of Jerusalem's close relationship to God by emphasizing it's location, on a hill, a high hill by the standards of the immediate region. Were they saying it was closer to the Heavens? I don't know but

they were clearly saying that Jerusalem was above the cities of Canaan and even above Babylon and that meant. . . it was holy; the city of David, God's beloved, looked down upon the other (known) cities of man. To Greeks and Hebrews alike, good men followed straight paths and men, like camels, had trouble passing through the eye of a needle (the name for narrow gates through deep portions of the wall of a city, used to deny access to bands of undesirable visitors). Camels are pretty big animals and those gates weren't much bigger; it could be a very tight fit for camels carrying any sort of load. The gates were narrow but sheerly impassable to those who thought to bring in large loads of goods or to those trying to enter in large groups rapidly and perhaps for nefarious reasons. Again, burden yourself with riches and your entry into the City of God becomes more difficult if not impossible for men to accomplish. Try to invade the City of God for man-centered purposes and the entry was also difficult.

We live in a world where the most obvious forms of being are physical things and physical relationships, many of which things and relationships are at least partially described by mathematics of various sorts, ranging from the simple and (maybe) non-theoretical geometries and trigonometries of ancient pyramid- and temple-builders. The very development of (again—maybe) purely empirical technologies combined with the preference of many ancient Greeks for abstract understandings. By the time that Ptolemy, the Greco-Egyptian scientist, built—among other serious intellectual edifices—an extraordinarily complex and very accurate model of the movements of the known large bodies of the solar system. This, like all higher-level scientific accomplishments through the ages, was based upon a great respect, almost idolatrous at times, for order of a sort allied to human reasoning—most especially in its abstract forms, metaphysical and mathematical. (The idolatry shows up mostly when our forms of reasoning prove inadequate but we refuse to pay proper attention and respect to empirical reality and the abstract realms to which they point, thus refusing to pay proper attention and respect to God in His role as Creator.)

I've provided a metaphysical understanding of this world and the greater Creation in which this world is embedded. In the tradition of all major schools of human thought, Christian and Jewish and Islamic and pagan and others, I've made a claim that we can understand each and every thing as well as the greater realms of Creation by keeping that understanding of Creation in mind and constantly using our understanding of the small to better our understanding of the large and vice-versa. My metaphysical un-

derstanding of Creation was based upon a reconstruction of something of a Thomistic system—radically existentialist among other traits, allowing for a more upfront recognition of the necessary respect for empirical knowledge—that of Creation. This respect requires that we consider: modern theories of spacetime, of biological evolution and development, of quantum physical theories of matter, and modern abstract mathematics which have sometimes spoken of facts and truths in empirical reality before we noticed them. My reconstruction, arguably a new Christian metaphysics as much as that of Aquinas was new relative to that of Anselm and earlier fathers, is somewhat superficial right now, but is presented as very much an open work in progress; if I'm heading in the correct direction, there is plenty of work for many generations of thinkers and teachers and popularizers.

I've not even scratched much of the surface of modern empirical knowledge, though a little bit more than I described above because I have made some serious consideration of the knowledge in modern fiction and in modern history and other 'softer' sciences.

But there is something missing in my work, despite my efforts to present my sketches of a metaphysical system in a way that shows all realms of created being, from our concrete realm back through abstract realms of created being and right to the truths and divine thoughts manifested as the raw stuff of Creation. That something which is missing is perhaps a necessary clarity rather than substantial claims to knowledge.

Let's assume, as a matter of necessity of the common sense variety, that Creation is made up of all of its pieces: creatures abstract and concrete as well as specific manifestations of divinity beyond or different from creatures—I write with a necessary vagueness for now. In what sense is my understanding of Creation, call it my worldview, made up of all the understandings I draw upon: Biblical revelation as well as a small body of other revelations along with human knowledge of concrete things and abstract things and all their various relationships?

We don't want things to fit together too tightly. That would conflict with our feelings and well-reasoned thoughts about freedom—not any sort of absolute freedom and not under the control of an agent called 'free-will' but some sort of freedom we can't describe but might be describable with appropriate qualitative abstractions of ideas from modern mathematics. In particular, we must protect the experienced constrained freedom of individual entities within larger entities (for individual human beings, this means communities as well as other corporate entities of a mostly physical nature).

Before coming to a conclusion, I'll point out the obvious—at least it's obvious to those with knowledge of history, including the history of human thought. What I'm saying has consequences for all fields of human thought and endeavor. For example, while there are no implied political policies of a specific sort in my work, there is a strong implication that true politics for human beings as they exist in this world as individuals and communities exclude most modern politics of a left-wing and right-wing sort, as well as any mushy politics in the so-called center. In fact, most 'idealistic' systems of thought about politics and even human nature are disallowed in favor of an ongoing analysis of revelation and empirical knowledge.

The conclusion of this meandering essay is basically the theme of my latest major effort: modern mathematics has tools, qualitative and conceptual as well quantitative, for dealing with parts and wholes—without dissolving the parts into the wholes or considering the wholes as merely nominal conglomerates. (This book is tentatively titled *The Shape of Reality* and is at least six months away from completion.)

This is philosophy and theology done right—to make greater sense of it all while not losing the sense of the smaller realms or particular things. Mathematics has provided, somewhat, the tools for this essential task in an age facing an embarrassing treasure of mostly undigested knowledge of the concrete and abstract realms of Creation. I qualify by 'somewhat' only because highly technical tools of modern, abstract mathematics (topology as a qualitative or abstracted geometry, abstract algebra as qualitative or abstracted studies of structure, etc) need to be understood and then appropriated (stolen?) for more general use by philosophers and theologians, and then by historians and mind-scientists and so on. A lot of work lies ahead of us if my views correspond at all to reality.

# 668 Christianity Without Christian Civilization is a Little Thing Indeed

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2248>. It was finished and uploaded on 2016/07/19.]

Even without a Christian civilization, Christianity remains a holy thing, but it would be a little thing.

Partly because of a bad bargain that various Christian traditions made in coming to the United States, dominated after the War Between the States, by a liberal, non-Creedal form of Protestantism, Catholics and Orthodox and Lutherans and other sorts of sacramental, maybe Sacramental, Christians act as if having forgotten about the dependence of a complex religion upon the entire context in which we live. As Jews learned over the centuries in which they had to live in the civilizations of others, mostly Christian or Islamic, a people who held on to such a rich and complex faith had to retreat to a 'ghetto' in which they raised their children and protected their more 'innocent' adults by providing a more complete environment. It takes a great effort, most often combined with a sophisticated intellectual outlook, to be a sacramental Christian in a Western Civilization which is desacralized. The West is most certainly **not** paganized; it is desacralized. From the Christian viewpoint, this is far worse because the people of the West no longer even have a sense of the divine or even a primitive pagan sense of spiritual beings. It's harder to talk with desacralized people than with paganized people about even the nature of truth—even the existence of truth, let alone specific beliefs or speculations about important matters.

The language and concepts used to discuss and explore and teach and

carry out politics, culture, mathematics and science, and everything else are all explicitly desacralized in the modern West. Too many Christians, some of them very devout indeed, think to paint holy colors upon our desacralized civilization, even upon our violently barbarian sports, and think to have baptized what is not compatible with the Body of Christ.

To be Christian is to prepare ourselves to be part of the Body of Christ, to prepare ourselves to share the life of Jesus Christ and His Father and Their Spirit. To do that is to learn how to properly use and enjoy the world and all it contains. Our modern school systems and our religious school systems have de-emphasized memorization of traditional texts, including the Bible, and those empty spaces in the minds of children have been filled with the life-stories of morally disordered figures from the sports and entertainment industry, with morally disordered or even evil lyrics, with knowledge of some disordered collections of facts and urban legends about the genetic foundations of sexual orientation and other matters which are far more complex than Catholic apologists, professional and amateur, imagine.

The world, indeed—the entirety of Creation, is far more complex than Catholic apologists, professional and amateur, imagine.

I wish to respond an intelligent and interesting post by Razib Khan, a geneticist born into a Muslim family who is now an atheist. Khan is interested in theology and history, a good match for a geneticist in this age when there is much exploration of the ancient genes found in long-buried corpses and the ancient genes found in each and every one of us. In particular, he has written a number of good posts on what we might call “Christianity in the real world,” among many good posts on similar issues.

Khan’s post is: *Institutional Religion Needs Institutions* found at <http://www.unz.com/gnxp/institutional-religion-needs-institutions/>. This short essay begins:

It is a common assertion to state Christianity helped maintain the continuity of Classical civilization down to the Medieval era, through the “Dark Age” of Europe after the Fall of Rome.

This wouldn’t be my assertion, though I am a practicing Sacramental Christian currently in communion with the Roman Catholic Church. In fact, as one who advocates the view that the Church Herself is but an organ, an all-important central organ to be sure, in the Body of Christ, I

would assert that Western Christianity became so successful and so powerful just because the Church was willing to build upon the foundation of Roman Classical ('pagan') Civilization and then worked hard to maintain what eventually became a very complex 'hybrid' civilization and to support massive rebuilding efforts following times of trouble. In modern times, the Churchmen seem to have not inclined to do anything of the sort (except for Joseph Ratzinger and a few others) and the Roman Catholic Church seems not to have the resources of creative energy and imagination to maintain or rebuild a civilization; it is different from but similar to the situation of the Germanic tribes which conquered much of the regions north of the Alps inhabited by Romanized Celts and soon discovered they didn't understand and couldn't care for that which they had conquered. Thus it was that this multicultural event led to the true Dark Age, a time of famine and disease and violence of all sorts; the breakdowns in physical and cultural infrastructure when under the control of men who didn't understand any of those sorts of infrastructure and had killed or driven away those who could have done so in servants' roles.

Those ancient Germans were born as barbarians, that is—outsiders to the established order of a civilization. Western Christians have turned themselves into peoples semi-alien to the Western Civilization they inherited; they have no other civilization and are barbarians, however good they are at matching a wine with each course of a banquet.

Unfortunately, most Christians have only a vague belief in the Body of Christ, largely because even members of Sacramental Christian churches are largely corrupted by modern ideologies of radical individualism. Even Sacramental Christians think the Eucharist to be but a symbolic joining of individuals into nominal communities.

Khan makes another good point but, in my opinion, misinterprets it when he writes:

What I would suggest is that complex human phenomena, such as Christianity, are not reducible down to abstract sets of ideas in terms of how they manifest themselves in our world. That is, Christianity is only marginally about the Athanasian Creed, or even the sacrifice made by the Son of God, from a naturalistic perspective. Rather, the religion includes a broader set of institutions and folkways which derive from the culture at large (e.g., the Roman Catholic Church is the "ghost of the Ro-

man Empire"). Additionally, it also expresses common human intuitions about the world and social relations.

While disagreeing with Khan's claim that the creeds are marginal to Christianity, disagreeing more strongly that "the sacrifice made by the Son of God, from a naturalistic perspective" is marginal to Christianity, I would support the general thrust of this claim. In the next paragraph, Khan brings matters to a tight focus: "[A]s a complex cultural phenomenon, Christianity is conditional on complex culture." Without that "complex culture," better still—civilization, Christianity is bound to be a sect of small communities with most being perhaps underground communities. That's not what God wanted Christianity to be, not just because He desires many to be His friends, wishes many to share His life, but also because the Body of Christ is the point of it all. We individual human beings are saved as part of that Body and not as a small or large gathering come together on a voluntary or contractual basis.

From another direction, we should also consider the question: Is a limited, mortal creature suited for life without end, life shared with God? In all honesty, the answer is, "No." If we accept God's promise of salvation, we must remember first that this salvation was promised to some tribes of Semites, Hebrews, as members of the people of Israel and then to all the friends of Jesus Christ as members of the Christian Church, however God Himself defines either the "people of Israel" or the "Christian Church."

We will be able to tolerate life without end just because we, first, will retain our own minds but also share the minds of great scientists and historians. We will retain our own hearts but share the hearts of spiritual giants. We will retain our own hands but share the hands of political reformers and carpenters. By way of becoming more fully members of the Body of Christ in Heaven, 'points' on the 'manifold' which is the Body, we can also share the mind and heart and hands of Jesus Christ and, through Him, share life with His Father and Their Spirit. It is only a complete, unified, and coherent civilization that can become the true Body of Christ, with the Church playing a central role. If the Church were the entirety of the Body of Christ, we would be destined to become "church ladies" of television comedy fame; that would be a fate which would lead most human beings, male and female, to pray for the end of time.

Near the end of the essay, Khan writes:

What is true for Christianity is probably true for many complex human ideas and institutions that we think are here for good. The reality is that complexity of thought and contingency of logic are dependent on the surpluses generated by a highly developed economy and centralized state.

Khan's claim has enough truth in it that I'll leave it unanswered in intellectual terms. In fact, the only possible answer is a strong, confident response by Christians, a response which leads to an understanding of the world in terms of Christian revelation. Elsewhere, and often, I've argued that such an understanding, expanded to cover all of Creation, is the true foundation of a civilization—ideally, a Christian Civilization, a new phase of the mortal life of the Body of Christ.

By responding properly to God's Creation, in light of our Christian belief, we will build a new Christian civilization.

# 669 Religious Liberty is a Nonstarter in the Modern United States

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2259>. It was finished and uploaded on 2016/08/23.]

A radically secularized society will make it tough to engage in any sort of religious practices. This happens in a particularly intense way if the majority of parents simply turn their children over to the school systems or to modern American culture as a whole. And so it is that I'll retreat from philosophical or historical discussions of the public square to deal, for a second time, with one of the weirdest psychological mutilations imaginable—the lack of development of the concept of truth, so basic to primitive tribal peoples as well as modern medical professionals and particle physicists.

Though I believe the narrative of Christian American to be mostly hogwash, there was a time when most Americans could be considered as washed-out Christians of a sort. No longer.

By at least 1800 or so, and probably a bit earlier than that, Americans inhabited a world stripped of divinity, a world fully subject to the mastery of men. I'm not concerned here with a specific set of religious opinions but only with the belief that there is a higher meaning than any we can find for ourselves in our mundane activities. In the term 'higher meaning', I include animistic pagans with noble, if sometimes strange, creation myths as well as the higher paganism of Plato and the high theisms of Maimonides and Aquinas. I also include the pantheism of Albert Einstein and his talk of the "Old One" whose thoughts he wished to know—it is much more correct to think of that "Old One" as some impersonal 'force' of reason, perhaps

an Einsteinian version of the Reason worshiped by some of the unstable participants in the Enlightenment.

A secularist doesn't have share a concept of higher truth with pagans and theists and pantheists and others, even some atheists who don't have central, partially divine, principle such as the reason of an Einstein. In March of 2016, I published a discussion of studies which didn't directly address secularism as a set of ideas, instead dealing with the irresponsibility of adults in recent decades who have not taught the children the concepts of right and wrong, nor that of truth—Chapter 665, *We Modern Christians Destroyed the Concept of Truth Along with Our Children's Minds*. The younger adults in the United States (probably most of the West) and those who are yet children have no way to even think in what we might call the categories of morality, even the categories of basic order which underly rational or intuitive or even tribal systems of morality.

Religious liberty might be recognized as a valid principle by those who are disbelievers in truth by way of reason. That isn't the case with most American adults below the age of 40 or so and even with some from those older than me (I was born in 1955). In many of these people, including some in my parents' generation—born in the 1920s or 1930s, even the weakest concept of truth seems to have disappeared. For much of my life, I've been mostly in contact with 'ordinary folk' such as smalltown teachers and bankers, carpenters and machinists, nurses and social-workers and I can testify that most such people have at least an undisciplined faith in, shall we say, a "higher power." I suspect that, from at least the late 1800s, there was at least a substantial minority of non-believers in truth among the big-city or university professionals and teachers. Unfortunately, I think there was a substantial minority of such thinkers among Protestant clergymen, at least of the Northeastern varieties, and Ivy League university professionals since at least 1800 or so. The ideas, more mind-killing than simply dangerous, have been working their way into most American minds from what might be called the liberalized Puritan mind.

Add in the problems raised by the studies discussed in Chapter 665, *We Modern Christians Destroyed the Concept of Truth Along with Our Children's Minds*, that is, the replacement of immediate feelings for those missing value judgments based upon some understanding of truth, and we have a substantial percentage of Americans and probably Westerners in general who can't even make sense of a claim that a Christian nurse or a Jewish doctor has a right to refuse to help a patient commit suicide.

There is anecdotal evidence galore out on the Internet and in books that a teacher or a public speaker has no right to upset someone by suggesting some claims of date-rape might be at least questioned. I even think that some of Obama's advisers are sincere in protesting against any suggestions they shouldn't be destroying entire countries and killing lots of people to prevent the leaders of those countries from killing lots of people. And the evidence for plans of those leaders to carry out such killings is typically, shall we say, below the level of court-room credibility. Apparently, some of these "Responsibility to Protect" advocates—and I'm sure some are actually outright war criminals—are the same sorts of delicate flowers who, bereft of even a concept of higher truths, feel a need to defend their innermost child and to enforce that child's feelings upon reality.

Religious liberty is a non-starter to the younger Americans who have been raised and morally non-formed by my generation and the one before and after my generation. A lot of institutions and individuals, including Christian churches and their leaders, including schools and their administrators and most teachers, have no right to protest at the oh-so tender moral monsters in our midst. They helped to form these people, most people below 40 and many older, who don't have enough of a concept of truth for professionals, test-givers from psychology or sociology, to draw out.

## 670 I Can Dream, Can't I?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2296>. It was finished and uploaded on 2016/11/25.]

For nearly 30 years, I've been writing novels and nonfiction, having sacrificed much of a chance of a good life of the normal sort, largely while deluding myself that some modest, or even substantial, financial rewards were coming in six months or, at worst, a year.

Though I had personal problems and inclinations that led me to be something of an independent Christian thinker, I was then led to take up a writing career which was also a Christian vocation and even a Christian mission. I continued to delude myself as my career as a non-profit, non-income writer began to develop and even as that career matured in the past 20 years or so—the first 10 years were practice. Could I say that my own self was maturing as a Christian? In particular, could I claim to be something of a good example? I who was too soft to have responded properly to being in classes which I should have easily handled according to professors who tried to give me some guidance, but I had spent 4 years or more being bored into submission in high school, 4 years of my reading skills degrading and my writing skills and math skills not developing. I shattered in classes in which a group of Malaysians, ethnic Chinese, excelled and in which the Ashkenazi Jews from NYC magnet schools did no better than okay. Broken, I ran into a career as an actuary which I found quite uninteresting and unfulfilling, a career in which I generally failed to even give a proper effort.

Raymond Wilder, an important figure in the development of the American mathematical community of the middle two-thirds of the 20th century, had claimed he could see the decline in the reasoning and manipulative skills of American students by the 1950s and others have said the last generation (as opposed to scattered individuals) of high-accomplishing Americans in

mathematics and hard sciences probably graduated from high school in 1965 or so. Much more can be said, but this is not the place.

Jacques Barzun, in his magisterial *From Dawn to Decadence* [9] made a prediction that the West will collapse upon itself, as in the horrible 14th century which followed a century of both cultural magnificence and increasing inequality of wealth; Barzun projected it will again take us a century to rise from the rubble. He thought that rise would begin when one or more young men of curious minds discover the glories of Western thought and begin to pursue new thoughts through old knowledge.

Can we not simply start that process of rising from the rubble right now? I think I have so started and there are others who can participate as soon as they accept the major insight underlying my work: we need to reunderstand Creation from the most basic level of being, the “raw stuff of Creation” as I have often labeled it. Even the nature of material being as studied by physicists and the nature of certain types of abstract being as studied by mathematicians and poets and moral philosophers, is far too particular a level for starting this project; starting at the level of evolutionary biology is simply absurd. We Christians don't need to complement physicists and biologists so much as we need to reunderstand the foundations, the very forms of being, which underly the strangeness of quantum physics and the wonders and nastiness of evolutionary biology. We need to think along with God in His freely chosen role as Creator.

And so I have dreamed and continue to dream of a community of Christians devoted to a fundamental reunderstanding and to exploring new, yet old, forms of Christian lives. We don't need to undo Kant or Rousseau or to baptize Nietzsche and Sartre. We need to take up the task of St Augustine of Hippo and of St Benedict of Nursia, as well as the task of Dante Alighieri. We need to start at a fundamental level—the level of perceived being was pretty fundamental in the days of Augustine and those of Benedict and a level of perceived being somewhat abstracted was a radical imagining of more complete being in the days of Dante.

I think to have done much of the re-understanding Creation in a way that considers modern empirical and abstract knowledge in the context of Christian revelations. I have little money and little of the entrepreneurial talent needed to organize one or more communities which can engage more fully in the work I've begun, work which might run parallel to or even overlap that of others who, like me, are working in relative obscurity as various sorts of benefactors continue to pour wealth and various sorts of talents and

efforts into the established institutions which are proving they are capable of little more than accommodating gradually to the anti-Christian mainstream of recent centuries. Some of those activities of accommodation seem to be moving ever faster and seem to be aiming at a pretty much complete surrender to some twisted lines of thought and feeling and action.

# 671 Christianity is an Intellectually Demanding Religion, and Deeply, Necessarily So

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2303>. It was finished and uploaded on 2016/12/13.]

Unfortunately, we don't have a public Christian intellectual elite which is re-understanding Creation and its Lord-Creator by way of courageous and honest responses to what is known from various fields of human exploration and speculation. We have a Christian intellectual elite more inclined to try to fit new knowledge into old schemes. We have ecclesiastical leaders more inclined to accept whatever understanding of this world is offered up by an increasingly non-Christian or even anti-Christian West.

Let me put that aside and speculate upon what has been true in some crisis periods of Christian history and what will have to be true again if Christianity is to recover and rebuild itself, that is, rebuild the pilgrim Body of Christ in its entirety—a Christian civilization with a healthy sacramental Church at its core.

First, we have to recognize the strangeness in the words of Christian pastoral leaders from the local level right up to some popes and leaders of other major branches of Christianity.

1. Christianity is simple, just live it. [Or some similar formula], but
2. That stuff about the Trinity and the one Person and two natures of Christ is just beyond anything the human mind can deal with. Return

to above item. . .

So which is it. Do we have a simple Christianity with handwaving about the core beliefs of traditional, Apostolic Christianity? Or do we have a Christianity in which some have to seriously grapple with understanding the Trinity and the one Person and two natures of Jesus Christ?

The second is true.

Without the Trinity and a sophisticated understanding of the totality of Jesus Christ, we of the West seem to either return to being Indo-European pagans or we become gentle and befuddled social-workers of a sort.

And yet it be true there are few—even among the population of Christian intellectuals—who can deal directly with those sophisticated issues. Even some excellent, Bible-centered Christian theologians are at their best when they can rely upon still plausible understandings of the more difficult parts of understanding Creation and its Lord. Unfortunately, there seem to be a fair number who overestimate the plausibility of established Christian ways of understanding Creation and its Lord, who think that the ways of thought of Augustine or Aquinas or Bonaventure can be taken as foundations for viable worldviews.

Darwin and Einstein, evolutionary biologists and geneticists, quantum physicists and physical cosmologists, technologists and political philosophers, poets and musicians, have pretty much showed us that Creation is a lot different place than even the best of premodern scientists and philosophers and theologians and poets thought. It's time for a reformation of the Christian understanding of God's work as a Creator. Its time for a refoundation of Christianity and of a Christian civilization.

Rather than trying to refound Christianity by the simple and simple-minded designs of social-justice warriors, we need a Christian intellectual elite to build a new understanding of Creation and the God who is the Creator and still Lord of Creation. If all were to go very well, unlikely considering that we're now starting from a general state of confusion on the part of nearly all Christians, then the poets and musicians and theologians and novelists and politicians could simultaneously start their work of implementing a good reunderstanding of Creation and its Lord even as that reunderstanding were still in early stages of development.

New Christian cultures could start growing, maybe to feed into a new Christian civilization some generation not too far away in what we can pray will be a better future than we seem determined to make possible.

## 672 Salvation: Paying Attention to States of Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2306>. It was finished and uploaded on 2016/12/20.]

I'm currently struggling, but joyfully at times, to finish my book, *The Shape of Reality*. Alas, it won't be finished by year-end as I had hoped, which hope I've stated on my blog. The end of January or even during February is more likely. As I struggle to complete this book, I'm obsessed with questions about human being, individual and communal but also mortal and 'divinized'. By the term 'divinized', I mean simply the state in which human being, individual and communal, is sharing God's life in Heaven. I use such a term as a Western Sacramental Christian who is positively impressed by some of the powerful insights of Eastern Sacramental Christians. I also write as one impressed by the potential of modern mathematics and science to provide powerful new abstractions, concepts, for better understanding God's Creation including those creatures who are we.

Think of a landscape in which there are mountains and hills with valleys and gullies, paths up and down some of the slopes. There are dangerous regions where the ground might give way and cliffs appear without warning, where various temptations might take the traveler off the road for a respite or for an attempt to make that small and mortal region into the goal of it all. This is the world in which God has placed us for some sort of journey toward Heaven.

I could go on and fully prepare the ground for an allegory in the mode of C S Lewis. I won't.

Some of these sorts of concrete allegorical elements are anticipations of powerful conceptual tools which can be more clearly seen in the mathemat-

ics and the physical sciences which have highly developed mathematical models. In other words, those allegorical elements are literary attempts at developing concepts which are needed, and I believe them to be a necessary step in our modern, deeper understanding of many aspects of God's Creation. It's likely not just an accident of history that Dante came as a forerunner of the modern age <sup>1</sup>, the age in which science and mathematics and scientifically developed technology has blossomed.

Since I believe that abstract being is true being and part of the same Creation as is concrete and thing-like forms of being, I am saying that an insightful poet or novelist or philosopher who draws upon properties and things of this concrete and thing-like world to make some point is trying, if not always with full awareness, to get at some abstraction lying behind or beneath or above the mountains and gullies of his tales of wonder, some abstraction which is shaped from the very same abstract being as is the abstractions of, say, statistical physics and the spaces of states of being which it studies.

The concrete allegories and other necessarily indirect ways which are used by novelists and poets and philosophers to explore and communicate difficult concepts are good but also limited. They are particularized, sometimes highly particularized shapings of the abstract forms of being which lie behind difficult climbs in both the moral and spiritual journeys through life and the physical journeys of explorers and of weekend wilderness warriors. Those two types of journey are linked and not by mere whim of the poet nor by pure accident.

Many animal species can think well, for their purposes, in terms of the concrete and thing-like being of this highly particular universe. Some species other than human beings, most notably chimpanzees, have some limited ability to think in abstract terms. Only human beings can think abstractly well enough to have a deeper understanding of God's Creation; following Aquinas, I often claim we have minds of the sort which are capable of encapsulating God's Creation in our minds, though any individual human mind is too limited to understand much at all. This power of the individual human mind itself leads to human being with much more complicated states of being and more complicated paths through a very complex

---

<sup>1</sup>There are historians and mathematicians who believe that Dante's vision of all of Creation is a remarkably intuitive vision of something few can visualize even knowing the mathematics: a three-dimensional manifold which is a sphere, that is, it is the surface of a four-dimensional solid ball.

space of possible human states of being. It also leads to some hope of understanding, which understanding would probably lead to more complicated and complex forms of human minds and, hence, of human states of being and of paths toward that glorious state in which we can share God's life. It leads to such possibilities largely because it leads to very, very powerful communal human minds and those minds can certainly be understood, or even conceived, only in terms of the sorts of abstractions I've been developing recently, hoping to provide some useful tools for exploration and understanding of these regions of abstract being in my upcoming book, *The Shape of Reality*, and maybe in future works. God willing.

I'm certainly not one to underestimate the importance of heart and hands, but...

More abstraction is needed, which means that we need to pay more attention to developing the minds of those Christians who can do that job of abstracting from various particulars so that we can learn how to think, for example, in terms of traveling across paths in the possible spaces of states of being as if we were traveling across possible landscapes in  $n$ -dimensional spaces where the value of 'n' might be large and the number of possible landscapes might also be large. We modern Christians, as well as many others, act as if we need to turn young people into good students, well-behaved consumers who are obsessed with playing or watching sports.

## 673 Covenants, Then and Now

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2315>. It was finished and uploaded on 2017/01/02.]

Let me go to the ever reliable 1913 edition of Webster's once-fine dictionary, listing just two definitions of 'covenant' which seem most relevant to my discussion:

**covenant** A mutual agreement of two or more persons or parties, or one of the stipulations in such an agreement. [Appropriate example:] Then Jonathan and David made a covenant. -1 Sam. xviii. 3.

**covenant** (Theol.) The promises of God as revealed in the Scriptures, conditioned on certain terms on the part of man, as obedience, repentance, faith, etc.

In general, covenants, in the sense of solemn and sometimes legally binding agreements, are fundamental to human societies, but the concept of covenant has been woven into a wrongful understanding of human being and of all of Creation and also into a wrongful understanding of the relationships between human beings and God. We can do better. The concept of covenant is valid and seemingly necessary to our understanding of human being and of Creation, but that's the rub; it's part of human being, individual and communal, to make covenants and to try to live by them. No less but no more. Yet, covenants—including those in the Bible—have given rise to the idea that human beings were created in some sort of state where they were already capable of forming the Body of Christ.

All of our inadequacies and actual rebellious or criminal acts are bundled up in the concept of sin (and "original sin"). In the newest and least plausible versions of this myth of human being, our apish ancestors—at some

mysterious instant and in the persons of a man and a woman genetically traceable to periods as much as 100,000 years apart from each other—a true human race rose fully capable of being God-like, true brethren of Christ, if only we would obey laws which were revealed in various ways in history, yet were actually declarations of truths imposed by a God from outside of time and space, truths said to be reflective of the moral nature of human beings evolved and developed and living in a highly particular time and space.

Whew!

The sheer breathlessness of the last sentence of the previous paragraph should alert us to the botched nature of our understanding of human being. We have created a chimera which is part Adam as conceived by premodern Christians and Jews and part the vague creature of nature as envisioned by Darwin and his successors. In fact, as Augustine of Hippo considered and rejected, as many modern writers of various and sundry beliefs seem to expect or fear, human beings are both of those and neither of those. They are partly the creatures found in the writings of the truly wise commentators of Jewish and Christian history—images of God in the usual terminology, as well as partly found in the writings of wise pagans; they are partly human animals descended from apes; they are something else in total.

It's the totality with which we have great problems, though tools are available in modern mathematics and modern physical scientists to make sense of totalities which are the sum of lesser entities which retain their individuality and which are also something else. The universe in which we live is the sum of its various components and also itself; it is container of much and also a universe with its own properties. (See *A Universe is More than it Contains* 193 for an early discussion of the issue based upon the fact that a relativistic universe, which ours **seems** to be, violates the so-called Law of the Conservation of Energy, though that law—better: principle—holds at all local places and times.)

We moderns who, in one example, have done so much good work in analyzing parts of communal human being, such as the political and economic and social parts, have shattered Humpty Dumpty and yet we retain memories of what we thought him to have been before we began our studies of his being. So it is that we have great knowledge of the biochemistry of his shell and his albumen and his DNA but we Christians have chosen to think yet of his totality in terms of the ancient view of an egg as containing a tiny chick which just needs to grow without any of the fancy development which is, in fact, necessary for that shell-enclosed puddle of chemicals to become

a Sunday roast. We can do better if we but have the courage and energy, the willingness to work hard and to experiment with new ideas, to engage with traditional and modern understandings, and to rethink matters, that we might produce total understandings which will be as powerful as useful.

We have various misunderstandings of human being and of Creation which can now be corrected because of our greater and more precise and more correct and more reliable knowledge of created being in this world of concrete, thing-like being and also better knowledge of some of the realms of abstract being which mathematicians in particular have explored in recent centuries.

We Christians, and some others, think of covenants in the context of a static Creation and of a static human being when such is not the case. Creation isn't just this world created once and in more or less final form, whether 4,000 years ago or 14 billion years ago.

Think of it all as a house built on-site and still under construction and also being remodeling in its existing sections. This house is set in a particular landscape of a grassy plain and nearby hills and a lake and so on; that house has human occupants. They make covenants with one another, as well as growing into existing covenants. Some of those occupants also make an explicit covenant with the Creator of it all, the maker of the landscape as well as of the house and its occupants.

All of those creatures, living and nonliving, are dynamic, always changing in their genetic family-lines (call this evolution, if you wish) and in their individual selves (call this development, if you wish). Human beings as a species have evolved a lot in just the past 10,000 years when human intelligence has risen dramatically and very much so for some groups of human beings. (See *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending.) This evolution was facilitated largely by changes in the structures of human communities responding to new opportunities; these changes were caused by and led to the need for higher social intelligence, though there was surely some effect as well from the sudden explosion in technology including metalworking as well as horse-breeding; warriors and kings and blacksmiths and horse-breeders gained large advantages in reproduction.

So it is that I claim that covenants in 2000BC (call it the Age of Abraham) and those in 1000BC (call it the Age of Moses) and 1750AD (call it the Age of Blackstone) were not the same. Covenants were once a supernatural relationship even when between two mortal men. Then they were

probably more a matter of honor. Now they are probably more of a dry legal matter.

The definitions from the 1913 edition of Webster at the beginning of this essay give us a pretty good way of understanding certain relationships between men and between God and men. In this short essay, I'm mostly interested in covenants between God and men, whether 'men' is one human being or many or all of those who respond positively to God's invitation of friendship or all human beings—with some necessary flexibility in definition.

In the far olden days, even those tending toward monotheism saw God and world in paganistic terms—God could impose His will upon the world but it existed somewhat in parallel to the Almighty and was maybe as 'old' as He was. To the later Hebrews and the early Jews and early Christians, it seemed clear—in some sense of the word 'clear—that God was a Creator in an absolute sense; before He spoke the world into being, there was nothing but God. Over some centuries, Christian thinkers—beginning with the ancient Christian Fathers and going through St Augustine of Hippo and on through Aquinas—developed a sophisticated metaphysics under which God could be coherently described as the absolute Creator of this world as understood in the centuries of the so-called Middle Ages of Europe (about 500-1400AD). More recently, any understanding of God as a Creator has to take account of such modern knowledge and theories as the Big Bang—not an act of Creation but rather some sort of strange change in the phase of being. This phase change or change in state of being is so strange because it was and is a weird sort of abstract being on the 'other' side and concrete, thing-like being on our side. So to speak.

Abstract being which seems to truly be some sort of mathematical entity, that is—the quantum wavefunction which 'collapses' (bad but useful term) to form matter-energy, can be awfully dynamic indeed, though actually deterministic in its abstract form as well as dynamic. Matter is more particular than the abstract mathematical being from which it is shaped; therefore, matter doesn't move so rapidly as does that mathematical being. And, yet, we know that quantum wavefunctions, the mathematical being from which matter is shaped, seem fully deterministic—raising a variety of questions as to where it comes from, but that is outside the scope of this essay.

More importantly for now, we have to realize that our own dynamic human being has passed through various states of being. As a species, we arose immediately from a line resulting from a split with chimpanzees. As

individuals, we developed from the combination and recombination of egg and DNA with sperm and DNA.

When did the first individual human being arise who could enter a conscious relationship, a covenant, with God?

Given the rapid evolution of human intelligence over the past 10,000 years, we'd have to assume that the undoubtedly real, though shadowy, men who became immortalized as the patriarchs of the Israelites, were of lesser intelligence than modern men—unless they were so unusual as was the handful of modern geniuses such as Newton and Goethe who were so much smarter in some ways than other modern men.

A covenant between God and an early (neolithic) anatomically modern human being would have been pretty rudimentary compared to what is found in the theological and metaphysical and devotional writings of St Basil the Great or John Henry Newman, though most such covenants are made between God and entire communities. A neolithic tribe would have had rich but simple relationships. That tribe itself wouldn't have been capable of forming a sophisticated covenant with God, nor with other tribes. A great leader from that tribe wouldn't have been capable, even with the proper upbringing, to have filled the shoes of Moses and certainly not those of Solon or Charlemagne or William the Conqueror or George Washington.

We can see in the Bible in a distorted, but largely true, way the formation of early civilizations in Southwestern Asia and northern Africa. It seems to have been true to human being, individual and communal, that the political structure of these civilizations were defined in self-serving ways by men talented in organizing human communities and individual projects—including large-scale acts of violence. Even as men during the lifetimes of Isaiah and Jeremiah were collecting and redacting ancient narratives, oral and written, we can speculate that the model for covenants between God and men were those enforced by warlords, princes and kings and sometimes leaders of nomadic tribes, yet, none organizing political or military communities so complex as those of the first Chinese emperor—see the article on *Qin Shi Huang* at [https://en.wikipedia.org/wiki/Qin\\_dynasty](https://en.wikipedia.org/wiki/Qin_dynasty), not nearly so complex as those of later empires in various parts of Eurasia and, eventually, the Americas and Africa.

A covenant with God remains true to the definition found above and taken from Webster's 1913:

**covenant** The promises of God as revealed in the Scriptures, conditioned

on certain terms on the part of man, as obedience, repentance, faith, etc.

But, it's also more than a bit different. After all, God is no longer quite the God of the ancient Hebrews, seen necessarily in terms of concepts available to the Patriarchs and Moses, nor is He the somewhat better encapsulated God of Isaiah and Jeremiah and Ezra and Ezekiel on to the Apostles and premodern Christian Fathers. Rather than a monotheistic version of a pagan Sky-God or Divine King, God has revealed Himself—through modern empirical knowledge—as a God who operates primarily through His power to create and to continuously create in the way of shaping, in the way of forming and maintaining relationships.

God is not **only** a mathematician, not **only** a designer—if a designer at all, but He is the Creator who made the abstract being studied by mathematicians, the universe studied by various people including those who overestimate the “design” elements, the living creatures studied by the most atheistic of biologists, the human race studied by historians and anthropologists.

God is not primarily a King and is not at all a King who lives up in Heaven and rules over a Creation which is at His feet. He is a Creator and Shaper of what is not Him. His covenant is given to us at all times of men in a way that we can best and—necessarily—partially understand. As I pointed out above, even the revelation that He is the Creator has been more fully revealed over time as human being has evolved and matured—starting as a pagan Father God who is dominant over other gods and over a creation not quite a creation from nothingness, the Almighty is now best seen and understood by use of not only Scriptural revelation re-understood by modern Biblical scholars but also by use of modern physics and biology and history and mathematics. Even thinkers such as Augustine of Hippo, Moses Maimonides, and Thomas Aquinas had a far simpler understanding of ‘Creator’ and ‘Creation’ than is possible because of, than is demanded by, better understanding of created being.

It's probably best to say that we can now understand our covenant with the God of Jesus Christ in terms not at odds with the ancient covenants of Noah and Abraham, of post-exile Jews and premodern Christians, but rather in those terms but enhanced with our modern knowledge of God in His freely chosen role as Creator. We owe all we are and all we have to

our Maker but He chose to make us out of the stuff explored by modern physicists and by processes explored by modern biologists.

# 674 A Very Simplified View of the Woes of Christianity—Now and at Two Earlier Times

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2319>. It was finished and uploaded on 2017/01/10.]

## 674.1 Introduction

Recently, I attended my monthly men’s prayer group and made a comment about history books telling of the importance of highly educated men from warlord (sometimes royal) families in converting many of the German peoples to Christianity—some of those evangelists, such as Boniface (“Apostle to the Germans”), were themselves Germanic. The organizer of the group and some of the other members asked me to give a presentation on. . . It was a somewhat vague request, wisely so. So it is that I’ve decided to give something of an introductory talk about my responses to the current woes of Christianity. It’s at least true that we Western Christians have great reason to worry about the future of our Christian ways of thinking and feeling and acting.

In any case, I’ve known for a while there is a need for some sort of popularization of my thoughts—not because of a lack of intelligence on the part of those in the greater audience but rather because of different sorts of intelligence, more generally different sorts of talents and inclinations, and because of that all-important constraint on human accomplishments—there are only 24 hours in the day, 365 days in the year, and maybe 80 or 90 years in the typical human life. Most human beings devote the working portion

of those years to greatly important tasks such as making a living in perhaps demanding crafts or professions and raising families.

So it is that this article is structured as an overview presentation on some aspects of my work which are most important to those with non-intellectual interests or inclinations. It does take some intelligence to understand what is presented but it can readily be the sort of intelligence that can be found in any thinking human being who is curious about reality. Someone smart enough to code software or do demanding tasks in metalworking or carpentry, someone who has taught writing skills to young boys or girls or settled complex insurance claims, should be able to understand what follows. If not, then I need to rework the material to make it more straightforward, not to make it simpler in the way of aiming at less intelligent ways of thought.

I'll start off with a very simple model of human being. In this model, which I first learned from the writings of Rabbi Jacob Neusner, human being is discussed, usefully and profoundly, as mind and heart and hands, as thinking and feeling and doing.

## 674.2 A Usefully Simplified Model of Human Being: Mind and Heart and Hands

Both the theological school of St John the Evangelist and modern physics, especially quantum mechanics, tell us relationships dominate stuff. Relationships create stuff, including thing-like stuff. Relationships shape existing stuff, including the things of this concrete world. For example, the world didn't come into existence and then God decided to love it; the world came into existence because God first loved it.

Christian theology tells us that God is so perfectly unified that when He thinks, He also feels and acts. When the Almighty feels, He also thinks and acts. When He acts, . . . Modern brain-science tells us something similar is true of human beings, though defectively so.

In any case, thinking and feeling and doing don't quite substitute for each other in mortal men living in this mortal world. Thinking and feeling and doing are all important and need to work together if we are to complete our human to-do lists. Having said that, I'm biased or unbalanced, if you will, toward mind and it remains true that intellectual insights can help immensely in guiding our hearts and our hands. I'll elaborate a little more

on that when I discuss a couple of historical crises for Christianity which might help us to understand our own crisis.

The main takeaway is that mind and heart and hands are useful ways of using our “human stuff” to discuss different ways of forming relationships, including the relationships which are our understandings of this world and of all Creation. We are (defectively) unified but we can use these “parts” of a human being to deal with our diversity within our (defective) unity.

So it is that I’ll ask without providing here an answer:

Individuals have minds, hearts, and hands. Do communities? That is, can we use our understandings of individual human being to understand communal human being? In asking this question, I assume a positive answer to the related question I’ll address below: are communities real or just gatherings of freestanding individuals as we are taught by our modern political and social systems? (It seems likely to me that Marxism came about as a botched effort to deny the modern denial of the reality of human communities.)

A partial answer will be found in an upcoming book tentatively titled *The Shape of Reality*.

### **674.3 Did Christianity Destroy the Roman Empire?: Ancient Christianity and the Fall of Rome, Circa 400AD**

The 18th century historian, Edward Gibbon, claimed that the adoption of Christianity in the Roman Empire led to the weakening and then the fall of that empire. That was also a claim of some prominent pagan thinkers who were observing and experiencing the decline and fall of the Roman Empire. In the decades around 400AD, Bishop Augustine of Hippo rose to the challenge by proposing that Christ is the Lord of History, a history which is linear from creation of this concrete world through the appearance of human beings (Augustine had considered and then rejected the hypothesis that man arose from lower species) and then hit a high point in the Incarnation and Crucifixion and Resurrection of the Lord Jesus Christ. From that point, history is a linear playing-out of men seeking or rejecting salvation.

So it was that Augustine's expansion of the human mind came in the form of a re-understanding of human history which became dominant in the West as it rose again from the decline and fall of the (Western) Roman Empire. More could be said about the defects of that understanding of history, which was essentially right, but this isn't the place. What is important is to see that such an understanding of human history opened up the Christian mind so that other, parallel or consequent, developments of human being could lead to the Christian West.

Heart? It was strange how the spiritual and even secular forms of human energy were unleashed. A young man living a century or so after Augustine found himself disgusted with the corruption of Rome. So it was that Benedict of Nursia headed out to live an eremitical or semi-eremitical life of prayer and penance. Benedictine monasticism was born and before long, large monasteries were preserving the technologies of Rome and also the intellectual heritage of the Christian Church, but also the heritage of pagan Athens and pagan Rome and much else. Some centuries later, white-robed reformers who were the Cistercians began to develop the water-power of Europe, becoming wealthy and powerful against their own desires even as they prepared Europe for industrialization while other peoples and regions in Eurasia with more sophisticated civilizations continued using asses and camels and oxen. (To be sure, animal power remained important in the West for centuries and is still important for some peoples such as the Amish.)

For all that the Benedictines accomplished, Western Civilization wouldn't have developed if not for better political and social orders. It's important to understand that many regions in the West retained fairly high living and educational standards but disruptions of transportation and communication systems fragmented a great civilization and left many areas impoverished. Powerful popes and other leaders of the Western Christian Church began to step forward to take care of the needs of their peoples and their regions, needs which seemed to fall under the authority of the Church and also needs which were more naturally under the authority of secular powers. It would be centuries before intelligent and farseeing warlords and kings and emperors could take up those needs at a higher level. In the meantime, the seeds had been planted for various conflicts between church and state, to use a modern way of speaking, and also for various sorts of corruption in the Church. Pope St Gregory the Great (540-604 or so) was one of the most prominent Church leaders representing forces of order, one who

played a major role in founding Medieval political and social order. There were others, earlier and later, including Pope St Leo the Great (400-461) who was arguably the last man recognized as the principal leader (though not absolute leader) of both West and East.

## **674.4 Is Christianity compatible with a rational understanding of Creation?: Christian Intellectual Backwardness, 900-1200AD**

During the early centuries of the Middle Ages (as defined for Europe), Islamic scholars and Jewish scholars living in or near Islamic centers of civilization had taken up the thought of the civilizations which had preceded them in the Eastern Mediterranean and contiguous regions. They had recovered much of the scientific and mathematical knowledge of the ancients and had also learned from the Indians. So far as philosophy goes, it is a great but useful simplification that the Islamic thinkers of the early Middle Ages (by European periods) had built their worldview upon the writings of Aristotle, rejecting the Neoplatonic worldview of Augustine and many other prominent ancient Christian fathers. That Aristotelian worldview seemed so much more rational than the mysticism into which Neoplatonism often fell. Since Aristotle's worldview was compatible with his own work as an observational biologist, it could provide a framework for many sorts of scientific efforts. (In fact, Plato and Aristotle were somewhat Siamese Twins of the mind, though Aristotle expressed a certain animosity toward his ex-teacher.)

During the first half of the 13th century, Thomas Aquinas produced a new understanding of Creator and Creation. Some say he disciplined European thought to Aristotelian standards, though it has taken many books over the centuries to discuss the insights and errors in such a viewpoint. I tend to the view of the great Neo-Thomist, Etienne Gilson, who said Aquinas seemed to follow Aristotle but he was actually making Aristotle say what Aquinas needed him to say—Aristotle had influenced but not determined Thomistic thought.

Aquinas thought in terms of a concept which Gilson translated as 'act-

of-being'. God is His own self-sustaining Act-of-being, the Supreme Act-of-being. All else is made up of acts-of-being which I discuss in terms of manifested truths which play the role of raw being (or acts-of-being) which are shaped into more and more particular forms of being up to the most concrete forms of being, such as human being. Even the most complex of things, living or nonliving, remain subject to evolution and development, at least in this highly particular mortal realm.

Aquinas saw that men could understand both God's self-sustaining act-of-being and His created acts-of-being by starting from one and traveling to the other. His so-called great Summa (Summa or *Summa Theologica*) started with revealed knowledge of God and traveled down to Creation. The other summa of Aquinas, *Summa Contra Gentiles*, started with a discussion of God in His necessary Being and then went to Creation before traveling back to God. A great circle could be composed from these two semicircles. This second summa, *Summa Contra Gentiles*, was probably written in response to a lack of respect for Christian thought on the part of the great Jewish and Islamic scholars, or at least a lack as perceived by Europeans.

Christians failed to properly integrate Thomistic thought (my preferred flavor or any other) into Western thought, though Aquinas did succeed in making Christian thought at least somewhat respectable to the scholars of the other Peoples of the Book. I'll explain below why it was that Thomistic thought wasn't used to build a more complete Western worldview, and this will allow us to see why Christianity is in a crisis mode, why it was that Western thought succeeded so spectacularly in understanding important parts of God's Creation and that thought separated itself from Christianity. In fact, that thought never cohered in any worldview worthy of the name, which is why the West isn't even able to re-form itself successfully into a pagan civilization.

It was St Francis and the friars who followed him who provided great human-energy to the High Middle Ages, powering great accomplishments which seemed yet to indicate that the West was deeply Christian—not entirely wrong, though the failure to refound the Christian understanding of Creation upon the work of Thomas Aquinas would soon show and would spill over to misunderstandings of the Creator as well as those of His Creation.

I'll complete my late Medieval trilogy by pointing to the hands of a man both a great Church leader and also a great leader of the world, the man

who guided Francis of Assisi in forming a disciplined religious order out of a chaotic movement, which continued to cause some trouble just because of that great Franciscan energy and devotion to God. Pope Innocent III should get much credit for the good that came out of the Franciscan order and movement. He should also be credited, positively and negatively, for playing an important role in establishing forms of late Medieval political and social order. Other popes, many Cardinals, and far more Christian laymen played a role in the formation of political entities which proved to be proto-states, that is, forerunners of modern states.

## 674.5 Can the Body of Christ be Real?: Bottom-up Thinking Denies Reality of Communities, 1300AD-?

Thomistic thought never really took root in Western thought and was in pretty distorted form when Giuseppe Pecci—see [https://en.wikipedia.org/wiki/Giuseppe\\_Pecci](https://en.wikipedia.org/wiki/Giuseppe_Pecci), the theologian and older brother of Pope Leo XIII—see [https://en.wikipedia.org/wiki/Pope\\_Leo\\_XIII](https://en.wikipedia.org/wiki/Pope_Leo_XIII), played a role in reviving Thomistic thought as a living—and quite radical—way of understanding God’s Creation. (Read some of the historical and analytic works of the French philosopher and historian, Etienne Gilson—see [https://en.wikipedia.org/wiki/Etienne\\_Gilson](https://en.wikipedia.org/wiki/Etienne_Gilson), who was educated in modern philosophical ways of thought and discovered the radical and profound nature of Thomistic thought on his own.) So it is that we modern thinkers have access to intelligent discussions of Thomistic ideas about God the Creator, about His acts-of-being and His Act-of-being which is Himself.

Most Catholic histories don’t talk much, or intelligently enough, about another problem—an anti-Thomism of sorts grew up in the heart of the Catholic Church in the generations after Aquinas. Most other histories also slide over a pro or con discussion of what is—in my opinion—one of the most damaging, intellectual developments in history.

Two powerful and powerfully dangerous thinkers—Franciscans both, Duns Scotus—see [https://en.wikipedia.org/wiki/Duns\\_Scotus](https://en.wikipedia.org/wiki/Duns_Scotus) and William of Ockham—see [https://en.wikipedia.org/wiki/William\\_of\\_Ockham](https://en.wikipedia.org/wiki/William_of_Ockham), developed ways of thought that led to various forms of what I’ll simplistically label as ‘reductionism’, such as radical political/social indi-

vidualism and reductionistic forms of materialism. Aquinas' position can be described as rather a sacramental materialism in which man is an embodied 'soul'. Be careful: the soul of Aquinas was not what we now call soul—it was a purely intellectual and nonhuman entity attached by (philosophical) accident to the human body.

Using Ockham's razor, we could claim that planets exist, and stars and galaxies and even men, but the universe doesn't exist in Einstein's terms, that is, as an entity in its own right and not just a collection of what it contains. The universe can't be observed directly though its existence is compatible with existing forms of gravitational theories—mostly, Einstein's General Theory of Relativity.

Modern thinkers often invoke that razor, and it is a good pragmatic rule to eliminate unnecessary entities from theories, but it is often used by thinkers who are willing to eliminate mind/soul and then speak of the universe without realizing they arise from similar types of thinking from directly observable entities to immaterial relationships or even to greater and more 'total' entities. In fact, the razor could be used to good effect if used to eliminate immaterial entities and to then speak of what is there as an immaterial relationship. Even the electromagnetic fields of modern science and engineering aren't really directly observable things but rather relationships observable from the effects of, say, a moving magnet interacting, or relating to, a charged wire.

All ways of thought have had to be modified or enlarged as we discover more about even revealed truths by exploring this universe and all that it is shaped from such as the strange, immaterial, and quite abstract type of being—quantum wavefunctions under one quantum formalism—from which thing-like being is shaped. As a non-scholar working to create better ways to understand Creation rather than studying existing ways to understand Creation, I have a strong opinion that Thomistic thought can be better updated and expanded to our modern needs—largely by adding in an understanding of being as subject to evolutionary and developmental processes. I think it would take drastic surgery on the insides of the systems of Duns Scotus and William of Ockham for them to correspond well to Creation as we now know.

The takeaway is that the universe is real and not **just** a collection of stars and galaxies and so on. I propose and argue in some of my more particular writings that the same is true of human communities. A human family is a real entity, a form of human being and not just a culturally defined

collection of individual human beings. A town or a nation or a civilization isn't just a collection of individuals but rather an entity in its own right. The Body of Christ, most of all, is for real, the ultimate, complete and perfected, human community, an entity much like an extraordinarily rich and complex human civilization with the Christian Church as its central organ.

I would further propose that the Christian mind can begin its recovery by building a worldview (as I've done) which starts from the above viewpoint. This worldview would be a necessary and central part of a civilization; it would be the organizing principle of a human communal mind which is Christian in the best sense: responsive to Creation as well as to God.

Energy is needed, high levels of energy as was released by Benedict in the 6th century and Francis in the 12th century. We might have faith that God will send us a new holy man of that sort, but we can't anticipate where he will be or even whether he is already with us.

The world needs one or more political and social orders adequate to the needs of huge and extraordinarily complex human communities. Our existing forms of order are quite clearly inadequate to the needs of nation-states, to complex religious institutions, to large universities, to scientific research organizations, and so on. It is a mystery where or when this need will be met.

# 675 The Metaphysics of the Christian Creeds: Why Christianity Is Not Simple.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2374>. It was finished and uploaded on 2017/04/17.]

Far too often, Christians—including some who should know better—claim that:

Christianity is simple; just follow Christ’s teaching of loving your neighbor and doing good for him.

Baloney.

For reference, you can find the most important of the Western Christian creeds, *Profession of Faith* which is used in the Catholic Mass on Sundays and other Holy Days, at <http://www.usccb.org/beliefs-and-teachings/what-we-believe/index.cfm>.

This is the first stanza:

I believe in one God,  
the Father almighty,  
maker of heaven and earth,  
of all things visible and invisible.

But then in the later stanzas of the Profession of Faith, we learn that God is Father. And Son. And a mysterious Person labeled as the “Holy Spirit” seems to also be God.

And God is one, even One, except when He is three, or Three.

What to make of this? We could certainly note that: *Alas, the World isn't So Simple* (see <http://loydfueston.com/?p=1476>); we could certainly ask how the actions of a Creator of a world not so simple could be understood in simple ways, indeed ways which are naive to the point of mindlessness. Did the Almighty complicate the environments and the very being of human beings in order to deliberately obscure all the true simplicity? Maybe Christians are quite confused because it all seemed so simple to those who were taught highly summarized and seemingly simple versions of an appropriately rich and complex understanding of a rich and complex Creation. See *Enriching Our Moral World: Simple Is Digested Complexity*, at <http://loydfueston.com/?p=1762> for a discussion of what is quite true and quite well summarized in the title of that essay.

The world seemed so simple for centuries as Christians lived in a Western Civilization which was Christian, imperfectly and incompletely Christian, but also substantially so.

While cautious about tricky matters of pure theology—that is, analysis of revealed knowledge of God in His transcendence—I made some suggestions in my recently released and freely downloadable book, *The Shape of Reality* [56]:

God is a divine manifold, in a manner of speaking. The light of revelation as best understood by human wisdom of the age shines upon God, also in a manner of speaking, and can project an image of Father. Let the wise man move a bit to catch the divine light of revelation from a different angle and the image is that of Son. Move a bit more and the image of the Holy Spirit appears.

Those who have read that book, *The Shape of Reality* [56], will have at least a feel for my preliminary development of a way of dealing with the reality of complex entities made of individuals which each retain their real existence. I concentrate on the reality of human communities. Those who haven't read the book but know some modern geometry (especially differential geometry) and topology might understand what I'm saying or, at least, trying to say. The 'manifold' in the above quotation refers to topological concepts under which a complex surface can have 'small' regions which have the topology or full geometry of a simple Euclidean plane; each of those regions exist as such while the global entity also exists, separately

in a distorted way of speaking. In human terms, the individual exists and continues to exist though he is part of a variety of communities which themselves truly exist and aren't just nominal ways of speaking of mere gatherings of individuals. Nor is it true that those individuals are merely parts of a Borg-like collective. (Warning, each of the three Persons of God is the entirety of God in a way beyond the sense of each member of the Body of Christ being the entirety of that Body. This is the primary reason for caution in extending this way of thinking into the theological realm.)

In other words, we now have the capability of thinking rationally and intelligently about the Trinitarian God of Christian belief. This doesn't mean this way of thinking about God in His transcendence is a perfect statement of the truth or the completeness of the truth, but it is a start on talking in rational and intelligent ways of the Trinitarian God, Father and Son and Holy Spirit.

Though I've been concentrating in recent writings on what might be labeled structural aspects of being, by way of geometry and topology, the real issue is relationships. A simple reading of the previous sentence is quite wrong—modern geometry and topology, largely by way of algebraic tools and concepts, is consistent with the trend in modern science and mathematics toward the realization of the primacy of relationships over stuff (or structures). There are major fields of geometry, such as symplectic geometry, where there aren't any well-defined shapes; in symplectic geometry, area is a constant but there is no well-defined measurement of distance or angles, no firm shape.

The best way to make sense of created being is to follow St John the Evangelist and the quantum theorists and evolutionary theorists in positing primacy of relationships over stuff, where stuff covers abstract forms of created being as well as concrete, thing-like forms. Relationships are ontologically prior to stuff and forms and structures and relationships create and shape all of those, sometimes forming complex entities. Something similar can be used to think through the Trinitarian God of Jesus Christ. After all, God is the Creator of all that is not Him and all that is not Him must, to some extent, reflect Him in being manifestations of some of His thoughts. God is unified, not in the sense of some frozen crystal, but in the sense that His mind and heart and hands, His thoughts and feelings and actions, are one.

God who is pure being and thus pure relationships in my metaphysical explorations can be seen to some—probably significant—extent even in

thing-like being.

I've written in this essay about this particular issue, being able to speak rationally of the Trinitarian God of Jesus Christ, as a case study of sorts. This short and informal study was intended merely to present the most fundamental belief of Christians as one which can be handled in a rational way recognizing modern knowledge of God's Creation, modern knowledge of both concrete and abstract created being, but we have to be willing to think in ways which are far from simple. Over time, these beliefs, which reflect modern knowledge of created being, will become the bedrock of Christian understandings of our world and all of created being which is not limited to this world. At that time, these beliefs will be part of a 'simple' understanding of reality—digested complexity as I discussed in the already referenced essay: *Enriching Our Moral World: Simple Is Digested Complexity*, at <http://loydfueston.com/?p=1762>.

It takes a lot of hard intellectual labor to see the world in simple terms, and the simple terms we Westerners inherited from Christian thinkers of past centuries are no longer plausible when we consider that modern knowledge of both concrete and abstract being. Either Western Christianity will retreat to a high-walled intellectual ghetto of superstitious beliefs and practices or else it will start passing through a generations-long period of digesting the complexity of the world to produce a seemingly simple understanding.

# 676 Making God's Thoughts Our Thoughts, God's Ways Our Ways: Why Christianity Is Not Simple.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2380>. It was finished and uploaded on 2017/04/21.]

## 676.1 We Are the Image of God, Except When that Requires Effort on Our Part

At an Easter Vigil Mass (Roman Catholic), I was a lector—5th reading. That reading is from the book of the prophet Isaiah and includes these lines Isaiah 55:8–9:

For my thoughts are not your thoughts,  
nor are your ways my ways, says the LORD.  
As high as the heavens are above the earth,  
so high are my ways above your ways  
and my thoughts above your thoughts.

[IS 55:8-9]

It's easy to misinterpret these words, reading into them warnings of a barrier between us and God which can't be surmounted—despite the

ongoing refrain: We are the images of God. In fact, much of the Christian support for human rights, including the rights of the unborn or the mentally disabled or others with little or no power to defend themselves, comes from this belief that we are the images of God. I'm going to recommend a different meaning for those words of Isaiah, a meaning which preserves the idea we are images of God in some substantial way—not just an ambiguous handwaving way.

In this age when Christian faith and Christian courage have weakened greatly, in this age when Christian minds have decayed still faster than Christian hearts and hands, these words are typically taken as a statement that understanding God is beyond our capabilities. The implication is that we should just relax, live with the advances which come from secularized intellectual activities in organizing complex organizations or or developing good and bad technology. The latter leads to the fear of some of us that, bereft of a Christian civilization—increasingly bereft of even Christian structure in our families and local societies, we are traveling with the increasingly secularized (not paganized!!) herd, a herd not heading toward the world where Christ's friends share the life of God.

Modern Christians, like perhaps nearly all modern human beings of the West, have been taught they have a right to hold opinions on all matters subject to human opinions; they have not been taught a duty to learn something about an issue before forming an opinion or even before somehow constructing a viable understanding of that issue. A quick trip to the local library isn't necessary for someone to determine that Iranians/Iraqis/whoever can't think rationally in the way of us Americans and some Europeans; it's knowledge that simply. . . Well, I think it's an assumption drawn out of the way American leaders and entertainment/news figurines act towards and talk about these other peoples.

In fact, while Americans talk as if they can get a factual and intellectual grasp of anything capable of being grasped by any human mind, they bow to self-serving ruling elites and their servants which present themselves as being plausibly true authorities. To be sure, acceptance of someone or some group as true authorities is a human act, often self-serving or self-justifying. It's easy enough for modern Westerners to accept an Einstein or his less famous successors, but quite disturbing to accept Darwin and his successors. More than a little bit of our self-understanding of our individual or ethnic or racial selves would be rendered vulnerable to disturbing changes if we were to honestly and courageously explore human origins and the resulting

human nature.

Our claims for our human natures are quite grand indeed but only in ways that don't require a response from us that demands time and energy and honest contemplation. We modern human beings in general truly don't do well in giving credit to the human mind or even the divine mind because we've been taught by a very bad and ideologically corrupted educational system to despise intellectual effort and to avoid it where possible; thus it is that the most popular of great literature of past generations, such as the novels of Charles Dickens, become mere obstacle courses to struggle through before returning to easier forms of thought.

We learn God's thoughts by studying His manifested thoughts. We learn God's ways by studying His acts-of-being, both creating and shaping created being. (God's ways are different from His thoughts only by way of creaturely perspective.)

I've claimed often and strongly that Aquinas was right, perhaps even modestly so, in his claims that the human mind is capable, in principle, of encapsulating any thing and all things in God's creation, though an actual human mind is not truly capable of understanding fully so much as a gnat. We have to have faith and courage and move resolutely forward in exploring the acts-of-being of God in His freely accepted role as Creator of a particular Creation, which particularity constrains the Almighty, by His own free acceptance, in a modern understanding of the covenanted relationship of Creator towards all that He had created. God honors His own thoughts as manifested in Creation, a modern view which honors but greatly expands upon the ancient Semitic idea of a covenant which is a divine version of what a human king offers to His subjects, with royal legal advisors hovering about. Nowadays, explorers of this world, tinkers and engineers as well as physicists and historians, have joined in, unconsciously in most cases, with old-fashioned lawyers in the struggle to forge new understandings of human communities and human history and technological possibilities and the sun and so on. Those understandings, which will total to an understanding of all of created being in a coherent civilization, are that modern equivalent of the covenants of the Bible.

In the first part of the first chapter of *A More Exact Understanding of Human Being* [53], I deal with an important part of this issue in a way that I might never improve upon. The chapter title is: *Being Empirical with St Thomas Aquinas*. The title of the first section of that chapter is: *A General Approach Toward Proper Shaping of the Human Mind*.

And here is the entirety of the text of that section (with some minor editing to allow for context):

## 676.2 A General Approach Toward Proper Shaping of the Human Mind

Because of the importance to my thought of some insights about metaphysical subjects by St Thomas Aquinas, I'm including a short chapter providing a short summary of those insights which are sometimes explicitly discussed elsewhere in this book but are always at the foundations of this way of thought.

Aquinas had a view of "the wisdom of this world" which greatly clarifies, or perhaps significantly modifies, the view expressed by St Paul in 1 Corinthians. In fact, the view of Aquinas is one I've struggled to communicate in my books and my Internet writings, though I've tried to expand and enrich that understanding to better consider the vast mountains of empirical knowledge which have accumulated since the 13th century. I think we should all contemplate the advice of St Thomas to learn humbly from Creation:

[J]ust as a disciple reaches an understanding of the teacher's wisdom by the words he hears from him, so man can reach an understanding of God's wisdom by examining the creatures [God] made. . . [Page 17 of St. Thomas Aquinas' commentary on 1 Corinthians.] [3]

Even our understanding of God's purposes for Creation should be subject to testing against empirical knowledge. I'll provide another quote from Aquinas:

[T]he wisdom which attains to God through the things of this world is not the wisdom of this world but the wisdom of God. . . [page 51 of St. Thomas Aquinas' commentary on 1 Corinthians.] [3]

In terms used by Aquinas and some other Scholastics: we know God through His effects in Creation. God has told us a few things about His

necessary and transcendent being, but most of what we can know about God relates to His freely adopted role as Creator of this particular Creation. And we have to remember that even God's words spoken to Moses or a few others were spoken in human languages and necessarily relied on concepts within the grasp of those the Almighty was speaking to. In the *Summa Contra Gentiles*, Aquinas had told us:

[T]he first philosophy [metaphysics] utilizes the teachings of all the sciences in order to realize its objectives. [page 35 of *Summa Contra Gentiles, Book Two: Creation* [4]]

Even theological systems are built upon metaphysical foundations. As such, they're built from the knowledge of the metaphysician, knowledge that should include that of specific sciences such as physics and mathematics and biology and history and so forth. I'll propose a definition of Wisdom which is put in greater context in a later chapter of *A More Exact Understanding of Human Being* [53] with the title of *The Wisdom of the World and The Wisdom of God*:

**Wisdom** An understanding of Creation and its relationship to its Creator that takes into account the best available empirical knowledge but orients that knowledge as well as the knower's personal experience toward the goals given by one's understanding of the Creator's revelations.

We should learn to respond to God's Creation when forming our ways of thought, hence, when shaping our minds, rather than holding on to ways of thought which are magnificent antiques, once plausible as well as beautiful but no longer consistent with what is known about Creation. Yet, we should honor those antiques for what they are and for the role they played in allowing us to advance further in human knowledge of Creation and its Creator.

# 677 We Don't Know What We Had and We're Making It Gone

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2400>. It was finished and uploaded on 2017/05/26.]

You don't know what you've got till it's gone. [*Big Yellow Taxi*, Joni Mitchell.]

As Western Civilization is decaying, we still don't know what we had and there's a good reason for that. As I've stated repeatedly, a civilization is mostly inside of its members: our understanding of ourselves and others, of Creation and Creator. That is in terms of theists such as Christians and Jews. The Body of Christ believe He has and they have received special revelations about the God Who is Creator. Something similar can be said about Jews, the People of Israel. For the civilizations of other sorts of peoples, you can adjust the language; such civilizations will resemble the Body of Christ even if they have truly evil aspects but, even in terms of this mortal realm, they won't have the fullness or most of the virtues of that Body.

Human communities are for real and Christians are bound to believe that the Body of Christ is the perfect and complete human community. Yet, there are many human communities, some of which feed into the Body of Christ in some ways, some of which are dead-ends of a sort. All of those communities are mortal creatures as much as are the individuals who are members of those communities. The United States has had a longer lifespan than did George Washington, but it won't live for ever and is currently a setting for battles between various gangs of bankers and politicians

and national security thugs and corporate executives and—very bad sign—seemingly a few generals of recent retirement and maybe a few still on active duty.

A well-known economist, Michael Hudson, wrote a book in recent years which bore the title, *Killing the Host: How Financial Parasites and Debt Bondage Destroy the Global Economy*. You can pretty guess his claim from the title. I think his idea can be generalized—and, in fact, without pretending to special prescience I can state that I had a similar idea based upon my readings of standard histories of periods when human communities were in turmoil and the ruling classes had broken up into gangs not fully different from those street gangs found in the bad neighborhoods of our greater cities. Each power-holder or wealth-holder is hard at work satisfying his own greed and ambition or perhaps—a little less despicably—trying to hold onto power and wealth for the sake of his own children or for the sake of his greater family. We wanted individualism and we got a snake-pit.

I'm going to lightly address one pseudo-charitable, pseudo-humanitarian program in the modern ideology of liberalism or reductionistic individualism: mass immigration based upon the idea that communities are nominal entities, mere voluntary gatherings of individuals which are accorded 'true existence'. We can build better communities, inclusive communities made of all sorts of peoples of different characteristics and beliefs and behaviors. By simply "taking down walls," we can advance directly to Heaven. None of this stuff about evolutionary and developmental processes which work over the millenia. None of this Christian stuff about slowly struggling toward Heaven and often falling back, seemingly further back than the position of our barbarian, devil-worshipping ancestors. We can do it because we're exceptional and we just need to describe a world of peace and justice and love and then harshly punish those who don't act up to our standards. I'll write a little later about our fall into a state of greed, but here I'd just like to note that some of our well-meaning citizens fell for the ploys of exploiters by way of an ignorant and stupid belief that we can design human communities, ones which approach perfection by some standard or other—usually a standard appropriate for a promising 12 year-old.

I've been writing more than a bit about communities recently and my latest book, *The Shape of Reality* [56], was an effort to to better describe complex entities, such as communities, by drawing upon concepts abstracted from mathematics, the qualitative drawn out of the quantitative and formal. I worked with differential geometry and topology and am

currently engaged in a slow and frustrating struggle to expand the mathematical horizons of my 62 year-old mind.

Before moving on, I wish to emphasize that, in this Creation, things happen slowly and gradually, by way of processes of evolution and development. The members of the Body of Christ come from a species which has evolved from unknown ancestors which lived about 3-3.5 billion years ago. The universe itself has been developing, and perhaps evolving, for about 14 billion years or so, though that estimate is subject to some revision.

We are an impatient species, a species which finds it hard to realize something I've claimed several times:

In this mortal realm, the mind's main domain is the future.

For example, our moral actions are habitual and almost reflexive—we don't have time to think through all our moral decisions or even many of our moral decisions. Our habits and usual behaviors are developed under the guidance of our elders in a particular cultural tradition. Some will participate actively in these complex processes of education and character-formation. Most will allow themselves to be shaped by those they trust or at least those they are dependent upon. Unconsciously formed in most, moral habits and other habits and attitudes will seem to be a part of our human being as much as our instincts to form families or kin-groups or even our instincts to survive.

This is likely one reason that multi-cultural human gatherings don't easily or quickly turn into real communities—and may turn into killing fields or highly stratified gatherings of peoples who remain separated, some maybe living under enforced condition of hardship. We often find living in settled communities easy just because we share habits with our storekeepers, lawyers, doctors, bankers, and local political leaders. If we don't share such habits with the various retailers and service-providers we depend upon, then we have to engage in exhausting and sometimes dangerous efforts to figure out the motives of mysterious aliens and then to enter potentially dangerous and nerve-wracking relationships. This is one reason that some cosmopolitan human beings are very valuable and are (sometimes) well-rewarded. They make it possible for Irish and Italian and Jewish and Black communities to exist separately but nearby, interacting through those with the skills and attitudes to deal with alien others. Most of us aren't Marco Polo and many will go voyaging among alien peoples and show ourselves to

be closer to the Spanish conquistadors—who were not evil but were tough warriors forged in centuries of fighting against North African Moslems and were also a bit ambitious and hungry for wealth. Their moral characters were better formed for the battlefield or for exploring dangerous wilderness regions than for peacefully occupying the lands of alien peoples.

There are some who can deal properly with alien peoples. Marco Polo comes ever to mind in that context, a man successful in his stay in China and after his return to Italy. Such men are very valuable, but they are valuable as bridges between communities of human beings who take relatively more time to grow comfortable with each other; that process of growing more comfortable involves the building of habits of behavior which are common to both peoples, at least under certain circumstances. A simple example of different habits is: fixed and (presumably) fair prices vs negotiated prices which typically start from a high offering price by the one holding a desired product. It's fun to bargain for hats or elephant statues in the shops in Tijuana, but it would be exhausting—at least for most Americans—to have to do that for their cans of peas and their children's underwear. And such problems lead to distrust, with one disturbing example being the seemingly simple issue of greeting a woman on the streets. Moslem women coming to the United States seem to feel free to move around with relative freedom but ignore the American customs of casual but friendly greetings on the sidewalks and in the public buildings in small towns.

So it is that I come to the research of Robert D Putnam (see [https://en.wikipedia.org/wiki/Robert\\_D.\\_Putnam](https://en.wikipedia.org/wiki/Robert_D._Putnam)), research which I've referenced a few times over the past ten years or so. In that article, we learn:

In recent years, Putnam has been engaged in a comprehensive study of the relationship between trust within communities and their ethnic diversity. His conclusion based on over 40 cases and 30,000 people within the United States is that, other things being equal, more diversity in a community is associated with less trust both between and within ethnic groups.

We learn in that same article that lowered trust in areas with high diversity is also associated with:

- Lower confidence in local government, local leaders and the local news media.

- Lower political efficacy—that is, confidence in one’s own influence.
- Lower frequency of registering to vote, but more interest and knowledge about politics and more participation in protest marches and social reform groups.
- Higher political advocacy, but lower expectations that it will bring about a desirable result.
- Less expectation that others will cooperate to solve dilemmas of collective action (e.g., voluntary conservation to ease a water or energy shortage).
- Less likelihood of working on a community project.
- Less likelihood of giving to charity or volunteering.
- Fewer close friends and confidants.
- Less happiness and lower perceived quality of life.
- More time spent watching television and more agreement that “television is my most important form of entertainment”.

Now we come to the punchline. The deliberate opening of the immigration gates and the other programs which have led to great damage, not yet complete destruction, of the countries of the West are the result of programs of the mainstream institutions of the West:

- the governments,
- the non-denominational charitable agencies,
- the Christian churches and the various branches of Judaism, including their charitable agencies,
- the schools at all levels,
- the publishing and journalistic industry,
- the banks and various corporations including the real estate developers local and national, etc.

The ongoing damage, and perhaps ultimate destruction, of Western Civilization has many of the appearances of a well-organized and huge conspiracy. As do most large-scale movements in human history. We need to realize that even the multi-culturing of the United States, and all of the West, is but a part of destructive parasitical behavior by our ruling elites and their allies—clueless snowflakes, morally corrupt intellectuals, politicians desperate to control all that exists, and so on.

Conspiracy? Well, we should reserve that word for specific, criminal projects, such as the Brink's robbery or the takeover of Russia by Lenin and his followers or some of history's most spectacular murders of public figures. Usually, we should think in terms of convergence, as individuals or small groups act in their own parochial interests and those interests turn out to significantly overlap with each other. Such a process might even be that which led to some of the spectacular crimes of recent decades in various parts of the world—the United States itself or those with an American embassy or those lacking in the capability of excluding American activists and intelligence agents.

The invisible hand. The invisible claw. The invisible fang dripping blood. Adam Smith saw truly but he saw truly in an age when there was very imperfect but still substantial Christian moral order in England and Scotland, when there was so much opportunity as to leave little room for the types of parasitical human beings described by Professor Hudson, when true innovators and wealth-creators were dominant and still rising. The invisible hand phenomena he saw can take some nasty forms in other circumstances than those of Glasgow and London in the 1760s. (Though they were nasty enough even in those circumstances; young men were setting off to make their fortunes and to have some adventures and would come back with chests of silver and gold after trading slaves or opium.)

Given some freedom for the various agents in the economy or politics or science or cultural projects, momentum builds and the herd starts moving together as if coordinated by an invisible hand. If not for this growing coordination between members of the involved populations, nations would not have formed and religions would have been all local and science wouldn't have become (at least for now) a self-sustaining operation. Nor would the West African slave-trade have taken on such a well-organized form—as if directed by an invisible hand. Or an invisible claw. Or an invisible fang dripping blood.

Clearly, it's only a minority of the people of the West who have con-

sciously turned a set of attitudes and incoherent ideologies into a project to destroy their own civilization—and that of their children, though they have recruited hordes of college students, snowflakes in a common way of speaking. More generally, those snowflakes are badly damaged human beings—including their communal parts and aspects of their human being. Perhaps mostly those communal parts and aspects. In any case, it might be that some of the children of the American middle-class and perhaps a lesser number of the children of the American working-class have been taught to hate their own families and ethnic groups, a lesson they've learned as least as well as the children of the Soviet Union in the days of Stalin and Beria. It would also seem that Christian leaders who have proven themselves incompetent at passing on the faith to the children in their communities have decided to betray the members of their communities in order to help peoples from other countries.

In Chapter 547, *Self-government Isn't Government Structure*, I had this to say about this situation:

We have let our exploitive classes destroy our own insides, our minds and hearts and hands—including all that is meant by “moral character.” We have, in old-fashioned language, sold our souls in return for television shows and the Superbowl and affordable tennis clubs and fancier housing than we need.

There is a major qualification to all of this. Many of the college students and religious leaders, probably some of the teachers and charity workers, some others, meant well and some might still mean well. Probably even some of the most greedy and ambitious of the exploitive class (elites, if you wish) had not meant ill when all of this decay was set in motion. At the same time, all of those people, and their equivalents in the past two or more centuries, should have been aware of a certain, shall we say, “loss of focus” in the Western mind, a problem which was spreading into Western feelings and behaviors by at least 1800: the mind leads the way into the future, the heart motivates and the hands get it done. The motivations of today's hearts and the actions of today's hands are shaped by yesterday's minds. This lack of focus on what's important led to various problems, including the one noted by Ortega y Gasset in *The Revolt of the Masses* [60]: the modern era freed many from what might be labeled peasant lives of limited opportunity and limited perspective but the leaders of all those parochial peoples who now

had some access to more cosmopolitan lives failed to lead; they chose not to raise their flocks to a higher outlook and a greater understanding of Western, Christian Civilization; they chose rather to descend to the more vulgar lives of peasants having some money and being set loose in the wonderful and dangerous city.

So it is that the herd is still larger than the total of exploiters and activist-suckers. The herd is most of us and our priests and ministers and teachers and town-fathers and smalltown journalists and so on. It was most of our parents, all of those parents who tolerated:

- the low-quality of the American schools, deteriorating still more beginning in the false prosperity of the 1950s—the distinguished mathematician Raymond Wilder saw a significant drop in mathematical knowledge and skills starting in that decade,
- the ideological corruption of their children in schools which did their best to delay maturing of those students and to socialize them into being American consumerist widgets (for lack of a better term),
- television with its noisy children's shows so destructive of any developing skills of concentration and its family entertainment composed of exceptionally nice people living in plastic communities bereft of the interesting characters found in the works of Mark Twain and other worthwhile, morally good entertainments,
- pro sports becoming a major part of American life even as it evolved from something largely admirable (“where have you gone, Joe DiMaggio”) to freak-shows run by moral degenerates,
- the destruction of smalltowns and city neighborhoods in the interests of mall developers and large stores,
- the centralization of the American economy and consequent mobilization of the American worker—didn't settled peoples once look down upon nomadic peoples?,
- the destruction of local political corruption in order to centralize it in Washington,

- the destruction of local banking systems in order to centralize financial power in New York City and other such places (wonderful in their own way),
- ...

In a word, we've destroyed what we inherited, what we were beholden to protect and hand on to future generations, and we did so in the interest of short-term gains of the sort that men and women of better moral characters might have disdained but certainly wouldn't have accepted under the terms offered: "become dependent upon us, the rulers of centralized power and wealth and give us your children, we'll provide you with your hearts' desires." We made a terrible bargain with Satan and now he can't even keep his promises of prosperity. But that matters not. Whatever the particulars of your beliefs—I consider myself a Catholic bound to a living tradition and don't believe in the existence of angels and demons, the evil we've done is to turn away from God and from our communities. If we can't get all we were promised in this mortal realm, we still gave up our desire to be saved, a desire which has to show in at least an awareness of our need to keep our priorities straight, for our sake and the sake of the future generations and the sake of the Body of Christ—the community of the friends of God. As it is, most Americans and most Westerners in general seem only to be upset that Satan isn't keeping his side of his bargain with us.

As I've claimed for years, the true foundation of a civilization is found inside the members of that civilization, in an understanding of all that exists. I'll be as intelligent as a musician or poet rather than as form-bound as 'good' writers; I'll repeat an earlier part of this essay.

[refrain]

In Chapter 547, *Self-government Isn't Government Structure*, I had this to say about this situation:

We have let our exploitive classes destroy our own insides, our minds and hearts and hands—including all that is meant by "moral character." We have, in old-fashioned language, sold our souls in return for television shows and the Superbowl and affordable tennis clubs and fancier housing than we need.

[end of refrain]

# 678 Is God's Creation Compatible with Centralization of Authority and Power?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2428>. It was finished and uploaded on 2017/08/01.]

Let's consider one historically important central power: the Papacy. The history of the Papacy was actually quite complicated but we can pass over those complications for my current purposes.

I choose the Papacy for several reasons. Firstly, I entered the Catholic Church as an adult and am currently an (excessively?) active Catholic parishioner. I hold an orthodox version of the Western Catholic Christian faith, including a largely Orthodox view about the history and true nature of the Christian Church and its hierarchy, sacraments, relationship to God, and so on. Secondly, the Western Church—mostly biased too strongly to Roman ways—was one of the central communities in the very formation of 'the West' in all of the strands of human being: political and cultural and economic and moral and so on. Thirdly, though not really separate from the prior claim, the inability of Western Christianity to deal with modern understandings of very important realms of God's Creation is perhaps the major reason for the current decline of the West—that decline seeming to be irreversible at this point. Fourthly, the Church Herself (a 'female' organ of the Body of Christ) seems to have a 'revolutionary' or 'progressive' leader who is trying hard to bring the Church and its leadership into synch with the Progressive communities of the modern West—which communities I have labeled as parasitical, living off the resources nurtured by the traditional (**not** stagnant) communities of the West. To be sure, many of

the traditional thinkers of the West in this time of decay do advocate a stagnant way of thinking and of structuring our human communities; this is true in political as well as in ecclesiastical communities.

The Papacy, the institution itself strongly centered on the Pope and sometimes even being his prison, is also useful as an intellectual organizing point for another reason: it is the only institution which has existed for the entirety of West's existence, where the West can be understood as a vaguely defined human community drawing upon Rome (after the collapse of Roman political authority in the West) and Jerusalem and developing over the years C300AD to C1800AD when the Enlightenment had clearly gone wrong after the incompetence of Christians in dealing with the great opportunities of modern science and other endeavors to explore this wonderful world God gave us. These endeavors include such fields as textual analysis and physical anthropology as well as physics and mathematics as well as the explorations of the physical world and the development of modern technology and industry.

And, of course, it's always useful in the search for larger-scale or abstract understandings to have something concrete to focus on. So, I'll turn to a quick schematic of papal authority. We have:

- the Pope in the context of:
- the Western Church in the context of:
- the entirety of Christianity in the context of:
- the entirety of the Body of Christ (<b>not</b> just the Church) in the context of:
- the universe in which we are pilgrims in the context of:
- the entirety of Creation in the context of:
- God's purposes for Creation and all it contains.

If the Catholic Church, especially the Roman Catholic church, has played a passive but essential role in the death-throes of Western Civilization, that passive attitude—defend but don't adapt in an intelligent

and tradition-respecting way, has led to this danger of the Church being corrupted inside by the same forces the Churchmen and other churchmen (Protestants and others) refused to engage in a healthy and productive and creative way. One good example of mindless defense was Pope Pius X's *Pascendi dominici gregis* ("Feeding the Lord's Flock", see [https://en.wikipedia.org/wiki/Pascendi\\_dominici\\_gregis](https://en.wikipedia.org/wiki/Pascendi_dominici_gregis)) which was a relentless condemnation of a certain (not all that common at the time) form of Modernism without a hint of Christian responses to the problems and opportunities which the so-called Modernists were responding to. There were no ideas of such responses, only ghetto-walls for the minds of most Catholics—likely it was that some who tried to stay outside those walls for all the right reasons ended up leaving the Catholic Church. And many who stayed began to nurture the suspicion that Christianity had no positive ideas, only brutal criticisms of the ideas and attitudes and behaviors growing up in a world increasingly beyond the comprehension of the Catholic Churchmen.

It seems to me that the all-too common understanding of the spiritual descendant of Peter as being the ruler of the Apostles is wrong because it conflicts with God's effects in His Work of Creation. The Pope is the head of the college of the Apostolic successors (all legitimate bishops, Catholic and others). He is not any sort of despotic ruler, though even good Popes have had to take on that role for the good—if it had been possible to shed such wrongful authority when no longer needed for God's purposes. Nor do the members of the college of Apostolic successors have the full authority they gained during the years when most educated men were priests and monks and those men, often against their own desires, were sucked up into a vacuum in the courts of kings and counts and in all departments of research and teaching institutions.

We live in a world in which evolution and development dominate. We rarely even suspect what the ideal is until it begins to show itself in the world; Hume and the other empiricists were wrong in thinking empirical reality to be the whole show but they were right in denying that empirical reality is just a curtain in front of some 'real-world', 'real' in the sense of Plato, 'ideal' in the sense of what this world is moving toward—so to speak. Looking at matters on the longer-term, we never know what the 'ideal' is since the human brain evolved in response to this physical world and the human mind has developed, upon that brain, in response to those realms and other realms of God's Creation which men could reach at any given

time—such as the abstract realms of mathematics and metaphysics. There is, in fact, strong truth in claims that the human mind and the world are evolving and developing in synch.

We live in a world where the insides to physical creatures, living and nonliving, are as dynamic as the outside. Neither Aristotle nor Thomas Aquinas could quite figure out how much of human thought could proceed—they knew the brain to be the center of thought and thought the brain to be a static entity and so they considered and somewhat endorsed the idea of a mind or soul as made of different ‘stuff’ than physical matter. They shouldn’t be blamed for living before modern chemistry and biochemistry and all the instrumentation, microscopes and MRIs and cellular dyes and so on. But they made that mistake and it’s embedded in Western thought in various ways, some of which I largely grasp and others I grasp but not well enough for clear expression, and others which are obscure to me. It’s all a confusing mess largely because of the entanglement of the human mind (think relationships largely mediated on our end by our brains) and all else we can perceive or validly conceive.

I’m in the same position I was in ten years ago or so regarding ways of thinking of communities as being real in this world seen in reductionistic terms. In my previous series of three posts, I moved forward in stating my confusion about the dynamic nature of God’s Creation using our own human being as a focus:

1. Chapter 336, *What is the Totality of a Human Life?: Individuals and Communities.*,
2. Chapter 337, *What is the Totality of a Human Life?: Individual and Communal Intent.*, and
3. Chapter 338, *What is the Totality of a Human Life?: Unity, Coherence, and Completeness.*

Though I can’t claim to have cleared up even the ‘structural’ issues of human being, I have made some progress in at least defining what needs to be done by those younger than me—see *The Shape of Reality* [56].

Sticking to just human being: how do we discuss and understand these dynamic relationships of human being which exist at so many levels? There are individual human beings and various communities, starting from the more or less biologically mandated communities of families and ‘tribes’ and

then ranging from card clubs through ethnic clubs to local political communities and through many others up to the entirety of the human race. To me, the ultimate community is one which is essentially a unified and coherent and complete civilization with the Christian Church as its primary and central organ.

But there is no centrally imposed order on all of this, this sheer mess in strong opposition to the human desire for simplicity and for static forms of order. Order does come to an entity partly from the greater realm in which it is embedded but also from inside of the entity—even inside the brute matter of that entity—and from other surrounding entities of various degrees of influence in either direction. And it's all rapidly changing, evolving and developing as well as decaying and dying.

Our desire for that simplicity and static forms of order conflicts with the way this world works, with the way that all of Creation works. The world is such that power and authority can't be truly centralized: the Creator Himself has not chosen to work in such a way, to exercise His power as a despot.

Order isn't to be enforced upon this world from a central region, or from above—if you prefer.

Yet, order is being established—though there seems to be a large de-  
volution or setback occurring in the West because of greedy and overly-ambitious leaders who aren't even very competent. Order is growing, despite the current setbacks. Human communities are generally growing and becoming better-ordered, though growth in recent centuries has sometimes overwhelmed any processes establishing order; many huge human communities have passed through or are passing through periods of partial chaos. Libertarians can be credited with seeing that stable and long-lasting order can't be imposed by central authorities. They fail to see that large and well-ordered human communities are, over the long-run, ordering themselves as if there was some sort of central authority, or Invisible Hand, directing the process; this is more or less known to be true in economic realms, but it's also true in other realms: political and cultural and so on.

Order grows from inside of entities and communities of entities; it is also impressed upon entities and communities of entities from the outside. Order comes bubbling up and comes raining down. Any of these growth and development processes can be gentle or harsh.

For now, lacking much of a program for making sense of this, for providing some way of properly enrichening and complexifying my worldview, I'm

going to describe my intentions in a way entangled with more traditional spiritual terms—which remain valid but aren't likely to produce the basic tools and concepts we need to move forward in better understanding Creation including human nature. Again, as we learn more and as our human communities grow and become more complex, Creation itself grows richer and more complex—we are creating new forms of being, most especially human being.

A pagan God rules from above or outside, rules as if being a more powerful version of a human king or aristocracy. That pagan God rules by command and by force imposed from above. And so it is that we have the ultimate sort of centralized power.

The Christian God (or the Jewish God) is the source of being, supreme but not needing to exercise powers in the way of a human king—though we should remember the Almighty can do so if He wishes. Since the God of Jesus Christ is the source of being, He is everywhere and is not a pagan God or god sitting on a throne on a mountaintop though that image seems to be the best that many believers can manage when thinking about the Almighty. And it becomes the false ideal for the Church regarded as the (entire) Body of Christ. We need ways to think about God and our relationships with Him which transcend the traps of our natural pagan ways of thought as well as the modern philosophical and scientific tendencies to push God off to the distance until He no longer even exists. You can see such a process of distancing in the family of John Adams who came from Calvinist stock, was himself a Deist who yet respected versions of Christianity with strong beliefs and whose descendants were increasingly Deistic until God was of no importance at all in their lives. When God is so far away and so little involved with His own Creation, He ceases to exist.

My current way of looking at matters, an expansion of my views as expressed in *The Shape of Reality* [56], isn't something that came to me from some sort of contemplations of immaterial realms of being. Rather did it come to me from interactions of Christian teachings with modern knowledge of concrete realms of being and also modern knowledge of certain abstract realms of being—mostly mathematics but also creative writings and other human fields of endeavor. It is those abstract realms of being which have led my thoughts and feelings and acts in directions at least somewhat parallel to the thoughts of those known as spiritual masters.

Elijah couldn't find God in all the great forces of nature but did find Him, and heard His commandment and encouragement, in a whisper (or

“gentle blowing” or similar words in various translations). (See 1 Kings 19:.)

To me, this means that Elijah found God inside, not just inside of his own mortal self but also inside of the atmosphere so that the Almighty could be heard more easily in a gentle breeze which didn't distract and frighten the senses of a human animal as did the winds of a great storm. God could have been found just as easily in the ground itself: to the modern mind in the wonders of the soils and rocks and waters and all the remarkable relationships that underly their properties, starting at the level of subatomic particles and all their relationships described by quantum physics.

Somewhere in his great pile of writings, Augustine of Hippo stated that God is deeper inside of us than we can reach. He is also higher than astronomers can see with their telescopes and more deeply inside matter than the physicists can see with their accelerators. He is more abstract than the category theory of mathematics, larger than the greatest of transfinite numbers. He is more concrete than a granite slab.

Again: the Almighty doesn't seem to run things in the way of a king, nor is He merely a kindly grandfather doting on His young ones. Let God be God, meaning that we have to be openminded about God in His transcendence and also in His freely chosen role as Creator of a particular Creation. We have a few abstract descriptions of God which are binding: all-powerful and all-knowing and all-loving. He has also revealed to us a few aspects of His 'concrete' transcendence, mostly His triune nature. We know much about God's acts as Creator and Shaper of His Creation. That latter knowledge doesn't yet show much in Christian thought. We think yet of God in the Neo-Platonic terms of many of the early Fathers of the Church.

Much of modern knowledge points to relationships, participation in being and in shaping being at all levels—from subatomic particles through blue whales and on to galactic clusters, and self-organization which feeds into the self-organization at smaller and greater scales of being. God is the driving force in all of this, absolutely powerful and all-knowing but still seemingly managing to give us some freedom—at all scales of being. When it comes to human being, at all scales from individuals through small communities and on to the Body of Christ or ultimate human civilization, we have a mind-boggling complexity of relationships with each other, with other animals, with all the physical universe, with all Creation, and with God. Our relationships with God and with creatures or all of Creation are internal as well as external, though human animals—of all known creatures—have brains capable of generating minds (certain sorts of rela-

tionships) which can respond to Creation in such a way as to encapsulate it. And we can encapsulate whatever God tells us, whether He gives us hints about the true nature of Creation or hints about His own nature. This is inside of us though Judaism and then Christianity mulled over bodies of private revelation and turned them into authoritative public revelation. Even the truly public revelations of Christianity came from those whispers inside of prophet or king or priest, of carpenter or tentmaker or fisherman. Jesus of Nazareth spoke softly when announcing that He was the Son of God and those who heard were often uncertain that those whispers were truly in God's voice.

God Himself leads and teaches as well as creating and shaping. In human terms, a leader such John Paul II and a teacher such as Benedict XVI take on some of the true nature of the God they served. Moreover, the nature of this world of evolution and development tells us—at least those of us who have studied some history and some evolutionary biology—that brute matter and animals of limited intelligence (including human beings emerging from darkness to a greater knowledge of God and Creation) sometimes need to be forced. William the Conqueror, Henry II, Henry VIII, and other brutal English kings played a role in establishing the order which became—almost miraculously—a political system which moved by some sort of internally generated forces toward an expanded franchise, approaching a state of inclusive self-government before the Enlightenment (British as well as Continental) went out of control and, more recently, turned developments back toward some sort of elitist rule—elitist in the sense of those who are most unscrupulous and not in the sense of any sort of earned or displayed merit.

After the tradition-respecting reforms of various modern Bishops of Rome, we're seeing the Papacy and the Curia of the Roman Catholic Church being returned to that same sort of elitist rule. In both cases, the rhetoric of the so-called progressives who are returning the institutions of the West to more primitive forms of organization forces them to pretend to be moving forward, and this is true of Pope Francis and his various packs of attack-dogs who pretend to be Christian intellectuals. Any forward movement is intended to destroy the structures of human communities and even those of healthy human individuals, to destroy in the interest of reshaping the political and ecclesiastical and other human communities of the West, reshaping them to be under the control of a small number of power-hungry leaders of Western Christianity and Western political systems, of bankers

and generals and corporate executives and morally degenerate intellectuals in the mold of Zbigniew Brzezinski as well as priests who seem to have moved beyond their Christianity. They themselves can't control in a centralized or hierarchical way—God didn't create a world in which such is possible. Yet, the power of convergent interests (think: Invisible Hand) moves them in this direction in which they'll destroy much that is good in a hubristic and impossible campaign to control a world in a way more like that of Satan than that of God. Our modern elites have little positive power but much destructive power.

I can't describe how it is that human being, individuals and communities, will operate when they are reborn in Heaven. We can see some hints by paying attention to the way that God works in this (mostly or most obviously) concrete world and in the entirety of Creation. We can get more hints by studying modern science in the light of the Johannine (St John the Evangelist's school) claim that relationships are primary and stuff is secondary. We can study such fields of thought as self-organization in the mathematical and biological domains or evolutionary and developmental fields of thought in general. We can study history and see the real trends—they aren't in the direction favored by American progressivist politicians and intellectuals and favored also by certain types of Christian leaders including Pope Francis. Modern progressivism is so 19th century, relying on outmoded theories of determinism, including forms of political and economic and moral determinism which lead to the the false possibilities of centralized control of at least the human realms of God's Creation.

So, I'll conclude that God's Creation isn't compatible with anything approaching complete centralization of power and authority, though centers of power and authority do exist and have their own role, often more thrilling and chilling than the roles of more modest human communities but not really more important and certainly far more dangerous when the leaders in those centers of power and authority wish to impose themselves and their thoughts and feelings and behaviors upon all the human communities they touch.

In my next post, I'll display my deep confusion a little more explicitly by arguing that God's Creation also isn't compatible with any sort of radical decentralization.

Something else is happening, the development of order by way of processes working from the inside and from the outside, from the lowest levels and from the highest levels. Somehow, things seem to work out, order is

being slowly established, though it can be beaten back by those blind to what is going on around them—including the leaders of the West in the 20th and 21st centuries.

# 679 Is God's Creation Compatible with Decentralization?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2435>. It was finished and uploaded on 2017/08/22.]

Mostly. That is, decentralization creates lots of opportunities for dynamic efforts of various sorts, some of which might well be very successful. By “successful in human history”, I write of both history proper (written narratives based upon facts) and also prehistory (the reconstructed narratives of pre-literate men and even of apish ancestors of men). By success, I write of the proper enrichment and complexification of human being, individual and communal, where that enrichment and complexification is such as to encapsulate those realms of Creation reachable by human mind and heart and hands at a particular time. In three earlier essays, I noted that this sort of human development (intertwined with significant evolutionary changes over surprisingly short times) has to take place at multiple levels of human being: individual and small communities and large communities up to that ultimate of all human communities, the Body of Christ which is essentially a completed and perfected human civilization with the Christian Church as its central organ. The three essays which very roughly sketch this viewpoint are:

1. Chapter 336, *What is the Totality of a Human Life?: Individuals and Communities.*,
2. Chapter 337, *What is the Totality of a Human Life?: Individual and Communal Intent.*, and

3. Chapter 338, *What is the Totality of a Human Life?: Unity, Coherence, and Completeness..*

For the past few years, my philosophical thoughts have been largely concerned with human communities and their reality. Now, I'm turning to an effort to describe some more dynamic aspects of human being. These dynamic aspects come into play in this situation because I'll take a position related to that of Adam Smith, of classical liberals and libertarians in general. The classical liberals and libertarians say that individual human beings form contractual and breakable relationships that provide for their needs and desires; I say that individual human beings along with the fundamental communities baked into our genes form relationships that lead to the formation of new human communities and even new types of human communities. Many of these newly formed communities will last for at least some generations and perhaps so long as humanity exists in this mortal realm. And some of these communities will reflect back and cause deep changes even in individual human being—changes which, if they last and lead to reproductive advantages for some, might be baked into the genes of future generations of individual human beings.

And so it is that I can claim that structures akin to hierarchical structures arise naturally, through the processes of community formation and especially in response to demographic factors and to increases in cultural or technological sophistication. Ideally, most structures will be—or least will evolve and develop to be—confederal or distributivist in the sense that authority and power is located at the lowest level possible.

I'm not trying to write any sort of complete account—if such is possible since I claim that new forms of human being come into existence with these new communities and even inside of individuals and of pre-existing communities as the new grows out of relationships involving individuals and those pre-existing communities. The production of better understandings of human being as it is and as it was will itself lead to enrichments and complexifications, new forms of human being.

I might be writing a book covering human being in a bit more detail—it seems nearly impossible that I can write such a book in less than a few years or so. For now, and as I explore new ways of thinking about this interesting stuff and non-stuff which is us, I'm motivating myself to move on and do more disciplined thinking about human being in the context of all of Creation. Perhaps some of my readers might also move on to such

thinking and exposition of the results. For now, I'll write a few paragraphs about the sorts of issues to be considered.

A man can't do what that man can't do. More of some things, such as irrigation or building defensive walls or temples, can be done by greater numbers of human beings. Some things, such as the forging of new types of weapons or tools or jewelry, can only be done by those who have the creativity and technical skills for innovations of that sort; on an ongoing basis, such work can be done by those at not so high a level of creativity but having at least steady hands and good eyes and good procedural memories. In effect, more people can lead to new forms of communal human being and so can a population with an increased number of certain types of individual human beings or new types of small-scale human communities—such as guilds which develop and pass on skills. Archaeology and ancient literature (including the book of Genesis) tells of the importance of new technology which was dependent upon the development of new skills.

Culture, in the form of literary or philosophical or artistic works, give human beings of a certain time and place an understanding of at least a major region of this world and maybe even of the Cosmos by some definition. The West, which seems to be enduring a prolonged, self-inflicted death, had a Christian Civilization of extraordinary depth and richness which drew upon the teachings of early Church Fathers. Western Civilization also drew upon the various Indo-European cultures, including those of Rome and Greece, and, over time, drew somewhat upon various Asian and North African cultures. The tightly related understandings found in the West had become the sea in which the European fish swam by at least the early Modern Era—say, around 1300. The sea is draining and becoming more and more toxic by the day, but this is a sea which can be replenished by the efforts of men. The replenishment would take much hard work and some amount of time (perhaps a generation or two if we get to work yesterday with a major effort), but it's quite possible. It's more likely that sophisticated schools of full-blooded, sacramental Christian fish will soon enough be swimming in a sea with Chinese or Russian minerals and salts, but I'm trying to start this replenishment with waters and minerals and salts flavored in my Gaelic and Saxon and Roman and American ways.

What can I say about the technological aspects of human life in this regard? Don't we all know that knowledge, true and false, can be distributed more rapidly by way of printed books than by handwritten texts on expensive parchments or animal hides? And the speed grew so much with radio

and then television and then cheap recordings of music and movies and documentary materials. We're nearly at the point where current human information could be put on small devices which would be affordable for many; at the same time, vast amounts of falsely or truly presented events could play their way across the widest of screens even as they occur. For now, this has played a role in a tremendous drop in literacy, which is the foundation of the styles of thinking which have produced the cultural and technological products of the West. (See *From Dawn to Decadence: 1500 to the Present* [9] by Jacques Barzun for a historian's brilliantly detached telling of this decline in literacy and in the styles of thinking which led to quantum physics as well as to the poetry of W. H. Auden as well as to the truths and the partly manufactured image of American greatness—see *The Image: A Guide to Pseudo-Events in America* [14] by Daniel J Boorstin.)

In summary, God's Creation is quite compatible with decentralization. In fact, most of the evolutionary and developmental processes in at least this concrete world occur by processes of self-organization, decentralized processes being explored under sometimes misleading terms such as "chaos theory" or "complexity theory" as opposed to centralized design or control processes. The odd thing is that these decentralized processes do build the hierarchical structures so beloved and misunderstood by the advocates of top-down design and control processes. And so easily corrupted into centralized, top-down control structures by those meaning well or ill for their fellowmen.

The longer discussions are delayed while I work out some ideas and some possible paths forward. I won't have the final answers anytime soon, probably not in my lifetime on earth, but I hope to be providing some interesting possibilities before the end of 2017. Until then, I'll be writing about various topics, some related directly to this line of thought and some not so related.

## 680 A Few Comments on Order in Human Being and All of Creation.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2439>. It was finished and uploaded on 2017/09/01.]

In Chapter 678, *Is God's Creation Compatible with Centralization of Authority and Power?*, I concluded:

...that God's Creation isn't compatible with anything approaching complete centralization of power and authority, though centers of power and authority do exist and have their own role, often more thrilling and chilling than the roles of more modest human communities but not really more important and certainly far more dangerous when the leaders in those centers of power and authority wish to impose themselves and their thoughts and feelings and behaviors upon all the human communities they touch.

In Chapter 679, *Is God's Creation Compatible with Decentralization?*, I concluded that:

God's Creation is quite compatible with decentralization. In fact, most of the evolutionary and developmental processes in at least this concrete world occur by processes of self-organization, decentralized processes being explored under sometimes misleading terms such as "chaos theory" or "complexity theory" as opposed to centralized design or control processes. The odd

thing is that these decentralized processes do build the hierarchical structures so beloved and misunderstood by the advocates of top-down design and control processes. And so easily corrupted into centralized, top-down control structures by those meaning well or ill for their fellowmen.

All recent political and social and economic and historical thinkers I know of are at the wrong level of abstraction for understanding the basic existing characteristics and potential characteristics of human being. There are at least three categories of such thinkers:

1. Those who recognize the concreteness of human being and remain at the level of concrete, thing-like being in nearly all their thoughts.
2. Those who use applied mathematics directly upon the concrete relationships and actions of human beings and their immediate environments.
3. Those who use forms of abstract reasoning which don't reflect what has been learned about the being of this world in its concrete and abstract attributes.

Of course, these categories are nearly empty though a lot of thinkers can be found standing in sometimes strange postures on the boundaries. Let's pretend there are such limited thinkers. In my opinion, the first group has the best of the arguments if our goal is to use these fields of thought to understand human being. Unfortunately, most of the (imaginary) members of that first group and nearly all the (imaginary) members of the other two groups forget that the non-human parts of this concrete world are so well understood because of the use of abstract reasoning as shown in quantum mechanics, physical theories of spacetime which are based on very abstract geometries. It seems questionable, and maybe outright silly, to try to use, for example, the uncertainty relationships of quantum mechanics to explain free-will, but there is a general principle I'd advocate:

Some of the complexity of the fundamental levels of concrete being in this universe might be smoothed out and simplified at the level of larger-scale entities such as human beings, but there is no reason to think that is always the case and perhaps some

reason to speculate that those entities have their own corresponding types of complexity.

Many hardheaded men and women might claim this doesn't matter because human individuals and human communities act at the level of concrete biological forms of being. True enough, so long as we're sure we're not missing some very important traits of living organisms and of human beings in particular. After all, it was not only literalistic interpreters of the Bible but also some competent or even outstanding physicists who attacked the early attempts by geologists and paleontologists to understand the chronology of rocks and living creatures. Not knowing about subatomic particles, those physicists thought the Sun had to be burning by chemical processes and, thus, the Solar System—including the Earth—couldn't possibly be as old as some geologists and paleontologists were claiming. Even more relevantly, overly concrete thinkers never even dreamed of one of the Einsteinian insights which the great man himself probably didn't grasp when first proposing the Theory of General Relativity: the Universe is an entity with its own properties and isn't just the sum of what it contains. Our thing-like world is defined by two-way interactions between the global whole and the local parts. Human being is very similar to the "global whole" understood in terms of descending levels of community and the "local parts" understood in terms of individuals and their ascending levels of community.

True it is that human being arose in this concrete world. Human being remains flesh and blood. We know that flesh and blood, even that of worms, is more dynamic and more complex than even the greatest of early biologists, say Aristotle and Galen, could have guessed.

But the complexity of human being rises above that of flesh and blood and even above most of the processes studied by physicists for various reasons including the simple and non-mystical reason that human being has come to include mind which developed geometry and calculus and algebra, physics and chemistry and biology, history and fiction writing and musical composition, theology and poetry and pictorial representation. Human being has taken on abstract attributes, and these exist at particularly intense levels in human communities engaged in the conversation over the ages between the great and creative thinkers of our race. (Similar but more vague statements can be made regarding the hearts and hands of those communities which tie together the generations, but—as I've claimed repeatedly, the human mind leads the way into the human future.)

All entities and more elementary forms of being in this universe, certainly the universe itself, were formed by abstract streams of being—relationships. Human beings are more so, because of our various forms of awareness which rise far above even the self-awareness of our fellow living creatures on earth. Mostly, we are aware of abstract relationships. We can somewhat perceive and more clearly conceive of the abstract being which forms part of the thing-like being of this universe.

Our awareness of ‘political’ relationships, for example, rises far above that of the lionesses in a pride or the various bull elephants in a band of rogues. Over the millenia, our awareness of political relationships has grown, leading to more abstract being of that sort. Thousands of years ago, the Indo-Europeans seem to have developed patronage (think of it as an initially gentle or persuasive form of feudalism) and the ancient Chinese must have developed something similar which led to the First Emperor. This sort of political relationship led to better-organized bands of warriors, which bands evolved and developed over some small number of centuries into communities which could truly be labeled as “armies of conquest”. It also led to the protection of and control over miners and blacksmiths and leather-workers and horse-breeders and others necessary to those early warlords.

Since then, various forms of government and of bureaucracy have evolved and developed—not often under the complete control of even the most ruthless of political leaders and sometimes not much under any sort of control of political leaders. Various communities, political and economic and military and artistic and academic and scientific and so on, have developed and grown large and complex. They overlap and intertwine and intrude on each other’s domains; bureaucracies and entities we might call ‘agencies’ have grown up as part of this process. Under conditions which have held in the Modern Age—from perhaps 1500, centralized political communities have become excessively powerful. The legitimate responsibilities of these centralized political communities have not always been a high priority because such communities allow individuals of great ambition and greed to grab more power and wealth for their selves or their families or their classes than they otherwise could have even dreamed of.

This sort of situation has occurred before with the leaders of various sorts and mixtures of political and military communities we find in history. Having achieved those positions of leadership, by means fair or foul, various sorts of leaders use their dominance over violent means to grab more power

and different sorts of power than is justified by the needs of the greater and encompassing communities of clan or tribe or confederation of tribes or nation or empire or whatever. There have been leaders who have refused to abuse their powers and perhaps many who were never so tempted. The ones who refused to abuse their powers include Jesus of Nazareth first and foremost but also, on a mundane level, the Roman patriot Cincinnatus and also George Washington who is often referred to as a modern Cincinnatus.

Over the generations, some larger-scale human communities have been able to grow along with their political and military communities. In a sense, the modern history of balanced powers reached a peak in the American Founding. Let me take one example: the Congress of the US (House of Representatives and Senate) was given authority to declare war and the House was given the further responsibility of funding a war or refusing to do so, at least refusing to give the President as much money as he and his military advisors wished to have.

The American system of government has broken down in various ways and the current efforts to control the world are but part of the problem. In fact, we can't fully see the problem in terms of the US Constitution since there are some very active centers of illegitimate power—the “national security agencies” and the related, quite bloated, bureaucracies in the military services and the State Department and Justice Department and other places; the political and military authorities seem to be allied with and dependent upon these bureaucracies and agencies and willingly so. Those agencies and bureaucracies have grown like fungus on and inside a living creature with a weak immune system. And, in fact, that is an accurate analogy. The more legitimate political and military communities can perhaps be more accurately compared to cancers, legitimate parts of the greater body which went bad and began to wage war upon that greater body.

The US Constitution doesn't consider the existence of national security agencies, though they have existed along with other parts of complex human political systems—in ancient China and in at least the later Roman Republic. Ruthless scavengers of information and those willing to commit brutal acts are often valuable to power-seekers and power-holders. Yet, they don't seem to have come into their own until their hyper-development in the various totalitarian societies, most especially those which inherited imperial intelligence and police agencies—think of the Bolsheviks absorbing the services which spied upon the Tsars as much as upon the Tsar's enemies.

The NKVD/KGB was certainly a power-center which even worried Stalin at times—hence, the purges. There is precedence for the growth of intelligence and police agencies into self-serving power-centers. And the United States, its government and its other communities and realms, had no experience in dealing with such. The Founding Fathers had no reason to foresee the development of a CIA which kills under orders of the constitutionally elected bosses or for its own communal purposes.

The historian Carroll Quigley, circa 1950s, had identified three dominant power-holding groups in the United States: bankers (think J P Morgan), monopolistic capitalists (think John D Rockefeller), and politicians (think Teddy Roosevelt). There are complications here as Rockefeller moved to New York City and started using banks to control his various corporations and trusts into which he had thrust productive enterprises which he had built up. Ignore these sorts of complications for now. The important issue here is that Quigley seems to have been right for the period before the Great Depression and somewhat right for 2 or 3 decades after that, but the creation of the CIA from the OSS (which had been subject to military discipline and reported to George Marshall) created something new. That the CIA is nominally under the control of the civilian leaders of the American government doesn't seem to matter any more than did the Tsar's nominal control of his secret services—George Kennan and other commentators have noted those secret police targeted the final Tsars as much as they targeted the revolutionaries or foreign agents.

We are seeing more explicitly what has been clear to many for years. In our huge and complex modern communities, new forms of institutions have grown up: the Red Cross as well as the modern intelligence and police agencies. Some are good institutions, some have developed into true communities. There are also some bad institutions and many of mixed natures and results.

So, the United States has at least four groups which hold great power at the regional or national level.

1. Politicians.
2. Bankers.
3. Capitalists of some sort.
4. National security agencies and private service-providers.

There is some sense in which the educationalists and entertainers have also become a strange power-holding group, molding the minds and moral characters of young Americans in ways compatible with the ideologies of the teachers and the administrators of schools and which are so compatible with the ideologies and greed of those in the entertainment industry. Those ideologies tend to strongly conflict with the needs and—maybe—desires of the United States as a whole and of most of its individual, adult residents.

We can see a major part of our problem in the split between power-holding groups which take a short-range outlook and act accordingly and those which take a long-range outlook and act accordingly. Our politicians and businessmen and church-leaders take care of this afternoon while the educationalists and entertainers and other child-exploiters like to experiment with the minds and moral characters of young human beings—those experiments have resulted in very bad, long-term results. So far as I can tell, no totalitarian society destroyed or deformed human being as successfully as have the educational and cultural communities of the West, with the Americans being dominant.

The leaders of the West, some lacking much knowledge and understanding and perhaps meaning well, some meaning to cynically or mindlessly exploit others, have responded to the opportunities of the Modern Age by badly damaging the human being which could have been greatly enriched and properly complexified. Individual human being in the West has been badly damaged and so has the communal human being.

The leaders of the West are the enemies of the West, the enemies of its individual and communal human beings, and the enemies of the God of Jesus Christ. They contribute little or nothing and live not to serve but to suck the blood out of the West. This includes not only the more active parasites but also the leaders of Christianity who have chosen to go along with the program, for example, by bringing in more human beings not suited to live in the West; by such means, the value of citizenship is stolen and many members of the middle-class are pushed down into the lower-class ranks along with immigrants from undeveloped countries.

We have to realize that the American citizenry failed to keep watch upon the government and its agencies and other parts. We and our parents and the truer public servants of recent generations failed to notice the dangers, failed to investigate signs that those dangers were there and growing—the national security thugs and likeminded creatures in the political and military communities had only to say, “There are monsters out there and

they have only one desire: to destroy us and all the good we represent.” Even Stalin, a true moral monster, had at least one rational desire: to survive, but we allowed our citizen-selves to believe, or at least act as if we believed, that Stalin and his henchmen were ready to commit some sort of suicide if only it allowed them to harm us. This built upon the earlier delusion that the Tsarist Russians were bad guys because they stood in the way of the West as it tried to steal and control much of Asia and parts of Eastern Europe. The Russians were evil for desiring to take the loot, the Ottoman Empire and huge parts of southern and eastern Asia, when the British—with Americans lurking in nearby shadows—were busy doing the same things which were evil on the part of the Russians. Ironically, the Russians actually had some legitimate reasons to exercise power over some of those regions close to Russia and thousands of miles from the British Isles.

Empires were and are a fact of life in this imperfect world, but don't pretend your country has a moral right to intervene throughout the world and control other countries while your country's competitors are evil for doing the same. That is a path to irrationality, to foreign policy by way of hatred and fanaticism. It would be better if we were to seriously explore other ways than conquest and violent interventions to bring greater and larger-scale order to the various communities of the world, but we court various sorts of moral corruptions and other dangers when we play the intervention game in a morally dishonest way. The game may be dishonest to begin with but it has brought much good to the world—think of the order established by the Romans and the Muscovites and Emperor Qin of China. See the somewhat depressing book by Lawrence H. Keeley, *War Before Civilization* [81], which provides facts and controversial but seemingly solid arguments supporting the contention that death-rates are higher in the small-scale but constant warfare of tribal societies than they were in 20th century Europe or other times of large-scale military activities. The concentrated violence of large nation-states might well be spectacular, and often unnecessary and harmful by rational standards, but we may soon see far worse, city by city and suburban block by suburban block in the formerly peaceful and orderly regions of the West. War after civilization might well be as bad as war before civilization.

If we are to regain some order and peace in the West, we must all do a better job of trying to understand—with mind and heart and hands—our modern complex problems and opportunities. By “all,” I mean artists

and authors and politicians and businessmen and generals and diplomats and scholars and pastors and everyone else. If we refuse to properly use our minds and hearts and hands for this task, we will have to endure the end of much that is good in civilization, perhaps the establishment of a brutal order by the sometime nasty processes of “mindless” or “purpose-free” Darwinian processes, and that new order might be at a much lower standard of living. We will have refused to use the human being which developed fully by the same processes to which brute animals and other living creatures are subject and we will remain subject to those processes rather than choosing to intelligently work with those processes.

# 681 Dualism: A Wrongful Response to Valid Intuitions?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2447>. It was finished and uploaded on 2017/09/26.]

Simplicity is quite useful and even necessary in understanding God's Creation, just as it was useful to such thinkers as Riemann and Einstein in developing the mathematics and the specific theories of spacetime. Yet, full understandings in many such matters comes only by way of analyses using concepts and words and ways of thinking which are quite complex. Simplicity can then follow, partly the simplicity which comes from simple acceptance of new ideas and the integration of those ideas, in words and related concepts, in our day-to-day language about our world. (See Chapter 641, *Enriching Our Moral World: Simple Is Digested Complexity* for a short and, yes, simple discussion.)

Complex ideas (such as dualistic speculations of ancient pagan and Christian thinkers) are digested and then take on simple forms in our words and concepts, in our ways of thinking and feeling and doing. This is true of the dualisms such as mind-body which seem to explain so much. Unfortunately, the explanations are now in conflict with what we know about the minds and bodies of those creatures which are us, but they are deeply embedded in our ways of thinking and feeling and doing. And so it is that the processes of moving toward better understandings of the Creator and His works is stalled by the very processes which make it possible for the great majority of human beings to understand and use the thoughts of the small minority of creative thinkers.

In terms which point to the same confusions, modern Christians have been reluctant to deal with the seeming, in fact—real, complexity of what

the Medieval scholastics labeled as the "effects of God." I would bring that to tighter focus by changing it to the "effects of the Creator," or even the "effects of God in His freely chosen role as the Creator of this particular world." As it is, the ordinary Christian believer as well as Christian leaders and scholars, have retreated to a stance that:

It's all simple.

It's so simple that, over the past two centuries or more, they have stood by helplessly while the greatest civilization mankind has known—the Christian West, fell into ruins, some parts of those ruins being occupied by strange or outright unattractive bands of gangsters and so-called "cultural Marxists" as well as the more ordinary and expected hedonists who come out from the shadows whenever a civilization falls toward decay. It's so simple that Christian leaders and scholars can't pass on their faith to their own children or the others within their range of influence. It's so simple they can't express the faith in ways that make sense, even to their own baptized and catechized children, in light of what is now known about God's Creation, about the Almighty's "effects in Creation."

Christian theology, Christian thought in general, deals with the relationships between and among God and all of Creation, Creation as a whole and all the individual created entities or realms of created being. Christian theology should teach its adherents or friends or even the merely curious how it is that we can think about, for example, the meeting of God and created being which occurs in the Sacraments of Christianity: baptism where God forms a special relationship with a human being, marriage where God and man and woman form a special relationship, the Eucharist where God forms a special relationship with the communicant through bread and wine after the Almighty has entered His own effects in a special way. There are other Sacraments and all of Creation is so many sacramental acts, that is, relationships involving God and creatures.

There is most certainly a dualism of a certain fundamental type: Creation and Creator, created being and He who creates all that is not Him. Thinking men have always had to account for living creatures or even creatures such as stars and planets, not obviously alive but constantly in motion. How could the stars be fully like rocks or even much like rocks if they seemed to move as if living creatures? Maybe they are living creatures or at least inhabited by living creatures? The Sun is a god driving a flaming chariot

across the sky? The obvious way to account for living matter or even non-living matter which seems to move on its own is to posit the existence of spirits of some sort. Arguably, it was the only way to make sense of the entirety of what lies around us.

But we created deep problems by literalizing this dualism, by making it simple in a way that it falsely seemed an obvious truth. Of course, men have souls (or minds or whatever). Of course, angels and demons exist.

One take-away is that there is a true dualism between what-is-created and He-Who-Is-Self-Sustaining, a true difference in being between He who is a self-sustaining Act-of-being, and all His creatures who are not. The further dualisms dividing created being into realms of body and soul, living and nonliving, are a different matter. They are contingent insights of past generations which are seen as truths by those not capable of or not willing to analyze newer knowledge of God's Creation. It's easy to understand how and why we fall into such errors since they greatly ease the necessary and inherently difficult task of determining the difference in moral status of a human child and a grizzly bear cub. Many slide over this difference, "It's all so simple, so easy to see," ignoring even the confusion of their own children who learn about the shared biological history and shared DNA and bodily organs and chemicals of human beings and grizzly bears, or even human beings and sharks.

Yet, we can deal with both revealed truths and empirical, contingent truths. We can recognize man is born a very unique animal—but an animal, and then, within the Biblical and Sacramental contexts, see that man rises above that status because of his relationship with Creation seen as such and his relationship with the Creator. From there, man can rise to a deeper relationship with God in His transcendent Being.

We start out by realizing that, from a metaphysical (or ontological) viewpoint, created being is created being is... The Almighty can make interstellar gas-clouds or lively little children of created being. Ultimately, all created entities are objects of God's attention, all of created being is an object of God's attention. What we are, what we perceive or conceive are relationships formed by God in such a way as to give the foci of those relationships objective existence, a certain sort of independence from even God Himself, but an independence which itself exists only as an object of God's attention.

The Satanic rebellion, which is the essence of the Enlightenment gone bad, is a grab for independence of a sort which is impossible for creatures;

it is unhealthy for creatures to even aspire to have control over their own being. It is unhealthy for rational creatures to be bereft of gratitude directed toward some creating and sustaining force which could be labeled ‘divine.’ We have allowed our educational communities and cultural communities to teach young human beings to aspire to that unwise, evil, state of controlling their own created being and the created being around them.

The nature of this universe is that of evolving and developing being. Entities might be born or might develop after birth into confused states—see Chapter 335, *The Life of a Human Animal Begins at Conception. And Ends at Death. Maybe..* This doesn’t justify the mutilation of the bodies of confused human beings nor does it justify the exploitation of, say, young boys and girls with lesser sorts of confusion. Nor does it justify changing institutions such as marriage which are centered on the begetting and raising of children, even though some man-woman marriages end up childless, perhaps child-centered by way of adoption or involvement with the children of other couples. The willful and ideological use of ephemeral or deep and permanent confusion in the sexuality of human beings is clearly an attempt to gain control over created being, to impose ideals of perverse imaginations upon the sometimes confused, and always evolving and developing, created being of this concrete, thing-like universe.

I’ve claimed in a number of writings that we can discuss and analyze communities as being real entities and not just ways of speaking about gatherings of individuals; we simply use concepts drawn from modern mathematics, especially some of the tools used by Einstein and others who dealt with gravity or—equivalently—spacetime. Those tools allowed physicists to treat the universe as itself an entity and not just a container for individuals entities such as stars or intergalactic magnetic fields. But stars themselves have properties which were speculations based upon empirical information about those stars; it doesn’t seem possible to have come to understand stars by starting with hydrogen and helium—though the bottom-up analyses and top-down analyses did meet by way of both that empirical information and theories fine-tuned to that information at each step of observation and then at each step of analysis. Lather, rinse, repeat. The result is the realization that entities such as communities or the universe can have real existence and aren’t just the gatherings of individual entities. (See *The Shape of Reality* [56].)

What accounts for life, even for mind? What accounts for the generally dynamic nature of the seemingly most inert forms of thing-like being?

Matter in this universe is actually a cooled-down form of energy, stable so long as ‘trapped’ in certain sorts of complex relationships and less stable otherwise. This way of thinking assumes the normative, or at least starting, state of the thing-like being of this universe is that which occurred in the early fractions of a second after the phase transition falsely seen by many as a creation-event: the so-called Big Bang. As I’ve noted before: both modern quantum physics and also the theology of St John the Evangelist claim relationships to be primary over stuff. Another way to think of these matters, and one which might be of central importance in my project is to think in terms similar to quantum mechanics where abstract stuff (described by wavefunctions in quantum mechanics) can localize or particularize to, say, an electron.

We need to correct our tendencies to split created being into completely separate realms: mind vs brain, soul vs body, (creaturely) spirit vs all thing-like being, self-moving entities vs inert matter, etc. Created being is created being is. . . Yet, to repeat redundantly, there is some truth captured in the traditional dualisms, such as mind vs brain. We don’t wish to lose that truth but we don’t wish to preserve that truth in a false way by imposing some idealistic scheme upon reality.

I’ll try to post further explorations on this line of thought, perhaps every two weeks or maybe every month, with occasional postings of on subjects easier to deal with.

## 682 Dualism: The Fragmentation and Crippling of Human Being

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2450>. It was finished and uploaded on 2017/10/10.]

In this chapter, I'll be mostly recapping ideas I've developed and written about over the previous 10 years or so. These ideas are necessary to understand my deepest and most hardened objections to forms of dualism other than those which are necessary and bracketed ways of speaking. Chapters will follow which will deal with some specific aspects of various forms of dualism and the ways in which such ways of thought are problematic to a Christian who believes in an all-powerful Creator of all that is not Him.

In my parrot-mode, I say: "Created being is created being is . . ."

I'll add: "Human being is human being is . . ."

An additional claim, often useful and productive of true insights is: These are attributes, aspects of human beings who are unified and coherent and complete in senses I've been discussing for more than a decade. When I write, "Human being is mind and heart and hands," I am claiming that human being is certain sorts of acts of thinking and feeling and doing. In other words, mind and heart and hands are ways in which a human being responds to different aspects of the environments of that human being. But those responses, these acts, are not a well-defined set. Human beings can respond to what lies around them in very flexible and creative ways. When they do respond in such ways—and assuming they respond in a proper way, they encapsulate part of what lies around them in their own bodies and, hence, in their own minds. Even the simplest of animals do that, even the simplest of brainless organisms do that, even nonliving complex systems do that—with proper modification of wording. This universe, probably all of

Creation as a Christian would define it, is an entity of evolutionary and developmental processes.

[In this metaphysical mode, acts has more to do with “bringing into being” or “shaping being into entities by way of creation-type forces” than with physical events measurable by scientists and engineers—though those events are among those acts.]

There is something special about the human (proper) responses, conscious and unconscious, something special about the encapsulation produced by those proper responses: the human mind which can see not only the relationships of concrete, thing-like being but also those of the abstract being which flows into and is shaped into that concrete, thing-like being. The human mind can conceive of an encapsulated flow of past into present into the future and even extend that past back to the badly-named *Big Bang*, see [https://en.wikipedia.org/wiki/The\\_Big\\_Bang\\_Theory](https://en.wikipedia.org/wiki/The_Big_Bang_Theory), and perhaps metaphysically back before that event which was a phase change.

The human mind can obscurely perceive and sometimes clearly conceive of abstract, complex entities (sort of: totalities) which show in altered relationships within groups of individual entities—such as human communities or the universe.

In many and sundry ways, this human mind has been greatly enriched and complexified in recent centuries as men began to explore the concrete and abstract regions of Creation, but a price has been paid. The sometimes extreme specialization of the human mind which began around 1600 or so reinforced the (Pseudo-Platonic or Neo-Platonic or dumber-down-Platonic) error which had assumed that the Reals were but the models for an entirely different realm of being. Or something like that. It’s likely that Plato, and certainly those ancient cultures which said a man knows a woman when his penis enters her vagina, wasn’t treating knowledge as something which isn’t really connected to concrete reality. That knowledge about more ethereal being could be used to judge concrete being but also magically provided ‘models’ for concrete things. A perceptive thinker might realize at this point that there was a deep problem in this form of Platonism, one which would lead future thinkers in a wrong direction: the ‘reals’ were themselves complex entities, if ghostly ones, rather than some sort of being from which concrete, thing-like being could be shaped.

What did Plato mean exactly by the Reals and by knowing? What did the authors of the Old Testament mean when they wrote about a man knowing his wife?

What does it mean for a man to know his heart (feelings) or his hands (behavior)? Can we know our own hearts only in the wrongful way in which casual history buffs might know about the American Revolution? What does it mean for a man's brain to come to know the mind it generates? Can we know our own brains only in the way of badly educated high school mathematics teachers who know manipulation of numbers and a little bit of manipulation of symbols but share not in what might be called "the mind of mathematicians"?

If our minds must know even the brains to which those minds are intimately connected in the modern sense of 'know', then we are truly lost, truly alienated first from our own selves and then from the world into which we are born, the world which will be the starting point (not something left behind) for the world of the resurrected. We will be inherently alienated from the world into which we are born, the world which is the foundation of the next world for those blessed to be friends of God.

In order for us to be part of our environment, even to the extent of all of the universe or all of Creation, that environment must be encapsulated in our minds. Christians should have a clear idea of what is going on when a human being responds properly to his environment: that human being is learning how to share the thoughts God manifested in His Creation, what the Medieval thinkers called "the effects of God."

Part of what we can learn to share with God is what I call a worldview, an understanding of the one-ness of Creation and of some of its levels, an understanding of one-ness not in terms of a homogeneous pudding of created being but rather a one-ness which is that of unified levels of complex entities arising from various sorts of created being, abstract and concrete, all arising in turn from truths God manifested as the primordial stuff of Creation, truths we Christians see as coming from and through the Son of God, the Word of God.

Without a Creation which is unified, such characteristics cannot hold in a human brain/mind complex which evolves and develops in response to what lies outside and inside of that human being. Similar statements can be made of coherence and completeness and also of the human heart and hands with respect to all three of those characteristics of unity and coherence and completeness.

There is a back-and-forth movement which tells us that a human mind fragmented into regions of human study, such as religion and science and history, won't be able to deal with the unity and coherence and completeness

of Creation or even of simply this universe of concrete, thing-like being. In fact, such a mind won't be able to deal with even the unity of a complex human community. Thus it is that the West has fragmented and begun a serious stage of an ongoing process of decay.

The above re-understanding of the decay of the West provides an answer to the oft-asked question: How is it that the Modern West has advanced so rapidly in science and mathematics while decaying so rapidly in moral order and social order and political order? The simple answer is: The Western Mind was fragmented and the individual minds in the scientific and mathematical fields remained energetic and adventurous while the minds in many fields such as philosophy and theology and (somewhat) in history and creative fiction settled down to travel ruts. The fields allied to human order in individuals and communities stagnated. This is the sort of thing which is likely to happen and we have no reason to believe that the minds devoted to mathematics and science will always be the minds which retain energy and good attitudes. In any case, with the radical separation between fields of human intellectual endeavor, the fields such as political philosophy or creative poetry or historical analysis which had stagnated weren't able to draw upon the ideas and energy of the fields of intellectual endeavor which were doing better. This also led to further separation, to a quite understandable loss of respect for "soft" fields of human knowledge on the part of those thinkers in "hard" fields of human knowledge, especially quantitative fields.

This general process of decay, seen from the viewpoint of a decay in literacy and literate styles of reasoning and knowing, is described brilliantly in Jacques Barzun's magnum opus: *From Dawn to Decadence: 1500 to the Present* [9]. Without claiming Professor Barzun would agree with all I've done, I've added a theory of being to the critical apparatus he developed to understand this decay of the West—fundamentally, a decay of the Western mind which led to a decay of Western human being.

# 683 Dualism: The Split Between the Practical and the Ideal

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2454>. It was finished and uploaded on 2017/11/07.]

This split between the practical and the ideal is generally acknowledged by modern thinkers and ‘common folk’ alike. But what is the ‘practical’ and the ‘ideal’? I think they are very much different from both the traditional and modern prejudices. I don’t think that prejudices are wrong as such; often, they carry good and useful information, though often undisciplined and only partially reliable even when true. But...Prejudices sometimes have to be corrected to make them better prejudices, more accurate and better suited for understanding reality (sort of: ‘ideal’) and dealing with reality (sort of: ‘practical’).

I’ll start by quoting definitions for ‘practical’ and ‘ideal’, using that ever reliable and literate dictionary, Webster’s of 1913. In that source, we find that ‘practical’ is an adjective meaning, “Of or pertaining to practice or action.” Somewhat useless for most purposes, but we can then learn that ‘practical’ means: “Capable of being turned to use or account; useful, in distinction from ideal or theoretical; as, practical chemistry.”

We can also learn that ‘ideal’ can be a noun meaning: “A mental conception regarded as a standard of perfection; a model of excellence, beauty, etc.” We can also read an illustrative quotation:

The ideal is to be attained by selecting and assembling in one whole the beauties and perfections which are usually seen in different individuals, excluding everything defective or unseemly, so as to form a type or model of the species. Thus, the

Apollo Belvedere is the ideal of the beauty and proportion of the human frame. —Fleming.

Webster's 1913 defines 'ideal', used as a noun, by: "Existing in idea or thought; conceptional; intellectual; mental; as, ideal knowledge." A second definition reads: "Reaching an imaginary standard of excellence; fit for a model; faultless; as, ideal beauty. —Byron." Another quote is of some serious interest in my current task:

There will always be a wide interval between practical and ideal excellence. —Rambler. [1913 Webster]

The above definitions and quotes deal with the 'practical' and the 'ideal' assuming pre-modern ways of understanding the world in categorical terms. See Chapter 335, *emph*The Life of a Human Animal Begins at Conception. And Ends at Death. Maybe. for a discussion of the rare but real blurring of even personal identity or sex of human beings. Along these lines but more importantly: what is the ideal for males—over-muscled men talented at violent activities or the bearers of talents equally dominated by males such as mathematics and theoretical science? Some of the above definitions and quotations imply the ideal would be Mike Tyson with the brain of Einstein; in the modern American viewpoint, he should also be sensitive and tenderhearted with maybe Rambo's ability to handle weapons and commit mass murder with a military flavor.

We live in a world of evolution and development, a world in which things move under partial control of global structures but those moving things shape those global structures as they move and as they begin to form more complicated entities. And so it is that we need to change to new concepts and language such as global/local and abstract/concrete. For the most part, and certainly in the context of this discussion, we can think of concrete as 'particular' or 'specific' or even 'peculiar'. I'll be writing several essays and won't deal here too much with the particulars, but—as a hint of future suggestions, I'll deny that 'just war' is only an ideal concept of no application in the real world of diplomacy and boots on the ground. I'll deny this because I consider the relationship ideal/practical to be at least analogous to (quantum wavefunction)/photon.

In any case, I perhaps implied the error that all evolution and development of, for example, human being both individual and communal, is

bottom-up. It isn't. It's bottom-up and it's top-down and sometimes a struggle between the shaping processes at the bottom and the force-generating structures at the top. From the top, relationships between and inside entities evolve and develop as fast as the stuff at the bottom evolves and develops into those entities. Above is the abstract, below the concrete. The language of 'practical' and 'ideal' can be pretty misleading as can even be that of 'concrete' and 'abstract'. But, mostly it's useful and truthful—if only in part, so long as we remember that the ideal itself is evolving and developing. The stars aren't frozen in place for eternity nor are they eternal, life in this world not eternal—not even in the way of eternal return of the ancient ones of our race. And so it is that we, at least from our perspective inside Creation, cannot think of the human 'ideal' as having come into existence in some mystical way at the (ontological) instant of Creation. I claim we can regard that instant as one when God manifested certain absolute truths, but those truths were used by evolutionary and developmental forces which produced men, concrete animals with specific and contingent sexual natures as an example of an important, but not 'absolutely true' aspect of the human animal or communities of human animals and, hence, of the human moral person which can develop from that animal or its communities.

In somewhat simple language which points to the truth, the ideal and practical, while different and—in some sense—coming from different directions, are intertwined in a way far more intimate and far weirder than any two balls of string after a pair of kittens finished their work.

What is the true and greater ideal: individual freedom or cooperation with the community?

And neither really determines the other, though one might be dominant at any one time. Let's talk economics.

First, I'll note this isn't so much different from asking: what is the ideal human physique: short and broad or tall and slender? We live in a world of evolutionary and developmental processes. We live in a world of differing environments which have selected different characteristics from human populations, monkey populations, rodent populations, fish populations, etc. In the case of human beings, there are human populations with different characteristic reflecting responses to their environments, over generations. For example:

The *Maasai people* “are a Nilotic ethnic group inhabiting

southern Kenya and northern Tanzania.” This is a hot and dry region and Maasai seem to have adapted to their environment by becoming tall and slender, increasing the ratio of heat-emitting skin to total body mass. See [https://en.wikipedia.org/wiki/Maasai\\_people](https://en.wikipedia.org/wiki/Maasai_people).

The *Eskimo* “have traditionally inhabited the northern circumpolar region from eastern Siberia (Russia), across Alaska (United States), Canada, and Greenland.” These people are typically stocky and have a low ratio of heat-emitting skin to total body mass, even though they wear heavy clothing over most of their bodies. See <https://en.wikipedia.org/wiki/Eskimo>.

There is no ideal human physique and I’m claiming this fact isn’t so much different from the more complex question of personality attributes. We have attributes inclining us toward individualistic endeavors and other attributes inclining us toward communalistic endeavors. Some groups of human beings might have stronger, even much stronger, inclinations toward individualistic endeavors and some might have stronger, even much stronger, inclinations toward communalistic endeavors. Some groups might be more of a mixture. A member of this latter group might enjoy behavior of a more individualistic sort, for example, when working as a writer and thinker and might also enjoy behavior of a more communalistic sort when doing volunteer work for his church.

Is it individualism or communalism which is more truly human? Which is the ideal of human life: to be a freestanding individual or be a loyal and humble member of a community? Of course, those of practical sense—especially those who understand what is meant by “evolutionary and developmental processes”—will likely conclude that this matter, perhaps many matters, which are often treated as being subject to *a priori* analyses are actually a matter of the evolved and developed attributes of a physical creature. Even the ‘ideal’ is something of a many-headed beast and not fully different from the ‘practical’.

I’m going to be a bit unfair to a good young thinker and claim the problem can be seen in even this title for a blog posting by *The Audacious Epigone: Breadwinning father, homemaking mother remains ideal in The Current Year* at <http://anepigone.blogspot.com/2017/10/breadwinning-father-homemaking-mother.html>.

It's not an ideal. It's a desirable situation based upon empirical (practical) facts on the ground. By using such language, better thinkers (including more than a few philosophers) have encouraged the lesser thinkers who trace their psychotic thinking back further than Marcuse and Gramsci—think about Ralph Waldo Emerson—to propose their own ideals. If the sexual dimorphism of the human race is an 'ideal', why not try to change to new ideals? If such efforts are seen instead as ideological goals based upon dreams and in conflict with facts, then the sheer insanity (psychosis or separation from reality) of much modern thinking becomes more obvious. To put it in theistic terms, the God of Moses or the God of Jesus Christ or the God and Father of all other gods and all else (working through the Demiurge in Plato's theology) could have created a different world or a different set of living creatures to live in whatever world He created. It is God's acts-of-being as manifested reality which give us the ideals for human animals, and we learn more facts about that manifested reality and come to better understand it even as we change the human parts of that reality by evolving and developing into somewhat different forms of human being.

The various sorts of roles for males and females, such as "breadwinners and homemakers", are natural ways of behavior, responses to—for example—the modern economic conditions. The obvious—Yes!—ways in which human communities will organize themselves correspond to practical goals, efficient ways of going about the formation of families and the raising of children and so on, determined by the human sexual dimorphism which arose by evolutionary processes and are refined by developmental processes. There are no ideals governing empirical reality but for those found in that reality or those which arise as that reality evolves and develops.

To pay attention to reality is to pay attention to what the Creator has done; to pay attention to reality is to pay attention to the wisdom the Creator would impart to us if we respond as His trusting children.

# 684 Dualism: The Delusions and Dangers of Believing in an Unembodied Free-will and Mind

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2460>. It was finished and uploaded on 2017/11/27.]

The doctrine of “free-will” and the similar doctrine positing an immaterial “mind” or “soul” seem to be attempts to avoid the limitations and constraints of biology, of an organism in this world which is a highly particularized realm within Creation. We wish to rise above such mere physical processes as hormonal flows and—at a ‘higher’ level—our desires to eat and to engage in sex acts. We try to see our better inclinations and behaviors as representative of absolute truths which are implanted in and thus we are primed to accept stories of primordial falls from higher states, including an implausible understanding of the story of Adam and Eve. We don’t wish to be too much a part of those evolutionary processes which most of us accept in this modern age of man, though that acceptance is nominalistic, verbal acceptance that doesn’t reflect our acts or deeper thoughts. To be sure, we can be pleasantly mystified by thinking that we are somehow descended from rat-like creatures which had to move fast so big dinosaurs wouldn’t step on them or smaller dinosaurs eat them. Far away and cartoonish. The closer reality of morality and intelligence being embodied and developing along with brain and heart and liver is not part of the sermons or homilies of our clergymen, part of only some recent histories, part of few Biblical commentaries though parts of the *Old Testament* seem compatible with a full-blown sociobiology.

In a sentence: we pretend that particular manifestations of human being,

individual or communal, are so plastic that we can make of that human being a better entity than did God the Creator. This is a form of a Satanic rebellion and will not turn out well.

I'll back up a little to consider the possibility that something exists in human beings which could be called free-will and leave it to the reader to investigate some of my earlier writings in which I discussed free-will as a disembodied mental activity (which it isn't). The discussions about mind or soul would follow a similar pattern to what will develop in this essay.

The interested reader might wish to review an earlier chapter addressing the biological, experimental, evidence which I originally wrote way back in 2008: Chapter 385, *Is this evidence against free-will?*. I dealt with the issue a number of times in chapters written in later years.

If "free-will" exists and is truly free of the constraints of human biology, it isn't us; that is, it is different from and somehow transcendent to the "us" which loves some other human beings and struggles to love God and perhaps all other human beings. In that case, that entity of "free-will" is free but we are enslaved to it and our good acts aren't to our credit nor our bad acts to our debit.

If "free-will" is more truly us, then it is part of our human being, an organism similar in many ways to a chimpanzee and in fewer ways to a spider organism. A human being is subject to various pressures related to survival—hunger which can drive us to eat at the expense of our own children, sexual desire which drives men to rape or acts of infidelity and drives some men to kill other men to take their women, a general desire for rest and comfort which can drive us into states of greed and ambition that we can live better at the expense of other human beings, and so on.

So, this "free-will" is either part of a human animal subject to various constraints which don't allow for anything which could be considered complete freedom or "free-will" is independent of this human animal, an alien entity (or agent) and our master.

We so-called modern men, heirs to a very promising Enlightenment gone bad—in part, bearers of badly-formed rumors of deep understandings of our physical world, are entrapped in ways of thought and feeling and behavior which are a result of that bad turn in the Enlightenment. Some might criticize me for being too abstract or too deep in my thoughts but this is necessary to clear out bad forms of abstract or deep thought that we might achieve better understandings of our own human selves, of life in general, of the physical universe, of all of Creation. The other way to clear out these

bad thoughts is for the West to go through a more total collapse followed by a fresh start. In any case, it takes some very abstract analyses to understand that there are many wrongful abstractions in our current understandings of concrete reality; those abstractions, such as those of various dualisms, feel concrete because they're part of the cultural air we take in from our earliest years.

I've fallen into a pessimistic outlook that foresees a period for the West of barbarism and huge population decreases in most regions as a result of the loss of social structures and a coming-soon drop in technological capabilities which already shows in a decay in the quality of American infrastructure. I'd like to be proven wrong but don't think that there is too much Western human being left; our human being is a far more primitive sort than that of even the Victorians let alone the Elizabethans. We no longer have the sophisticated conception of God's Creation, the resulting worldviews which turned the rocks and animals around us and the stars above us into manifestations of God's creative will. A worldview so rich and deep as to support anything so magnificent as Western Civilization will take generations to build and may never be built in such a way as to be "Western": European at heart. Though stated in my words, this is a situation which Joseph Ratzinger (Pope Benedict XVI) discussed and feared. The Christian unwillingness to gradually reform the Western worldviews, to retain what was still right in the Medieval worldviews but integrate those still good parts of traditional Western Christianity with modern knowledge, has doomed the West. All the political and moral and social decay is but an outcome of the increasing separation over recent centuries of Western science from Western philosophy and theology, the increasing separation of Western political beliefs and behaviors from Western moral teachings, the truly fundamental problem of the loss of literacy and literate styles of thought. (See Jacques Barzun's magnificent *From Dawn to Decadence: 1500 to the Present* [9].)

So, let's deal with one of our major problems by facing up to the obvious truth that we are human animals formed by way of evolutionary and developmental processes. The species *Homo sapiens sapiens* evolved from a creature also an ancestor of the chimpanzee. Human beings are creatures with a certain sexual nature and certain ways of forming communities. We form certain sorts of relationships with each other and with animals of other species and with trees and bodies of water and so on. We are blessed and cursed with the sort of abstract reasoning abilities which allow us to rise to higher understandings of all of these. But the rise when a human civilization

is forming or prospering is often slower than the fall from that state in which human communal being has become so rich and complex, with many—far from all—individuals taking on a significant amount of that richness and complexity. A civilization can collapse in a matter of years but can only be built by the efforts of a number of generations.

It's all so contingent, so much a matter of chance—of pure unrepeatable factuality. From the sort of stuff which makes up the Earth, human being as we know it is but one possibility, though some inclined to political or economic dogmatism have claimed to develop a scheme with the one and only true way to form political or economic communities. Not so. And we can see this with a little imaginative effort in dealing with individual human being and communal human being. There is no chance a purely individualistic scheme for interpersonal relationships would work nor would a purely communalistic work. How much individualism and how much communalism would we need for a rich and complex civilization true to its human being? The possibilities would be determined by the environment of a particular people and how its ancestors responded to opportunities and problems in that or similar environments—where I write of responses in terms of the entire human animal and the entirety of human communities rather than writing only of the responses which are external acts in which we consciously participate though those acts may not be consciously determined; this is to say that a human being living near the Arctic responds by becoming shorter and stockier as well as by learning how to fish from ice-floes or to hunt sea-mammals.

One thing is clear: we need some substantial set of virtues, inborn but properly developed by way of nurture. Our ancestors were selected not to be like the self-serving individualists of libertarian myth and not to be like the self-sacrificing communalists of . . . communism. What's needed is some combination of individualism and communalism allowing for some flexibility in the face of an uncertain and sometimes nasty, sometimes wonderful world.

So it is that nearly all human animals are born with some imperfect versions of those moral sentiments so beloved by many philosophers and poets and also by those who wish to live in peace in a human community (or communities) where some sort of decency reigns, some sort of recognition that we would have others respect our lives and property and beliefs and we should do the same for others. Obviously, such sentiments do exist in nearly all human animals, but not in one form—it's likely the virtues of an Iron Age barbarian were a bit harsh by our standards. Our inborn virtues

are also often weak and subject to great corruption. There is even reason to believe a (very?) weak form of the Fifth Commandment is written on the hearts of nearly all men—see *On Killing* [66] by Dave Grossman, a retired Lt Col and Airborne Ranger in the US Army, for a discussion and references to some underlying research which is admittedly dated and is the sort of research which often fails replication or even later plausibility analyses.

Many modern men—including many ideologically corrupted men of science—carried over parts of the mistaken understanding of human being developed by the early Christian Fathers: the belief that the human species came into existence as a result of a special act-of-being, set in nature but not part of it in the way of the creation of other animals. Increasingly, scientists have wandered away from scientific thought to gobble on about a future in which there will be a lot of Africans of various nationalities who are in the top ranks of scientists or other thinkers. The same sort of cruel irrationality is being spewed out on pages of (previously?) respected science societies about the need to get large numbers of women in male-dominated fields such as mathematical physics. Essentially, these mean-spirited bastards are trying to teach Africans and women that their moral worth and self-esteem, their true humanity, should be dependent upon Africans and of women of all colors making up an increasing percentage of Nobel Laureates in physics in coming years. It isn't going to happen, it can't happen, and this is why I claim this stupid campaign is also cruel. I hope Africans and women prove to be smarter in important ways than the scientists who run the societies and try to push schemes which are based upon clearly wrongful understandings of human being. Or maybe those scientists do know better, as surely some Senators and Catholic bishops do, and they are merely going along with this exploitation because they have not the courage to speak truth to power?

The main branch of Western Christian thought is Augustinian and Augustine of Hippo accepted the idea that non-human species could transmute into other species but rejected the idea for human beings, thinking that human being was a special creation. This is to say that many Christians of this time who—mostly—accept some version of biological evolution retain the assumption that men around the world form a species outside of the transmutation of species; men worldwide have the same attributes, the same personality traits making each and every one of them at least potential members of a complex civilization. Many of the West have passed outside of Christianity but took that convenient view that all men are alike with

them though claiming to be oh-so scientific when looking for arguments against Christian belief and practices.

By way of some sort of magical thought intermingled with reasoning about the empirical world, men were seen by the dominant thinkers of recent centuries to all be London gentlemen or Florence polymaths—at least potentially so if only those Central Africans and highlanders of New Guinea could be educated by the proper schoolmarm or semi-paganized Jesuit missionaries. The mind of powerfully abstract reasoning, the mind of an Archimedes or a Bismarck, was seen as having been gifted by God or the Deity or simply Nature upon all men though there be no sign of such a mind in the villages of Central Africans or highlanders of New Guinea and no reason to posit in the past of those peoples the sorts of environmental or opportunistic pressures leading to the selection of (expensive) brain developments supporting such a mind. In other words, these oh-so modern thinkers had rejected most of what is good in traditional Christian thought but had retained the false teaching that human being isn't fully subject to the same evolutionary forces as other forms of living being are. A man is the same whether a Swede or Maasai or a Cree.

Why would anyone, Christian who believes in the Bible or modern liberal, think that all peoples are the same when it comes to either reasoning or forming families and polities and other communities? Over the past 50,000 years, sub-Saharan African peoples have evolved separately from the peoples descended from the (probably multiple but not too multiple) out-of-Africa peoples. At various times, other peoples found in various regions of Asia and the Pacific also separated out and faced entirely different selective pressures from those faced by the peoples of Eurasia who are accurately labeled as “high-achievers” in matters of abstract thought as well as advanced technology. Over the past 10,000 years or so, some of the peoples of northern Eurasia have gone through a series of responses to opportunities and hardships which have led to significant increases in IQ and in personal traits—see *The 10,000 Year Explosion: How Civilization Accelerated Human Evolution* [23] by Gregory Cochran and Henry Harpending. Those peoples of Northern Eurasia evolved to survive in promising but tough environments and to carry out complex migrations and conquests. They moved on to form increasingly complex communities, culminating in a few major civilizations, including those of Western Europe and Eastern Europe and Iran and some parts of Southern Asia. Those Northern and Eastern Eurasians developed the personality traits to deal with, for example, ab-

stract justice systems rather than person-based justice systems. Human beings evolved to live in civilizations have the IQs (boosted by greater abstract reasoning powers) to deal with technology and economic relationships more complex than those found in tribal societies.

Most from the peoples, such as most sub-Saharan Africans and the Hmong of Southeastern Asia, who live in tribal societies and haven't formed more complex communities or engaged in more complex forms of thought than myth-based tales most likely are not capable of prospering or feeling comfortable in civilization without ongoing assistance from Western governments and charitable agencies or else falling into a barbarian life in the shadows of skyscrapers. People of the West shouldn't feel triumphalistic as the prior sentence is probably far too complex for most modern-day college professors to parse, let alone to truly understand—again, see Jacques Barzun's magnificent *From Dawn to Decadence: 1500 to the Present* [9]. For the foreseeable future, we will have no triumphs but those in our history books. And we can't understand those in our current state.

As for the descendants of those poor Africans or other tribal peoples brought to the West as slaves in the bad, old days so they might be used to the profit of the cotton and tobacco industries, as for those more recently brought to the West as clueless barbarians in the good days of now so they might be used to the profit of Democratic party vote-seekers and professional do-gooders, they might wonder, "Why is no one teaching us the magic that they use to design rocket-ships and to become politically powerful? Why do my children suffer so much when they try to learn algebra while those Jewish and Chinese and Polish children handle those symbols the way the witch-doctors back in Ghana could handle the ghosts of dead tribesmen?" There is, in fact, substantial overlap among the various populations. There are many in various Eurasian groups who have trouble passing beyond superstitious thought or elementary school literacy skills, but the Northern Eurasian and Eastern Asian peoples—and some others—produce enough human beings who are capable of higher forms of abstract reasoning, more often the forms of reasoning appropriate for entrepreneurship or organizing military units than those appropriate for solving difficult mathematical problems.

The continued importation of human beings not made for life in Western Civilization will not turn out well. I'll leave it to others to predict the details but I will repeat that we have to learn how to think about human being in its great variety. We need to think in terms of evolution and inherited

characteristics, to learn how to think about such facts as those provided by IQ tests rather than simply rejecting them or interpreting them to suit our personal isms.

Human beings are, first of all, human animals and we have characteristics such as intelligence and tendencies to impulsiveness or tendencies to work toward future results which are constrained by our genes, though any population of human beings has a spectrum of such characteristics and we can always work to make the best of our particular characteristics. We don't have something corresponding to a mind or soul or free-will which is pasted onto our animal bodies and is free of our biological-genetic constraints. Any improvements in the characteristics of a tribal and barbarian people which are conducive to civilized life have to come by way of reproductive advantages to the smarter and more diligent among that people. That isn't happening in our oh-so non-racist West which seems to place more value on West Africans who can jump very high than it does on Africans who can learn topology. A little research will show, for example, that the smarter and better-educated African-Americans tend to have few children and this has been true for more than a century. There are new reports, rumors, that some athletically talented African-Americans of little intellectual talent have dozens of children. Even if the rumors in the prior sentence are exaggerated, there seems to be reason to fear that African-American IQs won't be rising anytime soon.

Let's admit to our bad situation and to the damage done by misunderstandings of human nature currently being used by those in government or in charitable agencies or in schools to bring in more human beings who will eventually find themselves to be strangers in a strange civilization, unless they help to destroy that civilization and leave us all in a barbarian wasteland. I think that wasteland might come about though I would expect more of a fragmented West in which, for example, some politically independent parts of what is now the United States will be reasonably prosperous and even civilized and some won't. In any case, it's unlikely these immigrant populations will prosper over the long-run and some of them might be exterminated by bloody conflicts, largely with each other.

It was bad actions which brought about this mess, but those bad actions were motivated and justified by bad ideas, ideas based on desires to understand human being and other forms of created being by positing the existence of immaterial entities rather than settling down to the hard work of understanding God's Creation as it truly is.

# 685 Dualism: JFK and the Quite Speakable and Quite Historical

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2466>. It was finished and uploaded on 2017/12/07.]

This essay will seem more of a stretch as a case study in the problems of dualism, but there is a method to my stretchy madness. The general point will be: what we see as evil acts by human beings, individual or communal, are the results of behaviors often quite consistent with the bad part of the spectrum of behaviors on the part of evolved “apes” and also sometimes consistent with hubris on the part of well-meaning human beings who think they know how human communities should be organized and how human individuals should behave.

I recently read *JFK and the Unspeakable: Why He Died and Why It Matters* [30] by James W. Douglass. This book was recommended as the best on the topic by Ray McGovern (see <http://raymcgovern.com/>, a long-time CIA officer. One paragraph from his bio on that website tells us:

Ray came to Washington from his native Bronx in the early Sixties as an Army infantry/intelligence officer and then served as a CIA analyst for 27 years, from the administration of John F. Kennedy to that of George H. W. Bush. Ray’s duties included chairing National Intelligence Estimates and preparing the President’s Daily Brief, which he briefed one-on-one to President Ronald Reagan’s five most senior national security advisers from 1981 to 1985.

McGovern has been involved with various groups, some Christian, which have tried to re-orient our world towards peace. He also founded and has

remained involved with a group of other retired intelligence professionals—Veteran Intelligence Professionals for Sanity (see [https://en.wikipedia.org/wiki/Veteran\\_Intelligence\\_Professionals\\_for\\_Sanity](https://en.wikipedia.org/wiki/Veteran_Intelligence_Professionals_for_Sanity), an impressive group of men and women who've worked in the higher levels of the “honest” ranks of professionals in the CIA and FBI and State Department and in military agencies. (The group includes the admirable likes of Coleen Rowley, an FBI special agent who forced a meeting in the early summer of 2001 to ask the politically corrupt intelligence professionals why they told the agents in the Minneapolis FBI office not to investigate some illegal immigrants who were talking about flying jet-planes into buildings—these turned out to be men with loose but real connections to some of the alleged 9/11 attackers. We still don't know the answer to Ms Rowley's question. By “honest,” I refer to those below the “political” level in government agencies and not scheming to join that “political” level.)

McGovern discusses Douglass' book in this article: *The Deep State's JFK Triumph Over Trump* at <http://original.antiwar.com/mcgovern/2017/10/30/deep-states-jfk-triumph-trump/>. I'll quote him on just one interesting incident from his period of training for a promotion from agent to officer at CIA:

It was summer 1963 when a senior official of CIA's operations directorate treated our Junior Officer Trainee (JOT) class to an unbridled rant against President John F. Kennedy. He accused JFK, among other things, of rank cowardice in refusing to send U.S. armed forces to bail out Cuban rebels pinned down during the CIA-launched invasion at the Bay of Pigs, blowing the chance to drive Cuba's Communist leader Fidel Castro from power.

It seemed beyond odd that a CIA official would voice such scathing criticism of a sitting President at a training course for those selected to be CIA's future leaders. I remember thinking to myself, “This guy is unhinged; he would kill Kennedy, given the chance.”

Our special guest lecturer looked a lot like E. Howard Hunt, but more than a half-century later, I cannot be sure it was he. Our notes from such training/indoctrination were classified and kept under lock and key.

In his deathbed confession, E Howard Hunt (a police-state criminal and congenital liar for sure—see [//en.wikipedia.org/wiki/E.\\_Howard\\_Hunt](https://en.wikipedia.org/wiki/E._Howard_Hunt)), claimed to have been in Dealey Square on 1963/11/22 as part of the CIA project to murder JFK; he claimed the project name was *The Big Event*. Jesse Ventura found mugshots of men appearing to be homeless bums and they looked like Hunt and Frank Sturgis (another CIA covert agent involved in multiple crimes inside and outside the US including the so-called “Watergate burglaries”). (The wise reader will be skeptical about the Wikipedia article and most Wikipedia articles dealing with matters of interest to what some call the “deep-state” but it gives a start on learning about a man who was involved in a number of crimes including smuggling, regime-changes of legitimate governments, and (probably) assassination; at times, Hunt, a much published author, was the propaganda expert. In one of his collections of essays, Gore Vidal claims that Hunt certainly wrote the diary of Arthur Bremer (see [https://en.wikipedia.org/wiki/Arthur\\_Bremer](https://en.wikipedia.org/wiki/Arthur_Bremer)); Hunt appears in almost all the books summarizing investigations into the political murders of the 1960s, CIA smuggling activities and regime-change crimes in Latin America, and Watergate. Hunt was somewhat bluish of blood and apparently took up life as a loyal follower of Alan Dulles and a CIA warrior, maybe to avoid the boring life of the likes of his father, a successful lawyer and Republican Party official.

There is also much background information in Russ Baker’s book, *Family of Secrets: The Bush Dynasty, the Powerful Forces That Put it in the White House, and What Their Influence Means for America* [6] that ties Wall Street and the National Security agencies and military into the murder of JFK, though it seems likely to me that most of those with some inside knowledge played relatively minor roles, perhaps knowing the goal was the destruction of JFK and RFK but not knowing the details of the plot. Some maybe didn’t even realize that JFK would be killed rather than being politically neutralized in some other way as later happened to Nixon; I wouldn’t defend Nixon to the death but he was less of a villain than those who destroyed him. Read the books and pay attention to the roles played by J Edgar Hoover and Lyndon Johnson, each of whom likely knew that powerful forces were trying to kill Kennedy, neither of whom did anything to protect Kennedy, each of whom moved to benefit from his death—it’s unlikely Hoover was an insider but possible Johnson was in on the details before that fateful day in Dallas. Pay attention also to the testimony of

Hoover recorded in Douglass' book that the CIA had even infiltrated the FBI and had used the FBI for CIA purposes.

I think this points to the great background truth that there is no centrally-organized conspiracy of the ruling elite of the United States against its own people and against other countries and their citizens; rather is it the case that a certain "space" is open to those from the right families or, at least, the right schools, with further entry into the right social clubs and, maybe, marriage 'upwards' into a family bluer of blood. That "space" is also not a region where all residents are at peace: rather is it something of a battleground between forces, each of which control only a part of the wealth and power of the United States. This is why they are now such bumbling fools in international relations—our lack of (peaceful) response to the growth of wealth and power in various Eurasian countries, especially China, is largely due to the battles of our ruling elites against each other; China builds up wealth and trade relationships and so forth while much of our ruling elite is devoted to the destruction of Donald Trump and the related war against Russia, our natural ally in protecting Western interests.

The murder of John Kennedy might prove to have been practice for a period of warfare of bankers against industrialists, military against state police (in which category I would put the CIA in its current condition), leaders of populist religious movements against the major religious institutions, and so on. On this level, JFK's murder seems to have led to the elimination of some regional powerholders, ethnic political machines and truly progressive or truly conservative political parties. Generalize and also look back to the 1950s when Eisenhower acted to the benefit of the forces he would warn us about in his farewell speech; for example, the highway system was built to make nuclear war conceivable and, more generally, to give greater mobility **inside the United States** to the US military. It also gave advantages to corporations running centralized manufacturing facilities or centralized retail stores. The death of Main Street wasn't a necessary result of modern technology or prosperity but it was a likely result once Wall Street and other money-centers, some major corporations, the national political parties, and the new entertainment industries (television and movies and all that) gained the upper-hand.

Anyone wishing to understand what is happening can search on the Internet or your local library website for Peter Turchin and his writings, especially those dealing with "overproduction of elites," or they can read Barbara Tuchman's *A Distant Mirror* [135] for the story of some important

aspects of the collapse of the remarkably prosperous High Middle Ages into a period when Northwestern Europe's population dropped by perhaps 50% in a century overlapping with another century in which the common man regained some of his lost prosperity while Europe's ruling elite reduced its own population by way of murder, war, starvation in prison, and other activities apparently being glorified in some of the current television shows and video-games—I hear only rumors of those realms.

Anyone wishing to practice the art of tying together knowledge from different viewpoints or even different fields of study can also look up the writings of the economist, Michael Hudson—especially his explanations of damage done to the most prosperous of economies when wealth-producers are displaced by “rentiers” or wealth-holders who devote their energies to protecting their power and wealth and position relative to others and don't make much effort to increase the wealth of the human race. (Some, perhaps even most, are incapable of gaining wealth in these moral ways.)

To return to the actual murder of John Kennedy and to leave behind for now the greater background issues and motives, it all seems to be unnecessarily complicated, a problem that always bothered me; Douglass claims at least some of the complications had to do with CIA incompetence—for example, their bumbling use of Oswald doubles led to Oswald being in two or three places at the same time at some of the most important points in the plot. According to Douglass: By the time of the Warren Commission, Johnson and Hoover were on board to help run the cover-up for whatever reasons and the FBI suppressed evidence that would have led to the recognition of a complex conspiracy by some powerful forces, whether the CIA, the Mafia, the KGB, or some other group.

I'll move on to deal with the “Unspeakable” and why such notions are caused by dualisms which may be implicit in our thoughts even if we don't think or speak in terms of the more explicit dualisms of immaterial created beings (angels or demons).

Many things that we value in the modern West, such as our relatively high freedom—as individuals—in our social and political and economic and religious lives, have come about because of a history dominated at times, always strongly influenced, by men who were ruthless in their exploitation of other human beings. Those men put together the nations of Europe, their descendants were slowly brought into webs of disciplined power and of honor; the term ‘nobleman’ was often not a *non sequitur* when describing those who exercised power in post-Roman Europe, nor was it when describ-

ing the ancient Romans. At the same time, both Jeremiah the prophet and Lord Acton the historian made a point about wealthy and powerful men including a disproportionate share of evil men; I'll quote Acton:

And remember, where you have a concentration of power in a few hands, all too frequently men with the mentality of gangsters get control. History has proven that. All power corrupts; absolute power corrupts absolutely. [*Quotes by Lord Acton* at <http://www.quoteopia.com/famous.php?quotesby=lordacton>]

Such men have played important roles, good and bad, in American history. For example, you can read a little about the fortunes made in opium smuggling in China in James Bradley's *The China Mirage: The Hidden History of American Disaster in Asia* [15]; those making fortunes included such blue-bloods as Warren Delano, grandfather of Franklin Delano Roosevelt. In addition, as you can read in David Herbert Donald's *Lincoln* [29]: that president thought of his 'mercy' towards the South as simple justice since he knew that it was Northerners who sold African slaves to the Southerners and then left others to deal with the aftermath—the Africans and also Southerners in general, not just slaveowners or defenders of the *Peculiar institution*—see [https://en.wikipedia.org/wiki/Peculiar\\_institution](https://en.wikipedia.org/wiki/Peculiar_institution).

Some of the best families in the United States became "best" by way of drug-smuggling and slave-trading. They used the fortunes gained at the expense of Chinese and African victims to build railroads, to manufacture the large farm machinery which allowed the conquest of the middle of the North American continent, to build and expand the various textile and metal-product industries in a multitude of cities and towns in the US, along with much more in the way of high rate-of-return activities. They obeyed the Zeroth Commandment: Thou shalt seek the highest rate-of-return.

This is not so much different from other countries, however unexceptional they might be. It's the way the world works and, under some conditions, those criminals can do some good, though it might involve doing bad to one group and good to another which includes themselves and their children. Americans, perhaps even more than others, had a talent for washing their memories. Some, such as Warren Delano, came back from dealing in opium and talked in front of the ladies about the "China trade" as if they'd made their fortunes selling some unknown stuff to the Chinese (who

actually wanted no legal or moral goods that the United States or Europe could offer) and then coming back with valuable porcelains and jade statues and silk robes.

The United States seems to have been responsible for a new unleashing of men with the mentality of gangsters. Under the pretense of overthrowing the dead hand of European history, or something like that, the ruling elite of the United States actually overthrew the hard-won moral traditions of the West. The American citizenry didn't seem to mind so long as they could look forward to a new television season and, of course, a great Superbowl.

In any case, so long as men with the "mentality of gangsters" flow toward the centers of power in the United States, so long as there are receptive groups (institutions or agencies or... simply gangs) to receive those sorts of men and develop their ruthlessness and reinforce their sense of having the right to run at least part of the world at the expense of productive citizens and other victims, then the United States will continue to suffer from strange events such as murders or attempted murders of public figures, sometimes by implausible characters or by way of implausible events. Those in the centers of power will continue to tell us that it's plausible for these assassinations or other events to be carried out by badly schizophrenic young men or by demented loners or by illiterate nitwits from Saudi Arabia who didn't even know enough to adopt false identities when infiltrating a country and who had never learned to navigate—other than one alleged pilot of one hijacked plane going out from Chicago. They will also tell us it's crazy, "conspiratorial" thinking, to suggest that such events could be executed by highly-educated American men with many resources and high levels of technical understanding of airplanes and building structures, as well as governmental cover-up powers.

The citizens of the United States, from the end of the era of the Founding Fathers, have proven themselves incapable of self-rule.

There is no "unspeakable" aspects of the murder of John Kennedy and other public figures nor even of such events as the bombings of prominent American buildings. There are men with the mentality of gangsters among us and, currently, they seem to have grabbed a great deal of that power they crave. But they crave more and they need to fight others with the mentality of gangsters; after all, I have no power or wealth they can take. Be afraid, be very afraid, until they fail. But, they might be honestly investigated and prosecuted, perhaps to be hung. But don't hold your breath.

# 686 Thoughts in Response to "Where the Conflict Really Lies: Science, Religion, and Naturalism" by Alvin Plantinga

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2473>. It was finished and uploaded on 2017/12/20.]

I recently read Alvin Plantinga's powerful book, *Where the Conflict Really Lies: Science, Religion, and Naturalism* [115]. I have little to say against what he deals with and bow to his well-organized, scholarly mind. He does a better job than any of a half-dozen or so books I've read which critique the metaphysical imperialism of some branches of Darwinist thought. I would give more credit than he explicitly has to the importance of evolutionary and developmental processes in God's acts as Creator and Shaper of this universe and perhaps of other realms of Creation, but John Henry Newman—who also dismissed the wrongful claim that evolutionary thought is a true problem for Christianity—also missed the point that Darwinist thought points out the importance of evolutionary and developmental processes in God's ways of acting as Creator and Shaper of this universe. Still more importantly—in my opinion, modern empirical science has opened the path to understandings of all of Creation which couldn't have even been seen by the best of philosophical and theological thinkers before the maturing of scientific understandings of matter-energy, of space-time, of developmental and evolutionary processes. Should I have also written development-evolution? Perhaps and perhaps not. Cutting across those dual entities, matter and space and development seem strangely linked, as do energy and

time and evolution.

I'll move forward from a slightly different angle.

Most, perhaps a vast majority of scientists, pursue the truth as they can see possible paths which might lead to a new truth or a better or more complete version of a known truth. But, they also are human beings. Henri Poincare (see [https://en.wikipedia.org/wiki/Henri\\_Poincare](https://en.wikipedia.org/wiki/Henri_Poincare) was, and is, regarded as one of the greatest—perhaps the greatest—living mathematician and physicist alive as of 1900 or so. He had even developed parts of special relativity before Einstein; some others had done the same. (See [https://en.wikipedia.org/wiki/Relativity\\_priority\\_dispute](https://en.wikipedia.org/wiki/Relativity_priority_dispute).) But Poincare and, presumably those others, took their results as being formalisms within the general setting of Newtonian physics. So it is that Einstein most certainly wasn't alone in seeing the problems with that highly successful physics nor was he alone in seeing pieces of a solution; he was alone in taking the problems and those pieces as being 'reality', in a manner of speaking. He presented a theory which was a coherent and complete understanding of some central components of that physics.

A contemporary of Poincare, Max Planck—see [https://en.wikipedia.org/wiki/Max\\_Planck](https://en.wikipedia.org/wiki/Max_Planck), who was co-discoverer of quantum physics along with Einstein, put it this way:

A new scientific truth does not triumph by convincing its opponents and making them see the light, but rather because its opponents eventually die, and a new generation grows up that is familiar with it. [See the article on Max Planck at [https://www.brainyquote.com/quotes/authors/m/max\\_planck.html](https://www.brainyquote.com/quotes/authors/m/max_planck.html).]

John Polkinghorne, see [https://en.wikipedia.org/wiki/John\\_Polkinghorne](https://en.wikipedia.org/wiki/John_Polkinghorne), is "an English theoretical physicist, theologian, writer and Anglican priest." He's written about this problem in the specific form of the difficulties that physicists and others have in understanding the wavefunction of quantum physics—see [https://en.wikipedia.org/wiki/Wave\\_function](https://en.wikipedia.org/wiki/Wave_function). In *The Quantum World* [117], Polkinghorne tells us:

The wavefunction is the vehicle of our understanding of the quantum world. Judged by the robust standards of classical physics it may seem a rather wraith-like entity. But it is certainly the object of quantum mechanical discourse and, for all

the peculiarity of its collapse, its subtle essence may be the form that reality has to take on the atomic scale and below. Anyone who has had to teach a mathematically based subject will know the difficulties which students encounter in negotiating a new level of abstraction. They have met the idea of a vector as a crude arrow. You now explain to them that it is better thought of as an object with certain transformation properties under rotation. ‘But what is it *really*?’ they say. You implore them to believe that it is an object with certain transformation properties under rotation. They do not believe you; they think that you are holding back some secret clue that would make it all plain. Time and experience are great educators. A year later the student cannot conceive why he had such difficulty and suspicion about the nature of vectors. Perhaps we are in the midst of a similar, if much longer drawn out, process of education about the nature of quantum mechanical reality. If we are indeed in such a digestive, living-with-it, period, it would explain something which is otherwise puzzling. A great many theoretical physicists would be prepared to express some unease about the conceptual foundations of quantum mechanics – in particular, about Copenhagen orthodoxy – but only a tiny fraction of them ever direct serious attention to such questions. Perhaps the majority are right to submit themselves to a period of subliminal absorption. [page 82]

Freeman Dyson, see [https://en.wikipedia.org/wiki/Freeman\\_Dyson](https://en.wikipedia.org/wiki/Freeman_Dyson), is an important figure in various fields of physics and mathematics, including quantum physics as can be seen in the history section of the article, *Quantum electrodynamics* at [https://en.wikipedia.org/wiki/Quantum\\_electrodynamics#History](https://en.wikipedia.org/wiki/Quantum_electrodynamics#History). He’s also famous for being able to think outside of the mainstream on matters such as climate change. Let me move on to philosophy and theology by way a quote from Dyson:

The reason why new concepts in any branch of science are hard to grasp is always the same; contemporary scientists try to picture the new concept in terms of ideas which existed before.

[From Pat Ballew's website for the day of 2017/12/15:  
*Pat's Blog* at [http://pballew.blogspot.com/2017/12/  
on-this-day-in-math-december-15.html](http://pballew.blogspot.com/2017/12/on-this-day-in-math-december-15.html).]

Scientists, being human, have trouble accepting new ways of viewing the world, but the very limits of empirical reality and its perceptibility means that most of the natural sciences and even much of mathematics are subject to corrective forces which often act effectively over one or two generations. Philosophers and theologians deal with matters for which there are no such fast-acting corrective forces.

Let me return to Polkinghorne's description of the wavefunction of quantum mechanics as "a rather wraith-like entity." The wavefunction is what concrete matter is shaped from. To me, this points to rather obvious lines of thought which question the modern distinction between concrete being and abstractions which don't really exist but are useful for describing what does exist. In fact, the concrete, thing-like being of this universe is shaped from some strange abstract form of being which comes not to our eyes or hands or other sensory organs; it comes to our minds as abstractions. In my work since the late 1980s, and with some clarity since 2006 or so, I've been willing to claim this wavefunction is abstract being, true being. This would mean that all of mathematics is abstract being. And all of metaphysics; even metaphysics which has gone off-track starts from some body of truths—as one good example, Nietzsche's metaphysics started with a critique of subjective, man-centered thought and flew right past the possibility that the modern, liberal Protestantism into which he was born was, and is, a subjective distortion of objective truths. (Those liberal ideas didn't improve any when taken up more recently by mainstream Catholic thinkers.)

Perhaps, the ultimate strangeness of quantum physics is that it tells us that relationships, encapsulated in quantum wavefunctions as spectrums of possibilities, are primary to concrete stuff. Are there other such relationships? There is love which should lead us to remember that St John the Evangelist told us that God first loved the world. . . and then He created it. He loved the world we know, indeed—He loved all of Creation so much, that He manifested, through His Son, the truths from which He began to shape this world and the world of the Resurrected where the friends of Christ will live for time without end in perfect communion with God and with each other.

We need something as radical as a worldview which includes a metaphysics consistent with St John's theology as well as with quantum physics and other branches of the sciences of created nature, We need to understand what God is telling us through the work of the natural sciences. We need this to move forward in the formation of the Body of Christ, to move toward a sharing of God's life—a sharing which will give even inherently mortal human beings that life without end.

And it will be a life of peace and joy.

Merry Christmas to all and to all my hopes that you might come to share the peace and joy of life in the Body of Christ.

# 687 Dualism: Why Are Conspiracies So Prominent in American Political Discourse?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2477>. It was finished and uploaded on 2018/01/02.]

Short answer: conspiratorial worldviews and attitudes are necessary to preserve the fiction that the United States has no ruling class.

Who were and are the members of this ruling class?

They are the ones who went to the well-funded secondary academies of the Northeast, such as Phillips Exeter Academy, see [https://en.wikipedia.org/wiki/Phillips\\_Exeter\\_Academy](https://en.wikipedia.org/wiki/Phillips_Exeter_Academy) and all the many with less money. They went on to the Ivy league elite socialization centers in Cambridge and New Haven and Princeton and Philadelphia and even the unlikely location of Ithaca. As the saying goes, they went on to marry each other's sisters and to work in the investment banks and law-firms of their own grandfathers or those of their school-chums or distant cousins. In the early days, they went on to make their family fortunes in the African slave-trade or the Chinese opium trade. To be sure, the various members of the Adams family were taking care of the nation's interests, at least as they saw them, and seeming to live well but not so well as the Cabots and Perkins and Delanos (such as FDR) who got their money from trading slaves or opium.

In more recent decades, the membership of the ruling class has been expanded to take in the powerful oil-families of Texas and California and the overlapping group of families who made their money in California water. See the movie *Chinatown* for a less than flattering view of those water-

barons.

Ghost-like, they flowed into the State Department; the Dulles brothers acted as if cutting deals for their clients was one of their central duties, from the World War I era up to the 1960s—they were often active partners of the law-firm of Sullivan and Comwell. See [https://en.wikipedia.org/wiki/Sullivan\\_&\\_Cromwell](https://en.wikipedia.org/wiki/Sullivan_&_Cromwell) for a typical cleaned-up Wikipedia article on a powerful American institution or Stephen Kinzer's *The Brothers: John Foster Dulles, Allen Dulles, and Their Secret World War* [82] for a mere part of the truer and very disedifying story of American blue-blood corruption and sheer criminality, often in the form of coldblooded disregard for old-fashioned morality and concern for human beings outside of one's own family or 'tribe'.

More ghostly still, young blue-blooded men looking for excitement flowed into the OSS and then into the CIA, sometimes performing dangerous public service but also starting the first international heroin and cocaine cartels to raise money for the war against communism—some claim our elected officials wanted a very big world-wide war against communism but didn't like the estimated costs and thus sent the CIA out with partial funding and a directive to raise the rest of the money somehow. The CIA Watergate burglars, E Howard Hunt and Frank Sturgis, were from blue-blood families though not ones of the greatest wealth and power. These blue-bloods were reinforced by fresh blood recruited by a number of Ivy League professors, especially at Harvard and Yale, who were in cahoots with the Dulles brothers and other powerful men and sources of funding.

The CIA's criminal minority, the deepest part of its covert-operations, the All-American drug-smugglers and murderers and destroyers of countries innocent and guilty alike, was—and perhaps still is—a gathering heavy in graduates of Yale, many or most of them in the early years of the 1950s being members of Skull and Bones. Since then? Who knows? Maybe potential CIA thugs are now recruited at state universities and engineering schools along with those who will become the more respectable analysts or covert information gatherers?

But ruling classes can change. In the years of 1861-1865, the ruling classes of North(eastern) and South(eastern) fought a war to the death; the white aristocrats of Virginia and the Carolinas lost. There is an oddity of the sort which should be disturbing to most conspiracy theorists: the Northern(eastern) elites completed the destruction of the Cherokee elites who had been driven west by the South(eastern) aristocrats; in the War

Between the States, those Cherokee elites had allied themselves with their earlier enemies.

It's not the specific criminal operations or complex fantasies which matter the most for now. The first is no more than what professional criminals do whether blue-blood or Sicilian, whether capable of handling a complex hi-tech attack or capable of handling no more than a suicidal vehicular bomb attack. The second mostly doesn't exist though there might be some semblance of that sort of conspiracy in the hi-tech criminal conspiracies which might have taken advantage of insider information on the lesser crimes of other power-elite insiders. If we Americans could see the world clearly and simply realize that we do have a power-elite class and to further realize it has moved toward a criminal shape as it chose to hide and to raise their sons in the conspiratorial atmosphere of groups such as Skull and Bones—itsself founded by the Tafts and the Russells, the latter family being the core of the blue-bloods who made their families' fortunes smuggling opium into China. That "China Trade" was itself opened and dominated by the British Imperialists and was an effort to save the British Empire: the British people were buying so much tea from China—tea from India or Ceylon wasn't good enough—that the Empire's silver was spilling into China. The British government exploited Eastern Asian (mostly Chinese) opium addicts to draw the world's silver back out of China before the Chinese ended up owning the British Empire. Our national security agencies exploited junkies around the world to raise money for the war against communism. Progress of a sort. And all invisible to the American people though much of the story has been told by quite respectable historians and journalists; the story up to yesterday can be had in public libraries with updates to be found on Websites of journalist more honest and competent than well-paid.

I don't know if the British tea-drinkers knew they were endangering an Empire their power-elite was wedded to; I don't know if the British people even knew their dignified Colonial administrators and diplomats and military leaders and even! Queen Victoria were enabling opium smugglers to get that silver back out of China. I do know that Americans seem determined to be ignorant on very similar counts with respect to our power-elite and their attachment to an empire which is draining away American wealth and destroying American moral character. I also know that this American ignorance is enabled by the desire to pretend there is no such thing as an American power-elite. It isn't a Matrix but it was a club of those who went to the old Northeastern prep-schools and then on to Yale

and Harvard and so on and is likely still something similar. This desire to pretend we are a nation of people equal before the law is common to members of both the power-elite class and of all other American classes.

That American power-elite, once productive (probably) of more great men than drug-smugglers and slave-traders and not yet productive of assassins operating on the whole-sale level and regime-changers destroying entire regions of the world and dooming generations to poverty or struggles out of poverty, wasn't really so bad by the standards of history. And then Europe tried to destroy itself in the Great War of 1914-1945; with China and India prostrate for various reasons including British imperialism, the United States found itself in 1945 as the only great power in the world. The Dulles brothers and Rockefeller brothers, the Harrimans and Walkers and Bushes, the Fords and Watsons, the Roosevelts both Teddyites and FDRians, even the newly recruited business or military 'experts' such as McNamara and Odom, the intellectuals such as Kissinger and Brzezinski who provided an ideology glorifying American Hegemony as something different from and infinitely superior to mere empires, all led us on a crusade not to spread democracy and goodness but to turn the world, including the American homeland itself, into a plantation to be ruled by the American power-elite.

All of this is hidden because nearly all American citizens, members of the power-elite and servants of those and nearly all others, feel a need to pretend we've instituted forms of equality not possible in this world. It's led us into a pretense describable as a dark and morally sick joke. "They" occupy positions of wealth and power, grabbing more wealth and power; at the same time, "They" pretend they are just like us and want to be just like us. For a couple centuries, the ordinary folk of the United States have demanded this pretense and have brainwashed themselves to believe it. The ruling elite have gone along with the game, committing the crimes all such classes do in hidden, conspiratorial ways. They have raised some of their sons to form conspiratorial groups not so much different from such criminal groups as the Mafia and the Latin Kings and MS-13, partly through such institutions as Skull and Bones and CIA. Over the past two centuries, they have made or increased fortunes for various families of a bluish caste by whatever provides the highest rate-of-return. They pushed oil exploration in Texas and Oklahoma and the Gulf of Mexico at times when that provided that all-important highest rate-of-return and at other times destroyed the governments and societies and condemned millions in Southwest and Central Asia to death or to lives of poverty and victimhood

at the hands of misused American troops or Sunni terrorists. At times, they invested in pharmaceutical research and at other times they engaged in drug-smuggling in East Asia or Southeast Asia or in Mena, Arkansas.

We have a ruthless and fundamentally amoral ruling class going for the highest rate-of-return in legitimate business or in smuggling drugs or weapons and a large body of citizens who are determined to be oblivious to all this unless it impacts them immediately and personally. When something goes terribly wrong or terribly right depending on the perspective, it stinks to outsiders of a sci-fi sort of conspiracy when it is nothing more than the same-old thuggish behavior of power-hungry and money-hungry men. It's true that the technology of the modern world allows for spectacular crimes, but they are spectacular crimes possible to the likes of CIA or Israeli paramilitaries and other similar operatives and not really possible for the typical Salafis who have learned a little about fighting on the modern battlefield but otherwise are at the limits of their capabilities when they drive a vehicle loaded with explosives into a building.

I'll backtrack a little to note there there is a Matrix-like conspiracy: it is the agreement of the criminals in the American ruling-elite and the rest of the American people to pretend we have no powerful criminals among us of the type found in unexceptional countries such as Russia and China and Medieval France and Renaissance Italy and so on. And so it is that much is obscured though it is blindingly obvious to those who simply look at the American ruling-elite with the same skepticism appropriate for understanding the rulers in the days of William Tell or Robin Hood. Not that we have solid historical information about the clearly historical Tell or the probably historical Robin Hood, but books such as Barbara Tuchman's *A Distant Mirror* [135] relate the historical truths about the brutality of a ruling-elite, bishops and abbots as well as kings and dukes, when instability threatens their power and wealth. Some may have even believed their wars upon the "common people" was justified by the need to protect some level of human community.

A warning: the Swiss at the time of William Tell and Portuguese peasants about the same time defeated their exploiters from Austria and Spain only because they developed weapons and fighting techniques which could overwhelm those knights on horseback. Our situation is much different because of modern technology in weapons and communications technology and transportation and so on, but the principle remains that an exploitive and criminal overclass can only be tamed over many generations or upon

some sort of bloody battlefield. Even with the conversion of the German warriors to Christianity, it took many centuries to mold them into somewhat moral aristocracies in Western Europe despite the fact they willingly participated in that conversion to a (partly) Christ-centered life. Historians will likely find those German warriors of violent impulse were more easily converted than would be an amoral ruling-elite devoted to the abstraction of rate-of-return even in their materialistic greed.

I sadly predict we Americans will pretend that ruling-elite doesn't exist even as we grind our way toward relative poverty and powerlessness and probably fragmentation into a number of smaller states.

# 688 My Position on Hell, Purgatory, and Heaven

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2493>. It was finished and uploaded on 2018/04/06.]

Pope Francis has recently caused a stir by allegedly claiming there to be no Hell and even possibly once claiming there to be no Hell, Purgatory, or Heaven. See *Francis, Spin Doctor To Himself. His Latest Exploits* at <http://magister.blogautore.espresso.repubblica.it/2018/04/05/francis-spin-doctor-to-himself-his-latest-exploits/>.

I also have speculated there be no Hell and tend strongly to that view, but I'm a firm believer that the purpose of Creation is to provide brothers and sisters to share the life of the Lord Jesus Christ for time without end—in the world of the resurrected or Heaven, if you prefer. I'm also a firm believer in the need to be properly prepared to share that divine life and, thus Purgatory is necessary for some (many?) of us. Sharing the life of the Son of God would undoubtedly be so intense as to require a properly matured human being.

Before I'd thought this through in the context of an evolving human race within a universe of evolutionary and developmental processes, I'd already questioned the existence of Hell because of my reading of the Bible.

First of all, the Old Testament vision of Hell seems to be little different from that of the Greek pagan view. Hell is a dreary place of the 'souls' of all men separated from the bodies which had allowed them to experience the pleasures of this universe; the afterlife was a matter of dread to ancient Greeks and Romans and Semites.

Second, references to Hell in the Gospels occur mostly (entirely?) in parables meant to teach (usually moral) lessons and not meant to be taken

literally in all details anymore than we take Aesop's fables to be literal statements about talking hares and tortoises.

Third, Jesus Christ does sometimes talk more explicitly about the after-life, especially in the context of the Eucharist, the most definitive statement in my opinion being: "For this is the will of my Father, that every one who sees to Son and believes in Him should have eternal life; and I will raise him up at the last day." [John 6:40] The general thrust of the discourses of John is: eternal life is not something inherent to human beings but rather something God can give us if we respond properly to Him, especially through His Son. Only those who are saved are resurrected, though it's logical and not at all inconsistent with the statement of Christ just quoted that there be a place where some might be punished in a purging sense and others 're-educated'.

For me, this line of thought eventually lead to exploration of modern knowledge of human being as a physical embodiment within the realm of biology, not as a pasting together of body and soul as was believed by ancient men who recognized the special nature of human being but had no appreciation, for example, of the dynamic and responsive nature of mortal flesh. In fact, they generally couldn't understand dynamic events in the material world and posited spirits to do all the moving; the later, 'higher' pagans reduced the population of this spirit-world which surrounds us but never totally denied it to my knowledge. In any case, the fears of Aristotle and Thomas Aquinas that the brain was inert and not capable of engaging in abstract reasoning were proven wrong by modern understandings of cells and DNA and neurons and brain-structures at various levels and so on.

God is a competent Creator and didn't need to shim here with an immaterial soul or brace up things with an immaterial mind. What He created, what can be observed and measured in some very important ways, is sufficient for producing a species with a body suited to the needs of the incarnate Son of God.

So, we should be asking—if we have the faith and courage: at what point did some small group (only Adam and Eve?) of our ancestors become part of some covenanted relationship with God that they could have damned all their descendants by breaking that relationship? By the time that human beings existed with the abstract reasoning ability to understand in a coherent way the possibilities of one or more beings transcending this world of 'mere' matter, by the time they could even understand moral relationships in a human way, there were almost certainly multiple family lines separated

from each other but also interbreeding to some extent into each other; it even seems that we have genes from interbreeding with Neanderthals circa 40,000 years ago and—in the case of some ethnic groups—from very primitive human species at a similar time. There was no Adam and no Eve who could have contingently damned us and there were many human beings who simply never responded to God or His Creation, never rose above the state of being a human animal, perhaps out of choice and perhaps because it was beyond their capabilities or the capabilities of their communities. It would seem most plausible to think that ‘mere’ human animals would have the same fate as canine animals or chimpanzee animals or shark animals: the end of their mortal life is the end of their existence. On the other hand, there is the possibility of many who never form a personal relationship with God being saved because of membership in one or more communities of human beings who have such a personal relationship. This latter possibility has been badly reduced in scope in the modern West though it is frightening to think of the share we all have in national or other communities which have committed great crimes in recent years—such as the American invasion of Iraq in 2003.

I could be wrong, but not entirely. God is a competent Creator and there must be coherence between what we know of man empirically and what we know of man through his only inborn transcendental property: being capable of acknowledging and responding to a transcendent God. But, it is not clear to me if this transcendental property is truly inborn with all human beings—individual or communal. No less than the scribes and pharisees, modern defenders of Christianity strain at gnats and swallow camels. They worry about souls and angels and demons—our problematical inheritance from our pagan ancestors; they slide over the problems and opportunities of our relationships with the God of Jesus Christ, all-powerful and all-knowing and all-loving; they defend angels against the likelihood that Biblical angels are manifestations of God’s presence rather than independent creatures as if it be better to be visited by angels than by God.

This points to another problem with human beings, one which might require some re-training and remedial education institutes in purgatory: most people, even those with high IQs and capable of learning difficult material, have minds which seem to form once and then harden like instantly cured concrete. They become incapable of honestly and intelligently questioning what they were taught in second-grade Sunday School or seventh-grade CCD or tenth-grade American history class, they become incapable of re-

sponding to ongoing natural revelations from the Creator, they become incapable of responding to information indicating our understanding of the Bible or of the Creed is imperfect or is incomplete given new possibilities raised by modern thought, they become incapable of supplementing their idealistic high-school images of the United States without everything breaking in their understanding of the world.

At the same time, many modern men and women of the West—including Pope Francis—seem quite capable of somehow adopting parts, maybe many parts, of the dominant thought of their day, currently liberal secularism. I think their liberal secular thoughts and attitudes to be channeled through concrete ducts formed during their early education as Christians, but that is very much speculative and doesn't change matters too much. In any case, they can sometimes pick up some good ideas about history or human biology or the nature of logical and mathematical truth, though distorted in most cases. Liberal secularists also have such rigid minds and aren't any more comfortable with empirical fields of knowledge than are religious believers with rigid minds—or those who trust in the words of priests and ministers and writers who have rigid minds. Those religious believers with rigid minds wish to reduce empirical knowledge to a state of submission to their particular schemes for understanding life, the universe, and everything—which schemes include, nowadays, a lot of empirical knowledge circa 1800 or so. Secular liberals seem to have heads cleared of ideas and filled with a lot of policy goals; in the United States, they are those who have minds so open that their brains have fallen out; that sad state is not due to their own decision but rather to the moral irresponsibility of their parents and clergymen who retreated in front of the profit-seekers of Hollywood and the publishing companies as well as the ideological evil of those who set educational and cultural policies in the United States. Other countries, especially in the developed West, are in similar conditions.

Yet, Pope Francis starts out right if he's acting on the intuition that the Christian churches and other institutions, as well as authors and other individuals, have failed to deal with the discrepancy between traditional understandings and ways of life and newer possibilities. Some of those possibilities are no more than modern statements of ancient desires for freedom from the constraints of mortal human being. Some of those possibilities arise because of better knowledge and understanding of Creation, including even the revelations found in Holy Scripture. Some of those possibilities arise from the creation of new forms of human being, especially commu-

nal human being, as human populations have grown so large and human relationships and activities have grown so complex.

We need more serious creative thinkers addressing the issues, thinkers also with serious knowledge of tradition and respect for tradition, not an ignorant, weak-minded group which seems to be so progressive as to imagine they can jump to something resembling Heaven on Earth without bothering with inconvenient knowledge from the Bible or other sources of traditions, without bothering with the flesh-and-blood nature of fundamental human communities, without bothering with the constraints of the evolutionary and developmental processes which God Himself uses in Creation. The secular liberals have used modern science and pseudo-science to beat Christian believers into submission and then began creating their own systems of superstitious thought.

# 689 I Have No Horse in This Race

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2496>. It was finished and uploaded on 2018/04/14.]

I've proposed that the Body of Christ, the real and not nominal or virtual, community into which the friends of God will be integrated is a civilization with the Christian Church as His central organ. In this proposed understanding, the Church isn't the entirety of the Body; after all, I think that all that is good and proper in human nature will be completed and perfected in those resurrected to live with the Son of God for time without end. Our lives in the world of the resurrected, including the life of Jesus Christ, will be full and rich human lives which aren't lived in only the Heavenly Church pews where we sing and worship.

Sandro Magister has posted an article by Roberto Pertici who is "a professor of contemporary history at the university of Bergamo and has focused his studies on Italian culture in the nineteenth and twentieth centuries, with particular attention to relations between Church and state." See Magister article *Bergoglio's Reform Was Written Before. By Martin Luther* <http://magister.blogautore.espresso.repubblica.it/2018/04/13/bergoglios-reform-was-written-before-by-martin-luther/> for the article, *THE END OF ROMAN CATHOLICISM?* by Professor Pertici.

I was going to write an essay with the title: *I've Got No Horse in This Race Between Those Catholics With Leaking Brains and Those With Hardened Brains*. Pope Francis and his boys—and girls?—have mostly leaked out their brains and some might have dropped those organs on the sidewalk as one gloppy mess. On the other side are those who have brains

made of concrete cured as hard as those 2000 year-old Roman aqueducts.

So, the folks with no brains know something has changed in the world and know something should be done and. . . From there on, it's worse than politicians making sausage and butchers making laws.

The folks with concrete brains think that ideas borrowed from Hellenistic philosophers and forms of organization borrowed from Imperial Rome make up some sort of manifested truth as absolute as the Creedal beliefs of Christianity and the Bible from which they came. "If we've discovered that God had the bad judgment to run the world by way of evolutionary and developmental processes, then that's His problem. Special creation starring Adam and Eve is good enough. And, besides, my brain isn't flexible enough to admit such a new idea."

We need to respond to the empirical truths which we've discovered in the modern era, such as those regarding human origins, and we need to respond to new empirical truths which are being created as human being itself is enriched and complexified, such as new forms of political organization not yet found in the world. We need to so respond while remembering that we are still human beings with a specific history which dictates most aspects of our individual and communal human being. There are a lot of cultural variations between, say Maasai and Eskimos—see Chapter 683, *Dualism: The Split Between the Practical and the Ideal*, but they and nearly all human ethnic types who have survived are much alike in, for example, forming marriages of a type more like traditional Christian marriage than not.

# 690 A Plea From Syrian Christians—Will Any Western Christians Respond?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2498>. It was finished and uploaded on 2018/04/18.]

The Orthodox and Catholic Christian patriarchs of Syria have made a plea to Western countries and their citizens, especially to their fellow Christians in the West. This statement, follows on similar pleas over the years by Christians, including Orthodox and Catholic bishops, from various countries in Southwest Asia, a region which we Westerners, especially Americans, have turned into a suburb of Hell. The latest plea centers on the particular problems of Christians and other minorities at risk from the overthrow of governments which protect all these minorities from the head-chopping, liver-eating allies of the US and the UK and other western countries. Usually, when the US government and its European lapdogs get involved in a region, ancient Christian communities will disappear and individual Christians will be killed or enslaved or otherwise badly hurt; similar statements hold for Alawites, Kurds and Druse and other minorities.

I first learned of this recent plea from the blog post, *Here’s What Syrian Christian Leaders Think of their Western Saviours* at <http://www.theblogmire.com/heres-what-syrian-christian-leaders-think-of-their-western-saviours/>, a weblog well worth following by anyone concerned with the internal or external problems of modern Christianity.

The actual plea by Syrian Orthodox Patriarchs is *A Statement Issued by the Patriarchates of Antioch and all the*

*East for the Greek Orthodox, Syrian Orthodox, and Greek-Melkite Catholic* at <http://syriacpatriarchate.org/2018/04/a-statement-issued-by-the-patriarchates-of-antioch-and-all-the-east-for-the-> It's on the website of *Syrian Orthodox Patriarch of Antioch*. I'll provide just a short quote from that statement:

This brutal aggression [the recent missile attack by the United States, the United Kingdom, and France] is a clear violation of the international laws and the UN Charter, because it is an unjustified assault on a sovereign country, member of the UN. It causes us great pain that this assault comes from powerful countries to which Syria did not cause any harm in any way.

The Western countries bomb countries which are not doing anything against the West, the Western countries train and arm ISIS and Al-Qaeda terrorists, they steal the natural resources of Syria and Iraq and Libya and others.

The Orthodox and Catholic patriarchs of Antioch are crying for some respect for the sovereignty of Syria, for some peace and respect for the lives of Syrian peoples. They would like Western countries, most recently the United States, United Kingdom, and France to cease regarding Syria and other countries as means to the prosperity of those who, rather than working as most of us do, would rather steal, send armies into action, smuggle drugs and arms, train terrorists. These are men who seize or inherit power and, being incapable of doing something useful, wage war against the powerless who happen to live on or near reservoirs of petroleum or natural gas, near key transportation routes which can be profitably controlled by unscrupulous men.

Christians in the United States, the United Kingdom, France and non-Christians as well better realize they have a leadership made of those men described by Lord Acton in these quotes:

And remember, where you have a concentration of power in a few hands, all too frequently men with the mentality of gangsters get control. History has proven that. [From *BrainyQuote*, [https://www.brainyquote.com/quotes/lord\\_acton.](https://www.brainyquote.com/quotes/lord_acton.)]

Power tends to corrupt and absolute power corrupts absolutely. [From *BrainyQuote*, [https://www.brainyquote.com/quotes/lord\\_acton](https://www.brainyquote.com/quotes/lord_acton).]

These men are now turning against the American people—see Chapter 687, *Dualism: Why Are Conspiracies So Prominent in American Political Discourse?*. That chapter is an update of similar analyses I'd published in past years, an update motivated by a reading of a book about two brothers who definitely had the mentality of gangsters: Stephen Kinzer's *The Brothers: John Foster Dulles, Allen Dulles, and Their Secret World War* [82].

Modern day Christians of the West seem hardly to have the historical or other knowledge to recognize such gangsters though they dominate the West—not in the way of a great conspiracy organized by B-school brain-trusts but in the way of a disordered nation or even civilization which has become the battleground of gangsters who fight each other; sometimes combine to exploit the decent, law-abiding citizens, and often engage in wars against other countries or civilizations.

I'll make a point in closing: we should also consider our duties to the American soldiers who have suffered physically and mentally and in damage to their moral characters as a result of all the criminal *Kinetic military action[s]* (see [https://en.wikipedia.org/wiki/Kinetic\\_military\\_action](https://en.wikipedia.org/wiki/Kinetic_military_action)) in which they were inserted. We don't do our duty to these young men, and some young women as well—itself a matter of moral shame, by holding parades and picnics. We do our duty as voters by learning enough to know the location of these countries our leaders wish to invade, what their history is—including, if applicable, their recent decades or centuries of exploitation by Western countries. We do our further duty by identifying trusted commentators or by perhaps reading serious history books by well-regarded historians, including some retired diplomats and military officers—colonels are generally more to be trusted than generals. Most people can, and should, take shortcuts by finding friends or neighbors who have some 'bookish' talents and have taken the trouble to read a little about Syria and Iran and Iraq and the crimes we and the British and the French have been committing against them for at least a century and a half. And we reach a mature level of doing our duty by asking good questions about any proposed "kinetic military action" and forcing a serious and honest public debate. We become wise old men and wise old women by

finding replacements for those senators and representatives and presidents who don't measure up to the questions or don't live up to any promises they make, maybe showing themselves to be ignorant or simply giving signs they have weak moral character or the mentality of gangsters.

# 691 The Ultimate Christian Authority on Earth is the Pilgrim Body of Christ

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2522>. It was finished and uploaded on 2018/05/29.]

At his most authoritative, the Pope of the day has been the one who speaks on behalf of the community of Catholics, at times even on behalf of the community of all sacramental Christians—in centuries long past, those now called Eastern Orthodox accepted the authority of popes of the caliber of St Leo the Great—see [https://en.wikipedia.org/wiki/Pope\\_Leo\\_I](https://en.wikipedia.org/wiki/Pope_Leo_I). In recent decades, non-Catholics accorded some substantial personal authority to St John Paul II.

In a similar vein, those who translate and explain the Bible as well as those who give us narratives of the history of the Pilgrim Body of Christ (and not just the Christian churches) also exercise substantial authority (validly and invalidly) over the ways in which Christians understand even the revealed truths.

I entered the Catholic Church in the late 1980s because of my readings in the history of Christianity and the belief I developed that the Church of Rome was in some strong sense the center piece, or at least the largest piece, of the pilgrim Body of Christ—though I wouldn't have phrased it that way until the past decade or so.

That pilgrim Body of Christ has various organs and I now believe the Christian Church is the central organ of that Body—unlike St Paul who seemed to think the Church is the entire Body of Christ. Starting more than a decade ago, I'd been emphasizing the importance of a civilization

to the pilgrim Body of Christ and then about eight years ago, I began to suspect that the Body of Christ is like a civilization—the completion and perfection of all aspects of human being—with the Christian Church as its primary organ.

The Body of Christ existed on Earth in an embryonic form so long as Western Civilization existed, however uncertain its true adherence to Christian beliefs and practices. This should not be taken as a chauvinistic claim—Western Civilization wasn't more pure or more Christ-like than, say, Russian proto-civilization, rather was it more complete in having manifested a relative fullness of human attributes in communal forms. (See Chapter 594, *Freedom and Structure in Human Life – What Can We Say About the Body of Christ?* or download the book, *The Shape of Reality* [56], for a discussion of my developing views on communal human nature.)

Yet, the Eastern churches are also manifestations of the Body of Christ, those in communion with Orthodox patriarchs; there are also the ancient churches of Southwestern Asia—neither in communion with the Latins nor with the Greeks nor with the Russians, yet having a valid priesthood with an Apostolic succession. Western Civilization has been so successfully purged of its Christian foundations, and there are not available 'pagan' foundations to replace them—assuming it be possible to do something of that sort without bringing the original civilization to a crashing halt and then starting a multi-century reconstruction. We Western Christians have been passive collaborators in the destruction of the pilgrim Body of Christ.

In any case, I'm not making an effort in this essay to settle this issue conclusively as there are many groups with at least a plausible claim to be (perhaps radically incomplete) manifestations of the Body of Christ. What I am trying to make clear is the primacy of the Body of Christ rather than the primacy of the Pope or the entire hierarchy of Rome or the entire hierarchy of all plausible Christian churches. The descendants of the Apostles themselves are those selves only so long as they are part of the Body, leaders in some ways of the Body but also humbly subordinate to that entirety.

Christ is the point of it all, and that means that the Body of Christ is the point of all earthly human being.

We don't understand the Body of Christ in real-world terms and it would be a sheer grab for power if the leaders of the Catholic Church in Rome were to claim that Body is necessarily and inherently centered on the Pope or the Roman hierarchy in general. Those particular Christian leaders have,

in fact, been morally irresponsible in not seeing the clear need to respond to God's Creation; some, such as Pope Francis, seem to see some need to respond but they are far more likely to do as Francis is doing—trying to make peace with the dominant inhuman and inhumane ideology of the recent past, secular liberalism or cultural Marxism or whatever term you may prefer. Those terms are largely misunderstandings.

A truer understanding points to a deformed human mind, truly inhuman and inhumane in some important ways. Don't go to modern books of political philosophy, whether the creative originals or textbooks; don't go to modern books of religious thought or spiritual feelings; don't listen to the frantic analyses of the Web's political and religious commentators. Read Nathaniel Hawthorne's short story, *The Birth-mark*, and contemplate the self-serving, calculating coldness which defined the human being of the Calvinists of the Northeastern states of the US. It was the Calvinists of the American Northeast (call them New Englanders for short), dark of mind, self-centered and cold, who are the source of much which is wrong in the modern world or, at least, they are the most prominent manifestation of this distortion of human being.

We are in a mess because we are a mess. Pope Francis and most other Christian leaders, including the so-called Christian intellectuals, are worse off than most are.

To the extent that I'm right, Western Civilization was once the bulk of the pilgrim Body of Christ; if it was not the God-ordained center of the entire Body, it was certainly the dominant part of that Body—for good as well as bad. It is that Body, not even so central an organ as the Church and its hierarchy, which comes to some understanding of God's Creation, of our relationship to our Creator, of our history, of our futures as individuals and communities in the Body of Christ.

# 692 Is Modern Atheism a Result of High Loads of Genetic Mutations?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2526>. It was finished and uploaded on 2018/06/12.]

The basic idea is simple.

For decades, geneticists have been able to chemically separate and analyze genes. This made possible a fruitless search for the magic gene which ‘causes’ schizophrenia or depression or intelligence or other human qualities or disorders of human being. A lot was learned, perhaps most importantly—there are no such magic genes. Complex qualities and disorders involve complexes of genes. Intuitively, this would seem to emphasize the gradual side of evolution—that is, a build-up of changes of the genotype can result in sudden and dramatic changes of the phenotype.

As a result, complex attributes, such as intelligence or sociability, have developed not from a small number of dramatic mutations in a single gene but rather from a build-up of mutations over a number of genes each of which have only a small effect on the attribute; problems in those attributes might be similar in being caused by problems in a number of those underlying genes. An added complication: “high mutational loads” in these important human qualities will result (always?/often?/sometimes?) in immune system problems—thus under ‘natural’ conditions of selection—ie, no modern hospitals, someone with high mutational loads in intelligence will die young and not reproduce successfully. This is above and beyond the usual (Darwinian) selection pressures against such organisms as human beings who are asocial in our highly sociable species.

In particular, higher or abstract intelligence in human beings seems to involve better than 1,000 genes and similar statements can be made about tallness and some other human qualities; a single mutation causes problems on the order of 2% or less. Some disorders, such as schizophrenia and severe forms of depression, involve high rates of mutations across a number of genes playing a role in producing healthy versions of human characteristics. It seems to be, and was suggested by evolutionary theorists years ago, that the human inclination to engage in “mass-worship of moral gods” is fundamental to the formation of the particular community oriented human personalities we have and, thus, to the formation of complex communities as we know them.

It’s important to know a little about the background to these ideas. I’ll consider as evolutionary theorists scientists of different sorts: paleontologists, archaeologists, geneticists, linguists, and evolutionary theorists ‘proper’, along with various technical experts and general thinkers such as philosophers commenting upon the theories and speculations.

These various sorts of evolutionary theorists have been exploring selection pressures coming from cultures as well as from the non-human environment. A certain group of human ancestors learned how to control fire somewhat and there arose a new form of selection: upon the capabilities of humans to handle and advance technology and also upon human abilities to develop social mechanisms for maintaining and developing that technology and transmitting it to future generations. It appears from some ancient, prehistorical knowledge and is glaringly obvious in the records as humans learned to write that collective worship played a major role in shaping human communities—in politics and in setting us on the road to philosophy and theology and eventually to physics and mathematics. Most readers, at least Americans middle-aged or older, will be most aware of the centrality of religion in forming human cultures and states and civilizations from reading the Bible; skepticism as to details but not disbelief is warranted in reading the Bible. The non-Semitic literature of city-states and empires and expansive religions tell substantially the same story. Even the power of kings seems to have begun in the temples though it might mature by way of spears and disciplined bodies of warriors and by way of large-scale farming or mining and disciplined bodies of civil servants.

Putting it strongly, enflashed human social and moral natures evolved and developed in well-ordered societies on a foundation of “collective worship of moral gods” as some scientists put it. Healthy human being is tied to

religious practice. This is not a proof of God's existence, let alone a proof of the truths of particular revelations from Christianity or any other religion. It does point to the idea that complex human societies, and the individuals of those societies, will be unstable, disordered in morals and other ways, if those societies don't provide at least rich religious rituals for collective worship. Or if a large percentage of the individuals of a traditional community of a complex sort turn away from their temples and their gods. In the light of this knowledge coming from empirical science—including the historical analyses which try to make sense of ancient Uruk, the ancient pagan Romans had good reason to think of Christians as something like atheists.

It could be argued a different human race might have evolved but we are what we are.

So, there is something of a 'model' of a human being capable of forming and maintaining and living in a complex society, even a civilization. That model includes such traits as a reasonably high intelligence—a matter which should be considered relative to family lines of those capable of fulfilling roles in complex societies. It should also include the small-effect genes for general personality traits which almost certainly overlap those for general (or global) intelligence traits.

Again, the key idea is that there are no magical genes for complex attributes such as intelligence or the (collective-worship-centered) human social nature—communal human nature as I prefer to call it. There are a number of genes for such attributes, each having a small effect and also having an effect on general health. That is, a 'broken' human being, schizophrenic or not inclined to that collective worship is very likely to have a defective immune system as well their more obvious problems; prior to the industrial age with good sewer systems and fresh water systems and modern hospitals, those 'broken' human beings tended to die young. Now they can live lives of length similar to those of the healthy, more 'complete' human beings, producing more 'broken' human beings.

We now have two major problems in much of the developed West:

1. a growing part of the Western-descended population is made up of people not equipped to live in complex societies because of genetic mutations, and
2. another growing population coming from heavy migration of people

from regions of the world where evolutionary processes didn't produce high levels of some of these attributes necessary for living in these very complex societies which are parts of civilizations.

In my writings over the previous 12 years or so, I've developed a way of making sense of this in the context of Christian beliefs. Let me sketch this for you:

1. All human communities, and the Body of Christ in a complete and perfect way, are true communities and not just voluntary gatherings of freestanding individuals. Thus, we have communal human being which is as real as individual human being.
2. The Body of Christ is the true civilization with the Christian Church as the central organ—with my current understanding of that Church being: all sacramental Christian churches with a priesthood having Apostolic descent.
3. In my book, *The Shape of Reality* [56], I speculated on the possibility of using modern geometry of the sort used in Einstein's Theory of General Relativity to describe human communities with each 'point' representing a human being (point of spacetime) and the entire ball of wax being the Body of Christ (the universe). In practice, this could be complex and, for example, each individual might be a plane which is partly bent to the shape of the overall manifold.

Here are two links to a couple recent, (relatively) accessible discussions of the situation with growing numbers of human beings who have high mutation loads:

- *Are Atheists Genetic Mutants-A Product of Recent Evolution?* at <http://www.unz.com/article/are-atheists-genetic-mutants-a-product-of-recent-evolution> and
- *The Mutant Says in His Heart, "There Is No God": the Rejection of Collective Religiosity Centred Around the Worship of Moral Gods Is Associated with High Mutational Load* at <https://pdfs.semanticscholar.org/32df/6da2640d57af0fb5af42072c0351d65ea775.pdf>.

There is much to be done here. We need deeper and more reliable understandings and from such understandings, we need to revise our behavior to better protect the future of our children in the West without harming others, but perhaps by no longer helping others, if that help is at the expense of the futures of our children. (And I think there is good reason to believe we've hurt a lot of people and peoples greatly while thinking to be helping them.)

One final qualification: These analyses of genetic mutations don't seem to directly address the issue of highly intellectual forms of atheism or asociality, but it may encourage those holders of those intellectual ideas to think twice, or more, before trying to take away the faith of those of simpler ways of thought—especially their students. It may even encourage some of those holders of those intellectual ideas to evaluate their own beliefs.

# 693 Why Middle-class American Men Don't Care Much If They Die.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2529>. It was finished and uploaded on 2018/06/27.]

I'll ramble a bit in a way suited to a discussion of a life lived in the chaos and moral coarseness of Western Civilization in its period of advanced decay.

Why are there so many men, mostly white and middle-class, who are said to have been living good lives and said to have been happy, and yet they are committing suicide? There are, of course, the relatively many men who have various problems in their family lives or their memories of their participation in the criminal wars of the leaders of the US and its allies or their frustrations at finding a 'spot' in a West built by white European men which has been stolen and is being wasted by those who don't see the rather obvious differences between the races (indeed there are significant differences between some ethnic groups inside the races) or the more obvious differences between men and women.

I'm no expert in suicides or severe mental/emotional problems, though I learned a bit from occasional comments of my late sister who was such an expert—officially a psychiatric social-worker. I've also gotten into conversations with men back from the war-zones to which we send young men after doing our best in church and school and in 'entertainment' products to make those men soft inside so they can meet the standards of the priests who never heard of King St Louis and school-marms wishing everyone to be well-behaved in those horrible bla-bla sessions they hold in classrooms and the Hollywood creatures who've never met a lie they won't tell if it can

make them some money.

More to the current point: this is very personal to me for I find myself in a strange position. Moment to moment, I usually enjoy life. I think I'm doing important work which God has called me to. Yet, I feel strangely unmoored, dissatisfied with a life where I've bypassed the chance to have a wife and children, to gain some sort of moderate prosperity—the best kind in most cases, and I develop ideas and literature which could be part of a new Christian civilization. . . . And I get nowhere. And I get to watch the of ongoing processes of moral and spiritual and intellectual decay in which I'm trapped as well as other human beings in the modern West. (See Jacques Barzun's *From Dawn to Decadence* [9] for a magnificent analysis of the decay in quality of literacy from 1500 to 2000.) Even in the Catholic Church with its deep ties to the traditions of the West, I was told more than 20 years ago by a priest running a prominent press that American Catholics don't (can't?) read difficult books. So. . . pep rallies. We publish books of low intellectual and moral caliber and think we are honoring the Creator by turning **His** ideas to childish mush—not childlike but childish. Guides to a better pep rally also do well as guides to feeling comfortable in your ignorance and complacency. And, of course, we've been trained to expect something different from the upcoming television season or movie year—expectation of something new overwhelms our sense of tradition and that, only seemingly a paradox, prevents creative responses to what is truly new.

And nobody wants to look at the elephant in the room. Catholics and other Christians claim they wish to restore the Christian West and then, as one example, they go off to Masses or other worship services in which they joyfully howl out music which would have horrified the musicians of the rise and magnificent height of the West: Palestrina and Byrd and Bach and Mozart and so on. I'm not a expert in music and only a wannabe expert in Christian theology, but I've gathered that Bach's *Mass in B minor* (see [https://en.wikipedia.org/wiki/Mass\\_in\\_B\\_minor](https://en.wikipedia.org/wiki/Mass_in_B_minor)) is a magnificent synthesis of what might be called the heart of St Francis of Assisi and the mind of St Thomas Aquinas. The Gospel message at the very heights of Western art. Now we have. . . Well, Luther himself and Samuel Wesley (a convert to Catholicism who was the nephew of the founder of the Methodist church) wrote some pretty good, singable hymns. If you can't do better than what we already have, why produce stuff to crowd out that better stuff. If you can't ascend in mind and spirit toward Heaven, then you

maybe should work on that rather than propagating mediocre stuff which can't be part of the life of God which the saved will share. We aim low to middling and wonder why we aren't shooting bulls-eyes. We look for that something new even when it's of lower quality than what we already have.

This is very depressing to watch the horrors building up around me and to know that I could help move forward a process of rescuing much which will otherwise have to be rebuilt over generations. And the depressing mood is intensified as I see ever more clearly the truth of the claims made by better thinkers, such as Joseph Ratzinger and Etienne Gilson, that the West was not destroyed by enemies from the outside—it was ours and we gave in to the enticements of dangerous thinkers and doers who were our younger brothers and our nephews and the sons of our friends from college. The West was corrupted and destroyed from the inside, by its own residents and by some of its seemingly respectable citizens and also by well-meaning citizens of the West, even clergy and old-fashioned teachers and others who just wished to make it easier for all to understand or participate. To which I would respond: If the medium was mediocre, then the message wasn't Jesus Christ.

I repeat: Moment to moment, I usually enjoy life. This was a problem for me. I was a gifted student in a completely inadequate school system—at least, it was inadequate for me. Despite the statement of one teacher that he hated to watch what that high school did to me, I managed to enjoy myself much of the time. And I managed to respond too well to the gentle pressure of my peers, nice children who grew up into well-behaved adults—some of who are practicing Christians. Yet, I had to give up some of my reading time during which I had been discovering history in order to watch shows such as *The Monkees* but also a few 'family' shows about plastic creatures living in suburban gatherings of individuals and 'nuclear families'. So it was that a number of Christians and others with at least nominalistic ties to rich and profound traditions watched with approval as individuals and "nuclear families" held beach parties with the tsunami waves already moving in; so it was that more families moved off the remaining foundations up on high ground and set up their flimsy shelters on those sands. I didn't like it but had neither a well-formed moral character nor a well-formed mind which would have helped me to object or at least quietly protect myself or maybe some others around me such as my younger siblings.

When I went to college, I had no work habits worth talking about. Despite a significant—but not total—recovery by my junior year, that sent

me into a spin for about 10 years, at which time, I began a conversion to a Christianity which was largely alien to me after my upbringing in a mainline Protestant church where I'd learned Jesus was a nice guy and I should be as well. I went through Hell for nearly another 5 years and destroyed my career which was less than booming to start with.

Others might have had different problems, such as gentle children in a modern school system struggling to deal with the moral coarseness of the modern West. Some might have brutalized by a more traditional form of coarseness in their homes. But that moral coarseness isn't softened by current school curricula, especially those white males of European descent who learn of their innately evil nature and who learn they're responsible because Africa and Haiti and most regions of Latin America are remarkably lacking in sewage and fresh water systems and have not produced a lot of Nobel prizewinning physicists.

Actually, a lot of students are out of place in their schools and a lot of Westerners, most certainly including Americans, are out of place in their workplaces or churches, their communities in general. The modern workplaces and other sorts of human spaces are different from anything encountered by even our fairly recent ancestors. Of course, we are adaptable and opportunistic creatures, but we aren't being presented with natural, random or patterned, changes to our various sorts of spaces. Some of the talk about the alienation of human beings in the modern West is on the mark—because the West has moved ahead so rapidly in so many ways and also because the leaders, cultural and academic and political and religious, in the West have been so, shall we say, inadequate in providing guidance and assistance to those most affected by those rapid changes.

In fact, our leaders have become our enemies, maybe not so murderous as Stalin nor so destructive of traditional values as Mao, but they are our enemies as they realize they've made an utter mess of things, are about to fall, and need to secure their power and to grab any available wealth—soon to be that which is needed to operate American public schools and hospitals.

We are being presented with potential changes limited to those which suit the established powerholders and wealthholders. I'm not trying to advocate any radical sort of cynicism. I am trying to note that we live in a world not so different from that of any collapse from an age of great prosperity. I am also trying to convince my fellow Americans, and all Westerners, that the world has not changed since the "bad, old days

of kings and emperors and conquerors on horseback.” Psychopaths, exploiters and outright gangsters, gravitate towards centers of power and wealth. See the interesting study *Psychopathy by U.S. State* (at [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=3185182](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3185182)) for a discussion of the very dense concentration of psychopaths in Washington, DC—Connecticut has the highest concentration of any state but Washington’s concentration is far greater. In the case of Connecticut, think of all the hedge-fund managers and investment bankers who live in the Southwest of that state and work in New York City. But there are hints that some of these psychopaths were created by their nearness to power and wealth and maybe to the stresses of living in a region filled with aggressive, ambitious men and women. So it is that I can repeat some quotations from Lord Acton that I’ve used before:

And remember, where you have a concentration of power in a few hands, all too frequently men with the mentality of gangsters get control. History has proven that. [From *BrainyQuote* at [https://www.brainyquote.com/quotes/lord\\_acton](https://www.brainyquote.com/quotes/lord_acton).]

Power tends to corrupt and absolute power corrupts absolutely. [From *BrainyQuote* at [https://www.brainyquote.com/quotes/lord\\_acton](https://www.brainyquote.com/quotes/lord_acton).]

Note that the first of the quotes supports the idea of psychopaths being drawn to power and wealth and the second of the quotes supports the idea that some maybe not psychopathic, or not so much, can be corrupted by exposure to temptations greater than their moral character can handle.

Following the prophet Jeremiah and Lord Acton, I plead with God for some insight into the reasons He has made a world where such moral wretches are so disproportionately powerful and wealthy. So far as I can tell, God is leaving us to answer the question by proper exploration of reality and by intelligent analyses of the results through the disciplines of evolutionary biology, history, genetics, moral philosophy, etc. Another depressing matter: there is a notable lack of Christian thinkers dealing with these issues and a great number working to dumb-down the thoughts of earlier great thinkers so that we can have shallow explanations of the Creator and His work with those explanations set in the context of pre-modern empirical knowledge and theories. Of course, everyone is quick to note they accept

evolution—but it has remarkably little to do with explaining such matters as the moral nature of human beings; everyone is quick to accept quantum mechanics—but it has remarkably little to do with explaining that physical stuff which is a necessary part of a sacramental world, a necessary part of the Sacraments—including the Real Presence on the altar.

With my depression deepened, I go off to Mass or to pray by myself in front of the Tabernacle holding the Blessed Sacrament and. . . I find the darkness inside of me breaking up. Or I might go off to a volunteer project, perhaps scrubbing pots at a pasta dinner or starting off a pie-cooking project for the day—at 6:30AM, and. . . I find myself joking with the other volunteers and being concerned that a spouse is suffering badly from allergies. Some ordinary sad news and some good fellowship on top of work which should now belong to the young men and women who don't show up for worship or for volunteer projects.

More reason for my depression to deepen and, yet, I'm happy in various little ways. If you ever have problems being happy in this increasingly degenerate world (degenerate in moral and other aspects), then try a feisty attitude: Don't let the bastards get you down. The best revenge might be to go on to live a good life, but that's not always possible in terms of prosperity or worldly prestige. You can also remember the wisdom in the words: smile and the happiness will follow. Soon, I'll be writing an essay on the true religious nature of human beings, seemingly embodied in our genes: "collectively worship of moral gods" and faith or belief will eventually come—but seemingly after generations if you pay attention to the Bible or to the histories of ancient civilizations. Smile first and you'll be happy; worship God and praise God and thank God and you'll find yourself starting to believe. It remains hard to do so, especially for men—if you can forgive me for claiming men are different from women in some important ways, perhaps many.

There are different sorts of happiness. The happiness of being with pleasant and good human beings is of greater moral satisfaction than that of a good meal or a good mug of beer. All these are trumped by the happiness which can come even in a miserable life which is lived to a greater good. As for me, I live to better understand Creation and to use that better understanding to better understand our relationship with the Creator. And, so, I could mention. . . mathematics. I've argued for a need to draw concepts from those fields but especially from mathematics. See my book, *The Shape of Reality* [56], for an attempt to describe human communities (even the

Body of Christ) by way of concepts drawn from the same mathematics Einstein used to describe the universe in his General Theory of Relativity.

When I do such work, even when I prepare a small essay for the purposes of God and the needs of His children, I feel a deeper sort of happiness, perhaps a very weak foretaste of the bliss which is felt when sharing God's Own Life.

I don't feel such bliss so often as I once did when I devoted a greater share of my hours to serious study and thinking and writing. With all that is coming out:

- The Church continues to shrink leaving the likes of me to care for those who didn't pass on their faith to their own children; we, the current volunteers, can look behind us and see no one to do the same for us.
- We, the laity, continue to be surprised by the occasional revelation that there is still more moral filth and rot, more sacrilegious behavior, in the clerical regions of the Catholic Church. There is no reason to believe the situation is different in other Christian churches nor in the schools nor hospitals nor other institutions of the Modern West.
- Recent revelations of filth and rot in the Catholic also reveal that much was known to bishops and other priests free of those particular sins but too cowardly and self-serving to speak out, let alone try to call the sinful and predatory bishops to some sort of account.

So it is that we laity are being protected by our bishops, wise moral giants that they are, from knowledge of how some . . . ummm . . . bishops like to stick their penises up the butts of altar-boys and seminarians and also like to force young men into their homosexual networks which are apparently spread across the United States and maybe across the solar system. And, again, there is reason to believe such predators and their networks exist in the leadership ranks of all parts of the West—political and cultural and . . .

Much there for a practicing Catholic to be proud of. Much to make him happy to give money which partly goes to buy silence from the victims of . . . ummmm . . . bishops and priests and . . . soon to come to a diocese near you . . . lay bureaucrats and teachers and . . .

Much there to make me wish to encourage a man to enter the Catholic Church and to bring his children with him. Much to make me wish to encourage parents to send their sons off to seminary.

Just plain depressing.

And, yet, while I feel frustrated in not being able to respond fully to God's call to me, I'm reasonably happy in some ways. I'm looking forward to a Holy Hour at my parish in two days. Next week, I'll attend two meetings of prayer groups which are populated by holy and very likable Catholics, though not seemingly aware of the well-documented crimes of our political and religious leaders and... DEPRESSING!!!

But I happily make and execute plans to finish the second of four parts of the second volume of a planned three volume novel of a spiritual conversion of a man only vaguely like me. Sometimes I'm happy writing sentences which would be well-structured by old-fashioned grammatical diagramming techniques but... they go deeper, even just three or four levels, than a weak mind can follow. I'd suggest: read good books and your mind will grow stronger. Again, read Jacques Barzun's *From Dawn to Decadence* [9] to understand the destruction we've done to the literary standards which were necessary for Western Christian Civilization. I won't let the bastards get me down and I won't let a lack of truly literate readers weaken or corrupt the work I do for God and for that human community which is the Body of Christ.

Certain types of happiness are to be actively sought. I think I'll cut down on my volunteer hours and devote that time to such activities as studying mathematics and writing about new ways to understand relationships between human beings and those between God and human beings. I'm willing to give up some moments of lesser forms of happiness.

And losing myself in an effort to produce a better understanding of Creation, to produce better thoughts in general, is better than drinking more whiskey and beer or using crack or putting a gun to my temple. Not that I'll stop drinking a modest amount of whiskey and beer.

If only more of those lost souls could know of the better options, some of which are not available to all, but my study of mathematics and the writing of books could be a career as a volunteer counselor at a center which helps impoverished young mothers or a volunteer tutor or a volunteer companion and aid to an elderly man or woman.

Speak to God, perhaps on your knees at a church which is your own or could be your own. Then speak to a pastor—most are ordinary men who've

taken on a difficult and important task and are generally more trustworthy than most higher-level Christian leaders. Then speak to God again. And to some of His good friends you might meet at that church or the place where you're starting as a volunteer.

And smile. And worship. Praise and give thanks.

Happiness of lesser and greater sorts will likely come and maybe faith as well.

# 694 Seeing Creation as It Really Is

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2539>. It was finished and uploaded on 2018/08/06.]

I have begun a new research and thinking and writing project which bears the tentative title: *Through Christ: Creation*. It is intended as a step or two forward rather than a step or two toward a different goal than I've been pursuing in recent years: the use of modern knowledge of the world to build a new understanding of the world, a Christian worldview.

Some, including allegedly Christian leaders of Christian communities, act as if this is a world in which we can conduct our daily business as if God doesn't exist or, at least, isn't truly present. I think the Almighty, as Augustine told us, is deeper in us than we ourselves can reach. He is deeper in the constituents of matter than the most powerful of particle accelerators could ever reach—even with a boost to the energy levels found in the very early fractions of a second of this expansionary phase of... something we think of, sort of, as the Universe.

At the same time as we are to carry out most of our activities as if God doesn't exist or, at least, isn't truly present, we are also to understand God in His freely chosen role as Creator of this world as if we can just restate the understanding which grew up in the period of 1500-1800 or so, the early years of modern science. This early modern view of the world developed by Christian scholars and adopted by many Christians was partly as an effort to undo the damage caused by Galileo's persecution by men more occultists and magicians and desperate powerholders than Christian thinkers,

Separated for two centuries or more from much of the exploration and analyses of the real world, Christians have a bit of work in front of them to

make sense of reality in Christian terms. We were sometimes rescued by the strategy of “save the phenomena.” There are various ways to model reality—after all, Plato and Aristotle produced understandings of the world which were defective relative to the underlying empirical reality or “how God actually did it.” Even the great scientists, Archimedes and Galileo and Newton produced understandings of physical reality which were radically inadequate and sometimes wrong by the standards of 21st century physics and chemistry and astronomy. And, yet, they “saved the phenomenon,” their theories (call them “models” of reality, if you will) saved the appearances of macroscopic reality. The same can be said of, for example, Christian understandings of human being or of revealed knowledge. Intellectual leaders and other leaders of Christian don’t seem to even realize they sound like fools when they say they accept evolution (more generally: the idea that human beings arose in the natural world and our special relationship to God comes ‘after’ that) and then go to the pulpit or publish books which teach that human beings were a special creation of God who lived in Eden and...

We seem to have reached a point where Christian thought has lost most of its credibility. From my viewpoint: Christians started to rebuild their understanding of Creation based on empirical knowledge of this concrete region of Creation and then the effort halted, resulting in a reconstruction of a magnificent temple upon a foundation of sand. The tide has come in and the foundation is washing away. Yet, the strategy continues: God revealed (some of) the answers to us so we don’t have to bother learning how to reason toward the known answers based on what we now know about empirical reality and why bother reasoning toward new answers needed as human being (largely in its communal forms) grows ever more complex and complicated and as we learn much more about the matter and energy and spacetime of this universe.

Before moving on, I’ll give an example more clear than most of how an unconscious “saving of the phenomena” had allowed physicists and others to advance right up to 1900 with an understanding of matter, specifically of its stability, which was destroyed by the work of Planck and Einstein in founding a version of quantum mechanics which itself proved to be inadequate, a mere “saving of the phenomena.” And that’s it. Physicists, philosophers, theologians, engineers, and the rest of humanity had simply assumed matter was the stable and inert stuff it appears to be when you pick up a rock and examine it. When Planck and Einstein showed mathe-

matically (with Planck and others verifying it in the lab) that energy isn't continuous—it exists in quanta or units, pre-existing fears came out of the shadows and scientists realized that continuous energy transfers would have prevented matter or a material universe from ever stabilizing.

Now to move to the realm of human being and its sexual and moral traits. We've known since at least the time of the, more or less, final redaction (high-level edit) of the Hebrew scriptures adopted into the Christian Old Testament, that men are defectively monogamous—quite defectively in some cases. So, the laws of many religious communities, the kind of communities successful over time, enforced monogamy or at least a tightly regulated polygamy. See Chapter 692, *Is Modern Atheism a Result of High Loads of Genetic Mutations?*, for a discussion of the religious nature of evolved human being. For this essay, the important point is that evolutionary science, and the resulting reasoning—sometimes speculative, tells us that there are strong advantages to strong family and clan/tribe societies where the father is strongly tied to his own wife and children, but there is an advantage (in terms of fathering children) in being open to the occasional opportunity, enough of an advantage for this tendency to stray to remain in the behavior repertoire of the human male and to be lived out more fully in ages of moral disorder.

At this point, it's perhaps helpful to think of the Jesuit priest and professor of biology in James Joyce's *A Portrait of the Artist as a Young Man*. Left hand on Darwin's *Origin of Species*, he claimed it to be a description of what man is; right hand on the Bible, he claimed it to be a description of what man can be if he accepts God's offer of salvation. Western Christians never adopted any such coherent understanding of our general situation, choosing instead to assume that all individual human beings have a recent common ancestor (true enough so long as you take 100,000 or more years as recent) and that we've all changed or not changed as if soldiers marching on parade. This magic act of synchronization is thought by many oh-so modern thinkers to have linked together evolutionary forces in northern Eurasia and in Borneo and in the Americas and in central Africa and so on.

But even if we start to honestly accept the facts and information, sometimes processed into knowledge, of modern investigators of empirical reality, we have not enough. A universe can't be built out of its parts. See Chapter 193, *A Universe is More than it Contains* for a discussion of the inadequacies of such an understanding even from a purely material viewpoint. And things go beyond that: only God can make a Universe, or a Creation,

though it be possible we might one day gain the dangerously immoral power to ‘make’ a human being.

Going from embodied abstractions to that abstraction we know as ‘understanding’: We need a greater understanding of Creation than can be assembled from the pieces of modern science and mathematics—though it should certainly use the great knowledge and powerful tools of those and other ways of thought found in modern times, including the insights and tools of Biblical exegesis, theological and philosophical thought, historical investigation and analysis, literary arts and other arts as well.

I’ve been building an understanding of that sort for the past 12 years on my websites (*Acts of Being* at <https://loydfueston.com/> and *To See a World in a Grain of Sand* at <https://loydf.wordpress.com/>). For nearly two decades before that, my efforts had been directed toward the goal of simply enriching what seemed to be an increasingly impoverished Christian civilization—the West.

I’m ready to rebel more openly and more energetically against the claim that God has died or at least gone away. He’s alive and present and, anthropomorphically speaking, He’s probably not happy with us.

I’m ready to dispute the claim that man is what he wills to be, and even the claim there is such an abstraction as ‘man’. Rather is it the case that human being is concrete, individual and communal, and complex types of communal human being form in an appropriate and potentially stable way, first of all, through the “collective worship of a moral God who is all-powerful, all-knowing, and all-loving.” Communal human being is also real and concrete as is individual human being. The Universe we live in can also not be seen but, like a strong human community, its effects can be observed and sometimes quantified. To be sure, even an extended family group in the late New Stone Age would have had something of political and economic structures, but Babylon and Ur formed as small communities of human beings came together to worship in larger communities. And to build clusters of houses and shops, irrigation systems in some cases, eventually defensive walls, and then palaces and buildings for the bureaucrats.

Both moral and religious inclinations come from our innermost being as coded in our DNA and manifested in our bodies through developmental processes which work from that DNA but with some limited options due to DNA which can respond to environmental conditions—such as lower body sizes during general periods of lower prosperity. Yet, there are other factors at work. When Western Civilization was Christian and strong, the minds

and hearts and hands of even those with little inclination toward religious belief or practice could be shaped to be much like the minds and hearts and hands of those with strong inclination toward religious belief and practice.

Let us pray. . .

Lord God, please help us to open our hearts and our minds to you, please help us to order our hands to help You do your work. You are always with us, if you were not present to and within any creature, it would cease to exist. And, yet, we've shielded our hearts and our minds from Your presence, refused to order our hands to your purposes.

Yet, some were blind from birth, deaf, not inclined to bend the knee to what couldn't be seen, to what didn't seem to be conducive to immediate profit. A father of faith can conceive a daughter who is good in human ways but shows no signs of perceiving God. A mother regular in her private and public devotions can give birth to a son who doesn't bend knee or lift his voice in praise and thanks.

Lord, we don't know why you created the world in this way, but current estimates of genetic science indicate that inclination to belief in the "moral gods" is less than 50% heritable and the same is true of the inclination to engage in worship of those "moral gods." What are we to do, Lord, if we wish to help our children to enter Heaven if they're not so inclined to believe or practice as we are?

I've already developed an answer to the last question in the above prayer based upon my expansion of Pope Benedict XVI's explanation for the problems of the Western Christian churches and I'll be working to put that answer in a richer context, with the help of the grace of the Lord God Almighty.

This project might go slowly at times and I plan to write occasional short pieces on other topics, but I'll produce the rough draft of this book one essay at a time, maybe one thought at a time and maybe a rush of thoughts at a time.

# 695 St Paul Just Might Have Been Right.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2557>. It was finished and uploaded on 2018/10/09.]

In Romans 9:19–23 [141] (RSV Catholic Edition), we can read:

You will say to me then, “Why does he [God] still find fault? For who can resist his will?” But who are you, a man, to answer back to God? Will what is molded say to its molder, “Why have you made me thus?” Has the potter no right over the clay, to make out of the same lump one vessel for beauty and another for menial use? What if God, desiring to show his wrath and to make known his power, has endured with much patience the vessels of wrath made for destruction, in order to make known the riches of his glory for the vessels of mercy, which he has prepared beforehand for glory, even us whom he has called, not from the Jews only but also from the Gentiles?

So, maybe we have those who have chosen to turn to God, however unfaithfully or cowardly, in this mortal realm and we have those who have turned away from God. But, some who choose, do so because of their own embodied self? Some have genetically determined characteristics which incline them strongly to turn away from God? Maybe to live the life of a virtuous human animal? Maybe to live a life of vice? Some are “vessels of mercy”? Some are “vessels of wrath”?

I think the above is a tad too simple, though I threw in a few complications. Along those lines, I would propose four populations of human beings

as a better start to our understanding that St Paul’s “vessels of mercy” and “vessels of wrath”:

1. Those who are friends with God or trying to be, who would be happy in Heaven sharing the life of Jesus Christ and, through Him, God.
2. Those who have turned away from God for reasons understandable on the part of creatures—horrible death of a child or ????. Such might include those who would be happy in Heaven sharing the life of Jesus Christ and, through Him, God, and also those who would hate sharing the life of Jesus Christ.
3. Those who are enemies of God, who would hate sharing the life of Jesus Christ.
4. Those totally uninterested in the question of God or that of the meaning of life, who would hate sharing the life of Jesus Christ.

I think those four types exist. There may be some overlap of those who can move in one direction or another—that is, we mortals aren’t of one mind or one heart or one set of hands.

I may have missed one or more possibilities, but the above list of ‘types’ of human beings is a good starting point.

I also think the speculation of some Medieval thinkers was right:

Who will be saved?

Anyone who could enjoy life in Heaven, who could enjoy sharing the life of God.

Those Medieval thinkers were so to speak, following the somewhat speculative path of St Paul in asking the question: Is Heaven really a place which could be enjoyed by all human beings? Are there some human beings, creatures of God, who are made so that they would not be able to enjoy Heaven, perhaps because they are indifferent to issues beyond those of a human animal? Are there some human beings, creatures of God, who are made so that they would not be able to enjoy Heaven, perhaps because their brains and personality characteristics aren’t proper, perhaps causing them to turn away from God’s offer of friendship?

In any case, I would strongly say we presume wrongly when we presume that God made a Heaven which the most nonreligious human animal could

enjoy alongside the great saints. We also presume wrongly when we presume that God will necessarily save those who could enjoy Heaven but turned away from God in this mortal realm. We don't know, but we now know this: genetic analyses along with more general analyses of human being tell us there are some strong constraints on our individual human beings but also, sometimes, substantial freedom for development. There is such an entity as a genetically healthy human being—apparently inclined to “collective worship of moral gods”—and there are patterns of small mutations which are correlated with autism, atheism (of a deadening of mind and heart and not an intellectually active sort), homosexuality, and other complex problems. Such problems can be overcome by becoming a member of a community which gathers for the “collective worship of moral gods,” but preferably one which gathers to worship Christ and His Father and Their Holy Spirit, to worship and to learn their ways and their thoughts.

I'll close with the speculation that the term *free will* is a dangerous one, implying some agent, independent of our embodied human being, and able to override all human desires and inclinations. It's possible to override much that is bad or bad in a certain context, but possible only with a mind—perhaps more of a communal than individual mind—shaping the will (part of the heart in my usual way of discussing human being) and both guiding the hands.

We need to work from the concept of an embodied creature with limited but real freedom; we need educate and train young ones and our own selves by way of stories of moral import and by the development of habits of mind and heart and hands. We need to explicitly realize we have to find much that God wishes for us in our open responses to God the Creator, that is, in our open responses to Creation. Such a path will allow us to learn God's ways and God's thoughts and to make them our own.

[For background on some of my claims about genetic problems, see Chapter 692, *Is Modern Atheism a Result of High Loads of Genetic Mutations?* and Chapter 339, *What is Man? And All That?.*]

## 696 Here Be Dragons

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2560>. It was finished and uploaded on 2018/11/27.]

Despite the urban legend I had once accepted, the phrase *Here be dragons* (see [https://en.wikipedia.org/wiki/Here\\_be\\_dragons](https://en.wikipedia.org/wiki/Here_be_dragons)) was not often used on maps and sometimes the dragons or other monsters drawn on unknown regions were decoration rather than warnings. Yet, they clearly state what “should have been true” though it was only “sometimes” true:

“Here be dragons” means dangerous or unexplored territories, in imitation of a medieval practice of putting illustrations of dragons, sea-monsters and other mythological creatures on uncharted areas of maps.

The above is the summary at the beginning of the above referenced article though that article goes on to tell us the phrase was rarely used and might have referred to the quite real Komodo Dragons of Indonesia. The decorations of exotic and monstrous creatures were mostly...decorations. I’ll use it in full-blown ‘urban-legend’ form. “Here be dragons” identifies regions which promise catastrophes or even apocalypses. Enter at the risk of utter oblivion, perhaps painful at that. Enter at the risk of feeling the threats, of being terrified, even before something happens.

The entire human race is sailing full-speed into a region which should be labeled as “Here be Dragons,” but bubble-headed people—including most Catholics and other Christians—see only a continuation of the same-old possibilities, including that of a return to the good times which had held in the West since 1960 or so and had held in the US for a bit longer than that. (There have been some hard times but some of those would have seemed like paradise to those living in, for example, the 14th century after

the end of the very prosperous period labeled the 'High Middle Ages'. See Chapter 553, *Are the Gangsters Keeping Each Other Under Some Control?*, for a discussion of the similarity, especially in the US, of the end of the High Middle Ages and the past few generations—periods of declining but still substantial prosperity. Notice: that earlier period was, as we now know, approaching a brutal period [the 14th century] which ended with much smaller populations which were more prosperous and that wealth and power were more widely distributed.

But worse than that is coming to Christians, their faith and their beliefs will be tested by deep, deep conflicts between those beliefs and the realities of how this world works, conflicts between those beliefs and the “effects of the Creator in this world,” as Medieval thinkers would have expressed it. If we have faith in the God of Jesus Christ, we must re-evaluate those parts of our beliefs we draw from empirical facts and from contingent lines of reasoning. To anticipate what I've not yet said in this essay: we need to learn how to obey Christ's commandments without badly damaging the Body of Christ and threatening the futures of young Christians and those not yet born. This has come about because of deeper and broader understandings of the workings of God's Creation—understandings nearly all of our leaders are ignoring out of morally culpable ignorance and cowardice.

Arguably, many of our current and approaching problems could have been mitigated or even avoided entirely by prudential (timely and firm and courageous) action by the leaders of the West, political and academic and cultural and religious leaders alike. The deeper problem is that the easy solutions to the practical problems are in conflict with Christian respect for life. This is, to say the least, quite inconvenient to those who think being a Christian in this world is quite simple—a child can do it. But we are called to be not childish but child-like in accepting Creation as the work of God and in trying to obey the revealed commandments of God in that Creation and not in a Creation which is imagined by either Manichaeistic thinkers or idealistic dreamers. Our thoughts and dreams should be founded upon reality, upon the facts and derived relationships of Creation.

A practical example: we should have been wary about the possible dangers of entering the lands of tribal peoples, some at a level perhaps comparable to the Iron Age of Europe (think of the millennium beginning about 3000-3500 years ago and also think of Conan the Barbarian) and some at the level of the New Stone Age (ending perhaps 6000 years ago and indicative of the social forms and technologies and ways of hunting and

foraging of Central African Pygmies and Khoe San of South Africa) and most somewhere in between. Did the missionaries and conquerors really think these people to be “just like us,” waiting for us to come along and build them 1950s American dream-houses? Did they think those peoples indigenous to non-civilized regions were waiting for us to come along before moving from trial by fire or by combat to trial by abstract systems based upon intertwined natural law (philosophical and theological—sort-of) and positive law (legislated or ordained by recognized leaders)?

Culture and individual characteristics evolved together in the human species, though I think it better to think more generally, and more in tune with reality as being primarily relational and secondarily substantial. In fact and using evolutionary terms, it seems likely that the selective advantages of certain types of increasingly complex social organizations, communal agricultural communities (irrigation) and communities of warriors and metal-workers, drove human intelligence to higher levels and also forced the development of more cooperative personality traits. Something of the sort is also true of other social creatures, including rats and mice—as will be seen as important a little later in this essay.

A good number of those belonging to tribal peoples, and presumably having the intellectual and personality characteristics appropriate to tribal peoples, have moved into the regions of Western Civilization—along with a good number coming out of tribal peoples but having at least partially the characteristics appropriate to civilization.

What could go wrong?

In the case of those many immigrants who are fully and truly tribal peoples, perhaps a massive onslaught upon the very abstract, rules-based judicial and political systems of the West? Perhaps a return to blood-based and personal forms of justice and politics—as did happen in Rhodesia->Zimbabwe and is now happening in South Africa and other parts of Africa? Perhaps a tribalization of our own lives so that we, or our children, experience an increase in impulsiveness, a shortening of time-scales, so that we, or they, spend relatively more on immediate pleasures than did our ancestors and sacrifice relatively less for the future of the children and of generations not yet born?

In the case of those immigrants who have at least some of the abstract reasoning power and the personality traits appropriate to civilized communities, perhaps a draining into the industrialized and civilized countries of those necessary for the peoples of Africa to move towards a different future?

Let us be clear that selection processes give survival into adult lives and the consequent reproductive opportunities to those who meet the standards of those particular processes—in a particular context; those who ‘win’ also must be lucky at some minimal level. Prosperity, as Darwin speculated with respect to the ongoing Industrial Revolution—in ‘less modern’ terms, might endanger human communities by allowing the survival and successful reproduction of human beings who have high loads of mutations—especially important is the immune system which might have problems with fighting infections, which problems could impair development of the brain and other body parts and lead to early death. The problem of survival of those with, say, impaired immune systems might well prove to have been major factors or even the dominant factors in such events as the fall of Rome, the collapse of Western Europe into chaos during the 14th century, and even the collapses we read about in the Bible or in books of ancient history. (The struggle to fight diseases with an impaired immune system leads to the loss of crucial resources for development—including brain development.)

Though I read serious books in history, my knowledge is not wide—perhaps deep in small regions. My impression from those books is that there are multiple factors involved in the decay, often seeming rapid, of a great civilization or a prominent city or perhaps in a community of artists or scholars. Those factors do include purely external events such as climate change or invasions by, say, Central Asian nomads, but there are a variety of causes and effect-causes (probably effects of something more fundamental which go on to cause specific forms of damage) which include diseases which are a result of immune-system failure along with an invasive organism which might be new or old to the people under assault, loss of vigor, seemingly rapid loss of specific skills of civilization such as literacy or numeracy due to a decrease in both intelligence and the related personality traits. I make no pretenses of having thought long or hard to produce a complete understanding of this important, and repeating, historical situation: decay isn’t logically necessary given what we know but it does seem to always happen to be best of human communities. The takeaway is that much of these factors behind the decay of civilizations, or complex communities less than civilizations, might be caused by or aggravated by high rates of mutations in members of those civilizations surviving to reproduce successfully.

These are not matters to be taken lightly, especially by Christians who are forced—in my opinion—to consider human communities to be at least potentially part of the Body of Christ and maybe (Western Civilization?)

a very substantial part. Yet, the leaders of Christian churches and those who head up secular do-gooder agencies and many others, do take such matters lightly—we might note to the profit of manipulative politicians and financiers who seem to seek to consolidate their control over political and economic structures by replacing peoples suited for freedom and at least some self-rule by other peoples, tribal peoples, who can be more readily dominated. (My use of the word ‘seek’ in the prior sentence applies in the sense of an ‘invisible hand’ or in the more general sense of a dynamic, self-organizing system.)

So, many Western leaders and pseudo-intellectuals want to bring into the West a whole lot of people who, by their own inclinations and according to their own traits, continued living in family groups and tribes while the peoples of northern Eurasia and China were evolving to live in societies of ever greater complexity—in response to events often quite bloody and typically murderous towards the males, young and old, on the losing side of the fight. Do those leaders understand that we of Indo-European regions—including Iran and parts of Afghanistan and India—became what we are, the Han Chinese became what they are, because of monopolization of reproductive opportunities over generations by powerful men and their direct descendants? Over half of men of Western European descent are said to carry Y-chromosomes descended from that of one man who lived 4,000 years ago or so, probably somewhere in central or eastern Europe. My Y-chromosome comes from men who were present in the British Isles about that time and were closely related to that powerful man whose sons and later descendants dominated Western European reproduction. The Han Chinese went through similar processes, perhaps with even more extreme selection of ‘breeding’ males.

The Africans didn’t go through those sorts of processes and, logically enough, their intelligence levels and forms of personality are what we might expect in societies roughly, perhaps very roughly, equivalent to the Neolithic and Iron Ages of Indo-European societies—in the middle or so of the rapid increase in the intelligence of the peoples of those societies which covered much of Europe, parts of the Middle East, and parts of South Asia, as well as Northeast Asia. And we have to always remember that there are personality traits which also play a role in forming and maintaining communities as complex as civilizations, though those personality traits are closely related to the cognitive abilities and probably overlap with them.

Yet, things are worse than that, as I’ve discussed before; see:

- Chapter 692, *Is Modern Atheism a Result of High Loads of Genetic Mutations?*, and
- Chapter 339, *What is Man? And All That?*.

The results of certain experiments on rats and mice in the late 1950s to the early 1970s pointed to recent rigorous versions of these ideas about the dangers to communities of social animals caused by widespread survival of those with heavy loads of mutations. In two different experiments which produced substantially the same results, the experimenter kept alive as many rats or mice as possible in an enclosed population, the unhealthy and socially perverse rodents as well as those which were healthy and should have had proper behavior towards their communities and towards other community members. But even the healthy rodents picked up much of the perverse behavior of the mutants. The community decayed so that they even stopped reproducing. See *Behavioral sink* at [https://en.wikipedia.org/wiki/Behavioral\\_sink](https://en.wikipedia.org/wiki/Behavioral_sink) for some description and some explanation—density of population was hypothesized as the destructive factor of rodent communities. ‘Density of population’ didn’t hold up to further tests and that idea has been cast aside. High loads of genetic mutations seem to be the problem rather than high population densities or the very questionable explanations proposed by others than the original experimenter, John B Calhoun. In fact, high loads of mutations can be tested for and have been tested for in indirect and direct ways—it seems likely to be the reason for the destruction of the communities of highly social animals when they are kept alive despite health and other problems, whether kept alive by a curious scientist or an Industrial Revolution.

The basic idea is simple and goes back to Darwin, though he didn’t know how inheritable traits were transmitted or how they could change and, thus, knew not of the concept of ‘mutation’. This is it: mutations occur naturally because of external insults to DNA and also because of the complexity of the chemical processes in genes. Most mutations in genes carrying important traits are bad. Those bad mutations are culled by death, usually at a young age, or inability to successfully reproduce. Darwin warned that the Industrial Age might cause a decay in desirable traits as it kept alive humans who would have died in the normal processes of selection.

Along the same lines, we have this frightening article by Lance Welton, “the pen name of a freelance journalist living in New York”: *Are*

*Southpaws Really Sinister? Increased Incidence Suggests We’re Headed for a Mouse Utopia Collapse* at <http://www.unz.com/article/are-southpaws-really-sinister-increased-incidence-suggests-were-headed-for-mouse-utopia> “Mouse Utopia” is a nickname of sorts for the experiments of Professor Calhoun as summarized above and described in the referenced Wikipedia article.

This mysterious journalist was the source which referenced the article which started my ruminations along this line. The ‘non-existent’ Mr Welton wrote the article, *Are Atheists Genetic Mutants- A Product of Recent Evolution?* at <http://www.unz.com/article/are-atheists-genetic-mutants-a-product-of-recent-evolution/>, which linked to *The Mutant Says in His Heart, "There Is No God": the Rejection of Collective Religiosity Centred Around the Worship of Moral Gods Is Associated with High Mutational Load* at <https://pdfs.semanticscholar.org/32df/6da2640d57af0fb5af42072c0351d65ea775.pdf>.

So, what’s the takeaway?

Firstly, and not for the first time, we can see that Christians have a misunderstanding of this world which is part of God’s Creation; this misunderstanding is more ‘God-centered’ but otherwise just as bad a misunderstanding as that of other modern peoples.

Secondly, this has led to unwise and ultimately very cruel forms of charity. Perhaps more importantly, these forms of charity have done a great deal of damage to the Body of Christ and threaten more damage before the healing can start and perhaps many generations before the Body of Christ is once more robust.

Africa has been turned into a showcase of stupidity and exploitation beyond even that of the earlier colonizers. In *A Farewell to Alms: A Brief Economic History of the World* [22], the economist and historian Gregory Clark tells us that many Africans now have a lower standard of living than they had some thousands of years ago when most Sub-Saharanans were living as hunter-foragers or simple agriculturalists—perhaps as non-sedentary agriculturists such as some Indo-Europeans were living four or five thousand years ago with some continuing to live in such ways for generations after that. (Note that I use ‘Indo-European’ a bit loosely and intuitively; though having much in the way of common genetic roots, especially with respect to the male chromosome—the Y-chromosome, the Indo-Europeans were not a ‘people’ nor even—in a cultural sense—quite a ‘proto-Indo-European’ peo-

ple. They were biological ancestors from a small group of male-lines along with a significantly larger group of female lines; their traits made it easy for an initially closely related family of cultures to form and to spread over much of Europe and parts of West and South Asia. I also will use ‘African’ in the rest of this essay to mostly refer to Sub-Saharan human beings—individual and communal.)

Africa, that continent which was the birthplace of humanity—though there are some interesting qualifications to that claim, had a population of about 250 million in 1955, the year I was born. The UN projects an African population of 4 billion by 2100. We might look at all that has been accomplished in medical care and building some modern infrastructure in Africa but we have to realize that this has reversed the brutal, but not always bloody, way in which the human race has progressed, or even just maintained its good traits, over the millenia—in a world which is part of God’s Creation and operates as He intended. How else could the world operate if its Creator is the All-powerful and All-knowing God we Christians worship?

The important concept is ‘reproductive advantages’, though we have to survive before reproducing. And, with human being which is both communal and individual, we have to remember that both components are involved. As I put it a few months ago, relying on thinkers dealing with these issues in an honest way:

[E]nfleshed human social and moral natures [at least in the western Eurasia] evolved and developed in well-ordered societies on a foundation of “collective worship of moral gods” as some scientists put it. Healthy human being is tied to religious practice. [See Chapter 692, *Is Modern Atheism a Result of High Loads of Genetic Mutations?*.]

Africa does not now have, and never has had, the environmental conditions to provide reproductive advantages for those with the mental abilities compatible with civilization, European-style or Indian-style or Chinese-styl. These mental abilities cover not only ‘high-level genius’ but also metal-workers and highly disciplined farmers. There is one obvious, and disconcerting, exception I know about and perhaps others I don’t know about: the Igbos and other tribes began to develop signs of higher mental abilities in recent centuries, likely because they controlled the riverways coming out

of the inland regions of West Africa. The mental abilities of these African peoples seemed to rise and they began to also show related merchant-type personality traits as they traded with the Europeans—slaves as well as natural resources. This isn't unusual. The first, Nordic, aristocracy of Russia became prosperous because of trade with the Islamic regions to the south and their trade included Slavs sold as slaves—said to be the origin of the name 'Slav'. Some of the prominent American families of the Northeastern states, including many of the notable families of the northeastern American states, Cabots and Perkins and Russells and Tafts and Delanos and Walkers, made their money in slave-trading or opium-trading. Maybe some worked both trades.

If we Westerners had not intervened in Africa in ways exploitive or charitable by intention, perhaps Africans, as individuals and as peoples, would have moved towards societies which gave reproductive advantages to those with higher reasoning abilities or inclinations towards developing good work-habits or some combination of the two. Perhaps and perhaps not; and, if they chose to remain tribal peoples, so be it. After all, to wish that sub-Saharan Africans had lived under conditions to bring about higher IQs than they now have is to wish away many of the Africans who exist now. We should realize this. You can't magically 'elevate' someone suited to 'Iron Age' tribal life to make them compatible with life in a technologically advanced civilization.

There are differences in the distribution of IQs among even the most intelligent of peoples so that Europeans, including European Jews who also have higher average IQs, produce proportionately more geniuses than the highly intelligent peoples of East Asia. The leaders of the West, since at least the 1960s, have chosen not to educate the educable and nurture the academic talents of those who have any in the interests of trying to provide higher education to those with no talent or no interest. When that failed, they—consciously or otherwise, began to socialize all students to the simultaneous profit of government-allied 'private' corporations and left-wingnuts who are opposed to all that is good in the West—except for coffee-bars and European sports-cars. And so, in at least this way, we further aggravate the problems coming from a build-up in genetic mutations in the peoples of the West and from the entry into Western countries of those who are not suited to life in a civilization—certainly not one so technologically advanced. In fact, it's likely that many of the businessmen and ideologists profiting off the decay of the West—think of them as maggots on a dying

body if you wish—are sociopaths with a heavy load of genetic mutations or humans of more ordinary sorts of weak moral character who are picking up the personality traits of the sociopaths around them.

See Chapter 693, *Why Middle-class American Men Don't Care Much If They Die*, for a discussion of the way in which the leaders of the West behave in the way of psychopaths—though it's likely that only some are true psychopaths and many are humans of low moral character who pick up the behaviors and attitudes of surrounding psychopaths to prosper in a decaying civilization. That essay refers to the academic study, *Psychopathy by U.S. State* at [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=3185182](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3185182), where we learn of the very dense concentration of psychopaths in Washington, DC—Connecticut has the highest concentration of any state but the region of Washington has a far greater concentration. In the case of Connecticut, think of all the hedge-fund managers and investment bankers who live in the Southwest of that state and work in New York City. But there are hints that some of these psychopaths were created by their nearness to power and wealth and maybe to the stresses of living in a region filled with aggressive, ambitious men and women.

A proper sort of personality is necessary for a people to build or even maintain a civilization. That proper sort of personality is made of traits which can make for mathematicians dealing with abstractions and not 'just' triangles and novelists who can produce works exploring wrong or plausible philosophies of history or of human society and theologians capable of dealing with abstract metaphysics and politicians capable of dealing with such abstractions as impartial justice—non-tribal justice from a perspective important to understanding what is happening on American campuses and many other parts of our decaying polity. All citizens, and not just mathematicians and novelists and philosophers and politicians, must be comfortable with the ways of abstract justice, justice of laws and not justice of blood-ties; all citizens must be comfortable with abstract financial transactions and promises to be kept years in the future.

We should remember there are a large number of smart and capable Africans, intelligent human beings with personality traits at least sufficient to begin transcending tribal ways of thought and feeling and action, but too low a percentage of the total population to build a civilization and probably too low to maintain a civilization given to them—if that unwise project of Christian and secular missionaries had ever been possible. This has created a situation where those Africans who have the proper reasoning abilities

and personality traits often choose to migrate to Western countries. Those without such abilities and traits also choose to at least try to migrate to Western countries. The first travel quietly in jets carrying luggage bearing their diplomas from African or Western universities, the second travel with great publicity in boats, sometimes fragile, across the Mediterranean. This is all encouraged by unscrupulous politicians, as well as by those who have ideologically malformed senses of guilt for our past crimes against Africans, not recognizing that the slaves brought over to the United States were harmed far less than many of the descendants of those left behind in Africa who now are said by Professor Clark (see *A Farewell to Alms: A Brief Economic History of the World* [22]) to have lower standards of living than they had in their 'primitive' days before missionaries and investors and colonial administrators reached them.

I'll make a horrible speculation: Africa will suffer the greatest humanitarian disaster in history within the next two generations; hundreds of millions will die of starvation or disease or humanly-inflicted violence as a result of the breakdowns coming as Africans continue to try to take over the pieces of a civilization built for the benefit of the departed colonists and for the alleged benefit of African peoples. It's likely parts of Africa will be re-colonized by Asian and/or Western peoples wanting the natural resources and needing miners and plantation workers. As this is happening, desperate people will flee to safer regions which have cultures alien to the Africans. Many of those will probably die on the way or arrive to die soon or to live in poverty at the edge of the civilizations whose benefits they desire; some might survive and even prosper. In fact, it is happening already at a scale far smaller than what is all but certain. Both exploitive men and well-meaning men have created a situation moving towards a crisis which can't possibly end well so far as we Westerners or the Africans are concerned.

I've contemplated the problem for a few months or so, and managed to descend into a dark night of the soul, of sorts. I've ascended somewhat by putting aside any goal of reaching a good answer anytime soon. Instead, I'm trying to write about it, from different angles and using tools from different intellectual traditions. This more active approach has stopped the cold-war between my faith and my reason, my faith in God the Creator and my trust in established empirical facts. One faith-based fact is that God has told us to respect, to try to love as appropriate, all human beings. One empirical fact is that God has created a world and forms of life such

that constant culling of living creatures with genetic defects is necessary for the very survival of their family-lines and the entire species. Another empirical fact is that there is a build-up of mutational loads in the human race because we can now keep alive those who would have died young in that vast period prior to the Industrial Revolution.

And I remember also one claim I've made consistently for ten years or so: the Heavenly Body of Christ is a perfected and completed civilization with the Christian Church as the central organ. When we damage any Christian civilization, we damage part of the pilgrim Body of Christ.

What will happen in a society in which reproductive success is independent of selection for the traits so necessary, at least in a significant minority, for the human race to remain what it is or to move still closer to being an image of God? We are not only making choices which have already led to perhaps a 10-15 point drop in average intelligence in the West since 1900 or so, we have also made overlapping choices which have led to the destruction of the individual and communal traits which define the Body of Christ.

We Christians of the 21st century, and all of the secularized Christian and Jewish heretics of the West, need to realize that we weren't created by a special act in some paradise and can't create any paradise on earth by the best of motives and the strongest of wills. We live in a world of evolution and development. We need to make the best of such a world rather than developing delusions about our powers to keep all human beings alive while maintaining our human communities—ultimately, the Body of Christ. We need to do our best rather than assuming great good will come from the migration to civilized regions of peoples who have not the traits and characteristics for such ways of life; we also delude ourselves by thinking to do good by building technologically advanced infrastructure in those regions of peoples who have not the traits and characteristics of civilized peoples. Without a technologically advanced civilization, Africa can perhaps sustain a population in the tens of millions, probably far less than the 250 million population of 1955. As I noted, Africa could probably sustain a larger population if it were re-colonized and re-enslaved, but we should consider a policy of benign negligence: let nature take its course and then let the Africans choose their own future. Certainly, we can't let masses of pre-civilization peoples into regions of civilization without doing great harm to those regions and even to the immigrant peoples.

“Here be dragons.” Indeed. Here there are dangerous creatures, but real creatures of God's making, which are probably an even greater danger

to Christian thought and faith than are the various sexual and financial scandals of our days.

## 697 What is the World?

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2579>. It was finished and uploaded on 2018/12/17.]

I'll start with a digression to the question, "What is paganism, really?" In a simple comparison of paganism vs Christianity (in the sense of comparison and not of combat), I'll be able to better define the "world" from the Christian viewpoint but for modern sensibilities.

I'll write of higher paganism.

To a pagan, the world is what it is.

To a believer in a Creator—most strongly Christians, the world is what it is, given that God created it to be such.

In other words, the true dividing line between Christians and pagans is that the pagan thinks of the world as given to even the God or the gods or both or neither. Divinities and lesser spirits, if they are seen as existing, are also seen as having great powers over the world, though the Platonic God didn't even know of the existence of contingent things. He was lost in self-contemplation as His perfection was said to make Himself the only proper object of His attention.

The Christian believes the world to be contingent in the strongest way possible—it might have been different or might have not been at all. Or so should the Christian believe if he pays attention to the first verses of the Gospel of St John or to the first verses of the Book of Genesis as understood through those gospel verses. Yet, there are many Christians who think the pagan assertion, "God doesn't play dice with the universe," as spoken by Einstein, is the position consistent with Christian belief. From the human viewpoint, God first "played dice with the universe" by deciding to create it. Einstein's position is consistent only to Christian belief as deformed by the outlook of paganism that the world necessarily exists and is necessarily

what it is as is true also of any God or gods seen as existing. This pagan outlook, in this higher and self-aware set of beliefs as well as in naive sets of beliefs of pre-civilizational tribesmen, is something of a a stage of evolution towards a belief in a Creator.

Let me put matters in terms which are both spiritual and scientific.

First, we can start with my analysis in the short pieces: Chapter 156, *A Christian's View Einstein and Bohr's debate on the meaning of reality*, and Chapter 157, *Quantum Mechanics and Moral Formation*.

The idea is slightly more mature terms is:

Stuff isn't primary—hence, Einstein's overall view of reality isn't viable. Relationships are primary—hence, the strange view of reality held by Bohr and other 'radical' quantum theorists or philosophers is possible.

Relationships create stuff and can change stuff even in quite fundamental ways.

It's more than reasonable, perhaps necessary, for those creatures which respond to God to pray to God and to pray for contingent matters, such as the return of their children to faith and worship. Such God-responsive creatures can include those struggling with faith, including those who claim to be atheists or even some of those who are truly atheists. Indifference, the state of lukewarmness, is the ultimate blocker for entering Heaven—though even that can be overcome if the indifferent human being is a member of a community, at least a family, which has a good relationship with God. So I believe and teach.

“What is the world?”

Maybe it's better to ask: “What is Creation?”

It is a set of relationships involving God and all He created, with all that He created being a dynamic soup of sorts in which entities form and disappear, evolving and developing, all because of relationships formed:

1. by God creating and then interacting with what He created,
2. by non-living entities forming and interacting to change each other or to bring more such entities into existence,
3. by living entities forming and interacting with their environment, including each other, and changing each other as well as their environment and being changed by their environment,

4. by ever-more complex entities, non-living and living, coming into existence through all of this dynamic interaction,
5. by the ongoing formation of the Body of Christ and all He contains—I have no definitive catalog of who or what will be part of that Body or its true home in the World of the Resurrected.

[In item (3) above, I'm being redundant as each entity, non-living or living, is part of the environment. So far as item (5) goes, I tend to accept a Medieval proposition that everyone who could be happy in Heaven will be saved into Heaven though perhaps through a long period of re-formation and remedial learning in someplace we could call 'purgatory'.]

If we of the geographical West could put flesh upon this bare skeleton, we would be on our way to building a new Western civilization, that is, such an en fleshed understanding could provide the complete worldview for a Christian civilization.

# 698 God Can Do What is Forbidden to Men

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2594>. It was finished and uploaded on 2019/01/30.]

Christians in the past century or more have failed utterly to face up to the biological reality:

God has created a world where family-lines of organisms are kept in good condition by Darwinian selection processes leading to death or reproductive failure of organisms with ‘inadequate’ traits—often caused by mutations. Complex traits, such as intelligence or height or immune system health, are the results of complex systems of genes (more than 1000 for intelligence, more than 700 for height) and can be damaged by a load of small mutations. Damage to the immune system, or bad luck with diseases when young, can damage the developments of any or all traits.

If you only accept the above claim for the sake of argument, consider the possibility that the human race in 2019 includes many who would not have survived under past conditions, most because of undesirable mutations. There are now somewhere around 7.7 or so billion human beings alive. Would that population decrease to perhaps 3 billion if we didn’t have the resources to keep alive so many with weak immune systems or low intelligence by the standards of complex, technologically advanced countries which made it possible for them to survive and perhaps live in some state of comfort? Maybe only 2 billion? Or even 1 billion?

Is this horrible, this probable great loss of life if even so little as an economic depression makes it more difficult to feed and cloth and house many who would lose their incomes, make it more difficult for hospitals to offer cancer treatment for all or even more difficult for hospitals to stay open? Perhaps by human standards, but it's God who created this world and who still rules over it—mostly, at least to our perception, through the properties and laws of the created stuff of this Universe as well as the properties and laws of the Universe as its own self. The human species came to be by way of the sometimes nasty processes of biological evolution.

Think of parasitic wasps:

Parasitoid wasps are a large group of hymenopteran superfamilies, with all but the wood wasps (Orussoidea) being in the wasp-waisted Apocrita. As parasitoids, they lay their eggs on or in the bodies of other arthropods, sooner or later causing the death of these hosts. [See *Parasitoid wasp* at [https://en.wikipedia.org/wiki/Parasitoid\\_wasp](https://en.wikipedia.org/wiki/Parasitoid_wasp).]

The wasp larvae live by literally sucking the juices out of the bodies of their hosts. Not so much different from some of the parasites in parts of the world which infest human beings, destroying their vision or stripping them of their energy.

Or we can consider the brutal stories told by human genes. The major groups of American Indians carry Y-chromosomes (male sex genes) from the eastward migrating Ancient Northern Eurasians (ancestors of Mongols and Siberians and others, cousins to the westward migrating Ancient Northern Eurasians who gave rise to various 'Indo-European' peoples) and maternal genes from ancestors to the modern Han Chinese. What happened to the husbands and fathers and brothers and sons of those women? A lot of Mexican men carry Y-chromosomes from European men, mostly Spanish, while most of the Mexican women carry maternal genes from native American Indian populations. Oppressed peoples sometimes carry Y-chromosomes and other genes from the conquerors and exploiters of their indigenous ancestors.

Certainly, the histories implied by many a genetic study are pretty nasty.

This 'nastiness' is not something imposed upon God's world and a 'fallen' race by demons—'fallen angels' or otherwise. This is part and parcel

of the fundamental way in which God's world, this thing-like phase of His Creation, operates.

Let me take up a related process: miscarriages, most of which are the weeding out of human embryos which the mother's body detects as being unviable or perhaps just sub-optimal. Estimates of the percentage of fertilized human eggs which miscarry, including some which first reach relatively advanced stages of development, go up to 75% and would seem—by some quick checking on the Web—to be at least 50%. We human beings are forbidden to kill defenseless human beings, including most certainly embryos. God can do so.

In other words, evolutionary selection processes and some of the biological processes which have evolved are roughly describable as eugenic, often by nasty means. They are part of the world as God created it, where I use 'world' as this physical universe as seen in light of God's moral order. The Almighty can do what we are forbidden to do.

So it is that we Christians, and others who have a strong—if often inadequate or wrongful—understanding of God's moral order for this world, are in a difficult position. We can watch as the human race deteriorates in intelligence (probably a decline of at least 15 points in the average IQ of the people of the West from about 1850 to now), sociability, immune system health, and other important characteristics. We have likely reached a point where few, if any, peoples of the West have a large enough percentage of smart human beings to sustain advanced technologies. It is all but certain we couldn't rebuild our advanced political communities or economic communities or scientific research communities if they continue to deteriorate. We aggravate our problems by thinking to educate the ineducable, to over-educate the somewhat educable, and to force those with greater learning and thinking capacity down to the level of the somewhat educable. Our hubristic educational and political leaders of Western countries think it more or less given that the good times will never end and also think that anything they do will work.

For discussions of this general problem of the decay of the West, see:

- Chapter 692, *Is Modern Atheism a Result of High Loads of Genetic Mutations?*,
- Chapter 693, *Why Middle-class American Men Don't Care Much If They Die*, and

- Chapter 696, *Here Be Dragons*.

I have posted discussions of this issue from other perspectives in past years. A search on “Barzun” or “Ortega” or “Acton”, “conspiracy” or “conspiracies” or “gangsters” is one way to find some of them—in my speculations, power-elites turned to conspiracies of a more criminal type in response to their inability to innovate, to find solutions to the developing problems of the West. The problem of a population with general declines in intelligence is greatly aggravated by the decision I noted above to treat those talented in intellectual matters as if they have no such talents or, perhaps, as if those talents develop naturally in high-IQ individuals who are bored out of their minds for years and who are kept from developing the attitudes and habits proper to the development of—we can hope—innovative genius. We certainly don’t treat young athletes with serious talent in such a way.

I’ll note here that there are ups and downs and the West has come back from similar periods of decay. After the collapse of Western Christendom at the end of the 13th century, following the High Middle Ages, the population of Western Christendom fell by about half—a precondition of sorts of the recovery and not something which could have been avoided.

Could we of the Modern West do something to mitigate what we will suffer and to make it more likely there will be a recovery before long? Maybe, but we, in general, aren’t even paying attention. For example, we Catholics have been trained to chant, “We believe in biological evolution; aren’t we just so-so modern?” Then we pretend that such a belief, if it were for real, would have no effect upon our understandings of human morality or human behavior in general, no effect upon our understandings of our social organizations or their shaping. Evolution is just so-so clever in shaping our eyes, but it could never shape our moral or economic or political decision-making. Those human traits are just so-so soul-like and not at all affected by our stomachs or our sex organs.

Aquinas and some other thinkers of that magnificent period called the High Middle Ages (see *High Middle Ages* at [https://en.wikipedia.org/wiki/High\\_Middle\\_Ages](https://en.wikipedia.org/wiki/High_Middle_Ages)) claimed that most of what we know about God, we know from His effects (results of His actions) in Creation. In recent centuries, both quantitative and qualitative knowledge of this part or phase of God’s Creation filled with thing-like being has grown to immense heights but the leaders of Christianity, ecclesiastical and scholarly alike, haven’t considered it important to do much with these Himalayas, many piles of

data and some of verifiable facts and less often of facts processed into knowledge and very rarely indeed of a mountain knowledge distilled into wisdom. Those Christian leaders, as I have written before, have acted to increase the problems to come rather than to mitigate them. Africa, at a level of technology manageable by the indigenous population—I write mostly of Sub-Saharan Africa, can perhaps sustain a population of 200 million; their population now is believed to be about 1.7 trillion less the population of Northern African countries. Use your imagination to think of the suffering when the developed countries suffer their own decline and can no longer ‘help’ the Africans. Any mitigation at this time would require very elitist, caste-based societies in which of the vast majority of individuals in the indigenous peoples would be slaves of a sort—to the indigenous elites and to others from the developed countries.

From a theological and salvational viewpoint:

It’s clear we Christians of the modern West know mostly wrong things about the God we imagine as some sort of fuzzy-wuzzy, open-handed Grandpa with brains perhaps a little addled.

We sent missionaries around the world to act on an extension of Christ’s commandment to “love our neighbors” so extreme, so extensive, so patronizing, so based upon ignorance, that we’ve helped to create a huge disaster in the making.

We of the modern West, perhaps Americans most of all, worship a God we’ve conjured up for our convenience and the true God, the God of Jesus Christ, is probably quite angry with us. I don’t know what He’ll do but the Bible and modern knowledge alike indicate we should prepare for an afterlife starting off with long and painful periods of remedial training. At best. And those alive in the next generations should be prepared for a time of suffering and bloody struggle and—perhaps—recovery from the disasters we’ve been creating for the past 2 centuries or so.

# 699 First the Natural, Then the Spiritual.

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2608>. It was finished and uploaded on 2019/03/05.]

On 2019/02/24, Roman Catholics who attended the Mass for Seventh Sunday of Ordinary Time (Cycle C) heard St Paul telling the Corinthians:

It is written, ‘The first man, Adam, became a living being,’ the last Adam a life-giving spirit. But the spiritual was not first: rather the natural and then the spiritual. The first man was from the earth, earthly, the second man, from heaven. [The entire reading is 1 Corinthians 15:45–49.]

Let me put this in terms compatible with our current empirical and verifiable knowledge about human beings:

The man who is natural is the human animal who evolved from an ancestor common to humans and chimpanzees.

The man who is spiritual has developed a sense of wonder and a higher level of capacity for abstract reasoning. He has looked into the sky and has wondered if there is some meaning behind all of this confusion. He has detected the presence of some divine force though he might misinterpret it as forces of multiple spirits, some of them more mortal than immortal. At some point, men at this level of evolution gathered into communities increasingly complex over time, communities which gathered and which stayed together to engage in the collective worship of moral gods. (See *Is Modern Atheism a Result of High*

*Loads of Genetic Mutations?* 692.) Eventually, some such men began, and still begin, to worship the one true God. Eventually, the Son of God came to teach men a little about the internal life of this one true God, an internal life of interaction between Father and Son and Holy Spirit. He offered a share of this life to those who wished to be His friends.

The meaning of St Paul's analysis is retained as it is re-interpreted in terms of what we now know about God's acts-of-being, His acts of Creation and His acts of sustaining, acts described better by Einstein and Darwin than by those who saw the Almighty as a magician.

It's time for us to move on and, in acknowledgment of God as Creator of this evolutionary and developmental world, to realize that the Church Fathers were wrong, though their error was understandable: we need to confess we are conceived and are born as human animals (particular human natures in some philosophical and theological terms) and are raised by God to the status of His friends, as we play our role by properly responding to the Almighty or, at least, to His Creation.

The soul isn't necessary. What's necessary to me as an individual is for God to choose me as a friend to share the life of His Son, the Lord Jesus Christ, in the world of the resurrected. Arguably, the conjecture of a soul is nothing more than a pagan-like attempt to guarantee our survival into an afterlife (the region of the damned or that of the saved). Wrongful metaphysics and wrongful theological speculation couldn't see how we could survive without a part of us having continuous existence, though they couldn't have told anyone what it meant to have such continuity between this part of Creation and the part in which the resurrected share God's life. God created each of us one time in our mother's womb and, yet, we continue to exist only because of acts of sustaining us in being, acts-of-being which aren't so much different from an act of creation from nothingness. Each of us exists as a focus of God's love. He can direct His love into the world of the resurrected and, then, we exist there as the focus of the same love, the same act-of-being which is us.

Claiming we came into existence as a special act of creation, an act in which an 'eternal' soul is attached to flesh and blood is an effort to claim a form of being which doesn't belong, can't possibly belong, to any mortal being—even a mortal being which God will sustain in existence for time without end in that world of the resurrected.

# 700 Love and Stuff, Part 1: Introduction

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2626>. It was finished and uploaded on 2019/08/13.]

[This is the first in a series of some number of articles on this subject—*Love and Stuff*, which will be defined over the course of the series. The past eight months of so began with writer’s burnout, went into a streak of sinus infections, followed by flu in early July. I’ve also endured a rapidly developing cataract that messed up my vision in unusual ways starting around March of 2019. I can’t yet predict when I’ll be fully back on track, but I’m on my way.]

Years ago—perhaps 12, I had planned on writing a book titled: *Love and Stuff*. The basic theme for the book can be stated in a simple way though the underlying ideas are complex and complicated and sophisticated:

Relationships are primary, starting with God’s love and extending to relationships involving Creation and all its creatures. These relationships are primary, create stuff and shape stuff in various ways—‘developmental’ and ‘evolutionary’ are perhaps the two most important (or only?) such ways though we Christians have to be open to God’s direct intervention in a way which might seem instantaneous or ‘miraculous’. This is different from the basic assumption of most human thought that stuff exists and then it begins to form relationships with its own stuff and with other stuff.

I tend to think of this human intuition that stuff exists and then forms relationships as being ‘pagan’ or ‘paganistic’—not implying insult but rather

in acknowledgment of the great pagan thinkers, ancient Greek philosophers and Hindu theologians and Chinese philosophers and others, who developed magnificent and insightful ways of thought based upon that understanding of being. Despite my admiration of those thinkers, I'm arguing for a change of our understanding of being to that of St Thomas Aquinas—a radical existentialist in the teaching of Etienne Gilson. I find Gilson's viewpoint to be quite compatible with my understanding of creation from the viewpoint of empirical science and of mathematics.

But let's go back—in terms of human knowing. We'll start with existing stuff and temporarily put aside the question of the ultimate nature of the stuff we directly perceive. My contention is that stuff interacts in ways that actually change the stuff with which it interacts—the various bits and pieces and things and living creatures which are stuff. I've found this idea stated, perhaps as a dogma or perhaps in a more cautious and speculative manner, in two different contexts which are fundamental to two different fields of human thought:

- in the formulations of quantum mechanics (but various areas of modern science in general), and
- in the ideas taught in the writings of the Johannine school—the school of St John the Evangelist.

In both cases, we seem to have 'stuff' which is, at very most, partially explained but mostly assumed as if having necessary being—the electrons and photons which interact in strange ways in quantum mechanics and the higher-level forms of being which are of primary concern in the teachings of St John and his early disciples. In each case, in very different ways, we can penetrate to a deeper understanding of being though scientists and theologians alike—but for a few—refuse to speculate in ways that are radical and provide possibilities of deeper and more complete understandings of created being and of divine Being. In both cases, there is—or seems to be—something of the pagan view (with no insult intended):

- to empirical scientists and likeminded philosophers and theologians, matter exists though processes described by quantum mechanics, electrons and quarks come to be from something unknown, more abstract, and more formal; and

- to Biblical scholars and likeminded philosophers and theologians, matter co-exists with divine beings (or even one divine Being) and divine beings can impose their will upon that matter with lesser or greater effectiveness—with absolute effectiveness for Christians and some other religious believers and with lesser effectiveness for most pagans and for some Jews who seem to take literally the hints in the Hebrew Bible that men, at least Jacob, can outsmart God.

We can go beyond that in both cases, seeing that both quantum mechanics and Christian theology contain bright pointers to deeper layers of being—more abstract and closer to something which might be called ‘primordial being’.

We can see first what we can learn about God’s Creation from quantum mechanics.

Many have read about such mysterious ‘quantum’ phenomena as virtual particles (which arise from the ‘vacuum’ which is not nothingness) and a particle which might not have even so much as firm existence or non-existence until something interacts with it. This sort of thing is a consequence of the formalisms (systems of mathematical equations) of quantum mechanics, which formalisms describe relationships. So far as I know, there are three such formalisms: those of Heisenberg and Schrodinger which were developed in the 1920s and that of Feynman which was developed in the late 1940s.

There are ongoing efforts to discover particles (or even forces/interactions) which are more elementary than those currently known. For example, the weirdly-named quarks are considered to be a fundamental constituent of hadrons such as protons, neutrons, and mesons—see *Quark* at <https://en.wikipedia.org/wiki/Quark>. The electroweak interaction is “the unified description of two of the four known fundamental interactions of nature: electromagnetism and the weak interaction.” Quarks make up a variety of particles, the electroweak interaction makes up two interactions.

This is what is going on:

In recent centuries, science has been remarkably successful at building models which reproduce much of nature’s phenomena by way of simple components of fewer types. In general, this has been misunderstood as an ongoing march into nature which will

produce a small set of ‘stuff’ and ‘relationships’ (forces) which can then be used to build an accurate, and perhaps precise, model of all of nature—those parts of nature we can observe directly and at least some of the parts we can’t observe directly and may not ever be able to observe directly. To use a weak but suggestive analogy: skyscrapers are constructed from ‘simple’ components, steel-beams and copper wires and wallboard and so on, but a skyscraper is a greatly complex (and generally unique) thing—to build and to maintain and to demolish without damaging nearby structures. A theorist knowing only about those steel-beams and copper wires and wallboard could not design a skyscraper—it has taken prolonged and complicated learning processes for architects and engineers, steelworkers and electricians, to build those skyscrapers scattered across the earth.

For background on my claim that relationships are primary over stuff, see one of my earliest and shortest blog posts included as *A Christian View of Einstein’s and Bohr’s Debate on Reality*, Chapter 156. The referenced chapter is in *Love and Stuff*, Part IV. In this series, I plan on expanding on this matter or, perhaps, pulling together various expansions I’ve made over the past 13 or so years.

For now, I’ll address one specific, related issue: the ‘fear’ of some mathematicians that modern, very abstract mathematics is showing hints that the quantitative and formal structures of mathematics may rest upon a foundation of qualitative and less-formal forms of thought—or forms of being in my expanded and updated version of the radical existentialism of St Thomas Aquinas.

There seem to be qualitative transitions in going from one ‘type-level’ of being to another—where the scare-quotes indicate I can’t quite define what these ‘type-levels’ of being are though I can warn that naive use of both ‘type’ and level seem quite relevant. By ‘type’, I mean primarily—but not exclusively—qualitative vs quantitative. This speculation about mathematics perhaps resting upon qualitative foundations first appeared in my writings in *Adopting Mathematical Reasoning in Non-quantitative Fields of Thought*, Chapter 144. I’ll be addressing this issue by way of pulling together various lines of thought developed over the past six or seven years or, perhaps, pushing those lines of thought further.

So it is that I've speculated over the previous 13 years from both a mathematical and empirical perspective that relationships are primary over stuff and that there are some other insights of modern mathematics and empirical science which have not been properly, or deeply, understood. Much of mathematics and empirical science should be re-interpreted in radical ways consistent with what we know of our universe and all that lies above, below, and around it.

So far as my reasoning processes go, these theological and empirical speculations about relationships engaged in a dance of sorts with my speculations bringing thing-like being back through the abstractions of quantum wave-functions and back to some sort of being in which mathematics itself has become qualitative rather than quantitative.

Let us now see what the Gospel of St John has to tell us.

In the beginning was the Word, and the Word was with God, and the Word was God. He was in the beginning with God; all things were made through him, and without him was not anything made that was made. In him was life, and the life was the light of men. The light shines in the darkness, and the darkness has not overcome it. [John 1:1–5]

“[Christ] was in the beginning with God; all things were made through him, and without him was not anything made that was made.” [John 1:2-3]

Christian theologians and philosophers and preachers and poets and others have put strong interpretations upon these ideas of St John and his followers. I'll not say much in this essay but to endorse the interpretation that God, Father and Son and Holy Spirit, created what is not Him from nothingness—what doesn't exist in a somewhat weird way of speaking. Furthermore, we Christians see in this act-of-being, this act of creating, something important in the relationships of Father and Son and Holy Spirit:

The Father commands that Creation come into existence, the Father commanding in complete communion with the Son and the Holy Spirit; Creation came into existence and continues to do so with ongoing acts-of-being, through the Son and using the Son's Being as the source of created being, the Son giving of Himself in complete communion with the Father and the Holy Spirit; and the Holy Spirit played some special role sometimes

described in terms such as “breathing life into the world and its things and its living beings,” again done in complete communion with the Father and the Son.

‘Communion’ in the above paragraph indicates the sort of relationship described in conventional Christian (Trinitarian) theology: Father and Son and Holy Spirit remain individual Persons, yet are one in Being or Divine Nature. This is the same that is intended for those who enter the Body of Christ as friends of the Son of God and the act of communion, consumption of a consecrated host (Body of Christ) or consecrated wine (Blood of Christ), can be part of the process of entry. It all depends upon the intentions of those receiving communion. In any case, we as individuals who are also members of various communities such as families and tribes, become more fully and completely members of the Body of Christ. We become one Man with Christ as our Head.

This all points, again, to the existence of a transcendental God who created what is not Him and then set to work sustaining that ‘what’ and shaping it to His purposes, which purposes included the evolution of a species of living beings who bear a special resemblance to the Son and are capable of forming such a relationship with Him that we can enter into the Body of Christ where we remain individuals and, yet, we are fully part of that Body, sharing His life and His nature.

I’ll move on in upcoming essays to start elaborating the above ideas and to discuss them in various ways, including those of theology and philosophy and mathematics and physics and evolutionary biology. I will try to produce an outline of a reunderstanding of the Bible and the Christian theologies drawn largely from the Bible, of human history, of human arts and literature, of mathematics and empirical science. More fundamentally, this reunderstanding will be of the true being of all that is Creation or part of it. At the heart of my effort will be a strong belief that the most primary relationship of all is the love of Father, Son, and Holy Spirit for each other—and I would add the love Each feels for Their unified Being, Their love for their divine Community. Given that God chose to bring into being much that is not God, though coming from God, the next most important relationships are the love and loves God feels for Creation and for the individual bits of stuff, the things, the living beings, which are of Creation.

## 701 Love and Stuff, Part 2: A Kinder and Gentler Manichaeism

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2631>. It was finished and uploaded on 2019/09/17.]

We have with us always—in this mortal realm—various heresies which take too seriously the theological quandary: how could an all-powerful and all-good God have created a world in which there is so much evil? The great thinkers who have seeming headed this way, Isaiah and Jeremiah and Lord Acton are just 3 examples, have eventually retreated to a prayer such as, "Lord God Almighty, why did You create a world in which such a high percentage of powerful and successful men are outright evil?" In modern psychological terms, this is somewhat equivalent to asking, "Why is it so easy for men with the 'mentality of gangsters' (Acton's term) to gain power and wealth?" or even "Why is this world made so that psychopathic men can so easily take advantage of the bonds of trust which are necessary for complex (and potentially wealthy and powerful) communities to form?" The parasites eventually invade any successful centers of power and wealth, destroying the relationships which are productive of that power and wealth.

To think matters through to the formation of tightly phrased questions is good. In doing such, we are being honest to the workings of God's Creation, honest to the acts-of-being which God performed in creating from nothingness and in sustaining and shaping what He has so created. (Per Etienne Gilson, 'act-of-being' is an English-language term to give us a sense of the sheer action in God's interaction with contingent being, a sense of the radical existentialism involved in Thomas Aquinas' understanding of a true Creator-God.)

So it is that we can derive insights from analyses of and contemplations

upon this matter of a Creation with high levels of natural evils (volcanoes and parasites and so on) and seemingly higher levels of human evils. We can't draw anything that could be called answers or explanations which are more than partial and contingent. Yet, many try to explain this world of mixed goodness and evil in absolute terms, not always simple but absolute.

One possible set of explanations start with the idea found in ancient pagan traditions that there was some sort of a fall from perfect being which is 'spiritual'; our 'material' world is a mistake and must be conquered in such a way that 'material' being disappears and only 'spiritual' being continues to exist. This is more extreme, though similar to, the Greek idea of a Golden Age which decays to a Silver Age and on to the Bronze Age through a Heroic Age and on to the low-point of the corrupt Iron Age. (See *Ages of Man* at [https://en.wikipedia.org/wiki/Ages\\_of\\_Man](https://en.wikipedia.org/wiki/Ages_of_Man). See *Yuga* at <https://en.wikipedia.org/wiki/Yuga> for a Hindu version of this sort of a system. Note that the Greeks and Hindus both came from the people we can describe roughly as 'Indo-European people' who are discussed in *Proto-Indo-Europeans* at <https://en.wikipedia.org/wiki/Proto-Indo-Europeans> and *Indo-Aryan migration* at [https://en.wikipedia.org/wiki/Indo-Aryan\\_migration](https://en.wikipedia.org/wiki/Indo-Aryan_migration).)

One aspect of this whole matter confuses me: why is it that this idea of a fall, by stages or all at once, so thoroughly dominated any theories that man arose from more primitive creatures? Why do we tend to think of ourselves as being descendants of more perfect men? Is it a trait of Indo-European modes of thought only? I don't know enough to provide even tentative answers and doubt I'll explore this particular line of questions, but—even unanswered—such questions can point to interesting ideas.

My intent is to look at one particular problem coming from this: the tendency on the part of Christians to hypothesize a conflict between a more perfect state of being, spirit, and a state of being, material, which is imperfect at best and maybe outright evil.

A powerful thinker, *Mani*, lived during 216-274—see [https://en.wikipedia.org/wiki/Mani\\_\(prophet\)](https://en.wikipedia.org/wiki/Mani_(prophet)). He was of Persian origin (Indo-Aryan in all likelihood). He drew upon *Gnosticism*—see <https://en.wikipedia.org/wiki/Gnosticism>—which taught (roughly and simplifying over a variety of similar but not identical sets of beliefs as listed in that Wikipedia article):

- All matter is evil, and the non-material, spirit-realm is good.

- There is an unknowable God, who gave rise to many lesser spirit beings called Aeons.
- The creator of the (material) universe is not the supreme god, but an inferior spirit (the Demiurge).
- Gnosticism does not deal with "sin", only ignorance.
- To achieve salvation, one needs gnosis (knowledge).

This Wikipedia article on Gnosticism also tells us: “A major question in scholarly research is the qualification of Gnosticism, based on the study of its texts, as either an interreligious phenomenon or as an independent religion,” pretty much the same as my question regarding this entire line of thought and of feeling which I’ll simply label “pessimism about matter.”

Mani’s system, *Manichaeism*—see <https://en.wikipedia.org/wiki/Manichaeism>, taught:

an elaborate dualistic cosmology describing the struggle between a good, spiritual world of light, and an evil, material world of darkness. Through an ongoing process that takes place in human history, light is gradually removed from the world of matter and returned to the world of light, whence it came. Its beliefs were based on local Mesopotamian religious movements and Gnosticism.

Using categories of Christian thought: what exists necessarily (it couldn’t not exist) is good and pure; what exists contingently is evil and impure, but that which is good and pure has become trapped in this material world, which has basic stuff, matter, which is evil and impure. These lines of thought are so complex that its hard to properly criticize or analyze them without a good deal of study and a good deal of words. My goal is to deliberately stay at a more general level to drive home the point that there is no good reason to consider the usual understanding of the fall of Adam and Eve as even plausible while there is also no good reason to reject evolutionary theories as being incompatible with Holy Scripture or with nearly all subsequent Christian theologies—though some versions of Darwinian evolutionary theories have been corrupted by thought due more to Karl Marx than to Darwin and some versions of Christian theology have been corrupted by borrowins from Manichaeism and Gnosticism.

One aspect of Christian speculative theories (yes—not settled dogma) which puzzles me is: if we are to think about spirit as perfect and good and matter as evil and defective, why would we imagine that we share in spirit? Why do we think there is a form of human created being (matter or body) which is evil and defective and a form of human created being (spirit in the form of soul) which somehow shares in divinity? Mani, and his possible Gnostic forebears, might have been able to believe this because of their polytheistic religions and the confusion in or their lack of concern with various forms, but Christians believe in one God who is the one Creator, in divine Being and in contingent being. We should be more careful in blurring boundaries, while confessing that God has crossed the boundaries in creating what is not Him and then in taking on, through the Son, a human nature of contingent being.

Yet, it would seem that most modern Christians don't generally see the world as outright evil or even bad in a strong way, though anyone with open eyes and an active mind will see there is much in this world which is not good. Some might even perceive that such non-goodness might be the result of processes which lead to goodness. But... Modern Christians, and most other modern peoples in the West, form—or, more likely, adopt—their core beliefs as if the world were irrelevant, and so it is easy, as one important example, for them to absorb the liberal position that only individuals matter and communities have only nominalistic existence. (See *A Very Simplified View of the Woes of Christianity—Now and at Two Earlier Times*, Chapter 674.)

It becomes not only possible, but mandatory in a sense for those modern Christians to think in terms of soul as eternal (contingent being as eternal?) and matter as something ephemeral and created for the use of our 'pure' and 'eternal' souls. Even our bodies can be mutilated if we feel ourselves to be of a different sex than that to which we were born. (Lest the reader think I be indifferent to the small in percentage but real population of truly troubled people: see *Individuality, Freedom, and the Real Conflict Facing Modern Christians*, Chapter 650.)

Modern Western Christians, other residents of the Western regions of decay still more, have conformed their thoughts and feelings in such a way as to accept God's declaration that what He created is good or very good while also thinking only the spiritual can be truly good, though the spiritual is no more than an undisciplined desire. The world is not "what it is" but rather "what we feel it is or should be." So it is that modern Western

Christians can accept both evolution and the story of a human race born in Eden of a special Creation which is in nature but not of nature. It allows some to move toward the radical, but consistent, position that we are what we feel ourselves to be, or think to feel ourselves to be, at the present moment. Government bureaucrats and their soul-mates, Christian leaders, can decide to move primitive tribal peoples from Uganda to Maine, feeling that all human beings are the same—why in the world would they think natives of tropical Africa evolved to the same characteristics as natives of the temperate and arctic zones? Despite the illusions of such as those Christian leaders of the modern West, or most members of their flocks, this is the same reasoning, low-quality and oblivious to the facts of God's Creation, which is found in those who advocate that a 6 year-old boy who feels he is a girl should undergo hormone treatments and surgical mutilations to become a 'girl'. Africans have the traits to live in a suburb of Boston and boys have the traits to be girls with a little 'help' from the medical industry.

The above paragraph discusses ideas so stupid as to be held only by Catholic bishops and others educated beyond their capabilities—while trying to function in a chaotic environment, many might have functioned well enough in a morally and politically stable world. More interesting, from my perspective, the tendency of the modern man or woman or child of the West to overlay their own illusions and delusions upon the world outside of themselves has allowed many modern Christians of the West to accept the material benefits of modern science and engineering while remaining in the mainstream of a Christianity which relies upon an understanding of Creation which is made of both Bible-based theology and modern science—as of 1700 or so.

To these modern Christians of the West, our physical natures don't really matter much. Our desires, taking the place of spiritual natures in Gnostic or Manichaeistic thought, overrule any considerations of reason or even basic facts; this sort of corruption has even overtaken the self-sacrificing religious and secular missionaries of the modern world: see *Here Be Dragons*, Chapter 696 for a discussion of the great dangers they, with our support, have nurtured.

To hell with reality, even the ways in which God has created and continues to shape and to sustain Creation, in particular—the ways in which the human race has evolved and continues to evolve. To hell with reality, even our own bodies to which we were born.

## 702 Love and Stuff, Part 3: Is 'Empirical' a Meaningful Term

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2634>. It was finished and uploaded on 2019/10/01.]

I'll start by quoting The Collaborative International Dictionary of English v.0.48 [140], where that dictionary draws upon the 1913 edition of Webster's dictionary for the particular terms of interest in this essay. (The reader is well-advised to pay attention to the definitions and maybe even contemplate their deeper meanings and implications because I'll be moving fast in this essay outlining a future discussion which will be much more complete and part of a still more complete and complex work, God willing.)

**Empirical** Pertaining to, or founded upon, experiment or experience; depending upon the observation of phenomena; versed in experiments.

In philosophical language, the term empirical means simply what belongs to or is the product of experience or observation. –Sir W. Hamilton.

The village carpenter . . . lays out his work by empirical rules learnt in his apprenticeship. –H. Spencer.

Both of the quotes following the definition are also drawn from the 1913 Webster. That dictionary gives a second definition concentrating upon what 'empirical' is not:

**Empirical** Depending upon experience or observation alone, without due regard to science and theory; – said especially of medical practice, remedies, etc.; wanting in science and deep insight; as, empiric skill, remedies.

Taken together, so that we can catch a better view of these definitions in light of the context of general human understandings of being as of 1913, we can see a true problem. One of the clichés of modern scientific thought is, “There are no facts without theories.” Following that path a little: “There are no rational, human experiences without theories.” Of course, explicitly stated and rationally understood theories, theories in this sense, began (at least mostly) with the early Greek philosophers—whose work overlapped with mathematics and physics. Think of theory in a general sense, including the creation myths of pre-literate tribal peoples and the more sophisticated myths of the higher pagans; including a smorgasbord of ‘old wives’ tales’, fisherman’s tales, tales of totemic hunters; including rules of thumb of justice and social order, and so forth. Thus, there seems to be some sort of a mistake or gap in earlier understandings of what ‘empirical’ could be, in 1913 understandings. Our dogs and cats aren’t frightened by comets flashing across the sky as were our superstitious ancestors. Nor are those animals frightened by a comet coming directly at us, or in a glancing manner, as we modern, scientific humans are. Of course, even animals far less intelligent than dogs or cats will be frightened when the comet is blindingly bright.

Here’s a link to an entry at a serious technological blog: *Cats and Vision: is vision acquired or innate?* at <https://computervisionblog.wordpress.com/2013/06/01/cats-and-vision-is-vision-acquired-or-innate/>. Cats raised in an environment where they see only horizontal (vertical) lines during crucial periods of brain development will not be able to see vertical (horizontal) lines for the rest of their lives. It seems likely that even the basic (innate or intuitive) elements of our perceptions aren’t direct but rather formed by interaction with what is in our environments.

I’ll relate some recent personal experiences here. I recently had two lens replacements because of an unusual situation. By the age of 62—2017, I had normal slow-developing cataracts and then, sometime between 2017/09 and 2018/09, a third cataract began to develop rapidly. That third cataract developed so that it picked up the false image from a defect in my cornea (astigmatism) and threw it someplace on my retina apart from the location which was in my lens prescription. My brain was confused and I was seeing a weird world in which objects were compressed when seen through my left eye but normal when seen through my right eye. So I had two ‘premature’ but highly successful surgeries to correct the situation. Six weeks after the

second surgery and three weeks after getting new eyeglasses, my vision of the world around me is stabilizing. I no longer see shadows as real objects, perhaps very strange objects. I see the tops of pew-backs in my church as being parallel to each other. The eye-surgeon had warned me it was possible my brain would shut down the eye giving it information it couldn't make good sense of. It didn't shut the eye down but it was reeling like a punch-drunk boxer.

See *A Mathematical Model Unlocks the Secrets of Vision* at <https://www.quantamagazine.org/a-mathematical-model-unlocks-the-secrets-of-vision-20190821/> for an interesting discussion of:

the great mystery of human vision: Vivid pictures of the world appear before our mind's eye, yet the brain's visual system receives very little information from the world itself. Much of what we "see" we conjure in our heads.

"A lot of the things you think you see you're actually making up," said Lai-Sang Young, a mathematician at New York University. "You don't actually see them."

Yet the brain must be doing a pretty good job of inventing the visual world, since we don't routinely bump into doors.

It would seem that the 'empirical', world or aspects, isn't what it was thought to be by the editors of the 1913 Webster nor by David Hume nor Aristotle nor any of the authors of the Bible nor by any past thinker I'm aware of.

If the reader follows some path of thought similar to mine, he might wonder if 'empirical' is truly a useful concept—such skepticism is a necessary attitude in these sorts of situations even if that reader is convinced of the need and importance of experience, including bodily perceptions, in our efforts to understand some of the various aspects of our world—I'll label as 'practical' or 'scientific' those aspects and the thoughts they lead to. I am so convinced. I'm also convinced that our higher or more abstract thoughts originate in those, mostly reliable, bodily perceptions. They originate by way of processes I'll be trying to at least sketch out in this series of essays, which essays I plan to flesh out and put into book form.

There is another, more specific error embedded in this way of thinking, an error which is unconscious and dangerous in the thoughts of Kant and

many who followed him even while opposing him in many ways. We imagine schemes of human knowledge which are really for human comfort and convenience and which, I claim, don't correspond that well to the actual being of our world. It's a fully conscious error on my part, one I make to ease the path for my modern mind and the modern minds of my readers or any who might hear of some of my ideas by various second- or third-hand routes. This deliberate mis-categorization of knowledge corresponds to some fundamental errors in the ways in which we learn in formal schooling and, most likely, in our various cultural and social activities. A small amount of deep thinking after recognition of the interaction of eye and mind in even seeing the tree outside my window points to the unity of knowledge, of various sorts of knowledge including even revelation. If I'm right, the reader might take comfort in this: it took me years of reading and contemplation and more reading and some serious studying of various subjects to absorb this insight and make it truly mine.

The fundamental error which leads to a misunderstanding of knowledge begins with a misunderstanding of the being which is the object of knowledge. One important and pedagogically useful form of this error is simply:

Being is of two types, one material and one immaterial. The two types of being cannot mix though they can, under some circumstances, be in such communion as to form a human being. The material part of human being is flesh and blood, while the immaterial includes something we can't describe except by way of comparison to our beliefs about the nature of divine Being.

Yet, we must ask: If man is entirely a product of biological evolution and if his thinking is done, consciously or innately, in his physical brain, how has he been able to even conceive of such concepts as 'infinity'? The answer for now is simple: we learn of infinity by interacting with God—though many great thinkers haven't been able to believe this is what they are doing when contemplating truly abstract, truly deep matters. This blindness is made possible since most of our dealings with God are through what the Medievals labeled His 'effects in Creation'. Another term, more useful and more powerful, is 'acts-of-being', His acts of creating and of sustaining and shaping what He has created. This leads to my draft conclusion:

There are but two types of being: the necessary Being of God—Father, Son, and Holy Spirit—and the contingent being that God has created.

# 703 Love and Stuff, Part 4: Empirical Knowledge and Transcendental Knowledge

[The original version of this essay was published on the blog-site, *Acts of Being*, found at <http://loydfueston.com/?p=2640>. It was finished and uploaded on 2019/12/18.]

If we are flesh-and-blood creatures perceiving only what comes through our eyes and ears, our noses and the nerves on our fingertips and our elbows, how could we ever have transcendental knowledge? How could we know of God as other than a conjecture? Are we even likely to make a conjecture under the dualist assumption that flesh-and-blood be not enough for a creature to have consciousness, self-consciousness, rationality, longing for what lies beyond this world of flux? Would our God have remained a this-worldly god likely tied to our particular tribe?

We know various possible answers to this question, one of which is considered by some to be **the** answer. That one and only answer, which is actually a speculation from earlier centuries, and based upon earlier understandings of human nature and of creaturely nature in general, is: we know of transcendent things and of the Transcendent God through a soul which is itself transcendent in some sense, is itself above mere flesh-and-blood.

Let me suggest a different line of thought, one that doesn't posit some sort of 'magic' in a Creation not seeming to be much of a 'realm of magic' (no matter how many Christians delude themselves into thinking Middle Earth has anything to do with the God who presented Himself through Jesus of Nazareth) nor with acts of special creation (mostly, the creation of a first man and a first woman) by a God who otherwise acts through His effects in a rational world which existed prior to that act of a special

creation of men and women. More concisely: let us see if we can take God seriously as the rational Creator of a rationally ordered Creation.

Human beings (designated as ‘men’ from here on) are creatures which evolved from lines of clever, apish creatures. Those long-ago ancestors likely had some simple technology, such as the twigs altered by modern chimpanzees to make good tools for fishing for termites; interestingly, for a while, our ancestors were considered to be ‘anatomically modern humans’ but existed for tens of thousands of years without going beyond chimpish levels of technology. By various paths, lines of such ‘modern’ human beings evolved and then developed in specific environments—the environments in which they developed so as to display interesting and useful traits might have been different from the environments in which their recent ancestors had evolved. The previous sentence gives only a slight taste of the complexities and complications which have to be considered when analyzing natural processes, evolutionary processes in this case. A plausible, global analysis true to human reality would be sophisticated and not so schematic as to be profitable material for popular science, though such knowledge has to be somewhat reduced to teach the basics to young people or to provide material for general understandings on the part of literate scientific laymen or to provide entertainment for those fooled by such phrases as ‘chaos theory’—which is actually about the study of systems modeled by equations, those systems and their plausible models being both well-determined and impossible to calculate accurately beyond a certain time.

If we take God seriously as the rational Creator of a rationally ordered Creation, then we must take seriously our best knowledge of Creation, starting with the levels of Creation which we can directly perceive, perhaps through instruments such as microscopes, and can most readily develop theories, which are explanations or even symbolic encodings of what is known and not speculations. In small pieces or specific attributes, Creation is an observable and even testable manifestation of certain thoughts of the Creator. When we theorize or speculate, in science or mathematics or theology or philosophy or making of music or images, we are reaching for those thoughts of the Creator. (See Chapter 676, *Making God’s Thoughts Our Thoughts, God’s Ways Our Ways: Why Christianity Is Not Simple..*

As man himself has grown more complex and complicated in the various (intertangled) parts of his nature—most especially in his intelligence and in his social relationships, he has changed the environments in which he lives and in which he evolves. Among other dynamic traits, men have rational

minds and social relationships which allow for the passing of knowledge from generation to generation through education and the accumulation of knowledge in libraries and by way of training in specific skills and so forth. These processes can become self-sustaining—so long as the surrounding human community survives. In recent centuries, such processes have been most powerfully productive in the physical sciences though also quite productive in the historical sciences and in small regions of other social, or ‘soft’, sciences when there were practitioners both talented and honest.

So it was that certain regions of the mind of the Body of Christ and lots of individual minds in the West and some in other regions, were advancing in many ways into Creation. That is, they were making the being of Creation into human mind-stuff. Human minds, or least some—especially the communal mind of the Body of Christ, were reshaping themselves in imitation of the relationships of the Creator to His creatures, human and other. Moreover, the process by its very nature was self-reinforcing—as man became more god-like though not often more God-like, he could learn more from studying himself and his increasingly complex and complicated relationships with himself and with other human beings and with all the creatures around him. **And** his relationships with all the abstractions which emerged so gradually—reading one or more accessible histories of mathematics will give some idea of what was involved.

Abstractions are relationships. Objects don’t exist in an abstract sense and can only be described abstractly in terms of relationships, their perception by God or a living creature or their attractions to (involving forces between) God or other creatures. (In mathematics and physics, a repulsion is a negative attraction.)

To think or even feel and act in a more abstract way is to think and feel and act according to a different and, in some ways, higher realm of creation. We move closer to God’s act of Creation, the Act-of-being in which the abstract foundations of our concrete, thing-like world came to be. And, yet...

My overall understanding of Scripture and of our world leads me to believe that God, the nature and common Being of Father and Son and Holy Spirit, is both the most concrete and the most abstract of all possible entities. He’s not concrete in quite the sense of being thing-like, though His divine Concreteness is as particular as any possible thing.

But I diverge. In a necessary way, creating various forks which will be explored in future writings.

My main paths and my divergences alike will allow me to deal with the questions:

- So how can we know about transcendent truths and regions, about the Transcendent God Himself, if we have a non-transcendent form of being?
- Can we directly access transcendent being, to know it or to be in more intimate communion with it?

These are two paths, starting out as if somewhat in contradiction to each other. The contradiction lies in the direction of movement for our explorations. The first item above attempts to jump, as it were, to someplace in transcendent regions and then to move to the concrete and thing-like regions in which man lives—top-down thinking and exploration of reality. The second starts in those concrete and thing-like regions and attempts to move toward transcendent regions—bottom-up thinking and exploration of reality. At any given time, a particular thinker might be able and willing to provide a plausible description of one path and not the other. More than that, expansion of one line of human thought or of human exploration of reality might well lead various human communities to think one path is the true way of human thought.

The modern world has seen a new complication due to the weak efforts of theologians—do they have weak minds or weak spirits or both?—at a time when the bottom-uppers have recently had a few centuries of (soon ending?) great accomplishments. The Christian top-downers continue to work as if the knowledge of our physical worlds circa 1800 were adequate for a theology for modern men and the explicitly Christian bottom-uppers have nearly disappeared. The bottom-uppers of more recent generations have not been devout Christians or have been Christians who have kept their beliefs private and separated from their work in the real world.

In any case, I plan on using, probably have been using, both pathways—bottom-up and top-down. And I use them imperfectly. Only one man traveled both directions of knowledge in their fullness and that was because He followed both directions of being. The Son of God came down from Heaven to incarnate Himself as man, ‘emptying’ Himself of divinity in the process. He rose from the grave which is the fate of mortal men, taking up His full divinity. Christ knew of both paths (even during His kenosis—see the ar-

ticle, *Kenosis* at <https://en.wikipedia.org/wiki/Kenosis> because He was and is and always will be both paths.

It's important to note I'm not claiming that men have traveled toward transcendental truths only through explicit belief in Jesus of Nazareth as being the Son of God. I am claiming that the fullness of these paths (top-down from God and bottom-up from Creation) are through Christ and are Christ. Yet, it's certainly true that, for example, mathematicians can move from the empirical world of simple counting and measurement by rulers into more abstract realms and then move back again. It's not always the same mathematician who discovers some truths in abstract number theory and then develops algorithms for encoding of secret information.

As a first step, think of this as such: There is a continuum of sorts here, some dimension of Creation which runs from concrete, thing-like being to abstract forms of being. In fact, this a crutch. We know of some aspects of this divide between the concrete and the abstract, thought it really isn't so smooth as to be a spectrum: the quantum wave-function is a form of being quite abstract and mathematical and that entity 'collapses' to concrete, thing-like being in ways still being explored by theoretical and experimental physicists alike. I'll note in passing that I'm writing in a highly speculative mode to provide ways of speaking and writing about these issues.

'Inside' of the system which is all, both God-to-Creation and Creation-to-God, and which is united in Jesus Christ, we can go partway toward the transcendental God, the source of all truths, and then return to Creation so as to make sense of it all. Some mystics might be able to start in transcendental regions and travel partway, not all the way, back to concrete regions of flesh-and-blood creatures—I don't know. In any case, all such journeys remain inside of Creation and most remain deeply inside of Creation; all such journeys enter abstract regions but do not reach God's primordial act-of-being, the act in which He created contingent being.

To say that the journey of a mathematician to even realms of transfinite (greater than 'ordinary' infinity) is comparable to the journey to the transcendental regions is a bit of an exaggeration, but it is—again—a way of starting a journey only to be completed by those who choose to accept God's offer of adoption as sons and daughters of the Father. In some abstract sense of distance, we travel a distance to God which is greater than infinitely long—Cantorian theories of transfinite numbers would speak of absolute infinity, the Omega, which is more than infinitely larger than the ordinary infinity of counting numbers (1,2,3,...); I would hedge any state-

ments that even Omega is truly comparable to Godleaving open the possibility that God is in some true sense still ‘richer and larger’ than absolute infinity. At the same time, I would freely admit that I don’t quite know what that could mean and would also point out that being as understood in any age of philosophers or theologians or poets has always proven to be richer and larger than any prior thinkers had thought it to be. And those thoughts prove to be inadequate to the possibilities seen in later ages of men.

But how can I speak of the abstract reasoning of some branches of mathematics and some branches of other fields of human thought as being analogous to the spiritual and theological thoughts of God?

My first response to the above question is: I can only speak of such a matter bravely and honestly, hoping to make greater sense of it than has been done in recent centuries. Catholic thought is wedded to an understanding of Creation, circa 1800; Protestant thought is that bad or worse—depending upon the denomination.

Though there are hints of the transcendental in some of the oriental religions, Christianity is the only religion which matches, I think exceeds, the great metaphysical schools in seeking transcendental truths. In addition, the history of science and technology indicates that Christianity, at least that of the West, also deals better with the concrete, thing-like aspects of created being. It’s perhaps more accurate, as well as quite sad, to say that Christianity, especially the Western Catholic parts, **once** dealt better with the concrete, thing-like aspects of created being.

It is in that tradition, the real tradition of Aquinas and his master—Albert the Great, that Christianity reaches for a unified understanding of all created being and even an understanding of the Being of God, however limited that understanding might be. The ancient, and potentially hubristic but noble—if properly controlled, goal of reaching for the heavens has become the goal of reaching far beyond the heavens toward what I call the primordial stuff of Creation—stuff which is a particular manifestation of the very Being of the Son of God.

We see certain aspects of the transcendental in the pages of the Bible, especially in the Gospel, but we see other aspects in the abstract realms of Creation explored by mathematicians and physicists, theologians and philosophers, poets and musicians, builders and sculptors, craftsmen and women taking care of children, and many others. This global vision, what I often call a worldview, is an incomplete and imperfect vision of Creation

including the boundary regions where the Son of God provided the raw stuff of created being from His own divine Being.

## Colophon

This book was typeset using the LaTeX typesetting system created by Leslie Lamport and the memoir class written by Peter Wilson.

The LaTeX typesetting system is a set of macro commands using the TeX typesetting system written by Donald Knuth. The body text is set 10/12pt on a 33pc measure with

Computer Modern Roman designed by Donald Knuth. Other fonts include Sans, Smallcaps, Italic, Slanted and Typewriter, all from Knuth's Computer Modern family.
